### 29.11. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation may choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes...
parameters controlling the representative fragment test.

The \texttt{VkPipelineRepresentativeFragmentTestStateCreateInfoNV} structure is defined as:

\begin{verbatim}
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{representativeFragmentTestEnable} controls whether the representative fragment test is enabled.

If this structure is not included in the \texttt{pNext} chain, \texttt{representativeFragmentTestEnable} is considered to be \texttt{VK_FALSE}, and the representative fragment test is disabled.

If the active fragment shader does not specify the \texttt{EarlyFragmentTests} execution mode, the representative fragment shader test has no effect, even if enabled.

### Valid Usage (Implicit)

- \texttt{VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_REPRESENTATIVE_FRAGMENT_TEST_STATE_CREATE_INFO_NV}

To \textit{dynamically set} the \texttt{representativeFragmentTestEnable} state, call:

\begin{verbatim}
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRepresentativeFragmentTestEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 representativeFragmentTestEnable);
\end{verbatim}

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{representativeFragmentTestEnable} specifies the \texttt{representativeFragmentTestEnable} state.

This command sets the \texttt{representativeFragmentTestEnable} state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRepresentativeFragmentTestStateCreateInfoNV::representativeFragmentTestEnable} value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-None-08522
  Either the extendedDynamicState3RepresentativeFragmentTestEnable feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

29.12. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.
29.13. Fragment Coverage To Color

The \texttt{VkPipelineCoverageToColorStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.
- \texttt{coverageToColorEnable} controls whether the fragment coverage value replaces a fragment color output.
- \texttt{coverageToColorLocation} controls which fragment shader color output value is replaced.

If the \texttt{pNext} chain of \texttt{VkPipelineMultisampleStateCreateInfo} includes a \texttt{VkPipelineCoverageToColorStateCreateInfoNV} structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.

If \texttt{coverageToColorEnable} is \texttt{VK_TRUE}, the \textbf{coverage mask} replaces the first component of the color value corresponding to the fragment shader output location with Location equal to \texttt{coverageToColorLocation} and Index equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If \texttt{coverageToColorEnable} is \texttt{VK_FALSE}, these operations are skipped. If this structure is not included in the \texttt{pNext} chain, it is as if \texttt{coverageToColorEnable} is \texttt{VK_FALSE}.

### Valid Usage

- \textbf{VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404} If \texttt{coverageToColorEnable} is \texttt{VK_TRUE}, then the render pass subpass indicated by \texttt{VkGraphicsPipelineCreateInfo::renderPass} and \texttt{VkGraphicsPipelineCreateInfo::subpass} must have a color attachment at the location selected by \texttt{coverageToColorLocation}, with a \texttt{VkFormat} of \texttt{VK_FORMAT_R8_UINT}, \texttt{VK_FORMAT_R8_SINT}, \texttt{VK_FORMAT_R16_UINT}, \texttt{VK_FORMAT_R16_SINT}, \texttt{VK_FORMAT_R32_UINT}, or \texttt{VK_FORMAT_R32_SINT}.
Valid Usage (Implicit)

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType
  *sType must be* VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV

- VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask
  *flags must be* 0

```
// Provided by VK_NV_fragment_coverage_to_color
typedef VkFlags VkPipelineCoverageToColorStateCreateFlagsNV;
```

**VkPipelineCoverageToColorStateCreateFlagsNV** is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the coverageToColorEnable state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetCoverageToColorEnableNV(
  VkCommandBuffer commandBuffer,
  VkBool32 coverageToColorEnable);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *coverageToColorEnable* specifies the coverageToColorEnable state.

This command sets the coverageToColorEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorEnable value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageToColorEnableNV-None-08524
  Either the extendedDynamicState3CoverageToColorEnable feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-parameter
  *commandBuffer must be* a valid VkCommandBuffer handle

- VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-recording
  *commandBuffer must be* in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>

To dynamically set the `coverageToColorLocation` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetCoverageToColorLocationNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageToColorLocation);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorLocation` specifies the `coverageToColorLocation` state.

This command sets the `coverageToColorLocation` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorLocation` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageToColorLocationNV-None-08526
  Either the `extendedDynamicState3CoverageToColorLocation` feature or the `shaderObjectCoverageToColorLocation` feature or both must be enabled.
Valid Usage (Implicit)

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetCoverageToColorLocationNV-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

</table>

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

29.14.1. Pixel Coverage

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique `sample index`. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a **shading rate image** is used, and the fragment covers multiple pixels, each pixel’s coverage
consists of the coverage samples corresponding to that pixel, and each sample retains its unique sample index \( i \).

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index \( i \).

29.14.2. Color Sample Coverage

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of rasterizationSamples is identical to the number of samples in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered.

Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the VK_AMD_mixed_attachment_samples extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered; additional pixel coverage samples are discarded.

If the \( \text{pNext} \) chain of VkSubpassDescription2 or VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with the multisampledRenderToSingleSampledEnable field equal to VK_TRUE, sample coverage is calculated as if the attachment has VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples samples.

When the VK_NV_coverage_reduction_mode extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the VkPipelineCoverageReductionStateCreateInfoNV structure.

The VkPipelineCoverageReductionStateCreateInfoNV structure is defined as:

```
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType       sType;
    const void*            pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV    flags;
    VkCoverageReductionModeNV       coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- \( \text{sType} \) is a VkStructureType value identifying this structure.
- \( \text{pNext} \) is NULL or a pointer to a structure extending this structure.
- \( \text{flags} \) is reserved for future use.
- \( \text{coverageReductionMode} \) is a VkCoverageReductionModeNV value controlling how color sample coverage is generated from pixel coverage.
If this structure is not included in the `pNext` chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the `VK_NV_framebuffer_mixed_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_MERGE_NV`.
- If the `VK_AMD_mixed_attachment_samples` extension is enabled, then it is as if the `coverageReductionMode` is `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV`.
- If both `VK_NV_framebuffer_mixed_samples` and `VK_AMD_mixed_attachment_samples` are enabled, then the default coverage reduction mode is implementation-dependent.

**Valid Usage (Implicit)**

- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType` `sType must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV`
- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask` `flags must be 0`
- `VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter` `coverageReductionMode must be a valid VkCoverageReductionModeNV value`

```c
// Provided by VK_NV_coverage_reduction_mode
typedef VkFlags VkPipelineCoverageReductionStateCreateFlagsNV;
```

`VkPipelineCoverageReductionStateCreateFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode`, specifying how color sample coverage is generated from pixel coverage, are:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef enum VkCoverageReductionModeNV {
    VK_COVERAGE_REDUCTION_MODE_MERGE_NV = 0,
    VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV = 1,
} VkCoverageReductionModeNV;
```

- `VK_COVERAGE_REDUCTION_MODE_MERGE_NV` specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.
- `VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV` specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index is covered; other pixel coverage samples are discarded.

To **dynamically set** the `coverageReductionMode` state, call:
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object

void vkCmdSetCoverageReductionModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageReductionModeNV coverageReductionMode);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageReductionMode` specifies the `coverageReductionMode` state.

This command sets the `coverageReductionMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCoverageReductionModeNV-None-08528
  Either the `extendedDynamicState3CoverageReductionMode` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageReductionModeNV-coverageReductionMode-parameter
  `coverageReductionMode` must be a valid `VkCoverageReductionModeNV` value
- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetCoverageReductionModeNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

```c
// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice physicalDevice,  
    uint32_t* pCombinationCount,  
    VkFramebufferMixedSamplesCombinationNV* pCombinations);
```

- `physicalDevice` is the physical device from which to query the set of combinations.
- `pCombinationCount` is a pointer to an integer related to the number of combinations available or queried, as described below.
- `pCombinations` is either `NULL` or a pointer to an array of `VkFramebufferMixedSamplesCombinationNV` values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If `pCombinations` is `NULL`, then the number of supported combinations for the given `physicalDevice` is returned in `pCombinationCount`. Otherwise, `pCombinationCount` must point to a variable set by the user to the number of elements in the `pCombinations` array, and on return the variable is overwritten with the number of values actually written to `pCombinations`. If the value of `pCombinationCount` is less than the number of combinations supported for the given `physicalDevice`, at most `pCombinationCount` values will be written to `pCombinations`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the supported values were returned.

Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter` `pCombinationCount` must be a valid pointer to a `uint32_t` value
- `VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter`: If the value referenced by `pCombinationCount` is not 0, and `pCombinations` is not NULL, `pCombinations` must be a valid pointer to an array of `pCombinationCount`
The `VkFramebufferMixedSamplesCombinationNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
    VkCoverageReductionModeNV coverageReductionMode;
    VkSampleCountFlagBits rasterizationSamples;
    VkSampleCountFlags depthStencilSamples;
    VkSampleCountFlags colorSamples;
} VkFramebufferMixedSamplesCombinationNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **coverageReductionMode** is a `VkCoverageReductionModeNV` value specifying the coverage reduction mode.
- **rasterizationSamples** is a `VkSampleCountFlagBits` specifying the number of rasterization samples in the supported combination.
- **depthStencilSamples** specifies the number of samples in the depth stencil attachment in the supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.
- **colorSamples** specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

**Valid Usage (Implicit)**

- **VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV`
- **VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext**
  - **pNext** must be `NULL`
29.14.3. Coverage Modulation

As part of coverage reduction, fragment color values can also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the \texttt{VkPipelineCoverageModulationStateCreateInfoNV} structure.

The \texttt{VkPipelineCoverageModulationStateCreateInfoNV} structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageModulationStateCreateFlagsNV flags;
    VkCoverageModulationModeNV coverageModulationMode;
    VkBool32 coverageModulationTableEnable;
    uint32_t coverageModulationTableCount;
    const float* pCoverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.
- \texttt{coverageModulationMode} is a \texttt{VkCoverageModulationModeNV} value controlling which color components are modulated.
- \texttt{coverageModulationTableEnable} controls whether the modulation factor is looked up from a table in \texttt{pCoverageModulationTable}.
- \texttt{coverageModulationTableCount} is the number of elements in \texttt{pCoverageModulationTable}.
- \texttt{pCoverageModulationTable} is a table of modulation factors containing a value for each number of covered samples.

If \texttt{coverageModulationTableEnable} is \texttt{VK_FALSE}, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor \( R \) in the range \((0,1]\) (a value of zero would have been killed due to a color coverage of 0). Specifically:

- \( N = \text{value of rasterizationSamples} \)
- \( M = \text{value of VkAttachmentDescription::samples for any color attachments} \)
- \( R = \text{popcount(associated coverage bits)}/(N / M) \)

If \texttt{coverageModulationTableEnable} is \texttt{VK_TRUE}, the value \( R \) is computed using a programmable lookup table. The lookup table has \( N / M \) elements, and the element of the table is selected by:

- \( R = \text{pCoverageModulationTable[popcount(associated coverage bits)-1]} \)
Note that the table does not have an entry for \( \text{popcount}(\text{associated coverage bits}) = 0 \), because such samples would have been killed.

The values of \( p\text{CoverageModulationTable} \) may be rounded to an implementation-dependent precision, which is at least as fine as \( 1 / N \), and clamped to \([0,1]\).

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to \( M \) values which can each be modulated (multiplied) by that color sample's associated value of \( R \). Which components are modulated is controlled by \( \text{coverageModulationMode} \).

If this structure is not included in the \( p\text{Next} \) chain, it is as if \( \text{coverageModulationMode} \) is \( \text{VK_COVERAGE_MODULATION_MODE_NONE_NV} \).

If the coverage reduction mode is \( \text{VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV} \), each color sample is associated with only a single coverage sample. In this case, it is as if \( \text{coverageModulationMode} \) is \( \text{VK_COVERAGE_MODULATION_MODE_NONE_NV} \).

### Valid Usage

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405**
  
  If \( \text{coverageModulationTableEnable} \) is \( \text{VK_TRUE} \), \( \text{coverageModulationTableCount} \) must be equal to the number of rasterization samples divided by the number of color samples in the subpass

### Valid Usage (Implicit)

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType**
  
  \( s\text{Type} \) must be \( \text{VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV} \)

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zero bitmask**
  
  \( \text{flags} \) must be \( 0 \)

- **VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter**
  
  \( \text{coverageModulationMode} \) must be a valid \( \text{VkCoverageModulationModeNV} \) value

### // Provided by VK_NV_framebuffer_mixed_samples

```c
typedef VkFlags VkPipelineCoverageModulationStateCreateFlagsNV;
```

\( \text{VkPipelineCoverageModulationStateCreateFlagsNV} \) is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of \( \text{VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode} \), specifying which color components are modulated, are:
 typedef enum VkCoverageModulationModeNV {
    VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
    VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
    VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
    VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;

• VK_COVERAGE_MODULATION_MODE_NONE_NV specifies that no components are multiplied by the modulation factor.

• VK_COVERAGE_MODULATION_MODE_RGB_NV specifies that the red, green, and blue components are multiplied by the modulation factor.

• VK_COVERAGE_MODULATION_MODE_ALPHA_NV specifies that the alpha component is multiplied by the modulation factor.

• VK_COVERAGE_MODULATION_MODE_RGBA_NV specifies that all components are multiplied by the modulation factor.

To dynamically set the coverageModulationMode state, call:

 void vkCmdSetCoverageModulationModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageModulationModeNV coverageModulationMode);

• commandBuffer is the command buffer into which the command will be recorded.

• coverageModulationMode specifies the coverageModulationMode state.

This command sets the coverageModulationMode state for subsequent drawing commands when drawing using shader objects, or the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetCoverageModulationModeNV-None-08530
  Either the extendedDynamicState3CoverageModulationMode feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

• VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetCoverageModulationModeNV-coverageModulationMode-parameter
  coverageModulationMode must be a valid VkCoverageModulationModeNV value
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetCoverageModulationModeNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the coverageModulationTableEnable state, call:

```
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetCoverageModulationTableEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageModulationTableEnable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- coverageModulationTableEnable specifies the coverageModulationTableEnable state.

This command sets the coverageModulationTableEnable state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableEnable value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetCoverageModulationTableEnableNV-None-08532
  Either the extendedDynamicState3CoverageModulationTableEnable feature or the shaderObject feature or both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetCoverageModulationTableEnableNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the pCoverageModulationTable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetCoverageModulationTableNV(
  VkCommandBuffer commandBuffer,
  uint32_t coverageModulationTableCount,
  const float* pCoverageModulationTable);
```

- commandBuffer is the command buffer into which the command will be recorded.
coverageModulationTableCount specifies the number of elements in pCoverageModulationTable.

pCoverageModulationTable specifies the table of modulation factors containing a value for each number of covered samples.

This command sets the table of modulation factors for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableCount`, and `VkPipelineCoverageModulationStateCreateInfoNV::pCoverageModulationTable` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageModulationTableNV-None-08534**
  Either the `extendedDynamicState3CoverageModulationTable` feature or the `shaderObject` feature or both must be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-parameter**
  commandBuffer must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetCoverageModulationTableNV-pCoverageModulationTable-parameter**
  pCoverageModulationTable must be a valid pointer to an array of `coverageModulationTableCount float` values

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdSetCoverageModulationTableNV-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetCoverageModulationTableNV-coverageModulationTableCount-arraylength**
  coverageModulationTableCount must be greater than 0

### Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

Chapter 30. The Framebuffer

30.1. Blending

Blending combines the incoming source fragment’s R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment’s \((x_f, y_f)\) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- **sType** is a VkStructureType value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkPipelineColorBlendStateCreateInfoFlagBits** specifying additional color blending information.

• **logicOpEnable** controls whether to apply **Logical Operations**.

• **logicOp** selects which logical operation to apply.

• **attachmentCount** is the number of **VkPipelineColorBlendAttachmentState** elements in **pAttachments**.

• **pAttachments** is a pointer to an array of **VkPipelineColorBlendAttachmentState** structures defining blend state for each color attachment. It is ignored if the pipeline is created with **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set.

• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**.

---

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the **independentBlend** feature is not enabled, all elements of **pAttachments** must be identical

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the **logicOp** feature is not enabled, **logicOpEnable** must be **VK_FALSE**

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is **VK_TRUE**, **logicOp** must be a valid **VkLogicOp** value

- **VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465**
  If the **rasterizationOrderColorAttachmentAccess** feature is not enabled, **flags** must not include **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT**

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**
  If **attachmentCount** is not 0, and any of **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, or **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** are not set, **pAttachments** must be a valid pointer to an array of **attachmentCount** valid **VkPipelineColorBlendAttachmentState** structures

---

### Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO**

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkPipelineColorBlendAdvancedStateCreateInfoEXT**
or VkPipelineColorWriteCreateInfoEXT

• VUID-VkPipelineColorBlendStateCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineColorBlendStateCreateFlagBits values

• VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter
  If attachmentCount is not 0, and pAttachments is not NULL, pAttachments must be a valid pointer to an array of attachmentCount valid VkPipelineColorBlendAttachmentState structures

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;

VkPipelineColorBlendStateCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineColorBlendStateCreateFlagBits.

Bits which can be set in the VkPipelineColorBlendStateCreateInfo::flags parameter are:

// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
  // Provided by VK_EXT_rasterization_order_attachment_access
  VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT = 0x00000001,
  // Provided by VK_ARM_rasterization_order_attachment_access
  VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM = VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
} VkPipelineColorBlendStateCreateFlagBits;

• VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT indicates that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader.

When VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:

• The first synchronization scope includes the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage executed by all previous fragments (as defined by primitive order) in the corresponding framebuffer regions including those generated by the same draw command.
• The second synchronization scope includes the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage executed by the generated fragment.
• The first access scope includes all writes to color attachments.
• The second access scope includes all reads from input attachments.
The `VkPipelineColorBlendAttachmentState` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {
    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- `blendEnable` controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment's color for that attachment is passed through unmodified.
- `srcColorBlendFactor` selects which blend factor is used to determine the source factors ($S_r, S_g, S_b$).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors ($D_r, D_g, D_b$).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor $S_a$.
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor $D_a$.
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.
- `colorWriteMask` is a bitmask of `VkColorComponentFlagBits` specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

### Valid Usage

- **VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608**
  If the dualSrcBlend feature is not enabled, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-00609**
  If the dualSrcBlend feature is not enabled, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

- **VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-00610**
  If the dualSrcBlend feature is not enabled, `srcAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.
If the dualSrcBlend feature is not enabled, `dstAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

If either of `colorBlendOp` or `alphaBlendOp` is an advanced blend operation, then `colorBlendOp` must equal `alphaBlendOp`.

If `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend` is `VK_FALSE` and `colorBlendOp` is an advanced blend operation, then `colorBlendOp` must be the same for all attachments.

If `colorBlendOp` or `alphaBlendOp` is an advanced blend operation, then the `colorAttachmentCount` of the subpass this pipeline is compiled against must be less than or equal to `VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments`.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.
Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
  srcColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter
  dstColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter
  colorBlendOp must be a valid VkBlendOp value
- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp must be a valid VkBlendOp value
- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask must be a valid combination of VkColorComponentFlagBits values

To dynamically set blendEnable, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkBool32* pColorBlendEnables);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color blending enable applies.
- attachmentCount the number of color blending enables in the pColorBlendEnables array.
- pColorBlendEnables an array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::blendEnable values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendEnableEXT-None-08536
  Either the extendedDynamicState3ColorBlendEnable feature or the shaderObject feature or
both must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter
  pColorBlendEnables must be a valid pointer to an array of attachmentCount VkBool32 values
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetColorBlendEnableEXT-videoCoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arrayLength
  attachmentCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set color blend factors and operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```
• `commandBuffer` is the command buffer into which the command will be recorded.

• `firstAttachment` the first color attachment the color blend factors and operations apply to.

• `attachmentCount` the number of `VkColorBlendEquationEXT` elements in the `pColorBlendEquations` array.

• `pColorBlendEquations` an array of `VkColorBlendEquationEXT` structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::srcColorBlendFactor`, `VkPipelineColorBlendAttachmentState::dstColorBlendFactor`, `VkPipelineColorBlendAttachmentState::colorBlendOp`, `VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor`, `VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor`, and `VkPipelineColorBlendAttachmentState::alphaBlendOp` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetColorBlendEquationEXT-None-08538
  Either the extendedDynamicState3ColorBlendEquation feature or the shaderObject feature or both must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter
  `pColorBlendEquations` must be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetColorBlendEquationEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetColorBlendEquationEXT-attachmentCount-arraylength
  `attachmentCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkColorBlendEquationEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;
```

- `srcColorBlendFactor` selects which blend factor is used to determine the source factors \((S_r,S_g,S_b)\).
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors \((D_r,D_g,D_b)\).
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor \(S_a\).
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor \(D_a\).
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the color attachment.

Valid Usage

- `VUID-VkColorBlendEquationEXT-dualSrcBlend-07357`
  If the `dualSrcBlend` feature is not enabled, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`
If the `dualSrcBlend` feature is not enabled, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

If the `dualSrcBlend` feature is not enabled, `srcAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

If the `dualSrcBlend` feature is not enabled, `dstAlphaBlendFactor` must not be `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA`.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `srcColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors` is `VK_FALSE`, `dstColorBlendFactor` must not be `VK_BLEND_FACTOR_CONSTANT_ALPHA` or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`.

-----

**Valid Usage (Implicit)**

- **VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter**
  - `srcColorBlendFactor` must be a valid `VkBlendFactor` value.
• VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter
dstColorBlendFactor must be a valid VkBlendFactor value

• VUID-VkColorBlendEquationEXT-colorBlendOp-parameter
colorBlendOp must be a valid VkBlendOp value

• VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter
srcAlphaBlendFactor must be a valid VkBlendFactor value

• VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter
dstAlphaBlendFactor must be a valid VkBlendFactor value

• VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter
alphaBlendOp must be a valid VkBlendOp value

To dynamically set the color write masks, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorComponentFlags* pColorWriteMasks);
```

- commandBuffer is the command buffer into which the command will be recorded.
- firstAttachment the first color attachment the color write masks apply to.
- attachmentCount the number of VkColorComponentFlags values in the pColorWriteMasks array.
- pColorWriteMasks an array of VkColorComponentFlags values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAttachmentState::colorWriteMask values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetColorWriteMaskEXT-None-08540
  Either the extendedDynamicState3ColorWriteMask feature or the shaderObject feature or both must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter**
  `pColorWriteMasks` **must** be a valid pointer to an array of `attachmentCount` valid combinations of `VkColorComponentFlagBits` values

• **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

• **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

• **VUID-vkCmdSetColorWriteMaskEXT-videocoding**
  This command **must** only be called outside of a video coding scope

• **VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength**
  `attachmentCount` **must** be greater than 0

---

**Host Synchronization**

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**30.1.1. Blend Factors**

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 11,
    VK_BLEND_FACTOR_SRC_ALPHA_SAT = 12,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA_SAT = 13,
    VK_BLEND_FACTOR_SRC_COLOR_OVERLAY = 14,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR_OVERLAY = 15,
    VK_BLEND_FACTOR_DST_COLOR_OVERLAY = 16,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR_OVERLAY = 17,
    VK_BLEND_FACTOR_SRC_ALPHA_OVERLAY = 18,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA_OVERLAY = 19,
    VK_BLEND_FACTOR_SRC_ALPHA_SAT_OVERLAY = 20,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA_SAT_OVERLAY = 21
} VkBlendFactor;
```
The semantics of the enum values are described in the table below:

**Table 39. Blend Factors**

<table>
<thead>

<td>((1-A_{s1}, 1-A_{s1}, 1-A_{s1}))</td>
<td>(1-A_{s1})</td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0}, G_{s0}, B_{s0}\) and \(A_{s0}\) represent the first source color \(R, G, B,\) and \(A\) components, respectively, for the fragment output location corresponding to the color attachment being blended.
• $R_{s1}, G_{s1}, B_{s1}$ and $A_{s1}$ represent the second source color $R$, $G$, $B$, and $A$ components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.

• $R_d, G_d, B_d$ and $A_d$ represent the $R$, $G$, $B$, and $A$ components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.

• $R_c, G_c, B_c$ and $A_c$ represent the blend constant $R$, $G$, $B$, and $A$ components, respectively.

To **dynamically set and change** the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer, 
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the $R_c, G_c, B_c,$ and $A_c$ components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetBlendConstants-videocoding
  
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### 30.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1}, G_{s1}, B_{s1}, A_{s1})\) \((\text{VK\_BLEND\_FACTOR\_SRC1\_COLOR},\text{ VK\_BLEND\_FACTOR\_ONE\_MINUS\_SRC1\_COLOR},\text{ VK\_BLEND\_FACTOR\_SRC1\_ALPHA},\text{ and VK\_BLEND\_FACTOR\_ONE\_MINUS\_SRC1\_ALPHA})\) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of VkPhysicalDeviceLimits.

When using a fragment shader with dual-source blending functions, the color outputs are bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the result of the blending operation is not defined.

### 30.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and destination components are passed to the blending operations. RGB and alpha components can use different operations. Possible values of VkBlendOp, specifying the operations, are:

```c
// Provided by VK\_VERSION\_1\_0
typedef enum VkBlendOp {
    VK\_BLEND\_OP\_ADD = 0,
    VK\_BLEND\_OP\_SUBTRACT = 1,
    VK\_BLEND\_OP\_REVERSE\_SUBTRACT = 2,
    VK\_BLEND\_OP\_MIN = 3,
    VK\_BLEND\_OP\_MAX = 4,
    // Provided by VK\_EXT\_blend\_operation\_advanced
    VK\_BLEND\_OP\_ZERO\_EXT = 1000148000,
    // Provided by VK\_EXT\_blend\_operation\_advanced
    VK\_BLEND\_OP\_SRC\_EXT = 1000148001,
    // Provided by VK\_EXT\_blend\_operation\_advanced
    VK\_BLEND\_OP\__DST\_EXT = 1000148002,
    // Provided by VK\_EXT\_blend\_operation\_advanced
    VK\_BLEND\_OP\_SRC\_OVER\_EXT = 1000148003,
}```
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DST_OVER_EXT = 1000148004,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SRC_IN_EXT = 1000148005,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DST_IN_EXT = 1000148006,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SRC_OUT_EXT = 1000148007,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DST_OUT_EXT = 1000148008,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_XOR_EXT = 1000148011,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SCREEN_EXT = 1000148013,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_OVERLAY_EXT = 1000148014,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DARKEN_EXT = 1000148015,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARDODGE_EXT = 1000148025,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARBURN_EXT = 1000148026,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028
VK_BLEND_OP_PINLIGHT_EXT = 0x100148029,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDMIX_EXT = 0x100148030,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 0x100148031,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 0x100148032,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 0x100148033,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 0x100148034,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 0x100148035,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 0x100148036,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 0x100148037,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 0x100148038,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 0x100148039,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 0x100148040,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 0x100148041,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 0x100148042,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_RED_EXT = 0x100148043,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 0x100148044,
   // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 0x100148045,
} VkBlendOp;
The semantics of the basic blend operations are described in the table below:

**Table 40. Basic Blend Operations**

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_ADD</td>
<td>( R = R_s \times S_r + R_d \times D_r )</td>
<td>( A = A_s \times S_a + A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_s \times S_g + G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_s \times S_b + B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_SUBTRACT</td>
<td>( R = R_s \times S_r - R_d \times D_r )</td>
<td>( A = A_s \times S_a - A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_s \times S_g - G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_s \times S_b - B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>( R = R_d \times D_r - R_s \times S_r )</td>
<td>( A = A_d \times D_a - A_s \times S_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_d \times D_g - G_s \times S_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_d \times D_b - B_s \times S_b )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>( R = \min(R_s, R_d) )</td>
<td>( A = \min(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \min(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \min(B_s, B_d) )</td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>( R = \max(R_s, R_d) )</td>
<td>( A = \max(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \max(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_s, B_d) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_s, G_s, B_s \) and \( A_s \) represent the first source color \( R, G, B \), and \( A \) components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the \( R, G, B \), and \( A \) components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor \( R, G, B \), and \( A \) components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor \( R, G, B \), and \( A \) components, respectively.

The blending operation produces a new set of values \( R, G, B \) and \( A \), which are written to the framebuffer attachment. If blending is not enabled for this attachment, then \( R, G, B \) and \( A \) are assigned \( R_s, G_s, B_s \) and \( A_s \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the \( R, G, B \) destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each \( R, G, B \) component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final \( R, G \) and \( B \) values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF” section of the Khronos Data Format.
Specification.

If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting c values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is VK_ATTACHMENT_UNUSED, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the VkSubpassDescription::colorAttachmentCount or VkSubpassDescription2::colorAttachmentCount value.

### 30.1.4. Advanced Blend Operations

The advanced blend operations are those listed in tables f/X/Y/Z Advanced Blend Operations, Hue-Saturation-Luminosity Advanced Blend Operations, and Additional RGB Blend Operations.

If the pNext chain of VkPipelineColorBlendStateCreateInfo includes a VkPipelineColorBlendAdvancedStateCreateInfoEXT structure, then that structure includes parameters that affect advanced blend operations.

The VkPipelineColorBlendAdvancedStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a VkBlendOverlapEXT value specifying how the source and destination sample's coverage is correlated.

If this structure is not present, srcPremultiplied and dstPremultiplied are both considered to be VK_TRUE, and blendOverlap is considered to be VK_BLEND_OVERLAP_UNCORRELATED_EXT.

#### Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424
  If the non-premultiplied source color property is not supported, srcPremultiplied must be
VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-dstPremultiplied-01425
  If the non-premultiplied destination color property is not supported, dstPremultiplied must be VK_TRUE

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-01426
  If the correlated overlap property is not supported, blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-blendOverlap-parameter
  blendOverlap must be a valid VkBlendOverlapEXT value

To dynamically set the advanced blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendAdvancedEXT(
  VkCommandBuffer commandBuffer,
  uint32_t firstAttachment,
  uint32_t attachmentCount,
  const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the advanced blend parameters apply to.
- `attachmentCount` the number of VkColorBlendAdvancedEXT elements in the pColorBlendAdvanced array.
- `pColorBlendAdvanced` an array of VkColorBlendAdvancedEXT structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied,
VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied, and VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorBlendAdvancedEXT-None-08592
Either the extendedDynamicState3ColorBlendAdvanced feature or the shaderObject feature or both must be enabled.

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter: commandBuffer must be a valid VkCommandBuffer handle.
- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter: pColorBlendAdvanced must be a valid pointer to an array of attachmentCount valid VkColorBlendAdvancedEXT structures.
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording: commandBuffer must be in the recording state.
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool: The VkCommandPool that commandBuffer was allocated from must support graphics operations.
- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength: attachmentCount must be greater than 0.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkColorBlendAdvancedEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp advancedBlendOp;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkColorBlendAdvancedEXT;
```
VkBool32 clampResults;
} VkColorBlendAdvancedEXT;

- `advancedBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcPremultiplied` specifies whether the source color of the blend operation is treated as premultiplied.
- `dstPremultiplied` specifies whether the destination color of the blend operation is treated as premultiplied.
- `blendOverlap` is a `VkBlendOverlapEXT` value specifying how the source and destination sample’s coverage is correlated.
- `clampResults` specifies the results must be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

### Valid Usage

- **VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505**
  If the non-premultiplied source color property is not supported, `srcPremultiplied` must be `VK_TRUE`

- **VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506**
  If the non-premultiplied destination color property is not supported, `dstPremultiplied` must be `VK_TRUE`

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-07507**
  If the correlated overlap property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`

### Valid Usage (Implicit)

- **VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter**
  `advancedBlendOp` must be a valid `VkBlendOp` value

- **VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter**
  `blendOverlap` must be a valid `VkBlendOverlapEXT` value

When using one of the operations in table `f/X/Y/Z Advanced Blend Operations` or `Hue-Saturation-Luminosity Advanced Blend Operations`, blending is performed according to the following equations:

\[
\begin{align*}
R &= f(R'_s, R'_d) \cdot p_0(A_s, A_d) + Y \cdot R'_s \cdot p_1(A_s, A_d) + Z \cdot R'_d \cdot p_2(A_s, A_d) \\
G &= f(G'_s, G'_d) \cdot p_0(A_s, A_d) + Y \cdot G'_s \cdot p_1(A_s, A_d) + Z \cdot G'_d \cdot p_2(A_s, A_d) \\
B &= f(B'_s, B'_d) \cdot p_0(A_s, A_d) + Y \cdot B'_s \cdot p_1(A_s, A_d) + Z \cdot B'_d \cdot p_2(A_s, A_d) \\
A &= X \cdot p_0(A_s, A_d) + Y \cdot p_1(A_s, A_d) + Z \cdot p_2(A_s, A_d)
\end{align*}
\]

where the function `f` and terms `X`, `Y`, and `Z` are specified in the table. The `R`, `G`, and `B` components of...
the source color used for blending are derived according to srcPremultiplied. If srcPremultiplied is set to VK_TRUE, the fragment color components are considered to have been premultiplied by the A component prior to blending. The base source color \((R_s', G_s', B_s')\) is obtained by dividing through by the A component:

\[
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
\left(\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}\right) & \text{otherwise}
\end{cases}
\]

If srcPremultiplied is VK_FALSE, the fragment color components are used as the base color:

\[
(R_s', G_s', B_s') = (R_s, G_s, B_s)
\]

The R, G, and B components of the destination color used for blending are derived according to dstPremultiplied. If dstPremultiplied is set to VK_TRUE, the destination components are considered to have been premultiplied by the A component prior to blending. The base destination color \((R_d', G_d', B_d')\) is obtained by dividing through by the A component:

\[
(R_d', G_d', B_d') = \begin{cases} 
(0, 0, 0) & A_d = 0 \\
\left(\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}\right) & \text{otherwise}
\end{cases}
\]

If dstPremultiplied is VK_FALSE, the destination color components are used as the base color:

\[
(R_d', G_d', B_d') = (R_d, G_d, B_d)
\]

When blending using advanced blend operations, we expect that the R, G, and B components of premultiplied source and destination color inputs be stored as the product of non-premultiplied R, G, and B component values and the A component of the color. If any R, G, or B component of a premultiplied input color is non-zero and the A component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If dstPremultiplied is VK_FALSE, that result color’s R, G, and B components are divided by the A component before being written to the framebuffer. If any R, G, or B component of the color is non-zero and the A component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the A component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions \(p_0\), \(p_1\), and \(p_2\) are defined in table Advanced Blend Overlap Modes. In these functions, the A components of the source and destination colors are taken to indicate the portion of the pixel covered by the fragment (source) and the fragments previously accumulated in the pixel (destination). The functions \(p_0\), \(p_1\), and \(p_2\) approximate the relative portion of the pixel covered by the intersection of the source and destination, covered only by the source, and covered only by the destination, respectively.
Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- **VK_BLEND_OVERLAP_UNCORRELATED_EXT** specifies that there is no correlation between the source and destination coverage.
- **VK_BLEND_OVERLAP_CONJOINT_EXT** specifies that the source and destination coverage are considered to have maximal overlap.
- **VK_BLEND_OVERLAP_DISJOINT_EXT** specifies that the source and destination coverage are considered to have minimal overlap.

When using one of the HSL blend operations in table Hue-Saturation-Luminosity Advanced Blend Operations as the blend operation, the RGB color components produced by the function \(f\) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>. The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum) {
    float minbase = minv3(cbase);
    float sbase = satv3(cbase);
    float ssat = satv3(csat);
    vec3 color;
    if (sbase > 0) {
        // Equivalent (modulo rounding errors) to setting the
        // smallest (R,G,B) component to 0, the largest to <ssat>,
    }
// and interpolating the "middle" component based on its
// original value relative to the smallest/largest.
color = (cbase - minbase) * ssat / sbase;
} else {
    color = vec3(0.0);
}
return SetLum(color, clum);

</tr>
</tbody>
</table>
30.2. Logical Operations

The application can enable a logical operation between the fragment's color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.

Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied
independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND.Reverse = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND.Inverted = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_Equivalent = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_OR.Reverse = 11,
    VK_LOGIC_OP_COPY.Inverted = 12,
    VK_LOGIC_OP_OR.Inverted = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```
The logical operations supported by Vulkan are summarized in the following table in which

- ¬ is bitwise invert,
- ⊙ is bitwise and,
- ∨ is bitwise or,
- ⊕ is bitwise exclusive or,
- \( s \) is the fragment’s \( R_{s0} \), \( G_{s0} \), \( B_{s0} \) or \( A_{s0} \) component value for the fragment output corresponding to the color attachment being updated, and
- \( d \) is the color attachment’s \( R \), \( G \), \( B \) or \( A \) component value:

</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 logicOpEnable);
```
• commandBuffer is the command buffer into which the command will be recorded.
• logicOpEnable specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorBlendStateCreateInfo::logicOpEnable value used to create the currently active pipeline.

Valid Usage

• VUID-vkCmdSetLogicOpEnableEXT-None-08542
  Either the extendedDynamicState3LogicOpEnable feature or the shaderObject feature or both must be enabled

• VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the logicOp feature is not enabled, logicOpEnable must be VK_FALSE

Valid Usage (Implicit)

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
To **dynamically set** the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-08544
  Either the `extendedDynamicState2LogicOp` feature or the `shaderObject` feature or both **must** be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid `VkLogicOp` value
- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetLogicOpEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
30.3. Color Write Mask

Bits which can be set in VkPipelineColorBlendAttachmentState::colorWriteMask, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT = 0x00000008,
} VkColorComponentFlagBits;
```

- VK_COLOR_COMPONENT_R_BIT specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- VK_COLOR_COMPONENT_G_BIT specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- VK_COLOR_COMPONENT_B_BIT specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- VK_COLOR_COMPONENT_A_BIT specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if Color Write Enable is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the attachment are disabled.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkColorComponentFlags;
```

VkColorComponentFlags is a bitmask type for setting a mask of zero or more VkColorComponentFlagBits.
30.4. Color Write Enable

The `VkPipelineColorWriteCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of `VkPipelineColorBlendStateCreateInfo`, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of `VkPipelineColorBlendStateCreateInfo`, and `pColorWriteEnables` pointing to an array of as many `VK_TRUE` values.

If the `colorWriteEnable` feature is not enabled on the device, all `VkBool32` elements in the `pColorWriteEnables` array must be `VK_TRUE`.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is `VK_TRUE`, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is `VK_FALSE`, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` must be `VK_TRUE`.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-07608
  If the pipeline is being created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states not set, `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation.

- VUID-VkPipelineColorWriteCreateInfoEXT-attachmentCount-06655
attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-VkPipelineColorWriteCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT
- VUID-VkPipelineColorWriteCreateInfoEXT-pColorWriteEnables-parameter
  If attachmentCount is not 0, pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

To dynamically enable or disable writes to a color attachment, call:

```c
// Provided by VK_EXT_color_write_enable
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetColorWriteEnableEXT-None-04803
  The colorWriteEnable feature must be enabled
- VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-06656
  attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

- VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter
  pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength
  attachmentCount must be greater than 0

---

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

30.5. Framebuffer Query Instructions

To query the tile properties from the attachments in framebuffer, call:

```c
// Provided by VK_QCOM_tile_properties
VkResult vkGetFramebufferTilePropertiesQCOM(
    VkDevice device,          // Device associated with the framebuffer.
    VkFramebuffer framebuffer, // Handle of the framebuffer to query.
    uint32_t* pPropertiesCount, // Pointer to an integer related to the number of tile properties available or
    VkTilePropertiesQCOM* pProperties);   // Pointer to an array of VkTilePropertiesQCOM structures.
```

• device is a logical device associated with the framebuffer.
• framebuffer is a handle of the framebuffer to query.
• pPropertiesCount is a pointer to an integer related to the number of tile properties available or
queried, as described below.

- `pProperties` is either `NULL` or a pointer to an array of `VkTilePropertiesQCOM` structures.

If `pProperties` is `NULL`, then the number of tile properties available is returned in `pPropertiesCount`. Otherwise, `pPropertiesCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of properties actually written to `pProperties`. If `pPropertiesCount` is less than the number of tile properties available, at most `pPropertiesCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The number of tile properties available is determined by the number of merged subpasses, and each tile property is associated with a merged subpass. There will be at most as many properties as there are subpasses within the render pass. To obtain the tile properties for a given merged subpass, the `pProperties` array can be indexed using the `postMergeIndex` value provided in `VkRenderPassSubpassFeedbackInfoEXT`.

### Valid Usage (Implicit)

- VUID-vkGetFramebufferTilePropertiesQCOM-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parameter
  - `framebuffer` must be a valid `VkFramebuffer` handle
- VUID-vkGetFramebufferTilePropertiesQCOM-pPropertiesCount-parameter
  - `pPropertiesCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetFramebufferTilePropertiesQCOM-pProperties-parameter
  - If the value referenced by `pPropertiesCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertiesCount` `VkTilePropertiesQCOM` structures
- VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parent
  - `framebuffer` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`
Chapter 31. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer, 
    uint32_t groupCountX, 
    uint32_t groupCountY, 
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled.

### Valid Usage

- **VUID-vkCmdDispatch-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatch-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
• VUID-vkCmdDispatch-None-07888
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

• VUID-vkCmdDispatch-None-02692
If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

• VUID-vkCmdDispatch-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatch-filterCubicMinmax-02695
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDispatch-flags-02696
Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• VUID-vkCmdDispatch-OpTypeImage-07027
For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDispatch-OpTypeImage-07028
For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDispatch-OpTypeImage-07029
For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDispatch-OpTypeImage-07030
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDispatch-None-08600
For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create
the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatch-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatch-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must
be resident

- VUID-vkCmdDispatch-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- VUID-vkCmdDispatch-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDispatch-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- VUID-vkCmdDispatch-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- VUID-vkCmdDispatch-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDispatch-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDispatch-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the...
descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatch-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatch-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDispatch-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

• VUID-vkCmdDispatch-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aCk conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDispatch-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aCk conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdDispatch-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

• VUID-vkCmdDispatch-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the SampledType operand of the OpTypeImage must match

• VUID-vkCmdDispatch-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDispatch-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDispatch-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.
• VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDispatch-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdDispatch-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource.

• VUID-vkCmdDispatch-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource.

• VUID-vkCmdDispatch-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer.

• VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

• VUID-vkCmdDispatch-groupCountY-00387
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

• VUID-vkCmdDispatch-groupCountZ-00388
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

• VUID-vkCmdDispatch-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatch-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatch-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute
operations

- VUID-vkCmdDispatch-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatch-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- commandBuffer is the command buffer into which the command will be recorded.
- buffer is the buffer containing dispatch parameters.
- offset is the byte offset into buffer where parameters begin.

vkCmdDispatchIndirect behaves similarly to vkCmdDispatch except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a VkDispatchIndirectCommand structure taken from buffer starting at offset.

Valid Usage

- VUID-vkCmdDispatchIndirect-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If a `VkImageView` is sampled with depth comparison, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.
For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.
If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

If a descriptor is dynamically used with a VkPipeline created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory must be resident.

If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory must be resident.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and \texttt{VK_NULL_HANDLE} shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage.
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` must not be a protected resource.

If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C aCk conversion`, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C aCk conversion`, that object must not use the `ConstOffset` and `Offset` operands.

If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in `Instruction/Sampler/Image View Validation`.

If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` must match.
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDispatchIndirect-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDispatchIndirect-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 64.

- **VUID-vkCmdDispatchIndirect-SampledType-04471**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 32.

- **VUID-vkCmdDispatchIndirect-SampledType-04472**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 64.

- **VUID-vkCmdDispatchIndirect-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 32.

- **VUID-vkCmdDispatchIndirect-SparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command.

- **VUID-vkCmdDispatchIndirect-SparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command.

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDispatchIndirect-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.
• **VUID-vkCmdDispatchIndirect-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• **VUID-vkCmdDispatchIndirect-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• **VUID-vkCmdDispatchIndirect-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

• **VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

• **VUID-vkCmdDispatchIndirect-None-07288**
  Any shader invocation executed by this command must terminate.

• **VUID-vkCmdDispatchIndirect-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• **VUID-vkCmdDispatchIndirect-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

• **VUID-vkCmdDispatchIndirect-offset-02710**
  `offset` must be a multiple of 4.

• **VUID-vkCmdDispatchIndirect-commandBuffer-02711**
  `commandBuffer` must not be a protected command buffer.

• **VUID-vkCmdDispatchIndirect-offset-00407**
  The sum of `offset` and the size of `VkDispatchIndirectCommand` must be less than or equal to the size of `buffer`.

### Valid Usage (Implicit)

• **VUID-vkCmdDispatchIndirect-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

• **VUID-vkCmdDispatchIndirect-buffer-parameter**
  `buffer` must be a valid `VkBuffer` handle.
• VUID-vkCmdDispatchIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchIndirect-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDispatchIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

The VkDispatchIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

• x is the number of local workgroups to dispatch in the X dimension.

• y is the number of local workgroups to dispatch in the Y dimension.

• z is the number of local workgroups to dispatch in the Z dimension.

The members of VkDispatchIndirectCommand have the same meaning as the corresponding parameters of vkCmdDispatch.
Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  \(x\) must be less than or equal to \(\text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupCount}[0]\)
- VUID-VkDispatchIndirectCommand-y-00418
  \(y\) must be less than or equal to \(\text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupCount}[1]\)
- VUID-VkDispatchIndirectCommand-z-00419
  \(z\) must be less than or equal to \(\text{VkPhysicalDeviceLimits}::\text{maxComputeWorkGroupCount}[2]\)

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- \(\text{commandBuffer}\) is the command buffer into which the command will be recorded.
- \(\text{baseGroupX}\) is the start value for the X component of WorkgroupId.
- \(\text{baseGroupY}\) is the start value for the Y component of WorkgroupId.
- \(\text{baseGroupZ}\) is the start value for the Z component of WorkgroupId.
- \(\text{groupCountX}\) is the number of local workgroups to dispatch in the X dimension.
- \(\text{groupCountY}\) is the number of local workgroups to dispatch in the Y dimension.
- \(\text{groupCountZ}\) is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \(\text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ}\) local workgroups is assembled, with WorkgroupId values ranging from \([\text{baseGroup*},\)
baseGroup* + groupCount*) in each component. \texttt{vkCmdDispatch} is equivalent to \texttt{vkCmdDispatchBase(0,0,0,\text{groupCountX},\text{groupCountY},\text{groupCountZ})}.

### Valid Usage

- **VUID-vkCmdDispatchBase-magFilter-04553**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDispatchBase-mipmapMode-04770**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdDispatchBase-None-06479**
  If a \texttt{VkImageView} is sampled with depth comparison, the image view's format features must contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}

- **VUID-vkCmdDispatchBase-None-02691**
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- **VUID-vkCmdDispatchBase-None-07888**
  If a \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT}

- **VUID-vkCmdDispatchBase-None-02692**
  If a \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- **VUID-vkCmdDispatchBase-filterCubic-02694**
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- **VUID-vkCmdDispatchBase-filterCubicMinmax-02695**
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} with a reduction mode of either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering together with minmax filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- **VUID-vkCmdDispatchBase-flags-02696**
  Any \texttt{VkImage} created with a \texttt{VkImageCreateInfo::flags} containing
VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDispatchBase-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchBase-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchBase-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchBase-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatchBase-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout or VkDescriptorSetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchBase-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchBase-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchBase-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without
VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchBase-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchBase-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchBase-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchBase-None-08610
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDispatchBase-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDispatchBase-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource

- **VUID-vkCmdDispatchBase-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y′C′B′C conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDispatchBase-ConstOffset-06551**

---

2580
If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdDispatchBase-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDispatchBase-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

- **VUID-vkCmdDispatchBase-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDispatchBase-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDispatchBase-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDispatchBase-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDispatchBase-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDispatchBase-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this
command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdDispatchBase-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatchBase-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDispatchBase-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDispatchBase-commandBuffer-04617
If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer

- **VUID-vkCmd DispatchBase-baseGroupX-00421**
  - `baseGroupX` must be less than `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[0]`

- **VUID-vkCmd DispatchBase-baseGroupY-00422**
  - `baseGroupY` must be less than `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[1]`

- **VUID-vkCmd DispatchBase-baseGroupZ-00423**
  - `baseGroupZ` must be less than `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[2]`

- **VUID-vkCmd DispatchBase-groupCountX-00424**
  - `groupCountX` must be less than or equal to `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[0]` minus `baseGroupX`

- **VUID-vkCmd DispatchBase-groupCountY-00425**
  - `groupCountY` must be less than or equal to `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[1]` minus `baseGroupY`

- **VUID-vkCmd DispatchBase-groupCountZ-00426**
  - `groupCountZ` must be less than or equal to `VkPhysicalDeviceLimits::maxCompute WorkGroup Count[2]` minus `baseGroupZ`

- **VUID-vkCmd DispatchBase-baseGroupX-00427**
  - If any of `baseGroupX`, `baseGroupY`, or `baseGroupZ` are not zero, then the bound compute pipeline must have been created with the `VK_PIPELINE_CREATE_DISPATCH_BASE` flag

### Valid Usage (Implicit)

- **VUID-vkCmd DispatchBase-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmd DispatchBase-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmd DispatchBase-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmd DispatchBase-renderpass**
  - This command must only be called outside of a render pass instance

- **VUID-vkCmd DispatchBase-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
A subpass shading dispatches a compute pipeline work with the work dimension of render area of the calling subpass and work groups are partitioned by specified work group size. Subpass operations like subpassLoad and subpassLoadMS are allowed to be used.

To record a subpass shading, call:

```c
// Provided by VK_HUAWEI_subpass_shading
void vkCmdSubpassShadingHUAWEI(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of ceil (render area size / local workgroup size) local workgroups is assembled.

### Valid Usage

- **VUID-vkCmdSubpassShadingHUAWEI-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdSubpassShadingHUAWEI-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features
**must** contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`  

- **VUID-vkCmdSubpassShadingHUAWEI-None-02692**  
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`  

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubic-02694**  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`  

- **VUID-vkCmdSubpassShadingHUAWEI-filterCubicMinmax-02695**  
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`  

- **VUID-vkCmdSubpassShadingHUAWEI-flags-02696**  
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`  

- **VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07027**  
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`  

- **VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07028**  
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`  

- **VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07029**  
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`  

- **VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07030**  
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`  

- **VUID-vkCmdSubpassShadingHUAWEI-None-08600**  
  For each set `n` that is statically used by a **bound shader**, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in `Pipeline Layout Compatibility`  

- **VUID-vkCmdSubpassShadingHUAWEI-None-08601**  
  For each push constant that is statically used by a **bound shader**, a push constant value
must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdSubpassShadingHUAWEI-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdSubpassShadingHUAWEI-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdSubpassShadingHUAWEI-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdSubpassShadingHUAWEI-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdSubpassShadingHUAWEI-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdSubpassShadingHUAWEI-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdSubpassShadingHUAWEI-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdSubpassShadingHUAWEI-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdSubpassShadingHUAWEI-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline
If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_2D_ARRAY, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
command accesses a storage buffer, and that stage was created without enabling either
*VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT* or
*VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT* for *storageBuffers*,
and the *robustBufferAccess* feature is not enabled, that stage **must** not access values
outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-None-08613**
  If the *robustBufferAccess* feature is not enabled, and any *VkShaderEXT* bound to a stage
corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-02707**
  If *commandBuffer* is an unprotected command buffer and *protectedNoFault* is not supported, any resource accessed by *bound shaders**must** not be a protected resource

- **VUID-vkCmdSubpassShadingHUAWEI-None-06550**
  If a *bound shader* accesses a *VkSampler* or *VkImageView* object that enables *sampler YC<sub>a</sub>C<sub>b</sub>R* conversion, that object **must** only be used with *OpImageSample* or *OpImageSparseSample* instructions

- **VUID-vkCmdSubpassShadingHUAWEI-ConstOffset-06551**
  If a *bound shader* accesses a *VkSampler* or *VkImageView* object that enables *sampler YC<sub>a</sub>C<sub>b</sub>R* conversion, that object **must** not use the *ConstOffset* and *Offset* operands

- **VUID-vkCmdSubpassShadingHUAWEI-viewType-07752**
  If a *VkImageView* is accessed as a result of this command, then the image view’s *viewType**must** match the *Dim* operand of the *OpTypeImage* as described in *Instruction/Sampler/Image View Validation*

- **VUID-vkCmdSubpassShadingHUAWEI-format-07753**
  If a *VkImageView* is accessed as a result of this command, then the numeric *type* of the image view’s *format* and the *Sampled Type* operand of the *OpTypeImage**must** match

- **VUID-vkCmdSubpassShadingHUAWEI-None-04115**
  If a *VkImageView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdSubpassShadingHUAWEI-OpImageWrite-04469**
  If a *VkBufferView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470**
  If a *VkImageView* with a *VkFormat* that has a 64-bit component width is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 64

- **VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471**
  If a *VkImageView* with a *VkFormat* that has a component width less than 64-bit is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction **must** have a *Width* of 32
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 64

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a **Width** of 32

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command **must** terminate.

This command must be called in a subpass with bind point `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`. No draw commands can be called in the same subpass. Only one `vkCmdSubpassShadingHUAWEI` command can be called in a subpass.

**Valid Usage (Implicit)**

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-parameter**  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-recording**  
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSubpassShadingHUAWEI-commandBuffer-cmdpool**  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSubpassShadingHUAWEI-renderpass**  
  This command **must** only be called inside of a render pass instance

- **VUID-vkCmdSubpassShadingHUAWEI-videocoding**  
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Chapter 32. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they **must** be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

### 32.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```c
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

#### 32.1.1. Creation and Deletion

Indirect command layouts are created by:

```c
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(
    VkDevice device,                     // device,
    const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkIndirectCommandsLayoutNV* pIndirectCommandsLayout);
```

- `device` is the logical device that creates the indirect command layout.
- `pCreateInfo` is a pointer to a `VkIndirectCommandsLayoutCreateInfoNV` structure containing
parameters affecting creation of the indirect command layout.

- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pIndirectCommandsLayout` is a pointer to a `VkIndirectCommandsLayoutNV` handle in which the resulting indirect command layout is returned.

### Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkIndirectCommandsLayoutCreateInfoNV` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  `pIndirectCommandsLayout` must be a valid pointer to a `VkIndirectCommandsLayoutNV` handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkIndirectCommandsLayoutCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsLayoutUsageFlagsNV flags;
    VkPipelineBindPoint pipelineBindPoint;
    uint32_t tokenCount;
} VkIndirectCommandsLayoutCreateInfoNV;
```
const VkIndirectCommandsLayoutTokenNV* pTokens;
uint32_t streamCount;
const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **pipelineBindPoint** is the VkPipelineBindPoint that this layout targets.
• **flags** is a bitmask of VkIndirectCommandsLayoutUsageFlagBitsNV specifying usage hints of this layout.
• **tokenCount** is the length of the individual command sequence.
• **pTokens** is an array describing each command token in detail. See VkIndirectCommandsTokenTypeNV and VkIndirectCommandsLayoutTokenNV below for details.
• **streamCount** is the number of streams used to provide the token inputs.
• **pStreamStrides** is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```c
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
    for (s = 0; s < sequencesCount; s++)
    {
        sUsed = s;

        if (indirectCommandsLayout.flags &
            VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
            sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
        }

        if (indirectCommandsLayout.flags &
            VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
            sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
        }

        cmdProcessSequence( cmd, pipeline, indirectCommandsLayout,
pIndirectCommandsTokens, sUsed );
    }
}
```

When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in Alignment Requirements, or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment,
whichever is lower.

Note

A `minIndirectCommandsBufferOffsetAlignment` of 4 allows `VkDeviceAddress` to be packed as `uvec2` with scalar layout instead of `uint64_t` with 8 byte alignment. This enables direct compatibility with D3D12 command signature layouts.

Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The `pipelineBindPoint` must be `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  `tokenCount` must be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` it must be the first element of the array and there must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If `pTokens` contains an entry of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` there must be only a single element of such token type.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in `pTokens` must occur before any work provoking tokens (`VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`, `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`).

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of `pTokens` must include one single work provoking token that is compatible with the `pipelineBindPoint`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  `streamCount` must be greater than 0 and less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  Each element of `pStreamStrides` must be greater than 0 and less than or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride`. Furthermore the alignment of each token input must be ensured.

Valid Usage (Implicit)

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV`.

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext**
  `pNext` must be `null`.
pNext must be NULL

- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
  flags must be a valid combination of VkIndirectCommandsLayoutUsageFlagBitsNV values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
  pTokens must be a valid pointer to an array of tokenCount valid
  VkIndirectCommandsLayoutTokenNV structures

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
  pStreamStrides must be a valid pointer to an array of streamCount uint32_t values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
  tokenCount must be greater than 0

- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
  streamCount must be greater than 0

Bits which can be set in VkIndirectCommandsLayoutCreateInfoNV::flags, specifying usage hints of an indirect command layout, are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;
```

- VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV specifies that the layout is always used with the manual preprocessing step through calling
  vkCmdPreprocessGeneratedCommandsNV and executed by
  vkCmdExecuteGeneratedCommandsNV with isPreprocessed set to VK_TRUE.

- VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV specifies that the input data for
  the sequences is not implicitly indexed from 0..sequencesUsed but a user provided
  VkBuffer encoding the index is provided.

- VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV specifies that the processing of
  sequences can happen at an implementation-dependent order, which is not: guaranteed to be
  coherent using the same input data.

```c
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;
```

VkIndirectCommandsLayoutUsageFlagsNV is a bitmask type for setting a mask of zero or more
VkIndirectCommandsLayoutUsageFlagBitsNV.
Indirect command layouts are destroyed by:

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device,
    VkIndirectCommandsLayoutNV indirectCommandsLayout,
    const VkAllocationCallbacks* pAllocator);
```

• `device` is the logical device that destroys the layout.
• `indirectCommandsLayout` is the layout to destroy.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938
  All submitted commands that refer to `indirectCommandsLayout` must have completed execution

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939
  If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02940
  If no `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, `pAllocator` must be NULL

• VUID-vkDestroyIndirectCommandsLayoutNV-deviceGeneratedCommands-02941
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

**Valid Usage (Implicit)**

• VUID-vkDestroyIndirectCommandsLayoutNV-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parameter
  If `indirectCommandsLayout` is not `VK_NULL_HANDLE`, `indirectCommandsLayout` must be a valid `VkIndirectCommandsLayoutNV` handle

• VUID-vkDestroyIndirectCommandsLayoutNV-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-parent
  If `indirectCommandsLayout` is a valid handle, it must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to `indirectCommandsLayout` must be externally synchronized

### 32.1.2. Token Input Streams

The `VkIndirectCommandsStreamNV` structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- `buffer` specifies the `VkBuffer` storing the functional arguments for each sequence. These arguments can be written by the device.
- `offset` specified an offset into `buffer` where the arguments start.

### Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
  The `buffer`'s usage flag must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-VkIndirectCommandsStreamNV-offset-02943
  The `offset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`

- VUID-VkIndirectCommandsStreamNV-buffer-02975
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

### Valid Usage (Implicit)

- VUID-VkIndirectCommandsStreamNV-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle

The input streams can contain raw `uint32_t` values, existing indirect commands such as:

- `VkDrawIndirectCommand`
- `VkDrawIndexedIndirectCommand`
- `VkDrawMeshTasksIndirectCommandNV`
- `VkDrawMeshTasksIndirectCommandEXT`
or additional commands as listed below. How the data is used is described in the next section.

The `VkBindShaderGroupIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- `groupIndex` specifies which shader group of the current bound graphics pipeline is used.

**Valid Usage**

- VUID-VkBindShaderGroupIndirectCommandNV-None-02944
  The current bound graphics pipeline, as well as the pipelines it may reference, must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

- VUID-VkBindShaderGroupIndirectCommandNV-index-02945
  The `index` must be within range of the accessible shader groups of the current bound graphics pipeline. See `vkCmdBindPipelineShaderGroupNV` for further details

The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value can be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

**Valid Usage**

- VUID-VkBindIndexBufferIndirectCommandNV-None-02946
  The buffer’s usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set

- VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947
The bufferAddress must be aligned to the indexType used

- VUID-VkBindIndexBufferIndirectCommandNV-None-02948
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object.

Valid Usage (Implicit)

- VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter
  indexType must be a valid VkIndexType value.

The VkBindVertexBufferIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV token.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;
```

- bufferAddress specifies a physical address of the VkBuffer used as vertex input binding.
- size is the byte size range which is available for this operation from the provided address.
- stride is the byte size stride for this vertex input binding as in VkVertexInputBindingDescription::stride. It is only used if VkIndirectCommandsLayoutTokenNV::vertexDynamicStride was set, otherwise the stride is inherited from the current bound graphics pipeline.

Valid Usage

- VUID-VkBindVertexBufferIndirectCommandNV-None-02949
  The buffer’s usage flag from which the address was acquired must have the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT bit set.

- VUID-VkBindVertexBufferIndirectCommandNV-None-02950
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object.

The VkSetStateFlagsIndirectCommandNV structure specifies the input data for the VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV token. Which state is changed depends on the VkIndirectStateFlagBitsNV specified at VkIndirectCommandsLayoutNV creation time.

```
// Provided by VK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;
```
• data encodes packed state that this command alters.
  ◦ Bit 0: If set represents VK_FRONT_FACE_CLOCKWISE, otherwise VK_FRONT_FACE_COUNTER_CLOCKWISE

A subset of the graphics pipeline state can be altered using indirect state flags:

```cpp
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

• VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV allows to toggle the VkFrontFace rasterization state for subsequent draw operations.

```cpp
// Provided by VK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```

VkIndirectStateFlagsNV is a bitmask type for setting a mask of zero or more VkIndirectStateFlagBitsNV.

### 32.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```cpp
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset );

        // further details later
        indirectCommandsLayout.pTokens[t].command (cmd, pipeline, input, s);
    }
}
```

```cpp
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout,
```
The processing of each sequence is considered stateless, therefore all state changes must occur prior work provoking commands within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
    // Provided by VK_EXT_mesh_shader with VK_NV_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV = 1000328000,
} VkIndirectCommandsTokenTypeNV;
```

Table 46. Supported indirect command tokens

<table>
<thead>
<tr>

</tbody>
</table>
The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType sType;
    const void* pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t stream;
    uint32_t offset;
    uint32_t vertexBindingUnit;
    VkBool32 vertexDynamicStride;
    VkPipelineLayout pushconstantPipelineLayout;
    VkShaderStageFlags pushconstantShaderStageFlags;
    uint32_t pushconstantOffset;
    uint32_t pushconstantSize;
    VkIndirectStateFlagsNV indirectStateFlags;
    uint32_t indexTypeCount;
    const VkIndexType* pIndexTypes;
    const uint32_t* pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `tokenType` specifies the token command type.
- `stream` is the index of the input stream containing the token argument data.
- `offset` is a relative starting offset within the input stream memory for the token argument data.
- `vertexBindingUnit` is used for the vertex buffer binding command.
- `vertexDynamicStride` sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
- `pushconstantPipelineLayout` is the `VkPipelineLayout` used for the push constant command.
- `pushconstantShaderStageFlags` are the shader stage flags used for the push constant command.
- `pushconstantOffset` is the offset used for the push constant command.
- `pushconstantSize` is the size used for the push constant command.
- `indirectStateFlags` are the active states for the state flag command.
- `indexTypeCount` is the optional size of the `pIndexTypes` and `pIndexTypeValues` array pairings. If not zero, it allows to register a custom `uint32_t` value to be treated as specific `VkIndexType`.
- `pIndexTypes` is the used `VkIndexType` for the corresponding `uint32_t` value entry in
Valid Usage

- VUID-VkIndirectCommandsLayoutTokenNV-stream-02951  
  stream must be smaller than VkIndirectCommandsLayoutCreateInfoNV::streamCount.

- VUID-VkIndirectCommandsLayoutTokenNV-offset-02952  
  offset must be less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset.

- VUID-VkIndirectCommandsLayoutTokenNV-offset-06888  
  offset must be aligned to the scalar alignment of tokenType or minIndirectCommandsBufferOffsetAlignment, whichever is lower.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV, vertexBindingUnit must stay within device supported limits for the appropriate commands.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantPipelineLayout must be valid.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be a multiple of 4.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be a multiple of 4.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantOffset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02981  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, pushconstantSize must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus pushconstantOffset.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, for each byte in the range specified by pushconstantOffset and pushconstantSize and for each shader stage in pushconstantShaderStageFlags, there must be a push constant range in pushconstantPipelineLayout that includes that byte and that stage.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV, for each byte in the range specified by pushconstantOffset and pushconstantSize and for each push constant range that overlaps that byte, pushconstantShaderStageFlags must include all stages in that push constant range's VkPushConstantRange::stageFlags.

- VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984  
  If tokenType is VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV, indirectStateFlags must...
Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutTokenNV-sType
  - sType must be VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV
- VUID-VkIndirectCommandsLayoutTokenNV-pNext
  - pNext must be NULL
- VUID-VkIndirectCommandsLayoutTokenNV-tokenType
  - tokenType must be a valid VkIndirectCommandsTokenTypeNV value
- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout
  - If pushconstantPipelineLayout is not VK_NULL_HANDLE, pushconstantPipelineLayout must be a valid VkPipelineLayout handle
- VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags
  - pushconstantShaderStageFlags must be a valid combination of VkShaderStageFlagBits values
- VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags
  - indirectStateFlags must be a valid combination of VkIndirectStateFlagBitsNV values
- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes
  - If indexTypeCount is not 0, pIndexTypes must be a valid pointer to an array of indexTypeCount valid VkIndexType values
- VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues
  - If indexTypeCount is not 0, pIndexTypeValues must be a valid pointer to an array of indexTypeCount uint32_t values

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++){
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride = indirectCommandsLayout.pStreamStrides[token.stream];
        stream = pIndirectCommandsStreams[token.stream];
        uint32_t offset = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer( offset )

        switch(input.type){
        VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
            VkBindShaderGroupIndirectCommandNV* bind = input;
            vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint,
```
pipeline, bind->groupIndex);
break;

VK INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
VkSetStateFlagsIndirectCommandNV* state = input;

if (token.indirectStateFlags & VK INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
  if (state.data & (1 << 0)){
    set VK_FRONT_FACE_CLOCKWISE;
  } else {
    set VK_FRONT_FACE_COUNTER_CLOCKWISE;
  }
} break;

VK INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
uint32_t* data = input;

vkCmdPushConstants(cmd,
  token.pushconstantPipelineLayout
  token.pushconstantStageFlags,
  token.pushconstantOffset,
  token.pushconstantSize, data);
break;

VK INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
VkBindIndexBufferIndirectCommandNV* data = input;

// the indexType may optionally be remapped
// from a custom uint32_t value, via
// VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

vkCmdBindIndexBuffer(cmd,
  deriveBuffer(data->bufferAddress),
  deriveOffset(data->bufferAddress),
  data->indexType);
break;

VK INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
VkBindVertexBuffersIndirectCommandNV* data = input;

// if token.vertexDynamicStride is VK_TRUE
// then the stride for this binding is set
// using data->stride as well

vkCmdBindVertexBuffers(cmd,
  token.vertexBindingUnit, 1,
  deriveBuffer(data->bufferAddress),
  deriveOffset(data->bufferAddress));
break;
32.2. Indirect Commands Generation And Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

Valid Usage

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled.

### Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter
device must be a valid `VkDevice` handle
- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter
pInfo must be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure
- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter
pMemoryRequirements must be a valid pointer to a `VkMemoryRequirements2` structure

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` of the pipeline that this buffer memory is intended to be used with during the execution.
- `pipeline` is the `VkPipeline` that this buffer memory is intended to be used with during the execution.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that this buffer memory is intended to be used with.
- `maxSequencesCount` is the maximum number of sequences that this buffer memory in combination with the other state provided can be used with.

### Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907
maxSequencesCount must be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount`
Valid Usage (Implicit)

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV`.

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext**
  
  The `pNext` must be `NULL`.

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter**
  
  The `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter**
  
  The `pipeline` must be a valid `VkPipeline` handle.

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter**
  
  The `indirectCommandsLayout` must be a valid `VkIndirectCommandsLayoutNV` handle.

- **VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent**
  
  Both the `indirectCommandsLayout` and `pipeline` must have been created, allocated, or retrieved from the same `VkDevice`.

The actual generation of commands as well as their execution on the device is handled as single action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
    VkBool32 isPreprocessed,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```

- **commandBuffer** is the command buffer into which the command is recorded.
- **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.
- **pGeneratedCommandsInfo** is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the generation of commands.

Valid Usage

- **VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770**
  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain...
If a `VkImageView` is sampled with `depth comparison`, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`. 
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`. 
If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident.

If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident.

If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`,
and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, that stage was created without enabling either 
  
  `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT`  
  or  
  
  `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT`  
  for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C’C’R conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C’C’R conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the `OpTypeImage` must match

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04115**
  If a VkImageView is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469**
  If a VkBufferView is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's `format` features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail **integer texel coordinate validation**.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685**
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07748**
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07468**
  If any shader executed by this pipeline accesses an `OpTypeImage` variable with a Dim operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07469**
  Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09000**
If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT`
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-09001
If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT`
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-09002
If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT`
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-09003
If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-06539
If any previously recorded command in the current subpass accessed an image
subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07831
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT dynamic state enabled then vkCmdSetViewport must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07832
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR dynamic state enabled then vkCmdSetScissor must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07833
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_WIDTH dynamic state enabled then vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08618
  If a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current
command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07835
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants`
  must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08621
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent
  call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set
  `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to
  `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of
  `pColorBlendEnables` to `VK_TRUE`, and the most recent call to
  `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of
  `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor`
  member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`,
  `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or
  `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been
  called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07836
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS`
  dynamic state enabled then `vkCmdSetDepthBounds` must have been called in the current
  command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetDepthBoundsTestEnable` in the current command buffer set
  `depthBoundsTestEnable` to `VK_TRUE`, `vkCmdSetDepthBounds` must have been called in the
  current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07837
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled then `vkCmdSetStencilCompareMask`
  must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08623
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetStencilTestEnable` in the current command buffer set
  `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilCompareMask` must have been called in the
  current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07838
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` dynamic state enabled then `vkCmdSetStencilWriteMask`
  must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to
  `vkCmdSetStencilTestEnable` in the current command buffer set
  `stencilTestEnable` to `VK_TRUE`, `vkCmdSetStencilWriteMask` must have been called in the current command
buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07839
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled then
  vkCmdSetStencilReference must have been called in the current command buffer prior to
  this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to
  VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum
  instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with
  VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and
  the current subpass has a depth/stencil attachment, then that attachment must have been
  created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdExecuteGeneratedCommandsNV-None-06666
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then
  vkCmdSetSampleLocationsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08626
  If a shader object is bound to any graphics stage, and the most recent call to
  vkCmdSetSampleLocationsEnableEXT in the current command buffer set sampleLocationsEnable to VK_TRUE, vkCmdSetSampleLocationsEXT must have been called
  in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07934
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled, then the
  sampleLocationsPerPixel member of pSampleLocationsInfo in the last call to
  vkCmdSetSampleLocationsEXT must equal the rasterizationSamples member of the
  VkPipelineMultisampleStateCreateInfo structure the bound graphics pipeline has been created with

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07840
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then
  vkCmdSetCullMode must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08627
  If a shader object is bound to any graphics stage, vkCmdSetCullMode must have been
called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07841
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08628
  If a shader object is bound to any graphics stage, `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07843
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08629
  If a shader object is bound to any graphics stage, `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07844
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08630
  If a shader object is bound to any graphics stage, `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07845
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08631
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07846
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08632
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07847
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then
vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetStencilTestEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07848**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_OP dynamic state enabled then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, then vkCmdSetStencilOp must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08635**
  If a shader object is bound to any graphics stage, then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV`::viewportCount greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

If a shader object is bound to any graphics stage, and the `VK_NV_clip_space_w_scaling` extension is enabled on the device, then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV`::viewportCount greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` dynamic state enabled, then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state enabled, then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetExclusiveScissorEnableNV` in the current command buffer set any element of `pExclusiveScissorEnables` to `VK_TRUE`, then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled, then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid 2622.
If a shader object is bound to any graphics stage, and the logicOp feature is enabled on the device, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value.
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature is enabled, then the most recent call to vkCmdSetRasterizationSamplesEXT in the current command buffer must have set rasterizationSamples to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08876
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with vkCmdBeginRendering

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats`, if it exists, must be `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` equal to `VK_NULL_HANDLE` must have the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound pipeline equal to `VK_FORMAT_UNDEFINED`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the fragment stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the
• **VUID-vkCmdExecuteGeneratedCommandsNV-None-08647**
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the fragment stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-None-08649**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleModeEXT` must have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08913**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `dynamicRenderingUnusedAttachments` feature is not enabled, and `VkRenderingContextInfo::pDepthAttachment->imageView` was `VK_NULL_HANDLE`, the value of
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingContext::imageView

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingContext::imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingContext::imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08916
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingContext::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingContext::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingContext::imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingContext::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingContext::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingContextFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with
• **VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

• **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

• **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

• **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or...
VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline **must** be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- **VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline **must** be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- **VUID-vkCmdExecuteGeneratedCommandsNV-pNext-07935**
  If this command has been called inside a render pass instance started with vkCmdBeginRendering, and the pNext chain of VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the value of rasterizationSamples for the currently bound graphics pipeline **must** be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

- **VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-06198**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline **must** have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- **VUID-vkCmdExecuteGeneratedCommandsNV-pColorAttachments-08963**
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline **must** not be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-08964**
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline **must** not be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-08965**
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline **must** not be VK_FORMAT_UNDEFINED

- **VUID-vkCmdExecuteGeneratedCommandsNV-**
primitivesGeneratedQueryWithRasterizerDiscard-06708
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, **rasterization discard must not be enabled**

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then **vkCmdSetTessellationDomainOriginEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then **vkCmdSetDepthClampEnableEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then **vkCmdSetDepthClampEnableEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then **vkCmdSetPolygonModeEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08651**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then **vkCmdSetPolygonModeEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07622**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then **vkCmdSetRasterizationSamplesEXT must have been called in the current command buffer prior to this drawing command**

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08652**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then **vkCmdSetRasterizationSamplesEXT must have been called in the current command buffer prior to this drawing command**
• VUID-vkCmdExecuteGeneratedCommandsNV-None-07623
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08653
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07624
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08919
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08654
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08920
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07625
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08655
If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07626
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command.
If the `logicOp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` **must** have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteMaskEXT` **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` **must** have been called in the current command buffer prior to this drawing command.

If the `geometryStreams` feature is enabled, and a shader object is bound to the geometry stage, then `vkCmdSetRasterizationStreamEXT` **must** have been called in the current command buffer prior to this drawing command.
command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07631**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08661**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetConservativeRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07632**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` dynamic state enabled then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08662**
  If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07633**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08663**
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07634**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08664**
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command
buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07635
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07636
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08665
  If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the vertex stage, then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07637

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08666
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08667
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the vertex stage, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08668
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the tessellation evaluation or geometry stage, then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07638
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08669
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any
graphics stage, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08670**
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to the vertex stage, and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to any line topology, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08671**
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the tessellation evaluation or geometry stage, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07849**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` dynamic state enabled then `vkCmdSetLineStippleEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08672**
  If the `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07639**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08673**
  If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07640**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08674**
  If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07641**
  If the bound graphics pipeline state was created with the
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

If the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.
called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07646**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08680**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07647**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08681**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07648**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` dynamic state enabled then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08682**
  If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07649**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08683**
  If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pColorBlendEnables-07470**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view’s format features
must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07471
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does
not use any color and/or depth/stencil attachments, then the rasterizationSamples in the
last call to vkCmdSetRasterizationSamplesEXT must follow the rules for a zero-
attachment subpass

• VUID-vkCmdExecuteGeneratedCommandsNV-samples-07472
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state enabled and the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state disabled, then the samples parameter in
the last call to vkCmdSetSampleMaskEXT must be greater or equal to the
VkPipelineMultisampleStateCreateInfo::rasterizationSamples parameter used to create
the bound graphics pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-samples-07473
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_SAMPLE_MASK_EXT state and
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, then the samples parameter in the last call to vkCmdSetSampleMaskEXT
must be greater or equal to the rasterizationSamples parameter in the last call to
vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-
07475
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and none of the
VK_AMD_mixed_attachment_samples extension, VK_NV_framebuffer_mixed_samples extension, or
the multisampledRenderToSingleSampled feature is enabled, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the current
subpass color and/or depth/stencil attachments

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07476
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then
vkCmdSetColorBlendEnableEXT must have been called in the current command buffer
prior to this drawing command, and the attachments specified by the firstAttachment and
attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable
for all active color attachments in the current subpass

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07477
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then
vkCmdSetColorBlendEquationEXT must have been called in the current command buffer
prior to this drawing command, and the attachments specified by the firstAttachment and
attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend
equations for all active color attachments in the current subpass where blending is
enabled

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07478
If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07483**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` parameter of the last call to `vkCmdSetSampleLocationsPerPixelEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07483**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-advancedBlendMaxColorAttachments-07480**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07484**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` parameter of the last call to `vkCmdSetSampleLocationsPerPixelEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07479**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07484**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` parameter of the last call to `vkCmdSetSampleLocationsPerPixelEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07484**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` parameter of the last call to `vkCmdSetSampleLocationsPerPixelEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-advancedBlendMaxColorAttachments-07480**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.
was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07485**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07486**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07487**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by
vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07938
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdExecuteGeneratedCommandsNV-coverageModulationTableEnable-07488
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV state enabled and the last call to vkCmdSetCoverageModulationTableEnableNV set coverageModulationTableEnable to VK_TRUE, then the coverageModulationTableCount parameter in the last call to vkCmdSetCoverageModulationTableNV must equal the current rasterizationSamples divided by the number of color samples in the current subpass

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07489
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current rasterizationSamples must be the same as the sample count of the depth/stencil attachment

• VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV state enabled and the last call to vkCmdSetCoverageToColorEnableNV set the coverageToColorEnable to VK_TRUE, then the current subpass must have a color attachment at the location selected by the last call to vkCmdSetCoverageToColorLocationNV coverageToColorLocation, with a VkFormat of VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

• VUID-vkCmdExecuteGeneratedCommandsNV-coverageReductionMode-07491
  If this VK_NV_coverage_reduction_mode extension is enabled, the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV and VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT states enabled, the current coverage reduction mode coverageReductionMode, then the current rasterizationSamples, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV

• VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07492
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass has any color attachments and `rasterizationSamples` of the last call to `vkCmdSetRasterizationSamplesEXT` is greater than the number of color samples, then the pipeline `sampleShadingEnable` must be `VK_FALSE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `stippledRectangularLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the `stippledBresenhamLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the `stippledSmoothLines` feature must be enabled.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the `stippledRectangularLines` feature must be enabled and `VkPhysicalDeviceLimits::strictLines` must be `VK_TRUE`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, `conservativePointAndLineRasterization` is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the...
conservativeRasterizationMode set by the last call to
vkCmdSetConservativeRasterizationModeEXT must be
VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07850
  If dynamic state was inherited from VkCommandBufferInheritanceViewportScissorInfoNV, it must be set in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08684
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08685
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08689
  If there is no bound graphics pipeline, and the taskShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TASK_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08690
  If there is no bound graphics pipeline, and the meshShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_MESH_BIT_EXT
If there is no bound graphics pipeline, and at least one of the `taskShader` and `meshShader` features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound.

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` must be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

If there is no bound graphics pipeline, and both the `taskShader` and `meshShader` features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there must be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there must be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

If there is no bound graphics pipeline and the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution...
mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shaderv stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo` ::`pDynamicStates`, and the fragment shader declares the EarlyFragmentTests execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be 0

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04008**
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07842**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled then `vkCmdSetPrimitiveTopology` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07500**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` dynamic state enabled and the `dynamicPrimitiveTopologyUnrestricted` is `VK_FALSE`, then the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopology` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo` ::`topology` state

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08881**
If a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, then `vkCmdSetPrimitiveTopology` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-07939**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then all variables with the `Input` storage class decorated with `Location` in the `Vertex Execution Model OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-08734**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then if the numeric type associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding `Location` in the `Vertex Execution Model OpEntryPoint` must be 64-bit

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, and the scalar width associated with a `Location` decorated `Input` variable in the `Vertex Execution Model OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08882**
  If a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08883**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04879**
  If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE** dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-08884**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, `vkCmdSetPrimitiveRestartEnable` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-stage-06481**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo` ::`stage` member of an element of `VkGraphicsPipelineCreateInfo` ::`pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08885**
  There **must** be no shader object bound to either of the `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02970**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908**
  If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` **must** have already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV` ::`preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`’s `indirectCommandsLayout` **must** have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909**
  `VkGeneratedCommandsInfoNV` ::`pipeline` **must** match the current bound pipeline at `VkGeneratedCommandsInfoNV` ::`pipelineBindPoint`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02910**
  Transform feedback **must** not be active

- **VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911**
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV` ::`deviceGeneratedCommands` feature **must** be enabled

---

**Valid Usage (Implicit)**

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter**
  `pGeneratedCommandsInfo` **must** be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
• VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdExecuteGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkPipelineBindPoint pipelineBindPoint;
  VkPipeline pipeline;
  VkIndirectCommandsLayoutNV indirectCommandsLayout;
  uint32_t streamCount;
  const VkIndirectCommandsStreamNV* pStreams;
  uint32_t sequencesCount;
  VkBuffer preprocessBuffer;
  VkDeviceSize preprocessOffset;
  VkDeviceSize preprocessSize;
  VkBuffer sequencesCountBuffer;
  VkDeviceSize sequencesCountOffset;
  VkBuffer sequencesIndexBuffer;
  VkDeviceSize sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• **pipelineBindPoint** is the `VkPipelineBindPoint` used for the **pipeline**.

• **pipeline** is the `VkPipeline` used in the generation and execution process.

• **indirectCommandsLayout** is the `VkIndirectCommandsLayoutNV` that provides the command sequence to generate.

• **streamCount** defines the number of input streams

• **pStreams** is a pointer to an array of **streamCount** `VkIndirectCommandsStreamNV` structures providing the input data for the tokens used in `indirectCommandsLayout`.

• **sequencesCount** is the maximum number of sequences to reserve. If `sequencesCountBuffer` is `VK_NULL_HANDLE`, this is also the actual number of sequences generated.

• **preprocessBuffer** is the `VkBuffer` that is used for preprocessing the input data for execution. If this structure is used with `vkCmdExecuteGeneratedCommandsNV` with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped and data is only read from this buffer. The contents and the layout of this buffer is opaque to applications and must not be modified or copied to another buffer for reuse.

• **preprocessOffset** is the byte offset into `preprocessBuffer` where the preprocessed data is stored.

• **preprocessSize** is the maximum byte size within the `preprocessBuffer` after the `preprocessOffset` that is available for preprocessing.

• **sequencesCountBuffer** is a `VkBuffer` in which the actual number of sequences is provided as single `uint32_t` value.

• **sequencesCountOffset** is the byte offset into `sequencesCountBuffer` where the count value is stored.

• **sequencesIndexBuffer** is a `VkBuffer` that encodes the used sequence indices as `uint32_t` array.

• **sequencesIndexOffset** is the byte offset into `sequencesIndexBuffer` where the index values start.

---

### Valid Usage

- **VUID-VkGeneratedCommandsInfoNV-pipeline-02912**
  The provided pipeline must match the pipeline bound at execution time

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913**
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV`, then the pipeline must have been created with multiple shader groups

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914**
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV`, then the pipeline must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` set in `VkGraphicsPipelineCreateInfo::flags`

- **VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915**
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, then the pipeline's `VkPipelineLayout` must match the `VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout`
streamCount must match the indirectCommandsLayout's streamCount

sequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount and VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount that was used to determine the preprocessSize

preprocessBuffer must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set in its usage flag

preprocessOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment

preprocessBuffer must be at least equal to the memory requirement’s size returned by vkGetGeneratedCommandsMemoryRequirementsNV using the matching inputs (indirectCommandsLayout, ...) as within this structure

sequencesCountBuffer can be set if the actual used count of sequences is sourced from the provided buffer. In that case the sequencesCount serves as upper bound

If sequencesCountBuffer is not VK_NULL_HANDLE, its usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountOffset must be aligned to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment

If sequencesCountBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

If sequencesCountBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

If indirectCommandsLayout's VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV is set, sequencesIndexBuffer must be set otherwise it must be VK_NULL_HANDLE

If sequencesIndexBuffer is not VK_NULL_HANDLE, its usage flag must have the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

If sequencesIndexBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
• VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973
  If sequencesIndexBuffer is not VK_NULL_HANDLE and is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07078
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV, then the pipeline must contain a shader stage using the MeshNV Execution Model.

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07079
  If the indirectCommandsLayout uses a token of VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV, then the pipeline must contain a shader stage using the MeshEXT Execution Model.

---

**Valid Usage (Implicit)**

• VUID-VkGeneratedCommandsInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV.

• VUID-VkGeneratedCommandsInfoNV-pNext-pNext
  pNext must be NULL.

• VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value.

• VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle.

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle.

• VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
  pStreams must be a valid pointer to an array of streamCount valid VkIndirectCommandsStreamNV structures.

• VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter
  preprocessBuffer must be a valid VkBuffer handle.

• VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter
  If sequencesCountBuffer is not VK_NULL_HANDLE, sequencesCountBuffer must be a valid VkBuffer handle.

• VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter
  If sequencesIndexBuffer is not VK_NULL_HANDLE, sequencesIndexBuffer must be a valid VkBuffer handle.

• VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength
  streamCount must be greater than 0.

• VUID-VkGeneratedCommandsInfoNV-commonparent
  Each of indirectCommandsLayout, pipeline, preprocessBuffer, sequencesCountBuffer, and sequencesIndexBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.
Referencing the functions defined in *Indirect Commands Layout*, \( \text{vkCmdExecuteGeneratedCommandsNV} \) behaves as:

```c
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);
```

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

**Note**

It is important to note that the values of all state related to the `pipelineBindPoint` used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```

- `commandBuffer` is the command buffer which does the preprocessing.
- `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

**Valid Usage**

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974
  - `commandBuffer` must not be a protected command buffer
- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927
  - `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set
- VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928
  - The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled
Valid Usage (Implicit)

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter  
  `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording  
  `commandBuffer` must be in the recording state

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass  
  This command must only be called outside of a render pass instance

- VUID-vkCmdPreprocessGeneratedCommandsNV-videocoding  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

Chapter 33. Sparse Resources

As documented in Resource Memory Association, VkBuffer and VkImage resources in Vulkan must be bound completely and contiguously to a single VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

- Sparse resources can be bound non-contiguously to one or more VkDeviceMemory allocations.
- Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
- Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

33.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of VkImageCreateInfo or VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in VkPhysicalDeviceFeatures.

- The sparseBinding feature is the base, and provides the following capabilities:
  - Resources can be bound at some defined (sparse block) granularity.
  - The entire resource must be bound to memory before use regardless of regions actually accessed.
  - No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  - Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  - Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.

- A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both VK_IMAGE_TILING_OPTIMAL and VK_IMAGE_TILING_LINEAR tiling.

- Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  - Resources do not have to be completely bound to memory before use on the device.
  - Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  - Consistency of access to unbound regions of the resource is defined by the absence or presence of VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the...
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:

  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
  
  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

  - The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

    Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

    See Sparse Memory Aliasing for more information.

### 33.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 33.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`. `alignment` represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 33.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 33.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

---

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 33.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory may still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See **Physical Device Enumeration** for instructions for retrieving physical device properties.

---

**Implementor’s Note**

For implementations that cannot natively handle access to unbound regions of a resource, the implementation may allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations may use the same physical memory for all unbound regions of multiple resources within the same process.

---

### 33.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the `flags` member of `VkSparseImageFormatProperties`, for the image's `format`, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` may affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. must be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and may be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by \( VK_{\text{SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} \) in \( VkSparseImageMemoryRequirements::flags \).

The following diagrams depict how \( VK_{\text{SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} \) and \( VK_{\text{SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} \) alter memory usage and requirements.

![Diagrams showing memory usage and requirements](image)

*Figure 22. Sparse Image*

In the absence of \( VK_{\text{SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} \) and \( VK_{\text{SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} \), each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

**Figure 23. Sparse Image with Single Mip Tail**

**Figure 24. Sparse Image with Aligned Mip Size**
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first \(N\) mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 25. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

**Note**

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_ALIGNED\_MIP\_SIZE\_BIT} and \texttt{VK\_SPARSE\_IMAGE\_FORMAT\_SINGLE\_MIPTAIL\_BIT} are present the constraints from each of these flags are in effect.

### 33.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. \texttt{VK\_FORMAT\_BC5\_UNORM\_BLOCK}), the texel size is the size of the compressed texel block (e.g. 128-bit for \texttt{BC5}) thus the dimensions of the standard sparse image block
shapes apply in terms of compressed texel blocks.

**Note**

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.
Table 47. Standard Sparse Image Block Shapes (Single Sample)

</tr>
<tr>
<td>128-Bit</td>
<td>32 × 64 × 1</td>
<td>32 × 32 × 1</td>
<td>16 × 32 × 1</td>
<td>16 × 16 × 1</td>
</tr>
</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

### 33.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 33.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 26. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The
per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by \( \text{VkMemoryRequirements::alignment} \).

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

### 33.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

\( \text{VkDevice} \) objects that have the \( \text{sparseResidencyAliased} \) feature enabled are able to use the \( \text{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} \) and \( \text{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} \) flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the \( \text{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} / \text{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} \) flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
  - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory **cannot** be accessed in a data consistent fashion.
Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

33.6. Sparse Resource Implementation Guidelines
(Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

**Device Virtual Address**

The basic `sparseBinding` feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages **must** be bound to physical memory before the device accesses the resource.

The `sparseResidency` features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault **may** support `residencyNonResidentStrict`.

Not faulting on access to unbound pages is not enough to support `residencyNonResidentStrict`. An implementation **must** also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this **may** not always be possible.

Any implementation that does not fault, but does not guarantee correct read values **must** not support `residencyNonResidentStrict`.

Any implementation that **cannot** access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory **may** be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process **must** not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations **may** allocate more often (per instance, per device, or per resource).

**Binding Memory**

The byte size reported in `VkMemoryRequirements::size` **must** be greater than or equal to the amount of physical memory **required** to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for \( \text{VkSparseImageOpaqueMemoryBindInfo} \). This operation must be supported for all sparse images, even ones created with \( \text{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} \).

- If the holes are included in the size, this bind function becomes very easy. In most cases the \( \text{resourceOffset} \) is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping \( \text{resourceOffset} \) to the actual device virtual address intended to be mapped.

\[ \text{Note} \]

If the application always uses \( \text{VkSparseImageMemoryBindInfo} \) to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since \( \text{VkSparseImageMemoryBindInfo} \) uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset \( \rightarrow \) device virtual address mapping for handling \( \text{VkSparseImageOpaqueMemoryBindInfo} \).

To make this easier on the implementation, the \( \text{VK_SPARSE_MEMORY_BIND_METADATA_BIT} \) explicitly specifies when metadata is bound with \( \text{VkSparseImageOpaqueMemoryBindInfo} \). When this flag is not present, the \( \text{resourceOffset} \) may be treated as a strict device virtual address offset.

When \( \text{VK_SPARSE_MEMORY_BIND_METADATA_BIT} \) is present, the \( \text{resourceOffset} \) must have been derived explicitly from the \( \text{imageMipTailOffset} \) in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for \( \text{imageMipTailOffset} \), the \( \text{resourceOffset} \) does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
33.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

33.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in `VkPhysicalDeviceFeatures`. These features must be supported and enabled on the `VkDevice` object before applications can use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

**Sparse Physical Device Features**

- **sparseBinding**: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` flags, respectively.
- **sparseResidencyBuffer**: Support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag.
- **sparseResidencyImage2D**: Support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidencyImage3D**: Support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidency2Samples**: Support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidency4Samples**: Support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidency8Samples**: Support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidency16Samples**: Support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.
- **sparseResidencyAliased**: Support for creating `VkBuffer` and `VkImage` objects with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags, respectively.

33.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is **VK_TRUE** if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyStandard2DMultisampleBlockShape` is **VK_TRUE** if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyStandard3DBlockShape` is **VK_TRUE** if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not **required** to match the standard sparse image block dimensions listed in the table.

- `residencyAlignedMipSize` is **VK_TRUE** if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the `flags` member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- `residencyNonResidentStrict` specifies whether the physical device can consistently access non-resident regions of a resource. If this property is **VK_TRUE**, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
33.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
typedef VkFlags VkSparseImageFormatFlags;

VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkSampleCountFlagBits samples,
    VkImageUsageFlags usage,
    VkImageTiling tiling,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties* pProperties);

- physicalDevice is the physical device from which to query the sparse image format properties.
- format is the image format.
- type is the dimensionality of image.
- samples is a VkSampleCountFlagBits value specifying the number of samples per texel.
- usage is a bitmask describing the intended usage of the image.
- tiling is the tiling arrangement of the texel blocks in memory.
- pPropertyCount is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- pProperties is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be set to zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
Depth/stencil images with depth and stencil data interleaved into a single plane will return a single `VkSparseImageFormatProperties` structure with the `aspectMask` set to `VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT`.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094 samples must be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with format, type, tiling, and usage equal to those in this command and flags equal to the value that is set in `VkImageCreateInfo::flags` when the image is created.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter physicalDevice must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter format must be a valid `VkFormat` value.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter type must be a valid `VkImageType` value.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter samples must be a valid `VkSampleCountFlagBits` value.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter usage must be a valid combination of `VkImageUsageFlagBits` values.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitsetmask usage must not be 0.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter tiling must be a valid `VkImageTiling` value.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter pPropertyCount must be a valid pointer to a `uint32_t` value.
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` returns an array of `VkSparseImageFormatProperties2`. Each element will describe properties for one set of image aspects that are bound simultaneously in the image. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceSparseImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
    uint32_t* pPropertyCount,
    VkSparseImageFormatProperties2* pProperties);
```

- `physicalDevice` is the physical device from which to query the sparse image format properties.
- `pFormatInfo` is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- `pPropertyCount` is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter `pFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
```c
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;
```

or the equivalent

```c
typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the image format.
- **type** is the dimensionality of image.
- **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.

### Valid Usage

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095
  
  **samples** must be a bit value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with `format`, `type`, `tiling`, and `usage` equal to those in this command and flags equal to the value that is set in `VkImageCreateInfo`::flags when the image is created.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext
  
  **pNext** must be `NULL`

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter
  
  **format** must be a valid `VkFormat` value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter
type must be a valid VkImageType value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmap
  usage must not be 0

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
  tiling must be a valid VkImageTiling value

The VkSparseImageFormatProperties2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- properties is a VkSparseImageFormatProperties structure which is populated with the same values as in vkGetPhysicalDeviceSparseImageFormatProperties.

Valid Usage (Implicit)

- VUID-VkSparseImageFormatProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2

- VUID-VkSparseImageFormatProperties2-pNext-pNext
  pNext must be NULL

33.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the VkPhysicalDeviceFeatures structure described previously in the Physical Device Features section) when calling vkCreateDevice. When the appropriate device features are enabled, the VK_BUFFER_CREATE_SPARSE_* and VK_IMAGE_CREATE_SPARSE_* flags can be used. See vkCreateBuffer and
Note
Specifying `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` or `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` requires specifying `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` or `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, respectively, as well. This means that resources must be created with the appropriate `.SPARSE_BINDING_BIT` to be used with the sparse binding command (vkQueueBindSparse).

33.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for `VkBuffer` objects and `VkImage` objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from `VkMemoryRequirements`. For all sparse resources the `VkMemoryRequirements::alignment` member specifies both the bindable sparse block size in bytes and required alignment of `VkDeviceMemory`.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the `VkMemoryRequirements::alignment` field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for `VkImage` objects using `vkGetImageSparseMemoryRequirements` will return an array of one or more `VkSparseImageMemoryRequirements` structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The `VkSparseImageMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• **formatProperties** is a `VkSparseImageFormatProperties` structure specifying properties of the image format.

• **imageMipTailFirstLod** is the first mip level at which image subresources are included in the mip tail region.

• **imageMipTailSize** is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• **imageMipTailOffset** is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).

• **imageMipTailStride** is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device,            // Provided by VK_VERSION_1_0
    VkImage image,              // Logical device that owns the image.
    uint32_t* pSparseMemoryRequirementCount, // Pointer to an integer related to the number of sparse memory requirements available or queried.
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements); // Pointer to an array of `VkSparseImageMemoryRequirements` structures.
```

• **device** is the logical device that owns the image.

• **image** is the `VkImage` object to get the memory requirements for.

• **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• **pSparseMemoryRequirements** is either **NULL** or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is **NULL**, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

---

**Note**

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`.

2676
This may occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
image must be a valid VkImage handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageSparseMemoryRequirements2(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- device is the logical device that owns the image.
- pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

**Valid Usage (Implicit)**

- VUID-vkGetImageSparseMemoryRequirements2-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter
  
  `pInfo` must be a valid pointer to a valid `VkImageSparseMemoryRequirementsInfo2` structure

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter
  
  `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter
  
  If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount ` `VkSparseImageMemoryRequirements2` structures

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- `device` is the logical device intended to own the image.

- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.

- `pSparseMemoryRequirementCount` is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter**
  
  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter**
  
  `pInfo` must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure.

- **VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter**
  
  `pSparseMemoryRequirementCount` must be a valid pointer to a `uint32_t` value.

- **VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter**
  
  If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` must be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures.

The `VkImageSparseMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
   VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

### Valid Usage (Implicit)

- **VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`.

- **VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext**
  
  `pNext` must be `NULL`.  

2679
The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

### Valid Usage (Implicit)

- VUID-VkSparseImageMemoryRequirements2-sType-sType `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext `pNext` must be NULL

### 33.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources can be bound to memory non-contiguously and these bindings can be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use *synchronization primitives* to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**
Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include `VK_QUEUE_SPARSE_BINDING_BIT` support in queue families that also include graphics and compute support, other implementations **may** only expose a `VK_QUEUE_SPARSE_BINDING_BIT`-only queue family. In either case, applications **must** use *synchronization primitives* to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the `VK_IMAGE_ASPECT_METADATA_BIT` the application **must** use the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` in the `VkSparseMemoryBind`::flags field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the `VK_SPARSE_MEMORY_BIND_METADATA_BIT` flag.

Binding the mip tail for any aspect **must** only be performed using `VkSparseImageOpaqueMemoryBindInfo`. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, then it **can** be bound with a single `VkSparseMemoryBind` structure, with `resourceOffset = imageMipTailOffset` and `size = imageMipTailSize`.

If `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with `layerCount` `VkSparseMemoryBind` structures, each using `size = imageMipTailSize` and `resourceOffset = arrayMipTailOffset` as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The `VkSparseMemoryBind` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
} VkSparseMemoryBind;
```
VkDeviceSize memoryOffset;
VkSparseMemoryBindFlags flags;
} VkSparseMemoryBind;

• `resourceOffset` is the offset into the resource.
• `size` is the size of the memory region to be bound.
• `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
• `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
• `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range \([\text{resourceOffset}, \text{resourceOffset} + \text{size})\) has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the mip tail region of the metadata aspect. This metadata region is defined by:

\[
\text{metadataRegion} = [\text{base}, \text{base} + \text{imageMipTailSize})
\]

\[
\text{base} = \text{imageMipTailOffset} + \text{imageMipTailStride} \times n
\]

and `imageMipTailOffset`, `imageMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image,

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range **must** be within the range \([0, \text{VkMemoryRequirements::size})\).

### Valid Usage

- **VUID-VkSparseMemoryBind-memory-01096**
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` **must** match the memory requirements of the resource, as described in section Resource Memory Association

- **VUID-VkSparseMemoryBind-memory-01097**
  If `memory` is not `VK_NULL_HANDLE`, `memory` **must** not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set

- **VUID-VkSparseMemoryBind-size-01098**
  `size` **must** be greater than 0

- **VUID-VkSparseMemoryBind-resourceOffset-01099**
  `resourceOffset` **must** be less than the size of the resource

- **VUID-VkSparseMemoryBind-size-01100**
size must be less than or equal to the size of the resource minus resourceOffset

- VUID-VkSparseMemoryBind-memoryOffset-01101
  memoryOffset must be less than the size of memory

- VUID-VkSparseMemoryBind-size-01102
  size must be less than or equal to the size of memory minus memoryOffset

- VUID-VkSparseMemoryBind-memory-02730
  If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes or VkExternalMemoryImageCreateInfo::handleTypes when the resource was created

- VUID-VkSparseMemoryBind-memory-02731
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes or VkExternalMemoryImageCreateInfo::handleTypes when the resource was created

Valid Usage (Implicit)

- VUID-VkSparseMemoryBind-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-VkSparseMemoryBind-flags-parameter
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

Bits which can be set in VkSparseMemoryBind::flags, specifying usage of a sparse memory binding operation, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

- VK_SPARSE_MEMORY_BIND_METADATA_BIT specifies that the memory being bound is only for the metadata aspect.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkSparseMemoryBindFlags;
```

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag using the following structure:
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;

- **buffer** is the *VkBuffer* object to be bound.
- **bindCount** is the number of *VkSparseMemoryBind* structures in the *pBinds* array.
- **pBinds** is a pointer to an array of *VkSparseMemoryBind* structures.

### Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter *buffer* must be a valid *VkBuffer* handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter *pBinds* must be a valid pointer to an array of *bindCount* valid *VkSparseMemoryBind* structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength *bindCount* must be greater than 0

Memory is bound to opaque regions of *VkImage* objects created with the *VK_IMAGE_CREATE_SPARSE_BINDING_BIT* flag using the following structure:

typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;

- **image** is the *VkImage* object to be bound.
- **bindCount** is the number of *VkSparseMemoryBind* structures in the *pBinds* array.
- **pBinds** is a pointer to an array of *VkSparseMemoryBind* structures.

### Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103 If the *flags* member of any element of *pBinds* contains *VK_SPARSE_MEMORY_BIND_METADATA_BIT*, the binding range defined must be within the mip tail region of the metadata aspect of *image*
Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  bindCount must be greater than 0

Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case flags does not contain VK_SPARSE_MEMORY_BIND_METADATA_BIT, the resourceOffset is in the range [0, VkMemoryRequirements::size), This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the resourceOffset is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When flags contains VK_SPARSE_MEMORY_BIND_METADATA_BIT, the binding range specified must be within the mip tail region of the metadata aspect. In this case the resourceOffset is not required to be a simple device address offset within the resource. However, it is defined to be within [imageMipTailOffset, imageMipTailOffset + imageMipTailSize) for the metadata aspect. See VkSparseMemoryBind for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;
```

- image is the VkImage object to be bound
- bindCount is the number of VkSparseImageMemoryBind structures in pBinds array
• $pBinds$ is a pointer to an array of $VkSparseImageMemoryBind$ structures

Valid Usage

• VUID-VkSparseImageMemoryBindInfo-subresource-01722
  The $subresource.mipLevel$ member of each element of $pBinds$ must be less than the $mipLevels$ specified in $VkImageCreateInfo$ when $image$ was created.

• VUID-VkSparseImageMemoryBindInfo-subresource-01723
  The $subresource.arrayLayer$ member of each element of $pBinds$ must be less than the $arrayLayers$ specified in $VkImageCreateInfo$ when $image$ was created.

• VUID-VkSparseImageMemoryBindInfo-image-02901
  $image$ must have been created with $VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT$ set.

Valid Usage (Implicit)

• VUID-VkSparseImageMemoryBindInfo-image-parameter
  $image$ must be a valid $VkImage$ handle.

• VUID-VkSparseImageMemoryBindInfo-pBinds-parameter
  $pBinds$ must be a valid pointer to an array of $bindCount$ valid $VkSparseImageMemoryBind$ structures.

• VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength
  $bindCount$ must be greater than 0.

The $VkSparseImageMemoryBind$ structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;  // The aspect and region of interest in the image.
    VkOffset3D offset;               // The coordinates of the first texel within the image subresource to bind.
    VkExtent3D extent;              // The size in texels of the region within the image subresource to bind. The extent must be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it can instead be such that any coordinate of offset + extent equals the corresponding dimensions of the image subresource.
    VkDeviceMemory memory;          // The $VkDeviceMemory$ object that the sparse image blocks of the image are bound to. If memory is $VK_NULL_HANDLE$, the sparse image blocks are unbound.
    VkDeviceSize memoryOffset;      // The offset within the $VkDeviceMemory$ object.
    VkSparseMemoryBindFlags flags;  // Flags that control the behavior of the $VkSparseImageMemoryBind$.
} VkSparseImageMemoryBind;
```
• memoryOffset is an offset into VkDeviceMemory object. If memory is VK_NULL_HANDLE, this value is ignored.

• flags are sparse memory binding flags.

Valid Usage

• VUID-VkSparseImageMemoryBind-memory-01104
  If the sparseResidencyAliased feature is not enabled, and if any other resources are bound to ranges of memory, the range of memory being bound must not overlap with those bound ranges

• VUID-VkSparseImageMemoryBind-memory-01105
  memory and memoryOffset must match the memory requirements of the calling command’s image, as described in section Resource Memory Association

• VUID-VkSparseImageMemoryBind-subresource-01106
  subresource must be a valid image subresource for image (see Image Views)

• VUID-VkSparseImageMemoryBind-offset-01107
  offset.x must be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of the image

• VUID-VkSparseImageMemoryBind-extent-01108
  extent.width must either be a multiple of the sparse image block width of the image, or else (extent.width + offset.x) must equal the width of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01109
  offset.y must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of the image

• VUID-VkSparseImageMemoryBind-extent-01110
  extent.height must either be a multiple of the sparse image block height of the image, or else (extent.height + offset.y) must equal the height of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01111
  offset.z must be a multiple of the sparse image block depth (VkSparseImageFormatProperties::imageGranularity.depth) of the image

• VUID-VkSparseImageMemoryBind-extent-01112
  extent.depth must either be a multiple of the sparse image block depth of the image, or else (extent.depth + offset.z) must equal the depth of the image subresource

• VUID-VkSparseImageMemoryBind-memory-02732
  If memory was created with VkExportMemoryAllocateInfo::handleTypes not equal to 0, at least one handle type it contained must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when the image was created

• VUID-VkSparseImageMemoryBind-memory-02733
  If memory was created by a memory import operation, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created
Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBind-subresource-parameter**
  
  **subresource** must be a valid **VkImageSubresource** structure.

- **VUID-VkSparseImageMemoryBind-memory-parameter**
  
  If **memory** is not **VK_NULL_HANDLE**, **memory** must be a valid **VkDeviceMemory** handle.

- **VUID-VkSparseImageMemoryBind-flags-parameter**
  
  **flags** must be a valid combination of **VkSparseMemoryBindFlagBits** values.

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,  // is the queue that the sparse binding operations will be submitted to.
    uint32_t bindInfoCount,  // is the number of elements in the pBindInfo array.
    const VkBindSparseInfo* pBindInfo,  // is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
    VkFence fence);  // is an optional handle to a fence to be signaled. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.
```

- **queue** is the queue that the sparse binding operations will be submitted to.
- **bindInfoCount** is the number of elements in the **pBindInfo** array.
- **pBindInfo** is a pointer to an array of **VkBindSparseInfo** structures, each specifying a sparse binding submission batch.
- **fence** is an **optional** handle to a fence to be signaled. If **fence** is not **VK_NULL_HANDLE**, it defines a fence signal operation.

**vkQueueBindSparse** is a queue submission command, with each batch defined by an element of **pBindInfo** as a **VkBindSparseInfo** structure. Batches begin execution in the order they appear in **pBindInfo**, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a range is to be bound to one allocation and offset and then to another allocation and offset, then the application must guarantee (usually using semaphores) that the binding operations are executed in the correct order, as well as to order binding operations against the execution of command buffer submissions.

As no operation to **vkQueueBindSparse** causes any pipeline stage to access memory, synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization chapter.

Valid Usage

- **VUID-vkQueueBindSparse-fence-01113**
  
  If **fence** is not **VK_NULL_HANDLE**, **fence** must be unsignaled.
• VUID-vkQueueBindSparse-fence-01114
   If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue command that has not yet completed execution on that queue.

• VUID-vkQueueBindSparse-pSignalSemaphores-01115
   Each element of the pSignalSemaphores member of each element of pBindInfo must be unsignaled when the semaphore signal operation it defines is executed on the device.

• VUID-vkQueueBindSparse-pWaitSemaphores-01116
   When a semaphore wait operation referring to a binary semaphore defined by any element of the pWaitSemaphores member of any element of pBindInfo executes on queue, there must be no other queues waiting on the same semaphore.

• VUID-vkQueueBindSparse-pWaitSemaphores-03245
   All elements of the pWaitSemaphores member of all elements of pBindInfo created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

Valid Usage (Implicit)

• VUID-vkQueueBindSparse-queue-parameter
   queue must be a valid VkQueue handle.

• VUID-vkQueueBindSparse-pBindInfo-parameter
   If bindInfoCount is not 0, pBindInfo must be a valid pointer to an array of bindInfoCount valid VkBindSparseInfo structures.

• VUID-vkQueueBindSparse-fence-parameter
   If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle.

• VUID-vkQueueBindSparse-queuetype
   The queue must support sparse binding operations.

• VUID-vkQueueBindSparse-commonparent
   Both of fence, and queue that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

• Host access to queue must be externally synchronized.
• Host access to fence must be externally synchronized.

Command Properties

<table>
<thead>

2689
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
} VkBindSparseInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
- `pWaitSemaphores` is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
- `bufferBindCount` is the number of sparse buffer bindings to perform in the batch.
- `pBufferBinds` is a pointer to an array of VkSparseBufferMemoryBindInfo structures.
- `imageOpaqueBindCount` is the number of opaque sparse image bindings to perform.
- `pImageOpaqueBinds` is a pointer to an array of VkSparseImageOpaqueMemoryBindInfo structures, indicating opaque sparse image bindings to perform.
- `imageBindCount` is the number of sparse image bindings to perform.
- `pImageBinds` is a pointer to an array of VkSparseImageMemoryBindInfo structures, indicating sparse image bindings to perform.
• `signalSemaphoreCount` is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.

• `pSignalSemaphores` is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

---

**Valid Usage**

• [VUID-VkBindSparseInfo-pWaitSemaphores-03246](#)
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure.

• [VUID-VkBindSparseInfo-pNext-03247](#)
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`.

• [VUID-VkBindSparseInfo-pNext-03248](#)
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`.

• [VUID-VkBindSparseInfo-pSignalSemaphores-03249](#)
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed.

• [VUID-VkBindSparseInfo-pWaitSemaphores-03250](#)
  For each element of `pWaitSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`.

• [VUID-VkBindSparseInfo-pSignalSemaphores-03251](#)
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than `maxTimelineSemaphoreValueDifference`. 
Valid Usage (Implicit)

- VUID-VkBindSparseInfo-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_BIND_SPARSE_INFO

- VUID-VkBindSparseInfo-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupBindSparseInfo or VkTimelineSemaphoreSubmitInfo

- VUID-VkBindSparseInfo-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBindSparseInfo-pWaitSemaphores-parameter
  
  If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- VUID-VkBindSparseInfo-pBufferBinds-parameter
  
  If bufferBindCount is not 0, pBufferBinds must be a valid pointer to an array of bufferBindCount valid VkSparseBufferMemoryBindInfo structures

- VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
  
  If imageOpaqueBindCount is not 0, pImageOpaqueBinds must be a valid pointer to an array of imageOpaqueBindCount valid VkSparseImageOpaqueMemoryBindInfo structures

- VUID-VkBindSparseInfo-pImageBinds-parameter
  
  If imageBindCount is not 0, pImageBinds must be a valid pointer to an array of imageBindCount valid VkSparseImageMemoryBindInfo structures

- VUID-VkBindSparseInfo-pSignalSemaphores-parameter
  
  If signalSemaphoreCount is not 0, pSignalSemaphores must be a valid pointer to an array of signalSemaphoreCount valid VkSemaphore handles

- VUID-VkBindSparseInfo-commonparent
  
  Both of the elements of pSignalSemaphores, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To specify the values to use when waiting for and signaling semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The VkDeviceGroupBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType    sType;
    const void*        pNext;
};
```
uint32_t resourceDeviceIndex;
uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;

or the equivalent

// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• resourceDeviceIndex is a device index indicating which instance of the resource is bound.
• memoryDeviceIndex is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the resourceDeviceIndex.

If this structure is not present, resourceDeviceIndex and memoryDeviceIndex are assumed to be zero.

Valid Usage

• VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118 resourceDeviceIndex and memoryDeviceIndex must both be valid device indices
• VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119 Each memory allocation bound in this batch must have allocated an instance for memoryDeviceIndex

Valid Usage (Implicit)

• VUID-VkDeviceGroupBindSparseInfo-sType-sType sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_BIND_SPARSE_INFO
Chapter 34. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

34.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- #define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

34.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```c
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap `VkSurfaceKHR` objects.

### 34.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

**Note**

In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`'s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain’s `imageExtent` does not match the surface’s `currentExtent`, the presentable images will be scaled to the surface’s dimensions during presentation. `minImageExtent` is `(1,1)`, and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer’s preferred size).

### Valid Usage (Implicit)

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter instance must be a valid `VkInstance` handle
• VUID-vkCreateAndroidSurfaceKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAndroidSurfaceCreateInfoKHR structure

• VUID-vkCreateAndroidSurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAndroidSurfaceKHR-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

---

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

---

The `VkAndroidSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_android_surface
typedef struct VkAndroidSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAndroidSurfaceCreateFlagsKHR flags;
  struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **window** is a pointer to the ANativeWindow to associate the surface with.

---

**Valid Usage**

• VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  window must point to a valid Android ANativeWindow

---

**Valid Usage (Implicit)**

• VUID-VkAndroidSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ANDROID_SURFACE_CREATE_INFO_KHR
To remove an unnecessary compile time dependency, an incomplete type definition of `ANativeWindow` is provided in the Vulkan headers:

```cpp
// Provided by VK_KHR_android_surface
define ANativeWindow;
```

The actual `ANativeWindow` type is defined in Android NDK headers.

```cpp
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

`VkAndroidSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.2. Wayland Platform

To create a `VkSurfaceKHR` object for a Wayland surface, call:

```cpp
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance, 
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkWaylandSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  `instance` must be a valid `VkInstance` handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkWaylandSurfaceCreateInfoKHR` structure
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle.

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
typedef struct VkWaylandSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWaylandSurfaceCreateFlagsKHR flags;
    struct wl_display* display;
    struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the surface with.

Valid Usage

- `display` must point to a valid Wayland `wl_display`
- `surface` must point to a valid Wayland `wl_surface`

Valid Usage (Implicit)

- `sType` is a `VkStructureType` value identifying this structure.
sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain's imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each. The wl_surface.attach, wl_surface.damage, and wl_surface.commit requests must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR.

```c
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;
```

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```c
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* surface
);
```
const VkAllocationCallbacks* pAllocator,
VkSurfaceKHR* pSurface);

- **instance** is the instance to associate the surface with.

- **pCreateInfo** is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.

- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

- **pSurface** is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter
  - **instance** must be a valid VkInstance handle

- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter
  - **pCreateInfo** must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure

- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter
  - If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter
  - **pSurface** must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The VkWin32SurfaceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_win32_surface
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `hinstance` is the Win32 `HINSTANCE` for the window to associate the surface with.
• `hwnd` is the Win32 `HWND` for the window to associate the surface with.

### Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  
  `hinstance` **must** be a valid Win32 `HINSTANCE`

- VUID-VkWin32SurfaceCreateInfoKHR-hwnd-01308
  
  `hwnd` **must** be a valid Win32 `HWND`

### Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

- VUID-VkWin32SurfaceCreateInfoKHR-pNext-pNext
  
  `pNext` **must** be `NULL`

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  
  `flags` **must** be `0`

With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` **must** always equal the window size.

The `currentExtent` of a Win32 surface **must** have both width and height greater than 0, or both of them 0.

### Note

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become `(0, 0)` on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.
34.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,       // instance is the instance to associate the surface with.
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,  // pCreateInfo is a pointer to a VkXcbSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
    const VkAllocationCallbacks* pAllocator,       // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR* pSurface);                   // pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- `VUID-vkCreateXcbSurfaceKHR-instance-parameter` instance must be a valid `VkInstance` handle
- `VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter` `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- `VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter` If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateXcbSurfaceKHR-pSurface-parameter` `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
```
VkStructureType sType;
const void* pNext;
VkXcbSurfaceCreateFlagsKHR flags;
xcb_connection_t* connection;
xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;

• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **connection** is a pointer to an xcb_connection_t to the X server.
• **window** is the xcb_window_t for the X11 window to associate the surface with.

### Valid Usage

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection must point to a valid X11 xcb_connection_t
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window must be a valid X11 xcb_window_t

### Valid Usage (Implicit)

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR
- VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be 0

With Xcb, [minImageExtent](#), [maxImageExtent](#), and [currentExtent](#) must always equal the window size.

The **currentExtent** of an Xcb surface must have both **width** and **height** greater than 0, or both of them 0.

### Note

Due to above restrictions, unless [VkSwapchainPresentScalingCreateInfoEXT](#) is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with [imageExtent](#) being equal to the current size of the window, as reported in [VkSurfaceCapabilitiesKHR::currentExtent](#).

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.
Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

```c
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

VkXcbSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.5. Xlib Platform

To create a VkSurfaceKHR object for an X11 window, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(
    VkInstance instance,
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkXlibSurfaceCreateInfoKHR structure containing the parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateXlibSurfaceKHR-instance-parameter `instance` must be a valid VkInstance handle
- VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid VkXlibSurfaceCreateInfoKHR structure
- VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateXlibSurfaceKHR-pSurface-parameter
  
  *pSurface* must be a valid pointer to a *VkSurfaceKHR* handle

### Return Codes

**Success**
- *VK_SUCCESS*

**Failure**
- *VK_ERROR_OUT_OF_HOST_MEMORY*
- *VK_ERROR_OUT_OF_DEVICE_MEMORY*

The *VkXlibSurfaceCreateInfoKHR* structure is defined as:

```c
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display* dpy;
    Window window;
} VkXlibSurfaceCreateInfoKHR;
```

- *sType* is a *VkStructureType* value identifying this structure.
- *pNext* is `NULL` or a pointer to a structure extending this structure.
- *flags* is reserved for future use.
- *dpy* is a pointer to an Xlib *Display* connection to the X server.
- *window* is an Xlib *Window* to associate the surface with.

### Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  
  *dpy* must point to a valid Xlib *Display*

- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  
  *window* must be a valid Xlib *Window*

### Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  
  *sType* must be *VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR*

- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  
  *pNext* must be `NULL`
flags must be 0

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xlib surface must have both width and height greater than 0, or both of them 0.

**Note**
Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified Xlib Display connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call `XInitThreads()` before calling any other Xlib functions.

```c
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;

VkXlibSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.6. DirectFB Platform

To create a `VkSurfaceKHR` object for a DirectFB surface, call:

```c
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance instance,
    const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
```
• `instance` is the instance to associate the surface with.

• `pCreateInfo` is a pointer to a `VkDirectFBSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.

• `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

• VUID-vkCreateDirectFBSurfaceEXT-instance-parameter
  `instance` must be a valid `VkInstance` handle

• VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDirectFBSurfaceCreateInfoEXT` structure

• VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success
• `VK_SUCCESS`

Failure
• `VK_ERROR_OUT_OF_HOST_MEMORY`
• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDirectFBSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkDirectFBSurfaceCreateFlagsEXT flags;
  IDirectFB* dfb;
  IDirectFBSurface* surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.
• `surface` is a pointer to a `IDirectFBSurface` surface interface.

### Valid Usage

- VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
  
  `dfb` must point to a valid DirectFB `IDirectFB`

- VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
  
  `surface` must point to a valid DirectFB `IDirectFBSurface`

### Valid Usage (Implicit)

- VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT`

- VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zerobitmask
  
  `flags` must be `0`

With DirectFB, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the surface size.

```c
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
```

`VkDirectFBSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.7. Fuchsia Platform

To create a `VkSurfaceKHR` object for a Fuchsia ImagePipe, call:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult vkCreateImagePipeSurfaceFUCHSIA(
    VkInstance instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate with the surface.
• **pCreateInfo** is a pointer to a *VkImagePipeSurfaceCreateInfoFUCHSIA* structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a *VkSurfaceKHR* handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter
  
  *instance* must be a valid *VkInstance* handle

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter
  
  *pCreateInfo* must be a valid pointer to a valid *VkImagePipeSurfaceCreateInfoFUCHSIA* structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter
  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure

- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter
  
  *pSurface* must be a valid pointer to a *VkSurfaceKHR* handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The *VkImagePipeSurfaceCreateInfoFUCHSIA* structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **imagePipeHandle** is a *zx_handle_t* referring to the ImagePipe to associate with the surface.
Valid Usage

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  `imagePipeHandle` must be a valid `zx_handle_t`

Valid Usage (Implicit)

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA`

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
  `flags` must be `0`

On Fuchsia, the surface `currentExtent` is the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;
```

`VkImagePipeSurfaceCreateFlagsFUCHSIA` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.8. Google Games Platform

To create a `VkSurfaceKHR` object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate with the surface.
- `pCreateInfo` is a pointer to a `VkStreamDescriptorSurfaceCreateInfoGGP` structure containing parameters that affect the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- streamDescriptor is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.

Valid Usage

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681
streamDescriptor must be a valid GgpStreamDescriptor

**Valid Usage (Implicit)**

- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext
  pNext must be NULL
- VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The \textit{minImageExtent} will never be greater than 1080p and the \textit{maxImageExtent} will never be less than 1080p. The \textit{currentExtent} will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain’s \textit{imageExtent}, within the bounds of the surface. Using the surface’s \textit{currentExtent} will offer the best performance and quality. When a swapchain’s \textit{imageExtent} does not match the surface’s \textit{currentExtent}, the presentable images are scaled to the surface’s dimensions during presentation if possible and \texttt{VK_SUBOPTIMAL_KHR} is returned, otherwise presentation fails with \texttt{VK_ERROR_OUT_OF_DATE_KHR}.

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;
```

\texttt{VkStreamDescriptorSurfaceCreateFlagsGGP} is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.9. iOS Platform

To create a \texttt{VkSurfaceKHR} object for an iOS \texttt{UIView} or \texttt{CAMetalLayer}, call:

```c
// Provided by VK_MVK_ios_surface
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

\textbf{Note}

The \texttt{vkCreateIOSSurfaceMVK} function is considered deprecated and has been superseded by \texttt{vkCreateMetalSurfaceEXT} from the \texttt{VK_EXT_metal_surface} extension.

- \texttt{instance} is the instance with which to associate the surface.
• **pCreateInfo** is a pointer to a `VkIOSSurfaceCreateInfoMVK` structure containing parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see **Memory Allocation**).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

---

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter  
  *instance* must be a valid `VkInstance` handle

- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter  
  *pCreateInfo* must be a valid pointer to a valid `VkIOSSurfaceCreateInfoMVK` structure

- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter  
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter  
  *pSurface* must be a valid pointer to a `VkSurfaceKHR` handle

---

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR**

---

The **VkIOSSurfaceCreateInfoMVK** structure is defined as:

```
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkIOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **pView** is a reference to either a **CAMetalLayer** object or a **UIView** object.
Valid Usage

- VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
  If `pView` is a CAMetalLayer object, it must be a valid CAMetalLayer

- VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
  If `pView` is a UIView object, it must be a valid UIView, must be backed by a CALayer object of type CAMetalLayer, and `vkCreateIOSSurfaceMVK` must be called on the main thread

Valid Usage (Implicit)

- VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK

- VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` must be NULL

- VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` must be 0

```c
// Provided by VK_MVK_ios_surface
typedef VkFlags VkIOSSurfaceCreateFlagsMVK;
```

VkIOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.10. macOS Platform

To create a VkSurfaceKHR object for a macOS NSView or CAMetalLayer, call:

```c
// Provided by VK_MVK_macos_surface
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

**Note**

The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the VK_EXT_metal_surface extension.

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkMacOSSurfaceCreateInfoMVK structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is
no more specific allocator available (see Memory Allocation).

- \textit{pSurface} is a pointer to a \textit{VkSurfaceKHR} handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateMacOSSurfaceMVK-instance-parameter \textit{instance} \textbf{must} be a valid \textit{VkInstance} handle
- VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter \textit{pCreateInfo} \textbf{must} be a valid pointer to a valid \textit{VkMacOSSurfaceCreateInfoMVK} structure
- VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter If \textit{pAllocator} is not NULL, \textbf{pAllocator must} be a valid pointer to a valid \textit{VkAllocationCallbacks} structure
- VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter \textit{pSurface} \textbf{must} be a valid pointer to a \textit{VkSurfaceKHR} handle

### Return Codes

#### Success
- VK_SUCCESS

#### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The \textit{VkMacOSSurfaceCreateInfoMVK} structure is defined as:

```c
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;
```

- \textit{sType} is a \textit{VkStructureType} value identifying this structure.
- \textit{pNext} is \textbf{NULL} or a pointer to a structure extending this structure.
- \textit{flags} is reserved for future use.
- \textit{pView} is a reference to either a \textit{CAMetalLayer} object or an \textit{NSView} object.
Valid Usage

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If \( pView \) is a \texttt{CAMetalLayer} object, it \textbf{must} be a valid \texttt{CAMetalLayer}

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If \( pView \) is an \texttt{NSView} object, it \textbf{must} be a valid \texttt{NSView}, \textbf{must} be backed by a \texttt{CALayer} object of type \texttt{CAMetalLayer}, and \texttt{vkCreateMacOSSurfaceMVK} \textbf{must} be called on the main thread

Valid Usage (Implicit)

• VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK}

• VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  \texttt{pNext} \textbf{must} be \texttt{NULL}

• VUID-VkMacOSSurfaceCreateInfoMVK-flags-zerobitmask
  \texttt{flags} \textbf{must} be \textbf{0}

// Provided by VK_MVK_macos_surface

typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;

\texttt{VkMacOSSurfaceCreateFlagsMVK} is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.11. VI Platform

To create a \texttt{VkSurfaceKHR} object for an \texttt{nn::vi::Layer}, query the layer's native handle using \texttt{nn::vi::GetNativeWindow}, and then call:

// Provided by VK_NN_vi_surface

\texttt{VkResult \_vkCreateViSurfaceNN(}
  \texttt{VkInstance instance,}
  \texttt{const VkViSurfaceCreateInfoNN\* pCreateInfo,}
  \texttt{const VkAllocationCallbacks\* pAllocator,}
  \texttt{VkSurfaceKHR\* pSurface);}

• \texttt{instance} is the instance with which to associate the surface.

• \texttt{pCreateInfo} is a pointer to a \texttt{VkViSurfaceCreateInfoNN} structure containing parameters affecting the creation of the surface object.

• \texttt{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• \texttt{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.
During the lifetime of a surface created using a particular `nn::vi::NativeWindowHandle`, applications **must** not attempt to create another surface for the same `nn::vi::Layer` or attempt to connect to the same `nn::vi::Layer` through other platform mechanisms.

If the native window is created with a specified size, `currentExtent` will reflect that size. In this case, applications should use the same size for the swapchain's `imageExtent`. Otherwise, the `currentExtent` will have the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that applications are expected to choose an appropriate size for the swapchain's `imageExtent` (e.g., by matching the result of a call to `nn::vi::GetDisplayResolution`).

---

Valid Usage (Implicit)

- VUID-vkCreateViSurfaceNN-instance-parameter
  `instance` **must** be a valid `VkInstance` handle

- VUID-vkCreateViSurfaceNN-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid `VkViSurfaceCreateInfoNN` structure

- VUID-vkCreateViSurfaceNN-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateViSurfaceNN-pSurface-parameter
  `pSurface` **must** be a valid pointer to a `VkSurfaceKHR` handle

---

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

---

The `VkViSurfaceCreateInfoNN` structure is defined as:

```c
typedef struct VkViSurfaceCreateInfoNN {
    VkStructureType sType;
    const void* pNext;
    VkViSurfaceCreateFlagsNN flags;
    void* window;
} VkViSurfaceCreateInfoNN;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is reserved for future use.

• `window` is the `nn::vi::NativeWindowHandle` for the `nn::vi::Layer` with which to associate the surface.

### Valid Usage

- **VUID-VkViSurfaceCreateInfoNN-window-01318**
  
  `window` must be a valid `nn::vi::NativeWindowHandle`

### Valid Usage (Implicit)

- **VUID-VkViSurfaceCreateInfoNN-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN`

- **VUID-VkViSurfaceCreateInfoNN-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask**
  
  `flags` must be `0`

```
// Provided by VK_NN_vi_surface
typedef VkFlags VkViSurfaceCreateFlagsNN;
```

`VkViSurfaceCreateFlagsNN` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.12. Metal Platform

To create a `VkSurfaceKHR` object for a `CAMetalLayer`, call:

```
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
  VkInstance instance,
  const VkMetalSurfaceCreateInfoEXT* pCreateInfo,
  const VkAllocationCallbacks* pAllocator,
  VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.

- `pCreateInfo` is a pointer to a `VkMetalSurfaceCreateInfoEXT` structure specifying parameters affecting the creation of the surface object.

- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  `instance` must be a valid `VkInstance` handle

- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkMetalSurfaceCreateInfoEXT` structure

- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_NATIVE_WINDOW_IN_USE_KHR`

The `VkMetalSurfaceCreateInfoEXT` structure is defined as:

```c
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pLayer` is a reference to a `CAMetalLayer` object representing a renderable surface.

Valid Usage (Implicit)

- VUID-VkMetalSurfaceCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
To remove an unnecessary compile time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_surface
#ifdef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```c
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```

`VkMetalSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.13. QNX Screen Platform

To create a `VkSurfaceKHR` object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance           instance,           
    const VkScreenSurfaceCreateInfoQNX* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator, 
    VkSurfaceKHR*        pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateScreenSurfaceQNX-instance-parameter
instance must be a valid VkInstance handle

- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkScreenSurfaceCreateInfoQNX structure

- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

## Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkScreenSurfaceCreateInfoQNX structure is defined as:

```c
// Provided by VK_QNX_screen_surface
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType       sType;
    const void*           pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context* context;
    struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **context** and **window** are QNX Screen context and window to associate the surface with.

## Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  context must point to a valid QNX Screen struct _screen_context

- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  window must point to a valid QNX Screen struct _screen_window
Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX

- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  
  pNext must be NULL

- VUID-VkScreenSurfaceCreateInfoQNX-flags-zero bitmask
  
  flags must be 0

```
// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;
```

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.14. Platform-Independent Information

Once created, VkSurfaceKHR objects can be used in this and other extensions, in particular the VK_KHR_swapchain extension.

Several WSI functions return VK_ERROR_SURFACE_LOST_KHR if the surface becomes no longer available. After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance instance,
    VkSurfaceKHR surface,
    const VkAllocationCallbacks* pAllocator);
```

- instance is the instance used to create the surface.
- surface is the surface to destroy.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.
Valid Usage

- VUID-vkDestroySurfaceKHR-surface-01266
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface

- VUID-vkDestroySurfaceKHR-surface-01267
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySurfaceKHR-surface-01268
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroySurfaceKHR-instance-parameter
  instance must be a valid VkInstance handle

- VUID-vkDestroySurfaceKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkDestroySurfaceKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySurfaceKHR-surface-parent
  If surface is a valid handle, it must have been created, allocated, or retrieved from instance

Host Synchronization

- Host access to surface must be externally synchronized

34.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

34.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
```
Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount VkDisplayPropertiesKHR` structures

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
The `VkDisplayPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- `display` is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- `displayName` is `NULL` or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If `NULL`, no suitable name is available. If not `NULL`, the string pointed to must remain accessible and unmodified as long as `display` is valid.

- `physicalDimensions` describes the physical width and height of the visible portion of the display, in millimeters.

- `physicalResolution` describes the physical, native, or preferred resolution of the display.

  **Note**
  
  For devices which have no natural value to return here, implementations should return the maximum resolution supported.

- `supportedTransforms` is a bitmask of `VkSurfaceTransformFlagBitsKHR` describing which transforms are supported by this display.

- `planeReorderPossible` tells whether the planes on this display can have their z order changed. If this is `VK_TRUE`, the application can re-arrange the planes on this display in any order relative to each other.

- `persistentContent` tells whether the display supports self-refresh/internal buffering. If this is true, the application can submit persistent present operations on swapchains created against this display.

  **Note**
  
  Persistent presents may have higher latency, and may use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
```
VkPhysicalDevice
uint32_t*
VkDisplayProperties2KHR*

• **physicalDevice** is a physical device.
• **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.
• **pProperties** is either NULL or a pointer to an array of VkDisplayProperties2KHR structures.

vkGetPhysicalDeviceDisplayProperties2KHR behaves similarly to vkGetPhysicalDeviceDisplayPropertiesKHR, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter **physicalDevice** must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter **pPropertyCount** must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not NULL, **pProperties** must be a valid pointer to an array of pPropertyCount VkDisplayProperties2KHR structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

• **sType** is a VkStructureType value identifying this structure.
pNext is NULL or a pointer to a structure extending this structure.

displayProperties is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR

- VUID-VkDisplayProperties2KHR-pNext-pNext
  pNext must be NULL

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    VkDisplayKHR display);
```

- physicalDevice The physical device the display is on.
- dpy A connection to the X11 server that currently owns display.
- display The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with physicalDevice until the display is released or the X11 connection specified by dpy is terminated. Permission to access the display may be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to display. During such periods, operations which require access to the display must fail with an appropriate error code. If the X11 server associated with dpy does not own display, or if permission to access it has already been acquired by another entity, the call must return the error code VK_ERROR_INITIALIZATION_FAILED.

Note

One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

Valid Usage (Implicit)

- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkAcquireXlibDisplayEXT-dpy-parameter
dpy must be a valid pointer to a Display value

• VUID-vkAcquireXlibDisplayEXT-display-parameter
display must be a valid VkDisplayKHR handle

• VUID-vkAcquireXlibDisplayEXT-display-parent
display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_INITIALIZATION_FAILED

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle. To determine the VkDisplayKHR handle corresponding to an X11 RandR Output, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    RROutput rrOutput,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device to query the display handle on.
- **dpy** A connection to the X11 server from which rrOutput was queried.
- **rrOutput** An X11 RandR output ID.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to rrOutput on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

• VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetRandROutputDisplayEXT-dpy-parameter
  dpy must be a valid pointer to a Display value

• VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter
  pDisplay must be a valid pointer to a VkDisplayKHR handle
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with `physicalDevice` until the display is released or the application is terminated. Permission to access the display may be revoked by events that cause Windows 10 itself to lose access to `display`. If this has happened, operations which require access to the display must fail with an appropriate error code. If permission to access `display` has already been acquired by another entity, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Note**
The Vulkan instance acquires control of a “winrt::Windows::Devices::Display::Core::DisplayTarget” by performing an operation equivalent to “winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()” on the “DisplayTarget”.

**Note**
One example of when Windows 10 loses access to a display is when the display is hot-unplugged.

**Note**
One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. `vkAcquireWinrtDisplayNV` does not itself cause DWM to release a display; this action must be performed outside of Vulkan.
Valid Usage (Implicit)

- VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkAcquireWinrtDisplayNV-display-parameter
  display must be a valid VkDisplayKHR handle

- VUID-vkAcquireWinrtDisplayNV-display-parent
  display must have been created, allocated, or retrieved from physicalDevice

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a VkDisplayKHR handle.

To determine the VkDisplayKHR handle corresponding to a “winrt::Windows::Devices::Display::Core::DisplayTarget”, call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device on which to query the display handle.
- **deviceRelativeId** The value of the “AdapterRelativeId” property of a “DisplayTarget” that is enumerated by a “DisplayAdapter” with an “Id” property matching the deviceUID property of a VkPhysicalDeviceIDProperties for physicalDevice.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to deviceRelativeId on physicalDevice, VK_NULL_HANDLE must be returned in pDisplay.

Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter
**physicalDevice** must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetWinrtDisplayNV-pDisplay-parameter
  pDisplay` must be a valid pointer to a `VkDisplayKHR` handle

---

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_INITIALIZATION_FAILED`

---

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **drmFd** DRM primary file descriptor.
- **display** The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

---

### Valid Usage (Implicit)

- `VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter
  physicalDevice must be a valid `VkPhysicalDevice` handle`

- `VUID-vkAcquireDrmDisplayEXT-display-parameter
  display must be a valid `VkDisplayKHR` handle`
Before acquiring a display from the DRM interface, the caller may want to select a specific \texttt{VkDisplayKHR} handle by identifying it using a \texttt{connectorId}. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    uint32_t connectorId,
    VkDisplayKHR* display);
```

- \texttt{physicalDevice} The physical device to query the display from.
- \texttt{drmFd} DRM primary file descriptor.
- \texttt{connectorId} Identifier of the specified DRM connector.
- \texttt{display} The corresponding \texttt{VkDisplayKHR} handle will be returned here.

If there is no \texttt{VkDisplayKHR} corresponding to the \texttt{connectorId} on the \texttt{physicalDevice}, the returning \texttt{display} must be set to \texttt{VK_NULL_HANDLE}. The provided \texttt{drmFd} must correspond to the one owned by the \texttt{physicalDevice}. If not, the error code \texttt{VK_ERROR_UNKNOWN} must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given \texttt{connectorId} must be a resource owned by the provided \texttt{drmFd}. If not, the error code \texttt{VK_ERROR_UNKNOWN} must be returned. If any error is encountered during the identification of the display, the call must return the error code \texttt{VK_ERROR_INITIALIZATION_FAILED}.

### Valid Usage (Implicit)

- \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- \texttt{display} must be a valid pointer to a \texttt{VkDisplayKHR} handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display to release control of.

Valid Usage (Implicit)

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter **physicalDevice** must be a valid VkPhysicalDevice handle
- VUID-vkReleaseDisplayEXT-display-parameter **display** must be a valid VkDisplayKHR handle
- VUID-vkReleaseDisplayEXT-display-parent **display** must have been created, allocated, or retrieved from physicalDevice

Return Codes

**Success**
- VK_SUCCESS

Display Planes

Images are presented to individual planes on a display. Devices **must** support at least one plane on each display. Planes **can** be stacked and blended to composite multiple images on one display. Devices **may** support only a fixed stacking order and fixed mapping between planes and displays, or they **may** allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
```
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPlanePropertiesKHR* pProperties);

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlanePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display planes available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display planes for `physicalDevice`, at most `pPropertyCount` structures will be written.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlanePropertiesKHR` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlanePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```
 VkDisplayPlanePropertiesKHR;

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be `VK_NULL_HANDLE`.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device's display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pPropertyCount, 
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayPlaneProperties2KHR` structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle.
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value.
- `VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayPlaneProperties2KHR` structures.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
The `VkDisplayPlaneProperties2KHR` structure is defined as:

```c
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPlaneProperties` is a `VkDisplayPlanePropertiesKHR` structure.

### Valid Usage (Implicit)

- `VUID-VkDisplayPlaneProperties2KHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR`
- `VUID-VkDisplayPlaneProperties2KHR-pNext-pNext` `pNext` must be `NULL`

To determine which displays a plane is usable with, call

```c
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,  // Provided by VK_KHR_display
    uint32_t planeIndex,              // The plane which the application wishes to use, and must be in the range [0, physical device plane count - 1].
    uint32_t* pDisplayCount,          // A pointer to an integer related to the number of displays available or queried, as described below.
    VkDisplayKHR* pDisplays           // Either NULL or a pointer to an array of VkDisplayKHR handles.
);
```

- `physicalDevice` is a physical device.
- `planeIndex` is the plane which the application wishes to use, and `must` be in the range `[0, physical device plane count - 1]`.
- `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
- `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` must point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount`
handles will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available pairs were returned.

### Valid Usage

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249}
  - \texttt{planeIndex must} be less than the number of display planes supported by the device as determined by calling \texttt{vkGetPhysicalDeviceDisplayPlanePropertiesKHR}

### Valid Usage (Implicit)

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter}
  - \texttt{physicalDevice must} be a valid \texttt{VkPhysicalDevice} handle

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter}
  - \texttt{pDisplayCount must} be a valid pointer to a \texttt{uint32_t} value

- \texttt{VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter}
  - If the value referenced by \texttt{pDisplayCount is not 0, and pDisplays is not NULL, pDisplays must}
    - \texttt{be a valid pointer to an array of pDisplayCount VkDisplayKHR handles}

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

Additional properties of displays are queried using specialized query functions.

### Display Modes

Display modes are represented by \texttt{VkDisplayModeKHR} handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR()
```
**VkPhysicalDevice**
**VkDisplayKHR**
`uint32_t*`
**VkDisplayModePropertiesKHR**

- **physicalDevice** is the physical device associated with **display**.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModePropertiesKHR** structures.

If **pProperties** is **NULL**, then the number of display modes available on the specified **display** for **physicalDevice** is returned in **pPropertyCount**. Otherwise, **pPropertyCount** must point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of structures actually written to **pProperties**. If the value of **pPropertyCount** is less than the number of display modes for **physicalDevice**, at most **pPropertyCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available display modes were returned.

### Valid Usage (Implicit)
- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter
  **display** must be a valid **VkDisplayKHR** handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter
  **pPropertyCount** must be a valid pointer to a **uint32_t** value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
  If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModePropertiesKHR** structures
- VUID-vkGetDisplayModePropertiesKHR-display-parent
  **display** must have been created, allocated, or retrieved from **physicalDevice**

### Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
The VkDisplayModePropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

- **displayMode** is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
- **parameters** is a VkDisplayModeParametersKHR structure describing the display parameters associated with displayMode.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

VkDisplayModeCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(  
    VkPhysicalDevice physicalDevice,  
    VkDisplayKHR display,  
    uint32_t* pPropertyCount,  
    VkDisplayModeProperties2KHR* pProperties);
```

- **physicalDevice** is the physical device associated with display.
- **display** is the display to query.
- **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkDisplayModeProperties2KHR structures.

vkGetDisplayModeProperties2KHR behaves similarly to vkGetDisplayModePropertiesKHR, with the ability to return extended information via chained output structures.

---

**Valid Usage (Implicit)**

- **VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter**
  physicalDevice must be a valid VkPhysicalDevice handle
- **VUID-vkGetDisplayModeProperties2KHR-display-parameter**
  display must be a valid VkDisplayKHR handle
- **VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter**
pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayModeProperties2KHR structures

- VUID-vkGetDisplayModeProperties2KHR-display-parent
display must have been created, allocated, or retrieved from physicalDevice

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayModeProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- displayModeProperties is a VkDisplayModePropertiesKHR structure.

**Valid Usage (Implicit)**

- VUID-VkDisplayModeProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  pNext must be NULL

The VkDisplayModeParametersKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
```
VkExtent2D visibleRegion;
uint32_t refreshRate;
} VkDisplayModeParametersKHR;

• **visibleRegion** is the 2D extents of the visible region.
• **refreshRate** is a **uint32_t** that is the number of times the display is refreshed each second multiplied by 1000.

**Note**
For example, a 60Hz display mode would report a **refreshRate** of 60,000.

**Valid Usage**

- VUID-VkDisplayModeParametersKHR-width-01990
  The **width** member of **visibleRegion** must be greater than 0
- VUID-VkDisplayModeParametersKHR-height-01991
  The **height** member of **visibleRegion** must be greater than 0
- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  **refreshRate** must be greater than 0

Additional modes **may** also be created by calling:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,  // physicalDevice is the physical device associated with display.
    VkDisplayKHR display,             // display is the display to create an additional mode for.
    const VkDisplayModeCreateInfoKHR* pCreateInfo, // pCreateInfo is a pointer to a VkDisplayModeCreateInfoKHR structure describing the new mode to create.
    const VkAllocationCallbacks* pAllocator,   // pAllocator is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
    VkDisplayModeKHR* pMode)               // pMode is a pointer to a VkDisplayModeKHR handle in which the mode created is returned.
```

**Valid Usage (Implicit)**

- VUID-vkCreateDisplayModeKHR-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle
• VUID-vkCreateDisplayModeKHR-display-parameter
display must be a valid VkDisplayKHR handle

• VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter
pCreateInfo must be a valid pointer to a valid VkDisplayModeCreateInfoKHR structure

• VUID-vkCreateDisplayModeKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateDisplayModeKHR-pMode-parameter
pMode must be a valid pointer to a VkDisplayModeKHR handle

• VUID-vkCreateDisplayModeKHR-display-parent
display must have been created, allocated, or retrieved from physicalDevice

**Host Synchronization**

• Host access to display must be externally synchronized

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_INITIALIZATION_FAILED

The VkDisplayModeCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is reserved for future use, and must be zero.

• parameters is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display,
the implementation must return VK_ERROR_INITIALIZATION_FAILED.

Valid Usage (Implicit)

- VUID-VkDisplayModeCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR

- VUID-VkDisplayModeCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkDisplayModeCreateInfoKHR-parameters-parameter
  parameters must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- physicalDevice is the physical device associated with the display specified by mode
- mode is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- planeIndex is the plane which the application intends to use with the display, and is less than the number of display planes supported by the device.
- pCapabilities is a pointer to a VkDisplayPlaneCapabilitiesKHR structure in which the capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter
  mode must be a valid VkDisplayModeKHR handle

- VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter
  pCapabilities must be a valid pointer to a VkDisplayPlaneCapabilitiesKHR structure
Host Synchronization

- Host access to mode must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```

- **supportedAlpha** is a bitmask of `VkDisplayPlaneAlphaFlagBitsKHR` describing the supported alpha blending modes.
- **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.
- **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The x and y components of `maxSrcPosition` must each be greater than or equal to the x and y components of `minSrcPosition`, respectively.
- **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.
- **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.
- **minDstPosition, maxDstPosition, minDstExtent, maxDstExtent** all have similar semantics to their corresponding *Src* equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the *Src* offsets, `minDstPosition` and `maxDstPosition` may contain negative values.
The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain’s presentable images on the specified display plane. This is expressed by returning `minSrcPosition`, `maxSrcPosition`, `minSrcExtent`, and `maxSrcExtent` values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images’ content to a subset or superset of the visible region in the specified display mode. This is expressed by returning `minDstPosition`, `maxDstPosition`, `minDstExtent`, and `maxDstExtent` values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for `minSrcPosition`, `maxSrcPosition`, `minDstPosition`, and `maxDstPosition`, and (display mode width, display mode height) for `minSrcExtent`, `maxSrcExtent`, `minDstExtent`, and `maxDstExtent`.

The value `supportedAlpha` must contain at least one valid `VkDisplayPlaneAlphaFlagBitsKHR` bit.

These values indicate the limits of the implementation’s individual fields. Not all combinations of values within the offset and extent ranges returned in `VkDisplayPlaneCapabilitiesKHR` are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
    VkDisplayPlaneCapabilities2KHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with `pDisplayPlaneInfo`.
- `pDisplayPlaneInfo` is a pointer to a `VkDisplayPlaneInfo2KHR` structure describing the plane and mode.
- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilities2KHR` structure in which the capabilities are returned.

`vkGetDisplayPlaneCapabilities2KHR` behaves similarly to `vkGetDisplayPlaneCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

**Valid Usage (Implicit)**

- VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneInfo2KHR` structure is defined as:

```
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `mode` is the display mode the application intends to program when using the specified plane.

**Note**
This parameter also implicitly specifies a display.

- `planeIndex` is the plane which the application intends to use with the display.

The members of `VkDisplayPlaneInfo2KHR` correspond to the arguments to `vkGetDisplayPlaneCapabilitiesKHR`, with `sType` and `pNext` added for extensibility.

**Valid Usage (Implicit)**

- `VUID-VkDisplayPlaneInfo2KHR-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR`

- `VUID-VkDisplayPlaneInfo2KHR-pNext-pNext` 
  `pNext` must be `NULL`

- `VUID-VkDisplayPlaneInfo2KHR-mode-parameter`
mode must be a valid VkDisplayModeKHR handle

Host Synchronization

- Host access to mode must be externally synchronized.

The VkDisplayPlaneCapabilities2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- capabilities is a VkDisplayPlaneCapabilitiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayPlaneCapabilities2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR
- VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext
  pNext must be NULL

34.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device,
    VkDisplayKHR display,
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- device is a logical device associated with display.
- display is the display whose power state is modified.
- pDisplayPowerInfo is a pointer to a VkDisplayPowerInfoEXT structure specifying the new power state of display.
Valid Usage (Implicit)

• VUID-vkDisplayPowerControlEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkDisplayPowerControlEXT-display-parameter
display must be a valid VkDisplayKHR handle

• VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
pDisplayPowerInfo must be a valid pointer to a valid VkDisplayPowerInfoEXT structure

• VUID-vkDisplayPowerControlEXT-commonparent
Both of device, and display must have been created, allocated, or retrieved from the same VkPhysicalDevice

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkDisplayPowerInfoEXT structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• powerState is a VkDisplayPowerStateEXT value specifying the new power state of the display.

Valid Usage (Implicit)

• VUID-VkDisplayPowerInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT

• VUID-VkDisplayPowerInfoEXT-pNext-pNext
pNext must be NULL

• VUID-VkDisplayPowerInfoEXT-powerState-parameter
powerState must be a valid VkDisplayPowerStateEXT value
Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it may be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state may be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

### 34.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(VkInstance instance, const VkDisplaySurfaceCreateInfoKHR* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);
```

- `instance` is the instance corresponding to the physical device the targeted display is on.
- `pCreateInfo` is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

## Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure
• VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

## Return Codes

### Success
- **VK_SUCCESS**

### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkDisplaySurfaceCreateFlagsKHR flags;
  VkDisplayModeKHR displayMode;
  uint32_t planeIndex;
  uint32_t planeStackIndex;
  VkSurfaceTransformFlagBitsKHR transform;
  float globalAlpha;
  VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
  VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use, and must be zero.
- **displayMode** is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
- **planeIndex** is the plane on which this surface appears.
- **planeStackIndex** is the z-order of the plane.
- **transform** is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
- **globalAlpha** is the global alpha value. This value is ignored if `alphaMode` is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`. 
• `alphaMode` is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.

• `imageExtent` is the size of the presentable images to use with the surface.

Note
Creating a display surface must not modify the state of the displays, planes, or other resources it names. For example, it must not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

### Valid Usage

- VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252
  planeIndex must be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

- VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253
  If the planeReorderPossible member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to `displayMode` is VK_TRUE then planeStackIndex must be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise planeStackIndex must equal the currentStackIndex member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to `displayMode`

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254
  If `alphaMode` is VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR then `globalAlpha` must be between 0 and 1, inclusive

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255
  `alphaMode` must be one of the bits present in the supportedAlpha member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to `displayMode`

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740
  transform must be one of the bits present in the supportedTransforms member of `VkDisplayPropertiesKHR` for the display corresponding to `displayMode`

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of `imageExtent` must be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`

### Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR

- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask
flags must be 0

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
displayMode must be a valid VkDisplayModeKHR handle
- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
transform must be a valid VkSurfaceTransformFlagBitsKHR value
- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
alphaMode must be a valid VkDisplayPlaneAlphaFlagBitsKHR value

// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;

VkDisplaySurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which can be set in VkDisplaySurfaceCreateInfoKHR::alphaMode, specifying the type of alpha blending to use on a display, are:

// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;

- VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR specifies that the source image will be treated as opaque.
- VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR specifies that a global alpha value must be specified that will be applied to all pixels in the source image.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR specifies that the alpha value will be determined by the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.
- VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR is equivalent to VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR, except the source alpha values are assumed to be premultiplied into the source image's other color components.

// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;

VkDisplayPlaneAlphaFlagsKHR is a bitmask type for setting a mask of zero or more VkDisplayPlaneAlphaFlagBitsKHR.
34.3.4. Presenting to headless surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

Note

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless VkSurfaceKHR object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a VkHeadlessSurfaceCreateInfoEXT structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle
- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkHeadlessSurfaceCreateInfoEXT structure
- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkHeadlessSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT`
- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zerobitmask
  `flags` must be `0`

For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain’s `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.
34.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family.
- `surface` is the surface.
- `pSupported` is a pointer to a `VkBool32`, which is set to `VK_TRUE` to indicate support, and `VK_FALSE` otherwise.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269**
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter**
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter**
  `surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter**
  `pSupported` must be a valid pointer to a `VkBool32` value

- **VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent**
  Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

34.4.1. Android Platform

On Android, all physical devices and queue families must be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

34.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t queueFamilyIndex, 
    struct wl_display* display);
```

• `physicalDevice` is the physical device.
• `queueFamilyIndex` is the queue family index.
• `display` is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter
34.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32 vkGetPhysicalDeviceWin32PresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309
  - `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

34.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
• visual_id is an X11 visual (xcb_visualid_t).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter connection must be a valid pointer to an xcb_connection_t value

34.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
uint32_t

VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR( VkPhysicalDevice physicalDevice, uint32_t queueFamilyIndex, Display* dpy, VisualID visualId );
```

• physicalDevice is the physical device.
• queueFamilyIndex is the queue family index.
• dpy is a pointer to an Xlib Display connection to the server.
• visualId is an X11 visual (VisualID).

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01315 queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
  `dpy` must be a valid pointer to a `Display` value

34.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    IDirectFB* dfb);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by
  `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  `dfb` must be a valid pointer to an `IDirectFB` value

34.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families must be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.
34.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT` capabilities must be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

34.4.9. iOS Platform

On iOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

34.4.10. macOS Platform

On macOS, all physical devices and queue families must be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

34.4.11. VI Platform

On VI, all physical devices and queue families must be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

34.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `window` is the QNX Screen window object.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- `VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743` queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
  window must be a valid pointer to a _screen_window value

34.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

**Note**

In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by `vkGetPhysicalDeviceImageFormatProperties`. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

34.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
   VkPhysicalDevice physicalDevice,
   VkSurfaceKHR surface,
   VkSurfaceCapabilitiesKHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
  surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  surface must be supported by physicalDevice, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilitiesKHR structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
  Both of physicalDevice, and surface must have been created, allocated, or retrieved from the same VkInstance

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
} VkSurfaceCapabilitiesKHR;
```

- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to **minImageCount**. A value of 0 means that there is no limit on the number of images, though there may be limits related to
the total amount of memory used by presentable images.

- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of **minImageExtent**. The width and height of the extent will each be greater than or equal to the corresponding width and height of **currentExtent**, unless **currentExtent** has the special value described above.

- **maxImageArrayLayers** is the maximum number of layers presentable images **can** have for a swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of **VkSurfaceTransformFlagBitsKHR** indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is **VkSurfaceTransformFlagBitsKHR** value indicating the surface's current transform relative to the presentation engine's natural orientation.

- **supportedCompositeAlpha** is a bitmask of **VkCompositeAlphaFlagBitsKHR**, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition **can** be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of **VkImageUsageFlagBits** representing the ways the application **can** use the presentable images of a swapchain created with **VkPresentModeKHR** set to **VK_PRESENT_MODE_IMMEDIATE_KHR**, **VK_PRESENT_MODE_MAILBOX_KHR**, **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** for the surface on the specified device. **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** must be included in the set. Implementations may support additional usages.

  **Note**
  Supported usage flags of a presentable image when using **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** or **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** presentation mode are provided by **VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags**.

  **Note**
  Formulas such as min(N, maxImageCount) are not correct, since maxImageCount may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:
// Provided by VK_KHR_get_surface_capabilities2

VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522**
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07776**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07777**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfacePresentModeEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07778**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07779**
  If a `VkSurfacePresentScalingCapabilitiesEXT` structure is included in the `pNext` chain of
**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter
  pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter
  pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```

- `sType` is aVkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `surface` is the surface that will be associated with the swapchain.

The members of VkPhysicalDeviceSurfaceInfo2KHR correspond to the arguments to vkGetPhysicalDeviceSurfaceCapabilitiesKHR, with `sType` and `pNext` added for extensibility.

Additional capabilities of a surface may be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities can be queried by adding a VkSurfaceFullScreenExclusiveInfoEXT structure to the `pNext` chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a
The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure may also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the `pNext` chain of `VkSwapchainCreateInfoKHR`.

### Valid Usage

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672**
  If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullscreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` must be a valid `VkSurfaceKHR` handle.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, or `VkSurfacePresentModeEXT`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-parameter**
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be a valid `VkSurfaceKHR` handle.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkFullScreenExclusiveEXT fullScreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• `fullScreenExclusive` is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

**Valid Usage (Implicit)**

- `VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULLSCREEN_EXCLUSIVE_INFO_EXT`

- `VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullScreenExclusive-parameter`  
  `fullScreenExclusive` must be a valid `VkFullScreenExclusiveEXT` value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullScreenExclusive` are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT` indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.

- `VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT` indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.

- `VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT` indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.

- `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.

The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```c
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType     sType;
    const void*         pNext;
    HMONITOR             hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **hmonitor** is the Win32 **HMONITOR** handle identifying the display to create the surface with.

**Note**

If **hmonitor** is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return **VK_ERROR_OUT_OF_DATE_KHR**.

**Note**

It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes **may** alter the surface capabilities reported for the created surface.

### Valid Usage

- **VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673**

  **hmonitor** **must** be a valid **HMONITOR**

### Valid Usage (Implicit)

- **VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType**

  **sType** **must** be **VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT**

The **VkSurfaceCapabilities2KHR** structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **surfaceCapabilities** is a **VkSurfaceCapabilitiesKHR** structure describing the capabilities of the specified surface.

If the **VK_GOOGLE_surfaceless_query** extension is enabled and **VkPhysicalDeviceSurfaceInfo2KHR::surface** in the **vkGetPhysicalDeviceSurfaceCapabilities2KHR** call is **VK_NULL_HANDLE**, the values returned in **minImageCount**, **maxImageCount**, **currentExtent**, and **currentTransform** will not reflect that of any surface and will instead be as such:

• **minImageCount** and **maxImageCount** will be **0xFFFFFFFF**
• `currentExtent` will be (0xFFFFFFFF, 0xFFFFFFFF)
• `currentTransform` will be `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR`

### Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2KHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- **VUID-VkSurfaceCapabilities2KHR-pNext-pNext**
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDisplayNativeHdrSurfaceCapabilitiesAMD`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, `VkSurfaceCapabilitiesPresentBarrierNV`, `VkSurfacePresentModeCompatibilityEXT`, `VkSurfacePresentScalingCapabilitiesEXT`, or `VkSurfaceProtectedCapabilitiesKHR`

- **VUID-VkSurfaceCapabilities2KHR-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the value returned in `supportsProtected` will be identical for every valid surface created on this physical device, and so in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call, `VkPhysicalDeviceSurfaceInfo2KHR::surface` can be `VK_NULL_HANDLE`. In that case, the contents of `VkSurfaceCapabilities2KHR::surfaceCapabilities` as well as any other struct chained to it will be undefined.
Valid Usage (Implicit)

- **VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType**

  • `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`.

The `VkSurfacePresentScalingCapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentScalingCapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentScalingFlagsEXT supportedPresentScaling;
    VkPresentGravityFlagsEXT supportedPresentGravityX;
    VkPresentGravityFlagsEXT supportedPresentGravityY;
    VkExtent2D minScaledImageExtent;
    VkExtent2D maxScaledImageExtent;
} VkSurfacePresentScalingCapabilitiesEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **supportedPresentScaling** is a bitmask of `VkPresentScalingFlagBitsEXT` representing the scaling methods supported by the surface, or `0` if application-defined scaling is not supported.
- **supportedPresentGravityX** is a bitmask of `VkPresentGravityFlagBitsEXT` representing the X-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the X axis.
- **supportedPresentGravityY** is a bitmask of `VkPresentGravityFlagBitsEXT` representing the Y-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the Y axis.
- **minScaledImageExtent** contains the smallest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface. The width and height of the extent will each be smaller than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::minImageExtent`.
- **maxScaledImageExtent** contains the largest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value described above for `minScaledImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `VkSurfaceCapabilitiesKHR::maxImageExtent`.

Before creating a swapchain whose scaling mode can be specified through the use of `VkSwapchainPresentScalingCreateInfoEXT`, obtain the set of supported scaling modes by including a `VkSurfacePresentModeEXT` structure in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR` when calling `vkGetPhysicalDeviceSurfaceCapabilities2KHR`. The implementation must return the
same values in `VkSurfacePresentScalingCapabilitiesEXT` for any of the compatible present modes as obtained through `VkSurfacePresentModeCompatibilityEXT`.

**Valid Usage (Implicit)**

- VUID-VkSurfacePresentScalingCapabilitiesEXT-sType-sType
  
  *sType must be* `VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT`

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentScaling-parameter
  
  *supportedPresentScaling must be a valid combination of `VkPresentScalingFlagBitsEXT` values*

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityX-parameter
  
  *supportedPresentGravityX must be a valid combination of `VkPresentGravityFlagBitsEXT` values*

- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityY-parameter
  
  *supportedPresentGravityY must be a valid combination of `VkPresentGravityFlagBitsEXT` values*

**Bits which may be set in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, specifying scaling modes supported by the surface,** are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentScalingFlagBitsEXT {
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT = 0x00000001,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT = 0x00000002,
    VK_PRESENT_SCALING_STRETCH_BIT_EXT = 0x00000004,
} VkPresentScalingFlagBitsEXT;
```

- **`VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT`** specifies that no scaling occurs, and pixels in the swapchain image are mapped to one and only one pixel in the surface. The mapping between pixels is defined by the chosen presentation gravity.

- **`VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT`** specifies that the swapchain image will be minified or magnified such that at least one of the resulting width or height is equal to the corresponding surface dimension, and the other resulting dimension is less than or equal to the corresponding surface dimension, with the aspect ratio of the resulting image being identical to that of the original swapchain image.

- **`VK_PRESENT_SCALING_STRETCH_BIT_EXT`** specifies that the swapchain image will be minified or magnified such that the resulting image dimensions are equal to those of the surface.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentScalingFlagsEXT;
```

`VkPresentScalingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentScalingFlagBitsEXT`.
Bits which may be set in the `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX` or `supportedPresentGravityY` fields, specifying the gravity of presented pixels supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentGravityFlagBitsEXT {
    VK_PRESENT_GRAVITY_MIN_BIT_EXT = 0x00000001,
    VK_PRESENT_GRAVITY_MAX_BIT_EXT = 0x00000002,
    VK_PRESENT_GRAVITY_CENTERED_BIT_EXT = 0x00000004,
} VkPresentGravityFlagBitsEXT;
```

- `VK_PRESENT_GRAVITY_MIN_BIT_EXT` means that the pixels will gravitate towards the top or left side of the surface.
- `VK_PRESENT_GRAVITY_MAX_BIT_EXT` means that the pixels will gravitate towards the bottom or right side of the surface.
- `VK_PRESENT_GRAVITY_CENTERED_BIT_EXT` means that the pixels will be centered in the surface.

If the value in `VkSurfaceCapabilitiesKHR::currentTransform` is not `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, it is implementation-defined whether the gravity configuration applies to the presented image before or after transformation.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentGravityFlagsEXT;
```

`VkPresentGravityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentGravityFlagBitsEXT`.

The `VkSurfacePresentModeEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentModeKHR presentMode;
} VkSurfacePresentModeEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMode` is the presentation mode the swapchain will use.

If the `VkSurfacePresentModeEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR`, the values returned in `VkSurfaceCapabilitiesKHR::minImageCount`, `VkSurfaceCapabilitiesKHR::maxImageCount`, `VkSurfacePresentScalingCapabilitiesEXT::minScaledImageExtent`, and `VkSurfacePresentScalingCapabilitiesEXT::maxScaledImageExtent` are valid only for the specified
presentMode. If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the per-present mode image counts must both be
one. The per-present mode image counts may be less-than or greater-than the image counts
returned when VkSurfacePresentModeEXT is not provided.

Note
If VkSwapchainPresentModesCreateInfoEXT is provided to swapchain creation,
the requirements for forward progress may be less strict. For example, a FIFO
swapchain might only require 2 images to guarantee forward progress, but a
MAILBOX one might require 4. Without the per-present image counts, such an
implementation would have to return 4 in VkSurfaceCapabilitiesKHR
:::minImageCount, which pessimizes FIFO. Conversely, an implementation may return
a low number for minImageCount, but internally bump the image count when
application queries vkGetSwapchainImagesKHR, which can surprise applications,
and is not discoverable until swapchain creation. Using VkSurfacePresentModeEXT
and VkSwapchainPresentModesCreateInfoEXT together effectively removes this
problem.

VkSwapchainPresentModesCreateInfoEXT is required for the specification to be
backwards compatible with applications that do not know about, or make use of
this feature.

Valid Usage

• VUID-VkSurfacePresentModeEXT-presentMode-07780
  presentMode must be a value reported by vkGetPhysicalDeviceSurfacePresentModesKHR
  for the specified surface.

Valid Usage (Implicit)

• VUID-VkSurfacePresentModeEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT

• VUID-VkSurfacePresentModeEXT-presentMode-parameter
  presentMode must be a valid VkPresentModeKHR value

The VkSurfacePresentModeCompatibilityEXT structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeCompatibilityEXT {
    VkStructureType     sType;
    void*                pNext;
    uint32_t             presentModeCount;
    VkPresentModeKHR*     pPresentModes;
} VkSurfacePresentModeCompatibilityEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **presentModeCount** is an integer related to the number of present modes available or queried, as described below.
• **pPresentModes** is a pointer to an array of `VkPresentModeKHR` in which present modes compatible with a given present mode are returned.

If `pPresentModes` is `NULL`, then the number of present modes that are compatible with the one specified in `VkSurfacePresentModeEXT` is returned in `presentModeCount`. Otherwise, `presentModeCount` must be set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `presentModeCount` is less than the number of compatible present modes that are supported, at most `presentModeCount` values will be written to `pPresentModes`. The implementation must include the present mode passed to `VkSurfacePresentModeEXT` in `pPresentModes`, unless `presentModeCount` is zero.

Before creating a swapchain whose present modes can be modified through the use of `VkSwapchainPresentModesCreateInfoEXT`, obtain the set of present modes compatible with a given initial present mode by including a `VkSurfacePresentModeEXT` structure in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR` when calling `vkGetPhysicalDeviceSurfaceCapabilities2KHR`.

### Valid Usage (Implicit)

- **VUID-VkSurfacePresentModeCompatibilityEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT`

- **VUID-VkSurfacePresentModeCompatibilityEXT-pPresentModes-parameter**
  
  If `presentModeCount` is not 0, and `pPresentModes` is not `NULL`, `pPresentModes` must be a valid pointer to an array of `presentModeCount` `VkPresentModeKHR` values

The `VkSharedPresentSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **sharedPresentSupportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the shared presentable image from a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device.
VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set but implementations may support additional usages.

Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR

The VkDisplayNativeHdrSurfaceCapabilitiesAMD structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- localDimmingSupport specifies whether the surface supports local dimming. If this is VK_TRUE, VkSwapchainDisplayNativeHdrCreateInfoAMD can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by vkSetLocalDimmingAMD during the lifetime of the swapchain.

Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD

The VkSurfaceCapabilitiesFullScreenExclusiveEXT structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fullScreenExclusiveControlSupported is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the pNext chain of VkSurfaceCapabilities2KHR to determine
support for exclusive full-screen access. If `fullscreenExclusiveSupported` is `VK_FALSE`, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` set if `fullscreenExclusiveSupported` is `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULL_SCREEN_EXCLUSIVE_EXT`

The `VkSurfaceCapabilitiesPresentBarrierNV` structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSurfaceCapabilitiesPresentBarrierNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierSupported;
} VkSurfaceCapabilitiesPresentBarrierNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentBarrierSupported` is a boolean describing whether the surface is able to make use of the present barrier feature.

This structure can be included in the `pNext` chain of `VkSurfaceCapabilities2KHR` to determine support for present barrier access. If `presentBarrierSupported` is `VK_FALSE`, it indicates that the present barrier feature is not obtainable for this surface.

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilitiesPresentBarrierNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV`

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as
described for `vkCreateSwapchainKHR`.

- **surface** is the surface that will be associated with the swapchain.
- **pSurfaceCapabilities** is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523
  
  **surface** must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211
  
  **surface** must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter
  
  **physicalDevice** must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter
  
  **surface** must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter
  
  **pSurfaceCapabilities** must be a valid pointer to a `VkSurfaceCapabilities2EXT` structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent
  
  Both of `physicalDevice`, and **surface** must have been created, allocated, or retrieved from the same `VkInstance`

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**

The `VkSurfaceCapabilities2EXT` structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
```
typedef struct VkSurfaceCapabilities2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t minImageCount;
    uint32_t maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
    VkExtent2D maxImageExtent;
    uint32_t maxImageArrayLayers;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkSurfaceTransformFlagBitsKHR currentTransform;
    VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
    VkImageUsageFlags supportedUsageFlags;
    VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **minImageCount** is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- **maxImageCount** is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to minImageCount. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.
- **currentExtent** is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- **minImageExtent** contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of currentExtent, unless currentExtent has the special value described above.
- **maxImageExtent** contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of minImageExtent. The width and height of the extent will each be greater than or equal to the corresponding width and height of currentExtent, unless currentExtent has the special value described above.
- **maxImageArrayLayers** is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.
- **supportedTransforms** is a bitmask of VkSurfaceTransformFlagBitsKHR indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.
- **currentTransform** is VkSurfaceTransformFlagBitsKHR value indicating the surface's current transform relative to the presentation engine's natural orientation.
- **supportedCompositeAlpha** is a bitmask of VkCompositeAlphaFlagBitsKHR, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device.
device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- supportedUsageFlags is a bitmask of VkImageUsageFlagBits representing the ways the application can use the presentable images of a swapchain created with VkPresentModeKHR set to VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR for the surface on the specified device. VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT must be included in the set. Implementations may support additional usages.

- supportedSurfaceCounters is a bitmask of VkSurfaceCounterFlagBitsEXT indicating the supported surface counter types.

### Valid Usage

- VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246
  supportedSurfaceCounters must not include VK_SURFACE_COUNTER_VBLANK_BIT_EXT unless the surface queried is a display surface

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT

- VUID-VkSurfaceCapabilities2EXT-pNext-pNext
  pNext must be NULL

Bits which can be set in VkSurfaceCapabilities2EXT::supportedSurfaceCounters, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
    VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
    VK_SURFACE_COUNTER_VBLANK_EXT = VK_SURFACE_COUNTER_VBLANK_BIT_EXT,
} VkSurfaceCounterFlagBitsEXT;
```

- VK_SURFACE_COUNTER_VBLANK_BIT_EXT specifies a counter incrementing once every time a vertical blanking period occurs on the display associated with the surface.

```c
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
```

VkSurfaceCounterFlagsEXT is a bitmask type for setting a mask of zero or more VkSurfaceCounterFlagBitsEXT.
Bits which may be set in VkSurfaceCapabilitiesKHR::supportedTransforms indicating the presentation transforms supported for the surface on the specified device, and possible values of VkSurfaceCapabilitiesKHR::currentTransform indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

```c
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
```

- **VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR** specifies that image content is presented without being transformed.
- **VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR** specifies that image content is rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR** specifies that image content is rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR** specifies that image content is rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR** specifies that image content is mirrored horizontally.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- **VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR** specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- **VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR** specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.

```c
// Provided by VK_KHR_display
typedef VkFlags VkSurfaceTransformFlagsKHR;
```

VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the
following values:

```c
// Provided by VK_KHR_surface
typedef enum VkCompositeAlphaFlagBitsKHR {
    VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR = 0x00000002,
    VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR = 0x00000004,
    VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR = 0x00000008,
} VkCompositeAlphaFlagBitsKHR;
```

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

```c
// Provided by VK_KHR_surface
typedef VkFlags VkCompositeAlphaFlagsKHR;
```

`VkCompositeAlphaFlagsKHR` is a bitmask type for setting a mask of zero or more `VkCompositeAlphaFlagBitsKHR`.

### 34.5.2. Surface Format Support

To query the supported swapchain format-color space pairs for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as
described for \texttt{vkCreateSwapchainKHR}.

- \texttt{surface} is the surface that will be associated with the swapchain.
- \texttt{pSurfaceFormatCount} is a pointer to an integer related to the number of format pairs available or queried, as described below.
- \texttt{pSurfaceFormats} is either \texttt{NULL} or a pointer to an array of \texttt{VkSurfaceFormatKHR} structures.

If \texttt{pSurfaceFormats} is \texttt{NULL}, then the number of format pairs supported for the given \texttt{surface} is returned in \texttt{pSurfaceFormatCount}. Otherwise, \texttt{pSurfaceFormatCount} \textbf{must} point to a variable set by the user to the number of elements in the \texttt{pSurfaceFormats} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pSurfaceFormats}. If the value of \texttt{pSurfaceFormatCount} is less than the number of format pairs supported, at most \texttt{pSurfaceFormatCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available format pairs were returned.

The number of format pairs supported \textbf{must} be greater than or equal to 1. \texttt{pSurfaceFormats} \textbf{must} not contain an entry whose value for \texttt{format} is \texttt{VK_FORMAT_UNDEFINED}.

If \texttt{pSurfaceFormats} includes an entry whose value for \texttt{colorSpace} is \texttt{VK_COLOR_SPACE_SRGB_NONLINEAR_KHR} and whose value for \texttt{format} is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for \texttt{VK_IMAGE_TILING_OPTIMAL}, then \texttt{pSurfaceFormats} \textbf{must} also contain an entry with the same value for \texttt{colorSpace} and \texttt{format} equal to the corresponding SRGB (or UNORM) format.

If the \texttt{VK_GOOGLE_surfaceless_query} extension is enabled, the values returned in \texttt{pSurfaceFormats} will be identical for every valid surface created on this physical device, and so \texttt{surface} \textbf{can} be \texttt{VK_NULL_HANDLE}.

---

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524
  If the \texttt{VK_GOOGLE_surfaceless_query} extension is not enabled, \texttt{surface} \textbf{must} be a valid \texttt{VkSurfaceKHR} handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525
  If \texttt{surface} is not \texttt{VK_NULL_HANDLE}, it \textbf{must} be supported by \texttt{physicalDevice}, as reported by \texttt{vkGetPhysicalDeviceSurfaceSupportKHR} or an equivalent platform-specific mechanism

---

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  \texttt{physicalDevice} \textbf{must} be a valid \texttt{VkPhysicalDevice} handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  If \texttt{surface} is not \texttt{VK_NULL_HANDLE}, \texttt{surface} \textbf{must} be a valid \texttt{VkSurfaceKHR} handle

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
  \texttt{pSurfaceFormatCount} \textbf{must} be a valid pointer to a \texttt{uint32_t} value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
  If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormatKHR structures

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

---

**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormatKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- **format** is a VkFormat that is compatible with the specified surface.
- **colorSpace** is a presentation VkColorSpaceKHR that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormat2KHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- **pSurfaceInfo** is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
• `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.

• `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, it must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  `pSurfaceFormatCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
  If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not `NULL`, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures

**Return Codes**

**Success**

- `VK_SUCCESS`
The `VkSurfaceFormat2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

If the `imageCompressionControlSwapchain` feature is supported and a `VkImageCompressionPropertiesEXT` structure is included in the `pNext` chain of this structure, then it will be filled with the compression properties that are supported for the `surfaceFormat`.

### Valid Usage

- **VUID-VkSurfaceFormat2KHR-pNext-06750**
  
  If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionPropertiesEXT` structure.

### Valid Usage (Implicit)

- **VUID-VkSurfaceFormat2KHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`.

- **VUID-VkSurfaceFormat2KHR-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkImageCompressionPropertiesEXT`.

- **VUID-VkSurfaceFormat2KHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

While the format of a presentable image refers to the encoding of each pixel, the color space determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in...
CIE Lab), and a transfer function that is applied before storing or transmitting color data in the
given color space.

Possible values of VkSurfaceFormatKHR::colorSpace, specifying supported color spaces of a
presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
  VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
  // Provided by VK_AMD_display_native_hdr
  VK_COLOR_SPACE_DISPLAY_NATIVE_AMD = 1000213000,
  VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
  // Provided by VK_EXT_swapchain_colorspace
  VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;
```

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be
displayed using an sRGB-like EOTF (defined below).
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to
be displayed using a linear EOTF.
• **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.

• **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.

• **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.

• **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.

• **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.

• **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.

• **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.

• **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.

• **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.

• **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display's native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

---

**Note**

In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency with Vulkan naming rules. The older enum is still available for backwards compatibility.

---

**Note**

In older versions of this extension **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** was misnamed **VK_COLOR_SPACE_DCI_P3_LINEAR_EXT**. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.
For a traditional “Linear” or non-gamma transfer function color space use `VK_COLOR_SPACE_PASS_THROUGH_EXT`.

The color components of non-linear color space swapchain images must have had the appropriate transfer function applied. The color space selected for the swapchain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for `VkColorSpaceKHR` that correspond to the following color spaces:

</tbody>
</table>

The transfer functions are described in the “Transfer Functions” chapter of the Khronos Data Format Specification.

Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{\frac{1}{2.4}} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\ 
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where L is the linear value of a color component and E is the encoded value (as stored in the image in memory).
Note
For most uses, the sRGB OETF is equivalent.

34.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount must` point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `surface` is `VK_NULL_HANDLE`, the values returned in `pPresentModes` will only indicate support for `VK_PRESENT_MODE_FIFO_KHR`, `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, and `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`. To query support for any other present mode, a valid handle `must` be provided in `surface`.

Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` `must` be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
  If `surface` is not `VK_NULL_HANDLE`, it `must` be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  pPresentModeCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  If the value referenced by pPresentModeCount is not 0, and pPresentModes is not NULL, pPresentModes must be a valid pointer to an array of pPresentModeCount VkPresentModeKHR values

- VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);
```

- physicalDevice is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
- pSurfaceInfo is a pointer to a VkPhysicalDeviceSurfaceInfo2KHR structure describing the surface and other fixed parameters that would be consumed by vkCreateSwapchainKHR.
- pPresentModeCount is a pointer to an integer related to the number of presentation modes
available or queried, as described below.

- **pPresentModes** is either **NULL** or a pointer to an array of **VkPresentModeKHR** values, indicating the supported presentation modes.

vkGetPhysicalDeviceSurfacePresentModes2EXT behaves similarly to vkGetPhysicalDeviceSurfacePresentModesKHR, with the ability to specify extended inputs via chained input structures.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
  If the VK_GOOGLE_surfaceless_query extension is not enabled, **pSurfaceInfo->surface** must be a valid **VkSurfaceKHR** handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
  If **pSurfaceInfo->surface** is not **VK_NULL_HANDLE**, it must be supported by **physicalDevice**, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
  **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
  **pSurfaceInfo** must be a valid pointer to a valid **VkPhysicalDeviceSurfaceInfo2KHR** structure

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
  **pPresentModeCount** must be a valid pointer to a **uint32_t** value

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
  If the value referenced by **pPresentModeCount** is not 0, and **pPresentModes** is not **NULL**, **pPresentModes** must be a valid pointer to an array of **pPresentModeCount** **VkPresentModeKHR** values

**Return Codes**

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_SURFACE_LOST_KHR**
Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```c
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the next vertical blanking period to update the current image. If a vertical blanking period has already passed since the last update of the current image then the presentation engine does not wait for another vertical blanking period for the update, meaning this mode may result in visible tearing in this case. This mode is useful for reducing visual stutter with an application that will mostly present a new image before the next vertical blanking period, but may occasionally be late, and present a new image just after the next vertical blanking period. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during or after each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a shared presentable image. The presentation engine is only required to update the current image after a new presentation request is received. Therefore the application must make a presentation...
request whenever an update is required. However, the presentation engine may update the current image at any point, meaning this mode may result in visible tearing.

- **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** specifies that the presentation engine and application have concurrent access to a single image, which is referred to as a *shared presentable image*. The presentation engine periodically updates the current image on its regular refresh cycle. The application is only required to make one initial presentation request, after which the presentation engine must update the current image without any need for further presentation requests. The application can indicate the image contents have been updated by making a presentation request, but this does not guarantee the timing of when it will be updated. This mode may result in visible tearing if rendering to the image is not timed correctly.

The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

### Table 50. Presentable image usage queries

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by **VK_PRESENT_MODE_FIFO_KHR** is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by **VK_PRESENT_MODE_FIFO_RELAXED_KHR** is equivalent to the behavior of `{wgl|glX}SwapBuffers with a swap interval of -1 (from the {WGL|GLX}_EXT_swap_control_tear extensions).

### 34.6. Full Screen Exclusive Control

Swapchains created with **fullScreenExclusive** set to **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen-exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(   ```
VkDevice device, VkSwapchainKHR swapchain);

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

### Valid Usage

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674
  `swapchain` must not be in the retired state

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675
  `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676
  `swapchain` must not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

### Valid Usage (Implicit)

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
To release exclusive full-screen access from a swapchain, call:

```cpp
// Provided by VK_EXT_full_screen-exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to release exclusive full-screen access from.

**Note**
Applications will not be able to present to `swapchain` after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

**Valid Usage**

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677 `swapchain` must not be in the retired state
- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678 `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullScreenExclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`

### 34.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```cpp
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- `device` is the logical device.
• `pDeviceGroupPresentCapabilities` is a pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure in which the device’s capabilities are returned.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter**
  - `pDeviceGroupPresentCapabilities` must be a valid pointer to a `VkDeviceGroupPresentCapabilitiesKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in
VkDeviceGroupPresentInfoKHR::mode.

If a device group only includes a single physical device, then modes must equal VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR
- VUID-VkDeviceGroupPresentCapabilitiesKHR-pNext-pNext
  pNext must be NULL

Bits which may be set in VkDeviceGroupPresentCapabilitiesKHR::modes, indicating which device group presentation modes are supported, are:

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
    VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
    VKDEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
    VKDEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
    VKDEVICEGROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;

- VKDEVICEGROUP_PRESENT_MODE_LOCAL_BIT_KHR specifies that any physical device with a presentation engine can present its own swapchain images.
- VKDEVICEGROUP_PRESENT_MODE_REMOTE_BIT_KHR specifies that any physical device with a presentation engine can present swapchain images from any physical device in its presentMask.
- VKDEVICEGROUP_PRESENT_MODE_SUM_BIT_KHR specifies that any physical device with a presentation engine can present the sum of swapchain images from any physical devices in its presentMask.
- VKDEVICEGROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR specifies that multiple physical devices with a presentation engine can each present their own swapchain images.

// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;

VkDeviceGroupPresentModeFlagsKHR is a bitmask type for setting a mask of zero or more VkDeviceGroupPresentModeFlagBitsKHR.

Some surfaces may not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
    VkDevice device,
    VkSurfaceKHR surface,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

- **device** is the logical device.
- **surface** is the surface.
- **pModes** is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and **may** change in response to the surface being moved, resized, or occluded. These modes **must** be a subset of the modes returned by `vkGetDeviceGroupPresentCapabilitiesKHR`.

**Valid Usage**

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  surface must be supported by all physical devices associated with device, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
device must be a valid `VkDevice` handle.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  surface must be a valid `VkSurfaceKHR` handle.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  pModes must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value.

- VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  Both of device, and surface must have been created, allocated, or retrieved from the same `VkInstance`.

**Host Synchronization**

- Host access to surface must be externally synchronized.
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```
// Provided by VK_VERSION_1_1 with VK_EXT_full_screen_exclusive, VK_KHR_device_group
// with VK_EXT_full_screen_exclusive
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);
```

- `device` is the logical device.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

**Valid Usage**

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213
  `pSurfaceInfo->surface` must be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR`
structure

- VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter
  pModes must be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value

Return Codes

Success
  - VK_SUCCESS

Failure
  - VK_ERROR_OUT_OF_HOST_MEMORY
  - VK_ERROR_OUT_OF_DEVICE_MEMORY
  - VK_ERROR_SURFACE_LOST_KHR

When using VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
  VkPhysicalDevice physicalDevice,
  VkSurfaceKHR surface,
  uint32_t* pRectCount,
  VkRect2D* pRects);
```

- **physicalDevice** is the physical device.
- **surface** is the surface.
- **pRectCount** is a pointer to an integer related to the number of rectangles available or queried, as described below.
- **pRects** is either NULL or a pointer to an array of VkRect2D structures.

If **pRects** is NULL, then the number of rectangles used when presenting the given **surface** is returned in **pRectCount**. Otherwise, **pRectCount** must point to a variable set by the user to the number of elements in the **pRects** array, and on return the variable is overwritten with the number of structures actually written to **pRects**. If the value of **pRectCount** is less than the number of rectangles, at most **pRectCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.
The rectangles returned by this command **must** not overlap.

### Valid Usage

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  
  `surface` **must** be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  
  `surface` **must** be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-parameter
  
  `surface` **must** be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRectCount-parameter
  
  `pRectCount` **must** be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-pRects-parameter
  
  If the value referenced by `pRectCount` is not 0, and `pRects` is not NULL, `pRects` **must** be a valid pointer to an array of `pRectCount` `VkRect2D` structures

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-commonparent
  
  Both of `physicalDevice`, and `surface` **must** have been created, allocated, or retrieved from the same `VkInstance`

### Host Synchronization

- Host access to `surface` **must** be externally synchronized

### Return Codes

#### Success

- **VK_SUCCESS**
- **VK_INCOMPLETE**

#### Failure

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
34.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use `VK_PRESENT_MODE_FIFO_KHR` so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine’s display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The `VK_GOOGLE_display_timing` extension allows an application to satisfy these needs.

The presentation engine’s display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine’s display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
    VkDevice device,        // device
    VkSwapchainKHR swapchain,  // swapchain
    VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);  // pDisplayTimingProperties
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain the refresh duration for.
- **pDisplayTimingProperties** is a pointer to a `VkRefreshCycleDurationGOOGLE` structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**
**pDisplayTimingProperties** must be a valid pointer to a **VkRefreshCycleDurationGOOGLE** structure

- VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

---

**Host Synchronization**

- Host access to swapchain must be externally synchronized

---

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR

---

The **VkRefreshCycleDurationGOOGLE** structure is defined as:

```c
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;
```

- **refreshDuration** is the number of nanoseconds from the start of one refresh cycle to the next.

---

**Note**

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of **refreshDuration**. For example, if a display has a 60Hz refresh rate, **refreshDuration** will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of **refreshDuration**), or 33.33ms (2X multiplier of **refreshDuration**), or 50.0ms (3X multiplier of **refreshDuration**), etc.

In order to determine a target IPD for a display (i.e. a multiple of **refreshDuration**), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of **refreshDuration**). It will therefore position the geometry of a new image 16.67ms
later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of refreshDuration), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application’s IPD may be needed because different views of an application’s geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the actualPresentTime and earliestPresentTime members of the VkPastPresentationTimingGOOGLE structure are consistently different, and if presentMargin is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given vkQueuePresentKHR command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. CLOCK_MONOTONIC (see clock_gettime(2)) on Android and Linux).

To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE* pPresentationTimings);

- device is the device associated with swapchain.
- swapchain is the swapchain to obtain presentation timing information duration for.
- pPresentationTimingCount is a pointer to an integer related to the number of VkPastPresentationTimingGOOGLE structures to query, as described below.
- pPresentationTimings is either NULL or a pointer to an array of VkPastPresentationTimingGOOGLE structures.

If pPresentationTimings is NULL, then the number of newly-available timing records for the given swapchain is returned in pPresentationTimingCount. Otherwise, pPresentationTimingCount must point to a variable set by the user to the number of elements in the pPresentationTimings array, and on return the variable is overwritten with the number of structures actually written to pPresentationTimings. If the value of pPresentationTimingCount is less than the number of newly-
available timing records, at most `pPresentationTimingCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available timing records were returned.

### Valid Usage (Implicit)

- VUID-vkGetPastPresentationTimingGOOGLE-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter
  - `swapchain` **must** be a valid `VkSwapchainKHR` handle
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter
  - `pPresentationTimingCount` **must** be a valid pointer to a `uint32_t` value
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter
  - If the value referenced by `pPresentationTimingCount` is not 0, and `pPresentationTimings` is not `NULL`, `pPresentationTimings` **must** be a valid pointer to an array of `VkPastPresentationTimingGOOGLE` structures
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parent
  - `swapchain` **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `swapchain` **must** be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkPastPresentationTimingGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
};
```
• **presentID** is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::presentID` (see below). It can be used to uniquely identify a previous present with the `vkQueuePresentKHR` command.

• **desiredPresentTime** is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::desiredPresentTime`. If non-zero, it was used by the application to indicate that an image not be presented any sooner than `desiredPresentTime`.

• **actualPresentTime** is the time when the image of the swapchain was actually displayed.

• **earliestPresentTime** is the time when the image of the swapchain could have been displayed. This may differ from `actualPresentTime` if the application requested that the image be presented no sooner than `desiredPresentTime`.

• **presentMargin** is an indication of how early the `vkQueuePresentKHR` command was processed compared to how soon it needed to be processed, and still be presented at `earliestPresentTime`.

The results for a given swapchain and `presentID` are only returned once from `vkGetPastPresentationTimingGOOGLE`.

The application can use the `VkPastPresentationTimingGOOGLE` values to occasionally adjust its timing. For example, if `actualPresentTime` is later than expected (e.g. one `refreshDuration` late), the application may increase its target IPD to a higher multiple of `refreshDuration` (e.g. decrease its frame rate from 60Hz to 30Hz). If `actualPresentTime` and `earliestPresentTime` are consistently different, and if `presentMargin` is consistently large enough, the application may decrease its target IPD to a smaller multiple of `refreshDuration` (e.g. increase its frame rate from 30Hz to 60Hz). If `actualPresentTime` and `earliestPresentTime` are same, and if `presentMargin` is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as `refreshDuration`, can also adjust features until `actualPresentTime` is never late and `presentMargin` is satisfactory.

The full `VK_GOOGLE_display_timing` extension semantics are described for swapchains created with `VK_PRESENT_MODE_FIFO_KHR`. For example, non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` must be honored, and `vkGetPastPresentationTimingGOOGLE` should return a `VkPastPresentationTimingGOOGLE` structure with valid values for all images presented with `vkQueuePresentKHR`. The semantics for other present modes are as follows:

• **VK_PRESENT_MODE_IMMEDIATE_KHR.** The presentation engine may ignore non-zero values of `VkPresentTimeGOOGLE::desiredPresentTime` in favor of presenting immediately. The value of `VkPastPresentationTimingGOOGLE::earliestPresentTime` must be the same as `VkPastPresentationTimingGOOGLE::actualPresentTime`, which should be when the presentation engine displayed the image.

• **VK_PRESENT_MODE_MAILBOX_KHR.** The intention of using this present mode with this extension is to
handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of `VkPastPresentationTimingGOOGLE::actualPresentTime` must be when the image was displayed. For images that are not displayed to the user, `vkGetPastPresentationTimingGOOGLE` may not return a `VkPastPresentationTimingGOOGLE` structure, or it may return a `VkPastPresentationTimingGOOGLE` structure with the value of zero for both `VkPastPresentationTimingGOOGLE::actualPresentTime` and `VkPastPresentationTimingGOOGLE::earliestPresentTime`. It is possible that an application can submit images with `VkPresentTimeGOOGLE::desiredPresentTime` values such that new images may not be displayed. For example, if `VkPresentTimeGOOGLE::desiredPresentTime` is far enough in the future that an image is not presented before `vkQueuePresentKHR` is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- `VK_PRESENT_MODE_FIFO_RELAXED_KHR`. For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for `VK_PRESENT_MODE_FIFO_RELAXED_KHR`. For images that are presented late, and are displayed after the start of the vertical blanking period (i.e. with tearing), the values of `VkPastPresentationTimingGOOGLE` may be treated as if the image was displayed at the start of the vertical blanking period, or may be treated the same as for `VK_PRESENT_MODE_IMMEDIATE_KHR`.

### 34.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the `VK_GOOGLE_display_timing` extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The `VK_KHR_present_wait` extension allows applications to tell the presentation engine at the `vkQueuePresentKHR` call that it plans on waiting for presentation by passing a `VkPresentIdKHR` structure. The `presentId` passed in that structure may then be passed to a future `vkWaitForPresentKHR` call to cause the application to block until that presentation is finished.

### 34.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by `VkSwapchainKHR` handles:

```c
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface.
The presentable images are represented by `VkImage` objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

**Note**
The presentation engine is an abstraction for the platform’s compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.

Some implementations may use the device’s graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by `vkAcquireNextImageKHR`, and before it is released by `vkQueuePresentKHR`. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with `vkAcquireNextImageKHR`. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image’s layout, queue rendering commands to it, etc. Finally, the application presents the image with `vkQueuePresentKHR`, which releases the acquisition of the image. The application can also release the acquisition of the image through `vkReleaseSwapchainImagesEXT`, if the image is not in use by the device, and skip the present operation.

The presentation engine controls the order in which presentable images are acquired for use by the application.

**Note**
This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with `presentMode` set to either `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image’s layout after it is initially presented.
• With `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call `vkQueuePresentKHR` to guarantee an update. However, the presentation engine may update from it at any time.

• With `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to `vkQueuePresentKHR`, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling `vkQueuePresentKHR`, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and ensuring that color attachment writes are made available during the portion of the presentation engine’s refresh cycle they are intended for.

Note
The `VK_KHR_shared_presentable_image` extension does not provide functionality for determining the timing of the presentation engine’s refresh cycles.

In order to query a swapchain’s status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

• `device` is the device associated with `swapchain`.

• `swapchain` is the swapchain to query.

Valid Usage (Implicit)

• VUID-vkGetSwapchainStatusKHR-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  `swapchain` must be a valid `VkSwapchainKHR` handle

• VUID-vkGetSwapchainStatusKHR-swapchain-parent
  `swapchain` must have been created, allocated, or retrieved from `device`

Host Synchronization

• Host access to `swapchain` must be externally synchronized
**Return Codes**

**Success**

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The possible return values for `vkGetSwapchainStatusKHR` **should** be interpreted as follows:

- **VK_SUCCESS** specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_SUBOPTIMAL_KHR** the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain’s `VkPresentModeKHR`.

- **VK_ERROR_OUT_OF_DATE_KHR** the surface has changed in such a way that it is no longer compatible with the swapchain.

- **VK_ERROR_SURFACE_LOST_KHR** the surface is no longer available.

**Note**

The swapchain state **may** be cached by implementations, so applications **should** regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(
    VkDevice device,
    const VkSwapchainCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSwapchainKHR* pSwapchain);
```

- **device** is the device to create the swapchain for.
- **pCreateInfo** is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
• **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

• **pSwapchain** is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images **can** be used in any way that equivalent non-presentable images **can** be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:

<table>
<thead>
<tr>
<th><code>VkImageCreateInfo</code> Field</th>
<th>Value</th>
</tr>
</thead>
</table>
| `flags`                  | `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` is set if `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR` is set
|                          | `VK_IMAGE_CREATE_PROTECTED_BIT` is set if `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` is set
|                          | `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and `VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR` are both set if `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` is set
|                          | all other bits are unset |
| `imageType`              | `VK_IMAGE_TYPE_2D` |
| `format`                 | `pCreateInfo->imageFormat` |
| `extent`                 | `{pCreateInfo->imageExtent.width, pCreateInfo->imageExtent.height, 1}` |
| `mipLevels`              | 1 |
| `arrayLayers`            | `pCreateInfo->imageArrayLayers` |
| `samples`                | `VK_SAMPLE_COUNT_1_BIT` |
| `tiling`                 | `VK_IMAGE_TILING_OPTIMAL` |
| `usage`                  | `pCreateInfo->imageUsage` |
| `sharingMode`            | `pCreateInfo->imageSharingMode` |
| `queueFamilyIndexCount`  | `pCreateInfo->queueFamilyIndexCount` |
| `pQueueFamilyIndices`    | `pCreateInfo->pQueueFamilyIndices` |
| `initialLayout`          | `VK_IMAGE_LAYOUT_UNDEFINED` |

The `pCreateInfo->surface` **must** not be destroyed until after the swapchain is destroyed.

If `oldSwapchain` is `VK_NULL_HANDLE`, and the native window referred to by `pCreateInfo->surface` is
already associated with a Vulkan swapchain, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

If the native window referred to by `pCreateInfo->surface` is already associated with a non-Vulkan graphics API surface, **VK_ERROR_NATIVE_WINDOW_IN_USE_KHR** must be returned.

The native window referred to by `pCreateInfo->surface` must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

`vkCreateSwapchainKHR` will return **VK_ERROR_DEVICE_LOST** if the logical device was lost. The `VkSwapchainKHR` is a child of the device, and must be destroyed before the device. However, `VkSurfaceKHR` is not a child of any `VkDevice` and is not affected by the lost device. After successfully recreating a `VkDevice`, the same `VkSurfaceKHR` can be used to create a new `VkSwapchainKHR`, provided the previous one was destroyed.

If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

**Note**
This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation **may** fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, **VK_ERROR_INITIALIZATION_FAILED** will be returned.

**Note**
In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainPresentBarrierCreateInfoNV` structure, then that structure includes additional swapchain creation parameters specific to the present barrier. Swapchain creation **may** fail if the state of the current system restricts the usage of the present barrier feature `VkSurfaceCapabilitiesPresentBarrierNV`, or a swapchain itself does not satisfy all the required conditions. In this scenario **VK_ERROR_INITIALIZATION_FAILED** is returned.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface’s `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation **may** fail if that `VkDisplayKHR` is not acquired by the application. In this scenario **VK_ERROR_INITIALIZATION_FAILED** is returned.
Valid Usage (Implicit)

- VUID-vkCreateSwapchainKHR-device-parameter
  device **must** be a valid `VkDevice` handle

- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure

- VUID-vkCreateSwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
  pSwapchain **must** be a valid pointer to a `VkSwapchainKHR` handle

Host Synchronization

- Host access to pCreateInfo->surface **must** be externally synchronized
- Host access to pCreateInfo->oldSwapchain **must** be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_COMPRESSION_EXHAUSTED_EXT

The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkFormat imageFormat;
} VkSwapchainCreateInfoKHR;
```
vkColorSpaceKHR  
vkExtent2D  
uint32_t  
vkImageUsageFlags  
vkSharingMode  
uint32_t  
const uint32_t*  
vkSurfaceTransformFlagBitsKHR  
vkCompositeAlphaFlagBitsKHR  
vkPresentModeKHR  
vkBool32  
vkSwapchainKHR  
} VkSwapchainCreateInfoKHR;

- **sType** is a [VkStructureType](#) value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of [VkSwapchainCreateFlagBitsKHR](#) indicating parameters of the swapchain creation.
- **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.
- **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- **imageFormat** is a [VkFormat](#) value specifying the format the swapchain image(s) will be created with.
- **imageColorSpace** is a [VkColorSpaceKHR](#) value specifying the way the swapchain interprets image data.
- **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface’s `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>On some platforms, it is normal that <code>maxImageExtent</code> may become <code>(0, 0)</code>, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements, unless scaling is selected through <a href="#">VkSwapchainPresentScalingCreateInfoEXT</a>, if supported.</td>
</tr>
</tbody>
</table>

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- **imageUsage** is a bitmask of [VkImageUsageFlagBits](#) describing the intended usage of the (acquired) swapchain images.
- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.
- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`. 
• **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when **imageSharingMode** is **VK_SHARING_MODE_CONCURRENT**.

• **preTransform** is a **VkSurfaceTransformFlagBitsKHR** value describing the transform, relative to the presentation engine’s natural orientation, applied to the image content prior to presentation. If it does not match the **currentTransform** value returned by **vkGetPhysicalDeviceSurfaceCapabilitiesKHR**, the presentation engine will transform the image content as part of the presentation operation.

• **compositeAlpha** is a **VkCompositeAlphaFlagBitsKHR** value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.

• **presentMode** is the presentation mode the swapchain will use. A swapchain’s present mode determines how incoming present requests will be processed and queued internally.

• **clipped** specifies whether the Vulkan implementation is allowed to discard rendering operations that affect regions of the surface that are not visible.
  - If set to **VK_TRUE**, the presentable images associated with the swapchain may not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders may not execute for these pixels, and thus any side effects they would have had will not occur. Setting **VK_TRUE** does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.
  - If set to **VK_FALSE**, presentable images associated with the swapchain will own all of the pixels they contain.

  
  
  \[
  \text{Note} \quad \text{Applications should set this value to } \text{VK_TRUE} \text{ if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.}
  \]

• **oldSwapchain** is **VK_NULL_HANDLE**, or the existing non-retired swapchain currently associated with **surface**. Providing a valid **oldSwapchain** may aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling **vkCreateSwapchainKHR** with an **oldSwapchain** that is not **VK_NULL_HANDLE**, **oldSwapchain** is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not **oldSwapchain** is **VK_NULL_HANDLE**.

Upon calling **vkCreateSwapchainKHR** with an **oldSwapchain** that is not **VK_NULL_HANDLE**, any images from **oldSwapchain** that are not acquired by the application may be freed by the implementation, which may occur even if creation of the new swapchain fails. The application can destroy **oldSwapchain** to free all memory associated with **oldSwapchain**.

  
  
  \[
  \text{Note} \quad \text{Multiple retired swapchains can be associated with the same } \text{VkSurfaceKHR} \text{ through multiple uses of } \text{oldSwapchain} \text{ that outnumber calls to } \text{vkDestroySwapchainKHR}.\]
After oldSwapchain is retired, the application can pass to vkQueuePresentKHR any images it had already acquired from oldSwapchain. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, vkQueuePresentKHR may fail if oldSwapchain has entered a state that causes VK_ERROR_OUT_OF_DATE_KHR to be returned.

The application can continue to use a shared presentable image obtained from oldSwapchain until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

- VUID-VkSwapchainCreateInfoKHR-surface-01270
  surface must be a surface that is supported by the device as determined using vkGetPhysicalDeviceSurfaceSupportKHR

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
  minImageCount must be less than or equal to the value returned in the maxImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is not zero

- VUID-VkSwapchainCreateInfoKHR-presentMode-02839
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount must be greater than or equal to the value returned in the minImageCount member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
  minImageCount must be 1 if presentMode is either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR

- VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
  imageFormat and imageColorSpace must match the format and colorSpace members, respectively, of one of the VkSurfaceFormatKHR structures returned by vkGetPhysicalDeviceSurface FormatsKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07781
  If a VkSwapchainPresentScalingCreateInfoEXT structure was not included in the pNext chain, or it is included and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is zero then imageExtent must be between minImageExtent and maxImageExtent, inclusive, where minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-pNext-07782
  If a VkSwapchainPresentScalingCreateInfoEXT structure was included in the pNext chain and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is not zero then imageExtent must be between minScaledImageExtent and maxScaledImageExtent, inclusive, where minScaledImageExtent and maxScaledImageExtent are members of the
VkSurfacePresentScalingCapabilitiesEXT structure returned by
vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface and presentMode

- VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  imageExtent members width and height must both be non-zero

- VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers
  member of the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR,
  VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a
  subset of the supported usage flags present in the supportedUsageFlags member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-imageUsage-01384
  If presentMode is VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, imageUsage must be a subset of the
  supported usage flags present in the sharedPresentSupportedUsageFlags member of the
  VkSharedPresentSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, pQueueFamilyIndices must be a valid
  pointer to an array of queueFamilyIndexCount uint32_t values

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, queueFamilyIndexCount must be greater
  than 1

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428
  If imageSharingMode is VK_SHARING_MODE_CONCURRENT, each element of pQueueFamilyIndices
  must be unique and must be less than pQueueFamilyPropertyCount returned by either
  vkGetPhysicalDeviceQueueFamilyProperties or
  vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to
  create device

- VUID-VkSwapchainCreateInfoKHR-preTransform-01279
  preTransform must be one of the bits present in the supportedTransforms member of the
  VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280
  compositeAlpha must be one of the bits present in the supportedCompositeAlpha member of
  the VkSurfaceCapabilitiesKHR structure returned by
  vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- VUID-VkSwapchainCreateInfoKHR-presentMode-01281
  presentMode must be one of the VkPresentModeKHR values returned by
  vkGetPhysicalDeviceSurfacePresentModesKHR for the surface
If the logical device was created with `VkDeviceGroupDeviceCreateInfo` `physicalDeviceCount` equal to 1, `flags` must not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`.

If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a non-retired swapchain associated with native window referred to by `surface`.

The implied image creation parameters of the swapchain must be supported as reported by `vkGetPhysicalDeviceImageFormatProperties`.

If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain must include a `VkImageFormatListCreateInfo` structure with a `viewFormatCount` greater than zero and `pViewFormats` must have an element equal to `imageFormat`.

If a `VkImageFormatListCreateInfo` structure was included in the `pNext` chain and `VkImageFormatListCreateInfo` `viewFormatCount` is not zero then all of the formats in `VkImageFormatListCreateInfo` `pViewFormats` must be compatible with the `format` as described in the compatibility table.

If `flags` does not contain `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` and the `pNext` chain include a `VkImageFormatListCreateInfo` structure then `VkImageFormatListCreateInfo` `viewFormatCount` must be 0 or 1.

If `flags` contains `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR`, then `VkSurfaceProtectedCapabilitiesKHR` `supportsProtected` must be `VK_TRUE` in the `VkSurfaceProtectedCapabilitiesKHR` structure returned by `vkGetPhysicalDeviceSurfaceCapabilities2KHR` for `surface`.

If the `pNext` chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and `surface` was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain.

If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionControlEXT` structure.

Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`.
- `pNext` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR`.
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDeviceGroupSwapchainCreateInfoKHR`, `VkImageCompressionControlEXT`, `VkImageFormatListCreateInfo`, `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, `VkSwapchainCounterCreateInfoEXT`, `VkSwapchainDisplayNativeHdrCreateInfoAMD`, `VkSwapchainPresentBarrierCreateInfoNV`, `VkSwapchainPresentModesCreateInfoEXT`, or `VkSwapchainPresentScalingCreateInfoEXT`

- VUID-VkSwapchainCreateInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkSwapchainCreateInfoKHR-flags-parameter
  `flags` must be a valid combination of `VkSwapchainCreateFlagBitsKHR` values

- VUID-VkSwapchainCreateInfoKHR-surface-parameter
  `surface` must be a valid `VkSurfaceKHR` handle

- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
  `imageFormat` must be a valid `VkFormat` value

- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
  `imageColorSpace` must be a valid `VkColorSpaceKHR` value

- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
  `imageUsage` must be a valid combination of `VkImageUsageFlagBits` values

- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
  `imageUsage` must not be `0`

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
  `imageSharingMode` must be a valid `VkSharingMode` value

- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
  `preTransform` must be a valid `VkSurfaceTransformFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
  `compositeAlpha` must be a valid `VkCompositeAlphaFlagBitsKHR` value

- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
  `presentMode` must be a valid `VkPresentModeKHR` value

- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a valid `VkSwapchainKHR` handle

- VUID-VkSwapchainCreateInfoKHR-commonparent
  Both of `oldSwapchain` and `surface` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkInstance`

Bits which can be set in `VkSwapchainCreateInfoKHR::flags`, specifying parameters of swapchain creation, are:

```c
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
  // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
```
VK_KHR_swapchain

VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain
VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
// Provided by VK_KHR_swapchain
VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
// Provided by VK_KHR_swapchain_mutable_format
VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT = 0x00000008,
} VkSwapchainCreateFlagBitsKHR;

• VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR specifies that images created from
  the swapchain (i.e. with the swapchain member of VkImageSwapchainCreateInfoKHR set to this
  swapchain's handle) must use VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.

• VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR specifies that images created from the swapchain are
  protected images.

• VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR specifies that the images of the swapchain can be
  used to create a VkImageView with a different format than what the swapchain was created with. The
  list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo
  structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies
  that the swapchain can be created with usage flags that are not supported for the format the
  swapchain is created with but are supported for at least one of the allowed image view formats.

• VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT specifies that the implementation may
  defer allocation of memory associated with each swapchain image until its index is to be
  returned from vkAcquireNextImageKHR or vkAcquireNextImage2KHR for the first time.

typedef VkFlags VkSwapchainCreateFlagsKHR;

VkSwapchainCreateFlagsKHR is a bitmask type for setting a mask of zero or more
VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR
structure, then that structure includes a set of device group present modes that the swapchain can
be used with.

The VkDeviceGroupSwapchainCreateInfoKHR structure is defined as:

typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;

• sType is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `modes` is a bitfield of modes that the swapchain can be used with.

If this structure is not present, `modes` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR`

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter**
  
  `modes` must be a valid combination of `VkDeviceGroupPresentModeFlagBitsKHR` values

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-required bitmask**
  
  `modes` must not be 0

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

### Valid Usage (Implicit)

- **VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`

### Valid Usage

- **VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449**
  
  It is only valid to set `localDimmingEnable` to `VK_TRUE` if...
The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,  // device is the device associated with swapChain.
    VkSwapchainKHR swapChain,  // swapChain handle to enable local dimming.
    VkBool32 localDimmingEnable);  // localDimmingEnable specifies whether local dimming is enabled for the swapchain.
```

Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter: `device` must be a valid `VkDevice` handle.
- VUID-vkSetLocalDimmingAMD-swapChain-parameter: `swapChain` must be a valid `VkSwapchainKHR` handle.
- VUID-vkSetLocalDimmingAMD-swapChain-parent: `swapChain` must have been created, allocated, or retrieved from `device`.

Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618: `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` must be supported.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```
- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **surfaceCounters** is a bitmask of VkSurfaceCounterFlagBitsEXT specifying surface counters to enable for the swapchain.

## Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  The bits in **surfaceCounters** must be supported by VkSwapchainCreateInfoKHR::surface, as reported by vkGetPhysicalDeviceSurfaceCapabilities2EXT

## Valid Usage (Implicit)

- VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT
- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```c
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkSurfaceCounterFlagBitsEXT counter,
    uint64_t* pCounterValue);
```

- **device** is the VkDevice associated with swapchain.
- **swapchain** is the swapchain from which to query the counter value.
- **counter** is a VkSurfaceCounterFlagBitsEXT value specifying the counter to query.
- **pCounterValue** will return the current value of the counter.

If a counter is not available because the swapchain is out of date, the implementation may return VK_ERROR_OUT_OF_DATE_KHR.

## Valid Usage

- VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on swapchain must have been processed by the presentation engine
Valid Usage (Implicit)

- VUID-vkGetSwapchainCounterEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetSwapchainCounterEXT-swapchain-parameter
swapchain must be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainCounterEXT-counter-parameter
counter must be a valid VkSurfaceCounterFlagBitsEXT value
- VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
pCounterValue must be a valid pointer to a uint64_t value
- VUID-vkGetSwapchainCounterEXT-swapchain-parent
swapchain must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

To specify compression properties for the swapchain images in this swapchain, add a
VkImageCompressionControlEXT structure to the pNext chain of the VkSwapchainCreateInfoKHR
structure.

Applications can modify the presentation mode used by the swapchain on a per-presentation basis.
However, all presentation modes the application intends to use with the swapchain must be
specified at swapchain creation time. To specify more than one presentation mode when creating a
swapchain, include the VkSwapchainPresentModesCreateInfoEXT structure in the pNext chain of the
VkSwapchainCreateInfoKHR structure.

The VkSwapchainPresentModesCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModesCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t presentModeCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModesCreateInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **presentModeCount** is the number of presentation modes provided.

• **pPresentModes** is a list of presentation modes with `presentModeCount` entries

---

**Valid Usage**

- **VUID-VkSwapchainPresentModesCreateInfoEXT-None-07762**
  Each entry in `pPresentModes` **must** be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-07763**
  The entries in `pPresentModes` **must** be a subset of the present modes returned in `VkSurfacePresentModeCompatibilityEXT::pPresentModes`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-presentMode-07764**
  `VkSwapchainCreateInfoKHR::presentMode` **must** be included in `pPresentModes`.

---

**Valid Usage (Implicit)**

- **VUID-VkSwapchainPresentModesCreateInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODES_CREATE_INFO_EXT`.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-parameter**
  `pPresentModes` **must** be a valid pointer to an array of `presentModeCount` valid `VkPresentModeKHR` values.

- **VUID-VkSwapchainPresentModesCreateInfoEXT-presentModeCount-arraylength**
  `presentModeCount` **must** be greater than 0.

---

When an application presents a swapchain image with dimensions different than those of the target surface, different behavior is possible on different platforms per their respective specifications:

- Presentation fails and `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- Scaling is done and `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR` is returned.
- Unspecified scaling using an arbitrary combination of stretching, centering and/or clipping.

Applications **can** define specific behavior when creating a swapchain by including the `VkSwapchainPresentScalingCreateInfoEXT` structure in the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

The `VkSwapchainPresentScalingCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentScalingCreateInfoEXT {
```

2825
VkStructureType sType;
const void* pNext;
VkPresentScalingFlagsEXT scalingBehavior;
VkPresentGravityFlagsEXT presentGravityX;
VkPresentGravityFlagsEXT presentGravityY;
}

VkSwapchainPresentScalingCreateInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **scalingBehavior** is 0 or the scaling method to use when the dimensions of the surface and swapchain images differ.
- **presentGravityX** is 0 or the x-axis direction in which swapchain image pixels gravitate relative to the surface when **scalingBehavior** does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.
- **presentGravityY** is 0 or the y-axis direction in which swapchain image pixels gravitate relative to the surface when **scalingBehavior** does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

If **scalingBehavior** is 0, the result of presenting a swapchain image with dimensions that do not match the surface dimensions is implementation and platform-dependent. If **presentGravityX** or **presentGravityY** are 0, the presentation gravity must match that defined by the native platform surface on platforms which define surface gravity.

### Valid Usage

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07765
  If **presentGravityX** is 0, **presentGravityY** must be 0
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07766
  If **presentGravityX** is not 0, **presentGravityY** must not be 0
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07767
  **scalingBehavior** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07768
  **presentGravityX** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07769
  **presentGravityY** must not have more than one bit set
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07770
  **scalingBehavior** must be a valid scaling method for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling, given VkSwapchainCreateInfoKHR::presentMode in VkSurfacePresentModeEXT
- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07771
  If the swapchain is created with VkSwapchainPresentModesCreateInfoEXT, **scalingBehavior** must be a valid scaling method for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling, given each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes.
VkSurfacePresentModeEXT

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07772
  presentGravityX must be a valid x-axis present gravity for the surface as returned in
  VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX, given
  VkSwapchainCreateInfoKHR::presentMode in VkSurfacePresentModeEXT

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07773
  If the swapchain is created with VkSwapchainPresentModesCreateInfoEXT,
  presentGravityX must be a valid x-axis present gravity for the surface as returned in
  VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX, given each present
  mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in
  VkSurfacePresentModeEXT

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07774
  presentGravityY must be a valid y-axis present gravity for the surface as returned in
  VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY, given
  VkSwapchainCreateInfoKHR::presentMode in VkSurfacePresentModeEXT

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07775
  If the swapchain is created with VkSwapchainPresentModesCreateInfoEXT,
  presentGravityY must be a valid y-axis present gravity for the surface as returned in
  VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY, given each present
  mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in
  VkSurfacePresentModeEXT

Valid Usage (Implicit)

• VUID-VkSwapchainPresentScalingCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_SCALING_CREATE_INFO_EXT

• VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-parameter
  scalingBehavior must be a valid combination of VkPresentScalingFlagBitsEXT values

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-parameter
  presentGravityX must be a valid combination of VkPresentGravityFlagBitsEXTX values

• VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-parameter
  presentGravityY must be a valid combination of VkPresentGravityFlagBitsEXT values

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain

void vkDestroySwapchainKHR(
  VkDevice device,
  VkSwapchainKHR swapchain,
  const VkAllocationCallbacks* pAllocator);
```

• device is the VkDevice associated with swapchain.
• **swapchain** is the swapchain to destroy.

• **pAllocator** is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).

The application **must** not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. **swapchain** and all associated VkImage handles are destroyed, and **must** not be acquired or used any more by the application. The memory of each VkImage will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image **may** not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent VkSurfaceKHR, and a new swapchain **can** be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface **must** be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources **must** be left in their current state.

If **swapchain** has exclusive full-screen access, it is released before the swapchain is destroyed.

---

### Valid Usage

- **VUID-vkDestroySwapchainKHR-swapchain-01282**
  All uses of presentable images acquired from **swapchain** **must** have completed execution

- **VUID-vkDestroySwapchainKHR-swapchain-01283**
  If VkAllocationCallbacks were provided when **swapchain** was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroySwapchainKHR-swapchain-01284**
  If no VkAllocationCallbacks were provided when **swapchain** was created, **pAllocator** **must** be **NULL**

### Valid Usage (Implicit)

- **VUID-vkDestroySwapchainKHR-device-parameter**
  **device** **must** be a valid VkDevice handle

- **VUID-vkDestroySwapchainKHR-swapchain-parameter**
  If **swapchain** is not VK_NULL_HANDLE, **swapchain** **must** be a valid VkSwapchainKHR handle

- **VUID-vkDestroySwapchainKHR-pAllocator-parameter**
  If **pAllocator** is not NULL, **pAllocator** **must** be a valid pointer to a valid VkAllocationCallbacks structure

- **VUID-vkDestroySwapchainKHR-swapchain-parent**
  If **swapchain** is a valid handle, it **must** have been created, allocated, or retrieved from **device**
Host Synchronization

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,              // device
    uint32_t swapchainCount,      // swapchainCount
    const VkSwapchainCreateInfoKHR* pCreateInfos,  // pCreateInfos
    const VkAllocationCallbacks* pAllocator,       // pAllocator
    VkSwapchainKHR* pSwapchains);  // pSwapchains
```

- **device** is the device to create the swapchains for.
- **swapchainCount** is the number of swapchains to create.
- **pCreateInfos** is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- **pAllocator** is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
- **pSwapchains** is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

vkCreateSharedSwapchainsKHR is similar to vkCreateSwapchainKHR, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code VK_ERROR_INCOMPATIBLE_DISPLAY_KHR. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

Valid Usage (Implicit)

- VUID-vkCreateSharedSwapchainsKHR-device-parameter  
  device must be a valid VkDevice handle
- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter  
  pCreateInfos must be a valid pointer to an array of swapchainCount valid VkSwapchainCreateInfoKHR structures
- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter  
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
**VkAllocationCallbacks** structure

- **VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter**
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` `VkSwapchainKHR` handles

- **VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength**
  `swapchainCount` must be greater than 0

### Host Synchronization

- Host access to `pCreateInfos[].surface` must be externally synchronized
- Host access to `pCreateInfos[].oldSwapchain` must be externally synchronized

### Return Codes

#### Success
- **VK_SUCCESS**

#### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_INCOMPATIBLE_DISPLAY_KHR**
- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_SURFACE_LOST_KHR**

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` must point to a variable set by the user to
the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.

### Valid Usage (Implicit)

- **VUID-vkGetSwapchainImagesKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkGetSwapchainImagesKHR-swapchain-parameter**
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter**
  - `pSwapchainImageCount` must be a valid pointer to a `uint32_t` value
- **VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter**
  - If the value referenced by `pSwapchainImageCount` is not 0, and `pSwapchainImages` is not NULL, `pSwapchainImages` must be a valid pointer to an array of `pSwapchainImageCount` `VkImage` handles
- **VUID-vkGetSwapchainImagesKHR-swapchain-parent**
  - `swapchain` must have been created, allocated, or retrieved from `device`

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_INCOMPLETE`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

#### Note

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop. However, command buffers are not allowed to reference presentable images created with `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` until their indices have been returned from `vkAcquireNextImageKHR` at least once.

Images returned by `vkGetSwapchainImagesKHR` are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single `VkDeviceMemory` object, unless the swapchain is created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag. All presentable images are initially
in the `VK_IMAGE_LAYOUT_UNDEFINED` layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See `vkDestroySwapchainKHR` for further details on the lifetime of presentable images.

Images can also be created by using `vkCreateImage` with `VkImageSwapchainCreateInfoKHR` and bound to swapchain memory using `vkBindImageMemory2` with `VkBindImageMemorySwapchainInfoKHR`. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from `vkGetSwapchainImagesKHR`, these images must be destroyed with `vkDestroyImage`.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```cpp
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(  
    VkDevice device,  
    VkSwapchainKHR swapchain,  
    uint64_t timeout,  
    VkSemaphore semaphore,  
    VkFence fence,  
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain from which an image is being acquired.
- `timeout` specifies how long the function waits, in nanoseconds, if no image is available.
- `semaphore` is `VK_NULL_HANDLE` or a semaphore to signal.
- `fence` is `VK_NULL_HANDLE` or a fence to signal.
- `pImageIndex` is a pointer to a `uint32_t` in which the index of the next image to use (i.e. an index into the array of images returned by `vkGetSwapchainImagesKHR`) is returned.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application, as if it is bound completely and contiguously to a single `VkDeviceMemory` object.

### Valid Usage

- VUID-vkAcquireNextImageKHR-swapchain-01285
  `swapchain` must not be in the retired state
- VUID-vkAcquireNextImageKHR-semaphore-01286
  If `semaphore` is not `VK_NULL_HANDLE` it must be unsignaled
• VUID-vkAcquireNextImageKHR-semaphore-01779
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

• VUID-vkAcquireNextImageKHR-fence-01287
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

• VUID-vkAcquireNextImageKHR-semaphore-01780
  semaphore and fence must not both be equal to VK_NULL_HANDLE

• VUID-vkAcquireNextImageKHR-surface-07783
  If forward progress cannot be guaranteed for the surface used to create the swapchain member of pAcquireInfo, the timeout member of pAcquireInfo must not be UINT64_MAX

• VUID-vkAcquireNextImageKHR-semaphore-03265
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

---

Valid Usage (Implicit)

• VUID-vkAcquireNextImageKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkAcquireNextImageKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkAcquireNextImageKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-vkAcquireNextImageKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-vkAcquireNextImageKHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

• VUID-vkAcquireNextImageKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-semaphore-parent
  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

• VUID-vkAcquireNextImageKHR-fence-parent
  If fence is a valid handle, it must have been created, allocated, or retrieved from device

---

Host Synchronization

• Host access to swapchain must be externally synchronized
• Host access to semaphore must be externally synchronized
• Host access to fence must be externally synchronized
Return Codes

Success

- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

If an image is acquired successfully, vkAcquireNextImageKHR must either return VK_SUCCESS or VK_SUBOPTIMAL_KHR. The implementation may return VK_SUBOPTIMAL_KHR if the swapchain no longer matches the surface properties exactly, but can still be used for presentation.

When successful, vkAcquireNextImageKHR acquires a presentable image from swapchain that an application can use, and sets pImageIndex to the index of that image within the swapchain. The presentation engine may not have finished reading from the image at the time it is acquired, so the application must use semaphore and/or fence to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once vkAcquireNextImageKHR successfully acquires an image, the semaphore signal operation referenced by semaphore, if not VK_NULL_HANDLE, and the fence signal operation referenced by fence, if not VK_NULL_HANDLE, are submitted for execution. If vkAcquireNextImageKHR does not successfully acquire an image, semaphore and fence are unaffected. The order in which images are acquired is implementation-dependent, and may be different than the order the images were presented.

If timeout is zero, then vkAcquireNextImageKHR does not wait, and will either successfully acquire an image, or fail and return VK_NOT_READY if no image is available.

If the specified timeout period expires before an image is acquired, vkAcquireNextImageKHR returns VK_TIMEOUT. If timeout is UINT64_MAX, the timeout period is treated as infinite, and vkAcquireNextImageKHR will block until an image is acquired or an error occurs.

Let S be the number of images in swapchain. If swapchain is created with VkSwapchainPresentModesCreateInfoEXT, let M be the maximum of the values in VkSurfaceCapabilitiesKHR::minImageCount when queried with each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in VkSurfacePresentModeEXT. Otherwise, let M be the value of VkSurfaceCapabilitiesKHR::minImageCount without a VkSurfacePresentModeEXT as part of the query input.
**vkAcquireNextImageKHR** should not be called if the number of images that the application has currently acquired is greater than S-M. If **vkAcquireNextImageKHR** is called when the number of images that the application has currently acquired is less than or equal to S-M, **vkAcquireNextImageKHR** must return in finite time with an allowed **VkResult** code.

*Note*

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use **UINT64_MAX**. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

*Note*

**VK_SUBOPTIMAL_KHR** may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain in this state, or to re-create the swapchain to better match the platform surface properties.

If the swapchain images no longer match native surface properties, either **VK_SUBOPTIMAL_KHR** or **VK_ERROR_OUT_OF_DATE_KHR** must be returned. If **VK_ERROR_OUT_OF_DATE_KHR** is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with **VK_ERROR_OUT_OF_DATE_KHR**. Applications need to create a new swapchain for the surface to continue presenting if **VK_ERROR_OUT_OF_DATE_KHR** is returned.

If device loss occurs (see **Lost Device**) before the timeout has expired, **vkAcquireNextImageKHR** must return in finite time with either one of the allowed success codes, or **VK_ERROR_DEVICE_LOST**.

If **semaphore** is not **VK_NULL_HANDLE**, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

*Note*

Use of **semaphore** allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If **fence** is not equal to **VK_NULL_HANDLE**, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

*Note*

Applications should not rely on **vkAcquireNextImageKHR** blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use **fence** to meter their frame generation work to match the presentation rate.
An application must wait until either the semaphore or fence is signaled before accessing the image’s data.

**Note**
When the presentable image will be accessed by some stage \( S \), the recommended idiom for ensuring correct synchronization is:

- The \( 	ext{VkSubmitInfo} \) used to submit the image layout transition for execution includes \( 	ext{vkAcquireNextImageKHR:semaphore} \) in its \( 	ext{pWaitSemaphores} \) member, with the corresponding element of \( 	ext{pWaitDstStageMask} \) including \( S \).
- The synchronization command that performs any necessary image layout transition includes \( S \) in both the \( 	ext{srcStageMask} \) and \( 	ext{dstStageMask} \).

After a successful return, the image indicated by \( 	ext{pImageIndex} \) and its data will be unmodified compared to when it was presented.

**Note**
Exclusive ownership of presentable images corresponding to a swapchain created with \( 	ext{VK_SHARING_MODE_EXCLUSIVE} \) as defined in Resource Sharing is not altered by a call to \( 	ext{vkAcquireNextImageKHR} \). That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for \( 	ext{vkAcquireNextImageKHR} \) depend on the timeout provided:

- \( 	ext{VK_SUCCESS} \) is returned if an image became available.
- \( 	ext{VK_ERROR_SURFACE_LOST_KHR} \) is returned if the surface becomes no longer available.
- \( 	ext{VK_NOT_READY} \) is returned if timeout is zero and no image was available.
- \( 	ext{VK_TIMEOUT} \) is returned if timeout is greater than zero and less than \( 	ext{UINT64_MAX} \), and no image became available within the time allowed.
- \( 	ext{VK_SUBOPTIMAL_KHR} \) is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but can still be used to present to the surface successfully.

**Note**
This may happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to recreate the swapchain to better match the platform surface properties.

- \( 	ext{VK_ERROR_OUT_OF_DATE_KHR} \) is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications must query the new surface properties and recreate their swapchain if
they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation may fail unless the swapchain is created with a non-zero value in `VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior`. If presentation does succeed, the mapping from the presented image to the native surface is defined by the `VkSwapchainPresentScalingCreateInfoEXT` structure if provided. Otherwise it is implementation-defined. It is the application’s responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a `VK_ERROR_OUT_OF_DATE_KHR` error will be returned.

**Note**

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems may squash/stretch the image to fill the new window size without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application.

**Valid Usage**

- VUID-vkAcquireNextImage2KHR-surface-07784
  If forward progress cannot be guaranteed for the surface used to create `swapchain`, the `timeout` member of `pAcquireInfo` must not be `UINT64_MAX`

**Valid Usage (Implicit)**

- VUID-vkAcquireNextImage2KHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter
  pAcquireInfo must be a valid pointer to a valid VkAcquireNextImageInfoKHR structure
- VUID-vkAcquireNextImage2KHR-pImageIndex-parameter
  pImageIndex must be a valid pointer to a uint32_t value

## Return Codes

### Success
- VK_SUCCESS
- VK_TIMEOUT
- VK_NOT_READY
- VK_SUBOPTIMAL_KHR

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERRORDEVICELOST
- VK_ERROROUTOFDATE_KHR
- VK_ERRORSURFACELOST_KHR
- VK_ERRORFULLSCREENEXCLUSIVE_MODELOST_EXT

The VkAcquireNextImageInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType    sType;
    const void*        pNext;
    VkSwapchainKHR     swapchain;
    uint64_t           timeout;
    VkSemaphore        semaphore;
    VkFence            fence;
    uint32_t           deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchain** is a non-retired swapchain from which an image is acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is VK_NULL_HANDLE or a semaphore to signal.
• **fence** is **VK_NULL_HANDLE** or a fence to signal.

• **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If **vkAcquireNextImageKHR** is used, the device mask is considered to include all physical devices in the logical device.

**Note**

**vkAcquireNextImage2KHR** signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the **deviceMask**. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s) can wait upon.

### Valid Usage

- **VUID-VkAcquireNextImageInfoKHR-swapchain-01675**
  - *swapchain* must not be in the retired state

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01288**
  - If *semaphore* is not **VK_NULL_HANDLE** it must be unsignaled

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01781**
  - If *semaphore* is not **VK_NULL_HANDLE** it must not have any uncompleted signal or wait operations pending

- **VUID-VkAcquireNextImageInfoKHR-fence-01289**
  - If *fence* is not **VK_NULL_HANDLE** it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- **VUID-VkAcquireNextImageInfoKHR-semaphore-01782**
  - *semaphore* and *fence* must not both be equal to **VK_NULL_HANDLE**

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01290**
  - *deviceMask* must be a valid device mask

- **VUID-VkAcquireNextImageInfoKHR-deviceMask-01291**
  - *deviceMask* must not be zero

- **VUID-VkAcquireNextImageInfoKHR-semaphore-03266**
  - *semaphore* must have a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**

### Valid Usage (Implicit)

- **VUID-VkAcquireNextImageInfoKHR-sType-sType**
  - *sType* must be **VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR**
• VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  pNext must be NULL

• VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

• VUID-VkAcquireNextImageInfoKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

• VUID-VkAcquireNextImageInfoKHR-commonparent
  Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters
  must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to swapchain must be externally synchronized
• Host access to semaphore must be externally synchronized
• Host access to fence must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue
an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
  VkQueue queue,
  const VkPresentInfoKHR* pPresentInfo);
```

• queue is a queue that is capable of presentation to the target surface’s platform on the same
device as the image’s swapchain.

• pPresentInfo is a pointer to a VkPresentInfoKHR structure specifying parameters of the
presentation.

Note
There is no requirement for an application to present images in the same order
that they were acquired - applications can arbitrarily present any image that is
currently acquired.

Valid Usage

• VUID-vkQueuePresentKHR-pSwapchains-01292
  Each element of pSwapchains member of pPresentInfo must be a swapchain that is created
  for a surface for which presentation is supported from queue as determined using a call to
  vkGetPhysicalDeviceSurfaceSupportKHR
If more than one member of `pSwapchains` was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode.

When a semaphore wait operation referring to a binary semaphore defined by the elements of the `pWaitSemaphores` member of `pPresentInfo` executes on queue, there must be no other queues waiting on the same semaphore.

All elements of the `pWaitSemaphores` member of `pPresentInfo` must be created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_BINARY`.

All elements of the `pWaitSemaphores` member of `pPresentInfo` must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends (if any) must have also been submitted for execution.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Queueing an image for presentation defines a set of `queue operations`, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of `queue operations` does not include the actual processing of the image by the presentation engine.

Note

The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

If `vkQueuePresentKHR` fails to enqueue the corresponding set of `queue operations`, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error `VK_ERROR_OUT_OF_DATE_KHR`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`, or `VK_ERROR_SURFACE_LOST_KHR`, the set of `queue operations` are still considered to be enqueued and thus any semaphore wait operation specified in `VkPresentInfoKHR` will execute when the corresponding
queue operation is complete.

Calls to `vkQueuePresentKHR` **may** block, but **must** return in finite time.

If any `swapchain` member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that `swapchain` does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application’s control.

### Valid Usage (Implicit)

- VUID-vkQueuePresentKHR-queue-parameter
  - `queue` **must** be a valid `VkQueue` handle
- VUID-vkQueuePresentKHR-pPresentInfo-parameter
  - `pPresentInfo` **must** be a valid pointer to a valid `VkPresentInfoKHR` structure

### Host Synchronization

- Host access to `queue` **must** be externally synchronized
- Host access to `pPresentInfo->pWaitSemaphores[]` **must** be externally synchronized
- Host access to `pPresentInfo->pSwapchains[]` **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_SUBOPTIMAL_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_OUT_OF_DATE_KHR`
- `VK_ERROR_SURFACE_LOST_KHR`
- `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT`
The `VkPresentInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `waitSemaphoreCount` is the number of semaphores to wait for before issuing the present request. The number may be zero.
- `pWaitSemaphores` is `NULL` or a pointer to an array of `VkSemaphore` objects with `waitSemaphoreCount` entries, and specifies the semaphores to wait for before issuing the present request.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pSwapchains` is a pointer to an array of `VkSwapchainKHR` objects with `swapchainCount` entries. A given swapchain must not appear in this list more than once.
- `pImageIndices` is a pointer to an array of indices into the array of each swapchain’s presentable images, with `swapchainCount` entries. Each entry in this array identifies the image to present on the corresponding entry in the `pSwapchains` array.
- `pResults` is a pointer to an array of `VkResult` typed elements with `swapchainCount` entries. Applications that do not need per-swapchain results can use `NULL` for `pResults`. If non-`NULL`, each entry in `pResults` will be set to the `VkResult` for presenting the swapchain corresponding to the same index in `pSwapchains`.

Before an application can present an image, the image’s layout must be transitioned to the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, or for a shared presentable image the `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` layout.

**Note**

When transitioning the image to `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR` or `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR`, there is no need to delay subsequent processing, or perform any visibility operations (as `vkQueuePresentKHR` performs automatic visibility operations). To achieve this, the `dstAccessMask` member of the `VkImageMemoryBarrier` should be set to 0, and the `dstStageMask` parameter should be set to `VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT`.
Valid Usage

- VUID-VkPresentInfoKHR-pImageIndices-01430
  Each element of \texttt{pImageIndices} \textbf{must} be the index of a presentable image acquired from the swapchain specified by the corresponding element of the \texttt{pSwapchains} array, and the presented image subresource \textbf{must} be in the \texttt{VK_IMAGE_LAYOUT_PRESENT_SRC_KHR} or \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR} layout at the time the operation is executed on a \texttt{VkDevice}

- VUID-VkPresentInfoKHR-pNext-06235
  If a \texttt{VkPresentIdKHR} structure is included in the \texttt{pNext} chain, and the \texttt{presentId} feature is not enabled, each \texttt{presentIds} entry in that structure \textbf{must} be NULL

Valid Usage (Implicit)

- VUID-VkPresentInfoKHR-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_PRESENT_INFO_KHR}

- VUID-VkPresentInfoKHR-pNext-pNext
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain \textbf{must} be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDeviceGroupPresentInfoKHR}, \texttt{VkDisplayPresentInfoKHR}, \texttt{VkPresentFrameTokenGGP}, \texttt{VkPresentIdKHR}, \texttt{VkPresentRegionsKHR}, \texttt{VkPresentTimesInfoGOOGLE}, \texttt{VkSwapchainPresentFenceInfoEXT}, or \texttt{VkSwapchainPresentModelInfoEXT}

- VUID-VkPresentInfoKHR-sType-unique
  The \texttt{sType} value of each struct in the \texttt{pNext} chain \textbf{must} be unique

- VUID-VkPresentInfoKHR-pWaitSemaphores-parameter
  If \texttt{waitSemaphoreCount} is not 0, \texttt{pWaitSemaphores} \textbf{must} be a valid pointer to an array of \texttt{waitSemaphoreCount} valid \texttt{VkSemaphore} handles

- VUID-VkPresentInfoKHR-pSwapchains-parameter
  \texttt{pSwapchains} \textbf{must} be a valid pointer to an array of \texttt{swapchainCount} valid \texttt{VkSwapchainKHR} handles

- VUID-VkPresentInfoKHR-pImageIndices-parameter
  \texttt{pImageIndices} \textbf{must} be a valid pointer to an array of \texttt{swapchainCount} \texttt{uint32_t} values

- VUID-VkPresentInfoKHR-pResults-parameter
  If \texttt{pResults} is not \texttt{NULL}, \texttt{pResults} \textbf{must} be a valid pointer to an array of \texttt{swapchainCount} \texttt{VkResult} values

- VUID-VkPresentInfoKHR-swapchainCount-arraylength
  \texttt{swapchainCount} \textbf{must} be greater than 0

- VUID-VkPresentInfoKHR-commonparent
  Both of the elements of \texttt{pSwapchains}, and the elements of \texttt{pWaitSemaphores} that are valid handles of non-ignored parameters \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}
When the `VK_KHR_incremental_present` extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a `VkPresentRegionsKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure.

The `VkPresentRegionsKHR` structure is defined as:

```c
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pRegions` is `NULL` or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not `NULL`, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

**Valid Usage**

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  `swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentRegionsKHR structure`.

**Valid Usage (Implicit)**

- VUID-VkPresentRegionsKHR-sType-sType
  `sType must be VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`
- VUID-VkPresentRegionsKHR-pRegions-parameter
  If `pRegions` is not `NULL`, `pRegions must be a valid pointer to an array of swapchainCount valid VkPresentRegionKHR structures`
- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  `swapchainCount must be greater than 0`

For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:
typedef struct VkPresentRegionKHR {
    uint32_t rectangleCount;
    const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;

- rectangleCount is the number of rectangles in pRectangles, or zero if the entire image has changed and should be presented.

- pRectangles is either NULL or a pointer to an array of VkRectLayerKHR structures. The VkRectLayerKHR structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-NULL, each entry in pRectangles is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to VkSurfaceCapabilitiesKHR::currentTransform, regardless of the swapchain's preTransform. The presentation engine will apply the preTransform transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If rectangleCount is not 0, and pRectangles is not NULL, pRectangles must be a valid pointer to an array of rectangleCount valid VkRectLayerKHR structures

The VkRectLayerKHR structure is defined as:

typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;

- offset is the origin of the rectangle, in pixels.
- extent is the size of the rectangle, in pixels.
- layer is the layer of the image. For images with only one layer, the value of layer must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. VkRectLayerKHR specifies pixels of the swapchain's image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of offset and extent, after being transformed according to the preTransform
member of the VkSwapchainCreateInfoKHR structure, must be no greater than the imageExtent member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

- VUID-VkRectLayerKHR-layer-01262
  layer must be less than the imageArrayLayers member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

When the VK_KHR_display_swapchain extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting VkPresentInfoKHR::pNext to point to a VkDisplayPresentInfoKHR structure.

The VkDisplayPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display_swapchain
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcRect is a rectangular region of pixels to present. It must be a subset of the image being presented. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire presentable image.
- dstRect is a rectangular region within the visible region of the swapchain's display mode. If VkDisplayPresentInfoKHR is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- persistent: If this is VK_TRUE, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but may increase presentation latency. If VkDisplayPresentInfoKHR is not specified, persistent mode will not be used.

If the extent of the srcRect and dstRect are not equal, the presented pixels will be scaled accordingly.
Valid Usage

• VUID-VkDisplayPresentInfoKHR-srcRect-01257
  srcRect must specify a rectangular region that is a subset of the image being presented

• VUID-VkDisplayPresentInfoKHR-dstRect-01258
  dstRect must specify a rectangular region that is a subset of the visibleRegion parameter of the display mode the swapchain being presented uses

• VUID-VkDisplayPresentInfoKHR-persistentContent-01259
  If the persistentContent member of the VkDisplayPropertiesKHR structure returned by vkGetPhysicalDeviceDisplayPropertiesKHR for the display the present operation targets is VK_FALSE, then persistent must be VK_FALSE

Valid Usage (Implicit)

• VUID-VkDisplayPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR

If the pNext chain of VkPresentInfoKHR includes a VkDeviceGroupPresentInfoKHR structure, then that structure includes an array of device masks and a device group present mode.

The VkDeviceGroupPresentInfoKHR structure is defined as:

```c
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is zero or the number of elements in pDeviceMasks.
- pDeviceMasks is a pointer to an array of device masks, one for each element of VkPresentInfoKHR::pSwapchains.
- mode is a VkDeviceGroupPresentModeFlagBitsKHR value specifying the device group present mode that will be used for this present.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks must have exactly one bit set, and the corresponding physical device must have a presentation engine as
reported by VkDeviceGroupPresentCapabilitiesKHR.

If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of `pDeviceMasks` selects which instance of the swapchain image is presented. Each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of `pDeviceMasks` selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask.

If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then each element of `pDeviceMasks` selects which instance(s) of the swapchain images are presented. For each bit set in each element of `pDeviceMasks`, the corresponding physical device must have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If VkDeviceGroupPresentInfoKHR is not provided or swapchainCount is zero then the masks are considered to be 1. If VkDeviceGroupPresentInfoKHR is not provided, `mode` is considered to be VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR.

### Valid Usage

- VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297
  swapchainCount must equal 0 or VkPresentInfoKHR::swapchainCount

- VUID-VkDeviceGroupPresentInfoKHR-mode-01298
  If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of `pDeviceMasks` must have exactly one bit set, and the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-mode-01299
  If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR::presentMask

- VUID-VkDeviceGroupPresentInfoKHR-mode-01300
  If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR::presentMask

- VUID-VkDeviceGroupPresentInfoKHR-mode-01301
  If `mode` is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then for each bit set in each element of `pDeviceMasks`, the corresponding element of VkDeviceGroupPresentCapabilitiesKHR::presentMask must be non-zero

- VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302
  The value of each element of `pDeviceMasks` must be equal to the device mask passed in VkAcquireNextImageInfoKHR::deviceMask when the image index was last acquired

- VUID-VkDeviceGroupPresentInfoKHR-mode-01303
**Valid Usage (Implicit)**

- **VUID-VkDeviceGroupPresentInfoKHR-sType-sType**
  
  *sType* **must** be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`

- **VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter**
  
  If `swapchainCount` is not 0, *pDeviceMasks** must be a valid pointer to an array of `swapchainCount` `uint32_t` values

- **VUID-VkDeviceGroupPresentInfoKHR-mode-parameter**
  
  *mode** must be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value

---

When the `VK_GOOGLE_display_timing` extension is enabled, additional fields **can** be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application **can** instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a `VkPresentTimesInfoGOOGLE` structure to the *pNext* chain of the `VkPresentInfoKHR` structure.

The `VkPresentTimesInfoGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void*pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE*pTimes;
} VkPresentTimesInfoGOOGLE;
```

- *sType** is a `VkStructureType` value identifying this structure.
- *pNext** is NULL or a pointer to a structure extending this structure.
- *swapchainCount** is the number of swapchains being presented to by this command.
- *pTimes** is NULL or a pointer to an array of `VkPresentTimeGOOGLE` elements with `swapchainCount` entries. If not NULL, each element of *pTimes** contains the earliest time to present the image corresponding to the entry in the `VkPresentInfoKHR::pImageIndices` array.

---

**Valid Usage**

- **VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247**
  
  *swapchainCount** **must** be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the *pNext* chain of this `VkPresentTimesInfoGOOGLE` structure
**Valid Usage (Implicit)**

- **VUID-VkPresentTimesInfoGOOGLE-sType-sType**
  
  sType **must** be `VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE`

- **VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter**
  
  If `pTimes` is not NULL, `pTimes` **must** be a valid pointer to an array of `swapchainCount` `VkPresentTimeGOOGLE` structures

- **VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength**
  
  `swapchainCount` **must** be greater than 0

---

The `VkPresentTimeGOOGLE` structure is defined as:

```
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;
```

- `presentID` is an application-provided identification value, that **can** be used with the results of `vkGetPastPresentationTimingGOOGLE`, in order to uniquely identify this present. In order to be useful to the application, it **should** be unique within some period of time that is meaningful to the application.

- `desiredPresentTime` specifies that the image given **should** not be displayed to the user any earlier than this time. `desiredPresentTime` is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux). A value of zero specifies that the presentation engine **may** display the image at any time. This is useful when the application desires to provide `presentID`, but does not need a specific `desiredPresentTime`.

The `VkPresentIdKHR` structure is defined as:

```
// Provided by VK_KHR_present_id
typedef struct VkPresentIdKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint64_t* pPresentIds;
} VkPresentIdKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is NULL or a pointer to a structure extending this structure.

- `swapchainCount` is the number of swapchains being presented to the `vkQueuePresentKHR` command.
• **pPresentIds** is NULL or a pointer to an array of uint64_t with *swapchainCount* entries. If not NULL, each non-zero value in *pPresentIds* specifies the present id to be associated with the presentation of the swapchain with the same index in the *vkQueuePresentKHR* call.

For applications to be able to reference specific presentation events queued by a call to *vkQueuePresentKHR*, an identifier needs to be associated with them. When the *presentId* feature is enabled, applications can include the *VkPresentIdKHR* structure in the *pNext* chain of the *VkPresentInfoKHR* structure to supply identifiers.

Each *VkSwapchainKHR* has a presentId associated with it. This value is initially set to zero when the *VkSwapchainKHR* is created.

When a *VkPresentIdKHR* structure with a non-NULL *pPresentIds* is included in the *pNext* chain of a *VkPresentInfoKHR* structure, each *pSwapchains* entry has a presentId associated in the *pPresentIds* array at the same index as the swapchain in the *pSwapchains* array. If this presentId is non-zero, then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

**Valid Usage**

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  
  *swapchainCount* must be the same value as *VkPresentInfoKHR::swapchainCount*, where this *VkPresentIdKHR* is in the *pNext* chain of the *VkPresentInfoKHR* structure

- **VUID-VkPresentIdKHR-presentIds-04999**
  
  Each *presentIds* entry must be greater than any previous *presentIds* entry passed for the associated *pSwapchains* entry

**Valid Usage (Implicit)**

- **VUID-VkPresentIdKHR-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_PRESENT_ID_KHR*

- **VUID-VkPresentIdKHR-pPresentIds-parameter**
  
  If *pPresentIds* is not NULL, *pPresentIds* must be a valid pointer to an array of *swapchainCount* uint64_t values

- **VUID-VkPresentIdKHR-swapchainCount-arraylength**
  
  *swapchainCount* must be greater than 0

When the *presentWait* feature is enabled, an application can wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a *VkPresentIdKHR* structure to the *pNext* chain of the *VkPresentInfoKHR* structure and then waiting for that
presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint64_t presentId,
    uint64_t timeout);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the non-retired swapchain on which an image was queued for presentation.
- `presentId` is the presentation presentId to wait for.
- `timeout` is the timeout period in units of nanoseconds. `timeout` is adjusted to the closest value allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

`vkWaitForPresentKHR` waits for the presentId associated with `swapchain` to be increased in value so that it is at least equal to `presentId`.

For `VK_PRESENT_MODE_MAILBOX_KHR` (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image must be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related `pSwapchains` entry will be increased in value so that it is at least equal to the value provided in the `VkPresentIdKHR` structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to `vkWaitForPresentKHR` will block until either the presentId associated with `swapchain` is greater than or equal to `presentId`, or `timeout` nanoseconds passes. When the swapchain becomes `OUT_OF_DATE`, the call will either return `VK_SUCCESS` (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status `VK_ERROR_OUT_OF_DATE_KHR` (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the `swapchain` passed to `vkWaitForPresentKHR` may be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR`. Access to the swapchain data associated with this extension must be atomic within the implementation.

---

**Valid Usage**

- VUID-vkWaitForPresentKHR-swapchain-04997
  `swapchain` must not be in the retired state
- VUID-vkWaitForPresentKHR-presentWait-06234
The **presentWait** feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
  
  *device* **must** be a valid **VkDevice** handle

- VUID-vkWaitForPresentKHR-swapchain-parameter
  
  *swapchain* **must** be a valid **VkSwapchainKHR** handle

- VUID-vkWaitForPresentKHR-swapchain-parent
  
  *swapchain* **must** have been created, allocated, or retrieved from *device*

### Host Synchronization

- Host access to *swapchain* **must** be externally synchronized

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_TIMEOUT**
- **VK_SUBOPTIMAL_KHR**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**
- **VK_ERROR_DEVICE_LOST**
- **VK_ERROR_OUT_OF_DATE_KHR**
- **VK_ERROR_SURFACE_LOST_KHR**
- **VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT**

When the **VK_GGP_frame_token** extension is enabled, a Google Games Platform frame token **can** be specified when presenting an image to a swapchain by adding a **VkPresentFrameTokenGGP** structure to the *pNext* chain of the **VkPresentInfoKHR** structure.

The **VkPresentFrameTokenGGP** structure is defined as:

```c
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **frameToken** is the Google Games Platform frame token.

## Valid Usage

- **VUID-VkPresentFrameTokenGGP-frameToken-02680**
  
  `frameToken` must be a valid `GgpFrameToken`

## Valid Usage (Implicit)

- **VUID-VkPresentFrameTokenGGP-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP`

The `VkSwapchainPresentModeInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModeInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModeInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pPresentModes** is a list of presentation modes with `swapchainCount` entries.

If the **pNext** chain of `VkPresentInfoKHR` includes a `VkSwapchainPresentModeInfoEXT` structure, then that structure defines the presentation modes used for the current and subsequent presentation operations.

When the application changes present modes with `VkSwapchainPresentModeInfoEXT`, images that have already been queued for presentation will continue to be presented according to the previous present mode. The current image being queued for presentation and subsequent images will be presented according to the new present mode. The behavior during the transition between the two modes is defined as follows.

- Transition from `VK_PRESENT Mode_SHARED_CONTINUOUS_REFRESH_KHR` to `VK_PRESENT Mode_SHARED_DEMAND_REFRESH_KHR`: the presentation engine updates the shared presentable image according to the behavior of `VK_PRESENT Mode_SHARED_DEMAND_REFRESH_KHR`.
• Transition from **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** to **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**: the presentation engine **may** update the shared presentable image or defer that to its regular refresh cycle, according to the behavior of **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**.

• Transition between **VK_PRESENT_MODE_FIFO_KHR** and **VK_PRESENT_MODE_FIFO_RELAXED_KHR**: Images continue to be appended to the same FIFO queue, and the behavior with respect to waiting for vertical blanking period will follow the new mode for current and subsequent images.

• Transition from **VK_PRESENT_MODE_IMMEDIATE_KHR** to **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR**: As all prior present requests in the **VK_PRESENT_MODE_IMMEDIATE_KHR** mode are applied immediately, there are no outstanding present operations in this mode, and current and subsequent images are appended to the FIFO queue and presented according to the new mode.

• Transition from **VK_PRESENT_MODE_MAILBOX_KHR** to **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR**: Presentation in both modes require waiting for the next vertical blanking period, with **VK_PRESENT_MODE_MAILBOX_KHR** allowing the pending present operation to be replaced by a new one. In this case, the current present operation will replace the pending present operation and is applied according to the new mode.

• Transition from **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR** to **VK_PRESENT_MODE_IMMEDIATE_KHR** or **VK_PRESENT_MODE_MAILBOX_KHR**: If the FIFO queue is empty, presentation is done according to the behavior of the new mode. If there are present operations in the FIFO queue, once the last present operation is performed based on the respective vertical blanking period, the current and subsequent updates are applied according to the new mode.

• The behavior during transition between any other present modes, if possible, is implementation defined.

---

**Valid Usage**

- **VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-07760**
  - `swapchainCount` **must** be equal to `VkPresentInfoKHR::swapchainCount`

- **VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-07761**
  - Each entry in `pPresentModes` **must** be a presentation mode specified in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` when creating the entry’s corresponding swapchain

---

**Valid Usage (Implicit)**

- **VUID-VkSwapchainPresentModeInfoEXT-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODE_INFO_EXT`

- **VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-parameter**
  - `pPresentModes` **must** be a valid pointer to an array of `swapchainCount` valid `VkPresentModeKHR` values

- **VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-arraylength**
  - `swapchainCount` **must** be greater than 0
The `VkSwapchainPresentFenceInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentFenceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkFence* pFences;
} VkSwapchainPresentFenceInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pFences` is a list of fences with `swapchainCount` entries. Each entry must be `VK_NULL_HANDLE` or the handle of a fence to signal when the relevant operations on the associated swapchain have completed.

The set of queue operations defined by queuing an image for presentation, as well as operations performed by the presentation engine access the payloads of objects associated with the presentation operation. The associated objects include:

- The swapchain image, its implicitly bound memory, and any other resources bound to that memory.
- The wait semaphores specified when queuing the image for presentation.

The application can provide a fence that the implementation will signal when all such queue operations have completed and the presentation engine has taken a reference to the payload of any objects it accesses as part of the present operation. For all binary wait semaphores imported by the presentation engine using the equivalent of reference transference, as described in Importing Semaphore Payloads, this fence must not signal until all such semaphore payloads have been reset by the presentation engine.

The application can destroy the wait semaphores associated with a given presentation operation when the associated fence is signaled, and can destroy the swapchain when the fences associated with all past presentation requests have signaled.

Fences associated with presentations to the same swapchain on the same `VkQueue` must be signaled in the same order as the present operations.

To specify a fence for each swapchain in a present operation, include the `VkSwapchainPresentFenceInfoEXT` structure in the `pNext` chain of the `VkPresentInfoKHR` structure.

### Valid Usage

- VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-07757
  swapchainCount must be equal to `VkPresentInfoKHR::swapchainCount`
Each element of `pFences` must be unsignaled.

Each element of `pFences` must not be associated with any other queue command that has not yet completed execution on that queue.

**Valid Usage (Implicit)**

- **VUID-VkSwapchainPresentFenceInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_FENCE_INFO_EXT`.

- **VUID-VkSwapchainPresentFenceInfoEXT-pFences-parameter**
  
  `pFences` must be a valid pointer to an array of `swapchainCount` valid `VkFence` handles.

- **VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-arraylength**
  
  `swapchainCount` must be greater than 0.

`vkQueuePresentKHR` releases the acquisition of the images referenced by `imageIndices`. The queue family corresponding to the queue `vkQueuePresentKHR` is executed on must have ownership of the presented images as defined in Resource Sharing. `vkQueuePresentKHR` does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using `vkAcquireNextImageKHR`.

The processing of the presentation happens in issue order with other queue operations, but semaphores have to be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue, however, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If multiple swapchains are presented, the result code is determined applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.
- If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.
• If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.

• Otherwise `VK_SUCCESS` is returned.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

**Note**

The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes `vkQueuePresentKHR` to return `VK_ERROR_OUT_OF_DATE_KHR`.

To release images previously acquired through `vkAcquireNextImage2KHR` or `vkAcquireNextImageKHR`, call:

```c
// Provided by VK_EXT_swapchain_maintenance1
VkResult vkReleaseSwapchainImagesEXT(
    VkDevice device,
    const VkReleaseSwapchainImagesInfoEXT* pReleaseInfo);
```

• `device` is the device associated with `VkReleaseSwapchainImagesInfoEXT::swapchain`.

• `pReleaseInfo` is a pointer to a `VkReleaseSwapchainImagesInfoEXT` structure containing parameters of the release.

Only images that are not in use by the device can be released.

Releasing images is a read-only operation that will not affect the content of the released images. Upon reacquiring the image, the image contents and its layout will be the same as they were prior to releasing it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

**Note**

This functionality is useful during swapchain recreation, where acquired images from the old swapchain can be released instead of presented.

**Valid Usage (Implicit)**

• `VUID-vkReleaseSwapchainImagesEXT-device-parameter` `device` must be a valid `VkDevice` handle

• `VUID-vkReleaseSwapchainImagesEXT-pReleaseInfo-parameter`
**pReleaseInfo** must be a valid pointer to a valid `VkReleaseSwapchainImagesInfoEXT` structure

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_SURFACE_LOST_KHR**

The `VkReleaseSwapchainImagesInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkReleaseSwapchainImagesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndexCount;
    const uint32_t* pImageIndices;
} VkReleaseSwapchainImagesInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchain** is a swapchain to which images are being released.
- **imageIndexCount** is the number of image indices to be released.
- **pImageIndices** is a pointer to an array of indices into the array of `swapchain`'s presentable images, with `imageIndexCount` entries.

### Valid Usage

- **VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07785**
  Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by `swapchain`

- **VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07786**
  All uses of presentable images identified by elements of `pImageIndices` must have completed execution

### Valid Usage (Implicit)

- **VUID-VkReleaseSwapchainImagesInfoEXT-sType-sType**
  **sType** must be `VK_STRUCTURE_TYPE_RELEASE_SWAPCHAIN_IMAGES_INFO_EXT`
Host Synchronization

- Host access to `swapchain` must be externally synchronized

### 34.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```c
// Provided by VK_EXT_hdr_metadata
define void vkSetHdrMetadataEXT(
    VkDevice device,
    uint32_t swapchainCount,
    const VkSwapchainKHR* pSwapchains,
    const VkHdrMetadataEXT* pMetadata);
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

The metadata will be applied to the specified `VkSwapchainKHR` objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it.

### Valid Usage (Implicit)

- VUID-vkSetHdrMetadataEXT-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkSetHdrMetadataEXT-pSwapchains-parameter
**pSwapchains** must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles

- VUID-vkSetHdrMetadataEXT-pMetadata-parameter
  **pMetadata** must be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures

- VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength
  `swapchainCount` must be greater than 0

- VUID-vkSetHdrMetadataEXT-pSwapchains-parent
  Each element of **pSwapchains** must have been created, allocated, or retrieved from device

The `VkHdrMetadataEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displayPrimaryRed** is a **VkXYColorEXT** structure specifying the reference monitor's red primary in chromaticity coordinates
- **displayPrimaryGreen** is a **VkXYColorEXT** structure specifying the reference monitor's green primary in chromaticity coordinates
- **displayPrimaryBlue** is a **VkXYColorEXT** structure specifying the reference monitor's blue primary in chromaticity coordinates
- **whitePoint** is a **VkXYColorEXT** structure specifying the reference monitor's white-point in chromaticity coordinates
- **maxLuminance** is the maximum luminance of the reference monitor in nits
- **minLuminance** is the minimum luminance of the reference monitor in nits
- **maxContentLightLevel** is content's maximum luminance in nits
- **maxFrameAverageLightLevel** is the maximum frame average light level in nits
Valid Usage (Implicit)

- VUID-VkHdrMetadataEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_HDR_METADATA_EXT

- VUID-VkHdrMetadataEXT-pNext-pNext
  pNext must be NULL

Note

The validity and use of this data is outside the scope of Vulkan.

The VkXYColorEXT structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkXYColorEXT {
    float x;
    float y;
} VkXYColorEXT;
```

- x is the x chromaticity coordinate.
- y is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

### 34.12. Present Barrier

The VK_NV_present_barrier extension allows applications to synchronize corresponding presentation requests across multiple swapchains using the present barrier. A swapchain is said to be using the present barrier if the swapchain is created by adding a VkSwapchainPresentBarrierCreateInfoNV structure to the pNext chain of the VkSwapchainCreateInfoKHR structure, and setting VkSwapchainPresentBarrierCreateInfoNV::presentBarrierEnable to true.

A set of corresponding presentation requests is defined as exactly one queued presentation request associated with each swapchain using the present barrier, whether or not that queued request has executed. A given presentation request is added, when created by calling vkQueuePresentKHR and specifying a swapchain using the present barrier, either to the oldest existing set of corresponding requests for which there is no existing member associated with the request’s swapchain, or to a new set of corresponding requests if no such set exists.

A set of corresponding requests is said to be full when it contains one request from each swapchain using the present barrier. Queued presentation of an image to a swapchain using the present barrier is deferred by the implementation until the set of corresponding requests is full, and the visibility operations associated with all requests in that set, as described by vkQueuePresentKHR, have completed.
Additionally, the set of swapchains using the present barrier can be in the same process, or different processes running under the same operating system. And if the required synchronization hardware is connected and correctly configured, this extension also supports applications to synchronize corresponding presentation requests using the present barrier across distributed systems. However, the configuration mechanism of the required hardware is outside the scope of the Vulkan specification and this extension.

The `VkSwapchainPresentBarrierCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSwapchainPresentBarrierCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierEnable;
} VkSwapchainPresentBarrierCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentBarrierEnable` is a boolean value indicating a request for using the present barrier.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `presentBarrierEnable` is `VK_FALSE`, meaning the swapchain does not request to use the present barrier. Additionally, when recreating a swapchain that was using the present barrier, and the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, it means the swapchain will stop using the present barrier.

**Valid Usage (Implicit)**

- `VUID-VkSwapchainPresentBarrierCreateInfoNV-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV`
Chapter 35. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

35.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed by the implementation at any time until the deferred operation enters the complete state. The application must obey the following rules while a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.
When the deferred operation is complete, the application should call `vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation may perform memory management operations on the allocator supplied to `vkCreateDeferredOperationKHR` for the deferred operation object, as described in the Memory Allocation chapter. Such allocations must occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation may perform memory management operations on this allocator during the execution of `vkDeferredOperationJoinKHR`. These operations may occur concurrently and may be performed by any joined thread. The application must ensure that the supplied allocator is able to operate correctly under these conditions.

### 35.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- `device` is the device which owns operation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDeferredOperationKHR-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateDeferredOperationKHR-pAllocator-parameter
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter `pDeferredOperation` must be a valid pointer to a `VkDeferredOperationKHR` handle

## Return Codes

### Success
- `VK_SUCCESS`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,
    VkDeferredOperationKHR operation);
```

- `device` is the device which owns `operation`.
- `operation` is the deferred operation that the calling thread should work on.

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.
- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.
- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread
must execute the operation to completion and return `VK_SUCCESS`.

2. If multiple threads have concurrently invoked `vkDeferredOperationJoinKHR` on the same operation, then at least one of them must complete the operation and return `VK_SUCCESS`.

### Valid Usage (Implicit)

- VUID-vkDeferredOperationJoinKHR-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkDeferredOperationJoinKHR-operation-parameter
  
  `operation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkDeferredOperationJoinKHR-operation-parent
  
  `operation` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_THREAD_DONE_KHR`
- `VK_THREAD_IDLE_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

When a deferred operation is completed, the application can destroy the tracking object by calling:

```c
// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice device,
    VkDeferredOperationKHR operation,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the device which owns `operation`.
- `operation` is the completed operation to be destroyed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyDeferredOperationKHR-operation-03434
  
  If `VkAllocationCallbacks` were provided when `operation` was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDeferredOperationKHR-operation-03435
If no \texttt{VkAllocationCallbacks} were provided when \texttt{operation} was created, \texttt{pAllocator} must be \texttt{NULL}

- \texttt{VUID-vkDestroyDeferredOperationKHR-operation-03436} \\
  \texttt{operation} must be completed

### Valid Usage (Implicit)

- \texttt{VUID-vkDestroyDeferredOperationKHR-device-parameter} \\
  \texttt{device} must be a valid \texttt{VkDevice} handle

- \texttt{VUID-vkDestroyDeferredOperationKHR-operation-parameter} \\
  If \texttt{operation} is not \texttt{VK_NULL_HANDLE}, \texttt{operation} must be a valid \texttt{VkDeferredOperationKHR} handle

- \texttt{VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter} \\
  If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure

- \texttt{VUID-vkDestroyDeferredOperationKHR-operation-parent} \\
  If \texttt{operation} is a valid handle, it must have been created, allocated, or retrieved from \texttt{device}

### Host Synchronization

- Host access to \texttt{operation} must be externally synchronized

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device, 
    VkDeferredOperationKHR operation);
```

- \texttt{device} is the device which owns \texttt{operation}.
- \texttt{operation} is the deferred operation to be queried.

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications \textbf{can} join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins \textbf{may} return \texttt{VK_THREAD_DONE_KHR} immediately, performing no useful work.

If \texttt{operation} is complete, \texttt{vkGetDeferredOperationMaxConcurrencyKHR} returns zero.

If \texttt{operation} is currently joined to any threads, the value returned by this command \textbf{may}
immediately be out of date.

If \texttt{operation} is pending, implementations \textbf{must} not return zero unless at least one thread is currently executing \texttt{vkDeferredOperationJoinKHR} on \texttt{operation}. If there are such threads, the implementation \textbf{should} return an estimate of the number of additional threads which it could profitably use.

Implementations \textbf{may} return $2^{32} - 1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations \textbf{may} return values larger than the maximum concurrency available on the host CPU. In these situations, an application \textbf{should} clamp the return value rather than oversubscribing the machine.

\begin{quote}
\textbf{Note}

The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives \texttt{VK_THREAD_IDLE_KHR}, the application should schedule an additional join at some point in the future, but is not required to do so.
\end{quote}

\begin{itemize}
\item VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle
\item VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter \texttt{operation} \textbf{must} be a valid \texttt{VkDeferredOperationKHR} handle
\item VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent \texttt{operation} \textbf{must} have been created, allocated, or retrieved from \texttt{device}
\end{itemize}

The \texttt{vkGetDeferredOperationResultKHR} function is defined as:

\begin{verbatim}
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device, 
    VkDeferredOperationKHR operation);
\end{verbatim}

\begin{itemize}
\item \texttt{device} is the device which owns \texttt{operation}.
\item \texttt{operation} is the operation whose deferred result is being queried.
\end{itemize}

If no command has been deferred on \texttt{operation}, \texttt{vkGetDeferredOperationResultKHR} returns \texttt{VK_SUCCESS}.

If the deferred operation is pending, \texttt{vkGetDeferredOperationResultKHR} returns \texttt{VK_NOT_READY}.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value \textbf{must} be one of the \texttt{VkResult} values which could have been returned by the original command if the operation had not been deferred.
Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
  *device must* be a valid *VkDevice* handle

- VUID-vkGetDeferredOperationResultKHR-operation-parameter
  *operation must* be a valid *VkDeferredOperationKHR* handle

- VUID-vkGetDeferredOperationResultKHR-operation-parent
  *operation must* have been created, allocated, or retrieved from *device*

Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY
Chapter 36. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a VkDevicePrivateDataCreateInfo in the pNext chain in VkDeviceCreateInfo before device creation. Multiple VkDevicePrivateDataCreateInfo structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by VkPrivateDataSlot handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(
    VkDevice device, 
    const VkPrivateDataSlotCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkPrivateDataSlot* pPrivateDataSlot);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(
    VkDevice device, 
    const VkPrivateDataSlotCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkPrivateDataSlot* pPrivateDataSlot);
```

- **device** is the logical device associated with the creation of the object(s) holding the private data slot.
• `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfo`
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlot` handle in which the resulting private data slot is returned

### Valid Usage

- VUID-vkCreatePrivateDataSlot-privateData-04564
  The `privateData` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCreatePrivateDataSlot-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkPrivateDataSlotCreateInfo` structure
- VUID-vkCreatePrivateDataSlot-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter
  `pPrivateDataSlot` must be a valid pointer to a `VkPrivateDataSlot` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPrivateDataSlotCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
```
typedef VkPrivateDataSlotCreateInfo VkPrivateDataSlotCreateInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.

Valid Usage (Implicit)

• VUID-VkPrivateDataSlotCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO
• VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
  pNext must be NULL
• VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask
  flags must be 0

// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;

or the equivalent

// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;

VkPrivateDataSlotCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);

or the equivalent command

// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
    VkDevice device,
    VkPrivateDataSlot privateDataSlot,
    const VkAllocationCallbacks* pAllocator);
• **device** is the logical device associated with the creation of the object(s) holding the private data slot.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **privateDataSlot** is the private data slot to destroy.

### Valid Usage

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062
  If *VkAllocationCallbacks* were provided when *privateDataSlot* was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063
  If no *VkAllocationCallbacks* were provided when *privateDataSlot* was created, *pAllocator* must be NULL.

### Valid Usage (Implicit)

- VUID-vkDestroyPrivateDataSlot-device-parameter
  *device* must be a valid *VkDevice* handle.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter
  If *privateDataSlot* is not *VK_NULL_HANDLE*, *privateDataSlot* must be a valid *VkPrivateDataSlot* handle.

- VUID-vkDestroyPrivateDataSlot-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid *VkAllocationCallbacks* structure.

- VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent
  If *privateDataSlot* is a valid handle, it must have been created, allocated, or retrieved from *device*.

### Host Synchronization

- Host access to *privateDataSlot* must be externally synchronized.

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
VkResult _vkSetPrivateData(
  VkDevice                device,
  VkObjectType           objectType,
  uint64_t                objectHandle,
  VkPrivateDataSlot      privateDataSlot,
  uint64_t                data);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
  - `objectHandle` must be `device` or a child of `device`
- VUID-vkSetPrivateData-objectHandle-04017
  - `objectHandle` must be a valid handle to an object of type `objectType`

### Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetPrivateData-objectType-parameter
  - `objectType` must be a valid `VkObjectType` value
- VUID-vkSetPrivateData-privateDataSlot-parameter
  - `privateDataSlot` must be a valid `VkPrivateDataSlot` handle
- VUID-vkSetPrivateData-privateDataSlot-parent
  - `privateDataSlot` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

- **device** is the device that created the object
- **objectType** is a `VkObjectType` specifying the type of object data is associated with.
- **objectHandle** is a handle to the object data is associated with.
- **privateDataSlot** is a handle to a `VkPrivateDataSlot` specifying location of private data pointer storage.
- **pData** is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to `vkSetPrivateData` using the object specified by `objectHandle`.

**Note**

Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateData` for `VkSwapchainKHR` objects on which `vkSetPrivateData` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.

**Valid Usage**

- VUID-vkGetPrivateData-objectType-04018
  `objectType` must be `VK_OBJECT_TYPE_DEVICE`, or an object type whose parent is `VkDevice`

**Valid Usage (Implicit)**

- VUID-vkGetPrivateData-device-parameter
  `Device` must be a valid `VkDevice` handle
- VUID-vkGetPrivateData-objectType-parameter
  `objectType` **must** be a valid `VkObjectType` value

- VUID-vkGetPrivateData-privateDataSlot-parameter
  `privateDataSlot` **must** be a valid `VkPrivateDataSlot` handle

- VUID-vkGetPrivateData-pData-parameter
  `pData` **must** be a valid pointer to a `uint64_t` value

- VUID-vkGetPrivateData-privateDataSlot-parent
  `privateDataSlot` **must** have been created, allocated, or retrieved from `device`
Chapter 37. Acceleration Structures

37.1. Acceleration Structures

*Acceleration structures* are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see *Acceleration Structures*), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, *top level acceleration structures* and *bottom level acceleration structures*.

An acceleration structure is considered to be constructed if an *acceleration structure build command* or *copy command* has been executed with the given acceleration structure as the destination.

![Diagram of Acceleration Structures](image)

*Figure 27. Acceleration Structure*

**Caption**

The diagram shows the relationship between top and bottom level acceleration structures.

37.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.
37.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

37.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

37.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.

• Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT` was set in `flags`, the application must provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application must provide the original micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV` was set in `flags`, the application must provide a displacement micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and the displacement micromap update flag is not set the application must provide the original micromap to the update operation.

### 37.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal inactive primitives or instances.

An inactive triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An inactive instance is one whose acceleration structure reference is 0.

An inactive AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via `InstanceId` and `PrimitiveId` SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.
37.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure’s structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be `NULL` for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

**Valid Usage**

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241
  `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- VUID-vkCmdBuildAccelerationStructureNV-dst-02488
  `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, and `VkAccelerationStructureInfoNV::instanceCount`
VkAccelerationStructureInfoNV::geometryCount for dst are greater than or equal to the build size and each geometry in VkAccelerationStructureInfoNV::pGeometries for dst has greater than or equal to the number of vertices, indices, and AABBs

- VUID-vkCmdBuildAccelerationStructureNV-update-02489
  If update is VK_TRUE, src must not be VK_NULL_HANDLE

- VUID-vkCmdBuildAccelerationStructureNV-update-02490
  If update is VK_TRUE, src must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV set in VkAccelerationStructureInfoNV::flags in the original build

- VUID-vkCmdBuildAccelerationStructureNV-update-02491
  If update is VK_FALSE, the size member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure set to dst and VkAccelerationStructureMemoryRequirementsInfoNV::type set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset

- VUID-vkCmdBuildAccelerationStructureNV-update-02492
  If update is VK_TRUE, the size member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure set to dst and VkAccelerationStructureMemoryRequirementsInfoNV::type set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset

- VUID-vkCmdBuildAccelerationStructureNV-scratch-03522
  scratch must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag

- VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523
  If instanceData is not VK_NULL_HANDLE, instanceData must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag

- VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786
  Each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in instanceData must be a valid device address containing a value obtained from vkGetAccelerationStructureHandleNV

- VUID-vkCmdBuildAccelerationStructureNV-update-03524
  If update is VK_TRUE, then objects that were previously active must not be made inactive as per Inactive Primitives and Instances

- VUID-vkCmdBuildAccelerationStructureNV-update-03525
  If update is VK_TRUE, then objects that were previously inactive must not be made active as per Inactive Primitives and Instances

- VUID-vkCmdBuildAccelerationStructureNV-update-03526
  If update is VK_TRUE, the src and dst objects must either be the same object or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructureNV-dst-07787
  dst must be bound completely and contiguously to a single VkDeviceMemory object via
Valid Usage (Implicit)

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkAccelerationStructureInfoNV structure

• VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter
  If instanceData is not VK_NULL_HANDLE, instanceData must be a valid VkBuffer handle

• VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
  dst must be a valid VkAccelerationStructureNV handle

• VUID-vkCmdBuildAccelerationStructureNV-src-parameter
  If src is not VK_NULL_HANDLE, src must be a valid VkAccelerationStructureNV handle

• VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
  scratch must be a valid VkBuffer handle

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdBuildAccelerationStructureNV-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBuildAccelerationStructureNV-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBuildAccelerationStructureNV-commonparent
  Each of commandBuffer, dst, instanceData, scratch, and src that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To build acceleration structures call:

```c
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR | VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`. Accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure` must be synchronized...
with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, as appropriate.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member
must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of \texttt{pInfos}, if its \texttt{type} member is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR}, its \texttt{dstAccelerationStructure} member must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, inactive primitives in its \texttt{srcAccelerationStructure} member must not be made active

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, active primitives in its \texttt{srcAccelerationStructure} member must not be made inactive

- VUID-vkCmdBuildAccelerationStructuresKHR-None-03407
  The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must not be referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR} in any other element of \texttt{pInfos}

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{scratchData} member of any other element of \texttt{pInfos}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure} member of any element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it must not be NULL

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, and geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, then the value of each index referenced must be the same as the corresponding index value when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its primitiveCount member must have the same value which was specified when
**srcAccelerationStructure** was last built

- **VID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770**
  For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member must have the same value which was specified when `srcAccelerationStructure` was last built

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `pBuildRangeInfos[i][j].primitiveCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707**
  For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709**
  For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `build ScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672**
  If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where N is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

- **VID-vkCmdBuildAccelerationStructuresKHR-geometry-03673**
  The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag

- **VID-vkCmdBuildAccelerationStructuresKHR-pInfos-03674**
The buffer from which the buffer device address \texttt{pInfos[i].scratchData.deviceAddress} is queried \textbf{must} have been created with \texttt{VK_BUFFER_USAGE_STORAGE_BUFFER_BIT} usage flag

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03802
  For each element of \texttt{pInfos}, its \texttt{scratchData.deviceAddress} member \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03803
  For each element of \texttt{pInfos}, if \texttt{scratchData.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710
  For each element of \texttt{pInfos}, its \texttt{scratchData.deviceAddress} member \textbf{must} be a multiple of \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03804
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, \texttt{geometry.triangles.vertexData.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if \texttt{geometry.triangles.vertexData.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if \texttt{geometry.triangles.indexType} is not \texttt{VK_INDEX_TYPE_NONE_KHR}, \texttt{geometry.triangles.indexData.deviceAddress} \textbf{must} be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03807
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, if \texttt{geometry.triangles.indexType} is not \texttt{VK_INDEX_TYPE_NONE_KHR}, \texttt{geometry.triangles.indexData.deviceAddress} \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, and with \texttt{geometry.triangles.indexType} not equal to \texttt{VK_INDEX_TYPE_NONE_KHR}, \texttt{geometry.triangles.indexData.deviceAddress} \textbf{must} be aligned to the size in bytes of the type in \texttt{indexType}
VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.device Address must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, if geometry.aabbs.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03714
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_FALSE, geometry.instances.data.deviceAddress must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03715
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, geometry.instances.data.deviceAddress must be aligned to 8 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03716
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.arrayOfPointers is VK_TRUE, each element of geometry.instances.data.deviceAddress in device memory must be aligned to 16 bytes

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR`::`accelerationStructureReference` value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

For each `pInfos[i]`, `dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR`::`size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount)`.

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `VkAccelerationStructureBuildGeometryInfoKHR` structures.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures.
- `ppBuildRangeInfos` must be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- `commandBuffer` must only be called outside of a render pass instance.
- `commandBuffer` must only be called outside of a video coding scope.
- `infoCount` must be greater than 0.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

To build acceleration structures with some parameters sourced on the device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

• `commandBuffer` is the command buffer into which the command will be recorded.

• `infoCount` is the number of acceleration structures to build.

• `pInfos` is a pointer to an array of `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.

• `pIndirectDeviceAddresses` is a pointer to an array of `VkDeviceAddress` buffer device addresses which point to `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

• `pIndirectStrides` is a pointer to an array of `infoCount` byte strides between elements of `pIndirectDeviceAddresses`.

• `ppMaxPrimitiveCounts` is a pointer to an array of `infoCount` pointers to arrays of `pInfos[i].geometryCount` values indicating the maximum number of primitives that will be built by this command for each geometry.

Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with `vkCmdBuildAccelerationStructuresKHR`.

Accesses to any element of `pIndirectDeviceAddresses` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_INDIRECT_COMMAND_READ_BIT`. 
Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureIndirectBuild` feature **must** be enabled.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The `mode` member of each element of `pInfos` **must** be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member **must** be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` **must** be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its
The srcAccelerationStructure member must not be made active

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, active primitives in its srcAccelerationStructure member must not be made inactive

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407**
  The dstAccelerationStructure member of any element of pInfos must not be referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any other element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the dstAccelerationStructure member of any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfos (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704**
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705**
  The range of memory backing the scratchData member of any element of pInfos that is accessed by this command must not overlap the memory backing the srcAccelerationStructure member of any element of pInfos with a mode equal to VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and
dstAccelerationStructure members must either be the same
  VkAccelerationStructureKHR, or not have any memory aliasing

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have
  the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same
  value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same
  value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, its geometryType member must have the same value which was
  specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, its flags member must have the same value which was specified
  when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its
  geometry.triangles.vertexFormat member must have the same value which was specified
  when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03764
  For each element of pInfos, if its mode member is
  VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each
  VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or
  ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its
  geometry.triangles.maxVertex member must have the same value which was specified
  when srcAccelerationStructure was last built
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.transformData` address was NULL when `srcAccelerationStructure` was last built, then it **must** be NULL.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, its `primitiveCount` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each `VkAccelerationStructureBuildRangeInfoKHR` referenced by this command, if the corresponding geometry uses indices, its `firstVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppMaxPrimitiveCounts[i][j]` **must** be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to device memory.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag.

For each element of `pInfos`, its `scratchData.deviceAddress` member must be a valid device address obtained from `vkGetBufferDeviceAddress`.

For each element of `pInfos`, if `scratchData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`.
For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexData.deviceAddress is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexData.deviceAddress is aligned to the size in bytes of the type in indexType.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexData.deviceAddress not equal to VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to the size in bytes of the type in indexType.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be a valid device address obtained from vkGetBufferDeviceAddress.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not 0, it must be aligned to 16 bytes.

For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR...
**VK_GEOMETRY_TYPE_AABBS_KHR**, geometry.aabbs.data.deviceAddress must be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, if `geometry.aabbs.data.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, geometry.aabbs.data.deviceAddress must be bound completely to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, geometry.aabbs.data.deviceAddress must be aligned to 8 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, if `geometry.arrayOfPointers` is **VK_FALSE**, geometry.instances.data.deviceAddress must be aligned to 16 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, if `geometry.arrayOfPointers` is **VK_TRUE**, each element of geometry.instances.data.deviceAddress in device memory must be aligned to 8 bytes

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, geometry.instances.data.deviceAddress must be a valid device address obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, if geometry.instances.data.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-06707**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a geometryType of **VK_GEOMETRY_TYPE_AABBS_KHR**, each `VkAccelerationStructureInstanceKHR`::accelerationStructureReference value in geometry.instances.data.deviceAddress must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645**
  For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03646**
  For any element of `pIndirectDeviceAddresses[i]`, all device addresses between `pIndirectDeviceAddresses[i]` and `pIndirectDeviceAddresses[i] + (pInfos[i].geometryCount × 2901)`
pIndirectStrides[i] - 1 must be in the buffer device address range of the same buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03647
  For any element of pIndirectDeviceAddresses, the buffer from which it was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03648
  Each element of pIndirectDeviceAddresses must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03649
  Each element of pIndirectDeviceAddresses must be a multiple of 4

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-03649
  commandBuffer must not be a protected command buffer

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03651
  Each VkAccelerationStructureBuildRangeInfoKHR structure referenced by any element of pIndirectDeviceAddresses must be a valid VkAccelerationStructureBuildRangeInfoKHR structure

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652
  pInfo[i].dstAccelerationStructure must have been created with a value of VkAccelerationStructureCreateInfoKHR::size greater than or equal to the memory size required by the build operation, as returned by vkGetAccelerationStructureBuildSizesKHR with pBuildInfo = pInfo[i] and pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653
  Each ppMaxPrimitiveCounts[i][j] must be greater than or equal to the primitiveCount value specified by the VkAccelerationStructureBuildRangeInfoKHR structure located at pIndirectDeviceAddresses[i] + (j × pIndirectStrides[i])

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter
  pInfo must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state
The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

This command must only be called outside of a render pass instance.

This command must only be called outside of a video coding scope.

`infoCount` must be greater than 0.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkAccelerationStructureBuildGeometryInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeKHR type;
    VkBuildAccelerationStructureFlagsKHR flags;
    VkBuildAccelerationStructureModeKHR mode;
    VkAccelerationStructureKHR srcAccelerationStructure;
    VkAccelerationStructureKHR dstAccelerationStructure;
    uint32_t geometryCount;
    const VkAccelerationStructureGeometryKHR* pGeometries;
    const VkAccelerationStructureGeometryKHR* const* ppGeometries;
    VkDeviceOrHostAddressKHR scratchData;
} VkAccelerationStructureBuildGeometryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• **type** is a **VkAccelerationStructureTypeKHR** value specifying the type of acceleration structure being built.

• **flags** is a bitmask of **VkBuildAccelerationStructureFlagBitsKHR** specifying additional parameters of the acceleration structure.

• **mode** is a **VkBuildAccelerationStructureModeKHR** value specifying the type of operation to perform.

• **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the dst acceleration structure when **mode** is **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR**.

• **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.

• **geometryCount** specifies the number of geometries that will be built into **dstAccelerationStructure**.

• **pGeometries** is a pointer to an array of **VkAccelerationStructureGeometryKHR** structures.

• **ppGeometries** is a pointer to an array of pointers to **VkAccelerationStructureGeometryKHR** structures.

• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of **pGeometries** or **ppGeometries** can be a valid pointer, the other must be **NULL**. Each element of the non-**NULL** array describes the data used to build each acceleration structure geometry.

The index of each element of the **pGeometries** or **ppGeometries** members of **VkAccelerationStructureBuildGeometryInfoKHR** is used as the **geometry index** during ray traversal. The geometry index is available in ray shaders via the **RayGeometryIndexKHR** built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the **OpRayQueryGetIntersectionGeometryIndexKHR** instruction.

Setting **VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV** in **flags** indicates that this build is a motion top level acceleration structure. A motion top level uses instances of format **VkAccelerationStructureMotionInstanceNV** if **VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers** is **VK_FALSE**.

If **VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers** is **VK_TRUE**, the pointer for each element of the array of instance pointers consists of 4 bits of **VkAccelerationStructureMotionInstanceTypeNV** in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of **VkAccelerationStructureInstanceKHR**, **VkAccelerationStructureMatrixMotionInstanceNV** or **VkAccelerationStructureSRTMotionInstanceNV**, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances must set **VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV** in **flags**.

Members **srcAccelerationStructure** and **dstAccelerationStructure** may be the same or different for...
an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

**Valid Usage**

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654**
  
  *type* must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788**
  
  Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be `NULL`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, `geometryCount` must be 1

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must be the same

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then `geometryCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_AABBS_KHR`, the total number of AABBs in all geometries must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03795**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the total number of triangles in all geometries must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-03796**
  
  If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR` bit set, then it must not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR` bit set

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-dstAccelerationStructure-04927**
  
  If `dstAccelerationStructure` was created with `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` set in `VkAccelerationStructureCreateInfoKHR::flags`,
**VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV** must be set in **flags**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-04928
  If **VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV** is set in **flags**, **dstAccelerationStructure** must have been created with **VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV** set in **VkAccelerationStructureCreateInfoKHR::flags**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-04929
  If **VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV** is set in **flags**, **type** must not be **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-07334
  If **flags** has the **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT** bit set then it must not have the **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT** bit set

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext
  **pNext** must be **NULL**

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter
  **type** must be a valid **VkAccelerationStructureTypeKHR** value

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter
  **flags** must be a valid combination of **VkBuildAccelerationStructureFlagBitsKHR** values

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter
  If **geometryCount** is not 0, and **pGeometries** is not NULL, **pGeometries** must be a valid pointer to an array of **geometryCount** valid **VkAccelerationStructureGeometryKHR** structures

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter
  If **geometryCount** is not 0, and **ppGeometries** is not NULL, **ppGeometries** must be a valid pointer to an array of **geometryCount** valid pointers to valid **VkAccelerationStructureGeometryKHR** structures

- VUID-VkAccelerationStructureBuildGeometryInfoKHR-commonparent
  Both of **dstAccelerationStructure**, and **srcAccelerationStructure** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same **VkDevice**

The **VkBuildAccelerationStructureModeKHR** enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```
• **VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR** specifies that the destination acceleration structure will be built using the specified geometries.

• **VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR** specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The **VkDeviceOrHostAddressKHR** union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
```

• **deviceAddress** is a buffer device address as returned by the **vkGetBufferDeviceAddressKHR** command.

• **hostAddress** is a host memory address.

The **VkDeviceOrHostAddressConstKHR** union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

• **deviceAddress** is a buffer device address as returned by the **vkGetBufferDeviceAddressKHR** command.

• **hostAddress** is a const host memory address.

The **VkAccelerationStructureGeometryKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **geometryType** describes which type of geometry this **VkAccelerationStructureGeometryKHR** refers to.
• \textit{geometry} is a \texttt{VkAccelerationStructureGeometryDataKHR} union describing the geometry data for the relevant geometry type.

• \textit{flags} is a bitmask of \texttt{VkGeometryFlagBitsKHR} values describing additional properties of how the geometry should be built.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryKHR-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR}

- VUID-VkAccelerationStructureGeometryKHR-pNext-pNext
  \texttt{pNext} must be \texttt{NULL}

- VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter
  \texttt{geometryType} must be a valid \texttt{VkGeometryTypeKHR} value

- VUID-VkAccelerationStructureGeometryKHR-triangles-parameter
  If \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, the \texttt{triangles} member of \texttt{geometry} must be a valid \texttt{VkAccelerationStructureGeometryTrianglesDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter
  If \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_AABBS_KHR}, the \texttt{aabbs} member of \texttt{geometry} must be a valid \texttt{VkAccelerationStructureGeometryAabbsDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-instances-parameter
  If \texttt{geometryType} is \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR}, the \texttt{instances} member of \texttt{geometry} must be a valid \texttt{VkAccelerationStructureGeometryInstancesDataKHR} structure

- VUID-VkAccelerationStructureGeometryKHR-flags-parameter
  \texttt{flags} must be a valid combination of \texttt{VkGeometryFlagBitsKHR} values

The \texttt{VkAccelerationStructureGeometryDataKHR} union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
    VkAccelerationStructureGeometryTrianglesDataKHR triangles;
    VkAccelerationStructureGeometryAabbsDataKHR aabbs;
    VkAccelerationStructureGeometryInstancesDataKHR instances;
} VkAccelerationStructureGeometryDataKHR;
```

• \texttt{triangles} is a \texttt{VkAccelerationStructureGeometryTrianglesDataKHR} structure.

• \texttt{aabbs} is a \texttt{VkAccelerationStructureGeometryAabbsDataKHR} structure.

• \texttt{instances} is a \texttt{VkAccelerationStructureGeometryInstancesDataKHR} structure.

The \texttt{VkAccelerationStructureGeometryTrianglesDataKHR} structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```
const void* pNext;
VkFormat vertexFormat;
VkDeviceOrHostAddressConstKHR vertexData;
VkDeviceSize vertexStride;
uint32_t maxVertex;
VkIndexType indexType;
VkDeviceOrHostAddressConstKHR indexData;
VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **vertexFormat** is the **VkFormat** of each vertex element.
- **vertexData** is a device or host address to memory containing vertex data for this geometry.
- **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.
- **vertexStride** is the stride in bytes between each vertex.
- **indexType** is the **VkIndexType** of each index element.
- **indexData** is a device or host address to memory containing index data for this geometry.
- **transformData** is a device or host address to memory containing an optional reference to a **VkTransformMatrixKHR** structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

**Note**

Unlike the stride for vertex buffers in **VkVertexInputBindingDescription** for graphics pipelines which must not exceed **maxVertexInputBindingStride**, **vertexStride** for acceleration structure geometry is instead restricted to being a 32-bit value.

**Valid Usage**

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735**
  
  **vertexStride** must be a multiple of the size in bytes of the smallest component of **vertexFormat**

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819**
  
  **vertexStride** must be less than or equal to $2^{32} - 1$

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797**
  
  The format features of **vertexFormat** must contain **VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR**

- **VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798**
  
  **indexType** must be **VK_INDEX_TYPE_UINT16**, **VK_INDEX_TYPE_UINT32**, or **VK_INDEX_TYPENONE_KHR**
Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of 
  VkAccelerationStructureGeometryMotionTrianglesDataNV,
  VkAccelerationStructureTrianglesDisplacementMicromapNV, or
  VkAccelerationStructureTrianglesOpacityMicromapEXT

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  
  vertexFormat must be a valid VkFormat value

- VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  
  indexType must be a valid VkIndexType value

The VkAccelerationStructureGeometryMotionTrianglesDataNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- vertexData is a pointer to vertex data for this geometry at time 1.0

If VkAccelerationStructureGeometryMotionTrianglesDataNV is included in the pNext chain of a VkAccelerationStructureGeometryTrianglesDataKHR structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the vertexData in VkAccelerationStructureGeometryMotionTrianglesDataNV is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for VkAccelerationStructureGeometryMotionTrianglesDataNV vertexData is equivalent to the basic vertex position data.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV
The `VkAccelerationStructureTrianglesOpacityMicromapEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **indexType** is the type of triangle indices used when indexing this micromap.
- **indexBuffer** is the address containing the triangle indices.
- **indexStride** is the byte stride between triangle indices.
- **baseTriangle** is the base value added to the non-negative triangle indices.
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
- **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.
- **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
- **micromap** is the handle to the micromap object to include in this geometry.

If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. If that value is the unsigned cast of one of the values from `VkOpacityMicromapSpecialIndexEXT` then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given format and subdivisionLevel the number of triangles in this geometry matching those values after indirection and special index handling must be equal to the sum of matching `count` provided.

If `micromap` is `VK_NULL_HANDLE`, then every value read from `indexBuffer` must be one of the values in `VkOpacityMicromapSpecialIndexEXT`. 

...
Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other **must** be `NULL`.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT`.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter
  `indexType` **must** be a valid `VkIndexType` value.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If `usageCountsCount` is not 0, and `pUsageCounts` is not `NULL`, `pUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not 0, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` **must** be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` **must** be a valid `VkMicromapEXT` handle.

The `VkOpacityMicromapSpecialIndexEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT = -4,
} VkOpacityMicromapSpecialIndexEXT;
```

- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT` specifies that the entire triangle is fully transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT` specifies that the entire triangle is fully opaque.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT` specifies that the entire triangle is unknown-transparent.
- `VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT` specifies that the entire triangle is unknown-opaque.

The `VkAccelerationStructureTrianglesDisplacementMicromapNV` structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
```
typedef struct VkAccelerationStructureTrianglesDisplacementMicromapNV {
    VkStructureType sType;
    void* pNext;
    VkFormat displacementBiasAndScaleFormat;
    VkFormat displacementVectorFormat;
    VkDeviceOrHostAddressConstKHR displacementBiasAndScaleBuffer;
    VkDeviceSize displacementBiasAndScaleStride;
    VkDeviceOrHostAddressConstKHR displacementVectorBuffer;
    VkDeviceSize displacementVectorStride;
    VkDeviceOrHostAddressConstKHR displacedMicromapPrimitiveFlags;
    VkDeviceSize displacedMicromapPrimitiveFlagsStride;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesDisplacementMicromapNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displacementBiasAndScaleFormat** is the format of displacement bias and scale used in this displacement micromap reference.
- **displacementVectorFormat** is the format of displacement vector used in this displacement micromap reference.
- **displacementBiasAndScaleBuffer** is the address containing the bias and scale.
- **displacementBiasAndScaleStride** is the byte stride between bias and scale values.
- **displacementVectorBuffer** is the address containing the displacement vector values.
- **displacementVectorStride** is the byte stride between displacement vector values.
- **displacedMicromapPrimitiveFlags** is the address containing the primitive flags.
- **displacedMicromapPrimitiveFlagsStride** is the byte stride between primitive flag values.
- **indexType** is the type of triangle indices used when indexing this micromap.
- **indexBuffer** is the address containing the triangle indices.
- **indexStride** is the byte stride between triangle indices.
- **baseTriangle** is the base value added to the non-negative triangle indices.
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
- **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.
- **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
- **micromap** is the handle to the micromap object to include in this geometry.
If `VkAccelerationStructureTrianglesDisplacementMicromapNV` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. That triangle uses the displacement micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`. The elements of the non-`NULL` array describe the total count used to build this geometry. For a given `format` and `subdivisionLevel` the number of triangles in this geometry matching those values after indirection must be equal to the sum of matching `count` provided.

### Valid Usage

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-07992
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_DISPLACEMENT_MICROMAP_NV`.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementBiasAndScaleFormat-parameter
  `displacementBiasAndScaleFormat` must be a valid `VkFormat` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementVectorFormat-parameter
  `displacementVectorFormat` must be a valid `VkFormat` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-indexType-parameter
  `indexType` must be a valid `VkIndexType` value.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-ppUsageCounts-parameter
  If `usageCountsCount` is not `0`, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle.

The `VkTransformMatrixKHR` structure is defined as:
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
float matrix[3][4];
} VkTransformMatrixKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;

• matrix is a 3x4 row-major affine transformation matrix.

Valid Usage

• VUID-VkTransformMatrixKHR-matrix-03799
The first three columns of matrix must define an invertible 3x3 matrix

The VkAccelerationStructureGeometryAabbsDataKHR structure is defined as:

// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• data is a device or host address to memory containing VkAabbPositionsKHR structures containing position data for each axis-aligned bounding box in the geometry.
• stride is the stride in bytes between each entry in data. The stride must be a multiple of 8.

Valid Usage

• VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
    stride must be a multiple of 8
• VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
    stride must be less than or equal to $2^{32}-1$
Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABBS_DATA_KHR
- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  pNext must be NULL

The VkAabbPositionsKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VkAabbPositionsNV;
```

- minX is the x position of one opposing corner of a bounding box.
- minY is the y position of one opposing corner of a bounding box.
- minZ is the z position of one opposing corner of a bounding box.
- maxX is the x position of the other opposing corner of a bounding box.
- maxY is the y position of the other opposing corner of a bounding box.
- maxZ is the z position of the other opposing corner of a bounding box.

Valid Usage

- VUID-VkAabbPositionsKHR-minX-03546
  minX must be less than or equal to maxX
- VUID-VkAabbPositionsKHR-minY-03547
  minY must be less than or equal to maxY
- VUID-VkAabbPositionsKHR-minZ-03548
  minZ must be less than or equal to maxZ

The VkAccelerationStructureGeometryInstancesDataKHR structure is defined as:
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- arrayOfPointers specifies whether data is used as an array of addresses or just an array.
- data is either the address of an array of device or host addresses referencing individual VkAccelerationStructureInstanceKHR structures or packed motion instance information as described in motion instances if arrayOfPointers is VK_TRUE, or the address of an array of VkAccelerationStructureInstanceKHR or VkAccelerationStructureMotionInstanceNV structures. Addresses and VkAccelerationStructureInstanceKHR structures are tightly packed. VkAccelerationStructureMotionInstanceNV structures have a stride of 160 bytes.

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext pNext must be NULL

**Acceleration structure instances** can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```
or the equivalent
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;

- **transform** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure.

- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.

- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask & instance.mask != 0

- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.

- **flags** is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.

- **accelerationStructureReference** is either:
  - a device address containing the value obtained from vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV (used by device operations which reference acceleration structures) or,
  - a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory

- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter
  
  **flags** must be a valid combination of VkGeometryInstanceFlagBitsKHR values

Possible values of **flags** in the instance modifying the behavior of that instance are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    // Provided by VK_EXT_opacity_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    // Provided by VK_NV Ray Tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV Ray Tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;

- **VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR** disables face culling for this instance.
- **VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR** indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.
- **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **NoOpaqueKHR** ray flag.
- **VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** causes this instance to act as though **VK_GEOMETRY_OPAQUE_BIT_KHR** were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V **OpaqueKHR** ray flag.

**VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR** and **VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR** must not be used in the same flag.
typedef VkFlags VkGeometryInstanceFlagsKHR;

or the equivalent

typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;

VkGeometryInstanceFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryInstanceFlagBitsKHR.

Acceleration structure motion instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMotionInstanceNV {
  VkAccelerationStructureMotionInstanceTypeNV type;
  VkAccelerationStructureMotionInstanceFlagsNV flags;
  VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

- **type** is a VkAccelerationStructureMotionInstanceTypeNV enumerant identifying which type of motion instance this is and which type of the union is valid.
- **flags** is currently unused, but is required to keep natural alignment of data.
- **data** is a VkAccelerationStructureMotionInstanceDataNV containing motion instance data for this instance.

**Note**
If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureMotionInstanceNV-type-parameter
  type must be a valid VkAccelerationStructureMotionInstanceTypeNV value
- VUID-VkAccelerationStructureMotionInstanceNV-flags-zerobitmask
  flags must be 0
- VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter
  If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV, the staticInstance
member of `data` must be a valid `VkAccelerationStructureInstanceKHR` structure

- **VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter**
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV`, the `matrixMotionInstance` member of `data` must be a valid `VkAccelerationStructureMatrixMotionInstanceNV` structure

- **VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter**
  If `type` is `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV`, the `srtMotionInstance` member of `data` must be a valid `VkAccelerationStructureSRTMotionInstanceNV` structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

- `staticInstance` is a `VkAccelerationStructureInstanceKHR` structure containing data for a static instance.
- `matrixMotionInstance` is a `VkAccelerationStructureMatrixMotionInstanceNV` structure containing data for a matrix motion instance.
- `srtMotionInstance` is a `VkAccelerationStructureSRTMotionInstanceNV` structure containing data for an SRT motion instance.

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```

`VkAccelerationStructureMotionInstanceFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkAccelerationStructureMotionInstanceTypeNV` enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV` specifies that the instance is a static instance with no instance motion.
- `VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV` specifies that the instance is
a motion instance with motion specified by interpolation between two matrices.

- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- **transformT0** is a **VkTransformMatrixKHR** structure describing a transformation to be applied to the acceleration structure at time 0.
- **transformT1** is a **VkTransformMatrixKHR** structure describing a transformation to be applied to the acceleration structure at time 1.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the **InstanceCustomIndexKHR** built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance **may** only be hit if \( \text{Cull Mask} \& \text{instance.mask} \neq 0 \)
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of **VkGeometryInstanceFlagBitsKHR** values to apply to this instance.
- **accelerationStructureReference** is either:
  - a device address containing the value obtained from **vkGetAccelerationStructureDeviceAddressKHR** or **vkGetAccelerationStructureHandleNV** (used by device operations which reference acceleration structures) or,
  - a **VkAccelerationStructureKHR** object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single **uint32_t** was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory
- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single
uint32_t was specified in their place
- instanceShaderBindingTableRecordOffset occupies the 24 least significant bits of that memory
- flags occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a time in [0,1] the resulting transform is

\[ \text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time} \]

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter
  flags must be a valid combination of VkGeometryInstanceFlagBitsKHR values

An acceleration structure SRT motion instance is defined by the structure:

```c
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VkSRTDataNV transformT0;
    VkSRTDataNV transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```

- transformT0 is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 0.
- transformT1 is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 1.
- instanceCustomIndex is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.
- mask is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask & instance.mask != 0
- instanceShaderBindingTableRecordOffset is a 24-bit offset used in calculating the hit shader binding table index.
- flags is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.
- accelerationStructureReference is either:
  - a device address containing the value obtained from
vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV (used by device operations which reference acceleration structures) or,
- a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory
- **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a time in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter
  - **flags** must be a valid combination of VkGeometryInstanceFlagBitsKHR values

An acceleration structure SRT transform is defined by the structure:

```c
typedef struct VkSRTDataNV {
    float sx;
    float a;
    float b;
    float pvx;
    float sy;
    float c;
    float pvy;
    float sz;
    float pvz;
    float qx;
    float qy;
} VkSRTDataNV;
```
float qz;
float qw;
float tx;
float ty;
float tz;
} VkSRTDataNV;

- sx is the x component of the scale of the transform
- a is one component of the shear for the transform
- b is one component of the shear for the transform
- pxv is the x component of the pivot point of the transform
- sy is the y component of the scale of the transform
- c is one component of the shear for the transform
- pvy is the y component of the pivot point of the transform
- sz is the z component of the scale of the transform
- pvz is the z component of the pivot point of the transform
- qx is the x component of the rotation quaternion
- qy is the y component of the rotation quaternion
- qz is the z component of the rotation quaternion
- qw is the w component of the rotation quaternion
- tx is the x component of the post-rotation translation
- ty is the y component of the post-rotation translation
- tz is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix S, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:

\[
S = \begin{pmatrix}
sx & a & b & pxv \\
0 & sy & c & pvy \\
0 & 0 & sz & pvz
\end{pmatrix}
\]

The rotation quaternion is defined as:

\[
R = [ qx, qy, qz, qw ]
\]

This is a rotation around a conceptual normalized axis \([ ax, ay, az ]\) of amount theta such that:

\[
[ qx, qy, qz ] = \sin(\text{theta}/2) \times [ ax, ay, az ]
\]

and
\[ q_w = \cos(\theta/2) \]

Finally, the transform has a translation \( T \) constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz
\end{pmatrix}
\]

The effective derived transform is then given by

\[ T \times R \times S \]

\textbf{VkAccelerationStructureBuildRangeInfoKHR} is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- **primitiveCount** defines the number of primitives for a corresponding acceleration structure geometry.
- **primitiveOffset** defines an offset in bytes into the memory where primitive data is defined.
- **firstVertex** is the index of the first vertex to build from for triangle geometry.
- **transformOffset** defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the \textbf{VkGeometryTypeKHR} used:

- For geometries of type \textbf{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, **primitiveCount** is the number of triangles to be built, where each triangle is treated as 3 vertices.
  - If the geometry uses indices, **primitiveCount** \( \times 3 \) indices are consumed from \textbf{VkAccelerationStructureGeometryTrianglesDataKHR::indexData}, starting at an offset of **primitiveOffset**. The value of **firstVertex** is added to the index values before fetching vertices.
  - If the geometry does not use indices, **primitiveCount** \( \times 3 \) vertices are consumed from \textbf{VkAccelerationStructureGeometryTrianglesDataKHR::vertexData}, starting at an offset of **primitiveOffset** + \textbf{VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride} \( \times \) **firstVertex**.
  - If \textbf{VkAccelerationStructureGeometryTrianglesDataKHR::transformData} is not NULL, a single \textbf{VkTransformMatrixKHR} structure is consumed from \textbf{VkAccelerationStructureGeometryTrianglesDataKHR::transformData}, at an offset of
transformOffset. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

- For geometries of type VK_GEOMETRY_TYPE_AABBS_KHR, primitiveCount is the number of axis-aligned bounding boxes. primitiveCount VkAabbPositionsKHR structures are consumed from VkAccelerationStructureGeometryAabbsDataKHR::data, starting at an offset of primitiveOffset.

- For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, primitiveCount is the number of acceleration structures. primitiveCount VkAccelerationStructureInstanceKHR or VkAccelerationStructureMotionInstanceNV structures are consumed from VkAccelerationStructureGeometryInstancesDataKHR::data, starting at an offset of primitiveOffset.

### Valid Usage

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry uses indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::indexData must be a multiple of the element size of VkAccelerationStructureGeometryTrianglesDataKHR::indexType

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the geometry does not use indices, the offset primitiveOffset from VkAccelerationStructureGeometryTrianglesDataKHR::vertexData must be a multiple of the component size of VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat

- VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658
  For geometries of type VK_GEOMETRY_TYPE_TRIANGLES_KHR, the offset transformOffset from VkAccelerationStructureGeometryTrianglesDataKHR::transformData must be a multiple of 16

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659
  For geometries of type VK_GEOMETRY_TYPE_AABBS_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryAabbsDataKHR::data must be a multiple of 8

- VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03660
  For geometries of type VK_GEOMETRY_TYPE_INSTANCES_KHR, the offset primitiveOffset from VkAccelerationStructureGeometryInstancesDataKHR::data must be a multiple of 16

### 37.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
```
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);

• commandBuffer is the command buffer into which the command will be recorded.

• accelerationStructureCount is the count of acceleration structures for which to query the property.

• pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.

• queryType is a VkQueryType value specifying the type of queries managed by the pool.

• queryPool is the query pool that will manage the results of the query.

• firstQuery is the first query index within the query pool that will contain the accelerationStructureCount number of results.

Accesses to any of the acceleration structures listed in pAccelerationStructures must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR.

• If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then the value written out is the number of bytes required by a compacted acceleration structure.

• If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
  queryPool must have been created with a queryType matching queryType

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
  The queries identified by queryPool and firstQuery must be unavailable

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to device memory

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
  The sum of query plus accelerationStructureCount must be less than or equal to the number of queries in queryPool
All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command.

All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`.

`queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles.
- `queryType` must be a valid `VkQueryType` value.
- `queryPool` must be a valid `VkQueryPool` handle.
- `commandBuffer` must be in the `recording state`.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- `accelerationStructureCount` must be greater than 0.
- Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have been created, allocated, or retrieved from the same `VkDevice`.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

To query acceleration structure size parameters call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureNV* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `accelerationStructureCount` number of results.

Accesses to any of the acceleration structures listed in `pAccelerationStructures` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755: `queryPool` must have been created with a `queryType` matching `queryType`
The queries identified by `queryPool` and `firstQuery` must be unavailable.

`accelerationStructure` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.

All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command.

All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`.

`queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureNV` handles.
- `queryType` must be a valid `VkQueryType` value.
- `queryPool` must be a valid `VkQueryPool` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- `accelerationStructureCount` must be greater than 0.
- Each of `commandBuffer`, `queryPool`, and the elements of `pAccelerationStructures` must have been created, allocated, or retrieved from the same `VkDevice`. 
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkCopyAccelerationStructureModeKHR mode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dst` is the target acceleration structure for the copy.
- `src` is the source acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

Accesses to `src` and `dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureNV-mode-03410
  mode must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`

- VUID-vkCmdCopyAccelerationStructureNV-src-04963
  The source acceleration structure `src` must have been constructed prior to the execution of this command
If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build.

The `buffer` used to create `src` must be bound to device memory.

The `buffer` used to create `dst` must be bound to device memory.

The range of memory backing `dst` that is accessed by this command must not overlap the memory backing `src` that is accessed by this command.

dst must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `dst` must be a valid `VkAccelerationStructureNV` handle.
- `src` must be a valid `VkAccelerationStructureNV` handle.
- `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- Each of `commandBuffer`, `dst`, and `src` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
class CommandProperties

void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

• `commandBuffer` is the command buffer into which the command will be recorded.

• `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.

### Valid Usage

- VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  The buffer used to create `pInfo->src` must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  The buffer used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
• \textit{dst} is the target acceleration structure for the copy.

• \textit{mode} is a \texttt{VkCopyAccelerationStructureModeKHR} value specifying additional operations to perform during the copy.

\begin{center}
\textbf{Valid Usage}
\end{center}

• VUID-VkCopyAccelerationStructureInfoKHR-mode-03410
  \texttt{mode} \textit{must} be \texttt{VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR} or \texttt{VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR}

• VUID-VkCopyAccelerationStructureInfoKHR-src-04963
  The source acceleration structure \texttt{src} \textit{must} have been constructed prior to the execution of this command

• VUID-VkCopyAccelerationStructureInfoKHR-src-03411
  If \texttt{mode} is \texttt{VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR}, \texttt{src} \textit{must} have been constructed with \texttt{VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR} in the build

• VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718
  The buffer used to create \texttt{src} \textit{must} be bound to device memory

• VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719
  The buffer used to create \texttt{dst} \textit{must} be bound to device memory

• VUID-VkCopyAccelerationStructureInfoKHR-dst-07791
  The range of memory backing \texttt{dst} that is accessed by this command \textit{must} not overlap the memory backing \texttt{src} that is accessed by this command

• VUID-VkCopyAccelerationStructureInfoKHR-dst-07792
  \texttt{dst} \textit{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object via \texttt{vkBindAccelerationStructureMemoryNV}

\begin{center}
\textbf{Valid Usage (Implicit)}
\end{center}

• VUID-VkCopyAccelerationStructureInfoKHR-sType-sType
  \texttt{sType} \textit{must} be \texttt{VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR}

• VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext
  \texttt{pNext} \textit{must} be NULL

• VUID-VkCopyAccelerationStructureInfoKHR-src-parameter
  \texttt{src} \textit{must} be a valid \texttt{VkAccelerationStructureKHR} handle

• VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter
  \texttt{dst} \textit{must} be a valid \texttt{VkAccelerationStructureKHR} handle

• VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter
  \texttt{mode} \textit{must} be a valid \texttt{VkCopyAccelerationStructureModeKHR} value

• VUID-VkCopyAccelerationStructureInfoKHR-commonparent
  Both of \texttt{dst}, and \texttt{src} \textit{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}
Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHRVkCopyAccelerationStructureModeNV;
```

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in `src` into the one specified by `dst`. The `dst` acceleration structure **must** have been created with the same parameters as `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure `src` into `dst`. The acceleration structure `dst` **must** have been created with a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` after the build of the acceleration structure specified by `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR** serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR** deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `pInfo` is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining
the copy operation.

Accesses to pInfo->src must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR. Accesses to the buffer indicated by pInfo->dst.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_TRANSFER_WRITE_BIT.

This command produces the same results as vkCopyAccelerationStructureToMemoryKHR, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

The defined header structure for the serialized data consists of:

- VK_UUID_SIZE bytes of data matching VkPhysicalDeviceIDProperties::driverUUID
- VK_UUID_SIZE bytes of data identifying the compatibility for comparison using vkGetDeviceAccelerationStructureCompatibilityKHR
- A 64-bit integer of the total size matching the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR
- A 64-bit integer of the deserialized size to be passed in to VkAccelerationStructureCreateInfoKHR::size
- A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization.BOTTOM_LEVEL.POINTERS_KHR. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926 The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled
- VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739 pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory

2938
• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740 pInfo->dst.deviceAddress must be aligned to 256 bytes

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741 If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559 The buffer used to create pInfo->src must be bound to device memory

Valid Usage (Implicit)

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording commandBuffer must be in the recording state

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass This command must only be called outside of a render pass instance

• VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy
- `dst` is the device or host address to memory which is the target for the copy
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

**Valid Usage**

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959
  The source acceleration structure `src` **must** have been constructed prior to the execution of this command
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561
  The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-03412
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE.MODE_SERIALIZE_KHR`

**Valid Usage (Implicit)**

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter
  `src` **must** be a valid `VkAccelerationStructureKHR` handle
- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter
  `mode` **must** be a valid `VkCopyAccelerationStructureModeKHR` value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
```
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

Accesses to pInfo->dst must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR. Accesses to the buffer indicated by pInfo->src.deviceAddress must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

The structure provided as input to deserialize is as described in vkCmdCopyAccelerationStructureToMemoryKHR, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but must be created.

**Valid Usage**

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743
  pInfo->src.deviceAddress must be aligned to 256 bytes
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object
- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745
  The buffer used to create pInfo->dst must be bound to device memory

**Valid Usage (Implicit)**

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

• **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording**
  commandBuffer must be in the recording state

• **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass**
  This command must only be called outside of a render pass instance

• **VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>

The **VkCopyMemoryToAccelerationStructureInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **src** is the device or host address to memory containing the source data for the copy.

• **dst** is the target acceleration structure for the copy.
• `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960**
  The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyAccelerationStructureToMemoryKHR`, potentially modified to relocate acceleration structure references as described in that command.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746**
  `dst` must have been created with a `size` greater than or equal to that used to serialize the data in `src`.

### Valid Usage (Implicit)

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter**
  `dst` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter**
  `mode` must be a valid `VkCopyAccelerationStructureModeKHR` value.

To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- **device** is the device to check the version against.

- **pVersionInfo** is a pointer to a `VkAccelerationStructureVersionInfoKHR` structure specifying version information to check against the device.

- **pCompatibility** is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.
Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled.

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
  device must be a valid VkDevice handle.

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  pVersionInfo must be a valid pointer to a valid VkAccelerationStructureVersionInfoKHR structure.

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value.

The VkAccelerationStructureVersionInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pVersionData is a pointer to the version header of an acceleration structure as defined in vkCmdCopyAccelerationStructureToMemoryKHR.

Note

pVersionData is a pointer to an array of 2xVK_UUID_SIZE uint8_t values instead of two VK_UUID_SIZE arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureVersionInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR.
Possible values of pCompatibility returned by vkGetDeviceAccelerationStructureCompatibilityKHR are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR` if the pVersionData version acceleration structure is compatible with device.
- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR` if the pVersionData version acceleration structure is not compatible with device.

### 37.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the accelerationStructureHostCommands feature is enabled:

- `vkBuildAccelerationStructuresKHR` corresponding to `vkCmdBuildAccelerationStructuresKHR`
- `vkCopyAccelerationStructureKHR` corresponding to `vkCmdCopyAccelerationStructureKHR`
- `vkCopyAccelerationStructureToMemoryKHR` corresponding to `vkCmdCopyAccelerationStructureToMemoryKHR`
- `vkCopyMemoryToAccelerationStructureKHR` corresponding to `vkCmdCopyMemoryToAccelerationStructureKHR`
- `vkWriteAccelerationStructuresPropertiesKHR` corresponding to `vkCmdWriteAccelerationStructuresPropertiesKHR`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands must be bound to host-visible memory, and all input data for acceleration structure builds must be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

**Note**

The `vkBuildAccelerationStructuresKHR` and `vkCmdBuildAccelerationStructuresKHR` may use different algorithms, and thus
are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application can use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

**Note**
For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i].`

This command fulfills the same task as `vkCmdBuildAccelerationStructuresKHR` but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**
This means that an application cannot build a top-level acceleration structure in
the same `vkBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

**Valid Usage**

- **VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled.

- **VUID-vkBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` **must** be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member **must** be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member **must** not be `VK_NULL_HANDLE`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` **must** not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` **must** be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member **must** have been created with a value of `VkAccelerationStructureCreateInfoKHR::type` equal to either `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, inactive primitives in its `srcAccelerationStructure` member must not be made active.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, active primitives in its `srcAccelerationStructure` member must not be made inactive.

The `dstAccelerationStructure` member of any element of `pInfos` must not be referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any other element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` in any other element of `pInfos`, which is accessed by this command.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03668**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03758**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03759**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03760**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `type` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03761**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `geometryType` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03762**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03763**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member must have the same value which was specified when `srcAccelerationStructure` was last built.

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or...
ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03765
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03766
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03767
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was not NULL when srcAccelerationStructure was last built, then it must not be NULL.

- VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, its primitiveCount member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770
  For each VkAccelerationStructureBuildRangeInfoKHR referenced by this command, if the corresponding geometry uses indices, its firstVertex member must have the same value which was specified when srcAccelerationStructure was last built.

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03801
  For each element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount.
For each `pInfos[i]`, `dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0,pInfos[i].geometryCount)`

Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

Any previous deferred operation that was associated with `deferredOperation` must be complete

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to host-visible device memory

For each element of `pInfos`, if its mode member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to host-visible device memory

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to host-visible device memory

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of...
VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03772
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03773
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.hostAddress is not 0, it must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03775
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03776
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03777
  For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to memory that was not allocated with multiple instances

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03778
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, geometry.instances.data.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03779
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in geometry.instances.data.hostAddress must be a valid VkAccelerationStructureKHR object

- VUID-vkBuildAccelerationStructuresKHR-pInfos-04930
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV set, each accelerationStructureReference in any structure in VkAccelerationStructureMotionInstanceNV value in geometry.instances.data.hostAddress must be a valid VkAccelerationStructureKHR object
Valid Usage (Implicit)

- **VUID-vkBuild Acceleration Structures KHR-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkBuild Acceleration Structures KHR-deferred Operation-parameter**
  - If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- **VUID-vkBuild Acceleration Structures KHR-pInfos-parameter**
  - `pInfos` must be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures

- **VUID-vkBuild Acceleration Structures KHR-ppBuildRangeInfos-parameter**
  - `ppBuildRangeInfos` must be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- **VUID-vkBuild Acceleration Structures KHR-infoCount-arraylength**
  - `infoCount` must be greater than 0

- **VUID-vkBuild Acceleration Structures KHR-deferred Operation-parent**
  - If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

Return Codes

**Success**

- `VK_SUCCESS`

- `VK_OPERATION_DEFERRED_KHR`

- `VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`

- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(  
    VkDevice device,  
    VkDeferredOperationKHR deferredOperation,  
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns the acceleration structures.

- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
• pInfo is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureKHR but is executed by the host.

Valid Usage

• VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyAccelerationStructureKHR-buffer-03727
  The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst must be bound to host-visible device memory feature must be enabled

• VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

• VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device
Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToAccelerationStructureInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToAccelerationStructureKHR` but is executed by the host.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

Valid Usage

- VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature must be enabled

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

- VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete
• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
  pInfo->src.hostAddress must be a valid host pointer

• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
  pInfo->src.hostAddress must be aligned to 16 bytes

• VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
  The buffer used to create pInfo->dst must be bound to host-visible device memory

• VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

• VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS
  • VK_OPERATION_DEFERRED_KHR
  • VK_OPERATION_NOT_DEFERRED_KHR

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
  VkDevice device,
  VkDeferredOperationKHR deferredOperation,
```
const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);

- **device** is the device which owns pInfo->src.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **pInfo** is a pointer to a VkCopyAccelerationStructureToMemoryInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyAccelerationStructureToMemoryKHR but is executed by the host.

This command produces the same results as vkCmdCopyAccelerationStructureToMemoryKHR, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToAccelerationStructureKHR or vkCopyMemoryToAccelerationStructureKHR.

### Valid Usage

- **VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584**
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03677**
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678**
  Any previous deferred operation that was associated with deferredOperation must be complete

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731**
  The buffer used to create pInfo->src must be bound to host-visible device memory

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732**
  pInfo->dst.hostAddress must be a valid host pointer

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751**
  pInfo->dst.hostAddress must be aligned to 16 bytes

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783**
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- **VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter**
  device must be a valid VkDevice handle
If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle.

*pInfo* must be a valid pointer to a valid `VkCopyAccelerationStructureToMemoryInfoKHR` structure.

If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from device.

## Return Codes

### Success
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
    VkDevice device,            // device,
    uint32_t accelerationStructureCount,    // accelerationStructureCount,
    const VkAccelerationStructureKHR* pAccelerationStructures,    // pAccelerationStructures,
    VkQueryType queryType,     // queryType,
    size_t dataSize,            // dataSize,
    void* pData,               // pData,
    size_t stride)            // stride);
```

- `device` is the device which owns the acceleration structures in `pAccelerationStructures`.
- `accelerationStructureCount` is the count of acceleration structures for which to query the property.
- `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.  

2958
This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.

### Valid Usage

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands` feature **must** be enabled.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
  All acceleration structures in `pAccelerationStructures` **must** have been built prior to the execution of this command.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
  All acceleration structures in `pAccelerationStructures` **must** have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742**
  `queryType` **must** be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `pData` **must** point to a `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `pData` **must** point to a `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, then `pData` **must** point to a `VkDeviceSize`.

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `stride` **must** be a multiple of the size of `VkDeviceSize`.
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `pData` must point to a `VkDeviceSize`

`dataSize` must be greater than or equal to `accelerationStructureCount`*`stride`

The `buffer` used to create each acceleration structure in `pAccelerationStructures` must be bound to host-visible device memory

The `buffer` used to create each acceleration structure in `pAccelerationStructures` must be bound to memory that was not allocated with multiple instances

**Valid Usage (Implicit)**

- `device` must be a valid `VkDevice` handle
- `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles
- `queryType` must be a valid `VkQueryType` value
- `pData` must be a valid pointer to an array of `dataSize` bytes
- `accelerationStructureCount` must be greater than 0
- `dataSize` must be greater than 0
- Each element of `pAccelerationStructures` must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
Chapter 38. Micromap

38.1. Micromaps

Acceleration structures store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A micromap organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a bottom level acceleration structure.

An opacity micromap is a type of micromap which stores information to control intersection opacity as described in Ray Opacity Micromap.

A displacement micromap is a type of micromap which stores information to displace sub-triangle vertices as described in Displacement Micromap.

A micromap is considered to be constructed if a micromap build command or copy command has been executed with the given acceleration structure as the destination.

38.1.1. Building Micromaps

To build micromaps call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the `VkMicromapBuildInfoEXT` ::`scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `(VK_ACCESS_2_MICROMAP_READ_BIT_EXT | VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT)`. Accesses to
VkMicromapBuildInfoEXT::dstMicromap must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data or VkMicromapBuildInfoEXT::triangleArray must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

• VUID-vkCmdBuildMicromapsEXT-pInfos-07461
  For each pInfo[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfo[i]

• VUID-vkCmdBuildMicromapsEXT-mode-07462
  The mode member of each element of pInfo must be a valid VkBuildMicromapModeEXT value

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463
  The dstMicromap member of any element of pInfo must be a valid VkMicromapEXT handle

• VUID-vkCmdBuildMicromapsEXT-pInfos-07464
  For each element of pInfo its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the dstMicromap member of any element of pInfo that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfo, which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the dstMicromap member of any element of pInfo that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfo (including the same element), which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfo that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfo, which is accessed by this command

• VUID-vkCmdBuildMicromapsEXT-pInfos-07508
  For each element of pInfo, the buffer used to create its dstMicromap member must be bound to device memory

• VUID-vkCmdBuildMicromapsEXT-pInfos-07509
  If pInfo[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in
the buffer device address range of the same buffer, where \( N \) is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to `vkGetMicromapBuildSizesEXT` with an identical `VkMicromapBuildInfoEXT` structure and primitive count

- **VUID-vkCmdBuildMicromapsEXT-data-07510**
The buffers from which the buffer device addresses for all of the `data` and `triangleArray` members of all `pInfos[i]` are queried must have been created with the `VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT` usage flag

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07511**
For each element of `pInfos[i]` the buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is queried must have been created with `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT` usage flag

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07512**
For each element of `pInfos` its `scratchData.deviceAddress`, `data.deviceAddress`, and `triangleArray.deviceAddress` members must be valid device addresses obtained from `vkGetBufferDeviceAddress`

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07513**
For each element of `pInfos`, if `scratchData.deviceAddress`, `data.deviceAddress`, or `triangleArray.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07514**
For each element of `pInfos`, its `scratchData.deviceAddress` member must be a multiple of `VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment`

- **VUID-vkCmdBuildMicromapsEXT-pInfos-07515**
For each element of `pInfos`, its `triangleArray.deviceAddress` and `data.deviceAddress` members must be a multiple of 256

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBuildMicromapsEXT-pInfos-parameter**
  `pInfos` must be a valid pointer to an array of `infoCount` valid `VkMicromapBuildInfoEXT` structures

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool**
The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdBuildMicromapsEXT-renderpass**
  This command must only be called outside of a render pass instance
This command **must** only be called outside of a video coding scope.

**infoCount must** be greater than 0

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized.
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized.

### Command Properties

Formats which **can** be set in **VkMicromapUsageEXT::format** and **VkMicromapTriangleEXT::format** for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
    VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
    VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

- **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
- **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT** indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

**Note**
For compactness, these values are stored as 16-bit in some structures.

Formats which **can** be set in **VkMicromapUsageEXT::format** and **VkMicromapTriangleEXT::format** for micromap builds, are:

```c
// Provided by VK_NV_displacementMicromap
typedef enum VkDisplacementMicromapFormatNV {
    VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV = 1,
    VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV = 2,
} VkDisplacementMicromapFormatNV;
```
VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV = 3,
} VkDisplacementMicromapFormatNV;

- **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV** indicates that the given micromap format encodes 64 micro-triangles worth of displacements in 64 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 256 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

- **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 1024 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

---

**Note**
For compactness, these values are stored as 16-bit in some structures.

The **VkMicromapBuildInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceOrHostAddressKHR scratchData;
    VkDeviceOrHostAddressConstKHR triangleArray;
    VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **type** is a **VkMicromapTypeEXT** value specifying the type of micromap being built.
- **flags** is a bitmask of **VkBuildMicromapFlagBitsEXT** specifying additional parameters of the micromap.
- **mode** is a **VkBuildMicromapModeEXT** value specifying the type of operation to perform.
- **dstMicromap** is a pointer to the target micromap for the build.
- **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
• **pUsageCounts** is a pointer to an array of `VkMicromapUsageEXT` structures.

• **ppUsageCounts** is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.

• **data** is the device or host address to memory which contains the data for the micromap.

• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

• **triangleArray** is the device or host address to memory containing the `VkMicromapTriangleEXT` data.

• **triangleArrayStride** is the stride in bytes between each element of **triangleArray**.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-**NULL** array describe the total counts used to build each micromap. Each element contains a **count** which is the number of micromap triangles of that **format** and **subdivisionLevel** contained in the micromap. Multiple elements with the same **format** and **subdivisionLevel** are allowed and the total count for that **format** and **subdivisionLevel** is the sum of the **count** for each element.

Each micromap triangle refers to one element in **triangleArray** which contains the **format** and **subdivisionLevel** for that particular triangle as well as a **dataOffset** in bytes which is the location relative to **data** where that triangle’s micromap data begins. The data at **triangleArray** is laid out as a 4 byte unsigned integer for the **dataOffset** followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile `VkMicromapTriangleEXT` to match this pattern.

For opacity micromaps, the data at **data** is packed as either one bit per element for `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or two bits per element for `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in Ray Opacity Micromap.

For displacement micromaps, the data at **data** is interpreted as discussed in Displacement Micromap Encoding.

### Valid Usage

- **VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516**
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**.

- **VUID-VkMicromapBuildInfoEXT-type-07517**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of `VkMicromapUsageEXT` must be a valid value from `VkOpacityMicromapFormatEXT`.

- **VUID-VkMicromapBuildInfoEXT-type-07518**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of `VkMicromapTriangleEXT` must be a valid value from `VkOpacityMicromapFormatEXT`.

- **VUID-VkMicromapBuildInfoEXT-type-08704**
  If **type** is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` the **format** member of `VkMicromapUsageEXT` must be a valid value from `VkDisplacementMicromapFormatNV`.

- **VUID-VkMicromapBuildInfoEXT-type-08705**

---

2966
If `type` is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` the `format` member of `VkMicromapTriangleEXT` must be a valid value from `VkDisplacementMicromapFormatNV`.

Valid Usage (Implicit)

- VUID-VkMicromapBuildInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT`

- VUID-VkMicromapBuildInfoEXT-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkMicromapBuildInfoEXT-type-parameter
  `type` must be a valid `VkMicromapTypeEXT` value

- VUID-VkMicromapBuildInfoEXT-flags-parameter
  `flags` must be a valid combination of `VkBuildMicromapFlagBitsEXT` values

- VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter
  If `usageCountsCount` is not 0, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures

- VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not 0, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures

The `VkBuildMicromapModeEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- `VK_BUILD_MICROMAP_MODE_BUILD_EXT` specifies that the destination micromap will be built using the specified data.

The `VkMicromapUsageEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
    uint32_t count;
    uint32_t subdivisionLevel;
    uint32_t format;
} VkMicromapUsageEXT;
```

- `count` is the number of triangles in the usage format defined by the `subdivisionLevel` and `format` below in the micromap
- `subdivisionLevel` is the subdivision level of this usage format
Valid Usage

- **VUID-VkMicromapUsageEXT-format-07519**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then `format` must be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`.

- **VUID-VkMicromapUsageEXT-format-07520**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel`.

- **VUID-VkMicromapUsageEXT-format-07521**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and `format` is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel`.

- **VUID-VkMicromapUsageEXT-format-08706**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `format` must be `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV`, `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV`, or `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV`.

- **VUID-VkMicromapUsageEXT-subdivisionLevel-08707**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then `subdivisionLevel` must be less than or equal to `VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel`.

The `format` is interpreted based on the `type` of the micromap using it.

The `VkMicromapTriangleEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;
```

- `dataOffset` is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- `subdivisionLevel` is the subdivision level of this triangle.
• **format** is the format of this triangle

## Valid Usage

- **VUID-VkMicromapTriangleEXT-format-07522**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** then **format** must be **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** or **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT**

- **VUID-VkMicromapTriangleEXT-format-07523**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** and **format** is **VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT** then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceOpacityMicromapPropertiesEXT**:\texttt{maxOpacity2StateSubdivisionLevel}

- **VUID-VkMicromapTriangleEXT-format-07524**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT** and **format** is **VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT** then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceOpacityMicromapPropertiesEXT**:\texttt{maxOpacity4StateSubdivisionLevel}

- **VUID-VkMicromapTriangleEXT-format-08708**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** then **format** must be **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV**, **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** or **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV**

- **VUID-VkMicromapTriangleEXT-subdivisionLevel-08709**
  If the **VkMicromapTypeEXT** of the micromap is **VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV** then **subdivisionLevel** must be less than or equal to **VkPhysicalDeviceDisplacementMicromapPropertiesNV**:\texttt{maxDisplacementMicromapSubdivisionLevel}

The **format** is interpreted based on the **type** of the micromap using it.

### 38.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer commandBuffer,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    VkQueryPool queryPool,
);
```
- `commandBuffer` is the command buffer into which the command will be recorded.
- `micromapCount` is the count of micromaps for which to query the property.
- `pMicromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
- `queryPool` is the query pool that will manage the results of the query.
- `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`.

- If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then the value written out is the number of bytes required by a serialized micromap.
- If `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`, then the value written out is the number of bytes required by a compacted micromap.

### Valid Usage

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525
  `queryPool` must have been created with a `queryType` matching `queryType`

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526
  The queries identified by `queryPool` and `firstQuery` must be unavailable

- VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527
  The buffer used to create each micromap in `pMicromaps` must be bound to device memory

- VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528
  The sum of `query` plus `micromapCount` must be less than or equal to the number of queries in `queryPool`

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` must have been constructed prior to the execution of this command

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503
  `queryType` must be `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` or `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`
Valid Usage (Implicit)

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
  `pMicromaps` must be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
  `queryType` must be a valid `VkQueryType` value

- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteMicromapsPropertiesEXT-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  `micromapCount` must be greater than 0

- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pMicromaps` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

To copy a micromap call:
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command copies the `pInfo->src` micromap to the `pInfo->dst` micromap in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` or `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` as appropriate.

### Valid Usage

- VUID-vkCmdCopyMicromapEXT-buffer-07529
  The buffer used to create `pInfo->src` must be bound to device memory
- VUID-vkCmdCopyMicromapEXT-buffer-07530
  The buffer used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure
- VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations
- VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
The `VkCopyMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapInfoEXT {
    VkStructureType     sType;
    const void*         pNext;
    VkMicromapEXT       src;
    VkMicromapEXT       dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMicromapInfoEXT-mode-07531**
  - `mode` must be `VK_COPY_MICROMAP_MODE_COMPACT_EXT` or `VK_COPY_MICROMAP_MODE_CLONE_EXT`

- **VUID-VkCopyMicromapInfoEXT-src-07532**
  - The source acceleration structure `src` must have been constructed prior to the execution of this command

- **VUID-VkCopyMicromapInfoEXT-mode-07533**
  - If `mode` is `VK_COPY_MICROMAP_MODE_COMPACT_EXT`, `src` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` in the build

- **VUID-VkCopyMicromapInfoEXT-buffer-07534**
  - The `buffer` used to create `src` must be bound to device memory

- **VUID-VkCopyMicromapInfoEXT-buffer-07535**
  - The `buffer` used to create `dst` must be bound to device memory
Valid Usage (Implicit)

- **VUID-VkCopyMicromapInfoEXT-sType-sType**
  sType **must** be `VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT`

- **VUID-VkCopyMicromapInfoEXT-pNext-pNext**
  pNext **must** be `NULL`

- **VUID-VkCopyMicromapInfoEXT-src-parameter**
  src **must** be a valid `VkMicromapEXT` handle

- **VUID-VkCopyMicromapInfoEXT-dst-parameter**
  dst **must** be a valid `VkMicromapEXT` handle

- **VUID-VkCopyMicromapInfoEXT-mode-parameter**
  mode **must** be a valid `VkCopyMicromapModeEXT` value

- **VUID-VkCopyMicromapInfoEXT-commonparent**
  Both of dst, and src **must** have been created, allocated, or retrieved from the same VkDevice

Possible values of `mode` specifying additional operations to perform during the copy, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkCopyMicromapModeEXT {
  VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
  VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
  VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
  VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- **VK_COPY_MICROMAP_MODE_CLONE_EXT** creates a direct copy of the micromap specified in src into the one specified by dst. The dst micromap **must** have been created with the same parameters as src.

- **VK_COPY_MICROMAP_MODE_SERIALIZE_EXT** serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.

- **VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT** deserializes the semi-opaque serialization format in the buffer to the micromap.

- **VK_COPY_MICROMAP_MODE_COMPACT_EXT** creates a more compact version of a micromap src into dst. The micromap dst **must** have been created with a size at least as large as that returned by `vkCmdWriteMicromapsPropertiesEXT` after the build of the micromap specified by src.

To copy a micromap to device memory call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
  VkCommandBuffer commandBuffer,
```
const VkCopyMicromapToMemoryInfoEXT* pInfo);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pInfo** is an a pointer to a **VkCopyMicromapToMemoryInfoEXT** structure defining the copy operation.

Accesses to **pInfo->src** must be synchronized with the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage and an **access type** of **VK_ACCESS_2_MICROMAP_READ_BIT_EXT**. Accesses to the buffer indicated by **pInfo->dst.deviceAddress** must be synchronized with the **VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT** pipeline stage and an **access type** of **VK_ACCESS_TRANSFER_WRITE_BIT**.

This command produces the same results as **vkCopyMicromapToMemoryEXT**, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either **vkCmdCopyMemoryToMicromapEXT** or **vkCopyMemoryToMicromapEXT**.

The defined header structure for the serialized data consists of:

- **VK_UUID_SIZE** bytes of data matching **VkPhysicalDeviceIDProperties::driverUUID**
- **VK_UUID_SIZE** bytes of data identifying the compatibility for comparison using **vkGetDeviceMicromapCompatibilityEXT**

The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536**
  **pInfo->dst.deviceAddress** must be a valid device address for a buffer bound to device memory

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537**
  **pInfo->dst.deviceAddress** must be aligned to 256 bytes

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538**
  If the buffer pointed to by **pInfo->dst.deviceAddress** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539**
  The buffer used to create **pInfo->src** must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter**
  **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter**
  **pInfo** must be a valid pointer to a valid **VkCopyMicromapToMemoryInfoEXT** structure

- **VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording**
commandBuffer must be in the recording state

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyMicromapToMemoryEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMicromapToMemoryEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkDeviceOrHostAddressKHR dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- src is the source micromap for the copy
- dst is the device or host address to memory which is the target for the copy
- mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.
Valid Usage

• VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
The source micromap `src` must have been constructed prior to the execution of this command.

• VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
The memory pointed to by `dst` must be at least as large as the serialization size of `src`, as reported by `vkWriteMicromapsPropertiesEXT` or `vkCmdWriteMicromapsPropertiesEXT` with a query type of `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`.

• VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
`mode` must be `VK_COPY_MICROMAP_MODE_SERIALIZE_EXT`.

Valid Usage (Implicit)

• VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
`sType` must be `VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT`.

• VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
`pNext` must be `NULL`.

• VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
`src` must be a valid `VkMicromapEXT` handle.

• VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
`mode` must be a valid `VkCopyMicromapModeEXT` value.

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

Accesses to `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->src.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_READ_BIT`.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`. 

**Valid Usage**

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  
  pInfo->src.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  
  The buffer used to create pInfo->dst must be bound to device memory

**Valid Usage (Implicit)**

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  
  commandBuffer must be in the recording state

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07547**
  The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyMicromapToMemoryEXT`.

- **VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548**
  `mode` must be `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT`.

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07549**
  The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceMicromapCompatibilityEXT`.

- **VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550**
  `dst` must have been created with a `size` greater than or equal to that used to serialize the data in `src`.

---

2979
Valid Usage (Implicit)

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  dst must be a valid VkMicromapEXT handle

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  mode must be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```c
// Provided by VK_EXT_opacity_micromap
void vkGetDeviceMicromapCompatibilityEXT(
    VkDevice device,
    const VkMicromapVersionInfoEXT* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- device is the device to check the version against.
- pVersionInfo is a pointer to a VkMicromapVersionInfoEXT structure specifying version information to check against the device.
- pCompatibility is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  The micromap feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  pVersionInfo must be a valid pointer to a valid VkMicromapVersionInfoEXT structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value

The VkMicromapVersionInfoEXT structure is defined as:

```c
2980```
// Provided by VK_EXT_opacity_micromap

typedef struct VkMicromapVersionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pVersionData is a pointer to the version header of a micromap as defined in
  vkCmdCopyMicromapToMemoryEXT

Note
pVersionData is a pointer to an array of 2 × VK_UUID_SIZE uint8_t values instead of two
VK_UUID_SIZE arrays as the expected use case for this member is to be pointed at the
header of a previously serialized micromap (via
vkCmdCopyMicromapToMemoryEXT or vkCopyMicromapToMemoryEXT) that is
loaded in memory. Using arrays would necessitate extra memory copies of the
UUIDs.

Valid Usage (Implicit)
• VUID-VkMicromapVersionInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT
• VUID-VkMicromapVersionInfoEXT-pNext-pNext
  pNext must be NULL
• VUID-VkMicromapVersionInfoEXT-pVersionData-parameter
  pVersionData must be a valid pointer to an array of 2 × VK_UUID_SIZE uint8_t values

38.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if
the micromapHostCommands feature is enabled:

• vkBuildMicromapsEXT corresponding to vkCmdBuildMicromapsEXT
• vkCopyMicromapEXT corresponding to vkCmdCopyMicromapEXT
• vkCopyMicromapToMemoryEXT corresponding to vkCmdCopyMicromapToMemoryEXT
• vkCopyMemoryToMicromapEXT corresponding to vkCmdCopyMemoryToMicromapEXT
• vkWriteMicromapsPropertiesEXT corresponding to vkCmdWriteMicromapsPropertiesEXT

These commands are functionally equivalent to their device counterparts, except that they are
executed on the host timeline, rather than being enqueued into command buffers.
All micromaps used by the host commands **must** be bound to host-visible memory, and all input data for micromap builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

**Note**
The `vkBuildMicromapsEXT` and `vkCmdBuildMicromapsEXT` may use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

**Note**
For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device, // device is the VkDevice for which the micromaps are being built.
    VkDeferredOperationKHR deferredOperation, // deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.
    uint32_t infoCount, // infoCount is the number of micromaps to build. It specifies the number of the pInfo that must be provided.
    const VkMicromapBuildInfoEXT* pInfos // pInfos is a pointer to an array of infoCount VkMicromapBuildInfoEXT structures defining the geometry used to build each micromap.
);
```

This command fulfills the same task as `vkCmdBuildMicromapsEXT` but is executed by the host.

The `vkBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**
This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

---

**Valid Usage**

- VUID-vkBuildMicromapsEXT-pInfos-07461
For each \texttt{pInfos[i]}, \texttt{dstMicromap must} have been created with a value of \texttt{VkMicromapCreateInfoEXT::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetMicromapBuildSizesEXT} with \texttt{pBuildInfo = pInfos[i]}

- **VUID-vkBuildMicromapsEXT-mode-07462**
  The \texttt{mode} member of each element of \texttt{pInfos must} be a valid \texttt{VkBuildMicromapModeEXT} value

- **VUID-vkBuildMicromapsEXT-dstMicromap-07463**
  The \texttt{dstMicromap} member of any element of \texttt{pInfos must} be a valid \texttt{VkMicromapEXT} handle

- **VUID-vkBuildMicromapsEXT-pInfos-07464**
  For each element of \texttt{pInfos} its \texttt{type} member \texttt{must} match the value of \texttt{VkMicromapCreateInfoEXT::type} when its \texttt{dstMicromap} was created

- **VUID-vkBuildMicromapsEXT-dstMicromap-07465**
  The range of memory backing the \texttt{dstMicromap} member of any element of \texttt{pInfos} that is accessed by this command \texttt{must} not overlap the memory backing the \texttt{dstMicromap} member of any other element of \texttt{pInfos}, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-dstMicromap-07466**
  The range of memory backing the \texttt{dstMicromap} member of any element of \texttt{pInfos} that is accessed by this command \texttt{must} not overlap the memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} (including the same element), which is accessed by this command

- **VUID-vkBuildMicromapsEXT-scratchData-07467**
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command \texttt{must} not overlap the memory backing the \texttt{scratchData} member of any other element of \texttt{pInfos}, which is accessed by this command

- **VUID-vkBuildMicromapsEXT-pInfos-07552**
  For each element of \texttt{pInfos}, the \texttt{buffer} used to create its \texttt{dstMicromap} member \texttt{must} be bound to host-visible device memory

- **VUID-vkBuildMicromapsEXT-pInfos-07553**
  For each element of \texttt{pInfos}, all referenced addresses of \texttt{pInfos[i].data.hostAddress} \texttt{must} be valid host memory

- **VUID-vkBuildMicromapsEXT-pInfos-07554**
  For each element of \texttt{pInfos}, all referenced addresses of \texttt{pInfos[i].triangleArray.hostAddress} \texttt{must} be valid host memory

- **VUID-vkBuildMicromapsEXT-micromapHostCommands-07555**
  The \texttt{VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands} feature \texttt{must} be enabled

- **VUID-vkBuildMicromapsEXT-pInfos-07556**
  If \texttt{pInfos[i].mode} is \texttt{VK_BUILD_MICROMAP_MODE_BUILD_EXT}, all addresses between \texttt{pInfos[i].scratchData.hostAddress} and \texttt{pInfos[i].scratchData.hostAddress} + N - 1 \texttt{must} be valid host memory, where \texttt{N} is given by the \texttt{buildScratchSize} member of the \texttt{VkMicromapBuildSizesInfoEXT} structure returned from a call to
vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to memory that was not allocated with multiple instances

**Valid Usage (Implicit)**

- VUID-vkBuildMicromapsEXT-device-parameter
device must be a valid VkDevice handle

- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkBuildMicromapsEXT-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures

- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0

- VUID-vkBuildMicromapsEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

**Return Codes**

**Success**

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapInfoEXT* pInfo);
```
• **device** is the device which owns the micromaps.

• **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.

• **pInfo** is a pointer to a VkCopyMicromapInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapEXT but is executed by the host.

### Valid Usage

- **VUID-vkCopyMicromapEXT-deferredOperation-03677**
  If **deferredOperation** is not VK_NULL_HANDLE, it **must** be a valid VkDeferredOperationKHR object

- **VUID-vkCopyMicromapEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with **deferredOperation** **must** be complete

- **VUID-vkCopyMicromapEXT-buffer-07558**
  The **buffer** used to create pInfo->src **must** be bound to host-visible device memory

- **VUID-vkCopyMicromapEXT-buffer-07559**
  The **buffer** used to create pInfo->dst **must** be bound to host-visible device memory

- **VUID-vkCopyMicromapEXT-micromapHostCommands-07560**
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature **must** be enabled

- **VUID-vkCopyMicromapEXT-buffer-07561**
  The **buffer** used to create pInfo->src **must** be bound to memory that was not allocated with multiple instances

- **VUID-vkCopyMicromapEXT-buffer-07562**
  The **buffer** used to create pInfo->dst **must** be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapEXT-device-parameter**
  **device** **must** be a valid VkDevice handle

- **VUID-vkCopyMicromapEXT-deferredOperation-parameter**
  If **deferredOperation** is not VK_NULL_HANDLE, **deferredOperation** **must** be a valid VkDeferredOperationKHR handle

- **VUID-vkCopyMicromapEXT-pInfo-parameter**
  **pInfo** **must** be a valid pointer to a valid VkCopyMicromapInfoEXT structure

- **VUID-vkCopyMicromapEXT-deferredOperation-parent**
  If **deferredOperation** is a valid handle, it **must** have been created, allocated, or retrieved from **device**
Return Codes

Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToMicromapEXT` but is executed by the host.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

Valid Usage

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03677
  If `deferredOperation` is not `VK_NULL_HANDLE`, it must be a valid `VkDeferredOperationKHR` object

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  `pInfo->src.hostAddress` must be a valid host pointer

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  `pInfo->src.hostAddress` must be aligned to 16 bytes
Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle
- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToMicromapInfoEXT` structure
- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

Return Codes

Success
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy a micromap to host accessible memory, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice device,                 // Provided by VK_EXT_opacity_micromap
    VkDeferredOperationKHR deferredOperation,    // Provided by VK_EXT_opacity_micromap
    const VkCopyMemoryToMicromapInfoEXT* pInfo);  // Provided by VK_EXT_opacity_micromap
```
• **device** is the device which owns pInfo->src.

• **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.

• **pInfo** is a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapToMemoryEXT but is executed by the host.

This command produces the same results as vkCmdCopyMicromapToMemoryEXT, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

### Valid Usage

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03677
  If deferredOperation is not VK_NULL_HANDLE, it must be a valid VkDeferredOperationKHR object

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The buffer used to create pInfo->src must be bound to host-visible device memory

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  pInfo->dst.hostAddress must be a valid host pointer

- VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  pInfo->dst.hostAddress must be aligned to 16 bytes

- VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

- VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkCopyMicromapToMemoryEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
**Return Codes**

**Success**

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To query micromap size parameters on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

- `device` is the device which owns the micromaps in `pMicromaps`.
- `micromapCount` is the count of micromaps for which to query the property.
- `p Micromaps` is a pointer to an array of existing previously built micromaps.
- `queryType` is a `VkQueryType` value specifying the property to be queried.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.
- `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteMicromapsPropertiesEXT` but is executed by the host.

**Valid Usage**

- VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
All micromaps in `pMicromaps` must have been constructed prior to the execution of this command.

- **VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502**
  All micromaps in `pMicromaps` must have been constructed with
  `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is
  `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-07503**
  `queryType` must be `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` or
  `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-07573**
  If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then `stride` must be a
  multiple of the size of `VkDeviceSize`

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-07574**
  If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then `pData` must point to a
  `VkDeviceSize`

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-07575**
  If `queryType` is

- **VUID-vkWriteMicromapsPropertiesEXT-dataSize-07576**
  `dataSize` must be greater than or equal to `micromapCount*stride`

- **VUID-vkWriteMicromapsPropertiesEXT-buffer-07577**
  The buffer used to create each micromap in `pMicromaps` must be bound to host-visible
device memory

- **VUID-vkWriteMicromapsPropertiesEXT-micromapHostCommands-07578**
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- **VUID-vkWriteMicromapsPropertiesEXT-buffer-07579**
  The buffer used to create each micromap in `pMicromaps` must be bound to memory that
  was not allocated with multiple instances

---

**Valid Usage (Implicit)**

- **VUID-vkWriteMicromapsPropertiesEXT-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter**
  `pMicromaps` must be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT`
handles

- **VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter**
  `queryType` must be a valid `VkQueryType` value

- **VUID-vkWriteMicromapsPropertiesEXT-pData-parameter**
  `pData` must be a valid pointer to an array of `dataSize` bytes

- **VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength**
  `micromapCount` must be greater than 0
38.2.1. Displacement Micromap

A displacement micromap in an acceleration structure includes information in the `VkAccelerationStructureTrianglesDisplacementMicromapNV` to define a base triangle and displacement directions then uses displacement information encoded in the micromap to apply to those values to generate the final position.

### Displacement Base Triangle

If `displacementBiasAndScaleBuffer` is provided the bias and scale are fetched from that buffer. If `displacementBiasAndScaleBuffer` is zero the bias and scale are assumed to be 0.0 and 1.0, respectively.

Given an input position from the geometry, the base position and displacement vector used by the displacement are computed by:

\[
\text{basePosition} = \text{inputPosition} + \text{displacementVector} \times \text{bias}
\]

\[
\text{baseDisplacementVector} = \text{displacementVector} \times \text{scale}
\]

The parameters of each micro-vertex are derived from a combination of the base triangle parameters extracted from the bottom-level acceleration structure, the barycentrics of that micro-vertex, and the displacement value fetched from the displacement micromap corresponding to that micro-vertex.

\[
\text{microVertexBasePosition} = \text{lerp(basePositions, microVertexBarycentrics)}
\]

\[
\text{microVertexDisplacementVector} = \text{lerp(displacementVectors, microVertexBarycentrics)}
\]

\[
\text{microVertexDisplacedPosition} = \text{microVertexBasePosition} + \text{microVertexDisplacementVector} \times \text{micromapDisplacementValue}
\]
Displacement micromap encoding

Displacement amounts are stored in displacement blocks, each covering a triangular region of microvertices. Depending on the subdivision level and encoding format, one or more displacement blocks combine to store all displacement values for a given displacement micromap.

Displacement blocks are organized along a space filling curve within a displacement micromap if more than one block is required, then micro-vertices are organized along the same space filling curve within a displacement micromap.

The space-filling curve is purely hierarchical with recursive splitting, similar to that for opacity micromaps but operating on vertices instead of triangles. To maintain that the hierarchical ordering is contiguous while keeping continuous winding, some triangles are flipped and wound differently.

The `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV` format is an uncompressed, packed format which covers 64 microtriangles (subdivision level 3) in a block. The block contains 45 displacement values encoded as 11 bit unorm values and stored tightly packed in the vertex order described above, occupying 495 bits. This is followed by 15 unused bits then 2 reserved bits which must be 0. If this block is used to store displacement for a subdivision level below 3 the later unused values are ignored.

The `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV` and `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV` formats store displacements in a compressed form to save space. Both formats use the same compression algorithm, differing in the number of bits used in the different fields.

The compression algorithm works by starting with fully specified anchor vertices, then for each level, predicting the value for the displacement and encoding the correction for that value, using fewer bits for each level of subdivision.

When adding a vertex in the recursive subdivision process between two adjacent displacement values, the predicted value is given by the rounded average of the two adjacent values as integers:

prediction = \((A + B + 1) / 2\)

The decoded value after applying the correction is given by:

\[ \text{decoded} = \text{prediction} + (\text{SignExtend(correction)} \ll \text{shift}) \]

where correction is given by the corrections field for a given level and micro vertex and shift is given by the shifts field indexed from the level then by 4 values, selected from interior or the 3 edges in vertex order in that order.

Chapter 39. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute OpRayQueryProceedKHR or OpTraceRayKHR. When the rayTracingPipeline feature is enabled, OpTraceRayKHR can be used for ray tracing in a ray tracing pipeline. When the rayQuery feature is enabled, OpRayQueryProceedKHR can be used in any shader stage.

39.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

Note

Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in an bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space to ray space according to the ray origin and direction as follows:

\[
\begin{pmatrix}
    x_r \\
    y_r \\
    z_r
\end{pmatrix} = \begin{pmatrix}
    a_x^2(1 - c) + c & a_xa_y(1 - c) - sa_z & a_xa_z(1 - c) + sa_y \\
    a_xa_y(1 - c) + sa_z & a_y^2(1 - c) + c & a_ya_z(1 - c) - sa_x \\
    a_xa_z(1 - c) - sa_y & a_ya_z(1 - c) + sa_x & a_z^2(1 - c) + c
\end{pmatrix} \begin{pmatrix}
    x_{as} - o_x \\
    y_{as} - o_y \\
    z_{as} - o_z
\end{pmatrix}
\]

\( \mathbf{a} \) is the axis of rotation from the unnormalized ray direction vector \( \mathbf{d} \) to the axis vector \( \mathbf{k} \):
\[ a = \begin{cases} \frac{d \times k}{\|d \times k\|} & \text{if } \|d \times k\| \neq 0 \\ \begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} & \text{if } \|d \times k\| = 0 \end{cases} \]

\( s \) and \( c \) are the sine and cosine of the angle of rotation about \( a \) from \( d \) to \( k \):

\[ c = \frac{d \cdot k}{\|d\|} \]
\[ s = \sqrt{1 - c^2} \]

\( k \) is the unit vector:

\[ k = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix} \]

\( o \) and \( d \) are the ray origin and unnormalized direction, respectively; the vector described by \( x_{as}, y_{as}, \) and \( z_{as} \) is any position in acceleration structure space; and the vector described by \( x_r, y_r, \) and \( z_r \) is the same position in ray space.

An **intersection candidate** is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \( x_{as}, y_{as}, z_{as} \) such that

\[ x_r = 0 \]
\[ y_r = 0 \]
\[ t_{min} < -\frac{z_r}{\|d\|} < t_{max} \quad \text{if the primitive is a triangle,} \]
\[ t_{min} \leq -\frac{z_r}{\|d\|} \leq t_{max} \quad \text{otherwise} \]

(where \( t = -\frac{z_r}{\|d\|} \)), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

**Note**

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.
The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its \( t_{\text{min}} \) is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting \( t_{\text{min}} \) slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time specified in the \textit{time} parameter to \texttt{OpTraceRayMotionNV} by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with \texttt{OpTraceRayKHR}, it behaves as a \texttt{OpTraceRayMotionNV} with \textit{time} of 0.0.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positive intersections being reported to the application.

For triangle intersection candidates, the \( b \) and \( c \) barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with \texttt{OpTraceRayKHR}, these values are available as a vector of 2 32-bit floating point values in the \texttt{HitAttributeKHR} storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between
operations performed on different intersection candidates.

### 39.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a *shared vertex*.
- Any set of two triangles with two shared vertices that were specified in the same *winding order* in each triangle have a *shared edge* defined by those vertices.

A *closed fan* is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations *should* not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

### 39.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

#### 39.2.1. Ray Primitive Culling

If the *rayTraversalPrimitiveCulling* or *rayQuery* features are enabled, the *SkipTrianglesKHR* and *SkipAABBsKHR* ray flags *can* be specified when tracing a ray. *SkipTrianglesKHR* and *SkipAABBsKHR* are mutually exclusive. *SkipTrianglesKHR* is also mutually exclusive with *CullBackFacingTrianglesKHR* and *CullFrontFacingTrianglesKHR*.

If *SkipTrianglesKHR* was included in the *Ray Flags* operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If *VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR* was included in the pipeline, traversal with *OpTraceRayKHR* calls will all behave as if *SkipTrianglesKHR* was included in its *Ray Flags* operand.

If *SkipAABBsKHR* was included in the *Ray Flags* operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If *VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR* was included in the pipeline, traversal with *OpTraceRayKHR* calls will all behave as if *SkipAABBsKHR* was included in its *Ray Flags* operand.
39.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of `VkAccelerationStructureInstanceKHR::mask` used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if `mask & Cull Mask == 0`, the intersection is dropped, and no further processing occurs.

39.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon’s area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[
 a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i^r y_i^r - x_i^r \phi_1 y_i^r
\]

where \(x_i^r\) and \(y_i^r\) are the x and y ray space coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \mod n\).

By default, if \(a\) is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if \(a\) is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray’s perspective in a clockwise rotation order. `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with `OpTraceRayKHR`, the HitKindKHR built-in is set to `HitKindFrontFacingTriangleKHR` if the intersection is with front-facing geometry, and `HitKindBackFacingTriangleKHR` if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with `OpRayQueryProceedKHR`, `OpRayQueryGetIntersectionFrontFaceKHR` will return true for intersection candidates with front faces, or false for back faces.
Culling

If CullBackFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If CullFrontFacingTrianglesKHR was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR was included in VkAccelerationStructureInstanceKHR::flags for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (a == 0) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The CullBackFacingTrianglesKHR and CullFrontFacingTrianglesKHR Ray Flags are mutually exclusive.

39.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

Determination

Each individual intersection candidate is initially determined as opaque if VK_GEOMETRY_OPAQUE_BIT_KHR was included in the VkAccelerationStructureGeometryKHR::flags when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR in VkAccelerationStructureInstanceKHR::flags will force all geometries in the instance to be considered opaque. Similarly, setting VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including OpaqueKHR or NoOpaqueKHR in the Ray Flags parameter when tracing a ray. OpaqueKHR forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, NoOpaqueKHR forces all geometries to behave as if they are non-opaque.

If the ray was traced with OpRayQueryProceedKHR, to determine the opacity of AABB intersection candidates, OpRayQueryGetIntersectionCandidateAABBopaqueKHR can be used. This instruction will return true for opaque intersection candidates, and false for non-opaque intersection candidates.
Culling

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The OpaqueKHR, NoOpaqueKHR, CullOpaqueKHR, and CullNoOpaqueKHR Ray Flags are mutually exclusive.

39.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` and `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` values in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from ⌊u⌋ + ⌊v⌋, clamping ⌊u⌋ as needed to keep the sum less than or equal to 1 << subdivisionlevel. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 29. Example ordering for micromap data](image)

Note

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque,
non-opaque, or ignored. The interpretation of the values depends on
VK_GEOMETRY_INSTANCE_FORCE_OPAcity_MICROMAP_2_STATE_EXT in the instance of the candidate
intersection or ForceOpacityMicromap2StateEXT ray flags on the ray. If either is set, the opacity
micromap information is interpreted in 2 state override mode.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT, each
element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT, each
element is represented by a two bit value at the index derived above.

39.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB,
candidate intersections are further processed to determine the eventual hit result. Candidates
generated from AABB intersections run through the same confirmation process as triangle hits.
39.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with OpTraceRayKHR, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with OpTraceRayKHR, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

39.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with OpTraceRayKHR, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

### 39.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its \( t \) value is compared to \( t_{\text{max}} \) to determine which intersection is closer, where \( t \) is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to \( t \) and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

### 39.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with OpTraceRayKHR, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with OpTraceRayKHR where no hit result was identified, the miss shader identified by the Miss Index parameter of OpTraceRayKHR is invoked. Control returns to the shader that executed OpTraceRayKHR once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning false. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of RayQueryCommittedIntersectionGeneratedKHR or RayQueryCommittedIntersectionTriangleKHR. If no closest hit was identified, the committed intersection type will be RayQueryCommittedIntersectionNoneKHR.

No further processing of a ray query occurs after this result is determined.
Chapter 40. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray Tracing Pipeline](image)

Figure 30. Ray tracing pipeline execution

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, `OpTraceRayKHR` or `OpTraceRayMotionNV` can be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a `VkBuffer` object known as a shader binding table. `OpExecuteCallableKHR` can also be used in ray tracing pipelines to invoke a callable shader.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. **Traversal**, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The **Workgroup** scope and variables with a storage class of **Workgroup** must not be used in the ray tracing pipeline.

### 40.1. Shader Call Instructions

A shader call is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- `OpTraceRayKHR` which may invoke intersection, any-hit, closest hit, or miss shaders,
• **OpTraceRayMotionNV** which may invoke intersection, any-hit, closest hit, or miss shaders,

• **OpReportIntersectionKHR** which may invoke any-hit shaders, and

• **OpExecuteCallableKHR** which will invoke a callable shader.

• **OpHitObjectTraceRayNV, OpHitObjectTraceRayMotionNV, and OpHitObjectExecuteShaderNV** which may invoke intersection, any-hit, closest hit, miss, or callable shaders.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups may be unrelated to the subgroup of the parent invocation.

**Pipeline trace ray instructions** can be used recursively; invoked shaders can themselves execute pipeline trace ray instructions, to a maximum depth defined by the `maxRecursionDepth` or `maxRayRecursionDepth` limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications must not invoke a shader with a recursion depth greater than the value of `maxRecursionDepth` or `maxPipelineRayRecursionDepth` specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. **OpExecuteCallableKHR**) but there is an upper bound determined by the stack size.

An **invocation repack instruction** is a ray tracing shader call instruction where the implementation may change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which may result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it may be resumed in a different subgroup or at a different `SubgroupLocalInvocationId` within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same `SubgroupLocalInvocationId`.

The invocations that are executing before an invocation repack instruction, after the instruction, or are created by the instruction, are shader-call-related.

If the implementation changes the composition of subgroups, the values of `SubgroupSize, SubgroupLocalInvocationId, SMIDNV, WarpIDNV`, and built-in variables that are derived from them (`SubgroupEqMask, SubgroupGeMask, SubgroupGtMask, SubgroupLeMask, SubgroupLtMask`) must be changed accordingly by the invocation repack instruction. The application must use Volatile semantics on these `BuiltIn` variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application must use Volatile semantics on any `RayTmaxKHR` decorated `BuiltIn` used in an intersection shader.

**Note**

**Subgroup operations** are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic
instance of that instruction are potentially valid. For example, care **must** be taken when using the result of a ballot operation that was computed before an invocation repack instruction, after that repack instruction. The ballot **may** be incorrect as the set of invocations could have changed.

While the **SubgroupSize** built-in is required to be declared **Volatile**, its value will never change unless `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` is set on pipeline creation, as without that bit set, its value is required to match that of `VkPhysicalDeviceSubgroupProperties::subgroupSize`.

For clock operations, the value of a **Subgroup** scoped `OpReadClockKHR` read before the dynamic instance of a repack instruction **should** not be compared to the result of that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by **shader-call-order**.

For ray tracing invocations that are **shader-call-related**:

- **memory operations** on `StorageBuffer`, `Image`, and `ShaderRecordBufferKHR` storage classes **can** be synchronized using the `ShaderCallKHR` scope.
- the `CallableDataKHR`, `IncomingCallableDataKHR`, `RayPayloadKHR`, `HitAttributeKHR`, and `IncomingRayPayloadKHR` storage classes are **system-synchronized** and no application availability and visibility operations are required.
- **memory operations** within a single invocation before and after the invocation repack instruction are ordered by **program-order** and do not require explicit synchronization.

### 40.2. Ray Tracing Commands

**Ray tracing commands** provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline **must** be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

```c
// Provided by VK_NV_ray_tracing
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer raygenShaderBindingTableBuffer,
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer missShaderBindingTableBuffer,
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer hitShaderBindingTableBuffer,
    VkDeviceSize hitShaderBindingOffset,
)
```

3007
• `commandBuffer` is the command buffer into which the command will be recorded.

• `raygenShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the ray generation shader stage.

• `raygenShaderBindingOffset` is the offset in bytes (relative to `raygenShaderBindingTableBuffer`) of the ray generation shader being used for the trace.

• `missShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the miss shader stage.

• `missShaderBindingOffset` is the offset in bytes (relative to `missShaderBindingTableBuffer`) of the miss shader being used for the trace.

• `missShaderBindingStride` is the size in bytes of each shader binding table record in `missShaderBindingTableBuffer`.

• `hitShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the hit shader stages.

• `hitShaderBindingOffset` is the offset in bytes (relative to `hitShaderBindingTableBuffer`) of the hit shader group being used for the trace.

• `hitShaderBindingStride` is the size in bytes of each shader binding table record in `hitShaderBindingTableBuffer`.

• `callableShaderBindingTableBuffer` is the buffer object that holds the shader binding table data for the callable shader stage.

• `callableShaderBindingOffset` is the offset in bytes (relative to `callableShaderBindingTableBuffer`) of the callable shader being used for the trace.

• `callableShaderBindingStride` is the size in bytes of each shader binding table record in `callableShaderBindingTableBuffer`.

• `width` is the width of the ray trace query dimensions.

• `height` is height of the ray trace query dimensions.

• `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width \times height \times depth` rays is assembled.

---

**Valid Usage**

- **VUID-vkCmdTraceRaysNV-magFilter-04553**

  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this
command, then the image view's format features must contain 
\texttt{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}

- **VUID-vkCmdTraceRaysNV-mipmapMode-04770**
  If a\texttt{VkSampler} created with\texttt{mipmapMode} equal to\texttt{VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR} and\texttt{compareEnable} equal to\texttt{VK\_FALSE} is used to sample a\texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}

- **VUID-vkCmdTraceRaysNV-None-06479**
  If a\texttt{VkImageView} is sampled with depth comparison, the image view's format features must contain \texttt{VK\_FORMAT\_FEATURE\_2\_SAMPLED\_IMAGE\_DEPTH\_COMPARISON\_BIT}

- **VUID-vkCmdTraceRaysNV-None-02691**
  If a\texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK\_FORMAT\_FEATURE\_STORAGE\_IMAGE\_ATOMIC\_BIT}

- **VUID-vkCmdTraceRaysNV-None-07888**
  If a\texttt{VK\_DESCRIPTOR\_TYPE\_STORAGE\_TEXEL\_BUFFER} descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain \texttt{VK\_FORMAT\_FEATURE\_STORAGE\_TEXEL\_BUFFER\_ATOMIC\_BIT}

- **VUID-vkCmdTraceRaysNV-filterCubic-02694**
  Any\texttt{VkImageView} being sampled with\texttt{VK\_FILTER\_CUBIC\_EXT} as a result of this command must have a\texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- **VUID-vkCmdTraceRaysNV-filterCubicMinmax-02695**
  Any\texttt{VkImageView} being sampled with\texttt{VK\_FILTER\_CUBIC\_EXT} with a reduction mode of either\texttt{VK\_SAMPLER\_REDUCTION\_MODE\_MIN} or\texttt{VK\_SAMPLER\_REDUCTION\_MODE\_MAX} as a result of this command must have a\texttt{VkImageViewType} and format that supports cubic filtering together with minmax filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- **VUID-vkCmdTraceRaysNV-flags-02696**
  Any\texttt{VkImage} created with a\texttt{VkImageCreateInfo::flags} containing \texttt{VK\_IMAGE\_CREATE\_CORNER\_SAMPLED\_BIT\_NV} sampled as a result of this command must only be sampled using a\texttt{VkSamplerAddressMode} of \texttt{VK\_SAMPLER\_ADDRESS\_MODE\_CLAMP\_TO\_EDGE}

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07027**
  For any\texttt{VkImageView} being written as a storage image where the image format field of the\texttt{OpTypeImage} is \texttt{Unknown}, the view's format features must contain \texttt{VK\_FORMAT\_FEATURE\_2\_STORAGE\_WRITE\_WITHOUT\_FORMAT\_BIT}

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07028**
  For any\texttt{VkImageView} being read as a storage image where the image format field of the
OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysNV-None-08600
  For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a VkPipelineLayout that is compatible for set \( n \), with the VkPipelineLayout or VkDescriptorSetLayout array that was used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysNV-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysNV-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout or VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkPipeline or VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysNV-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysNV-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysNV-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysNV-None-08604
  Descriptors in bound descriptor buffers, specified via
\texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysNV-None-08117**
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, the bound \texttt{VkPipeline} \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- **VUID-vkCmdTraceRaysNV-None-08119**
  If a descriptor is dynamically used with a \texttt{VkPipeline} created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- **VUID-vkCmdTraceRaysNV-None-08605**
  If a descriptor is dynamically used with a \texttt{VkShaderEXT} created with a \texttt{VkDescriptorSetLayout} that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- **VUID-vkCmdTraceRaysNV-None-08606**
  If the \texttt{shaderObject} feature is not enabled, a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-None-08607**
  If the \texttt{shaderObject} is enabled, either a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command, or a valid combination of valid and \texttt{VK_NULL_HANDLE} shader objects \textbf{must} be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdTraceRaysNV-None-08609**
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-08610**
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-08611**
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this
command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V **OpImageSample** or **OpImageSparseSample** instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdTraceRaysNV-uniformBuffers-06935**
  If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT** or **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT** for **uniformBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-None-08612**
  If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-storageBuffers-06936**
  If any stage of the **VkPipeline** object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT** or **VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT** for **storageBuffers**, and the **robustBufferAccess** feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-None-08613**
  If the **robustBufferAccess** feature is not enabled, and any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-commandBuffer-02707**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, any resource accessed by **bound shaders** **must** not be a protected resource

- **VUID-vkCmdTraceRaysNV-None-06550**
  If a **bound shader** accesses a **VkSampler** or **VkImageView** object that enables **sampler Y′C aCk conversion**, that object **must** only be used with **OpImageSample** or **OpImageSparseSample** instructions

- **VUID-vkCmdTraceRaysNV-ConstOffset-06551**
  If a **bound shader** accesses a **VkSampler** or **VkImageView** object that enables **sampler Y′C aCk conversion**, that object **must** not use the **ConstOffset** and **Offset** operands

- **VUID-vkCmdTraceRaysNV-viewType-07752**
  If a **VkImageView** is accessed as a result of this command, then the image view's **viewType** **must** match the **Dim** operand of the **OpTypeImage** as described in **Instruction/Sampler/Image View Validation**

- **VUID-vkCmdTraceRaysNV-format-07753**
If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the `OpTypeImage` must match.

- **VUID-vkCmdTraceRaysNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdTraceRaysNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

- **VUID-vkCmdTraceRaysNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

- **VUID-vkCmdTraceRaysNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

- **VUID-vkCmdTraceRaysNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

- **VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdTraceRaysNV-OpImageBoxFilterQCOM-06973**
If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdTraceRaysNV-None-03429
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

• VUID-vkCmdTraceRaysNV-commandBuffer-04624
  commandBuffer must not be a protected command buffer

• VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625
  This command must not cause a pipeline trace ray instruction to be executed from a shader invocation with a recursion depth greater than the value of maxRecursionDepth used to create the bound ray tracing pipeline

• VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042
  If raygenShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455
  raygenShaderBindingOffset must be less than the size of raygenShaderBindingTableBuffer

• VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456
  raygenShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment
• VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043
  If missShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457
  missShaderBindingOffset must be less than the size of missShaderBindingTableBuffer.

• VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458
  missShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment.

• VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044
  If hitShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459
  hitShaderBindingOffset must be less than the size of hitShaderBindingTableBuffer.

• VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460
  hitShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment.

• VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If callableShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
  callableShaderBindingOffset must be less than the size of callableShaderBindingTableBuffer.

• VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
  callableShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment.

• VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
  missShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize.

• VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
  hitShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize.

• VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
  callableShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize.

• VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
  missShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride.

• VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
  hitShaderBindingStride must be less than or equal to VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride.

• VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
  callableShaderBindingStride must be less than or equal to...
VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-width-02469
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdTraceRaysNV-height-02470
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdTraceRaysNV-depth-02471
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
  raygenShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
  If missShaderBindingTableBuffer is not VK_NULL_HANDLE, missShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
  If hitShaderBindingTableBuffer is not VK_NULL_HANDLE, hitShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
  If callableShaderBindingTableBuffer is not VK_NULL_HANDLE, callableShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdTraceRaysNV-commonparent
  Each of callableShaderBindingTableBuffer, commandBuffer, hitShaderBindingTableBuffer, missShaderBindingTableBuffer, and raygenShaderBindingTableBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

To dispatch ray tracing use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
define void vkCmdTraceRaysKHR(  
    VkCommandBuffer commandBuffer,  
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,  
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,  
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,  
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,  
    uint32_t width,  
    uint32_t height,  
    uint32_t depth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of `width × height × depth` rays is assembled.

### Valid Usage

- VUID-vkCmdTraceRaysKHR-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and
The `compareEnable` variable is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdTraceRaysKHR-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdTraceRaysKHR-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features **must** contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdTraceRaysKHR-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdTraceRaysKHR-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command **must** have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdTraceRaysKHR-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07028**
For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysKHR-None-08600**
  For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysKHR-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysKHR-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysKHR-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-None-08604**
Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysKHR-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysKHR-None-08119**
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysKHR-None-08605**
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysKHR-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysKHR-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysKHR-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdTraceRaysKHR-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any
A Vulkan shader (VkShaderEXT) bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08613**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

- **VUID-vkCmdTraceRaysKHR-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdTraceRaysKHR-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdTraceRaysKHR-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.
If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match.

If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.
If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must not** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command **must** terminate.

Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline.

This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

`commandBuffer` **must** not be a protected command buffer.

The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member.

If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
The buffer from which the pRayGenShaderBindingTable->deviceAddress is queried must
have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

pRayGenShaderBindingTable->deviceAddress must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

If the buffer from which pMissShaderBindingTable->deviceAddress was queried is non-
sparse then it must be bound completely and contiguously to a single VkDeviceMemory
object

The buffer from which the pMissShaderBindingTable->deviceAddress is queried must have
been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

pMissShaderBindingTable->deviceAddress must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

pMissShaderBindingTable->stride must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

pMissShaderBindingTable->stride must be less than or equal to
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which pHitShaderBindingTable->deviceAddress was queried is non-
sparse then it must be bound completely and contiguously to a single VkDeviceMemory
object

The buffer from which the pHitShaderBindingTable->deviceAddress is queried must have
been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

pHitShaderBindingTable->deviceAddress must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

pHitShaderBindingTable->stride must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

pHitShaderBindingTable->stride must be less than or equal to
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which pCallableShaderBindingTable->deviceAddress was queried is non-
sparse then it must be bound completely and contiguously to a single VkDeviceMemory
object

pCallableShaderBindingTable->deviceAddress must be a multiple of
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

pCallableShaderBindingTable->stride must be less than or equal to
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which pCallableShaderBindingTable->deviceAddress was queried is non-
sparse then it must be bound completely and contiguously to a single VkDeviceMemory
object

VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692
The buffer from which the pCallableShaderBindingTable->deviceAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag.

• VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693
  pCallableShaderBindingTable->deviceAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysKHR-stride-03694
  pCallableShaderBindingTable->stride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

• VUID-vkCmdTraceRaysKHR-stride-04041
  pCallableShaderBindingTable->stride must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

• VUID-vkCmdTraceRaysKHR-flags-03696
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADER_BIT_KHR, pHitShaderBindingTable->deviceAddress must not be zero

• VUID-vkCmdTraceRaysKHR-flags-03697
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADER_BIT_KHR, pHitShaderBindingTable->deviceAddress must not be zero

• VUID-vkCmdTraceRaysKHR-flags-03511
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADER_BIT_KHR, the shader group handle identified by pMissShaderBindingTable->deviceAddress must not be set to zero

• VUID-vkCmdTraceRaysKHR-flags-03512
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADER_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an any-hit shader must not be set to zero

• VUID-vkCmdTraceRaysKHR-flags-03513
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADER_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader must not be set to zero

• VUID-vkCmdTraceRaysKHR-flags-03514
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADER_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader must not be set to zero

• VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR.
Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR.

**Valid Usage (Implicit)**

- VUID-vkCmdTraceRaysKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
  pRaygenShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
  pMissShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
  pHitShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
  pCallableShaderBindingTable must be a valid pointer to a valid VkStridedDeviceAddressRegionKHR structure

- VUID-vkCmdTraceRaysKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysKHR-videocoding

width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]

height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]

depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]

width × height × depth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount
This command **must** only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

</tr>
</tbody>
</table>

The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress    deviceAddress;
    VkDeviceSize       stride;
    VkDeviceSize       size;
} VkStridedDeviceAddressRegionKHR;
```

- `deviceAddress` is the device address (as returned by the `vkGetBufferDeviceAddress` command) at which the region starts, or zero if the region is unused.
- `stride` is the byte stride between consecutive elements.
- `size` is the size in bytes of the region starting at `deviceAddress`.

**Valid Usage**

- VUID-VkStridedDeviceAddressRegionKHR-size-04631
  If `size` is not zero, all addresses between `deviceAddress` and `deviceAddress + size - 1` **must** be in the buffer device address range of the same buffer.

- VUID-VkStridedDeviceAddressRegionKHR-size-04632
  If `size` is not zero, `stride` **must** be less than or equal to the size of the buffer from which `deviceAddress` was queried.

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:
// Provided by VK_HUAWEI_invocation_mask
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer commandBuffer,
    VkImageView imageView,
    VkImageLayout imageLayout);

• commandBuffer is the command buffer into which the command will be recorded
• imageView is an image view handle specifying the invocation mask image imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with ones value.
• imageLayout is the layout that the image subresources accessible from imageView will be in when the invocation mask image is accessed

Valid Usage

• VUID-vkCmdBindInvocationMaskHUAWEI-None-04976
  The invocationMask feature must be enabled

• VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977
  If imageView is not VK_NULL_HANDLE, it must be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D

• VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978
  If imageView is not VK_NULL_HANDLE, it must have a format of VK_FORMAT_R8_UINT

• VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979
  If imageView is not VK_NULL_HANDLE, it must have been created with VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI set

• VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980
  If imageView is not VK_NULL_HANDLE, imageLayout must be VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdBindInvocationMaskHUAWEI-width-04981
  Thread mask image resolution must match the width and height in vkCmdTraceRaysKHR

• VUID-vkCmdBindInvocationMaskHUAWEI-None-04982
  Each element in the invocation mask image must have the value 0 or 1. The value 1 means the invocation is active

• VUID-vkCmdBindInvocationMaskHUAWEI-depth-04983
  depth in vkCmdTraceRaysKHR must be 1

Valid Usage (Implicit)

• VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindInvocationMaskHUAWEI-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle

• VUID-vkCmdBindInvocationMaskHUAWEI-imageLayout-parameter

3028
imageLayout must be a valid VkImageLayout value

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBindInvocationMaskHUAWEI-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBindInvocationMaskHUAWEI-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindInvocationMaskHUAWEI-commonparent
  Both of commandBuffer, and imageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

---

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef void vkCmdTraceRaysIndirectKHR(
  VkCommandBuffer commandBuffer,
  const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
  const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
  const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
  const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
  VkDeviceAddress indirectDeviceAddress);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pRaygenShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.
- **pMissShaderBindingTable** is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.

- **pHitShaderBindingTable** is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.

- **pCallableShaderBindingTable** is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.

- **indirectDeviceAddress** is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommandKHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirectKHR` behaves similarly to `vkCmdTraceRaysKHR` except that the ray trace query dimensions are read by the device from `indirectDeviceAddress` during execution.

### Valid Usage

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdTraceRaysIndirectKHR-None-06479**
  If a `VkImageView` is sampled with `depth comparison`, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdTraceRaysIndirectKHR-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdTraceRaysIndirectKHR-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

- **VUID-vkCmdTraceRaysIndirectKHR-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkGetPhysicalDeviceImageFormatProperties2::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` **must** have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource.

If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y′C aC` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the numeric type of the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImage` object created with the sparseImageInt64Atomics feature is not enabled, `VkImage` objects created with the...
VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdTraceRaysIndirectKHR-None-03429
  Any shader group handle referenced by this call must have been queried from the
Currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679**
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635**
  `commandBuffer` **must** not be a protected command buffer.

- **VUID-vkCmdTraceRaysIndirectKHR-size-04023**
  The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member.

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680**
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681**
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682**
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683**
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684**
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685**
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03686**
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`.

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04029**
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`.

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687**
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688**
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have
been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689**
  \( \text{pHitShaderBindingTable} \rightarrow \text{deviceAddress} \) **must** be a multiple of \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{shaderGroupBaseAlignment} \)

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03690**
  \( \text{pHitShaderBindingTable} \rightarrow \text{stride} \) **must** be a multiple of \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{shaderGroupHandleAlignment} \)

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04035**
  \( \text{pHitShaderBindingTable} \rightarrow \text{stride} \) **must** be less than or equal to \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{maxShaderGroupStride} \)

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691**
  If the buffer from which \( \text{pCallableShaderBindingTable} \rightarrow \text{deviceAddress} \) was queried is non-sparse then it **must** be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692**
  The buffer from which the \( \text{pCallableShaderBindingTable} \rightarrow \text{deviceAddress} \) is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03693**
  \( \text{pCallableShaderBindingTable} \rightarrow \text{deviceAddress} \) **must** be a multiple of \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{shaderGroupBaseAlignment} \)

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03694**
  \( \text{pCallableShaderBindingTable} \rightarrow \text{stride} \) **must** be a multiple of \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{shaderGroupHandleAlignment} \)

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04041**
  \( \text{pCallableShaderBindingTable} \rightarrow \text{stride} \) **must** be less than or equal to \( \text{VkPhysicalDeviceRayTracingPipelinePropertiesKHR} : \text{maxShaderGroupStride} \)

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03696**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, \( \text{pHitShaderBindingTable} \rightarrow \text{deviceAddress} \) **must** not be zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03697**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, \( \text{pHitShaderBindingTable} \rightarrow \text{deviceAddress} \) **must** not be zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03511**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by \( \text{pMissShaderBindingTable} \rightarrow \text{deviceAddress} \) **must** not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03512**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by \( \text{pHitShaderBindingTable} \rightarrow \text{deviceAddress} \) accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero
If the currently bound ray tracing pipeline was created with flags that included
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, entries in the table
identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command
in order to execute a closest hit shader must not be set to zero.

If the currently bound ray tracing pipeline was created with flags that included
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, entries in the
table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this
command in order to execute an intersection shader must not be set to zero.

Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of
VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with
VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR.

Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of
VK_GEOMETRY_TYPE_AABBS_KHR must have been created with
VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR.

If the buffer from which indirectDeviceAddress was queried is non-sparse then it must
be bound completely and contiguously to a single VkDeviceMemory object.

The buffer from which indirectDeviceAddress was queried must have been created with
the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

indirectDeviceAddress must be a multiple of 4.

All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof
(VkTraceRaysIndirectCommandKHR) - 1 must be in the buffer device address range of the
same buffer.

The rayTracingPipelineTraceRaysIndirect feature must be enabled.

If the bound ray tracing pipeline was created with
VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect
feature must be enabled.
Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
  `pRaygenShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
  `pMissShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
  `pHitShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
  `pCallableShaderBindingTable` **must** be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- VUID-vkCmdTraceRaysIndirectKHR-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirectKHR-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

The `VkTraceRaysIndirectCommandKHR` structure is defined as:
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommandKHR;

- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommandKHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

### Valid Usage

- **VUID-VkTraceRaysIndirectCommandKHR-width-03638**
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- **VUID-VkTraceRaysIndirectCommandKHR-height-03639**
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- **VUID-VkTraceRaysIndirectCommandKHR-depth-03640**
  `depth` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]` × `VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- **VUID-VkTraceRaysIndirectCommandKHR-width-03641**
  `width` × `height` × `depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommand2KHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to `vkCmdTraceRaysIndirectKHR` except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.
Valid Usage

- **VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirect2KHR-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdTraceRaysIndirect2KHR-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdTraceRaysIndirect2KHR-None-07888**
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdTraceRaysIndirect2KHR-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdTraceRaysIndirect2KHR-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027**
For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` or `VkDescriptorSetLayout` array that was used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdTraceRaysIndirect2KHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdTraceRaysIndirect2KHR-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` or `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkPipeline` or `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdTraceRaysIndirect2KHR-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-08115
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- VUID-vkCmdTraceRaysIndirect2KHR-None-08116
  Descriptors in bound descriptor buffers, specified via...
**vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by the **VkPipeline** bound to the pipeline bind point used by this command and the bound **VkPipeline** was created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08604**
  Descriptors in bound descriptor buffers, specified via **vkCmdSetDescriptorBufferOffsetsEXT**, **must** be valid if they are dynamically used by any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08617**
  If the descriptors used by the **VkPipeline** bound to the pipeline bind point were specified via **vkCmdSetDescriptorBufferOffsetsEXT**, the bound **VkPipeline** **must** have been created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08609**
  If a descriptor is dynamically used with a **VkPipeline** created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08605**
  If a descriptor is dynamically used with a **VkShaderEXT** created with a **VkDescriptorSetLayout** that was created with **VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08607**
  If the **shaderObject** is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and **VK_NULL_HANDLE** shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the **VkPipeline** object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08609**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler **must** not be used to sample from any **VkImage** with a **VkImageView** of the type **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, **VK_IMAGE_VIEW_TYPE_1D_ARRAY**, **VK_IMAGE_VIEW_TYPE_2D_ARRAY** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**, in any shader stage

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08610**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any **VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler
**must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysIndirect2KHR-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirect2KHR-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables sampler YC4C4 conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdTraceRaysIndirect2KHR-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables sampler YC4C4 conversion, that object **must** not use the `ConstOffset` and `Offset` operands.
If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` must match.

If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.
If \texttt{OpImageWeightedSampleQCOM} uses a \texttt{VkImageView} as a sample weight image as a result of this command, then the image view’s format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM}

If \texttt{OpImageBoxFilterQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view’s format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM}

If \texttt{OpImageBlockMatchSSDQCOM} is used to read from an \texttt{VkImageView} as a result of this command, then the image view’s format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}

If \texttt{OpImageBlockMatchSADQCOM} is used to read from an \texttt{VkImageView} as a result of this command, then the image view’s format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}

If \texttt{OpImageBlockMatchSSDQCOM} or \texttt{OpImageBlockMatchSADQCOM} is used to read from a reference image as result of this command, then the specified reference coordinates \textbf{must} not fail \texttt{integer texel coordinate validation}

If \texttt{OpImageWeightedSampleQCOM}, \texttt{OpImageBoxFilterQCOM}, \texttt{OpImageBlockMatchSSDQCOM}, or \texttt{OpImageBlockMatchSADQCOM} uses a \texttt{VkSampler} as a result of this command, then the sampler \textbf{must} have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}

If any command other than \texttt{OpImageWeightedSampleQCOM}, \texttt{OpImageBoxFilterQCOM}, \texttt{OpImageBlockMatchSSDQCOM}, or \texttt{OpImageBlockMatchSADQCOM} uses a \texttt{VkSampler} as a result of this command, then the sampler \textbf{must} not have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}

Any shader invocation executed by this command \textbf{must} terminate

Any shader group handle referenced by this call \textbf{must} have been queried from the currently bound ray tracing pipeline

This command \textbf{must} not cause a shader call instruction to be executed from a shader invocation with a \texttt{recursion depth} greater than the value of \texttt{maxPipelineRayRecursionDepth} used to create the bound ray tracing pipeline

\texttt{commandBuffer} \textbf{must} not be a protected command buffer

If the buffer from which \texttt{indirectDeviceAddress} was queried is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object
• VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03633
  The buffer from which indirectDeviceAddress was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03634
  indirectDeviceAddress must be a multiple of 4

• VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03636
  All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof (VkTraceRaysIndirectCommand2KHR) - 1 must be in the buffer device address range of the same buffer

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingPipelineTraceRaysIndirect2-03637
  The rayTracingPipelineTraceRaysIndirect2 feature must be enabled

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
  If the bound ray tracing pipeline was created with
  VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
  VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdTraceRaysIndirect2KHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdTraceRaysIndirect2KHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkTraceRaysIndirectCommand2KHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress raygenShaderRecordAddress;
    VkDeviceSize raygenShaderRecordSize;
    VkDeviceAddress missShaderBindingTableAddress;
    VkDeviceSize missShaderBindingTableSize;
    VkDeviceSize missShaderBindingTableStride;
    VkDeviceAddress hitShaderBindingTableAddress;
    VkDeviceSize hitShaderBindingTableSize;
    VkDeviceSize hitShaderBindingTableStride;
    VkDeviceAddress callableShaderBindingTableAddress;
    VkDeviceSize callableShaderBindingTableSize;
    VkDeviceSize callableShaderBindingTableStride;
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommand2KHR;
```

- `raygenShaderRecordAddress` is a `VkDeviceAddress` of the ray generation shader binding table record used by this command.
- `raygenShaderRecordSize` is a `VkDeviceSize` number of bytes corresponding to the ray generation shader binding table record at base address `raygenShaderRecordAddress`.
- `missShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the miss shader binding table used by this command.
- `missShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the miss shader binding table at `missShaderBindingTableAddress` that may be accessed by this command.
- `missShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the miss shader binding table.
- `hitShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the hit shader binding table used by this command.
- `hitShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the hit shader binding table at `hitShaderBindingTableAddress` that may be accessed by this command.
hitShaderBindingTableStride is a VkDeviceSize number of bytes between records of the hit shader binding table.

callableShaderBindingTableAddress is a VkDeviceAddress of the first record in the callable shader binding table used by this command.

callableShaderBindingTableSize is a VkDeviceSize number of bytes corresponding to the total size of the callable shader binding table at callableShaderBindingTableAddress that may be accessed by this command.

callableShaderBindingTableStride is a VkDeviceSize number of bytes between records of the callable shader binding table.

width is the width of the ray trace query dimensions.

height is height of the ray trace query dimensions.

depth is depth of the ray trace query dimensions.

The members of VkTraceRaysIndirectCommand2KHR have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.

Indirect shader binding table buffer parameters must satisfy the same memory alignment and binding requirements as their counterparts in vkCmdTraceRaysIndirectKHR and vkCmdTraceRaysKHR.

### Valid Usage

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680**
  If the buffer from which raygenShaderRecordAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681**
  The buffer from which the raygenShaderRecordAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag.

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682**
  raygenShaderRecordAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment.

- **VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683**
  If the buffer from which missShaderBindingTableAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684**
  The buffer from which the missShaderBindingTableAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag.

- **VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03685**
  missShaderBindingTableAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment.

- **VUID-VkTraceRaysIndirectCommand2KHR-stride-03686**
  missShaderBindingTableStride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment.
missShaderBindingTableStride must be less than or equal to 
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which hitShaderBindingTableAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

The buffer from which the hitShaderBindingTableAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

hitShaderBindingTableAddress must be a multiple of 
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

hitShaderBindingTableStride must be a multiple of 
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

hitShaderBindingTableStride must be less than or equal to 
VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, hitShaderBindingTableAddress must not be zero

If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, hitShaderBindingTableAddress must not be zero

If the currently bound ray tracing pipeline was created with flags that included
VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle identified by missShaderBindingTableAddress must not be set to zero.

- VUID-VkTraceRaysIndirectCommand2KHR-flags-03512
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, entries in the table identified by hitShaderBindingTableAddress accessed as a result of this command in order to execute an any-hit shader must not be set to zero.

- VUID-VkTraceRaysIndirectCommand2KHR-flags-03513
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table identified by hitShaderBindingTableAddress accessed as a result of this command in order to execute an any-hit shader must not be set to zero.

- VUID-VkTraceRaysIndirectCommand2KHR-flags-03514
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR, entries in the table identified by hitShaderBindingTableAddress accessed as a result of this command in order to execute an intersection shader must not be set to zero.

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by hitShaderBindingTableAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR.

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by hitShaderBindingTableAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR.

- VUID-VkTraceRaysIndirectCommand2KHR-width-03638
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0].

- VUID-VkTraceRaysIndirectCommand2KHR-height-03639
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1].

- VUID-VkTraceRaysIndirectCommand2KHR-depth-03640
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2].

- VUID-VkTraceRaysIndirectCommand2KHR-width-03641
  width × height × depth must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount.

### 40.3. Shader Binding Table

A shader binding table is a resource which establishes the relationship between the ray tracing
pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages shader binding tables as VkBuffer objects.

Each entry in the shader binding table consists of shaderGroupHandleSize bytes of data, either as queried by vkGetRayTracingShaderGroupHandlesKHR to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of VK_SHADER_UNUSED_KHR. The remainder of the data specified by the stride is application-visible data that can be referenced by a ShaderRecordBufferKHR block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the vkCmdTraceRaysNV, vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the ShaderRecordBufferKHR storage class are used to access the provided shader binding table. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the ShaderRecordBufferKHR storage class must not cause the space required for that variable to extend outside the range [0, maxStorageBufferRange).

Accesses to the shader binding table from ray tracing pipelines must be synchronized with the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

**Note**

Because different shader record buffers can be associated with the same shader, a shader variable with ShaderRecordBufferKHR storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the ShaderRecordBufferKHR storage class, the index should be decorated as NonUniform.

### 40.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation must be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application must organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.
Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For **vkCmdTraceRaysKHR**, the location of the ray generation shader is specified by the `pRaygenShaderBindingTable->deviceAddress` parameter—there is no indexing. All data accessed must be less than `pRaygenShaderBindingTable->size` bytes from `deviceAddress`. `pRaygenShaderBindingTable->stride` is unused, and must be equal to `pRaygenShaderBindingTable->size`.

For **vkCmdTraceRaysNV**, the location of the ray generation shader is specified by the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters—there is no indexing.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the `instanceShaderBindingTableRecordOffset` value stored with each instance of a top-level acceleration structure (`VkAccelerationStructureInstanceKHR`). This value determines the beginning of the shader binding table records for a given instance.

In the following rule, `geometryIndex` refers to the `geometry index` of the intersected geometry within the instance.

The `sbtRecordOffset` and `sbtRecordStride` values are passed in as parameters to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the `SBTOffset` and `SBTStride` parameters to the `OpTraceRayNV` or `OpTraceRayKHR` or `OpTraceRayMotionNV` instruction.

The result of this computation is then added to `pHitShaderBindingTable->deviceAddress`, a device address passed to `vkCmdTraceRaysKHR`, or `hitShaderBindingOffset`, a base offset passed to `vkCmdTraceRaysNV`.

For **vkCmdTraceRaysKHR**, the complete rule to compute a hit shader binding table record address in the `pHitShaderBindingTable` is:

\[
\text{pHitShaderBindingTable->deviceAddress} + \text{pHitShaderBindingTable->stride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

All data accessed must be less than `pHitShaderBindingTable->size` bytes from the base address.

For **vkCmdTraceRaysNV**, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the `hitShaderBindingTableBuffer` is:

\[
\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]
Miss Shaders

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders may be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is pMissShaderBindingTable->deviceAddress, a device address passed into vkCmdTraceRaysKHR, or missShaderBindingOffset, a base offset passed into vkCmdTraceRaysNV.

The missIndex value is passed in as a parameter to traceNV() or traceRayEXT() calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the MissIndex parameter to the OpTraceRayNV or OpTraceRayKHR or OpTraceRayMotionNV instruction.

For vkCmdTraceRaysKHR, the complete rule to compute a miss shader binding table record address in the pMissShaderBindingTable is:

\[ pMissShaderBindingTable->deviceAddress + pMissShaderBindingTable->stride \times missIndex \]

All data accessed must be less than pMissShaderBindingTable->size bytes from the base address.

For vkCmdTraceRaysNV, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the missShaderBindingTableBuffer is:

\[ missShaderBindingOffset + missShaderBindingStride \times missIndex \]

Callable Shaders

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders may be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is pCallableShaderBindingTable->deviceAddress, a device address passed into vkCmdTraceRaysKHR, or callableShaderBindingOffset, a base offset passed into vkCmdTraceRaysNV.

The sbtRecordIndex value is passed in as a parameter to executeCallableNV() or executeCallableEXT() calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the SBTIndex parameter to the OpExecuteCallableNV or OpExecuteCallableKHR instruction.

For vkCmdTraceRaysKHR, the complete rule to compute a callable shader binding table record address in the pCallableShaderBindingTable is:

\[ pCallableShaderBindingTable->deviceAddress + pCallableShaderBindingTable->stride \times sbtRecordIndex \]

All data accessed must be less than pCallableShaderBindingTable->size bytes from the base address.
For \texttt{vkCmdTraceRaysNV}, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the \texttt{callableShaderBindingTableBuffer} is:

\[
\text{callableShaderBindingOffset} + \text{callableShaderBindingStride} \times \text{sbtRecordIndex}
\]

### 40.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which \textbf{may} be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation \textbf{may} use a stack of data in memory. This stack \textbf{must} be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

\[
\text{rayGenStackMax} + \min(1, \max\text{-PipelineRayRecursionDepth}) \times \max(\text{closestHitStackMax}, \text{missStackMax}, \text{intersectionStackMax} + \text{anyHitStackMax}) + \max(0, \max\text{-PipelineRayRecursionDepth} -1) \times \max(\text{closestHitStackMax}, \text{missStackMax}) + 2 \times \text{callableStackMax}
\]

where \text{rayGenStackMax}, \text{closestHitStackMax}, \text{missStackMax}, \text{anyHitStackMax}, \text{intersectionStackMax}, and \text{callableStackMax} are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application \textbf{may} want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

\textbf{Note}

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

\[
\text{rayGenStack} + \max(\text{closestHit1Stack, miss1Stack}) + \max(\text{closestHit2Stack, miss2Stack})
\]

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.

### 40.5. Ray Tracing Capture Replay

In a similar way to \texttt{bufferDeviceAddressCaptureReplay}, the \texttt{rayTracingPipelineShaderGroupHandleCaptureReplay} feature allows the querying of opaque data which \textbf{can} be used in a future replay.
During the capture phase, capture/replay tools are expected to query opaque data for shader group handle replay using `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`.

Providing the opaque data during replay, using `VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle` at pipeline creation time, causes the implementation to generate identical shader group handles to those in the capture phase, allowing capture/replay tools to reuse previously recorded shader binding table buffer contents or to obtain the same handles by calling `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR` again.
Chapter 41. Memory Decompression

To decompress data between one or more memory regions call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryNV(
    VkCommandBuffer commandBuffer,  // Provided by VK_NV_memory_decompression
    uint32_t decompressRegionCount,  // Provided by VK_NV_memory_decompression
    const VkDecompressMemoryRegionNV* pDecompressMemoryRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `decompressRegionCount` is the number of memory regions to decompress.
- `pDecompressMemoryRegions` is a pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures specifying decompression parameters.

Each region specified in `pDecompressMemoryRegions` is decompressed from the source to destination region based on the specified decompression method.

### Valid Usage

- **VUID-vkCmdDecompressMemoryNV-None-07684**
The `memoryDecompression` feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCmdDecompressMemoryNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdDecompressMemoryNV-pDecompressMemoryRegions-parameter**
  `pDecompressMemoryRegions` **must** be a valid pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures
- **VUID-vkCmdDecompressMemoryNV-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdDecompressMemoryNV-commandBuffer-cmdpool**
The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- **VUID-vkCmdDecompressMemoryNV-renderpass**
  This command **must** only be called outside of a render pass instance
- **VUID-vkCmdDecompressMemoryNV-videocoding**
  This command **must** only be called outside of a video coding scope
- **VUID-vkCmdDecompressMemoryNV-decompressRegionCount-arraylength**
  `decompressRegionCount` **must** be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkDecompressMemoryRegionNV` structure is defined as:

```c
// Provided by VK_NV_memory_decompression
typedef struct VkDecompressMemoryRegionNV {
    VkDeviceAddress srcAddress;
    VkDeviceAddress dstAddress;
    VkDeviceSize compressedSize;
    VkDeviceSize decompressedSize;
    VkMemoryDecompressionMethodFlagsNV decompressionMethod;
} VkDecompressMemoryRegionNV;
```

- `srcAddress` is the address where compressed data is stored.
- `dstAddress` is the destination address where decompressed data will be written.
- `compressedSize` is the size of compressed data in bytes.
- `decompressedSize` is the size of decompressed data in bytes.
- `decompressionMethod` is a bitmask of `VkMemoryDecompressionMethodFlagBitsNV` with a single bit set specifying the method used to decompress data.

Valid Usage

- VUID-VkDecompressMemoryRegionNV-srcAddress-07685
  The `srcAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-srcAddress-07686
  The memory in range `srcAddress` and `srcAddress + compressedSize` must be valid and bound to a `VkDeviceMemory` object
- VUID-VkDecompressMemoryRegionNV-dstAddress-07687
  The `dstAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-dstAddress-07688
The memory in range $dstAddress$ and $dstAddress + decompressedSize$ **must** be valid and bound to a VkDeviceMemory object

- **VUID-VkDecompressMemoryRegionNV-decompressedSize-07689**
  - The decompressedSize **must** be large enough to hold the decompressed data based on the decompressionMethod

- **VUID-VkDecompressMemoryRegionNV-decompressionMethod-07690**
  - The decompressionMethod **must** have a single bit set

- **VUID-VkDecompressMemoryRegionNV-srcAddress-07691**
  - The srcAddress to srcAddress + compressedSize region **must** not overlap with the dstAddress and dstAddress + decompressedSize region

**Valid Usage (Implicit)**

- **VUID-VkDecompressMemoryRegionNV-decompressionMethod-parameter**
  - decompressionMethod **must** be a valid combination of VkMemoryDecompressionMethodFlagBitsNV values

- **VUID-VkDecompressMemoryRegionNV-decompressionMethod-requiredbitmask**
  - decompressionMethod **must** not be 0

To decompress data between one or more memory regions by specifying decompression parameters indirectly in a buffer, call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryIndirectCountNV(
    VkCommandBuffer       commandBuffer,
    VkDeviceAddress       indirectCommandsAddress,
    VkDeviceAddress       indirectCommandsCountAddress,
    uint32_t              stride);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **indirectCommandsAddress** is the device address containing decompression parameters laid out as an array of VkDecompressMemoryRegionNV structures.
- **indirectCommandsCountAddress** is the device address containing the decompression count.
- **stride** is the byte stride between successive sets of decompression parameters located starting from indirectCommandsAddress.

Each region specified in indirectCommandsAddress is decompressed from the source to destination region based on the specified decompression method.

**Valid Usage**

- **VUID-vkCmdDecompressMemoryIndirectCountNV-None-07692**
  - The memoryDecompression feature **must** be enabled
• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsAddress-07693
If indirectCommandsAddress comes from a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsAddress-07694
The VkBuffer that indirectCommandsAddress comes from must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

• VUID-vkCmdDecompressMemoryIndirectCountNV-offset-07695
offset must be a multiple of 4.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07696
If indirectCommandsCountAddress comes from a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07697
The VkBuffer that indirectCommandsCountAddress comes from must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07698
indirectCommandsCountAddress must be a multiple of 4.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07699
The count stored in indirectCommandsCountAddress must be less than or equal to VkPhysicalDeviceMemoryDecompressionPropertiesNV::maxDecompressionIndirectCount.

• VUID-vkCmdDecompressMemoryIndirectCountNV-stride-07700
stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDecompressMemoryRegionNV).

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07701
If the count stored in indirectCommandsCountAddress is equal to 1, (offset + sizeof(VkDecompressMemoryRegionNV)) must be less than or equal to the size of the VkBuffer that indirectCommandsAddress comes from.

• VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07702
If the count stored in indirectCommandsCountAddress is greater than 1, indirectCommandsAddress + sizeof(VkDecompressMemoryRegionNV) + (stride × (count stored in countBuffer - 1)) must be less than or equal to the last valid address in the VkBuffer that indirectCommandsAddress was created from.

**Valid Usage (Implicit)**

• VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle.

• VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-recording
**commandBuffer** must be in the recording state

typedef VkFlags64 VkMemoryDecompressionMethodFlagsNV;
```

**VkMemoryDecompressionMethodFlagsNV** is a bitmask type for specifying a mask of one or more **VkMemoryDecompressionMethodFlagBitsNV**: 

- **VkMemoryDecompressionMethodFlagsNV** is a bitmask type for specifying a mask of one or more **VkMemoryDecompressionMethodFlagBitsNV**:
Chapter 42. Video Coding

Vulkan implementations may expose one or more queue families supporting video coding operations. These operations are performed by recording them into a command buffer within a video coding scope, and submitting them to queues with compatible video coding capabilities.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

42.1. Video Picture Resources

In the context of video coding, multidimensional arrays of image data that can be used as the source or target of video coding operations are referred to as video picture resources. They may store additional metadata that includes implementation-private information used during the execution of video coding operations, as discussed later.

Video picture resources are backed by VkImage objects. Individual subregions of VkImageView objects created from such resources can be used as decode output pictures, encode input pictures, reconstructed pictures, and/or reference pictures.

The parameters of a video picture resource are specified using a VkVideoPictureResourceInfoKHR structure.

The VkVideoPictureResourceInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    uint32_t baseArrayLayer;
    VkImageView imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **codedOffset** is the offset in texels of the image subregion to use.
- **codedExtent** is the size in pixels of the coded image data.
• `baseArrayLayer` is the array layer of the image view specified in `imageViewBinding` to use as the video picture resource.

• `imageViewBinding` is an image view representing the video picture resource.

The image subresource referred to by such a structure is defined as the image array layer index specified in `baseArrayLayer` relative to the image subresource range the image view specified in `imageViewBinding` was created with.

The meaning of the `codedOffset` and `codedExtent` depends on the command and context the video picture resource is used in, as well as on the used video profile and corresponding codec-specific semantics, as described later.

A video picture resource is uniquely defined by the image subresource referred to by an instance of this structure, together with the `codedOffset` and `codedExtent` members that identify the image subregion within the image subresource referenced corresponding to the video picture resource according to the particular codec-specific semantics.

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. As a result, given an effective image subregion corresponding to a video picture resource, the actual image subregion accessed may be larger than that as it may include additional padding texels due to the picture access granularity. Any writes performed by video coding operations to such padding texels will result in undefined texel values.

Two video picture resources match if they refer to the same image subresource and they specify identical `codedOffset` and `codedExtent` values.

---

**Valid Usage**

- **VUID-VkVideoPictureResourceInfoKHR-baseArrayLayer-07175**
  
  `baseArrayLayer` must be less than the `VkImageViewCreateInfo`::`subresourceRange.layerCount` specified when the image view `imageViewBinding` was created.

---

**Valid Usage (Implicit)**

- **VUID-VkVideoPictureResourceInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR`.

- **VUID-VkVideoPictureResourceInfoKHR-pNext-pNext**
  
  `pNext` must be `NULL`.

- **VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter**
  
  `imageViewBinding` must be a valid `VkImageView` handle.
42.2. Decoded Picture Buffer

An integral part of video coding pipelines is the reconstruction of pictures from a compressed video bitstream. A reconstructed picture is a video picture resource resulting from this process.

Such reconstructed pictures can be used as reference pictures in subsequent video coding operations to provide predictions of the values of samples of subsequently decoded or encoded pictures. The correct use of such reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

The list of reference pictures used to provide such predictions within a single video coding operation is referred to as the list of active reference pictures.

The decoded picture buffer (DPB) is an indexed data structure that maintains the set of reference pictures available to be used in video coding operations. Individual indexed entries of the DPB are referred to as the decoded picture buffer (DPB) slots. The range of valid DPB slot indices is between zero and \( N-1 \), where \( N \) is the capacity of the DPB. Each DPB slot can refer to a reference picture containing a video frame or can refer to up to two reference pictures containing the top and/or bottom fields that, when both present, together represent a full video frame.

In Vulkan, the state and the backing store of the DPB is separated as follows:

- The state of individual DPB slots is maintained by video session objects.
- The backing store of DPB slots is provided by subregions of VkImage objects used as video picture resources.

In addition, the implementation may also maintain opaque metadata associated with DPB slots, including:

- Reference picture metadata corresponding to the video picture resource associated with the DPB slot.

Such metadata may be stored by the implementation as part of the DPB slot state maintained by the video session, or as part of the video picture resource backing the DPB slot.

Any metadata stored in the video picture resources backing DPB slots are independent of the video session used to store it, hence such video picture resources can be shared with other video sessions. Correspondingly, any metadata that is dependent on the video session will always be stored as part of the DPB slot state maintained by that video session.

The responsibility of managing the DPB is split between the application and the implementation as follows:

- The application maintains the association between DPB slot indices and corresponding video picture resources.
- The implementation maintains global and per-slot opaque reference picture metadata.

In addition, the application is also responsible for managing the mapping between the codec-specific picture IDs and DPB slots, and any other codec-specific states unless otherwise specified.
42.2.1. DPB Slot States

At a given time, each DPB slot is either in active or inactive state. Initially, all DPB slots managed by a video session are in inactive state.

A DPB slot can be activated by using it as the target of picture reconstruction within a video coding operation, changing its state to active.

As part of the picture reconstruction, the implementation may also generate reference picture metadata.

If such a video coding operation completes successfully, the activated DPB slot will have a valid picture reference and the reconstructed picture is associated with the DPB slot. This is true even if the DPB slot is used as the target of a picture reconstruction that only sets up a top field or bottom field reference picture and thus does not yet refer to a complete frame. However, if any data provided as input to such a video coding operation is not compliant to the video compression standard used, that video coding operation may complete unsuccessfully, in which case the activated DPB slot will have an invalid picture reference. This is true even if the DPB slot previously had a valid picture reference to a top field or bottom field reference picture, but the reconstruction of the other field corresponding to the DPB slot failed.

The application can use queries to get feedback about the outcome of video coding operations and use the resulting VkQueryResultStatusKHR value to determine whether the video coding operation completed successfully (result status is positive) or unsuccessfully (result status is negative).

Using a reference picture associated with a DPB slot that has an invalid picture reference as an active reference picture in subsequent video coding operations is legal, however, the contents of the outputs of such operations are undefined, and any DPB slots activated by such video coding operations will also have an invalid picture reference. This is true even if such video coding operations may otherwise complete successfully.

A DPB slot can also be deactivated by the application, changing its state to inactive and invalidating any picture references and reference picture metadata associated with the DPB slot.

A DPB slot can be activated with a new frame even if it is already active. In this case all previous associations of the DPB slots with reference pictures are replaced with an association with the reconstructed picture used to activate it. If an already active DPB slot is activated with a reconstructed field picture, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then that association is replaced with an association with the reconstructed field picture used to activate it.
- If the DPB slot is not currently associated with a top field picture or the DPB slot is activated with a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the DPB slot is activated with a bottom field picture, then the DPB slot is associated with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.
- If the DPB slot is currently associated with a top field picture and the DPB slot is activated with a new top field picture, or if the DPB slot is currently associated with a bottom field picture and the DPB slot is activated with a new bottom field picture, then that association is replaced with
an association with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.

42.3. Video Profiles

The `VkVideoProfileInfoKHR` structure is defined as follows:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR lumaBitDepth;
    VkVideoComponentBitDepthFlagsKHR chromaBitDepth;
} VkVideoProfileInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoCodecOperation` is a `VkVideoCodecOperationFlagBitsKHR` value specifying a video codec operation.
- `chromaSubsampling` is a bitmask of `VkVideoChromaSubsamplingFlagBitsKHR` specifying video chroma subsampling information.
- `lumaBitDepth` is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video luma bit depth information.
- `chromaBitDepth` is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video chroma bit depth information.

Video profiles are provided as input to video capability queries such as `vkGetPhysicalDeviceVideoCapabilitiesKHR` or `vkGetPhysicalDeviceVideoFormatPropertiesKHR`, as well as when creating resources to be used by video coding operations such as images, buffers, query pools, and video sessions.

The full description of a video profile is specified by an instance of this structure, and the codec-specific and auxiliary structures provided in its `pNext` chain.

When this structure is specified as an input parameter to `vkGetPhysicalDeviceVideoCapabilitiesKHR`, or through the `pProfiles` member of an `VkVideoProfileListInfoKHR` structure in the `pNext` chain of the input parameter of a query command such as `vkGetPhysicalDeviceVideoFormatPropertiesKHR` or `vkGetPhysicalDeviceImageFormatProperties2`, the following error codes indicate specific causes of the failure of the query operation:

- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR` indicates that the requested video picture layout (e.g. through the `pictureLayout` member of a `VkVideoDecodeH264ProfileInfoKHR` structure included in the `pNext` chain of `VkVideoProfileInfoKHR`) is not supported.
• **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** indicates that a video profile operation specified by `videoCodecOperation` is not supported.

• **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** indicates that video format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.

• **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** indicates that the codec-specific parameters corresponding to the video codec operation are not supported.

### Valid Usage

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013**
  - `chromaSubsampling` **must** have a single bit set

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014**
  - `lumaBitDepth` **must** have a single bit set

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015**
  - If `chromaSubsampling` is not `VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR`, then `chromaBitDepth` **must** have a single bit set

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07179**
  - If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain **must** include a `VkVideoDecodeH264ProfileInfoKHR` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07180**
  - If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain **must** include a `VkVideoDecodeH265ProfileInfoKHR` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07181**
  - If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then the `pNext` chain **must** include a `VkVideoEncodeH264ProfileInfoEXT` structure

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-07182**
  - If `videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, then the `pNext` chain **must** include a `VkVideoEncodeH265ProfileInfoEXT` structure

### Valid Usage (Implicit)

- **VUID-VkVideoProfileInfoKHR-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR`

- **VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter**
  - `videoCodecOperation` **must** be a valid `VkVideoCodecOperationFlagBitsKHR` value

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter**
  - `chromaSubsampling` **must** be a valid combination of `VkVideoChromaSubsamplingFlagBitsKHR` values

- **VUID-VkVideoProfileInfoKHR-chromaSubsampling-requiredbitmask**
  - `chromaSubsampling` **must** not be 0

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter**
  - `lumaBitDepth` **must** be a valid combination of `VkVideoComponentBitDepthFlagBitsKHR` values
values

- **VUID-VkVideoProfileInfoKHR-lumaBitDepth-required bitmask**
  
  **lumaBitDepth** must not be 0

- **VUID-VkVideoProfileInfoKHR-chromaBitDepth-parameter**
  
  **chromaBitDepth** must be a valid combination of **VkVideoComponentBitDepthFlagBitsKHR** values

Possible values of **VkVideoProfileInfoKHR::videoCodecOperation**, specifying the type of video coding operation and video compression standard used by a video profile, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT = 0x00010000,
    #endif
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_EXT_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT = 0x00020000,
    #endif
    // Provided by VK_KHR_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR = 0x00000002,
} VkVideoCodecOperationFlagBitsKHR;
```

- **VK_VIDEO_CODEC_OPERATION_NONE_KHR** indicates no support for any video codec operations.
- **VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR** specifies support for H.264 video decode operations.
- **VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR** specifies support for H.265 video decode operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT** specifies support for H.264 video encode operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT** specifies support for H.265 video encode operations.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

**VkVideoCodecOperationFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoCodecOperationFlagBitsKHR**.

The video format chroma subsampling is defined with the following enums:
Typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;

• VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR specifies that the format is monochrome.
• VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR specified that the format is 4:2:0 chroma subsampled, i.e. the two chroma components are sampled horizontally and vertically at half the sample rate of the luma component.
• VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR - the format is 4:2:2 chroma subsampled, i.e. the two chroma components are sampled horizontally at half the sample rate of luma component.
• VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR - the format is 4:4:4 chroma sampled, i.e. all three components of the Y’C_bC_r format are sampled at the same rate, thus there is no chroma subsampling.

Chroma subsampling is described in more detail in the Chroma Reconstruction section.

Typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;

VkVideoChromaSubsamplingFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoChromaSubsamplingFlagBitsKHR.

Possible values for the video format component bit depth are:

Typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;

• VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR specifies a component bit depth of 8 bits.
• VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR specifies a component bit depth of 10 bits.
• VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR specifies a component bit depth of 12 bits.

Typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

Additional information about the video decode use case can be provided by adding a VkVideoDecodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoDecodeUsageInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeUsageFlagsKHR videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoUsageHints** is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR

- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  
  **videoUsageHints** must be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits can be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    VK_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```

- **VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR** specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.
- **VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR** specifies that video decoding is intended to be used to consume a local video bitstream.
- **VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR** specifies that video decoding is intended to be used to
consume a video bitstream received as a continuous flow over network.

**Note**

There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;
```

**VkVideoDecodeUsageFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeUsageFlagBitsKHR**.

Additional information about the video encode use case **can** be provided by adding a **VkVideoEncodeUsageInfoKHR** structure to the **pNext** chain of **VkVideoProfileInfoKHR**.

The **VkVideoEncodeUsageInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeUsageFlagsKHR videoUsageHints;
    VkVideoEncodeContentFlagsKHR videoContentHints;
    VkVideoEncodeTuningModeKHR tuningMode;
} VkVideoEncodeUsageInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoUsageHints** is a bitmask of **VkVideoEncodeUsageFlagBitsKHR** specifying hints about the intended use of the video encode profile.
- **videoContentHints** is a bitmask of **VkVideoEncodeContentFlagBitsKHR** specifying hints about the content to be encoded using the video encode profile.
- **tuningMode** is a **VkVideoEncodeTuningModeKHR** value specifying the tuning mode to use when encoding with the video profile.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeUsageInfoKHR-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR**

- **VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter**
  - **videoUsageHints** must be a valid combination of **VkVideoEncodeUsageFlagBitsKHR** values

- **VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter**
**videoContentHints** **must** be a valid combination of *VkVideoEncodeContentFlagBitsKHR* values

- VUID-VkVideoEncodeUsageInfoKHR-tuningMode-parameter
  If `tuningMode` is not 0, `tuningMode` **must** be a valid *VkVideoEncodeTuningModeKHR* value

The following bits **can** be specified in *VkVideoEncodeUsageInfoKHR:*:\texttt{videoUsageHints} as a hint about the video encode use case:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
  VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
  VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
  VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
  VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
  VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR** specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.

- **VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR** specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.

- **VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR** specifies that video encoding is intended to be used for real-time recording for offline consumption.

- **VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR** specifies that video encoding is intended to be used in a video conferencing scenario.

**Note**
There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;
```

*VkVideoEncodeUsageFlagsKHR* **is** a bitmask type for setting a mask of zero or more *VkVideoEncodeUsageFlagBitsKHR*.

The following bits **can** be specified in *VkVideoEncodeUsageInfoKHR:*:\texttt{videoContentHints} as a hint about the encoded video content:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeContentFlagBitsKHR {
```
VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,

} VkVideoEncodeContentFlagBitsKHR;

- **VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR** specifies that video encoding is intended to be used to encode camera content.
- **VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR** specifies that video encoding is intended to be used to encode desktop content.
- **VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR** specified that video encoding is intended to be used to encode rendered (e.g. game) content.

**Note**

There are no restrictions on the combination of bits that **can** be specified by the application. However, applications **should** use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeContentFlagsKHR;

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more **VkVideoEncodeContentFlagBitsKHR**.

Possible video encode tuning mode values are as follows:

// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeTuningModeKHR {
    VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
    VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
    VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
    VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;

- **VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR** specifies the default tuning mode.
- **VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR** specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation **may** compromise the latency of video encoding operations to improve quality.
- **VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR** specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation **may** compromise quality to increase the performance and lower the latency of video encode operations.
- **VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR** specifies that video encoding is tuned for
ultra-low latency. When using this tuning mode, the implementation may compromise quality to maximize the performance and minimize the latency of video encoding operations.

- **VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR** specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

The **VkVideoProfileListInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t profileCount;
    const VkVideoProfileInfoKHR* pProfiles;
} VkVideoProfileListInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **profileCount** is the number of elements in the **pProfiles** array.
- **pProfiles** is a pointer to an array of **VkVideoProfileInfoKHR** structures.

**Note:** Video transcoding is an example of a use case that necessitates the specification of multiple profiles in various contexts.

When the application provides a video decode profile and one or more video encode profiles in the profile list, the implementation ensures that any capabilities returned or resources created are suitable for the video transcoding use cases without the need for manual data transformations.

**Valid Usage**

- **VUID-VkVideoProfileListInfoKHR-pProfiles-06813**
  
  **pProfiles** must not contain more than one element whose **videoCodecOperation** member specifies a decode operation

**Valid Usage (Implicit)**

- **VUID-VkVideoProfileListInfoKHR-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR**

- **VUID-VkVideoProfileListInfoKHR-pProfiles-parameter**
  
  If **profileCount** is not 0, **pProfiles** must be a valid pointer to an array of **profileCount** valid **VkVideoProfileInfoKHR** structures
42.4. Video Capabilities

42.4.1. Video Coding Capabilities

To query video coding capabilities for a specific video profile, call:

```
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkVideoProfileInfoKHR* pVideoProfile,
    VkVideoCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device from which to query the video decode or encode capabilities.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure.
- `pCapabilities` is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

If the video profile described by `pVideoProfile` is supported by the implementation, then this command returns `VK_SUCCESS` and `pCapabilities` is filled with the capabilities supported with the specified video profile. Otherwise, one of the video-profile-specific error codes are returned.

### Valid Usage

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07183
  If `pVideoProfile->videoCodecOperation` specifies a decode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeCapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07184
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH264CapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07185
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH265CapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07186
  If `pVideoProfile->videoCodecOperation` specifies an encode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07187
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH264CapabilitiesEXT` structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH265CapabilitiesEXT` structure
then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH265CapabilitiesEXT` structure

### Valid Usage (Implicit)

- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter` `pVideoProfile` must be a valid pointer to a valid `VkVideoProfileInfoKHR` structure
- `VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter` `pCapabilities` must be a valid pointer to a `VkVideoCapabilitiesKHR` structure

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkVideoCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType sType;
    void*pNext;
    VkVideoCapabilityFlagsKHR flags;
    VkDeviceSize minBitstreamBufferOffsetAlignment;
    VkDeviceSize minBitstreamBufferSizeAlignment;
    VkExtent2D pictureAccessGranularity;
    VkExtent2D minCodedExtent;
    VkExtent2D maxCodedExtent;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    VkExtensionProperties stdHeaderVersion;
} VkVideoCapabilitiesKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is a bitmask of `VkVideoCapabilityFlagBitsKHR` specifying capability flags.
• **minBitstreamBufferOffsetAlignment** is the minimum alignment for bitstream buffer offsets.
• **minBitstreamBufferSizeAlignment** is the minimum alignment for bitstream buffer range sizes.
• **pictureAccessGranularity** is the granularity at which image access to video picture resources happen.
• **minCodedExtent** is the minimum width and height of the coded frames.
• **maxCodedExtent** is the maximum width and height of the coded frames.
• **maxDpbSlots** is the maximum number of DPB slots supported by a single video session.
• **maxActiveReferencePictures** is the maximum number of active reference pictures a single video coding operation can use.
• **stdHeaderVersion** is a `VkExtensionProperties` structure reporting the Video Std header name and version supported for the video profile.

**Note:**
It is common for video compression standards to allow using all reference pictures associated with active DPB slots as active reference pictures, hence for video decode profiles the values returned in `maxDpbSlots` and `maxActiveReferencePictures` are often equal. Similarly, in case of video decode profiles supporting field pictures the value of `maxActiveReferencePictures` often equals `maxDpbSlots × 2`.

### Valid Usage (Implicit)

- **VUID-VkVideoCapabilitiesKHR-sType-sType**
  
  sType **must** be `VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR`

- **VUID-VkVideoCapabilitiesKHR-pNext-pNext**
  
  Each pNext member of any structure (including this one) in the pNext chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoDecodeCapabilitiesKHR`, `VkVideoDecodeH264CapabilitiesKHR`, `VkVideoDecodeH265CapabilitiesKHR`, `VkVideoEncodeCapabilitiesKHR`, `VkVideoEncodeH264CapabilitiesEXT`, or `VkVideoEncodeH265CapabilitiesEXT`

- **VUID-VkVideoCapabilitiesKHR-sType-unique**
  
  The sType value of each struct in the pNext chain **must** be unique

Bits which **can** be set in `VkVideoCapabilitiesKHR::flags` are:

```cpp
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,

    // Other flags...
};
```
• **VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR** specifies that video sessions support producing and consuming protected content.

• **VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE/Images_BIT_KHR** specifies that the video picture resources associated with the DPB slots of a video session can be backed by separate VkImage objects. If this capability flag is not present, then all DPB slots of a video session must be associated with video picture resources backed by the same VkImage object (e.g. using different layers of the same image).

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

**VkVideoCapabilityFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoCapabilityFlagBitsKHR**.

### 42.4.2. Video Format Capabilities

To enumerate the supported output, input and DPB image formats and corresponding capabilities for a specific video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,
    uint32_t* pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR* pVideoFormatProperties);
```

• **physicalDevice** is the physical device from which to query the video format properties.

• **pVideoFormatInfo** is a pointer to a **VkPhysicalDeviceVideoFormatInfoKHR** structure specifying the usage and video profiles for which supported image formats and capabilities are returned.

• **pVideoFormatPropertyCount** is a pointer to an integer related to the number of video format properties available or queried, as described below.

• **pVideoFormatProperties** is a pointer to an array of **VkVideoFormatPropertiesKHR** structures in which supported image formats and capabilities are returned.

If **pVideoFormatProperties** is NULL, then the number of video format properties supported for the given **physicalDevice** is returned in **pVideoFormatPropertyCount**. Otherwise, **pVideoFormatPropertyCount** must point to a variable set by the user to the number of elements in the **pVideoFormatProperties** array, and on return the variable is overwritten with the number of values actually written to **pVideoFormatProperties**. If the value of **pVideoFormatPropertyCount** is less than the number of video format properties supported, at most **pVideoFormatPropertyCount** values will be written to **pVideoFormatProperties**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.
Video format properties are always queried with respect to a specific set of video profiles. These are specified by chaining the `VkVideoProfileListInfoKHR` structure to `pVideoFormatInfo`.

For most use cases, the images are used by a single video session and a single video profile is provided. For a use case such as video transcoding, where a decode session output image can be used as encode input in one or more encode sessions, multiple video profiles corresponding to the video sessions that will share the image must be provided.

If any of the video profiles specified via `VkVideoProfileListInfoKHR::pProfiles` are not supported, then this command returns one of the video-profile-specific error codes. Furthermore, if `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` includes any image usage flags not supported by the specified video profiles, then this command returns `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

This command also returns `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR` if `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` does not include the appropriate flags as dictated by the decode capability flags returned in `VkVideoDecodeCapabilitiesKHR::flags` for any of the profiles specified in the `VkVideoProfileListInfoKHR` structure provided in the `pNext` chain of `pVideoFormatInfo`.

If the decode capability flags include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` but not `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR`, then in order to query video format properties for decode DPB and output usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include both `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

If the decode capability flags include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` but not `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR`, then in order to query video format properties for decode DPB usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, but not `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`. Similarly, to query video format properties for decode output usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, but not `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

The `imageUsage` member of the `VkPhysicalDeviceVideoFormatInfoKHR` structure specifies the expected video usage flags that the returned video formats must support. Correspondingly, the `imageUsageFlags` member of each `VkVideoFormatPropertiesKHR` structure returned will contain at least the same set of image usage flags.

If the implementation supports using video input, output, or DPB images of a particular format in operations other than video decode/encode then the `imageUsageFlags` member of the corresponding `VkVideoFormatPropertiesKHR` structure returned will include additional image usage flags indicating that.

**Note:**

For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcoding, if the image were to be shared between
decode and encode session(s), then both decode and encode related usage flags can be set.

Multiple VkVideoFormatPropertiesKHR entries may be returned with the same format member with different componentMapping, imageType, or imageTiling values, as described later.

In addition, a different set of VkVideoFormatPropertiesKHR entries may be returned depending on the imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.

The application can select the parameters returned in the VkVideoFormatPropertiesKHR entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications should create images only with those that are necessary for the particular use case.

Before creating an image, the application can obtain the complete set of supported image format features by calling vkGetPhysicalDeviceImageFormatProperties2 using parameters derived from the members of one of the reported VkVideoFormatPropertiesKHR entries and adding the same VkVideoProfileListInfoKHR structure to the pNext chain of VkPhysicalDeviceImageFormatInfo2.

The following applies to all VkVideoFormatPropertiesKHR entries returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR:

- vkGetPhysicalDeviceFormatProperties2 must succeed when called with VkVideoFormatPropertiesKHR::format.
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_OPTIMAL, then the optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2 must include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_LINEAR, then the linearTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2 must include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
- vkGetPhysicalDeviceImageFormatProperties2 must succeed when called with a VkPhysicalDeviceImageFormatInfo2 structure containing the following information:
  - The pNext chain including the same VkVideoProfileListInfoKHR structure used to call vkGetPhysicalDeviceVideoFormatPropertiesKHR.
  - format set to the value of VkVideoFormatPropertiesKHR::format.
  - type set to the value of VkVideoFormatPropertiesKHR::imageType.
  - tiling set to the value of VkVideoFormatPropertiesKHR::imageTiling.
  - usage set to the value of VkVideoFormatPropertiesKHR::imageUsageFlags.
flags set to the value of VkVideoFormatPropertiesKHR::imageCreateFlags.

The componentMapping member of VkVideoFormatPropertiesKHR defines the ordering of the Y'CbCr color channels from the perspective of the video codec operations specified in VkVideoProfileListInfoKHR. For example, if the implementation produces video decode output with the format VK_FORMAT_G8_B8R8_2PLANE_420_UNORM where the blue and red chrominance channels are swapped then the componentMapping member of the corresponding VkVideoFormatPropertiesKHR structure will have the following member values:

```c

components.r = VK_COMPONENT_SWIZZLE_B;  // Cb component
components.g = VK_COMPONENT_SWIZZLE_IDENTITY; // Y component
components.b = VK_COMPONENT_SWIZZLE_R;  // Cr component
components.a = VK_COMPONENT_SWIZZLE_IDENTITY; // unused, defaults to 1.0
```

Valid Usage

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The pNext chain of pVideoFormatInfo must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  pVideoFormatInfo must be a valid pointer to a valid VkPhysicalDeviceVideoFormatInfoKHR structure

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
  pVideoFormatPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by pVideoFormatPropertyCount is not 0, and pVideoFormatProperties is not NULL, pVideoFormatProperties must be a valid pointer to an array of pVideoFormatPropertyCount VkVideoFormatPropertiesKHR structures

Return Codes

Success

- VK_SUCCESS
- VK_INCOMPLETE
Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The `VkPhysicalDeviceVideoFormatInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkImageUsageFlags imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageUsage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the video images.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkVideoProfileListInfoKHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter
  `imageUsage` must be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-requiredbitsetmask
  `imageUsage` must not be `0`

The `VkVideoFormatPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
  VkStructureType sType;
```
void* pNext;
VkFormat format;
VkComponentMapping componentMapping;
VkImageCreateFlags imageCreateFlags;
VkImageType imageType;
VkImageTiling imageTiling;
VkImageUsageFlags imageUsageFlags;
}

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- format is a VkFormat that specifies the format that can be used with the specified video profiles and image usages.
- componentMapping defines the color channel order used for the format. format along with componentMapping describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the format reported does not require component swizzling then all members of componentMapping will be set to VK_COMPONENT_SWIZZLE_IDENTITY.
- imageCreateFlags is a bitmask of VkImageCreateFlagBits specifying the supported image creation flags for the format.
- imageType is a VkImageType that specifies the image type the format can be used with.
- imageTiling is a VkImageTiling that specifies the image tiling the format can be used with.
- imageUsageFlags is a bitmask of VkImageUsageFlagBits specifying the supported image usage flags for the format.

### Valid Usage (Implicit)

- VUID-VkVideoFormatPropertiesKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR
- VUID-VkVideoFormatPropertiesKHR-pNext-pNext pNext must be NULL

### 42.5. Video Sessions

Video sessions are objects that represent and maintain the state needed to perform video decode or encode operations using a specific video profile.

Video sessions are represented by VkVideoSessionKHR handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```
42.5.1. Creating a Video Session

To create a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice device,
    const VkVideoSessionCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionKHR* pVideoSession);
```

- **device** is the logical device that creates the video session.
- **pCreateInfo** is a pointer to a `VkVideoSessionCreateInfoKHR` structure containing parameters to be used to create the video session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSession** is a pointer to a `VkVideoSessionKHR` handle in which the resulting video session object is returned.

The resulting video session object is said to be created with the video codec operation specified in `pCreateInfo->pVideoProfile->videoCodecOperation`.

The name and version of the codec-specific Video Std header to be used with the video session is specified by the `VkExtensionProperties` structure pointed to by `pCreateInfo->pStdHeaderVersion`. If a non-existent or unsupported Video Std header version is specified in `pCreateInfo->pStdHeaderVersion->specVersion`, then this command returns `VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR`.

Video session objects are created in uninitialized state. In order to transition the video session into initial state, the application must issue a `vkCmdControlVideoCodingKHR` command with `VkVideoCodingControlInfoKHR::flags` including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`.

Video session objects also maintain the state of the DPB. The number of DPB slots usable with the created video session is specified in `pCreateInfo->maxDpbSlots`, and each slot is initially in the inactive state.

Each DPB slot maintained by the created video session can refer to a reference picture representing a video frame.

In addition, if the `videoCodecOperation` member of the `VkVideoProfileInfoKHR` structure pointed to by `pCreateInfo->pVideoProfile` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the pictureLayout member of the `VkVideoDecodeH264ProfileInfoKHR` structure provided in the `VkVideoProfileInfoKHR::pNext` chain is not `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR`, then the created video session supports interlaced frames and each DPB slot maintained by the created video session can instead refer to separate top field and bottom field reference pictures that together can represent a full video frame. In this case, it is up to the application, driven by the video content, whether it associates any individual DPB slot with separate top and/or bottom field pictures or a single picture representing a full frame.
The created video session can be used to perform video coding operations using video frames up to the maximum size specified in \texttt{pCreateInfo->maxCodedExtent}. The minimum frame size allowed is implicitly derived from \texttt{VkVideoCapabilitiesKHR::minCodedExtent}, as returned by \texttt{vkGetPhysicalDeviceVideoCapabilitiesKHR} for the video profile specified by \texttt{pCreateInfo->pVideoProfile}. Accordingly, the created video session is said to be created with a \texttt{minCodedExtent} equal to that.

In case of video session objects created with a video encode operation, implementations may return the \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR} error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

\begin{itemize}
\item \textbf{Note} Applications should not rely on the \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR} error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.
\end{itemize}

\begin{table}[h]
\centering
\begin{tabular}{|l|}
\hline
\textbf{Valid Usage (Implicit)}
\hline
\textbullet\ VUID-vkCreateVideoSessionKHR-device-parameter \quad \textit{device must} be a valid \texttt{VkDevice} handle
\hline
\textbullet\ VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter \quad \textit{pCreateInfo must} be a valid pointer to a valid \texttt{VkVideoSessionCreateInfoKHR} structure
\hline
\textbullet\ VUID-vkCreateVideoSessionKHR-pAllocator-parameter \quad \textbf{If} \textit{pAllocator is not NULL}, \textit{pAllocator must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure
\hline
\textbullet\ VUID-vkCreateVideoSessionKHR-pVideoSession-parameter \quad \textit{pVideoSession must} be a valid pointer to a \texttt{VkVideoSessionKHR} handle
\hline
\end{tabular}
\end{table}

\begin{table}[h]
\centering
\begin{tabular}{|l|}
\hline
\textbf{Return Codes}
\hline
\textbf{Success} \quad \textbullet\ \texttt{VK_SUCCESS}
\hline
\textbf{Failure} \quad \textbullet\ \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
\textbullet\ \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
\textbullet\ \texttt{VK_ERROR_INITIALIZATION_FAILED}
\textbullet\ \texttt{VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR}
\textbullet\ \texttt{VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR}
\hline
\end{tabular}
\end{table}
The `VkVideoSessionCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    VkVideoSessionCreateFlagsKHR flags;
    const VkVideoProfileInfoKHR* pVideoProfile;
    VkFormat pictureFormat;
    VkExtent2D referencePictureFormat;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    const VkExtensionProperties* pStdHeaderVersion;
} VkVideoSessionCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyIndex` is the index of the queue family the created video session will be used with.
- `flags` is a bitmask of `VkVideoSessionCreateFlagBitsKHR` specifying creation flags.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure specifying the video profile the created video session will be used with.
- `pictureFormat` is the image format the created video session will be used with. If `pVideoProfile->videoCodecOperation` specifies a decode operation, then `pictureFormat` is the image format of decode output pictures usable with the created video session. If `pVideoProfile->videoCodecOperation` specifies an encode operation, then `pictureFormat` is the image format of encode input pictures usable with the created video session.
- `maxCodedExtent` is the maximum width and height of the coded frames the created video session will be used with.
- `referencePictureFormat` is the image format of reference pictures stored in the DPB the created video session will be used with.
- `maxDpbSlots` is the maximum number of DPB Slots that can be used with the created video session.
- `maxActiveReferencePictures` is the maximum number of active reference pictures that can be used in a single video coding operation using the created video session.
- `pStdHeaderVersion` is a pointer to a `VkExtensionProperties` structure requesting the Video Std header version to use for the `videoCodecOperation` specified in `pVideoProfile`.

**Valid Usage**

- VUID-VkVideoSessionCreateInfoKHR-protectedMemory-07189
  If the `protectedMemory` feature is not enabled or if `VkVideoCapabilitiesKHR::flags` does not
include `VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`, then `flags` must not include `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR`.

- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845 `pVideoProfile` must be a supported video profile.

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04847 `maxDpbSlots` must be less than or equal to `VkVideoCapabilitiesKHR::maxDpbSlots`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04849 `maxActiveReferencePictures` must be less than or equal to `VkVideoCapabilitiesKHR::maxActiveReferencePictures`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04850 If either `maxDpbSlots` or `maxActiveReferencePictures` is 0, then both must be 0.

- VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851 `maxCodedExtent` must be between `VkVideoCapabilitiesKHR::minCodedExtent` and `VkVideoCapabilitiesKHR::maxCodedExtent`, inclusive, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-04852 If `pVideoProfile->videoCodecOperation` specifies a decode operation and `maxActiveReferencePictures` is greater than 0, then `referencePictureFormat` must be one of the supported decode DPB formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_DECODER_DPB_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-06814 If `pVideoProfile->videoCodecOperation` specifies an encode operation and `maxActiveReferencePictures` is greater than 0, then `referencePictureFormat` must be one of the supported encode DPB formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_ENCODER_DPB_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853 If `pVideoProfile->videoCodecOperation` specifies a decode operation, then `pictureFormat` must be one of the supported decode output formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_DECODER_DST_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.
structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

• VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854
  If pVideoProfile->videoCodecOperation specifies an encode operation, then pictureFormat must be one of the supported encode input formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format when called with the imageUsage member of its pVideoFormatInfo parameter containing VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, and with a VkVideoProfileListInfoKHR structure specified in the pNext chain of its pVideoFormatInfo parameter whose pProfiles member contains an element matching pVideoProfile

• VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07190
  pStdHeaderVersion->extensionName must match VkVideoCapabilitiesKHR::stdHeaderVersion.extensionName, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

• VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07191
  pStdHeaderVersion->specVersion must be less than or equal to VkVideoCapabilitiesKHR::stdHeaderVersion.specVersion, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile

Valid Usage (Implicit)

• VUID-VkVideoSessionCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_CREATE_INFO_KHR

• VUID-VkVideoSessionCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264SessionCreateInfoEXT or VkVideoEncodeH265SessionCreateInfoEXT

• VUID-VkVideoSessionCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkVideoSessionCreateInfoKHR-flags-parameter
  flags must be a valid combination of VkVideoSessionCreateFlagBitsKHR values

• VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter
  pVideoProfile must be a valid pointer to a valid VkVideoProfileInfoKHR structure

• VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter
  pictureFormat must be a valid VkFormat value

• VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-parameter
  referencePictureFormat must be a valid VkFormat value

• VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-parameter
  pStdHeaderVersion must be a valid pointer to a valid VkExtensionProperties structure

Bits which can be set in VkVideoSessionCreateInfoKHR::flags are:
typedef enum VkVideoSessionCreateFlagBitsKHR {
    VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR = 0x00000001,

    #ifdef VK_ENABLE_BETA_EXTENSIONS
    VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR = 0x00000002,
    #endif
} VkVideoSessionCreateFlagBitsKHR;

• VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR specifies that the video session uses protected video content.

• VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR specifies that the implementation is allowed to override video session parameters and other codec-specific encoding parameters to optimize video encode operations based on the specific use case defined by the video profile and the used video encode quality level.

typedef VkFlags VkVideoSessionCreateFlagsKHR;

VkVideoSessionCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoSessionCreateFlagBitsKHR.

42.5.2. Destroying a Video Session

To destroy a video session, call:

void vkDestroyVideoSessionKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the video session.

• videoSession is the video session to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyVideoSessionKHR-videoSession-07192
  All submitted commands that refer to videoSession must have completed execution

• VUID-vkDestroyVideoSessionKHR-videoSession-07193
  If VkAllocationCallbacks were provided when videoSession was created, a compatible set of callbacks must be provided here
Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroyVideoSessionKHR-videoSession-parameter
If videoSession is not VK_NULL_HANDLE, videoSession must be a valid VkVideoSessionKHR handle

- VUID-vkDestroyVideoSessionKHR-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyVideoSessionKHR-videoSession-parent
If videoSession is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to videoSession must be externally synchronized

42.5.3. Video Session Memory Association

After creating a video session object, and before the object can be used to record video coding operations into command buffers using it, the application must allocate and bind device memory to the video session. Device memory is allocated separately (see Device Memory) and then associated with the video session.

Video sessions may have multiple memory bindings identified by unique unsigned integer values. Appropriate device memory must be bound to each such memory binding before using the video session to record command buffer commands with it.

To determine the memory requirements for a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t* pMemoryRequirementsCount,
    VkVideoSessionMemoryRequirementsKHR* pMemoryRequirements);
```

- device is the logical device that owns the video session.
• videoSession is the video session to query.

• pMemoryRequirementsCount is a pointer to an integer related to the number of memory binding requirements available or queried, as described below.

• pMemoryRequirements is NULL or a pointer to an array of VkVideoSessionMemoryRequirementsKHR structures in which the memory binding requirements of the video session are returned.

If pMemoryRequirements is NULL, then the number of memory bindings required for the video session is returned in pMemoryRequirementsCount. Otherwise, pMemoryRequirementsCount must point to a variable set by the user with the number of elements in the pMemoryRequirements array, and on return the variable is overwritten with the number of memory binding requirements actually written to pMemoryRequirements. If pMemoryRequirementsCount is less than the number of memory bindings required for the video session, then at most pMemoryRequirementsCount elements will be written to pMemoryRequirements, and VK_INCOMPLETE will be returned, instead of VK_SUCCESS, to indicate that not all required memory binding requirements were returned.

Valid Usage (Implicit)

• VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter
videoSession must be a valid VkVideoSessionKHR handle

• VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirementsCount-parameter
pMemoryRequirementsCount must be a valid pointer to a uint32_t value

• VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirements-parameter
If the value referenced by pMemoryRequirementsCount is not 0, and pMemoryRequirements is not NULL, pMemoryRequirements must be a valid pointer to an array of pMemoryRequirementsCount VkVideoSessionMemoryRequirementsKHR structures

• VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent
videoSession must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

The VkVideoSessionMemoryRequirementsKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionMemoryRequirementsKHR {
    VkStructureType sType;
```
```c
void* pNext;
uint32_t memoryBindIndex;
VkMemoryRequirements memoryRequirements;
} VkVideoSessionMemoryRequirementsKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryBindIndex** is the index of the memory binding.
- **memoryRequirements** is a `VkMemoryRequirements` structure in which the requested memory binding requirements for the binding index specified by `memoryBindIndex` are returned.

### Valid Usage (Implicit)

- VUID-VkVideoSessionMemoryRequirementsKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR`

- VUID-VkVideoSessionMemoryRequirementsKHR-pNext-pNext
  
  **pNext** must be NULL

To attach memory to a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkBindVideoSessionMemoryKHR(
    VkDevice device, 
    VkVideoSessionKHR videoSession, 
    uint32_t bindSessionMemoryInfoCount, 
    const VkBindVideoSessionMemoryInfoKHR* pBindSessionMemoryInfos);
```

- **device** is the logical device that owns the video session.
- **videoSession** is the video session to be bound with device memory.
- **bindSessionMemoryInfoCount** is the number of elements in `pBindSessionMemoryInfos`.
- **pBindSessionMemoryInfos** is a pointer to an array of `bindSessionMemoryInfoCount` `VkBindVideoSessionMemoryInfoKHR` structures specifying memory regions to be bound to specific memory bindings of the video session.

The valid usage statements below refer to the `VkMemoryRequirements` structure corresponding to a specific element of `pBindSessionMemoryInfos`, which is defined as follows:

- If the `memoryBindIndex` member of the element of `pBindSessionMemoryInfos` in question matches the `memoryBindIndex` member of one of the elements returned in `pMemoryRequirements` when `vkGetVideoSessionMemoryRequirementsKHR` is called with the same `videoSession` and with `pMemoryRequirementsCount` equal to `bindSessionMemoryInfoCount`, then the `memoryRequirements` member of that element of `pMemoryRequirements` is the `VkMemoryRequirements` structure corresponding to the element of `pBindSessionMemoryInfos` in question.
• Otherwise the element of pBindSessionMemoryInfos in question is said to not have a corresponding VkMemoryRequirements structure.

Valid Usage

• VUID-vkBindVideoSessionMemoryKHR-videoSession-07195
  The memory binding of videoSession identified by the memoryBindIndex member of any element of pBindSessionMemoryInfos must not already be backed by a memory object

• VUID-vkBindVideoSessionMemoryKHR-memoryBindIndex-07196
  The memoryBindIndex member of each element of pBindSessionMemoryInfos must be unique within pBindSessionMemoryInfos

• VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07197
  Each element of pBindSessionMemoryInfos must have a corresponding VkMemoryRequirements structure

• VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07198
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memory member of that element of pBindSessionMemoryInfos must have been allocated using one of the memory types allowed in the memoryTypeBits member of the corresponding VkMemoryRequirements structure

• VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07199
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memoryOffset member of that element of pBindSessionMemoryInfos must be an integer multiple of the alignment member of the corresponding VkMemoryRequirements structure

• VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07200
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memorySize member of that element of pBindSessionMemoryInfos must equal the size member of the corresponding VkMemoryRequirements structure

Valid Usage (Implicit)

• VUID-vkBindVideoSessionMemoryKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter
  videoSession must be a valid VkVideoSessionKHR handle

• VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-parameter
  pBindSessionMemoryInfos must be a valid pointer to an array of bindSessionMemoryInfoCount valid VkBindVideoSessionMemoryInfoKHR structures

• VUID-vkBindVideoSessionMemoryKHR-bindSessionMemoryInfoCount-arraylength
  bindSessionMemoryInfoCount must be greater than 0

• VUID-vkBindVideoSessionMemoryKHR-videoSession-parent
  videoSession must have been created, allocated, or retrieved from device
Host Synchronization

- Host access to videoSession must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkBindVideoSessionMemoryInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkBindVideoSessionMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t memoryBindIndex;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkDeviceSize memorySize;
} VkBindVideoSessionMemoryInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryBindIndex` is the memory binding index to bind memory to.
- `memory` is the allocated device memory to be bound to the video session's memory binding with index `memoryBindIndex`.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound.
- `memorySize` is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage

- VUID-VkBindVideoSessionMemoryInfoKHR-memoryOffset-07201
  `memoryOffset` must be less than the size of `memory`

- VUID-VkBindVideoSessionMemoryInfoKHR-memorySize-07202
  `memorySize` must be less than or equal to the size of `memory` minus `memoryOffset`
Valid Usage (Implicit)

- VUID-VkBindVideoSessionMemoryInfoKHR-sType-sType
  *sType must be* VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR

- VUID-VkBindVideoSessionMemoryInfoKHR-pNext-pNext
  *pNext must be* NULL

- VUID-VkBindVideoSessionMemoryInfoKHR-memory-parameter
  *memory must be a valid* VkDeviceMemory *handle

42.6. Video Profile Compatibility

Resources and query pools used with a particular video session must be compatible with the video profile the video session was created with.

A VkBuffer is compatible with a video profile if it was created with the VkBufferCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkBufferCreateInfo::usage including at least one bit specific to video coding usage.

- VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR

A VkImage is compatible with a video profile if it was created with the VkImageCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkImageCreateInfo::usage including at least one bit specific to video coding usage.

- VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

A VkImageView is compatible with a video profile if the VkImage it was created from is also compatible with that video profile.

A VkQueryPool is compatible with a video profile if it was created with the VkQueryPoolCreateInfo::pNext chain including a VkVideoProfileInfoKHR structure chain describing the same video profile, and VkQueryPoolCreateInfo::queryType having one of the following values:

- VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR
42.7. Video Session Parameters

Video session parameters objects can store preprocessed codec-specific parameters used with a compatible video session, and enable reducing the number of parameters needed to be provided and processed by the implementation while recording video coding operations into command buffers.

Parameters stored in such objects are immutable to facilitate the concurrent use of the stored parameters in multiple threads. At the same time, new parameters can be added to existing objects using the vkUpdateVideoSessionParametersKHR command.

In order to support concurrent use of the stored immutable parameters while also allowing the video session parameters object to be extended with new parameters, each video session parameters object maintains an update sequence counter that is set to 0 at object creation time and must be incremented by each subsequent update operation.

Certain video sequences that adhere to particular video compression standards permit updating previously supplied parameters. If a parameter update is necessary, the application has the following options:

- Cache the set of parameters on the application side and create a new video session parameters object adding all the parameters with appropriate changes, as necessary; or
- Create a new video session parameters object providing only the updated parameters and the previously used object as the template, which ensures that parameters not specified at creation time will be copied unmodified from the template object.

The actual types of parameters that can be stored and the capacity for individual parameter types, and the methods of initializing, updating, and referring to individual parameters are specific to the video codec operation the video session parameters object was created with.

- For VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR these are defined in the H.264 Decode Parameter Sets section.
- For VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR these are defined in the H.265 Decode Parameter Sets section.

Video session parameters are represented by VkVideoSessionParametersKHR handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```

42.7.1. Creating Video Session Parameters

To create a video session parameters object, call:

```c
// Provided by VK_KHR_video_queue
```
VkResult vkCreateVideoSessionParametersKHR(
    VkDevice device,
    const VkVideoSessionParametersCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionParametersKHR* pVideoSessionParameters);

- **device** is the logical device that creates the video session parameters object.
- **pCreateInfo** is a pointer to `VkVideoSessionParametersCreateInfoKHR` structure containing parameters to be used to create the video session parameters object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSessionParameters** is a pointer to a `VkVideoSessionParametersKHR` handle in which the resulting video session parameters object is returned.

The resulting video session parameters object is said to be created with the video codec operation `pCreateInfo->videoSession` was created with.

If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then it will be used as a template for constructing the new video session parameters object. This happens by first adding any parameters according to the additional creation parameters provided in the `pCreateInfo->pNext` chain, followed by adding any parameters from the template object that have a key that does not match the key of any of the already added parameters.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the created video session parameters object will initially contain the following sets of parameter entries:

- **StdVideoH264SequenceParameterSet** structures representing **H.264 SPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id`.

- **StdVideoH264PictureParameterSet** structures representing **H.264 PPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id` and `pic_parameter_set_id`.

If `pCreateInfo->videoSession` was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the created video session parameters object
will initially contain the following sets of parameter entries:

- **StdVideoH265VideoParameterSet** structures representing **H.265 VPS** entries, as follows:
  
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added first;
  
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `vps_video_parameter_set_id`.

- **StdVideoH265SequenceParameterSet** structures representing **H.265 SPS** entries, as follows:
  
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id` and `sps_seq_parameter_set_id`.

- **StdVideoH265PictureParameterSet** structures representing **H.265 PPS** entries, as follows:
  
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id`.

In case of video session parameters objects created with a video encode operation, implementations **may return** the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications **should not** rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.
Valid Usage (Implicit)

- VUID-vkCreateVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkVideoSessionParametersCreateInfoKHR structure

- VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateVideoSessionParametersKHR-pVideoSessionParameters-parameter
  pVideoSessionParameters must be a valid pointer to a VkVideoSessionParametersKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

The VkVideoSessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionParametersCreateFlagsKHR flags;
    VkVideoSessionParametersKHR videoSessionParametersTemplate;
    VkVideoSessionKHR videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- videoSessionParametersTemplate is VK_NULL_HANDLE or a valid handle to a VkVideoSessionParametersKHR object used as a template for constructing the new video session parameters object.
• **videoSession** is the video session object against which the video session parameters object is going to be created.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

• If **videoSession** was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264SequenceParameterSet spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;

  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

• If **videoSession** was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264PictureParameterSet ppsAddList[]` be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;

  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` or `pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

• If **videoSession** was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265VideoParameterSet vpsAddList[]` be the list of H.265 VPS entries to add to the created video session parameters object, defined as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added to `vpsAddList`;

  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it with `vps_video_parameter_set_id` not matching any of the entries already in `vpsAddList` is added to `vpsAddList`.

• If **videoSession** was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265SequenceParameterSet spsAddList[]` be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;

If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it with `sps_video_parameter_set_id` or `sps_seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265PictureParameterSet ppsAddList[]` be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:

If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;

If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, or `pps_pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

### Valid Usage

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855**
  If `videoSessionParametersTemplate` represents a valid handle, it **must** have been created against `videoSession`

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07203**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain **must** include a `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07204**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of elements of `spsAddList` **must** be less than or equal to the `maxStdSPSCount` specified in the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure included in the `pNext` chain

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07205**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of elements of `ppsAddList` **must** be less than or equal to the `maxStdPPSCount` specified in the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure included in the `pNext` chain

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07206**
  If `videoSession` was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain must include a VkVideoDecodeH265SessionParametersCreateInfoKHR structure

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07207
If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of vpsAddList must be less than or equal to the maxStdVPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07208
If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of spsAddList must be less than or equal to the maxStdSPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07209
If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the number of elements of ppsAddList must be less than or equal to the maxStdPPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07210
If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT, then the pNext chain must include a VkVideoEncodeH264SessionParametersCreateInfoEXT structure

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07211
If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, then the pNext chain must include a VkVideoEncodeH265SessionParametersCreateInfoEXT structure

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR

- VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoDecodeH264SessionParametersCreateInfoKHR,
  VkVideoDecodeH265SessionParametersCreateInfoKHR,
  VkVideoEncodeH264SessionParametersCreateInfoEXT,
  VkVideoEncodeH265SessionParametersCreateInfoEXT,
  or VkVideoEncodeQualityLevelInfoKHR

- VUID-VkVideoSessionParametersCreateInfoKHR-sType-unique The sType value of each struct in the pNext chain must be unique
• VUID-VkVideoSessionParametersCreateInfoKHR-flags-zerobitmask
  flags must be 0

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter
  If videoSessionParametersTemplate is not VK_NULL_HANDLE, videoSessionParametersTemplate must be a valid VkVideoSessionParametersKHR handle

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter
  videoSession must be a valid VkVideoSessionKHR handle

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent
  If videoSessionParametersTemplate is a valid handle, it must have been created, allocated, or retrieved from videoSession

• VUID-VkVideoSessionParametersCreateInfoKHR-commonparent
  Both of videoSession, and videoSessionParametersTemplate that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionParametersCreateFlagsKHR;

VkVideoSessionParametersCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 42.7.2. Destroying Video Session Parameters

To destroy a video session parameters object, call:

// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
  VkDevice device,
  VkVideoSessionParametersKHR videoSessionParameters,
  const VkAllocationCallbacks* pAllocator);

• device is the logical device that destroys the video session parameters object.

• videoSessionParameters is the video session parameters object to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07212
  All submitted commands that refer to videoSessionParameters must have completed execution

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07213
  If VkAllocationCallbacks were provided when videoSessionParameters was created, a
compatible set of callbacks must be provided here

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07214
  If no VkAllocationCallbacks were provided when videoSessionParameters was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-parameter
  If videoSessionParameters is not VK_NULL_HANDLE, videoSessionParameters must be a valid VkVideoSessionParametersKHR handle

- VUID-vkDestroyVideoSessionParametersKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

Host Synchronization

- Host access to videoSessionParameters must be externally synchronized

42.7.3. Updating Video Session Parameters

To update video session parameters object with new parameters, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkUpdateVideoSessionParametersKHR(
  VkDevice device,
  VkVideoSessionParametersKHR videoSessionParameters,
  const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);
```

- device is the logical device that updates the video session parameters.
- videoSessionParameters is the video session parameters object to update.
- pUpdateInfo is a pointer to a VkVideoSessionParametersUpdateInfoKHR structure specifying the parameter update information.

After a successful call to this command, the update sequence counter of videoSessionParameters is changed to the value specified in pUpdateInfo->updateSequenceCount.

Note:
As each update issued to a video session parameters object needs to specify the next available update sequence count value, concurrent updates of the same video session parameters object are inherently disallowed. However, recording video
coding operations to command buffers referring to parameters previously added to the video session parameters object is allowed, even if there is a concurrent update in progress adding some new entries to the object.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:

- The H.264 SPS entries specified in `VkVideoDecodeH264SessionParametersAddInfoKHR::pStdSPSs`.
- The H.264 PPS entries specified in `VkVideoDecodeH264SessionParametersAddInfoKHR::pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:

- The H.265 VPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdVPSs`.
- The H.265 SPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdSPSs`.
- The H.265 PPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdPPSs`.

In case of video session parameters objects created with a video encode operation, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications should not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

**Valid Usage**

- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-07215
  `pUpdateInfo->updateSequenceCount` must equal the current `update sequence counter` of `videoSessionParameters` plus one

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07216
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes
a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `VkVideoDecodeH264SessionParametersAddInfoKHR::pStdSPSs`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07217**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of `StdVideoH264SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the `VkVideoDecodeH264SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `maxStdSPSCount` included in the `videoSessionParameters` was created with.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07218**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH264PictureParameterSet` entry with both `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of `VkVideoDecodeH264SessionParametersAddInfoKHR::pStdPPSs`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07219**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH264PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH264SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `maxStdPPSCount` included in the `videoSessionParameters` was created with.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07220**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdVPSs`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07221**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265VideoParameterSet` entries already stored in it plus the value of the `stdVPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `maxStdVPSCount` included in the `videoSessionParameters` was created with.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07222**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes...
a. `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` **must** not already contain a `StdVideoH265SequenceParameterSet` entry with both `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR`::`pStdSPSs`

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07223
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the `maxStdSPSCount` included in the `videoSessionParameters` was created with

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07224
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` **must** not already contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` all matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR`::`pStdPPSs`

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07225
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain **must** be less than or equal to the `maxStdPPSCount` included in the `videoSessionParameters` was created with

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07226
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` **must** not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT`::`pStdSPSs`

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07227
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure, then `videoSessionParameters` **must** not already contain a `StdVideoH264PictureParameterSet` entry with both `seq_parameter_set_id` and `pic_parameter_set_id` matching any of the elements of `VkVideoEncodeH264SessionParametersAddInfoEXT`::`pStdPPSs`

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07228
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes
a `VkVideoEncodeH265SessionParametersAddInfoEXT` structure, then
`videoSessionParameters` must not already contain a `StdVideoH265VideoParameterSet` entry
with `vps_video_parameter_set_id` matching any of the elements of `VkVideoEncodeH265SessionParametersAddInfoEXT::pStdVPSs`

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07229**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH265SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH265SequenceParameterSet` entry with both `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching any of the elements of `VkVideoEncodeH265SessionParametersAddInfoEXT::pStdSPSs`

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07230**
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoEncodeH265SessionParametersAddInfoEXT` structure, then `videoSessionParameters` must not already contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` all matching any of the elements of `VkVideoEncodeH265SessionParametersAddInfoEXT::pStdPPSs`

### Valid Usage (Implicit)

- **VUID-vkUpdateVideoSessionParametersKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter**
  `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle

- **VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter**
  `pUpdateInfo` must be a valid pointer to a valid `VkVideoSessionParametersUpdateInfoKHR` structure

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR`

The `VkVideoSessionParametersUpdateInfoKHR` structure is defined as:
typedef struct VkVideoSessionParametersUpdateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t updateSequenceCount;
} VkVideoSessionParametersUpdateInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **updateSequenceCount** is the new update sequence count to set for the video session parameters object.

### Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR`

- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeH264SessionParametersAddInfoKHR`, `VkVideoDecodeH265SessionParametersAddInfoKHR`, `VkVideoEncodeH264SessionParametersAddInfoEXT`, or `VkVideoEncodeH265SessionParametersAddInfoEXT`

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

#### 42.8. Video Coding Scope

Applications can record video coding commands for a video session only within a video coding scope.

To begin a video coding scope, call:

```c
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoBeginCodingInfoKHR* pBeginInfo);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pBeginInfo** is a pointer to a `VkVideoBeginCodingInfoKHR` structure specifying the parameters of the video coding scope, including the video session and video session parameters object to use.

After beginning a video coding scope, the video session object specified in `pBeginInfo->videoSession`...
is bound to the command buffer, and the command buffer is ready to record video coding operations. Similarly, if `pBeginInfo->videoSessionParameters` is not `VK_NULL_HANDLE`, it is also bound to the command buffer, and video coding operations can refer to the codec-specific parameters stored in it.

This command also establishes the set of bound reference picture resources that can be used as reconstructed pictures or reference pictures within the video coding scope. Each element of this set consists of a video picture resource and the DPB slot index associated with it, if there is one.

The set of bound reference picture resources is immutable within a video coding scope, however, the DPB slot index associated with any of the bound reference picture resources can change during the video coding scope in response to video coding operations.

The `VkVideoReferenceSlotInfoKHR` structures provided as the elements of `pBeginInfo->pReferenceSlots` are interpreted by this command as follows:

- If `slotIndex` is non-negative and `pPictureResource` is not NULL, then the video picture resource defined by the `VkVideoPictureResourceInfoKHR` structure pointed to by `pPictureResource` is added to the set of bound reference picture resources and is associated with the DPB slot index specified in `slotIndex`.
- If `slotIndex` is non-negative and `pPictureResource` is NULL, then the DPB slot with index `slotIndex` is deactivated by this command.
- If `slotIndex` is negative and `pPictureResource` is not NULL, then the video picture resource defined by the `VkVideoPictureResourceInfoKHR` structure pointed to by `pPictureResource` is added to the set of bound reference picture resources without an associated DPB slot. Such a picture resource can be subsequently used as a reconstructed picture to associate it with a DPB slot.
- If `slotIndex` is negative and `pPictureResource` is NULL, then the element is ignored.

**Note:**

It is possible for multiple bound reference picture resources to be associated with the same DPB slot index, or for a single bound reference picture to refer to multiple separate reference pictures. For example, in case of an H.264 decode profile with interlaced frame support a single DPB slot can refer to two separate pictures for the top and bottom fields. Depending on the picture layout used by the H.264 decode profile, the following special cases may arise:

- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`, then the top and bottom field pictures are physically co-located in the same video picture resource with even scanlines corresponding to the top field and odd scanlines corresponding to the bottom field, respectively.
- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then the top and bottom field pictures are stored in separate video picture resources (in separate subregions of the same image layer, in separate layers of the same image, or in entirely separate images), hence two elements of `VkVideoBeginCodingInfoKHR::pReferenceSlots` can contain the same `slotIndex`
but specify different video picture resources in their `pPictureResource` members.

All non-negative `slotIndex` values specified in the elements of `pBeginInfo->pReferenceSlots` must identify DPB slots of the video session that are in the active state at the time this command is executed on the device.

**Note:**
The application does not have to specify an entry in `pBeginInfo->pReferenceSlots` corresponding to all active DPB slots of the video session, but only for those which are intended to be used in the video coding scope. This way the application can avoid any potential runtime cost associated with binding the corresponding picture resources to the command buffer.

---

**Valid Usage**

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07231**
  The `VkCommandPool` that `commandBuffer` was allocated from must support the video codec operation `pBeginInfo->videoSession` was created with, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

- **VUID-vkCmdBeginVideoCodingKHR-None-07232**
  There must be no active queries.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07233**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pBeginInfo->videoSession` must not have been created with `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR`.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07234**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pBeginInfo->videoSession` must have been created with `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR`.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07235**
  If `commandBuffer` is an unprotected command buffer, `protectedNoFault` is not supported, and the `pPictureResource` member of any element of `pBeginInfo->pReferenceSlots` is not NULL, then `pPictureResource->imageViewBinding` for that element must not specify an image view created from a protected image.

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07236**
  If `commandBuffer` is a protected command buffer `protectedNoFault` is not supported, and the `pPictureResource` member of any element of `pBeginInfo->pReferenceSlots` is not NULL, then `pPictureResource->imageViewBinding` for that element must specify an image view created from a protected image.

- **VUID-vkCmdBeginVideoCodingKHR-slotIndex-07239**
  If the `slotIndex` member of any element of `pBeginInfo->pReferenceSlots` is not negative, then it must specify the index of a DPB slot that is in the active state in `pBeginInfo-
Each video picture resource specified by any non-NULL *pPictureResource* member specified in the elements of *pBeginInfo->pReferenceSlots* for which *slotIndex* is not negative must match one of the video picture resources currently associated with the DPB slot index of *pBeginInfo->videoSession* specified by *slotIndex* at the time the command is executed on the device.

**Valid Usage (Implicit)**

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-parameter**
  
  
  *commandBuffer* must be a valid *VkCommandBuffer* handle

- **VUID-vkCmdBeginVideoCodingKHR-pBeginInfo-parameter**
  
  *pBeginInfo* must be a valid pointer to a valid *VkVideoBeginCodingInfoKHR* structure

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording**
  
  *commandBuffer* must be in the recording state

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool**
  
  The *VkCommandPool* that *commandBuffer* was allocated from must support decode, or encode operations

- **VUID-vkCmdBeginVideoCodingKHR-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdBeginVideoCodingKHR-videocoding**
  
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBeginVideoCodingKHR-bufferlevel**
  
  *commandBuffer* must be a primary *VkCommandBuffer*

**Host Synchronization**

- Host access to *commandBuffer* must be externally synchronized

- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

**Command Properties**

The *VkVideoBeginCodingInfoKHR* structure is defined as:
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoBeginCodingFlagsKHR flags;
    VkVideoSessionKHR videoSession;
    VkVideoSessionParametersKHR videoSessionParameters;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
} VkVideoBeginCodingInfoKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **videoSession** is the video session object to be bound for the processing of the video commands.
• **videoSessionParameters** is `VK_NULL_HANDLE` or a handle of a `VkVideoSessionParametersKHR` object to be used for the processing of the video commands. If `VK_NULL_HANDLE`, then no video session parameters object is bound for the duration of the video coding scope.
• **referenceSlotCount** is the number of elements in the **pReferenceSlots** array.
• **pReferenceSlots** is a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures specifying the information used to determine the set of bound reference picture resources for the video coding scope and their initial association with DPB slot indices.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

• Let `VkOffset2D codedOffsetGranularity` be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the `x` and `y` members of `codedOffsetGranularity` are 0.
  • If **videoSession** was created with an H.264 decode profile with a `VkVideoDecodeH264ProfileInfoKHR::pictureLayout` of `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then `codedOffsetGranularity` is equal to `VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for that video profile.

**Valid Usage**

- VUID-VkVideoBeginCodingInfoKHR-videoSession-07237
  **videoSession** must have memory bound to all of its memory bindings returned by `vkGetVideoSessionMemoryRequirementsKHR` for **videoSession**

- VUID-VkVideoBeginCodingInfoKHR-slotIndex-04856
  Each non-negative `VkVideoReferenceSlotInfoKHR::slotIndex` specified in the elements of **pReferenceSlots** must be less than the `VkVideoSessionCreateInfoKHR::maxDpbSlots`
specified when *videoSession* was created

- **VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07238**
  Each video picture resource corresponding to any non-NULL *pPictureResource* member specified in the elements of *pReferenceSlots* must be unique within *pReferenceSlots*

- **VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07240**
  If the *pPictureResource* member of any element of *pReferenceSlots* is not NULL, then the image view specified in *pPictureResource-*imageViewBinding for that element must be compatible with the video profile *videoSession* was created with

- **VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07241**
  If the *pPictureResource* member of any element of *pReferenceSlots* is not NULL, then the format of the image view specified in *pPictureResource-*imageViewBinding for that element must match the *VkVideoSessionCreateInfoKHR::referencePictureFormat* *videoSession* was created with

- **VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07242**
  If the *pPictureResource* member of any element of *pReferenceSlots* is not NULL, then its *codedOffset* member must be an integer multiple of *codedOffsetGranularity*

- **VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07243**
  If the *pPictureResource* member of any element of *pReferenceSlots* is not NULL, then its *codedExtent* member must be between *minCodedExtent* and *maxCodedExtent*, inclusive, *videoSession* was created with

- **VUID-VkVideoBeginCodingInfoKHR-flags-07244**
  If *VkVideoCapabilitiesKHR::flags* does not include *VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR*, as returned by *vkGetPhysicalDeviceVideoCapabilitiesKHR* for the video profile *videoSession* was created with, then *pPictureResource-*imageViewBinding of all elements of *pReferenceSlots* with a non-NULL *pPictureResource* member must specify image views created from the same image

- **VUID-VkVideoBeginCodingInfoKHR-slotIndex-07245**
  If *videoSession* was created with a decode operation and the *slotIndex* member of any element of *pReferenceSlots* is not negative, then the image view specified in *pPictureResource-*imageViewBinding for that element must have been created with *VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR*

- **VUID-VkVideoBeginCodingInfoKHR-slotIndex-07246**
  If *videoSession* was created with an encode operation and the *slotIndex* member of any element of *pReferenceSlots* is not negative, then the image view specified in *pPictureResource-*imageViewBinding for that element must have been created with *VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR*

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07247**
  If *videoSession* was created with the video codec operation *VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR*, then *videoSessionParameters* must not be *VK_NULL_HANDLE*

- **VUID-VkVideoBeginCodingInfoKHR-videoSession-07248**
  If *videoSession* was created with the video codec operation *VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR*, then *videoSessionParameters* must not be
If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, then `videoSessionParameters` must not be `VK_NULL_HANDLE`.

If `videoSessionParameters` is not `VK_NULL_HANDLE`, it must have been created with `videoSession` specified in `VkVideoSessionParametersCreateInfoKHR::videoSession`.

Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264GopRemainingFrameInfoEXT`, `VkVideoEncodeH264RateControlInfoEXT`, `VkVideoEncodeH265GopRemainingFrameInfoEXT`, `VkVideoEncodeH265RateControlInfoEXT`, or `VkVideoEncodeRateControlInfoKHR`
- The `sType` value of each struct in the `pNext` chain must be unique
- Flags must be 0
- `videoSession` must be a valid `VkVideoSessionKHR` handle
- If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle
- If `referenceSlotCount` is not 0, `pReferenceSlots` must be a valid pointer to an array of `referenceSlotCount` valid `VkVideoReferenceSlotInfoKHR` structures
- If `videoSessionParameters` is a valid handle, it must have been created, allocated, or retrieved from `videoSession`
- Both of `videoSession`, and `videoSessionParameters` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`
typedef VkFlags VkVideoBeginCodingFlagsKHR;

VkVideoBeginCodingFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

The VkVideoReferenceSlotInfoKHR structure is defined as:

typedef struct VkVideoReferenceSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    int32_t slotIndex;
    const VkVideoPictureResourceInfoKHR* pPictureResource;
} VkVideoReferenceSlotInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **slotIndex** is the index of the DPB slot or a negative integer value.
- **pPictureResource** is NULL or a pointer to a VkVideoPictureResourceInfoKHR structure describing the video picture resource associated with the DPB slot index specified by **slotIndex**.

### Valid Usage (Implicit)

- VUID-VkVideoReferenceSlotInfoKHR-sType-sType **sType must be** VK_STRUCTURE_TYPE_VIDEO_REFERENCE_SLOT_INFO_KHR
- VUID-VkVideoReferenceSlotInfoKHR-pNext-pNext Each **pNext** member of any structure (including this one) in the **pNext** chain must be either NULL or a pointer to a valid instance of VkVideoDecodeH264DpbSlotInfoKHR, VkVideoDecodeH265DpbSlotInfoKHR, VkVideoEncodeH264DpbSlotInfoKHR, or VkVideoEncodeH265DpbSlotInfoKHR
- VUID-VkVideoReferenceSlotInfoKHR-sType-unique The sType value of each struct in the **pNext** chain must be unique
- VUID-VkVideoReferenceSlotInfoKHR-pPictureResource-parameter If **pPictureResource** is not NULL, **pPictureResource** must be a valid pointer to a valid VkVideoPictureResourceInfoKHR structure

To end a video coding scope, call:

```c
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer commandBuffer,
```
const VkVideoEndCodingInfoKHR* pEndCodingInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pEndCodingInfo` is a pointer to a `VkVideoEndCodingInfoKHR` structure specifying the parameters for ending the video coding scope.

After ending a video coding scope, the video session object, the optional video session parameters object, and all reference picture resources previously bound by the corresponding `vkCmdBeginVideoCodingKHR` command are unbound.

### Valid Usage

- VUID-vkCmdEndVideoCodingKHR-None-07251
  There must be no active queries

### Valid Usage (Implicit)

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
  `pEndCodingInfo` must be a valid pointer to a valid `VkVideoEndCodingInfoKHR` structure

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode, or encode operations

- VUID-vkCmdEndVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdEndVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdEndVideoCodingKHR-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The \texttt{VkVideoEndCodingInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEndCodingFlagsKHR flags;
} VkVideoEndCodingInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is reserved for future use.

### Valid Usage (Implicit)

- \texttt{VUID-VkVideoEndCodingInfoKHR-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR}
- \texttt{VUID-VkVideoEndCodingInfoKHR-pNext-pNext} \texttt{pNext} must be \texttt{NULL}
- \texttt{VUID-VkVideoEndCodingInfoKHR-flags-zerobitmask} \texttt{flags} must be \texttt{0}

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoEndCodingFlagsKHR;
```

\texttt{VkVideoEndCodingFlagsKHR} is a bitmask type for setting a mask, but is currently reserved for future use.

### 42.9. Video Coding Control

To apply dynamic controls to the currently bound video session object, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdControlVideoCodingKHR(
```
VkCommandBuffer commandBuffer,
const VkVideoCodingControlInfoKHR* pCodingControlInfo);

- `commandBuffer` is the command buffer in which to record the command.
- `pCodingControlInfo` is a pointer to a `VkVideoCodingControlInfoKHR` structure specifying the control parameters.

The control parameters provided in this call are applied to the video session at the time the command executes on the device and are in effect until a subsequent call to this command with the same video session bound changes the corresponding control parameters.

A newly created video session **must** be reset before performing video coding operations using it by including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` in `pCodingControlInfo->flags`. The reset operation also returns all DPB slots of the video session to the **inactive state**. Correspondingly, any DPB slot index associated with the **bound reference picture resources** is removed.

For encode sessions, the reset operation returns rate control configuration to implementation default settings and sets the video encode quality level to zero.

After video coding operations are performed using a video session, the reset operation **can** be used to return the video session to the same **initial state** as after the reset of a newly created video session. This **can** be used, for example, when different video sequences are needed to be processed with the same video session object.

---

**Valid Usage**

- **VUID-vkCmdControlVideoCodingKHR-flags-07017**
  If `pCodingControlInfo->flags` does not include `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`, then the bound video session **must** not be in **uninitialized** state at the time the command is executed on the device

**Valid Usage (Implicit)**

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter**
  `pCodingControlInfo` **must** be a valid pointer to a valid `VkVideoCodingControlInfoKHR` structure
- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**
- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support decode, or encode operations
- **VUID-vkCmdControlVideoCodingKHR-renderpass**
  This command **must** only be called outside of a render pass instance

3119
- VUID-vkCmdControlVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdControlVideoCodingKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Inside</td>
<td>Decode</td>

</tbody>
</table>

The VkVideoCodingControlInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodingControlFlagsKHR flags;
} VkVideoCodingControlInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkVideoCodingControlFlagsKHR specifying control flags.

Valid Usage

- VUID-VkVideoCodingControlInfoKHR-flags-07018
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, then the pNext chain must include a VkVideoEncodeRateControlInfoKHR structure

- VUID-VkVideoCodingControlInfoKHR-flags-07021
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, the rateControlMode member of VkVideoEncodeRateControlInfoKHR included in the pNext chain is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, and the bound video session was
created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, then the `pNext` chain must include a `VkVideoEncodeH264RateControlInfoEXT` structure

- **VUID-VkVideoCodingControlInfoKHR-pNext-07022**
  If the `pNext` chain includes a `VkVideoEncodeRateControlInfoKHR`, and `VkVideoEncodeRateControlInfoKHR:layerCount` is greater than 1, then `VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount` must be equal to `layerCount`

- **VUID-VkVideoCodingControlInfoKHR-flags-07024**
  If `flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the `rateControlMode` member of `VkVideoEncodeRateControlInfoKHR` included in the `pNext` chain is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, and the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT`, then the `pNext` chain must include a `VkVideoEncodeH265RateControlInfoEXT` structure

- **VUID-VkVideoCodingControlInfoKHR-pNext-07025**
  If the `pNext` chain includes a `VkVideoEncodeRateControlInfoKHR`, and `VkVideoEncodeRateControlInfoKHR::layerCount` is greater than 1, then `VkVideoEncodeH265RateControlInfoEXT::subLayerCount` must be equal to `layerCount`

---

**Valid Usage (Implicit)**

- **VUID-VkVideoCodingControlInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR`

- **VUID-VkVideoCodingControlInfoKHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264RateControlInfoEXT`, `VkVideoEncodeH265RateControlInfoEXT`, `VkVideoEncodeQualityLevelInfoKHR`, or `VkVideoEncodeRateControlInfoKHR`

- **VUID-VkVideoCodingControlInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkVideoCodingControlInfoKHR-flags-parameter**
  `flags` must be a valid combination of `VkVideoCodingControlFlagBitsKHR` values

- **VUID-VkVideoCodingControlInfoKHR-flags-required bitmask**
  `flags` must not be 0

---

Bits which can be set in `VkVideoCodingControlInfoKHR::flags`, specifying the video coding control parameters to be modified, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
};

#ifdef VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR = 0x00000002,
```
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingControlFlagsKHR;

VkVideoCodingControlFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoCodingControlFlagBitsKHR.

### 42.10. Video Decode Operations

Video decode operations consume compressed video data from a video bitstream buffer and zero or more reference pictures, and produce a *decode output picture* and an optional *reconstructed picture*.

**Note:**
Such decode output pictures can be shared with the [Decoded Picture Buffer](#), and can also be used as the *input* of video encode operations, with graphics or compute operations, or with [Window System Integration](#) APIs, depending on the capabilities of the implementation.

Video decode operations *may* access the following resources in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

- The source video bitstream buffer range and the image subregions corresponding to the list of *active reference pictures* with access VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR.

- The image subregions corresponding to the target *decode output picture* and *reconstructed picture* with access VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR.

The image subresource of each *video picture resource* accessed by the video coding operation is specified using a corresponding VkVideoPictureResourceInfoKHR structure. Each such image subresource *must* be in the appropriate image layout as follows:
• If the image subresource is used in the video decode operation only as decode output picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR layout.

• If the image subresource is used in the video decode operation both as decode output picture and reconstructed picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

• If the image subresource is used in the video decode operation only as reconstructed picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

• If the image subresource is used in the video decode operation as a reference picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

A video decode operation may complete unsuccessfully. In this case the decode output picture will have undefined contents. Similarly, if a reconstructed picture is specified, it will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

42.10.1. Codec-Specific Semantics

The following aspects of video decode operations are codec-specific:

• The interpretation of the contents of the source video bitstream buffer range.

• The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.

• The construction and interpretation of information related to the decode output picture and the generation of picture data to the corresponding image subregion.

• The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.

These codec-specific behaviors are defined for each video codec operation separately.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.264 Decode Operations section.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.265 Decode Operations section.

42.10.2. Video Decode Operation Steps

Each video decode operation performs the following steps in the VK_PIPELINE_STAGE(video) _2_VIDEO_DECODE_BIT_KHR stage:

1. Reads the encoded video data from the source video bitstream buffer range.

2. Performs picture reconstruction of the encoded video data according to the codec-specific semantics, applying any prediction data read from the active reference pictures in the process;

3. Writes the decoded picture data to the decode output picture, and to the reconstructed picture, if one is specified and is different from the decode output picture, according to the codec-specific semantics;
4. When reconstructed picture information is provided, the requested DPB slot is activated with the specified picture and the DPB slot index is associated with the corresponding bound reference picture resource.

42.10.3. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with pVideoProfile->videoCodecOperation specifying a decode operation, the VkVideoDecodeCapabilitiesKHR structure must be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve capabilities specific to video decoding.

The VkVideoDecodeCapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoDecodeCapabilityFlagsKHR flags;
} VkVideoDecodeCapabilitiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of VkVideoDecodeCapabilityFlagBitsKHR describing the supported video decoding capabilities.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
  - sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR

Bits which may be set in VkVideoDecodeCapabilitiesKHR::flags, indicating the decoding capabilities supported, are:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeCapabilityFlagBitsKHR {
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR = 0x00000002,
} VkVideoDecodeCapabilityFlagBitsKHR;
```

- **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** indicates support for using the same video picture resource as the reconstructed picture and decode output picture in a video decode operation.
- **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR** indicates support for using distinct video picture resources as the reconstructed picture and decode output picture in a video decode operation.
Implementations are only required to support one of VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR and VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR. Accordingly, applications should handle both cases to maximize portability.

**Note:**
If both VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR and VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR are supported, an application can choose to create separate images for decode DPB and decode output. E.g. in cases when linear tiling is preferred (and supported) for the decode output picture and the DPB requires optimal tiling, this avoids the need for a separate copy at the expense of additional memory bandwidth requirements during decoding.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeCapabilityFlagsKHR;
```

VkVideoDecodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeCapabilityFlagBitsKHR.

### 42.10.4. Video Decode Commands

To launch video decode operations, call:

```c
// Provided by VK_KHR_video_decode_queue
void vkCmdDecodeVideoKHR(
    VkCommandBuffer commandBuffer,  
    const VkVideoDecodeInfoKHR* pDecodeInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pDecodeInfo` is a pointer to a VkVideoDecodeInfoKHR structure specifying the parameters of the video decode operations.

Each call issues one or more video decode operations. The implicit parameter `opCount` corresponds to the number of video decode operations issued by the command. After calling this command, the active query index of each active query is incremented by `opCount`.

Currently each call to this command results in the issue of a single video decode operation.

**Active Reference Picture Information**

The list of active reference pictures used by a video decode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the VkVideoReferenceSlotInfoKHR structures provided as the elements of the `pDecodeInfo->pReferenceSlots` array. For each element of `pDecodeInfo->pReferenceSlots`, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:
• The image subregion within the image subresource referred to by the video picture resource used as the reference picture.

• The DPB slot index the reference picture is associated with.

• The codec-specific reference information related to the reference picture.

Reconstructed Picture Information

Information related to the optional reconstructed picture used by a video decode operation is derived from the VkVideoReferenceSlotInfoKHR structure pointed to by pDecodeInfo->pSetupReferenceSlot, if not NULL, as defined by the codec-specific semantics, and consists of the following:

• The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.

• The DPB slot index to activate with the reconstructed picture.

• The codec-specific reference information related to the reconstructed picture.

Decode Output Picture Information

Information related to the decode output picture used by a video decode operation is derived from pDecodeInfo->dstPictureResource and any codec-specific parameters provided in the pDecodeInfo->pNext chain, as defined by the codec-specific semantics, and consists of the following:

• The image subregion within the image subresource referred to by the video picture resource used as the decode output picture.

• The codec-specific picture information related to the decode output picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

• Let uint32_t activeReferencePictureCount be the size of the list of active reference pictures used by the video decode operation. Unless otherwise defined, activeReferencePictureCount is set to the value of pDecodeInfo->referenceSlotCount.

  ◦ If the bound video session was created with an H.264 decode profile, then let activeReferencePictureCount be the value of pDecodeInfo->referenceSlotCount plus the number of elements of the pDecodeInfo->pReferenceSlots array that have a VkVideoDecodeH264DpbSlotInfoKHR structure included in their pNext chain with both pStdReferenceInfo->flags.top_field_flag and pStdReferenceInfo->flags.bottom_field_flag set.

  Note

  This means that the elements of pDecodeInfo->pReferenceSlots that include both a top and bottom field reference are counted as two separate active reference pictures, as described in the active reference picture list construction rules for H.264 decode operations.

• Let VkOffset2D codedOffsetGranularity be the minimum alignment requirement for the coded
offset of video picture resources. Unless otherwise defined, the value of the x and y members of codedOffsetGranularity are 0.

- If the bound video session was created with an H.264 decode profile with a VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR, then codedOffsetGranularity is equal to VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for that video profile.

- Let uint32_t dpbFrameUseCount[] be an array of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the array be 0.

  - If pDecodeInfo->pSetupReferenceSlot is not NULL, then dpbFrameUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain.

  - For each element of pDecodeInfo->pReferenceSlots, dpbFrameUseCount[i] is incremented by one, where i equals the slotIndex member of the corresponding element. If the bound video session object was created with an H.264 decode profile, then dpbFrameUseCount[i] is decremented by one if either pStdReferenceInfo->flags.top_field_flag or pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pNext chain of the corresponding element of pDecodeInfo->pReferenceSlots.

- Let uint32_t dpbTopFieldUseCount[] and uint32_t dpbBottomFieldUseCount[] be arrays of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times the top field or the bottom field, respectively, associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the arrays be 0.

  - If the bound video session object was created with an H.264 decode profile and pDecodeInfo->pSetupReferenceSlot is not NULL, then perform the following:

    - If pStdReferenceInfo->flags.top_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain, then dpbTopFieldUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex.

    - If pStdReferenceInfo->flags.bottom_field_flag is set in the VkVideoDecodeH264DpbSlotInfoKHR structure in the pDecodeInfo->pSetupReferenceSlot->pNext chain, then dpbBottomFieldUseCount[i] is incremented by one, where i equals pDecodeInfo->pSetupReferenceSlot->slotIndex.

  - If the bound video session object was created with an H.264 decode profile, then perform the following for each element of pDecodeInfo->pReferenceSlots:
• If `pStdReferenceInfo->flags.top_field_flag` is set in the `VkVideoDecodeH264DpbSlotInfoKHR` structure in the `pNext` chain of the element, then `dpbTopFieldUseCount[i]` is incremented by one, where `i` equals the `slotIndex` member of the element.

• If `pStdReferenceInfo->flags.bottom_field_flag` is set in the `VkVideoDecodeH264DpbSlotInfoKHR` structure in the `pNext` chain of the element, then `dpbBottomFieldUseCount[i]` is incremented by one, where `i` equals the `slotIndex` member of the element.

Valid Usage

• VUID-vkCmdDecodeVideoKHR-None-07011
  The bound video session must not be in `uninitialized` state at the time the command is executed on the device

• VUID-vkCmdDecodeVideoKHR-opCount-07134
  For each active query, the active query index corresponding to the query type of that query plus `opCount` must be less than or equal to the last activatable query index corresponding to the query type of that query plus one

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07135
  `pDecodeInfo->srcBuffer` must be compatible with the video profile the bound video session was created with

• VUID-vkCmdDecodeVideoKHR-commandBuffer-07136
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->srcBuffer` must not be a protected buffer

• VUID-vkCmdDecodeVideoKHR-commandBuffer-07137
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->srcBuffer` must be a protected buffer

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07138
  `pDecodeInfo->srcBufferOffset` must be an integer multiple of `VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07139
  `pDecodeInfo->srcBufferRange` must be an integer multiple of `VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07140
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL` and `VkVideoDecodeCapabilitiesKHR::flags` does not include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must not match
If `pDecodeInfo->pSetupReferenceSlot` is not `NULL` and `VkVideoDecodeCapabilitiesKHR::flags` does not include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must match.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07142**
  `pDecodeInfo->dstPictureResource.imageViewBinding` must be compatible with the video profile the bound video session was created with.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07143**
  The format of `pDecodeInfo->dstPictureResource.imageViewBinding` must match the `VkVideoSessionCreateInfoKHR::pictureFormat` the bound video session was created with.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07144**
  `pDecodeInfo->dstPictureResource.codedOffset` must be an integer multiple of `codedOffsetGranularity`.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07145**
  `pDecodeInfo->dstPictureResource.codedExtent` must be between `minCodedExtent` and `maxCodedExtent`, inclusive, the bound video session was created with.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07146**
  `pDecodeInfo->dstPictureResource.imageViewBinding` must have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`.

- **VUID-vkCmdDecodeVideoKHR-commandBuffer-07147**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->dstPictureResource.imageViewBinding` must not have been created from a protected image.

- **VUID-vkCmdDecodeVideoKHR-commandBuffer-07148**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->dstPictureResource.imageViewBinding` must have been created from a protected image.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07170**
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then `pDecodeInfo->pSetupReferenceSlot->slotIndex` must be less than the `VkVideoSessionCreateInfoKHR::maxDpbSlots` specified when the bound video session was created.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07173**
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then `pDecodeInfo->pSetupReferenceSlot->pPictureResource->codedOffset` must be an integer multiple of `codedOffsetGranularity`.

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07149**
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must match one of the bound reference picture resource.

- **VUID-vkCmdDecodeVideoKHR-activeReferencePictureCount-07150**
  `activeReferencePictureCount` must be less than or equal to the `VkVideoSessionCreateInfoKHR::maxActiveReferencePictures` specified when the bound video session was created.
• VUID-vkCmdDecodeVideoKHR-slotIndex-07256
  The slotIndex member of each element of pDecodeInfo->pReferenceSlots must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created.

• VUID-vkCmdDecodeVideoKHR-codedOffset-07257
  The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pDecodeInfo->pReferenceSlots must be an integer multiple of codedOffsetGranularity.

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07151
  The pPictureResource member of each element of pDecodeInfo->pReferenceSlots must match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element.

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07264
  Each video picture resource corresponding to the pPictureResource member specified in the elements of pDecodeInfo->pReferenceSlots must be unique within pDecodeInfo->pReferenceSlots.

• VUID-vkCmdDecodeVideoKHR-dpbFrameUseCount-07176
  All elements of dpbFrameUseCount must be less than or equal to 1.

• VUID-vkCmdDecodeVideoKHR-dpbTopFieldUseCount-07177
  All elements of dpbTopFieldUseCount must be less than or equal to 1.

• VUID-vkCmdDecodeVideoKHR-dpbBottomFieldUseCount-07178
  All elements of dpbBottomFieldUseCount must be less than or equal to 1.

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07252
  If pDecodeInfo->pSetupReferenceSlot is NULL or pDecodeInfo->pSetupReferenceSlot->pPictureResource does not refer to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource must be in the VK_IMAGE_LAYOUT_VIDEO_DECODER_DST_KHR layout at the time the video decode operation is executed on the device.

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07253
  If pDecodeInfo->pSetupReferenceSlot is not NULL and pDecodeInfo->pSetupReferenceSlot->pPictureResource refers to the same image subresource as pDecodeInfo->dstPictureResource, then the image subresource referred to by pDecodeInfo->dstPictureResource must be in the VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR layout at the time the video decode operation is executed on the device.

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07254
  If pDecodeInfo->pSetupReferenceSlot is not NULL, then the image subresource referred to by pDecodeInfo->pSetupReferenceSlot->pPictureResource must be in the VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR layout at the time the video decode operation is executed on the device.

• VUID-vkCmdDecodeVideoKHR-pPictureResource-07255
  The image subresource referred to by the pPictureResource member of each element of pDecodeInfo->pReferenceSlots must be in the VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR layout at the time the video decode operation is executed on the device.
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` must include a `VkVideoDecodeH264PictureInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, then the decode output picture must represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then all elements of the `pSliceOffsets` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must be less than `pDecodeInfo->srcBufferRange`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264PictureParameterSet` entry with `seq_parameter_set_id` and `pic_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VKVIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not NULL, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, and `pDecodeInfo->pSetupReferenceSlot` is not NULL, then the reconstructed picture must represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of each element of `pDecodeInfo->pReferenceSlots` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of each element of `pReferenceSlots` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR but was not created with interlaced frame support, then each active reference picture corresponding to the elements of pDecodeInfo->pReferenceSlots must represent a frame

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07261
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not NULL, and the decode output picture represents a frame, then the reconstructed picture must also represent a frame

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07262
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not NULL, and the decode output picture represents a top field, then the reconstructed picture must also represent a top field

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07263
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, pDecodeInfo->pSetupReferenceSlot is not NULL, and the decode output picture represents a bottom field, then the reconstructed picture must also represent a bottom field

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07266
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture corresponding to any element of pDecodeInfo->pReferenceSlots represents a frame, then the DPB slot index of the bound video session specified by the slotIndex member of that element must be currently associated with a frame picture matching the video picture resource specified by the pPictureResource member of the same element at the time the command is executed on the device

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07267
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture corresponding to any element of pDecodeInfo->pReferenceSlots represents a top field, then the DPB slot index of the bound video session specified by the slotIndex member of that element must be currently associated with a top field picture matching the video picture resource specified by the pPictureResource member of the same element at the time the command is executed on the device

• VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07268
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR and an active reference picture corresponding to any element of pDecodeInfo->pReferenceSlots represents a bottom field, then the DPB slot index of the bound video session specified by the slotIndex member of that element must be currently associated with a bottom field picture matching the video picture resource specified by the pPictureResource member of the same element at the time the command is executed on the device

• VUID-vkCmdDecodeVideoKHR-pNext-07158
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain of pDecodeInfo must...
include a \texttt{VkVideoDecodeH265PictureInfoKHR} structure

- **VUID-vkCmdDecodeVideoKHR-pSliceSegmentOffsets-07159**
  If the bound video session was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR}, then all elements of the \texttt{pSliceSegmentOffsets} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo} must be less than \texttt{pDecodeInfo->srcBufferRange}

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265VideoParameterSet-07160**
  If the bound video session was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR}, then the bound video session parameters object must contain a \texttt{StdVideoH265VideoParameterSet} entry with \texttt{vps_video_parameter_set_id} matching \texttt{StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id} that is provided in the \texttt{pStdPictureInfo} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo}

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265SequenceParameterSet-07161**
  If the bound video session was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR}, then the bound video session parameters object must contain a \texttt{StdVideoH265SequenceParameterSet} entry with \texttt{sps_video_parameter_set_id} and \texttt{sps_seq_parameter_set_id} matching \texttt{StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id} and \texttt{StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id}, respectively, that are provided in the \texttt{pStdPictureInfo} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo}

- **VUID-vkCmdDecodeVideoKHR-StdVideoH265PictureParameterSet-07162**
  If the bound video session was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR}, then the bound video session parameters object must contain a \texttt{StdVideoH265PictureParameterSet} entry with \texttt{sps_video_parameter_set_id}, \texttt{pps_seq_parameter_set_id}, and \texttt{pps_pic_parameter_set_id} matching \texttt{StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id}, \texttt{StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id}, and \texttt{StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id}, respectively, that are provided in the \texttt{pStdPictureInfo} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo}

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07163**
  If the bound video session was created with the video codec operation \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR} and \texttt{pDecodeInfo->pSetupReferenceSlot} is not \texttt{NULL}, then the \texttt{pNext} chain of \texttt{pDecodeInfo->pSetupReferenceSlot} must include a \texttt{VkVideoDecodeH265DpbSlotInfoKHR} structure

- **VUID-vkCmdDecodeVideoKHR-pNext-07164**
  If the bound video session was created with the video codec operation \texttt{VKVIDEO_CODEC_OPERATION_DECODER_H265_BIT_KHR}, then the \texttt{pNext} chain of each element of \texttt{pDecodeInfo->pReferenceSlots} must include a \texttt{VkVideoDecodeH265DpbSlotInfoKHR} structure
Valid Usage (Implicit)

- VUID-vkCmdDecodeVideoKHR-commandBuffer-parameter
  \texttt{commandBuffer must} be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-parameter
  \texttt{pDecodeInfo must} be a valid pointer to a valid \texttt{VkVideoDecodeInfoKHR} structure

- VUID-vkCmdDecodeVideoKHR-commandBuffer-recording
  \texttt{commandBuffer must} be in the \texttt{recording state}

- VUID-vkCmdDecodeVideoKHR-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support decode operations

- VUID-vkCmdDecodeVideoKHR-renderpass
  This command \texttt{must} only be called outside of a render pass instance

- VUID-vkCmdDecodeVideoKHR-videocoding
  This command \texttt{must} only be called inside of a video coding scope

- VUID-vkCmdDecodeVideoKHR-bufferlevel
  \texttt{commandBuffer must} be a primary \texttt{VkCommandBuffer}

Host Synchronization

- Host access to \texttt{commandBuffer must} be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} be externally synchronized

The \texttt{VkVideoDecodeInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeInfoKHR {
    VkStructureType           sType;  
    const void*               pNext;  
    VkVideoDecodeFlagsKHR     flags;  
    VkBuffer                  srcBuffer;  
    VkDeviceSize              srcBufferOffset;  
    VkDeviceSize              srcBufferRange;  
    VkVideoPictureResourceInfoKHR dstPictureResource;  
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;  
} VkVideoDecodeInfoKHR;
```
uint32_t referenceSlotCount;
const VkVideoReferenceSlotInfoKHR* pReferenceSlots;

VkVideoDecodeInfoKHR

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `srcBuffer` is the source video bitstream buffer to read the encoded bitstream from.
- `srcBufferOffset` is the starting offset in bytes from the start of `srcBuffer` to read the encoded bitstream from.
- `srcBufferRange` is the size in bytes of the encoded bitstream to decode from `srcBuffer`, starting from `srcBufferOffset`.
- `dstPictureResource` is the video picture resource to use as the decode output picture.
- `pSetupReferenceSlot` is `NULL` or a pointer to a `VkVideoReferenceSlotInfoKHR` structure describing the DPB slot to activate and the video picture resource to use as the reconstructed picture to activate the DPB slot with.
- `referenceSlotCount` is the number of elements in the `pReferenceSlots` array.
- `pReferenceSlots` is `NULL` or a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures describing the DPB slots and corresponding reference picture resources to use in this video decode operation (the set of active reference pictures).

**Valid Usage**

- VUID-VkVideoDecodeInfoKHR-srcBuffer-07165 `srcBuffer` must have been created with `VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR` set
- VUID-VkVideoDecodeInfoKHR-srcBufferOffset-07166 `srcBufferOffset` must be less than the size of `srcBuffer`
- VUID-VkVideoDecodeInfoKHR-srcBufferRange-07167 `srcBufferRange` must be less than or equal to the size of `srcBuffer` minus `srcBufferOffset`
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07168 If `pSetupReferenceSlot` is not `NULL`, then its `slotIndex` member must not be negative
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07169 If `pSetupReferenceSlot` is not `NULL`, then its `pPictureResource` must not be `NULL`
- VUID-VkVideoDecodeInfoKHR-slotIndex-07171 The `slotIndex` member of each element of `pReferenceSlots` must not be negative
- VUID-VkVideoDecodeInfoKHR-pPictureResource-07172 The `pPictureResource` member of each element of `pReferenceSlots` must not be `NULL`
Valid Usage (Implicit)

- **VUID-VkVideoDecodeInfoKHR-sType-sType**
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR

- **VUID-VkVideoDecodeInfoKHR-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoDecodeH264PictureInfoKHR or VkVideoDecodeH265PictureInfoKHR

- **VUID-VkVideoDecodeInfoKHR-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkVideoDecodeInfoKHR-flags-zerobitmask**
  flags must be 0

- **VUID-VkVideoDecodeInfoKHR-srcBuffer-parameter**
  srcBuffer must be a valid VkBuffer handle

- **VUID-VkVideoDecodeInfoKHR-dstPictureResource-parameter**
  dstPictureResource must be a valid VkVideoPictureResourceInfoKHR structure

- **VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-parameter**
  If pSetupReferenceSlot is not NULL, pSetupReferenceSlot must be a valid pointer to a valid VkVideoReferenceSlotInfoKHR structure

- **VUID-VkVideoDecodeInfoKHR-pReferenceSlots-parameter**
  If referenceSlotCount is not 0, pReferenceSlots must be a valid pointer to an array of referenceSlotCount valid VkVideoReferenceSlotInfoKHR structures

// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeFlagsKHR;

VkVideoDecodeFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 42.11. H.264 Decode Operations

Video decode operations using an H.264 decode profile can be used to decode elementary video stream sequences compliant to the ITU-T H.264 Specification.

**Note**

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.264 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following
structures:
  ◦ The `StdVideoH264SequenceParameterSet` structure corresponding to the active SPS specifying the H.264 sequence parameter set.
  ◦ The `StdVideoH264PictureParameterSet` structure corresponding to the active PPS specifying the H.264 picture parameter set.
  ◦ The `StdVideoDecodeH264PictureInfo` structure specifying the H.264 picture information.
  ◦ The `StdVideoDecodeH264ReferenceInfo` structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.

• The contents of the provided video bitstream buffer range are interpreted as defined in the H.264 Decode Bitstream Data Access section.

• Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.264 Decode Picture Data Access section.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.264 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation **may** complete unsuccessfully.

### 42.11.1. H.264 Decode Bitstream Data Access

If the target decode output picture is a frame, then the video bitstream buffer range **should** contain a VCL NAL unit comprised of the slice headers and data of a picture representing an entire frame, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

If the target decode output picture is a field, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing a field, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively.

The offsets provided in `VkVideoDecodeH264PictureInfoKHR::pSliceOffsets` **should** specify the starting offsets corresponding to each slice header within the video bitstream buffer range.

### 42.11.2. H.264 Decode Picture Data Access

The effective `imageOffset` and `imageExtent` corresponding to a decode output picture, reference picture, or reconstructed picture used in video decode operations with an H.264 decode profile are defined as follows:

- **imageOffset** is `(codedOffset.x, codedOffset.y)` and **imageExtent** is `(codedExtent.width, codedExtent.height)`, if the picture represents a frame.
- **imageOffset** is `(codedOffset.x, codedOffset.y)` and **imageExtent** is `(codedExtent.width, codedExtent.height)`, if the picture represents a field and the picture layout of the used H.264 decode profile is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`. 
• imageOffset is \((\text{codedOffset}.x, \text{codedOffset}.y)\) and imageExtent is \((\text{codedExtent}.\text{width}, \text{codedExtent}.\text{height} / 2)\), if the picture represents a field and the picture layout of the used H.264 decode profile is \(\text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}\).

Where \text{codedOffset} and \text{codedExtent} are the members of the \text{VkVideoPictureResourceInfoKHR} structure corresponding to the picture.

However, accesses to image data within a video picture resource happen at the granularity indicated by \text{VkVideoCapabilitiesKHR::pictureAccessGranularity}, as returned by \text{vkGetPhysicalDeviceVideoCapabilitiesKHR} for the used video profile. This means that the complete image subregion accessed by video coding operations using an H.264 decode profile for the video picture resource is defined as the set of texels within the coordinate range:

\[
([\text{startX}, \text{endX}), [\text{startY}, \text{endY}])
\]

Where:

• \text{startX} equals \text{imageOffset}.x rounded down to the nearest integer multiple of pictureAccessGranularity.width;

• \text{endX} equals \text{imageOffset}.x + \text{imageExtent}.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure;

• \text{startY} equals \text{imageOffset}.y rounded down to the nearest integer multiple of pictureAccessGranularity.height;

• \text{endY} equals \text{imageOffset}.y + \text{imageExtent}.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure.

In case of video decode operations using an H.264 decode profile, any access to a picture at the coordinates \((x, y)\), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding \text{VkVideoPictureResourceInfoKHR} structure at the texel coordinates specified below:

• \((x, y)\), if the accessed picture represents a frame.

• \((x, y \times 2)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \(\text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}\).

• \((x, y \times 2 + 1)\), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is \(\text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}\).

• \((x, y)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \(\text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}\).

• \((\text{codedOffset}.x + x, \text{codedOffset}.y + y)\), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is \(\text{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}\).

Where \text{codedOffset} is the member of the corresponding \text{VkVideoPictureResourceInfoKHR} structure.
42.11.3. H.264 Decode Profile

A video profile supporting H.264 video decode operations is specified by setting \texttt{VkVideoProfileInfoKHR::videoCodecOperation} to \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR} and adding a \texttt{VkVideoDecodeH264ProfileInfoKHR} structure to the \texttt{VkVideoProfileInfoKHR::pNext} chain.

The \texttt{VkVideoDecodeH264ProfileInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagBitsKHR pictureLayout;
} VkVideoDecodeH264ProfileInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{stdProfileIdc} is a \texttt{StdVideoH264ProfileIdc} value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.
- \texttt{pictureLayout} is a \texttt{VkVideoDecodeH264PictureLayoutFlagBitsKHR} value specifying the picture layout used by the H.264 video sequence to be decoded.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264ProfileInfoKHR-sType-sType \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR}
- VUID-VkVideoDecodeH264ProfileInfoKHR-pictureLayout-parameter If \texttt{pictureLayout} is not \texttt{0}, \texttt{pictureLayout} must be a valid \texttt{VkVideoDecodeH264PictureLayoutFlagBitsKHR} value

The H.264 video decode picture layout flags are defined as follows:

```c
// Provided by VK_KHR_video_decode_h264
typedef enum VkVideoDecodeH264PictureLayoutFlagBitsKHR {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR = 0x00000002,
} VkVideoDecodeH264PictureLayoutFlagBitsKHR;
```

- \texttt{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR} specifies support for progressive content. This flag has the value \texttt{0}. 

• **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to the top field are decoded to the even-numbered lines within the picture resource, and all lines belonging to the bottom field are decoded to the odd-numbered lines within the picture resource.

• **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to a field are grouped together in a single image subregion, and the two fields comprising the frame can be stored in separate image subregions of the same image subresource or in separate image subresources.

```cpp
// Provided by VK_KHR_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsKHR;
```

**VkVideoDecodeH264PictureLayoutFlagsKHR** is a bitmask type for setting a mask of zero or more **VkVideoDecodeH264PictureLayoutFlagBitsKHR**.

### 42.11.4. H.264 Decode Capabilities

When calling **vkGetPhysicalDeviceVideoCapabilitiesKHR** to query the capabilities for an **H.264 decode profile**, the **VkVideoCapabilitiesKHR::pNext** chain must include a **VkVideoDecodeH264CapabilitiesKHR** structure that will be filled with the profile-specific capabilities.

The **VkVideoDecodeH264CapabilitiesKHR** structure is defined as:

```cpp
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH264LevelIdc maxLevelIdc;
    VkOffset2D fieldOffsetGranularity;
} VkVideoDecodeH264CapabilitiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxLevelIdc** is a **StdVideoH264LevelIdc** value specifying the maximum H.264 level supported by the profile, as defined in section A.3 of the ITU-T H.264 Specification.
- **fieldOffsetGranularity** is the minimum alignment for **VkVideoPictureResourceInfoKHR::codedOffset** specified for a video picture resource when using the picture layout **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR**.

### Valid Usage (Implicit)

• **VUID-VkVideoDecodeH264CapabilitiesKHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR**
42.11.5. H.264 Decode Parameter Sets

Video session parameters objects created with the video codec operation
VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR can contain the following types of parameters:

H.264 Sequence Parameter Sets (SPS)

Represented by StdVideoH264SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- seq_parameter_set_id is used as the key of the SPS entry;
- if flags.seq_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to seq_scaling_list_present_flag[i] as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;
- if flags.vui_parameters_present_flag is set, then pSequenceParameterSetVui is a pointer to a StdVideoH264SequenceParameterSetVui structure that is interpreted as follows:
  - reserved1 is used only for padding purposes and is otherwise ignored;
  - if flags.nal_hrd_parameters_present_flag or flags.vcl_hrd_parameters_present_flag is set, then the StdVideoH264HrdParameters structure pointed to by pHrdParameters is interpreted as follows:
    - reserved1 is used only for padding purposes and is otherwise ignored;
    - all other members of StdVideoH264HrdParameters are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;
    - all other members of StdVideoH264SequenceParameterSetVui are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;
- all other members of StdVideoH264SequenceParameterSet are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.

H.264 Picture Parameter Sets (PPS)

Represented by StdVideoH264PictureParameterSet structures and interpreted as follows:

- the pair constructed from seq_parameter_set_id and pic_parameter_set_id is used as the key of the PPS entry;
- if flags.pic_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to
pic_scaling_list_present_flag[i] as defined in section 7.4.2.2 of the ITU-T H.264 Specification;

- use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;

- ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;

- all other members of StdVideoH264PictureParameterSet are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeH264SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH264SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersCreateInfoKHR {
    VkStructureType     sType;     
    const void*         pNext;     
    uint32_t            maxStdSPSCount;     
    uint32_t            maxStdPPSCount;     
    const VkVideoDecodeH264SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdSPSCount is the maximum number of H.264 SPS entries the created VkVideoSessionParametersKHR can contain.
- maxStdPPSCount is the maximum number of H.264 PPS entries the created VkVideoSessionParametersKHR can contain.
- pParametersAddInfo is NULL or a pointer to a VkVideoDecodeH264SessionParametersAddInfoKHR structure specifying H.264 parameters to add upon object creation.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-sType-sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter If pParametersAddInfo is not NULL, pParametersAddInfo must be a valid pointer to a valid VkVideoDecodeH264SessionParametersAddInfoKHR structure
The `VkVideoDecodeH264SessionParametersAddInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoDecodeH264SessionParametersAddInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdSPSCount` is the number of elements in the `pStdSPSs` array.
- `pStdSPSs` is a pointer to an array of `StdVideoH264SequenceParameterSet` structures describing the H.264 SPS entries to add.
- `stdPPSCount` is the number of elements in the `pStdPPSs` array.
- `pStdPPSs` is a pointer to an array of `StdVideoH264PictureParameterSet` structures describing the H.264 PPS entries to add.

This structure can be specified in the following places:

- In the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure specified in the `pNext` chain of `VkVideoSessionParametersCreateInfoKHR` used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
- In the `pNext` chain of `VkVideoSessionParametersUpdateInfoKHR`. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

### Valid Usage

- **VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04825**  
  The `seq_parameter_set_id` member of each `StdVideoH264SequenceParameterSet` structure specified in the elements of `pStdSPSs` must be unique within `pStdSPSs`

- **VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04826**  
  The pair constructed from the `seq_parameter_set_id` and `pic_parameter_set_id` members of each `StdVideoH264PictureParameterSet` structure specified in the elements of `pStdPPSs` must be unique within `pStdPPSs`
Valid Usage (Implicit)

- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR

- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, pStdSPSs must be a valid pointer to an array of stdSPSCount
  StdVideoH264SequenceParameterSet values

- VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, pStdPPSs must be a valid pointer to an array of stdPPSCount
  StdVideoH264PictureParameterSet values

42.11.6. H.264 Decoding Parameters

The VkVideoDecodeH264PictureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264PictureInfo* pStdPictureInfo;
    uint32_t sliceCount;
    const uint32_t* pSliceOffsets;
} VkVideoDecodeH264PictureInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdPictureInfo is a pointer to a StdVideoDecodeH264PictureInfo structure specifying H.264 picture information.
- sliceCount is the number of elements in pSliceOffsets.
- pSliceOffsets is a pointer to an array of sliceCount offsets specifying the start offset of the slices of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.264 decode operation.

Decode Output Picture Information

When this structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- If pStdPictureInfo->flags.field_pic_flag is not set, then the picture represents a frame.
- If pStdPictureInfo->flags.field_pic_flag is set, then the picture represents a field. Specifically:
If pStdPictureInfo->flags.bottom_field_flag is not set, then the picture represents the top field of the frame.

If pStdPictureInfo->flags.bottom_field_flag is set, then the picture represents the bottom field of the frame.

• The image subregion used is determined according to the H.264 Decode Picture Data Access section.

• The decode output picture is associated with the H.264 picture information provided in pStdPictureInfo.

Std Picture Information
The members of the StdVideoDecodeH264PictureInfo structure pointed to by pStdPictureInfo are interpreted as follows:

• reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
• flags.is_intra as defined in section 3.73 of the ITU-T H.264 Specification;
• flags.is_reference as defined in section 3.136 of the ITU-T H.264 Specification;
• flags.complementary_field_pair as defined in section 3.35 of the ITU-T H.264 Specification;
• seq_parameter_set_id and pic_parameter_set_id are used to identify the active parameter sets, as described below;
• all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Active Parameter Sets
The members of the StdVideoDecodeH264PictureInfo structure pointed to by pStdPictureInfo are used to select the active parameter sets to use from the bound video session parameters object, as follows:

• The active SPS is the SPS identified by the key specified in StdVideoDecodeH264PictureInfo::seq_parameter_set_id.

• The active PPS is the PPS identified by the key specified by the pair constructed from StdVideoDecodeH264PictureInfo::seq_parameter_set_id and StdVideoDecodeH264PictureInfo::pic_parameter_set_id.

Valid Usage (Implicit)

• VUID-VkVideoDecodeH264PictureInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR

• VUID-VkVideoDecodeH264PictureInfoKHR-pStdPictureInfo-parameter pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeH264PictureInfo value

• VUID-VkVideoDecodeH264PictureInfoKHR-pSliceOffsets-parameter pSliceOffsets must be a valid pointer to an array of sliceCount uint32_t values

• VUID-VkVideoDecodeH264PictureInfoKHR-sliceCount-arraylength sliceCount must be greater than 0
The `VkVideoDecodeH264DpbSlotInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pStdReferenceInfo** is a pointer to a `StdVideoDecodeH264ReferenceInfo` structure specifying H.264 reference information.

This structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots` to specify the codec-specific reference picture information for an H.264 decode operation.

### Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of `VkVideoDecodeInfoKHR::pReferenceSlots`, one or two elements are added to the list of active reference pictures used by the video decode operation for each element of `VkVideoDecodeInfoKHR::pReferenceSlots` as follows:

- If neither `pStdReferenceInfo->flags.top_field_flag` nor `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a frame reference to the list of active reference pictures.
- If `pStdReferenceInfo->flags.top_field_flag` is set, then the picture is added as a top field reference to the list of active reference pictures.
- If `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture is added as a bottom field reference to the list of active reference pictures.
- For each added reference picture, the corresponding image subregion used is determined according to the H.264 Decode Picture Data Access section.
- Each added reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of `VkVideoDecodeInfoKHR::pReferenceSlots`.
- Each added reference picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

**Note**

When both the top and bottom field of an interlaced frame currently associated with a DPB slot is intended to be used as an active reference picture and both fields are stored in the same image subregion (which is the case when using `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR` which stores the two fields at even and odd scanlines of the same image subregion), both references have to be provided through a single `VkVideoReferenceSlotInfoKHR`. 

3146
structure that has both `flags.top_field_flag` and `flags.bottom_field_flag` set in the `StdVideoDecodeH264ReferenceInfo` structure pointed to by the `pStdReferenceInfo` member of the `VkVideoDecodeH264DpbSlotInfoKHR` structure included in the corresponding `VkVideoReferenceSlotInfoKHR` structure’s `pNext` chain. However, this approach can only be used when both fields are stored in the same image subregion. If that is not the case (e.g. when using `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR` which requires separate `codedOffset` values for the two fields and also allows storing the two fields of a frame in separate image layers or entirely separate images), then a separate `VkVideoReferenceSlotInfoKHR` structure needs to be provided for referencing the two fields, each only setting one of `flags.top_field_flag` or `flags.bottom_field_flag`, and providing the appropriate video picture resource information in `VkVideoReferenceSlotInfoKHR::pPictureResource`.

**Reconstructed Picture Information**

When this structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- If neither `pStdReferenceInfo->flags.top_field_flag` nor `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture represents a frame.
- If `pStdReferenceInfo->flags.top_field_flag` is set, then the picture represents a field, specifically, the top field of the frame.
- If `pStdReferenceInfo->flags.bottom_field_flag` is set, then the picture represents a field, specifically, the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- The reconstructed picture is used to activate the DPB slot with the index specified in `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

**Std Reference Information**

The members of the `StdVideoDecodeH264ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.top_field_flag` is used to indicate whether the reference is used as top field reference;
- `flags.bottom_field_flag` is used to indicate whether the reference is used as bottom field reference;
- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.2.5.1 of the ITU-T H.264 Specification;
- `flags.is_non_existing` is used to indicate whether the picture is marked as “non-existing” as defined in section 8.2.5.2 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.
42.11.7. H.264 Decode Requirements

This section describes the **required** H.264 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

**Table 51. Required Video Std Header Versions**

</tbody>
</table>

42.12. H.265 Decode Operations

Video decode operations using an **H.265 decode profile** can be used to decode elementary video stream sequences compliant to the **ITU-T H.265 Specification**.

*Note*

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of ITU-T H.265 Specification:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH265VideoParameterSet` structure corresponding to the active VPS specifying the H.265 video parameter set.
  - The `StdVideoH265SequenceParameterSet` structure corresponding to the active SPS specifying the H.265 sequence parameter set.
  - The `StdVideoH265PictureParameterSet` structure corresponding to the active PPS specifying the H.265 picture parameter set.
  - The `StdVideoDecodeH265PictureInfo` structure specifying the H.265 picture information.
  - The `StdVideoDecodeH265ReferenceInfo` structures specifying the H.265 reference information.
corresponding to the optional reconstructed picture and any active reference pictures.

- The contents of the provided video bitstream buffer range are interpreted as defined in the H.265 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.265 Decode Picture Data Access section.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

### 42.12.1. H.265 Decode Bitstream Data Access

The video bitstream buffer range should contain a VCL NAL unit comprised of the slice segment headers and data of a picture representing a frame, as defined in sections 7.3.6 and 7.3.8, and this data is interpreted as defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively.

The offsets provided in VkVideoDecodeH265PictureInfoKHR::pSliceSegmentOffsets should specify the starting offsets corresponding to each slice segment header within the video bitstream buffer range.

### 42.12.2. H.265 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 decode profile is defined as the set of texels within the coordinate range:

\((0, endX), (0, endY)\)

Where:

- endX equals codedExtent.width rounded up to the nearest integer multiple of pictureAccessGranularity.width and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- endY equals codedExtent.height rounded up to the nearest integer multiple of pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.
In case of video decode operations using an H.265 decode profile, any access to a picture at the coordinates \((x, y)\), as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates \((x, y)\).

### 42.12.3. H.265 Decode Profile

A video profile supporting H.265 video decode operations is specified by setting `VkVideoProfileInfoKHR::videoCodecOperation` to `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and adding a `VkVideoDecodeH265ProfileInfoKHR` structure to the `VkVideoProfileInfoKHR::pNext` chain.

The `VkVideoDecodeH265ProfileInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoDecodeH265ProfileInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC, as defined in section A3 of the ITU-T H.265 Specification.

### Valid Usage (Implicit)

- VUID-VkVideoDecodeH265ProfileInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR`

### 42.12.4. H.265 Decode Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for an H.265 decode profile, the `VkVideoCapabilitiesKHR::pNext` chain must include a `VkVideoDecodeH265CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoDecodeH265CapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoDecodeH265CapabilitiesKHR;
```
**sType** is a VkStructureType value identifying this structure.

**pNext** is NULL or a pointer to a structure extending this structure.

**maxLevelIdc** is a StdVideoH265LevelIdc value specifying the maximum H.265 level supported by the profile, as defined in section A.4 of the ITU-T H.265 Specification.

---

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265CapabilitiesKHR-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR

---

#### 42.12.5. H.265 Decode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR can contain the following types of parameters:

**H.265 Video Parameter Sets (VPS)**

Represented by StdVideoH265VideoParameterSet structures and interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
- **vps_video_parameter_set_id** is used as the key of the VPS entry;
- the **max_latency_increase_plus1**, **max_dec_pic_buffering_minus1**, and **max_num_reorder_pics** members of the StdVideoH265DecPicBufMgr structure pointed to by **pDecPicBufMgr** correspond to **vps_max_latency_increase_plus1**, **vps_max_dec_pic_buffering_minus1**, and **vps_max_num_reorder_pics**, respectively, as defined in section 7.4.3.1 of the ITU-T H.265 Specification;
- the StdVideoH265HrdParameters structure pointed to by **pHrdParameters** is interpreted as follows:
  - reserved is used only for padding purposes and is otherwise ignored;
  - **flags.fixed_pic_rate_general_flag** is a bitmask where bit index i corresponds to **fixed_pic_rate_general_flag[i]** as defined in section E.3.2 of the ITU-T H.265 Specification;
  - **flags.fixed_pic_rate_within_cvs_flag** is a bitmask where bit index i corresponds to **fixed_pic_rate_within_cvs_flag[i]** as defined in section E.3.2 of the ITU-T H.265 Specification;
  - **flags.low_delay_hrd_flag** is a bitmask where bit index i corresponds to **low_delay_hrd_flag[i]** as defined in section E.3.2 of the ITU-T H.265 Specification;
  - if **flags.nal_hrd_parameters_present_flag** is set, then **pSubLayerHrdParametersNal** is a pointer to an array of **vps_max_sub_layers_minus1 + 1** number of StdVideoH265SubLayerHrdParameters structures where **vps_max_sub_layers_minus1** is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
    - **cbr_flag** is a bitmask where bit index i corresponds to **cbr_flag[i]** as defined in
section E.3.3 of the ITU-T H.265 Specification;

- all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of vps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where vps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:

  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;

  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

- the members of the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

- all other members of StdVideoH265VideoParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

### H.265 Sequence Parameter Sets (SPS)

Represented by StdVideoH265SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;

- the pair constructed from sps_video_parameter_set_id and sps_seq_parameter_set_id is used as the key of the SPS entry;

- the members of the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

- the max_latency_increase_plus1, max_dec_pic_buffering_minus1, and max_num_reorder_pics members of the StdVideoH265DecPicBufMgr structure pointed to by pDecPicBufMgr correspond to sps_max_latency_increase_plus1, sps_max_dec_pic_buffering_minus1, and sps_max_num_reorder_pics, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

- if flags.sps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:

  - ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

  - ScalingListDCCoef16x16 and ScalingListDCCoef32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

- pShortTermRefPicSet is a pointer to an array of num_short_term_ref_pic_sets number of StdVideoH265ShortTermRefPicSet structures where each element is interpreted as follows:
• reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;

• used_by_curr_pic_flag is a bitmask where bit index i corresponds to used_by_curr_pic_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;

• use_delta_flag is a bitmask where bit index i corresponds to use_delta_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;

• used_by_curr_pic_s0_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s0_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;

• used_by_curr_pic_s1_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s1_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;

• all other members of StdVideoH265ShortTermRefPicSet are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;

• if flags.long_term_ref_pics_present_flag is set then the StdVideoH265LongTermRefPicsSps structure pointed to by pLongTermRefPicsSps is interpreted as follows:

  • used_by_curr_pic_lt_sps_flag is a bitmask where bit index i corresponds to used_by_curr_pic_lt_sps_flag[i] as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

  • all other members of StdVideoH265LongTermRefPicsSps are interpreted as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

• if flags.vui_parameters_present_flag is set, then the StdVideoH265SequenceParameterSetVui structure pointed to by pSequenceParameterSetVui is interpreted as follows:

  • reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;

  • the StdVideoH265HrdParameters structure pointed to by pHrdParameters is interpreted as follows:

    ▪ flags.fixed_pic_rate_general_flag is a bitmask where bit index i corresponds to fixed_pic_rate_general_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

    ▪ flags.fixed_pic_rate_within_cvs_flag is a bitmask where bit index i corresponds to fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

    ▪ flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

    ▪ if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:

      ▪ cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;

      ▪ all other members of the StdVideoH265SubLayerHrdParameters structure are
interpreted as defined in section E.3.3 of the ITU-T H.265 Specification; 

- if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
  
  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  
  - all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;
    
  - all other members of pSequenceParameterSetVui are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;
  
- if flags.sps_palette_predictorInitializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
  
- all other members of StdVideoH265SequenceParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Picture Parameter Sets (PPS)

Represented by StdVideoH265PictureParameterSet structures and interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
  
- the triplet constructed from sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id is used as the key of the PPS entry;
  
- if flags.pps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:
    
    - ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
    
    - ScalingListDCCoef16x16 and ScalingListDCCoef32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
    
- if flags.pps_palette_predictorInitializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
  
- all other members of StdVideoH265PictureParameterSet are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.
When a video session parameters object is created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, the `VkVideoSessionParametersCreateInfoKHR::pNext` chain must include a `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure specifying the capacity and initial contents of the object.

The `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH265SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH265SessionParametersCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `maxStdVPSCount` is the maximum number of H.265 VPS entries the created `VkVideoSessionParametersKHR` can contain.
- `maxStdSPSCount` is the maximum number of H.265 SPS entries the created `VkVideoSessionParametersKHR` can contain.
- `maxStdPPSCount` is the maximum number of H.265 PPS entries the created `VkVideoSessionParametersKHR` can contain.
- `pParametersAddInfo` is NULL or a pointer to a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure specifying H.265 parameters to add upon object creation.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR`
- VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid `VkVideoDecodeH265SessionParametersAddInfoKHR` structure

The `VkVideoDecodeH265SessionParametersAddInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
} VkVideoDecodeH265SessionParametersAddInfoKHR;
```
const StdVideoH265VideoParameterSet* pStdVPSs;
uint32_t stdVPSCount;
const StdVideoH265SequenceParameterSet* pStdSPSs;
uint32_t stdSPSCount;
const StdVideoH265PictureParameterSet* pStdPPSs;
uint32_t stdPPSCount;
} VkVideoDecodeH265SessionParametersAddInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• stdVPSCount is the number of elements in the pStdVPSs array.
• pStdVPSs is a pointer to an array of StdVideoH265VideoParameterSet structures describing the H.265 VPS entries to add.
• stdSPSCount is the number of elements in the pStdSPSs array.
• pStdSPSs is a pointer to an array of StdVideoH265SequenceParameterSet structures describing the H.265 SPS entries to add.
• stdPPSCount is the number of elements in the pStdPPSs array.
• pStdPPSs is a pointer to an array of StdVideoH265PictureParameterSet structures describing the H.265 PPS entries to add.

This structure can be specified in the following places:

• In the pParametersAddInfo member of the VkVideoDecodeH265SessionParametersCreateInfoKHR structure specified in the pNext chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).
• In the pNext chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

Valid Usage

• VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04833
  The vps_video_parameter_set_id member of each StdVideoH265VideoParameterSet structure specified in the elements of pStdVPSs must be unique within pStdVPSs

• VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04834
  The pair constructed from the sps_video_parameter_set_id and sps_seq_parameter_set_id members of each StdVideoH265SequenceParameterSet structure specified in the elements of pStdSPSs must be unique within pStdSPSs

• VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04835
  The triplet constructed from the sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id members of each StdVideoH265PictureParameterSet structure
specified in the elements of `pStdPPSs` must be unique within `pStdPPSs`

## Valid Usage (Implicit)

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR`

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter
  
  If `stdVPSCount` is not 0, `pStdVPSs` must be a valid pointer to an array of `stdVPSCount` StdVideoH265VideoParameterSet values

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter
  
  If `stdSPSCount` is not 0, `pStdSPSs` must be a valid pointer to an array of `stdSPSCount` StdVideoH265SequenceParameterSet values

- VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter
  
  If `stdPPSCount` is not 0, `pStdPPSs` must be a valid pointer to an array of `stdPPSCount` StdVideoH265PictureParameterSet values

### 42.12.6. H.265 Decoding Parameters

The `VkVideoDecodeH265PictureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265PictureInfo* pStdPictureInfo;
    uint32_t sliceSegmentCount;
    const uint32_t* pSliceSegmentOffsets;
} VkVideoDecodeH265PictureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pStdPictureInfo` is a pointer to a `StdVideoDecodeH265PictureInfo` structure specifying H.265 picture information.
- `sliceSegmentCount` is the number of elements in `pSliceSegmentOffsets`.
- `pSliceSegmentOffsets` is a pointer to an array of `sliceSegmentCount` offsets specifying the start offset of the slice segments of the picture within the video bitstream buffer range specified in `VkVideoDecodeInfoKHR`.

This structure is specified in the `pNext` chain of the `VkVideoDecodeInfoKHR` structure passed to `vkCmdDecodeVideoKHR` to specify the codec-specific picture information for an H.265 decode operation.
Decode Output Picture Information

When this structure is specified in the `pNext` chain of the `VkVideoDecodeInfoKHR` structure passed to `vkCmdDecodeVideoKHR`, the information related to the decode output picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The decode output picture is associated with the H.265 picture information provided in `pStdPictureInfo`.

Std Picture Information

The members of the `StdVideoDecodeH265PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `reserved` is used only for padding purposes and is otherwise ignored;
- `flags.IrapPicFlag` as defined in section 3.73 of the ITU-T H.265 Specification;
- `flags.IdrPicFlag` as defined in section 3.67 of the ITU-T H.265 Specification;
- `flags.IsReference` as defined in section 3.132 of the ITU-T H.265 Specification;
- `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- `PicOrderCntVal` as defined in section 8.3.1 of the ITU-T H.265 Specification;
- `NumBitsForSTRefPicSetInSlice` is the number of bits used in `st_ref_pic_set` when `short_term_ref_pic_set_sps_flag` is 0, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;
- `NumDeltaPocsOfRefRpsIdx` is the value of `NumDeltaPocs[RefRpsIdx]` when `short_term_ref_pic_set_sps_flag` is 1, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;
- `RefPicSetStCurrBefore`, `RefPicSetStCurrAfter`, and `RefPicSetLtCurr` are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value 0xFF to indicate "no reference picture";
- all other members are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification.

Active Parameter Sets

The members of the `StdVideoDecodeH265PictureInfo` structure pointed to by `pStdPictureInfo` are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The active VPS is the VPS identified by the key specified in `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id`.
- The active SPS is the SPS identified by the key specified by the pair constructed from `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id` and `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`.
- The active PPS is the PPS identified by the key specified by the triplet constructed from...
Valid Usage (Implicit)

- VUID-VkVideoDecodeH265PictureInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR
- VUID-VkVideoDecodeH265PictureInfoKHR-pStdPictureInfo-parameter
  pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeH265PictureInfo value
- VUID-VkVideoDecodeH265PictureInfoKHR-pSliceSegmentOffsets-parameter
  pSliceSegmentOffsets must be a valid pointer to an array of sliceSegmentCount uint32_t values
- VUID-VkVideoDecodeH265PictureInfoKHR-sliceSegmentCount-arraylength
  sliceSegmentCount must be greater than 0

The VkVideoDecodeH265DpbSlotInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pStdReferenceInfo is a pointer to a StdVideoDecodeH265ReferenceInfo structure specifying reference picture information described in section 8.3 of the ITU-T H.265 Specification.

This structure is specified in the pNext chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, if not NULL, and the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots to specify the codec-specific reference picture information for an H.265 decode operation.

Active Reference Picture Information

When this structure is specified in the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots, one element is added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::pReferenceSlots as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the slotIndex member of the corresponding element of VkVideoDecodeInfoKHR::pReferenceSlots.
- The reference picture is associated with the H.265 reference information provided in pStdReferenceInfo.
Reconstructed Picture Information

When this structure is specified in the `pNext` chain of `VkVideoDecodeInfoKHR::pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reconstructed picture is used to activate the DPB slot with the index specified in `VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

Std Reference Information

The members of the `StdVideoDecodeH265ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:

- `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
- `flags.unused_for_reference` is used to indicate whether the picture is marked as “unused for reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
- all other members are interpreted as defined in section 8.3 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265DpbSlotInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_DPBI_SLOT_INFO_KHR`
- VUID-VkVideoDecodeH265DpbSlotInfoKHR-pStdReferenceInfo-parameter
  `pStdReferenceInfo` must be a valid pointer to a valid `StdVideoDecodeH265ReferenceInfo` value

42.12.7. H.265 Decode Requirements

This section describes the required H.265 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

42.13. Video Encode Operations

Before the application can start recording Vulkan command buffers for the Video Encode
Operations, it **must** do the following, beforehand:

1. Ensure that the implementation can encode the Video Content by querying the supported codec operations and profiles using `vkGetPhysicalDeviceQueueFamilyProperties2`.
2. By using `vkGetPhysicalDeviceVideoFormatPropertiesKHR` and providing one or more video profiles, choose the Vulkan formats supported by the implementation. The formats for *input* and *reference* pictures **must** be queried and chosen separately. Refer to the section on Video Format Capabilities.
3. Before creating an image to be used as a video picture resource, obtain the supported image creation parameters by querying with `vkGetPhysicalDeviceFormatProperties2` and `vkGetPhysicalDeviceImageFormatProperties2` using one of the reported formats and adding `VkVideoProfileListInfoKHR` to the `pNext` chain of `VkFormatProperties2`. When querying the parameters with `vkGetPhysicalDeviceImageFormatProperties2` for images targeting *input* and reference (DPB) pictures, the `VkPhysicalDeviceImageFormatInfo2::usage` field should contain `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, respectively.
4. Create none, some, or all of the required images for the *input* and *reference* pictures. More Video Picture Resources **can** be created at some later point if needed while processing the content to be encoded. Also, if the size of the picture to be encoded is expected to change, the images **can** be created based on the maximum expected content size.
5. Create the **video session** to be used for video encode operations. Before creating the Encode Video Session, the encode capabilities **should** be queried with `vkGetPhysicalDeviceVideoCapabilitiesKHR` to obtain the limits of the parameters allowed by the implementation for a particular codec profile.
6. Bind memory resources with the encode video session by calling `vkBindVideoSessionMemoryKHR`. The video session **cannot** be used until memory resources are allocated and bound to it. In order to determine the required memory sizes and heap types of the device memory allocations, `vkGetVideoSessionMemoryRequirementsKHR` **should** be called.
7. Create one or more Video Session Parameter objects for use across command buffer recording operations, if required by the codec extension in use. These objects **must** be created against a video session with the parameters required by the codec. Each Video Session Parameter object created is a child object of the associated Session object and **cannot** be bound in the command buffer with any other Session Object.

The recording of Video Encode Commands against a Vulkan Command Buffer consists of the following sequence:

1. `vkCmdBeginVideoCodingKHR` starts the recording of one or more Video Encode operations in the command buffer. For each Video Encode Command operation, a Video Session **must** be bound to the command buffer within this command. This command establishes a Vulkan Video Encode Context that consists of the bound Video Session Object, Session Parameters Object, and the required Video Picture Resources. The established Video Encode Context is in effect until the `vkCmdEndVideoCodingKHR` command is recorded. If more Video Encode operations are to be required after the `vkCmdEndVideoCodingKHR` command, another Video Encode Context **can** be started with the `vkCmdBeginVideoCodingKHR` command.
2. `vkCmdEncodeVideoKHR` specifies one or more frames to be encoded. The `VkVideoEncodeInfoKHR` parameters, and the codec extension structures chained to this, specify the details of the encode operation.

3. `vkCmdControlVideoCodingKHR` records operations against the encoded data, encoding device, or the Video Session state.

4. `vkCmdEndVideoCodingKHR` signals the end of the recording of the Vulkan Video Encode Context, as established by `vkCmdBeginVideoCodingKHR`.

In addition to the above, the following commands can be recorded between `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR`:

- Query operations
- Global Memory Barriers
- Buffer Memory Barriers
- Image Memory Barriers (these must be used to transition the Video Picture Resources to the proper `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` and `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` layouts).
- Pipeline Barriers
- Events
- Timestamps
- Device Groups (device mask)

The following Video Encode related commands must be recorded outside the Vulkan Video Encode Context established with the `vkCmdBeginVideoCodingKHR` and `vkCmdEndVideoCodingKHR` commands:

- Sparse Memory Binding
- Copy Commands
- Clear Commands

### 42.13.1. Encode Input Picture

The primary source of input pixels for the video encoding process is the Encode Input Picture, represented by a `VkImageView`. It may also be a direct target of video decode, graphics, or compute operations, or with Window System Integration APIs.

### 42.13.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as one of the encode operation bits, the `VkVideoEncodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video encoding.

The `VkVideoEncodeCapabilitiesKHR` structure is defined as:
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeCapabilityFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagsKHR rateControlModes;
    uint32_t maxRateControlLayers;
    uint64_t maxBitrate;
    uint32_t maxQualityLevels;
    VkExtent2D encodeInputPictureGranularity;
    VkVideoEncodeFeedbackFlagsKHR supportedEncodeFeedbackFlags;
} VkVideoEncodeCapabilitiesKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is a bitmask of VkVideoEncodeCapabilityFlagBitsKHR describing supported encoding features.
- rateControlModes is a bitmask of VkVideoEncodeRateControlModeFlagBitsKHR indicating supported rate control modes.
- maxRateControlLayers indicates the maximum number of rate control layers supported.
- maxBitrate indicates the maximum supported bitrate.
- maxQualityLevels indicates the number of discrete video encode quality levels supported. Implementations must report at least 1.
- encodeInputPictureGranularity indicates the granularity at which encode input picture data is encoded.
- supportedEncodeFeedbackFlags is a bitmask of VkVideoEncodeFeedbackFlagBitsKHR values specifying the supported flags for video encode feedback queries.

Implementations must include support for at least VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR and VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR in supportedEncodeFeedbackFlags.

The input content and encode resolution (specified in VkVideoEncodeInfoKHR::codedExtent) may not be aligned with the codec-specific coding block size. For example, the input content may be 1920x1080 and the coding block size may be 16x16 pixel blocks. In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with the coding block size. Encoding of the last row of blocks may be impacted by contents of the input image in pixel rows 1081 to 1088 (the next vertical alignment with the coding block size). In general, to ensure efficient encoding for the last row/column of blocks, and/or to ensure consistent encoding results between repeated encoding of the same input content, these extra pixel rows/columns should be filled to known values up to the coding block size alignment before encoding operations are performed. Some implementations support performing auto-fill of unaligned pixels beyond a specific alignment for the purposes of encoding, which is reported in encodeInputPictureGranularity. For example, if an implementation reports 1x1 in encodeInputPictureGranularity, then the implementation will perform auto-fill for any unaligned pixels beyond the encode resolution up to
the next coding block size. For a coding block size of 16x16, if the implementation reports 16x16 in
encodeInputPictureGranularity, then it is the application's responsibility to fill any unaligned pixels,
if desired. When the application does not fill these unaligned pixels, there may be an impact on the
encoding efficiency but there will be no effect on the validity of the generated bitstream. If the
implementation reports 8x8 in encodeInputPictureGranularity, then for the 1920x1080 example,
since the content is aligned to 8 pixels vertically, the implementation will auto-fill pixel rows 1081
to 1088 (up to the 16x16 coding block size in the example). The auto-fill value(s) are
implementation-specific. The auto-fill value(s) are not written to the input image memory, but are
used as part of the encoding operation on the input image.

Valid Usage (Implicit)

• VUID-VkVideoEncodeCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

VkVideoEncodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more
VkVideoEncodeCapabilityFlagBitsKHR.

Bits which may be set in VkVideoEncodeCapabilitiesKHR::flags, indicating the encoding tools
supported, are:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR = 0x00000001,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

• VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR indicates that the
  implementation supports the use of VkVideoEncodeInfoKHR::precedingExternallyEncodedBytes.

42.13.3. Video Encode Quality Levels

To query properties for a specific video encode quality level supported by a video encode profile, call:

```
// Provided by VK_KHR_video_encode_queue
VkResult vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR* pQualityLevelInfo,
    VkVideoEncodeQualityLevelPropertiesKHR* pQualityLevelProperties);
```

• physicalDevice is the physical device to query the video encode quality level properties for.
• `pQualityLevelInfo` is a pointer to a `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure specifying the video encode profile and quality level to query properties for.

• `pQualityLevelProperties` is a pointer to a `VkVideoEncodeQualityLevelPropertiesKHR` structure in which the properties are returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-parameter
  `pQualityLevelInfo` must be a valid pointer to a valid `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelProperties-parameter
  `pQualityLevelProperties` must be a valid pointer to a `VkVideoEncodeQualityLevelPropertiesKHR` structure

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR`
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR`

The `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkVideoProfileInfoKHR* pVideoProfile;
    uint32_t qualityLevel;
} VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **pVideoProfile** is a pointer to a *VkVideoProfileInfoKHR* structure specifying the video profile to query the video encode quality level properties for.
• **qualityLevel** is the video encode quality level to query properties for.

<table>
<thead>
<tr>
<th>Valid Usage (Implicit)</th>
</tr>
</thead>
</table>
| • VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-sType-sType  
  *sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR** |
| • VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pNext-pNext  
  *pNext* must be **NULL** |
| • VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-parameter  
  *pVideoProfile** must be a valid pointer to a valid *VkVideoProfileInfoKHR* structure |

The *VkVideoEncodeQualityLevelPropertiesKHR* structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeRateControlModeFlagBitsKHR preferredRateControlMode;
    uint32_t preferredRateControlLayerCount;
} VkVideoEncodeQualityLevelPropertiesKHR;
```

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **preferredRateControlMode** is a *VkVideoEncodeRateControlModeFlagBitsKHR* value indicating the preferred rate control mode to use with the video encode quality level.
• **preferredRateControlLayerCount** indicates the preferred number of rate control layers to use with the quality level.

<table>
<thead>
<tr>
<th>Valid Usage (Implicit)</th>
</tr>
</thead>
</table>
| • VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-sType  
  *sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR** |
| • VUID-VkVideoEncodeQualityLevelPropertiesKHR-pNext-pNext  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either **NULL** or a pointer to a valid instance of *VkVideoEncodeH264QualityLevelPropertiesEXT* or *VkVideoEncodeH265QualityLevelPropertiesEXT* |
| • VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-unique  
  The *sType* value of each struct in the *pNext* chain must be unique |
The `VkVideoEncodeQualityLevelInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t qualityLevel;
} VkVideoEncodeQualityLevelInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `qualityLevel` is the used video encode quality level.

This structure can be specified in the following places:

- In the `pNext` chain of `VkVideoSessionParametersCreateInfoKHR` to specify the video encode quality level to use for a video session parameters object created for a video encode session. If no instance of this structure is included in the `pNext` chain of `VkVideoSessionParametersCreateInfoKHR`, then the video session parameters object is created with a video encode quality level of zero.
- In the `pNext` chain of `VkVideoCodingControlInfoKHR` to change the video encode quality level state of the bound video session.

### Valid Usage (Implicit)

- `VUID-VkVideoEncodeQualityLevelInfoKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`  

#### 42.13.4. Retrieving Encoded Session Parameters

Any codec-specific parameters stored in video session parameters objects may need to be separately encoded and included in the final video bitstream data, depending on the used video compression standard. In such cases the application must call the `vkGetEncodedVideoSessionParametersKHR` command to retrieve the encoded parameter data from the used video session parameters object in order to be able to produce a compliant video bitstream.

Encoded parameter data can be retrieved from a video session parameters object created with a video encode operation using the command:

```c
// Provided by VK_KHR_video_encode_queue
VkResult vkGetEncodedVideoSessionParametersKHR(
    VkDevice device,  
    const VkVideoEncodeSessionParametersGetInfoKHR* pVideoSessionParametersInfo,  
    VkVideoEncodeSessionParametersFeedbackInfoKHR* pFeedbackInfo,  
    size_t* pDataSize,
    ...
);
```
void* pData);

- **device** is the logical device that owns the video session parameters object.
- **pVideoSessionParametersInfo** is a pointer to a **VkVideoEncodeSessionParametersGetInfoKHR** structure specifying the parameters of the encoded parameter data to retrieve.
- **pFeedbackInfo** is either **NULL** or a pointer to a **VkVideoEncodeSessionParametersFeedbackInfoKHR** structure in which feedback about the requested parameter data is returned.
- **pDataSize** is a pointer to a **size_t** value related to the amount of encode parameter data returned, as described below.
- **pData** is either **NULL** or a pointer to a buffer to write the encoded parameter data to.

If **pData** is **NULL**, then the size of the encoded parameter data, in bytes, that **can** be retrieved is returned in **pDataSize**. Otherwise, **pDataSize** must point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the number of bytes actually written to **pData**. If **pDataSize** is less than the size of the encoded parameter data that **can** be retrieved, then no data will be written to **pData**, zero will be written to **pDataSize**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that no encoded parameter data was returned.

If **pFeedbackInfo** is not **NULL** then the members of the **VkVideoEncodeSessionParametersFeedbackInfoKHR** structure and any additional structures included in its **pNext** chain that are applicable to the video session parameters object specified in **pVideoSessionParametersInfo::videoSessionParameters** will be filled with feedback about the requested parameter data on all successful calls to this command.

Note:
This includes the cases when **pData** is **NULL** or when **VK_INCOMPLETE** is returned by the command, and enables the application to determine whether the implementation overrode any of the requested video session parameters without actually needing to retrieve the encoded parameter data itself.

**Valid Usage (Implicit)**

- **VUID-vkGetEncodedVideoSessionParametersKHR-device-parameter**
  - **device** must be a valid **VkDevice** handle

- **VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-parameter**
  - **pVideoSessionParametersInfo** must be a valid pointer to a valid **VkVideoEncodeSessionParametersGetInfoKHR** structure

- **VUID-vkGetEncodedVideoSessionParametersKHR-pFeedbackInfo-parameter**
  - If **pFeedbackInfo** is not **NULL**, **pFeedbackInfo** must be a valid pointer to a **VkVideoEncodeSessionParametersFeedbackInfoKHR** structure

- **VUID-vkGetEncodedVideoSessionParametersKHR-pDataSize-parameter**
**pDataSize** must be a valid pointer to a **size_t** value

- VUID-vkGetEncodedVideoSessionParametersKHR-pData-parameter
  If the value referenced by **pDataSize** is not 0, and **pData** is not NULL, **pData** must be a valid pointer to an array of **pDataSize** bytes

---

**Return Codes**

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkVideoEncodeSessionParametersGetInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersGetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionParametersKHR videoSessionParameters;
} VkVideoEncodeSessionParametersGetInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **videoSessionParameters** is the **VkVideoSessionParametersKHR** object to retrieve encoded parameter data from.

Depending on the used video encode operation, additional codec-specific structures may need to be included in the **pNext** chain of this structure to identify the specific video session parameters to retrieve encoded parameter data for, as described in the corresponding sections.

---

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR**

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-pNext-pNext
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkVideoEncodeH264SessionParametersGetInfoEXT** or **VkVideoEncodeH265SessionParametersGetInfoEXT**

- VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-unique
  The **sType** value of each struct in the **pNext** chain must be unique
The `VkVideoEncodeSessionParametersFeedbackInfoKHR` structure is defined as:

```
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersFeedbackInfoKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasOverrides;
} VkVideoEncodeSessionParametersFeedbackInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `hasOverrides` indicates whether any of the requested parameter data were overridden by the implementation.

Depending on the used video encode operation, additional codec-specific structures may need to be included in the `pNext` chain of this structure to capture feedback information about the requested parameter data, as described in the corresponding sections.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR`.

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-pNext-pNext
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of

  - `VkVideoEncodeH264SessionParametersFeedbackInfoEXT`
  - `VkVideoEncodeH265SessionParametersFeedbackInfoEXT`

- VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-unique

  The `sType` value of each struct in the `pNext` chain must be unique.

### 42.13.5. Video Encode Commands

To launch video encode operations, call:

```
// Provided by VK_KHR_video_encode_queue
void vkCmdEncodeVideoKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoEncodeInfoKHR* pEncodeInfo);
```

- `commandBuffer` is the command buffer to be filled with this function for encoding to generate a bitstream.
• \texttt{pEncodeInfo} is a pointer to a \texttt{VkVideoEncodeInfoKHR} structure.

Each call issues one or more video encode operations. The implicit parameter \texttt{opCount} corresponds to the number of video encode operations issued by the command. After calling this command, the active query index of each active query is incremented by \texttt{opCount}.

Currently each call to this command results in the issue of a single video encode operation.

**Valid Usage**

- VUID-vkCmdEncodeVideoKHR-opCount-07174
  
  For each active query, the active query index corresponding to the query type of that query plus \texttt{opCount} must be less than or equal to the last activatable query index corresponding to the query type of that query plus one

**Valid Usage (Implicit)**

- VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter
  \texttt{pEncodeInfo} must be a valid pointer to a valid \texttt{VkVideoEncodeInfoKHR} structure

- VUID-vkCmdEncodeVideoKHR-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support encode operations

- VUID-vkCmdEncodeVideoKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdEncodeVideoKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdEncodeVideoKHR-bufferlevel
  \texttt{commandBuffer} must be a primary \texttt{VkCommandBuffer}

**Host Synchronization**

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized
The `VkVideoEncodeInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFlagsKHR flags;
    VkBuffer dstBuffer;
    VkDeviceSize dstBufferOffset;
    VkDeviceSize dstBufferRange;
    VkVideoPictureResourceInfoKHR srcPictureResource;
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
    uint32_t precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is a pointer to a structure extending this structure. A codec-specific extension structure must be chained to specify what bitstream unit to generate with this encode operation.
- `flags` is reserved for future use.
- `dstBuffer` is the destination video bitstream buffer to write the encoded bitstream to.
- `dstBufferOffset` is the starting offset in bytes from the start of `dstBuffer` to write the encoded bitstream to. `dstBufferOffset`'s value must be aligned to `VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment`, as reported by the implementation.
- `dstBufferRange` is the maximum size in bytes of the encoded bitstream written to `dstBuffer`, starting from `dstBufferOffset`. `dstBufferRange`'s value must be aligned to `VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment`, as reported by the implementation.
- `srcPictureResource` is the Picture Resource of the Input Picture to be encoded by the operation.
- `pSetupReferenceSlot` is a pointer to a `VkVideoReferenceSlotInfoKHR` structure used for generating a reconstructed reference slot and Picture Resource. `pSetupReferenceSlot->slotIndex` specifies the slot index number to use as a target for producing the Reconstructed (DPB) data. `pSetupReferenceSlot` must be one of the entries provided in `VkVideoBeginCodingInfoKHR` via the `pReferenceSlots` within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Encode Context for this command.
- `referenceSlotCount` is the number of Reconstructed Reference Pictures that will be used when this encoding operation is executing.
• `pReferenceSlots` is `NULL` or a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures that will be used when this encoding operation is executing. Each entry in `pReferenceSlots` must be one of the entries provided in `VkVideoBeginCodingInfoKHR` via the `pReferenceSlots` within the `vkCmdBeginVideoCodingKHR` command that established the Vulkan Video Encode Context for this command.

• `precedingExternallyEncodedBytes` is the number of bytes externally encoded for insertion in the active video encode session overall bitstream prior to the bitstream that will be generated by the implementation for this instance of `VkVideoEncodeInfoKHR`. The value provided is used to update the implementation's rate control algorithm for the rate control layer this instance of `VkVideoEncodeInfoKHR` belongs to, by accounting for the bitrate budget consumed by these externally encoded bytes. See `VkVideoEncodeRateControlInfoKHR` for additional information about encode rate control.

The coded size of the encode operation is specified in `codedExtent` of `srcPictureResource`.

Multiple `vkCmdEncodeVideoKHR` commands may be recorded within a Vulkan Video Encode Context. The execution of each `vkCmdEncodeVideoKHR` command will result in generating codec-specific bitstream units. These bitstream units are generated consecutively into the bitstream buffer specified in `dstBuffer` of a `VkVideoEncodeInfoKHR` structure within the `vkCmdBeginVideoCodingKHR` command. The produced bitstream is the sum of all these bitstream units, including any padding between the bitstream units. Any bitstream padding must be filled with data compliant to the codec standard so as not to cause any syntax errors during decoding of the bitstream units with the padding included. The range of the bitstream buffer written can be queried via video encode feedback queries.

---

**Valid Usage**

- VUID-VkVideoEncodeInfoKHR-None-07012
  The bound video session must not be in uninitialized state at the time the command is executed on the device

---

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR`

- VUID-VkVideoEncodeInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264PictureInfoEXT` or `VkVideoEncodeH265PictureInfoEXT`

- VUID-VkVideoEncodeInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkVideoEncodeInfoKHR-flags-zero bitmask
  `flags` must be 0

- VUID-VkVideoEncodeInfoKHR-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

---

3173
• VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter
  srcPictureResource must be a valid VkVideoPictureResourceInfoKHR structure

• VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter
  If pSetupReferenceSlot is not NULL, pSetupReferenceSlot must be a valid pointer to a valid
  VkVideoReferenceSlotInfoKHR structure

• VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter
  If referenceSlotCount is not 0, pReferenceSlots must be a valid pointer to an array of
  referenceSlotCount valid VkVideoReferenceSlotInfoKHR structures

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeFlagsKHR;

VkVideoEncodeFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future
use.

The VkVideoEncodeRateControlInfoKHR structure is defined as:

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkVideoEncodeRateControlFlagsKHR flags;
  VkVideoEncodeRateControlModeFlagBitsKHR rateControlMode;
  uint32_t layerCount;
  const VkVideoEncodeRateControlLayerInfoKHR* pLayers;
  uint32_t virtualBufferSizeInMs;
  uint32_t initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• rateControlMode is a VkVideoEncodeRateControlModeFlagBitsKHR value specifying the encode
  stream rate control mode.
• layerCount specifies the number of rate control layers in the video encode stream.
• pLayers is a pointer to an array of VkVideoEncodeRateControlLayerInfoKHR structures
  specifying the rate control configurations of layerCount rate control layers.
• virtualBufferSizeInMs is the leaky bucket model virtual buffer size in milliseconds, with respect
to peak bitrate. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR
  or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR. For example, virtual buffer size is
  (virtualBufferSizeInMs × maxBitrate / 1000).
• initialVirtualBufferSizeInMs is the initial occupancy in milliseconds of the virtual buffer in the
  leaky bucket model. Valid when rate control mode is
Including this structure in the pNext chain of VkVideoCodingControlInfoKHR and including VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR in VkVideoCodingControlInfoKHR::flags will define stream rate control settings for video encoding.

Additional structures providing codec-specific rate control parameters may need to be included in the pNext chain of VkVideoCodingControlInfoKHR depending on the codec profile the bound video session was created with and the parameters specified in VkVideoEncodeRateControlInfoKHR (see Video Coding Control).

To ensure that the video session is properly initialized with stream-level rate control settings, the application must call vkCmdControlVideoCodingKHR with stream-level rate control settings at least once in execution order before the first vkCmdEncodeVideoKHR command that is executed after video session reset. If not provided, default implementation-specific stream rate control settings will be used.

Stream rate control settings can also be re-initialized during an active video encoding session. The re-initialization takes effect whenever the VkVideoEncodeRateControlInfoKHR structure is included in the pNext chain of the VkVideoCodingControlInfoKHR structure in the call to vkCmdControlVideoCodingKHR, and only impacts vkCmdEncodeVideoKHR operations that follow in execution order.

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR

- VUID-VkVideoEncodeRateControlInfoKHR-flags-zerobitmask
  flags must be 0

- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter
  If rateControlMode is not 0, rateControlMode must be a valid
  VkVideoEncodeRateControlModeFlagBitsKHR value

- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-parameter
  If layerCount is not 0, pLayers must be a valid pointer to an array of layerCount valid
  VkVideoEncodeRateControlLayerInfoKHR structures

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;

VkVideoEncodeRateControlFlagsKHR is a bitmask type for setting a mask, but currently reserved for future use.

The rate control modes are defined with the following enums:
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 0x00000004,
} VkVideoEncodeRateControlModeFlagBitsKHR;

- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR** specifies the use of implementation-specific rate control.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR** specifies that rate control is disabled and any quality control parameters for the encoding are provided on a per-picture basis. In this mode implementations will encode pictures independently of the output bitrate of prior video encode operations. When using an H.264 encode profile, implementations will use the QP values specified in the `VkVideoEncodeH264RateControlInfoEXT` structure for the encoded picture. When using an H.265 encode profile, implementations will use the QP values specified in the `VkVideoEncodeH265RateControlInfoEXT` structure for the encoded picture.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR** specifies the use of constant bitrate rate control mode.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR** specifies the use of variable bitrate rate control mode.

typedef VkFlags VkVideoEncodeRateControlModeFlagsKHR;

VkVideoEncodeRateControlModeFlagsKHR is a bitmask type for setting a mask of zero or more `VkVideoEncodeRateControlModeFlagBitsKHR`.

The `VkVideoEncodeRateControlLayerInfoKHR` structure is defined as:

typedef struct VkVideoEncodeRateControlLayerInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint64_t averageBitrate;
    uint64_t maxBitrate;
    uint32_t frameRateNumerator;
    uint32_t frameRateDenominator;
} VkVideoEncodeRateControlLayerInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is a pointer to a structure extending this structure.
- **averageBitrate** is the average bitrate in bits/second. Valid when rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR`
maxBitrate is the peak bitrate in bits/second. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.

frameRateNumerator is the numerator of the frame rate. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.

frameRateDenominator is the denominator of the frame rate. Valid when rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR or VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR.

A codec-specific structure specifying additional per-layer rate control settings must be chained to VkVideoEncodeRateControlLayerInfoKHR. If multiple rate control layers are enabled (VkVideoEncodeRateControlInfoKHR::layerCount is greater than 1), then the chained codec-specific extension structure also identifies the specific video coding layer its parent VkVideoEncodeRateControlLayerInfoKHR applies to. If multiple rate control layers are enabled, the number of rate control layers must match the number of video coding layers. The specification for an encode codec-specific extension would describe how multiple video coding layers are enabled for the corresponding codec.

Per-layer rate control settings for all enabled rate control layers must be initialized or re-initialized whenever stream rate control settings are provided via VkVideoEncodeRateControlInfoKHR. This is done by specifying settings for all enabled rate control layers in VkVideoEncodeRateControlInfoKHR::pLayers.

It is possible for an application to enable multiple video coding layers (via codec-specific extensions to encoding operations) while only enabling a single layer of rate control for the entire video stream. To achieve this, layerCount in VkVideoEncodeRateControlInfoKHR must be set to 1, and the single VkVideoEncodeRateControlLayerInfoKHR provided in pLayers would apply to all encoded segments of the video stream, regardless of which codec-defined video coding layer they belong to. In this case, the implementation decides bitrate distribution across video coding layers (if applicable to the specified stream rate control mode).

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR
- VUID-VkVideoEncodeRateControlLayerInfoKHR-pNext-pNext Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264RateControlLayerInfoEXT or VkVideoEncodeH265RateControlLayerInfoEXT
- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-unique The sType value of each struct in the pNext chain must be unique
42.14. Encode H.264

The VK_EXT_video_encode_h264 extension adds H.264 codec specific structures/types needed to support H.264 encoding. Unless otherwise noted, all references to the H.264 specification are to the 2010 edition published by the ITU-T, dated March 2010. This specification is available at https://www.itu.int/rec/T-REC-H.264.

Note
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

42.14.1. H.264 encode profile

The VkVideoEncodeH264ProfileInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
} VkVideoEncodeH264ProfileInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdProfileIdc** is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC.

An H.264 encode profile is specified by including a VkVideoEncodeH264ProfileInfoEXT structure in the `pNext` chain of the VkVideoProfileInfoKHR structure when `VkVideoProfileInfoKHR::videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_EXT`

42.14.2. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, the VkVideoEncodeH264CapabilitiesEXT structure must be included in the `pNext` chain of the VkVideoCapabilitiesKHR structure to retrieve more capabilities specific to H.264 video encoding.

The VkVideoEncodeH264CapabilitiesEXT structure is defined as:
typedef struct VkVideoEncodeH264CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264CapabilityFlagsEXT flags;
    StdVideoH264LevelIdc maxLevelIdc;
    uint32_t maxSliceCount;
    uint32_t maxPPictureL0ReferenceCount;
    uint32_t maxBPictureL0ReferenceCount;
    uint32_t maxL1ReferenceCount;
    uint32_t maxTemporalLayerCount;
    VkBool32 expectDyadicTemporalLayerPattern;
    int32_t minQp;
    int32_t maxQp;
    VkBool32 prefersGopRemainingFrames;
    VkBool32 requiresGopRemainingFrames;
    VkVideoEncodeH264StdFlagsEXT stdSyntaxFlags;
} VkVideoEncodeH264CapabilitiesEXT;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is a bitmask of VkVideoEncodeH264CapabilityFlagBitsEXT indicating supported H.264 encoding capabilities.

• maxLevelIdc is a StdVideoH264LevelIdc value indicating the maximum H.264 level supported.

• maxSliceCount indicates the maximum number of slices that can be encoded for a single picture. Further restrictions may apply to the number of slices that can be encoded for a single picture depending on other capabilities and codec-specific rules.

• maxPPictureL0ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.

• maxBPictureL0ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures. The reported value is 0 if encoding of B pictures is not supported.

• maxL1ReferenceCount reports the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.

• maxTemporalLayerCount indicates the maximum number of H.264 temporal layers supported by the implementation.

• expectDyadicTemporalLayerPattern indicates that the implementation’s rate control algorithms expect the application to use a dyadic temporal layer pattern when encoding multiple temporal layers.

• minQp indicates the minimum QP value supported.

• maxQp indicates the maximum QP value supported.

• prefersGopRemainingFrames indicates that the implementation’s rate control algorithm prefers
the application to specify the number of frames of each type remaining in the current group of pictures.

- `requiresGopRemainingFrames` indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures.

- `stdSyntaxFlags` is a bitmask of `VkVideoEncodeH264StdFlagBitsEXT` indicating capabilities related to H.264 syntax elements.

When `vkGetPhysicalDeviceVideoCapabilitiesKHR` is called to query the capabilities with parameter `videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT`, a `VkVideoEncodeH264CapabilitiesEXT` structure can be chained to `VkVideoCapabilitiesKHR` to retrieve H.264 extension specific capabilities.

### Valid Usage (Implicit)

- `VUID-VkVideoEncodeH264CapabilitiesEXT-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_EXT`

Bits which may be set in `VkVideoEncodeH264CapabilitiesEXT::flags`, indicating the supported H.264 encoding capabilities, are:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_CAPABILITY_BFRAME_IN_L0_LIST_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H264_CAPABILITY_BFRAME_IN_L1_LIST_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT = 0x00000100,
} VkVideoEncodeH264CapabilityFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_EXT` indicates if the implementation guarantees generating a HRD compliant bitstream if `nal_hrd_parameters_present_flag` or `vcl_hrd_parameters_present_flag` are enabled in `StdVideoH264SpsVuiflags`.

- `VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT` indicates that when `weighted_pred_flag` is enabled or `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT` from `StdVideoH264WeightedBipredIdc` is used, the implementation is able to internally decide syntax for `pred_weight_table`.

- `VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_EXT` indicates that each slice in a frame with multiple slices may begin or finish at any offset in a macroblock row. If not supported, all slices in the frame must begin at the start of a macroblock row (and hence each
slice must finish at the end of a macroblock row).  

- **VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_EXT** indicates that when a frame is encoded with multiple slices, the implementation allows encoding each slice with a different StdVideoEncodeH264SliceHeader::slice_type. If not supported, all slices of the frame must be encoded with the same slice_type which corresponds to the picture type of the frame. For example, all slices of a P-frame would be encoded as P-slices.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT** indicates support for using a B frame as L0 reference.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT** indicates support for using a B frame as L1 reference.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT** indicates support for specifying different QP values in the members of VkVideoEncodeH264QpEXT.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_EXT** indicates support for specifying different constant QP values for each slice.

- **VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_EXT** indicates support for generating prefix NALUs by setting VkVideoEncodeH264PictureInfoEXT::generatePrefixNalu to VK_TRUE.

```c
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264CapabilityFlagsEXT;
```

VkVideoEncodeH264CapabilityFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH264CapabilityFlagBitsEXT.

Bits which may be set in VkVideoEncodeH264CapabilitiesEXT::stdSyntaxFlags, indicating the capabilities related to the H.264 syntax elements, are:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264StdFlagBitsEXT {  
     VK_VIDEO_ENCODE_H264_STD SEPARATE_COLOR_PLANE FLAG_SET BIT EXT = 0x00000001,
     VK_VIDEO_ENCODE_H264_STD_QP PRIME Y ZERO TRANSFORM BYPASS FLAG_SET BIT EXT =
     0x00000002,
     VK_VIDEO_ENCODE_H264_STD SCALING MATRIX PRESENT FLAG_SET BIT EXT = 0x00000004,
     VK_VIDEO_ENCODE_H264_STD CHROMA_QP INDEX OFFSET_BIT EXT = 0x00000008,
     VK_VIDEO_ENCODE_H264_STD SECOND CHROMA_QP INDEX OFFSET_BIT EXT = 0x00000010,
     VK_VIDEO_ENCODE_H264_STD PIC INIT QP MINUS26_BIT EXT = 0x00000020,
     VK_VIDEO_ENCODE_H264_STD WEIGHTED PRED_FLAG_SET_BIT EXT = 0x00000040,
     VK_VIDEO_ENCODE_H264_STD WEIGHTED BIPRED IDC EXPLICIT_BIT EXT = 0x00000080,
     VK_VIDEO_ENCODE_H264_STD WEIGHTED BIPRED IDC IMPLICIT_BIT EXT = 0x00000100,
     VK_VIDEO_ENCODE_H264_STD TRANSFORM 8X8_MODE_FLAG SET_BIT_EXT = 0x00000200,
     VK_VIDEO_ENCODE_H264_STD DIRECT_SPATIAL MV PRED_FLAG_UNSET_BIT EXT = 0x00000400,
     VK_VIDEO_ENCODE_H264_STD ENTROPY CODING_MODE_FLAG_UNSET_BIT_EXT = 0x00000800,
     VK_VIDEO_ENCODE_H264_STD DEBLOCKING FILTER DISABLED_BIT_EXT = 0x00001000,
     VK_VIDEO_ENCODE_H264_STD DEBLOCKING FILTER ENABLED_BIT_EXT = 0x00010000,
};
```
• VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT indicates if enabling separate_colour_plane_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_QP_PRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_EXT indicates if enabling qpprime_y_zero_transform_bypass_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_EXT indicates if enabling seq_scaling_matrix_present_flag in StdVideoH264SpsFlags or pic_scaling_matrix_present_flag in StdVideoH264PpsFlags are supported.

• VK_VIDEO_ENCODE_H264_STD_CHROMA_QP_INDEX_OFFSET_BIT_EXT indicates if setting non-zero chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_EXT indicates if setting non-zero second_chroma_qp_index_offset in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_EXT indicates if setting non-zero pic_init_qp_minus26 in StdVideoH264PictureParameterSet is supported.

• VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT indicates if enabling weighted_pred_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_EXT indicates if using STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT from StdVideoH264WeightedBipredIdc is supported.

• VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_EXT indicates if enabling transform_8x8_mode_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_EXT indicates if disabling StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag is supported when it is present in the slice header.

• VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_UNSET_BIT_EXT indicates if CAVLC entropy coding is supported.

• VK_VIDEO_ENCODE_H264_STD_ENTROPY_CODING_MODE_FLAG_SET_BIT_EXT indicates if CABAC entropy coding is supported. An implementation must support at least one entropy coding mode.

• VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_EXT indicates if disabling direct_8x8_inference_flag in StdVideoH264SpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_EXT indicates if enabling constrained_intra_pred_flag in StdVideoH264PpsFlags is supported.

• VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_EXT indicates if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED from StdVideoH264DisableDeblockingFilterIdc is supported.

• VKVIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_EXT indicates if using STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_ENABLED from StdVideoH264DisableDeblockingFilterIdc is supported.
• **VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_PARTIAL_BIT_EXT** indicates if using **STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL** from StdVideoH264DisableDeblockingFilterIdc is supported. An implementation must support at least one deblocking filter mode.

```c
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264StdFlagsEXT;
```

**VkVideoEncodeH264StdFlagsEXT** is a bitmask type for setting a mask of zero or more **VkVideoEncodeH264StdFlagBitsEXT**.

### 42.14.3. H.264 Encode Quality Level Properties

When calling **vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR** with **pVideoProfile->videoCodecOperation** specified as **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_EXT**, the **VkVideoEncodeH264QualityLevelPropertiesEXT** structure can be included in the **pNext** chain of the **VkVideoEncodeQualityLevelPropertiesKHR** structure to retrieve additional video encode quality level properties specific to H.264 encoding.

The **VkVideoEncodeH264QualityLevelPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QualityLevelPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264RateControlFlagsEXT preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
    uint32_t preferredConsecutiveBFrameCount;
    uint32_t preferredTemporalLayerCount;
    VkVideoEncodeH264QpEXT preferredConstantQp;
    uint32_t preferredMaxL0ReferenceCount;
    uint32_t preferredMaxL1ReferenceCount;
    VkBool32 preferredStdEntropyCodingModeFlag;
} VkVideoEncodeH264QualityLevelPropertiesEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **preferredRateControlFlags** is a bitmask of **VkVideoEncodeH264RateControlFlagBitsEXT** values indicating the preferred flags to use for **VkVideoEncodeH264RateControlInfoEXT::flags**.
- **preferredGopFrameCount** indicates the preferred value to use for **VkVideoEncodeH264RateControlInfoEXT::gopFrameCount**.
- **preferredIdrPeriod** indicates the preferred value to use for **VkVideoEncodeH264RateControlInfoEXT::idrPeriod**.
- **preferredConsecutiveBFrameCount** indicates the preferred value to use for
VkVideoEncodeH264RateControlInfoEXT::consecutiveBFramCount.

- preferredTemporalLayerCount indicates the preferred value to use for VkVideoEncodeH264RateControlInfoEXT::temporalLayerCount.

- preferredConstantQp indicates the preferred values to use for VkVideoEncodeH264NaluSliceInfoEXT::constantQp for each picture type when using rate control mode VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR.

- preferredMaxL0ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L0.

- preferredMaxL1ReferenceCount indicates the preferred maximum number of reference pictures to use in the reference list L1.

- preferredStdEntropyCodingModeFlag indicates the preferred value to use for entropy_coding_mode_flag in StdVideoH264PpsFlags.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264QualityLevelPropertiesEXT-sType-sType

  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_EXT

42.14.4. H.264 Encode Session

Additional parameters can be specified when creating a video session with an H.264 encode profile by including an instance of the VkVideoEncodeH264SessionCreateInfoEXT structure in the pNext chain of VkVideoSessionCreateInfoKHR.

The VkVideoEncodeH264SessionCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkBool32 useMaxLevelIdc;
  StdVideoH264LevelIdc maxLevelIdc;
} VkVideoEncodeH264SessionCreateInfoEXT;
```

- sType is a VkStructureType value identifying this structure.

- pNext is NULL or a pointer to a structure extending this structure.

- useMaxLevelIdc indicates whether the value of maxLevelIdc should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the value of maxLevelIdc and uses the value of VkVideoEncodeH264CapabilitiesEXT::maxLevelIdc, as reported by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile.

- maxLevelIdc provides the upper bound on the H.264 level for the video bitstreams produced by the created video session.
42.14.5. Encoder Parameter Sets

To reduce parameter traffic during encoding, the encoder parameter set object supports storing H.264 SPS/PPS parameter sets that may be later referenced during encoding.

The `VkVideoEncodeH264SessionParametersCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH264SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxStdSPSCount** is the maximum number of SPS parameters that the `VkVideoSessionParametersKHR` can contain.
- **maxStdPPSCount** is the maximum number of PPS parameters that the `VkVideoSessionParametersKHR` can contain.
- **pParametersAddInfo** is `NULL` or a pointer to a `VkVideoEncodeH264SessionParametersAddInfoEXT` structure specifying H.264 parameters to add upon object creation.

The `VkVideoEncodeH264SessionParametersAddInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersAddInfoEXT {
    VkStructureType
    const void*
    uint32_t
    uint32_t
    const VkVideoEncodeH264SessionParametersAddInfoEXT*
} VkVideoEncodeH264SessionParametersAddInfoEXT;
```
VkStructureType sType;
const void* pNext;
uint32_t stdSPSCount;
const StdVideoH264SequenceParameterSet* pStdSPSs;
uint32_t stdPPSCount;
const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoEncodeH264SessionParametersAddInfoEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdSPSCount** is the number of SPS elements in the pStdSPSs. Its value **must** be less than or equal to the value of maxStdSPSCount.
- pStdSPSs is a pointer to an array of StdVideoH264SequenceParameterSet structures representing H.264 sequence parameter sets. Each element of the array **must** have a unique H.264 SPS ID.
- **stdPPSCount** is the number of PPS provided in pStdPPSs. Its value **must** be less than or equal to the value of maxStdPPSCount.
- pStdPPSs is a pointer to an array of StdVideoH264PictureParameterSet structures representing H.264 picture parameter sets. Each element of the array **must** have a unique H.264 SPS-PPS ID pair.

**Valid Usage**

- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-stdSPSCount-04837
  The values of stdSPSCount and stdPPSCount **must** be less than or equal to the values of maxStdSPSCount and maxStdPPSCount, respectively
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdSPSCount-04838
  When the maxStdSPSCount number of parameters of type StdVideoH264SequenceParameterSet in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add additional data to this object at this point
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-maxStdPPSCount-04839
  When the maxStdPPSCount number of parameters of type StdVideoH264PictureParameterSet in the Video Session Parameters object is reached, no additional parameters of that type can be added to the object. VK_ERROR_TOO_MANY_OBJECTS will be returned if an attempt is made to add additional data to this object at this point
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04840
  Each entry to be added **must** have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, SPS-PPS IDs
- VUID-VkVideoEncodeH264SessionParametersAddInfoEXT-None-04841
  Parameter entries that already exist in Video Session Parameters object with a particular SPS-PPS IDs **cannot** be replaced nor updated
When creating a new object using a Video Session Parameters as a template, the array's parameters with the same SPS-PPS IDs as the ones from the template take precedence.

SPS/PPS parameters must comply with the limits specified in `VkVideoSessionCreateInfoKHR` during Video Session creation.

Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_EXT`.
- If `pStdSPSs` is not `NULL`, `pStdSPSs` must be a valid pointer to an array of `stdSPSCount` `StdVideoH264SequenceParameterSet` values.
- If `pStdPPSs` is not `NULL`, `pStdPPSs` must be a valid pointer to an array of `stdPPSCount` `StdVideoH264PictureParameterSet` values.
- `stdSPSCount` must be greater than 0.
- `stdPPSCount` must be greater than 0.

The `VkVideoEncodeH264SessionParametersGetInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersGetInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH264SessionParametersGetInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **writeStdSPS** indicates whether the encoded H.264 sequence parameter set identified by `stdSPSId` is requested to be retrieved.
- **writeStdPPS** indicates whether the encoded H.264 picture parameter set identified by the pair constructed from `stdSPSId` and `stdPPSId` is requested to be retrieved.
- **stdSPSId** specifies the H.264 sequence parameter set ID used to identify the retrieved H.264 sequence and/or picture parameter set(s).
- **stdPPSId** specifies the H.264 picture parameter set ID used to identify the retrieved H.264 picture parameter set when **writeStdPPS** is set to **VK_TRUE**.

When this structure is specified in the **pNext** chain of the `VkVideoEncodeSessionParametersGetInfoKHR` structure passed to `vkGetEncodedVideoSessionParametersKHR`, the command will write encoded parameter data to the output buffer in the following order:

1. The H.264 sequence parameter set identified by **stdSPSId**, if **writeStdSPS** is set to **VK_TRUE**.
2. The H.264 picture parameter set identified by the pair constructed from **stdSPSId** and **stdPPSId**, if **writeStdPPS** is set to **VK_TRUE**.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264SessionParametersGetInfoEXT-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_EXT**

The `VkVideoEncodeH264SessionParametersFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersFeedbackInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasStdSPSOverrides;
    VkBool32 hasStdPPSOverrides;
} VkVideoEncodeH264SessionParametersFeedbackInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **hasStdSPSOverrides** indicates whether any of the parameters of the requested H.264 sequence parameter set, if one was requested via `VkVideoEncodeH264SessionParametersGetInfoEXT::writeStdSPS`, were overridden by the implementation.
- **hasStdPPSOverrides** indicates whether any of the parameters of the requested H.264 picture parameter set, if one was requested via `VkVideoEncodeH264SessionParametersGetInfoEXT::writeStdPPS`, were overridden by the implementation.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264SessionParametersFeedbackInfoEXT-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_EXT**
42.14.6. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH264PictureInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH264PictureInfoEXT` structure representing a frame encode operation is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264PictureInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t naluSliceEntryCount;
    const VkVideoEncodeH264NaluSliceInfoEXT* pNaluSliceEntries;
    const StdVideoEncodeH264PictureInfo* pStdPictureInfo;
    VkBool32 generatePrefixNalu;
} VkVideoEncodeH264PictureInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `naluSliceEntryCount` is the number of slice NALUs in the frame.
- `pNaluSliceEntries` is a pointer to an array of `naluSliceEntryCount` `VkVideoEncodeH264NaluSliceInfoEXT` structures specifying the division of the current picture into slices and the properties of these slices. This is an ordered sequence; the NALUs are generated consecutively in `VkVideoEncodeInfoKHR::dstBuffer` in the same order as in this array.
- `pStdPictureInfo` is a pointer to a `StdVideoEncodeH264PictureInfo` structure specifying the syntax and other codec-specific information from the H.264 specification associated with this picture. The information provided must reflect the decoded picture marking operations that are applicable to this frame.
- `generatePrefixNalu` controls whether prefix NALUs are generated before slice NALUs into the target bitstream.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH264PictureInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_EXT`

- `VUID-VkVideoEncodeH264PictureInfoEXT-pNaluSliceEntries-parameter`  
  `pNaluSliceEntries` must be a valid pointer to an array of `naluSliceEntryCount` valid `VkVideoEncodeH264NaluSliceInfoEXT` structures

- `VUID-VkVideoEncodeH264PictureInfoEXT-pStdPictureInfo-parameter`  
  `pStdPictureInfo` must be a valid pointer to a valid `StdVideoEncodeH264PictureInfo` value

- `VUID-VkVideoEncodeH264PictureInfoEXT-naluSliceEntryCount-arraylength`  
  `naluSliceEntryCount` must be greater than 0
The `VkVideoEncodeH264NaluSliceInfoEXT` structure representing a slice is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int32_t constantQp;
    const StdVideoEncodeH264SliceHeader* pStdSliceHeader;
} VkVideoEncodeH264NaluSliceInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantQp` is the QP to use for the slice if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `pStdSliceHeader` is a pointer to a `StdVideoEncodeH264SliceHeader` structure specifying the slice header for the current slice.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264NaluSliceInfoEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_EXT`
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pNext-pNext `pNext` must be `NULL`
- VUID-VkVideoEncodeH264NaluSliceInfoEXT-pStdSliceHeader-parameter `pStdSliceHeader` must be a valid pointer to a valid `StdVideoEncodeH264SliceHeader` value

The `VkVideoEncodeH264DpbSlotInfoEXT` structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoEncodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH264ReferenceInfo` structure specifying the syntax and other codec-specific information from the H.264 specification associated with this reference picture.
42.14.7. Rate control

The `VkVideoEncodeH264RateControlInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH264RateControlFlagsEXT flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t temporalLayerCount;
} VkVideoEncodeH264RateControlInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH264RateControlFlagBitsEXT` specifying H.264 rate control flags.
- `gopFrameCount` is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B-frames between I- and/or P-frames within the GOP.
- `temporalLayerCount` specifies the number of temporal layers enabled in the stream.

In order to provide H.264-specific stream rate control parameters, add a `VkVideoEncodeH264RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.
It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264RateControlInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_INFO_EXT`

- **VUID-VkVideoEncodeH264RateControlInfoEXT-flags-parameter**
  - `flags` must be a valid combination of `VkVideoEncodeH264RateControlFlagBitsEXT` values

- **VUID-VkVideoEncodeH264RateControlInfoEXT-flags-requiredbitsetmask**
  - `flags` must not be 0

Bits which **can** be set in `VkVideoEncodeH264RateControlInfoEXT::flags`, specifying H.264 rate control flags, are:

```c
// Provided by VK_EXT_video_encode_h264
typedef enum VkVideoEncodeH264RateControlFlagBitsEXT {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_EXT = 0x00000010,
} VkVideoEncodeH264RateControlFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT` specifies that rate control should attempt to produce an HRD compliant bitstream.

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_EXT` specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the `VkVideoEncodeH264RateControlInfoEXT` structure.

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT` specifies that the application intends to follow a flat reference pattern.

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic reference pattern.

- `VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic temporal layer pattern.

```c
// Provided by VK_EXT_video_encode_h264
typedef VkFlags VkVideoEncodeH264RateControlFlagsEXT;
```
VkVideoEncodeH264RateControlFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH264RateControlFlagBitsEXT.

The VkVideoEncodeH264RateControlLayerInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH264QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH264QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH264FrameSizeEXT maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useMinQp** indicates whether the values within minQp should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in minQp and chooses suitable values.
- **minQp** provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxQp** indicates whether the values within maxQp should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in maxQp and chooses suitable values.
- **maxQp** provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- **useMaxFrameSize** indicates whether the values within maxFrameSize should be used by the implementation.
- **maxFrameSize** provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the maxQp limit may prevent the implementation from respecting the maxFrameSize limit.

H.264-specific per-layer rate control parameters must be specified by adding a VkVideoEncodeH264RateControlLayerInfoEXT structure to the pNext chain of each VkVideoEncodeRateControlLayerInfoKHR structure in a call to vkCmdControlVideoCodingKHR command, when the command buffer context has an active video encode H.264 session.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264RateControlLayerInfoEXT-sType-sType
sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_EXT

• VUID-VkVideoEncodeH264RateControlLayerInfoEXT-minQp-parameter
  minQp must be a valid VkVideoEncodeH264QpEXT structure

• VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxQp-parameter
  maxQp must be a valid VkVideoEncodeH264QpEXT structure

• VUID-VkVideoEncodeH264RateControlLayerInfoEXT-maxFrameSize-parameter
  maxFrameSize must be a valid VkVideoEncodeH264FrameSizeEXT structure

The VkVideoEncodeH264QpEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264QpEXT {
  int32_t qpI;
  int32_t qpP;
  int32_t qpB;
} VkVideoEncodeH264QpEXT;
```

• qpI is the QP to be used for I-frames.
• qpP is the QP to be used for P-frames.
• qpB is the QP to be used for B-frames.

The VkVideoEncodeH264FrameSizeEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeEXT {
  uint32_t frameISize;
  uint32_t framePSize;
  uint32_t frameBSize;
} VkVideoEncodeH264FrameSizeEXT;
```

• frameISize is the size in bytes to be used for I-frames.
• framePSize is the size in bytes to be used for P-frames.
• frameBSize is the size in bytes to be used for B-frames.

The VkVideoEncodeH264GopRemainingFrameInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h264
typedef struct VkVideoEncodeH264GopRemainingFrameInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkBool32 useGopRemainingFrames;
  uint32_t gopRemainingI;
  uint32_t gopRemainingP;
  uint32_t gopRemainingB;
} VkVideoEncodeH264GopRemainingFrameInfoEXT;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

useGopRemainingFrames indicates whether the implementation's rate control algorithm should use the values specified in gopRemainingI, gopRemainingP, and gopRemainingB. If useGopRemainingFrames is VK_FALSE, then the values of gopRemainingI, gopRemainingP, and gopRemainingB are ignored.

gopRemainingI specifies the number of I-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

gopRemainingP specifies the number of P-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

UseGopRemainingB specifies the number of B-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

Setting useGopRemainingFrames to VK_TRUE and including this structure in the pNext chain of VkVideoEncodeInfoKHR is only mandatory if the VkVideoEncodeH264CapabilitiesEXT::requiresGopRemainingFrames reported for the used video profile is VK_TRUE. However, implementations may use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values may provide additional guidance for the implementation's rate control algorithm.

The VkVideoEncodeH264CapabilitiesEXT::prefersGopRemainingFrames capability is also used to indicate that the implementation's rate control algorithm may operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm may deviate from the one expected by the application.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264GopRemainingFrameInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_EXT

42.15. Encode H.265

The VK_EXT_video_encode_h265 extension adds H.265 codec-specific structures/types needed to support H.265 video encoding. Unless otherwise noted, all references to the H.265 specification are to the 2013 edition published by the ITU-T, dated April 2013. This specification is available at https://www.itu.int/rec/T-REC-H.265.
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

42.15.1. H.265 encode profile

An H.265 encode profile is specified by including the VkVideoEncodeH265ProfileInfoEXT structure in the pNext chain of the VkVideoProfileInfoKHR structure when VkVideoProfileInfoKHR::videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT.

The VkVideoEncodeH265ProfileInfoEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265ProfileInfoEXT {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoEncodeH265ProfileInfoEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- stdProfileIdc is a StdVideoH265ProfileIdc value specifying the H.265 codec profile IDC.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265ProfileInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PROFILE_INFO_EXT

42.15.2. Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT, the VkVideoEncodeH265CapabilitiesEXT structure must be included in the pNext chain of the VkVideoCapabilitiesKHR structure to retrieve more capabilities specific to H.265 video encoding.

The VkVideoEncodeH265CapabilitiesEXT structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265CapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH265CapabilityFlagsEXT flags;
    StdVideoH265LevelIdc maxLevelIdc;
    uint32_t maxSliceSegmentCount;
    VkExtent2D maxTiles;
    VkVideoEncodeH265CtbSizeFlagsEXT ctbSizes;
} VkVideoEncodeH265CapabilitiesEXT;
```
<table>
<thead>
<tr>

<td>Indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported. The reported value is 0 if encoding of B pictures is not supported.</td>
</tr>
<tr>
<td><code>maxSubLayerCount</code></td>
<td>Indicates the maximum number of H.265 sub-layers supported by the implementation.</td>
</tr>
<tr>
<td><code>expectDyadicTemporalSubLayerPattern</code></td>
<td>Indicates that the implementation’s rate control algorithms expect the application to use a dyadic temporal sub-layer pattern when encoding multiple temporal sub-layers.</td>
</tr>
<tr>
<td><code>minQp</code></td>
<td>Indicates the minimum QP value supported.</td>
</tr>
</tbody>
</table>
• maxQp indicates the maximum QP value supported.

• prefersGopRemainingFrames indicates that the implementation's rate control algorithm prefers the application to specify the number of frames of each type remaining in the current group of pictures.

• requiresGopRemainingFrames indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures.

• stdSyntaxFlags is a bitmask of VkVideoEncodeH265StdFlagBitsEXT indicating capabilities related to H.265 syntax elements.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH265CapabilitiesEXT-sType-sType

  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_EXT

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::flags indicating the supported H.265 encoding capabilities, are:

```
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_EXT = 0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_EXT = 0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_EXT = 0x00000200,
} VkVideoEncodeH265CapabilityFlagBitsEXT;
```

• VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_EXT indicates if the implementation guarantees generating a HRD compliant bitstream if nal_hrd_parameters_present_flag, vcl_hrd_parameters_present_flag, or sub_pic_hrd_params_present_flag are enabled in StdVideoH265HrdFlags, or vui_hrd_parameters_present_flag is enabled in StdVideoH265SpsVuiFlags.

• VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_EXT indicates that when weighted_pred_flag or weighted_bipred_flag in StdVideoH265PpsFlags are enabled, the implementation is able to internally decide syntax for pred_weight_table.

• VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_EXT indicates that each slice segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a
CTB row. If not supported, all slice segments in such a frame must begin at the start of a CTB row (and hence each slice segment must finish at the end of a CTB row). Also indicates that each slice segment in a frame with multiple slices per tile may begin or finish at any offset within the enclosing tile’s CTB row. If not supported, slice segments in such a frame must begin at the start of the enclosing tile’s CTB row (and hence each slice segment must finish at the end of the enclosing tile’s CTB row).

- **VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_EXT** indicates that when a frame is encoded with multiple slice segments, the implementation allows encoding each slice segment with a different StdVideoEncodeH265SliceSegmentHeader::slice_type. If not supported, all slice segments of the frame must be encoded with the same slice_type which corresponds to the picture type of the frame. For example, all slice segments of a P-frame would be encoded as P-slices.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_EXT** indicates support for using a B frame as L0 reference.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_EXT** indicates support for using a B frame as L1 reference.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_EXT** indicates support for specifying different QP values in the members of VkVideoEncodeH265QpEXT.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_EXT** indicates support for specifying different constant QP values for each slice segment.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_EXT** indicates if encoding multiple tiles per slice segment is supported. If not set, the implementation is only able to encode a single tile for each slice segment.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_EXT** indicates if encoding multiple slice segments per tile is supported. If not set, the implementation is only able to encode a single slice segment for each tile.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsEXT;
```

VkVideoEncodeH265CapabilityFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265CapabilityFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::stdSyntaxFlags, indicating the capabilities related to the H.265 syntax elements, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265StdFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_EXT = 0x00000010,
    VK_VIDEO_ENCODE_H265_STD_INIT_QP_MINUS26_BIT_EXT = 0x00000020,
};
```
VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT = 0x00000040,
VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_EXT = 0x00000080,
VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT = 0x00000100,
VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_EXT = 0x00000200,
VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_EXT = 0x00000400,
VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_EXT = 0x00000800,
VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_FLAG_SET_BIT_EXT = 0x00001000,
VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_EXT = 0x00002000,
VK_VIDEO_ENCODE_H265_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_EXT = 0x00004000,
VK_VIDEO_ENCODE_H265_STD_ENTROPY_CODING_SYNC_ENABLED_FLAG_SET_BIT_EXT = 0x00008000,
VK_VIDEO_ENCODE_H265_STD_DEBLOCKING_FILTER_OVERRIDE_ENABLED_FLAG_SET_BIT_EXT = 0x00010000,
VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_EXT = 0x00020000,
VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_EXT = 0x00040000,

} VkVideoEncodeH265StdFlagBitsEXT;

- **VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_EXT** indicates if enabling separate_colour_plane_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling sample_adaptive_offset_enabled_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_EXT** indicates if enabling scaling_list_enabled_flag and sps_scaling_list_data_present_flag in StdVideoH265SpsFlags, or enabling pps_scaling_list_data_present_flag in StdVideoH265PpsFlags are supported.
- **VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling pcm_enable_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling sps_temporal_mvp_enabled_flag in StdVideoH265SpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_INIT_QP_MINUS26_BIT_EXT** indicates if setting non-zero init_qp_minus26 in StdVideoH265PictureParameterSet is supported.
- **VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_EXT** indicates if enabling weighted_pred_flag in StdVideoH265PpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_EXT** indicates if enabling weighted_bipred_flag in StdVideoH265PpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_EXT** indicates if setting non-zero value for log2_parallel_merge_level_minus2 in StdVideoH265PictureParameterSet is supported.
- **VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling sign_data_hiding_enabled_flag in StdVideoH265PpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_EXT** indicates if enabling transform_skip_enabled_flag in StdVideoH265PpsFlags is supported.
- **VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_EXT** indicates if disabling
transform_skip_enabled_flag in StdVideoH265PpsFlags is supported. Implementations must report at least one of VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_EXT and VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_EXT as supported.

• VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_QP_OFFSETS_PRESENT_FLAG_SET_BIT_EXT indicates if enabling pps_slice_chroma_qp_offsets_present_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_EXT indicates if enabling transquant_bypass_enabled_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_CONstrained_INTRA_PRED_FLAG_SET_BIT_EXT indicates if enabling constrained_intra_pred_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_ENTROPY_CODING_SYNC_ENABLED_FLAG_SET_BIT_EXT indicates if enabling entropy_coding_sync_enabled_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_DEBLOCKING_FILTER_OVERRIDE_ENABLED_FLAG_SET_BIT_EXT indicates if enabling deblocking_filter_override_enabled_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_EXT indicates if enabling dependent_slice_segments_enabled_flag in StdVideoH265PpsFlags is supported.

• VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_EXT indicates if enabling dependent_slice_segment_flag in StdVideoEncodeH265SliceHeaderFlags is supported.

// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265StdFlagsEXT;

VkVideoEncodeH265StdFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265StdFlagBitsEXT.

// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265CtbSizeFlagsEXT;

VkVideoEncodeH265CtbSizeFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265CtbSizeFlagBitsEXT. Implementations must set at least one of VkVideoEncodeH265CtbSizeFlagBitsEXT.

Bits which may be set in VkVideoEncodeH265CapabilitiesEXT::ctbSizes, indicating the CTB sizes supported by the implementation, are:

// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT = 0x00000004,
} VkVideoEncodeH265CtbSizeFlagBitsEXT;

• VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_EXT specifies that a CTB size of 16x16 is supported.

• VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_EXT specifies that a CTB size of 32x32 is supported.
• **VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_EXT** specifies that a CTB size of 64x64 is supported.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsEXT;
```

**VkVideoEncodeH265TransformBlockSizeFlagsEXT** is a bitmask type for setting a mask of zero or more **VkVideoEncodeH265TransformBlockSizeFlagBitsEXT**. Implementations **must** set at least one of **VkVideoEncodeH265TransformBlockSizeFlagBitsEXT**.

Bits which **may** be set in **VkVideoEncodeH265CapabilitiesEXT::transformBlockSizes**, indicating the transform block sizes supported by the implementation, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsEXT;
```

• **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_EXT** specifies that a transform block size of 4x4 is supported.
• **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_EXT** specifies that a transform block size of 8x8 is supported.
• **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_EXT** specifies that a transform block size of 16x16 is supported.
• **VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_EXT** specifies that a transform block size of 32x32 is supported.

### 42.15.3. H.265 Encode Quality Level Properties

When calling **vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR** with **pVideoProfile->videoCodecOperation** specified as **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_EXT**, the **VkVideoEncodeH265QualityLevelPropertiesEXT** structure **can** be included in the **pNext** chain of the **VkVideoEncodeQualityLevelPropertiesKHR** structure to retrieve additional video encode quality level properties specific to H.265 encoding.

The **VkVideoEncodeH265QualityLevelPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265QualityLevelPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH265RateControlFlagsEXT preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
} VkVideoEncodeH265QualityLevelPropertiesEXT;
```
uint32_t preferredConsecutiveBFrameCount;
uint32_t preferredSubLayerCount;
VkVideoEncodeH265QpEXT preferredConstantQp;
uint32_t preferredMaxL0ReferenceCount;
uint32_t preferredMaxL1ReferenceCount;
}
VkVideoEncodeH265QualityLevelPropertiesEXT;

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `preferredRateControlFlags` is a bitmask of `VkVideoEncodeH265RateControlFlagBitsEXT` values indicating the preferred flags to use for `VkVideoEncodeH265RateControlInfoEXT::flags`.
• `preferredGopFrameCount` indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoEXT::gopFrameCount`.
• `preferredIdrPeriod` indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoEXT::idrPeriod`.
• `preferredConsecutiveBFrameCount` indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoEXT::consecutiveBFrameCount`.
• `preferredSubLayerCount` indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoEXT::subLayerCount`.
• `preferredConstantQp` indicates the preferred values to use for `VkVideoEncodeH265NaluSliceSegmentInfoEXT::constantQp` for each picture type when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
• `preferredMaxL0ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L0.
• `preferredMaxL1ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L1.

Valid Usage (Implicit)

• `VUID-VkVideoEncodeH265QualityLevelPropertiesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUALITY_LEVEL_PROPERTIES_EXT`

42.15.4. H.265 Encode Session

Additional parameters can be specified when creating a video session with an H.265 encode profile by including an instance of the `VkVideoEncodeH265SessionCreateInfoEXT` structure in the `pNext` chain of `VkVideoSessionCreateInfoKHR`.

The `VkVideoEncodeH265SessionCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionCreateInfoEXT {
    VkStructureType sType;
```
const void* pNext;
VkBool32 useMaxLevelIdc;
StdVideoH265LevelIdc maxLevelIdc;
} VkVideoEncodeH265SessionCreateInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **useMaxLevelIdc** indicates whether the value of `maxLevelIdc` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the value of `maxLevelIdc` and uses the value of `VkVideoEncodeH265CapabilitiesEXT::maxLevelIdc`, as reported by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile.
- **maxLevelIdc** provides the upper bound on the H.265 level for the video bitstreams produced by the created video session.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_EXT`

### 42.15.5. Encoder H.265 Video Session Parameters Object

When creating a Video Session Parameters object, add a `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure to the `pNext` chain of the `VkVideoSessionParametersCreateInfoKHR` structure passed to `vkCreateVideoSessionParametersKHR` in order to specify the H.265-specific video encoder session parameters.

The `VkVideoEncodeH265SessionParametersCreateInfoEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH265SessionParametersCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH265SessionParametersAddInfoEXT* pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxStdVPSCount** is the maximum number of entries of type `StdVideoH265VideoParameterSet` within `VkVideoSessionParametersKHR`.
- **maxStdSPSCount** is the maximum number of entries of type `StdVideoH265SequenceParameterSet`
Within `VkVideoSessionParametersKHR`:

- `maxStdPPSCount` is the maximum number of entries of type `StdVideoH265PictureParameterSet` within `VkVideoSessionParametersKHR`.

- `pParametersAddInfo` is `NULL` or a pointer to a `VkVideoEncodeH265SessionParametersAddInfoEXT` structure specifying the video session parameters to add upon creation of this object.

When a `VkVideoSessionParametersKHR` object contains `maxStdVPSCount` `StdVideoH265VideoParameterSet` entries, no additional `StdVideoH265VideoParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries.

When a `VkVideoSessionParametersKHR` object contains `maxStdSPSCount` `StdVideoH265SequenceParameterSet` entries, no additional `StdVideoH265SequenceParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries.

When a `VkVideoSessionParametersKHR` object contains `maxStdPPSCount` `StdVideoH265PictureParameterSet` entries, no additional `StdVideoH265PictureParameterSet` entries can be added to it, and `VK_ERROR_TOO_MANY_OBJECTS` will be returned if an attempt is made to add these entries.

---

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-sType-sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_EXT`

- `VUID-VkVideoEncodeH265SessionParametersCreateInfoEXT-pParametersAddInfo-parameter` If `pParametersAddInfo` is not `NULL`, `pParametersAddInfo` must be a valid pointer to a valid `VkVideoEncodeH265SessionParametersAddInfoEXT` structure

The `VkVideoEncodeH265SessionParametersAddInfoEXT` structure is defined as:

```c
typedef struct VkVideoEncodeH265SessionParametersAddInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoEncodeH265SessionParametersAddInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `stdVPSCount` is the number of VPS elements in `pStdVPSs`.

- `pStdVPSs` is a pointer to an array of `stdVPSCount StdVideoH265VideoParameterSet` structures
representing H.265 video parameter sets.

- **stdSPSCount** is the number of SPS elements in pStdSPSs.
- **pStdSPSs** is a pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet structures representing H.265 sequence parameter sets.
- **stdPPSCount** is the number of PPS elements in pStdPPSs.
- **pStdPPSs** is a pointer to an array of stdPPSCount StdVideoH265PictureParameterSet structures representing H.265 picture parameter sets.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_EXT

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-parameter
  If pStdVPSs is not NULL, pStdVPSs must be a valid pointer to an array of stdVPSCount StdVideoH265VideoParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-parameter
  If pStdSPSs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-parameter
  If pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH265PictureParameterSet values

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdVPSCount-arraylength
  stdVPSCount must be greater than 0

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdSPSCount-arraylength
  stdSPSCount must be greater than 0

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdPPSCount-arraylength
  stdPPSCount must be greater than 0

**Valid Usage**

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-stdVPSCount-06438
  The values of stdVPSCount, stdSPSCount and stdPPSCount must be less than or equal to the values of VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdVPSCount, VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdSPSCount, and VkVideoEncodeH265SessionParametersCreateInfoEXT::maxStdPPSCount, respectively

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdVPSs-06439
  Each StdVideoH265VideoParameterSet entry in pStdVPSs must have a unique H.265 VPS ID

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdSPSs-06440
  Each StdVideoH265SequenceParameterSet entry in pStdSPSs must have a unique H.265 VPS-SPS ID pair

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-pStdPPSs-06441
Each `StdVideoH265PictureParameterSet` entry in `pStdPPSs` must have a unique H.265 VPS-SPS-PPS ID tuple

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06442
  Each entry to be added must have a unique, to the rest of the parameter array entries and the existing parameters in the Video Session Parameters Object that is being updated, VPS-SPS-PPS IDs

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06443
  Parameter entries that already exist in Video Session Parameters object with a particular VPS-SPS-PPS IDs must not be replaced nor updated

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06444
  When creating a new object using a Video Session Parameters as a template, the array's parameters with the same VPS-SPS-PPS IDs as the ones from the template take precedence

- VUID-VkVideoEncodeH265SessionParametersAddInfoEXT-None-06445
  VPS/SPS/PPS parameters must comply with the limits specified in `VkVideoSessionCreateInfoKHR` during Video Session creation

The `VkVideoEncodeH265SessionParametersGetInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersGetInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdVPS;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdVPSId;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH265SessionParametersGetInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `writeStdVPS` indicates whether the encoded H.265 video parameter set identified by `stdVPSId` is requested to be retrieved.
- `writeStdSPS` indicates whether the encoded H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId` is requested to be retrieved.
- `writeStdPPS` indicates whether the encoded H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId` is requested to be retrieved.
- `stdVPSId` specifies the H.265 video parameter set ID used to identify the retrieved H.265 video, sequence, and/or picture parameter set(s).
- `stdSPSId` specifies the H.265 sequence parameter set ID used to identify the retrieved H.265 sequence and/or picture parameter set(s) when `writeStdSPS` and/or `writeStdPPS` is set to `VK_TRUE`
- `stdPPSId` specifies the H.265 picture parameter set ID used to identify the retrieved H.265 picture
parameter set when `writeStdPPS` is set to `VK_TRUE`.

When this structure is specified in the `pNext` chain of the `VkVideoEncodeSessionParametersGetInfoKHR` structure passed to `vkGetEncodedVideoSessionParametersKHR`, the command will write encoded parameter data to the output buffer in the following order:

1. The H.265 video parameter set identified by `stdVPSId`, if `writeStdVPS` is set to `VK_TRUE`.
2. The H.265 sequence parameter set identified by the pair constructed from `stdVPSId` and `stdSPSId`, if `writeStdSPS` is set to `VK_TRUE`.
3. The H.265 picture parameter set identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId`, if `writeStdPPS` is set to `VK_TRUE`.

```
Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersGetInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_GET_INFO_EXT

The `VkVideoEncodeH265SessionParametersFeedbackInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersFeedbackInfoEXT {
    VkStructureType sType;        // sType is a VkStructureType value identifying this structure.
    void* pNext;                  // pNext is NULL or a pointer to a structure extending this structure.
    VkBool32 hasStdVPSOverrides;   // hasStdVPSOverrides indicates whether any of the parameters of the requested H.265 video parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdVPS, were overridden by the implementation.
    VkBool32 hasStdSPSOverrides;   // hasStdSPSOverrides indicates whether any of the parameters of the requested H.265 sequence parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdSPS, were overridden by the implementation.
    VkBool32 hasStdPPSOverrides;   // hasStdPPSOverrides indicates whether any of the parameters of the requested H.265 picture parameter set, if one was requested via VkVideoEncodeH265SessionParametersGetInfoEXT::writeStdPPS, were overridden by the implementation.
} VkVideoEncodeH265SessionParametersFeedbackInfoEXT;
```

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersFeedbackInfoEXT-sType-sType
```
42.15.6. Frame Encoding

In order to encode a frame, add a `VkVideoEncodeH265PictureInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeInfoKHR` structure passed to the `vkCmdEncodeVideoKHR` command.

The `VkVideoEncodeH265PictureInfoEXT` structure representing a frame encode operation is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265PictureInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t naluSliceSegmentEntryCount;
    const VkVideoEncodeH265NaluSliceSegmentInfoEXT* pNaluSliceSegmentEntries;
    const StdVideoEncodeH265PictureInfo* pStdPictureInfo;
} VkVideoEncodeH265PictureInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **naluSliceSegmentEntryCount** is the number of slice segment NALUs in the frame.
- **pNaluSliceSegmentEntries** is a pointer to an array of `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures specifying the division of the current picture into slice segments and the properties of these slice segments.
- **pStdPictureInfo** is a pointer to a `StdVideoEncodeH265PictureInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this picture.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH265PictureInfoEXT-sType-sType`  
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PICTURE_INFO_EXT`

- `VUID-VkVideoEncodeH265PictureInfoEXT-pNaluSliceSegmentEntries-parameter`  
  **pNaluSliceSegmentEntries** must be a valid pointer to an array of `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structures

- `VUID-VkVideoEncodeH265PictureInfoEXT-pStdPictureInfo-parameter`  
  **pStdPictureInfo** must be a valid pointer to a valid `StdVideoEncodeH265PictureInfo` value

- `VUID-VkVideoEncodeH265PictureInfoEXT-naluSliceSegmentEntryCount-arraylength`  
  **naluSliceSegmentEntryCount** must be greater than 0

The `VkVideoEncodeH265NaluSliceSegmentInfoEXT` structure representing a slice segment is
defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265NaluSliceSegmentInfoEXT {
    VkStructureType sType;
    const void* pNext;
    int32_t constantQp;
    const StdVideoEncodeH265SliceSegmentHeader* pStdSliceSegmentHeader;
} VkVideoEncodeH265NaluSliceSegmentInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantQp` is the QP to use for the slice segment if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `pStdSliceSegmentHeader` is a pointer to a `StdVideoEncodeH265SliceSegmentHeader` structure specifying the slice segment header for the current slice segment.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_EXT`

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pNext
  
  `pNext` must be `NULL`

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoEXT-pStdSliceSegmentHeader-parameter
  
  `pStdSliceSegmentHeader` must be a valid pointer to a valid `StdVideoEncodeH265SliceSegmentHeader` value

The `VkVideoEncodeH265DpbSlotInfoEXT` structure, representing a reconstructed picture that is being used as a reference picture, is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265DpbSlotInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const StdVideoEncodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH265ReferenceInfo` structure specifying the syntax and other codec-specific information from the H.265 specification, associated with this reference picture.
42.15.7. Rate control

The `VkVideoEncodeH265RateControlInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH265RateControlFlagsEXT flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t subLayerCount;
} VkVideoEncodeH265RateControlInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH265RateControlFlagBitsEXT` specifying H.265 rate control flags.
- `gopFrameCount` is the number of frames contained within the group of pictures (GOP), starting from an intra frame and until the next intra frame. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames. If it is set to 0, the implementation chooses a suitable value. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
- `consecutiveBFrameCount` is the number of consecutive B-frames between I- and/or P-frames within the GOP.
- `subLayerCount` specifies the number of sub layers enabled in the stream.

In order to provide H.265-specific stream rate control parameters, add a `VkVideoEncodeH265RateControlInfoEXT` structure to the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command.

The parameters from this structure act as a guidance for implementations to apply various rate control heuristics.
It is possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided in `vkCmdEncodeVideoKHR`. Additionally, it is not required for the video session to be reset if the inferred picture type does not match the actual picture type.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH265RateControlInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_EXT`
- VUID-VkVideoEncodeH265RateControlInfoEXT-flags-parameter flags must be a valid combination of `VkVideoEncodeH265RateControlFlagBitsEXT` values
- VUID-VkVideoEncodeH265RateControlInfoEXT-flags-requiredbitmap flags must not be 0

Bits which can be set in `VkVideoEncodeH265RateControlInfoEXT::flags`, specifying H.265 rate control flags, are:

```c
// Provided by VK_EXT_video_encode_h265
typedef enum VkVideoEncodeH265RateControlFlagBitsEXT {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT = 0x00000001,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_EXT = 0x00000002,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT = 0x00000004,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT = 0x00000008,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_EXT = 0x00000010,
} VkVideoEncodeH265RateControlFlagBitsEXT;
```

- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_EXT` specifies that rate control should attempt to produce an HRD compliant bitstream.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_EXT` specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the `VkVideoEncodeH265RateControlInfoEXT` structure.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_EXT` specifies that the application intends to follow a flat reference pattern.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic reference pattern.
- `VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_EXT` specifies that the application intends to follow a dyadic temporal sub-layer pattern.

```c
// Provided by VK_EXT_video_encode_h265
typedef VkFlags VkVideoEncodeH265RateControlFlagsEXT;
```
VkVideoEncodeH265RateControlFlagsEXT is a bitmask type for setting a mask of zero or more VkVideoEncodeH265RateControlFlagBitsEXT.

The VkVideoEncodeH265RateControlLayerInfoEXT structure is defined as:

```
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265RateControlLayerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH265QpEXT minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH265QpEXT maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH265FrameSizeEXT maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `useMinQp` indicates whether the values within `minQp` should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in `minQp` and chooses suitable values.
- `minQp` provides the lower bound on the QP values for each picture type, to be used in rate control calculations.
- `useMaxQp` indicates whether the values within `maxQp` should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the values in `maxQp` and chooses suitable values.
- `maxQp` provides the upper bound on the QP values for each picture type, to be used in rate control calculations.
- `useMaxFrameSize` indicates whether the values within `maxFrameSize` should be used by the implementation.
- `maxFrameSize` provides the upper bound on the encoded frame size for each picture type. The implementation does not guarantee the encoded frame sizes will be within the specified limits, however these limits may be used as a guide in rate control calculations. If enabled and not set properly, the `maxQp` limit may prevent the implementation from respecting the `maxFrameSize` limit.

H.265-specific per-layer rate control parameters must be specified by adding a VkVideoEncodeH265RateControlLayerInfoEXT structure to the `pNext` chain of each VkVideoEncodeRateControlLayerInfoKHR structure in a call to `vkCmdControlVideoCodingKHR` command, when the command buffer context has an active video encode H.265 session.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-sType-sType
**sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_EXT`

- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-minQp-parameter
  - `minQp` must be a valid `VkVideoEncodeH265QpEXT` structure
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-maxQp-parameter
  - `maxQp` must be a valid `VkVideoEncodeH265QpEXT` structure
- VUID-VkVideoEncodeH265RateControlLayerInfoEXT-maxFrameSize-parameter
  - `maxFrameSize` must be a valid `VkVideoEncodeH265FrameSizeEXT` structure

The `VkVideoEncodeH265QpEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265QpEXT {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH265QpEXT;
```

- `qpI` is the QP to be used for I-frames.
- `qpP` is the QP to be used for P-frames.
- `qpB` is the QP to be used for B-frames.

The `VkVideoEncodeH265FrameSizeEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef structVkVideoEncodeH265FrameSizeEXT {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH265FrameSizeEXT;
```

- `frameISize` is the size in bytes to be used for I-frames.
- `framePSize` is the size in bytes to be used for P-frames.
- `frameBSize` is the size in bytes to be used for B-frames.

The `VkVideoEncodeH265GopRemainingFrameInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_video_encode_h265
typedef struct VkVideoEncodeH265GopRemainingFrameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useGopRemainingFrames;
    uint32_t gopRemainingI;
    uint32_t gopRemainingP;
    uint32_t gopRemainingB;
} VkVideoEncodeH265GopRemainingFrameInfoEXT;
```
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **useGopRemainingFrames** indicates whether the implementation's rate control algorithm should use the values specified in `gopRemainingI`, `gopRemainingP`, and `gopRemainingB`. If `useGopRemainingFrames` is VK_FALSE, then the values of `gopRemainingI`, `gopRemainingP`, and `gopRemainingB` are ignored.

• **gopRemainingI** specifies the number of I-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

• **gopRemainingP** specifies the number of P-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

• **gopRemainingB** specifies the number of B-frames the implementation's rate control algorithm should assume to be remaining in the GOP prior to executing the video encode operation.

Setting `useGopRemainingFrames` to VK_TRUE and including this structure in the `pNext` chain of `VkVideoEncodeInfoKHR` is only mandatory if the `VkVideoEncodeH265CapabilitiesEXT::requiresGopRemainingFrames` reported for the used video profile is VK_TRUE. However, implementations may use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values may provide additional guidance for the implementation's rate control algorithm.

The `VkVideoEncodeH265CapabilitiesEXT::prefersGopRemainingFrames` capability is also used to indicate that the implementation's rate control algorithm may operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm may deviate from the one expected by the application.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeH265GopRemainingFrameInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_GOP_REMAINING_FRAME_INFO_EXT`
Chapter 43. Optical Flow

43.1. Optical Flow Queues

VK_NV_optical_flow adds a optical flow queue type bit VK_QUEUE_OPTICALFLOW_BIT_NV to VkQueueFlagBits. Optical flow operations are supported by queues with an advertised queue capability of VK_QUEUE_OPTICALFLOW_BIT_NV. As in the case of other queue types, an application must use vkGetPhysicalDeviceQueueFamilyProperties to query whether the physical device has support for the Optical Flow Queue. When the implementation reports the VK_QUEUE_OPTICALFLOW_BIT_NV bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

43.2. Optical Flow Image Formats

To enumerate the supported image formats for a specific optical flow usage, call:

```c
// Provided by VK_NV_optical_flow
VkResult vkGetPhysicalDeviceOpticalFlowImageFormatsNV(
    VkPhysicalDevice physicalDevice,
    const VkOpticalFlowImageFormatInfoNV* pOpticalFlowImageFormatInfo,
    uint32_t* pFormatCount,
    VkOpticalFlowImageFormatPropertiesNV* pImageFormatProperties);
```

- `physicalDevice` is the physical device being queried.
- `pOpticalFlowImageFormatInfo` is a pointer to a VkOpticalFlowImageFormatInfoNV structure specifying the optical flow usage for which information is returned.
- `pFormatCount` is a pointer to an integer related to the number of optical flow properties available or queried, as described below.
- `pImageFormatProperties` is a pointer to an array of VkOpticalFlowImageFormatPropertiesNV structures in which supported formats and image parameters are returned.

If `pImageFormatProperties` is NULL, then the number of optical flow properties supported for the given `physicalDevice` is returned in `pFormatCount`. Otherwise, `pFormatCount` must point to a variable set by the user to the number of elements in the `pImageFormatProperties` array, and on return the variable is overwritten with the number of values actually written to `pImageFormatProperties`. If the value of `pFormatCount` is less than the number of optical flow properties supported, at most `pFormatCount` values will be written to `pImageFormatProperties`, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available values were returned. Before creating an image to be used as a optical flow frame, obtain the supported image creation parameters by querying with vkGetPhysicalDeviceFormatProperties2 and vkGetPhysicalDeviceImageFormatProperties2 using one of the reported formats and adding VkOpticalFlowImageFormatInfoNV to the `pNext` chain of VkPhysicalDeviceImageFormatInfo2. When querying the parameters with vkGetPhysicalDeviceImageFormatProperties2 for images used for optical flow operations, the VkOpticalFlowImageFormatInfoNV::usage field should contain one or more of the bits defined in VkOpticalFlowUsageFlagBitsNV.
Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-physicalDevice-parameter**
  *physicalDevice* must be a valid *VkPhysicalDevice* handle

  *pOpticalFlowImageFormatInfo* must be a valid pointer to a valid *VkOpticalFlowImageFormatInfoNV* structure

- **VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-pFormatCount-parameter**
  *pFormatCount* must be a valid pointer to a *uint32_t* value

  If the value referenced by *pFormatCount* is not 0, and *pImageFormatProperties* is not NULL, *pImageFormatProperties* must be a valid pointer to an array of *pFormatCount* *VkOpticalFlowImageFormatPropertiesNV* structures

Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_EXTENSION_NOT_PRESENT**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_FORMAT_NOT_SUPPORTED**

Note

- **VK_FORMAT_B8G8R8A8_UNORM**, **VK_FORMAT_R8_UNORM** and **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** are initially supported for images with optical usage **VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV**.

- **VK_FORMAT_R16G16_S10_5_NV** is initially supported for images with optical flow usage **VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV**, **VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV** and **VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV**.

- **VK_FORMAT_R8_UINT** and **VK_FORMAT_R32_UINT** are initially supported for images with optical flow usage **VK_OPTICAL_FLOW_USAGE_COST_BIT_NV**. It is recommended to use **VK_FORMAT_R8_UINT** because of the lower bandwidth.

The **VkOpticalFlowImageFormatInfoNV** structure is defined as:

```c
// Provided by VK_NV_optical_flow
```
typedef struct VkOpticalFlowImageFormatInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkOpticalFlowUsageFlagsNV usage;
} VkOpticalFlowImageFormatInfoNV;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkOpticalFlowUsageFlagBitsNV` describing the intended optical flow usage of the image.

### Valid Usage (Implicit)

- VUID-VkOpticalFlowImageFormatInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_INFO_NV`
- VUID-VkOpticalFlowImageFormatInfoNV-usage-parameter
  `usage` must be a valid combination of `VkOpticalFlowUsageFlagBitsNV` values
- VUID-VkOpticalFlowImageFormatInfoNV-usage-required bitmask
  `usage` must not be `0`

Bits which can be set in `VkOpticalFlowImageFormatInfoNV::usage`, controlling optical flow usage, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowUsageFlagBitsNV {
    VK_OPTICAL_FLOW_USAGE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_USAGE_COST_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV = 0x00000010,
} VkOpticalFlowUsageFlagBitsNV;
```

- `VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV` specifies that the image can be used as input or reference frame for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV` specifies that the image can be used as output flow vector map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV` specifies that the image can be used as hint flow vector map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_COST_BIT_NV` specifies that the image can be used as output cost map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV` specifies that the image can be used as global flow vector for an optical flow operation.
typedef VkFlags VkOpticalFlowUsageFlagsNV;

VkOpticalFlowUsageFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowUsageFlagBitsNV.

The VkOpticalFlowImageFormatPropertiesNV structure is defined as:

```c
typedef struct VkOpticalFlowImageFormatPropertiesNV {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
} VkOpticalFlowImageFormatPropertiesNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **format** is a VkFormat that specifies the format that can be used with the specified optical flow image usages.

### Valid Usage (Implicit)

- VUID-VkOpticalFlowImageFormatPropertiesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_PROPERTIES_NV
- VUID-VkOpticalFlowImageFormatPropertiesNV-pNext-pNext
  pNext must be NULL

### 43.3. Optical Flow Session

#### 43.3.1. Optical Flow Session Object

Optical flow session objects are abstracted and represented by VkOpticalFlowSessionNV handles:

```c
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkOpticalFlowSessionNV)
```

### Creating an Optical Flow Session

To create an optical flow session object, call:

```c
VkResult vkCreateOpticalFlowSessionNV(VkDevice device,
```

---

3219
const VkOpticalFlowSessionCreateInfoNV* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkOpticalFlowSessionNV* pSession);

- **device** is the logical device that creates the optical flow session object.
- **pCreateInfo** is a pointer to a `VkOpticalFlowSessionCreateInfoNV` structure containing parameters specifying the creation of the optical flow session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSession** is a pointer to a `VkOpticalFlowSessionNV` handle specifying the optical flow session object which will be created by this function when it returns **VK_SUCCESS**

### Valid Usage (Implicit)

- VUID-vkCreateOpticalFlowSessionNV-device-parameter
  - **device** must be a valid `VkDevice` handle
- VUID-vkCreateOpticalFlowSessionNV-pCreateInfo-parameter
  - **pCreateInfo** must be a valid pointer to a valid `VkOpticalFlowSessionCreateInfoNV` structure
- VUID-vkCreateOpticalFlowSessionNV-pAllocator-parameter
  - If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateOpticalFlowSessionNV-pSession-parameter
  - **pSession** must be a valid pointer to a `VkOpticalFlowSessionNV` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

The `VkOpticalFlowSessionCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t width;
    uint32_t height;
    VkFormat imageFormat;
    VkFormat flowVectorFormat;
} VkOpticalFlowSessionCreateInfoNV;
```
VkFormat costFormat;
VkOpticalFlowGridSizeFlagsNV outputGridSize;
VkOpticalFlowGridSizeFlagsNV hintGridSize;
VkOpticalFlowPerformanceLevelNV performanceLevel;
VkOpticalFlowSessionCreateFlagsNV flags;
}

VkOpticalFlowSessionCreateInfoNV

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **width** is the width in pixels of the input or reference frame to be bound to this optical flow session.
- **height** is the height in pixels of the input or reference frame to be bound to this optical flow session.
- **imageFormat** is the `VkFormat` of the input and reference frame to be bound to this optical flow session.
- **flowVectorFormat** is the `VkFormat` of the flow vector maps (output or hint) to be bound to this optical flow session.
- **costFormat** is the `VkFormat` of the cost maps to be bound to this optical flow session.
- **outputGridSize** is exactly one bit of `VkOpticalFlowGridSizeFlagsNV` specifying the grid size of the output flow and cost maps to be bound to this optical flow session. The size of the output flow and cost maps is determined by `VkOpticalFlowSessionCreateInfoNV::width` and `VkOpticalFlowSessionCreateInfoNV::height` divided by `VkOpticalFlowSessionCreateInfoNV::outputGridSize`.
- **hintGridSize** is one exactly bit of `VkOpticalFlowGridSizeFlagsNV` specifying the grid size of the hint flow vector maps to be bound to this optical flow session. The size of the hint maps is determined by `VkOpticalFlowSessionCreateInfoNV::width` and `VkOpticalFlowSessionCreateInfoNV::height` divided by `VkOpticalFlowSessionCreateInfoNV::hintGridSize`.
- **performanceLevel** is the `VkOpticalFlowPerformanceLevelNV` used for this optical flow session.
- **flags** are the `VkOpticalFlowSessionCreateFlagsNV` used for this optical flow session.

### Valid Usage

- **VUID-VkOpticalFlowSessionCreateInfoNV-width-07581**
  - `width` **must** be greater than or equal to `VkPhysicalDeviceOpticalFlowPropertiesNV::minWidth` and less than or equal to `VkPhysicalDeviceOpticalFlowPropertiesNV::maxWidth`.

- **VUID-VkOpticalFlowSessionCreateInfoNV-height-07582**
  - `height` **must** be greater than or equal to `VkPhysicalDeviceOpticalFlowPropertiesNV::minHeight` and less than or equal to `VkPhysicalDeviceOpticalFlowPropertiesNV::maxHeight`.

- **VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-07583**
  - `imageFormat` **must** be one of the formats returned by `vkGetPhysicalDeviceOpticalFlowImageFormatsNV` for `VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV`.

- **VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-07584**
flowVectorFormat must be one of the formats returned by `vkGetPhysicalDeviceOpticalFlowImageFormatsNV` for `VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV`.

- VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-07585
costFormat must be one of the formats returned by `vkGetPhysicalDeviceOpticalFlowImageFormatsNV` for `VK_OPTICAL_FLOW_USAGE_COST_BIT_NV` if `VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV` is set in flags.

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-07586
outputGridSize must be exactly one of the bits reported in `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes`.

- VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-07587
hintGridSize must be exactly one of the bits reported in `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes` if `VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV` is set in flags.

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07588
`VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV` must not be set in flags if `VkPhysicalDeviceOpticalFlowPropertiesNV::hintSupported` is `VK_FALSE`.

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07589
`VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV` must not be set in flags if `VkPhysicalDeviceOpticalFlowPropertiesNV::costSupported` is `VK_FALSE`.

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07590
`VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV` must not be set in flags if `VkPhysicalDeviceOpticalFlowPropertiesNV::globalFlowSupported` is `VK_FALSE`.

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07591
`VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV` must not be set in flags if `VkPhysicalDeviceOpticalFlowPropertiesNV::maxNumRegionsOfInterest` is 0.

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-07592
`VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV` must not be set in flags if `VkPhysicalDeviceOpticalFlowPropertiesNV::bidirectionalFlowSupported` is `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkOpticalFlowSessionCreateInfoNV-sType-sType
  sType must be `VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_INFO_NV`.

- VUID-VkOpticalFlowSessionCreateInfoNV-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of `VkOpticalFlowSessionCreatePrivateDataInfoNV`.

- VUID-VkOpticalFlowSessionCreateInfoNV-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-parameter
  imageFormat must be a valid `VkFormat` value.

- VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-parameter
  flowVectorFormat must be a valid `VkFormat` value.
**flowVectorFormat** must be a valid VkFormat value

- VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-parameter
  If costFormat is not 0, costFormat must be a valid VkFormat value

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-parameter
  outputGridSize must be a valid combination of VkOpticalFlowGridSizeFlagBitsNV values

- VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-requiredbitmask
  outputGridSize must not be 0

- VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-parameter
  hintGridSize must be a valid combination of VkOpticalFlowGridSizeFlagBitsNV values

- VUID-VkOpticalFlowSessionCreateInfoNV-performanceLevel-parameter
  If performanceLevel is not 0, performanceLevel must be a valid VkOpticalFlowPerformanceLevelNV value

- VUID-VkOpticalFlowSessionCreateInfoNV-flags-parameter
  flags must be a valid combination of VkOpticalFlowSessionCreateFlagBitsNV values

The **VkOpticalFlowSessionCreatePrivateDataInfoNV** structure is for NV internal use only and is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreatePrivateDataInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t id;
    uint32_t size;
    const void* pPrivateData;
} VkOpticalFlowSessionCreatePrivateDataInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **id** is an identifier for data which is passed at a memory location specified in VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData.
- **size** is the size of data in bytes which is passed at a memory location specified in VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData.
- **pPrivateData** is a pointer to NV internal data.

**Valid Usage (Implicit)**

- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_PRIVATE_DATA_INFO_NV

- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-pPrivateData-parameter
  pPrivateData must be a pointer value
Optical flow vectors are generated block-wise, one vector for each block of NxN pixels (referred to as grid).

Bits which can be set in `VkOpticalFlowSessionCreateInfoNV::outputGridSize` and `VkOpticalFlowSessionCreateInfoNV::hintGridSize`, or which are returned in `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes` and `VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes` controlling optical flow grid sizes, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowGridSizeFlagBitsNV {
    VK_OPTICAL_FLOW_GRID_SIZE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV = 0x00000008,
} VkOpticalFlowGridSizeFlagBitsNV;
```

- `VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV` specifies that grid is 1x1 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV` specifies that grid is 2x2 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV` specifies that grid is 4x4 pixel.
- `VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV` specifies that grid is 8x8 pixel.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowGridSizeFlagsNV;
```

`VkOpticalFlowGridSizeFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowGridSizeFlagBitsNV`.

Optical flow exposes performance levels which the user can choose based on the desired performance and quality requirement.

The optical flow performance level types are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowPerformanceLevelNV {
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV = 1,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV = 2,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV = 3,
} VkOpticalFlowPerformanceLevelNV;
```

- `VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV` is a level with slower performance but higher quality.
- `VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV` is a level with medium performance and medium quality.
- `VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV` is a level with faster performance but lower quality.
quality.

- **VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV** is a preset with higher performance but lower quality.

Bits which can be set in VkOpticalFlowSessionCreateInfoNV::flags, controlling optical flow session operations, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionCreateFlagBitsNV {
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV = 0x00000010,
} VkOpticalFlowSessionCreateFlagBitsNV;
```

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV** specifies that a VkImageView with external flow vectors will be used as hints in performing the motion search and must be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV** specifies that the cost for the forward flow is generated in a VkImageView which must be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV. Additionally, if VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV is also set, the cost for backward flow is generated in a VkImageView which must be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV. The cost is the confidence level of the flow vector for each grid in the frame. The Cost implies how (in)accurate the flow vector is. Higher cost value implies the flow vector to be less accurate and vice-versa.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV** specifies that a global flow vector is estimated from forward flow in a single pixel VkImageView which must be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV** specifies that regions of interest can be specified in VkOpticalFlowExecuteInfoNV.

- **VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV** specifies that backward flow is generated in addition to forward flow which is always generated.

VkOpticalFlowSessionCreateFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowSessionCreateFlagBitsNV.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowSessionCreateFlagsNV;
```

### Destroying an Optical Flow Session

To destroy a optical flow session object, call:

```c
3225
```
// Provided by VK_NV_optical_flow

void vkDestroyOpticalFlowSessionNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    const VkAllocationCallbacks* pAllocator);

- **device** is the device that was used for the creation of the optical flow session.
- **session** is the optical flow session to be destroyed.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage (Implicit)

- **VUID-vkDestroyOpticalFlowSessionNV-device-parameter**
  - device **must** be a valid `VkDevice` handle
- **VUID-vkDestroyOpticalFlowSessionNV-session-parameter**
  - session **must** be a valid `VkOpticalFlowSessionNV` handle
- **VUID-vkDestroyOpticalFlowSessionNV-pAllocator-parameter**
  - If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkDestroyOpticalFlowSessionNV-session-parent**
  - session **must** have been created, allocated, or retrieved from device

#### 43.3.2. Binding vulkan image views to an optical flow session

To bind a vulkan image to an optical flow session object, call:

// Provided by VK_NV_optical_flow

VkResult vkBindOpticalFlowSessionImageNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    VkOpticalFlowSessionBindingPointNV bindingPoint,
    VkImageView view,
    VkImageLayout layout);

- **device** is the device which owns the optical flow session object **session**.
- **session** is the optical flow session object to which the image view is to be bound.
- **bindingPoint** specifies the binding point `VkOpticalFlowSessionBindingPointNV` to which the image view is bound.
- **view** is a `VkImageView` to be bound.
- **layout** **must** specify the layout that the image subresources accessible from view will be in at the time the optical flow vectors are calculated with `vkCmdOpticalFlowExecuteNV` on a `VkDevice`. 
Valid Usage (Implicit)

- 
  VUID-vkBindOpticalFlowSessionImageNV-device-parameter
  
  
  device must be a valid VkDevice handle

- 
  VUID-vkBindOpticalFlowSessionImageNV-session-parameter
  
  session must be a valid VkOpticalFlowSessionNV handle

- 
  VUID-vkBindOpticalFlowSessionImageNV-bindingPoint-parameter
  
  bindingPoint must be a valid VkOpticalFlowSessionBindingPointNV value

- 
  VUID-vkBindOpticalFlowSessionImageNV-view-parameter
  
  If view is not VK_NULL_HANDLE, view must be a valid VkImageView handle

- 
  VUID-vkBindOpticalFlowSessionImageNV-layout-parameter
  
  layout must be a valid VkImageLayout value

- 
  VUID-vkBindOpticalFlowSessionImageNV-session-parent
  
  session must have been created, allocated, or retrieved from device

- 
  VUID-vkBindOpticalFlowSessionImageNV-view-parent
  
  If view is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success
- 
  VK_SUCCESS

Failure
- 
  VK_ERROR_OUT_OF_HOST_MEMORY
- 
  VK_ERROR_INITIALIZATION_FAILED

The optical flow session binding points are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionBindingPointNV {
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV = 1,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV = 2,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV = 3,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV = 4,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV = 5,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV = 6,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV = 7,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV = 8,
} VkOpticalFlowSessionBindingPointNV;
```

- 
  VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV specifies the binding point for the input frame.
*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV* specifies the binding point for the input reference frame.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV* specifies the binding point for the optional external hint flow vectors.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW VECTOR_NV* specifies the binding point for output flow vectors of default forward flow calculation.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW VECTOR_NV* specifies the binding point for the optional output flow vector map of optional backward flow calculation.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV* specifies the binding point for the optional output cost map of default forward flow calculation.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV* specifies the binding point for the optional output cost map of optional backward flow calculation.

*VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV* specifies the binding point for the optional global flow value of default forward flow calculation.

### 43.3.3. Optical Flow Execution

Default direction of flow estimation is forward which calculates the optical flow from input frame to reference frame. Optionally backward flow estimation can be additionally calculated. An output flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of input frame can be found at location \((x+V_x, y+V_y)\) in reference frame. A backward flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of reference frame can be found at location \((x+V_x, y+V_y)\) in input frame.

To calculate optical flow vectors from two input frames, call:

```c
// Provided by VK_NV_optical_flow
void vkCmdOpticalFlowExecuteNV(
    VkCommandBuffer commandBuffer,
    VkOpticalFlowSessionNV session,
    const VkOpticalFlowExecuteInfoNV* pExecuteInfo);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *session* is the optical flow session object on which this command is operating.
- *pExecuteInfo* Info is a pointer to a *VkOpticalFlowExecuteInfoNV*.

### Valid Usage (Implicit)

- VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-parameter *commandBuffer* must be a valid *VkCommandBuffer* handle
- VUID-vkCmdOpticalFlowExecuteNV-session-parameter *session* must be a valid *VkOpticalFlowSessionNV* handle
- VUID-vkCmdOpticalFlowExecuteNV-pExecuteInfo-parameter *pExecuteInfo* must be a valid pointer to a valid *VkOpticalFlowExecuteInfoNV* structure
• VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support optical flow operations

• VUID-vkCmdOpticalFlowExecuteNV-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdOpticalFlowExecuteNV-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdOpticalFlowExecuteNV-commonparent
  Both of commandBuffer, and session must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Opticalflow</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkOpticalFlowExecuteInfoNV structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowExecuteInfoNV {
    VkStructureType sType;
    void* pNext;
    VkOpticalFlowExecuteFlagsNV flags;
    uint32_t regionCount;
    const VkRect2D* pRegions;
} VkOpticalFlowExecuteInfoNV;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags are the VkOpticalFlowExecuteFlagsNV used for this command.
• regionCount is the number of regions of interest specified in pRegions.
• pRegions is a pointer to regionCount VkRect2D regions of interest.
Valid Usage

- **VUID-VkOpticalFlowExecuteInfoNV-regionCount-07593**
  - `regionCount` must be 0 if `VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV` was not set for `VkOpticalFlowSessionNV` on which this command is operating.

Valid Usage (Implicit)

- **VUID-VkOpticalFlowExecuteInfoNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_OPTICAL_FLOW_EXECUTE_INFO_NV`.

- **VUID-VkOpticalFlowExecuteInfoNV-pNext-pNext**
  - `pNext` must be `NULL`.

- **VUID-VkOpticalFlowExecuteInfoNV-flags-parameter**
  - `flags` must be a valid combination of `VkOpticalFlowExecuteFlagBitsNV` values.

- **VUID-VkOpticalFlowExecuteInfoNV-pRegions-parameter**
  - If `regionCount` is not 0, `pRegions` must be a valid pointer to an array of `regionCount` `VkRect2D` structures.

Bits which can be set in `VkOpticalFlowExecuteInfoNV::flags`, controlling optical flow execution, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowExecuteFlagBitsNV {
    VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV = 0x00000001,
} VkOpticalFlowExecuteFlagBitsNV;
```

- **`VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV`** specifies that temporal hints from previously generated flow vectors are not used. If temporal hints are enabled, optical flow vectors from previous `vkCmdOpticalFlowExecuteNV` call are automatically used as hints for the current `vkCmdOpticalFlowExecuteNV` call, to take advantage of temporal correlation in a video sequence. Temporal hints should be disabled if there is a-priori knowledge of no temporal correlation (e.g. a scene change, independent successive frame pairs).

`VkOpticalFlowExecuteFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowExecuteFlagBitsNV`:

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowExecuteFlagsNV;
```
Chapter 44. Extending Vulkan

New functionality may be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

### 44.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a *VkInstance* object as a parameter, are considered instance-level functionality.

Commands that dispatch from a *VkDevice* object or a child object of a *VkDevice*, or take any of them as a parameter, are considered device-level functionality. Types defined by a *device extension* are also considered device-level functionality.

Commands that dispatch from *VkPhysicalDevice*, or accept a *VkPhysicalDevice* object as a parameter, are considered either instance-level or device-level functionality depending if the functionality is specified by an *instance extension* or *device extension* respectively.

Additionally, commands that enumerate physical device properties are considered device-level functionality.

*Note*

Applications usually interface to Vulkan using a loader that implements only instance-level functionality, passing device-level functionality to implementations of the full Vulkan API on the system. In some circumstances, as these may be implemented independently, it is possible that the loader and device implementations on a given installation will support different versions. To allow for this and call out when it happens, the Vulkan specification enumerates device and instance level functionality separately - they have independent version queries.

*Note*

Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, *VK_KHR_get_physical_device_properties2* (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

### 44.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new
functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

44.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The **variant** indicates the variant of the Vulkan API supported by the implementation. This is always 0 for the Vulkan API.

A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Specification. As Vulkan uses variant 0, this change is fully backwards compatible with the previous version number format for Vulkan implementations. New version number macros have been added for this change and the old macros deprecated. For existing applications using the older format and macros, an implementation with non-zero variant will decode as a very high Vulkan version. The high version number should be detectable by applications performing suitable version checking.

The **major version** indicates a significant change in the API, which will encompass a wholly new version of the specification.

The **minor version** indicates the incorporation of new functionality into the core specification.

The **patch version** indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in Core Versions

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

**VK_API_VERSION_VARIANT** extracts the API variant number from a packed version number:

```c
// Provided by VK_VERSION_1_0
```
#define VK_API_VERSION_VARIANT(version) (((uint32_t)(version) >> 29U))

**VK_API_VERSION_MAJOR** extracts the API major version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22U) & 0x7FU)
```

**VK_VERSION_MAJOR** extracts the API major version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_MAJOR should be used instead.
#define VK_VERSION_MAJOR(version) ((uint32_t)(version) >> 22U)
```

**VK_API_VERSION_MINOR** extracts the API minor version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

**VK_VERSION_MINOR** extracts the API minor version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_MINOR should be used instead.
#define VK_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

**VK_API_VERSION_PATCH** extracts the API patch version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

**VK_VERSION_PATCH** extracts the API patch version number from a packed version number:

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_API_VERSION_PATCH should be used instead.
#define VK_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

**VK_MAKE_API_VERSION** constructs an API version number:

```c
// Provided by VK_VERSION_1_0
#define VK_MAKE_API_VERSION(variant, major, minor, patch) 
  (((uint32_t)(variant)) << 29U) | (((uint32_t)(major)) << 22U) | 
  (((uint32_t)(minor)) << 12U) | ((uint32_t)(patch))
```
• **variant** is the variant number.
• **major** is the major version number.
• **minor** is the minor version number.
• **patch** is the patch version number.

**VK_MAKE_VERSION** constructs an API version number.

```c
// Provided by VK_VERSION_1_0
// DEPRECATED: This define is deprecated. VK_MAKE_API_VERSION should be used instead.
#define VK_MAKE_VERSION(major, minor, patch) 
    (((uint32_t)(major)) << 22U) | (((uint32_t)(minor)) << 12U) |
    ((uint32_t)(patch))
```

• **major** is the major version number.
• **minor** is the minor version number.
• **patch** is the patch version number.

**VK_API_VERSION_1_0** returns the API version number for Vulkan 1.0.0.

```c
// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0) // Patch version should always be set to 0
```

**VK_API_VERSION_1_1** returns the API version number for Vulkan 1.1.0.

```c
// Provided by VK_VERSION_1_1
// Vulkan 1.1 version number
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0) // Patch version should always be set to 0
```

**VK_API_VERSION_1_2** returns the API version number for Vulkan 1.2.0.

```c
// Provided by VK_VERSION_1_2
// Vulkan 1.2 version number
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0) // Patch version should always be set to 0
```

**VK_API_VERSION_1_3** returns the API version number for Vulkan 1.3.0.

```c
// Provided by VK_VERSION_1_3
// Vulkan 1.3 version number
#define VK_API_VERSION_1_3 VK_MAKE_API_VERSION(0, 1, 3, 0) // Patch version should always be set to 0
```
44.2.2. Querying Version Support

The version of instance-level functionality can be queried by calling `vkEnumerateInstanceVersion`.

The version of device-level functionality can be queried by calling `vkGetPhysicalDeviceProperties` or `vkGetPhysicalDeviceProperties2`, and is returned in `VkPhysicalDeviceProperties::apiVersion`, encoded as described in Version Numbers.

44.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers can be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

**Note**

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

**Note**

Vulkan layers may wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

To query the available layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
    uint32_t* pPropertyCount,
    VkLayerProperties* pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is NULL, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually
written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to `vkEnumerateInstanceLayerProperties` with the same parameters may return different results, or retrieve different `pPropertyCount` values or `pProperties` contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

### Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter
  `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkLayerProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char    layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t specVersion;
    uint32_t implementationVersion;
    char    description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```

- `layerName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the `ppEnabledLayerNames` array passed in the `VkInstanceCreateInfo` structure to enable this layer for an instance.

- `specVersion` is the Vulkan version the layer was written to, encoded as described in Version Numbers.
• **implementationVersion** is the version of this layer. It is an integer, increasing with backward compatible changes.

• **description** is an array of **VK_MAX_DESCRIPTION_SIZE** char containing a null-terminated UTF-8 string which provides additional details that can be used by the application to identify the layer.

**VK_MAX_EXTENSION_NAME_SIZE** is the length in char values of an array containing a layer or extension name string, as returned in `VkLayerProperties::layerName`, `VkExtensionProperties::extensionName`, and other queries.

```c
#define VK_MAX_EXTENSION_NAME_SIZE 256U
```

**VK_MAX_DESCRIPTION_SIZE** is the length in char values of an array containing a string with additional descriptive information about a query, as returned in `VkLayerProperties::description` and other queries.

```c
#define VK_MAX_DESCRIPTION_SIZE 256U
```

To enable a layer, the name of the layer **should** be added to the **ppEnabledLayerNames** member of `VkInstanceCreateInfo` when creating a `VkInstance`.

Loader implementations may provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the **ppEnabledLayerNames** member of `VkInstanceCreateInfo` are *explicitly enabled*. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

### 44.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept `vkCreateDevice`. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there were no known device-only layers and no compelling reason to create one.

In order to maintain compatibility with implementations released prior to device-layer deprecation, applications should still enumerate and enable device layers. The behavior of `vkEnumerateDeviceLayerProperties` and valid usage of the **ppEnabledLayerNames** member of `VkDeviceCreateInfo` maximizes compatibility with applications written to work with the previous...
To enumerate device layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pPropertyCount, 
    VkLayerProperties* pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either `NULL` or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is `NULL`, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of layers enumerated by `vkEnumerateDeviceLayerProperties` must be exactly the sequence of layers enabled for the instance. The members of `VkLayerProperties` for each enumerated layer must be the same as the properties when the layer was enumerated by `vkEnumerateInstanceLayerProperties`.

**Note**
Due to platform details on Android, `vkEnumerateDeviceLayerProperties` may be called with `physicalDevice` equal to `NULL` during layer discovery. This behaviour will only be observed by layer implementations, and not the underlying Vulkan driver.

**Valid Usage (Implicit)**

- `VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter`  
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- `VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter`  
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are deprecated and their values **must** be ignored by implementations. However, for compatibility, only an empty list of layers or a list that exactly matches the sequence enabled at instance creation time are valid, and validation layers **should** issue diagnostics for other cases.

Regardless of the enabled layer list provided in `VkDeviceCreateInfo`, the sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

44.4. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in Command Function Pointers. Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

**Note**

To enable an instance extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`.

Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension,
other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the Valid Usage for Extensions section.

### 44.4.1. Instance Extensions

Instance extensions add new instance-level functionality to the API, outside of the core specification.

To query the available instance extensions, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `pLayerName` is either NULL or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is NULL, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is NULL, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.
Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
  If pLayerName is not NULL, pLayerName must be a null-terminated UTF-8 string

- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
  pPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
  If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkExtensionProperties structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

44.4.2. Device Extensions

Device extensions add new device-level functionality to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(
    VkPhysicalDevice physicalDevice,
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- physicalDevice is the physical device that will be queried.
- pLayerName is either NULL or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- pPropertyCount is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the vkEnumerateInstanceExtensionProperties::pPropertyCount parameter.
- pProperties is either NULL or a pointer to an array of VkExtensionProperties structures.
When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations **must** not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Implementations claiming support for the Roadmap 2022 profile **must** advertise the `VK_KHR_global_priority` extension in `pProperties`.

---

### Valid Usage (Implicit)

- VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter
  - If `pLayerName` is not `NULL`, `pLayerName` must be a null-terminated UTF-8 string
- VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter
  - `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkEnumerateDeviceExtensionProperties-pProperties-parameter
  - If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_LAYER_NOT_PRESENT`

The `VkExtensionProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
```
VkExtensionProperties

- `extensionName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the extension.
- `specVersion` is the version of this extension. It is an integer, incremented with backward compatible changes.

**Accessing device-level functionality from a VkPhysicalDevice**

Some device extensions also add support for physical-device-level functionality. Physical-device-level functionality can be used, if the required extension is supported as advertised by `vkEnumerateDeviceExtensionProperties` for a given ` VkPhysicalDevice`.

**Accessing device-level functionality from a VkDevice**

For commands that are dispatched from a `VkDevice`, or from a child object of a `VkDevice`, device extensions must be enabled in `vkCreateDevice`.

### 44.5. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any required extensions must also be enabled through the same API mechanisms when creating an instance with `vkCreateInstance` or a device with `vkCreateDevice`. Each extension which has such dependencies documents them in the appendix summarizing that extension.

If an extension is supported (as queried by `vkEnumerateInstanceExtensionProperties` or `vkEnumerateDeviceExtensionProperties`), then required extensions of that extension must also be supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by `vkCreateInstance` is considered to be unsupported, hence it must not be returned by `vkEnumerateDeviceExtensionProperties` for any `VkPhysicalDevice` child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been promoted to another extension or to a core API version, then as a general rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency may not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the Layers & Extensions and Core Revisions appendices.

**Note**

There is metadata in `vk.xml` describing some aspects of promotion, especially
requires, promotedto and deprecatedby attributes of <extension> tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency.

### 44.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.

#### 44.6.1. Core Versions

Each of the major, minor, and patch versions of the Vulkan specification provide different compatibility guarantees.

**Patch Versions**

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. VkVendorId).

The specification’s patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are fully compatible with each other - such that a valid application written against one will work with an implementation of another.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.</td>
</tr>
</tbody>
</table>

**Minor Versions**

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and may also include behavior changes and bug fixes. Core functionality may be deprecated in a minor version, but will not be obsoleted or removed.

The specification’s minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.
Specifications with a lower minor version are *backwards compatible* with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see Obsoletion for more information.

**Major Versions**

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of deprecated functionality, and the modification, addition, or replacement of other functionality.

The specification's major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realise significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

### 44.6.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is made obsolete by either a core version or another extension, which will be highlighted in the extension appendix.

**Promotion**

Extensions, or features of an extension, **may** be promoted to a new core version of the API, or a newer extension which an equal or greater number of implementors are in favour of.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
• Non-intrusive parameters changes
• Feature advertisement/enablement
• Combining structure parameters into larger structures
• Author ID suffixes changed or removed

**Note**

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavours to ensure that larger changes are marked as either deprecated or obsoleted as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will **not** be promoted.

**Note**

As a hypothetical example, if the VK_KHR_surface extension were promoted to part of a future core version, the `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` token defined by that extension would be promoted to `VK_COLOR_SPACE_SRGB_NONLINEAR`. However, the `VK_COLORSPACE_SRGB_NONLINEAR_KHR` token aliases `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`. The `VK_COLORSPACE_SRGB_NONLINEAR_KHR` would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

**Deprecation**

Extensions **may** be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

**Note**

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

**Obsoletion**

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension **must** not be used with the
extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

**Aliases**

When an extension is promoted or deprecated by a newer feature, some or all of its functionality may be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as *aliases* of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

*Note*

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply *typedef* the older aliases to the promoted types.

For promoted command aliases, however, there are two separate entry point definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling via either entry point definition will produce identical behavior within the bounds of the specification, and should still invoke the same entry point in the implementation. Debug tools may use separate entry points with different debug behavior; to write the appropriate command name to an output log, for instance.

**Special Use Extensions**

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

*Table 53. Extension Special Use Cases*

<table>
<thead>
<tr>
<th>Special Use</th>
<th>XML Tag</th>
<th>Full Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAD support</td>
<td>cadsupport</td>
<td>Extension is intended to support specialized functionality used by CAD/CAM apps.</td>
</tr>
<tr>
<td>D3D support</td>
<td>d3demulation</td>
<td>Extension is intended to support D3D emulation layers, and apps ported from D3D.</td>
</tr>
<tr>
<td>Developer tools</td>
<td>devtools</td>
<td>Extension is intended to support developer tools such as capture-replay libraries.</td>
</tr>
<tr>
<td>Debugging tools</td>
<td>debugging</td>
<td>Extension is intended for use by apps when debugging.</td>
</tr>
<tr>
<td>Special Use</td>
<td>XML Tag</td>
<td>Full Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>---------</td>
<td>----------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>OpenGL / ES support</td>
<td>glemulation</td>
<td>Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.</td>
</tr>
</tbody>
</table>

Special use extensions are identified in the metadata for each such extension in the Layers & Extensions appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in vk.xml with the short name in “XML Tag” column above, as described in the “API Extensions (extension tag)” section of the registry schema documentation.
Chapter 45. Features

Features describe functionality which is not supported on all implementations. Features are properties of the physical device. Features are optional, and must be explicitly enabled before use. Support for features is reported and enabled on a per-feature basis.

Note
Features are reported via the basic VkPhysicalDeviceFeatures structure, as well as the extensible structure VkPhysicalDeviceFeatures2, which was added in the VK_KHR_get_physical_device_properties2 extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension should introduce one new feature structure, if needed. This structure can be added to the pNext chain of the VkPhysicalDeviceFeatures2 structure.

For convenience, new core versions of Vulkan may introduce new unified feature structures for features promoted from extensions. At the same time, the extension’s original feature structure (if any) is also promoted to the core API, and is an alias of the extension’s structure. This results in multiple names for the same feature: in the original extension’s feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API must be reported consistently: either all must be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases must be supported.

Table 54. Extension Feature Aliases

<table>
<thead>
<tr>
<th>Extension</th>

To query supported features, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(  
    VkPhysicalDevice physicalDevice,  
    VkPhysicalDeviceFeatures* pFeatures);
```

- **physicalDevice** is the physical device from which to query the supported features.
- **pFeatures** is a pointer to a VkPhysicalDeviceFeatures structure in which the physical device
features are returned. For each feature, a value of `VK_TRUE` specifies that the feature is supported on this physical device, and `VK_FALSE` specifies that the feature is not supported.

---

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle`
- `VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter pFeatures must be a valid pointer to a VkPhysicalDeviceFeatures structure`

Fine-grained features used by a logical device must be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the `VkDeviceCreateInfo` structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is set to `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features can also be enabled by using the `VkPhysicalDeviceFeatures2` structure.

If an application wishes to enable all features supported by a device, it can simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application can set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a `VkPhysicalDeviceFeatures2` in the `pNext` chain of `VkDeviceCreateInfo` is equivalent to setting all members of the structure to `VK_FALSE`.

Note

Some features, such as `robustBufferAccess`, may incur a runtime performance cost. Application writers should carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFeatures2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```
• `physicalDevice` is the physical device from which to query the supported features.

• `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures2` structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. `vkGetPhysicalDeviceFeatures2` writes each member to a boolean value indicating whether that feature is supported.

### Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter
  `pFeatures` must be a valid pointer to a `VkPhysicalDeviceFeatures2` structure

The `VkPhysicalDeviceFeatures2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType sType;
    void*pNext;
    VkPhysicalDeviceFeatures features;
} VkPhysicalDeviceFeatures2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceFeatures2 VkPhysicalDeviceFeatures2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `features` is a `VkPhysicalDeviceFeatures` structure describing the fine-grained features of the Vulkan 1.0 API.

The `pNext` chain of this structure is used to extend the structure with features defined by extensions. This structure can be used in `vkGetPhysicalDeviceFeatures2` or can be included in the `pNext` chain of a `VkDeviceCreateInfo` structure, in which case it controls which features are enabled on the device in lieu of `pEnabledFeatures`.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceFeatures2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2`
The `VkPhysicalDeviceFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32 robustBufferAccess;
    VkBool32 fullDrawIndexUint32;
    VkBool32 imageCubeArray;
    VkBool32 independentBlend;
    VkBool32 geometryShader;
    VkBool32 tessellationShader;
    VkBool32 sampleRateShading;
    VkBool32 dualSrcBlend;
    VkBool32 logicOp;
    VkBool32 multiDrawIndirect;
    VkBool32 drawIndirectFirstInstance;
    VkBool32 depthClamp;
    VkBool32 depthBiasClamp;
    VkBool32 fillModeNonSolid;
    VkBool32 depthBounds;
    VkBool32 wideLines;
    VkBool32 largePoints;
    VkBool32 alphaToOne;
    VkBool32 multiViewport;
    VkBool32 samplerAnisotropy;
    VkBool32 textureCompressionETC2;
    VkBool32 textureCompressionASTC_LDR;
    VkBool32 textureCompressionBC;
    VkBool32 occlusionQueryPrecise;
    VkBool32 pipelineStatisticsQuery;
    VkBool32 vertexPipelineStoresAndAtomics;
    VkBool32 fragmentStoresAndAtomics;
    VkBool32 shaderTessellationAndGeometryPointSize;
    VkBool32 shaderImageGatherExtended;
    VkBool32 shaderStorageImageExtendedFormats;
    VkBool32 shaderStorageImageMultisample;
    VkBool32 shaderStorageImageReadWithoutFormat;
    VkBool32 shaderStorageImageWriteWithoutFormat;
    VkBool32 shaderUniformBufferArrayDynamicIndexing;
    VkBool32 shaderSampledImageArrayDynamicIndexing;
    VkBool32 shaderStorageBufferArrayDynamicIndexing;
    VkBool32 shaderStorageImageArrayDynamicIndexing;
    VkBool32 shaderClipDistance;
    VkBool32 shaderCullDistance;
    VkBool32 shaderFloat64;
    VkBool32 shaderInt64;
    VkBool32 shaderInt16;
    VkBool32 shaderResourceResidency;
    VkBool32 shaderResourceMinLod;
    VkBool32 sparseBinding;
    VkBool32 sparseResidencyBuffer;
};
```
This structure describes the following features:

- **robustBufferAccess** specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by `VkDescriptorBufferInfo::range`, `VkBufferViewCreateInfo::range`, or the size of the buffer). Out of bounds accesses must not cause application termination, and the effects of shader loads, stores, and atomics must conform to an implementation-dependent behavior as described below.

  - A buffer access is considered to be out of bounds if any of the following are true:

    - The pointer was formed by `OpImageTexelPointer` and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.

    - The pointer was not formed by `OpImageTexelPointer` and the object pointed to is not wholly contained within the bound range. This includes accesses performed via *variable pointers* where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to `OpConstantNull` are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked.

    - If the `VkPhysicalDeviceCooperativeMatrixFeaturesNV::cooperativeMatrixRobustBufferAccess` feature is not enabled, then accesses using `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` may not be bounds-checked.

    - If the `VkPhysicalDeviceCooperativeMatrixFeaturesKHR::cooperativeMatrixRobustBufferAccess` feature is not enabled, then accesses using `OpCooperativeMatrixLoadKHR` and `OpCooperativeMatrixStoreKHR` may not be bounds-checked.

  - If a SPIR-V `OpLoad` instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

- If **robustBufferAccess2** is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address may also be considered out of bounds.
If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load may be the value stored by the store instruction, even if the access is out of bounds. If the load is Volatile, then an out of bounds load must return the appropriate out of bounds value.

- **Accesses to descriptors written with a VK_NULL_HANDLE resource or view are not considered to be out of bounds.** Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.

- **Out-of-bounds buffer loads will return any of the following values:**
  - If the access is to a uniform buffer and robustBufferAccess2 is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustUniformBufferAccessSizeAlignment bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of robustUniformBufferAccessSizeAlignment bytes must return zero values.
  - If the access is to a storage buffer and robustBufferAccess2 is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes must return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes may be discarded.
  - Non-atomic accesses to storage buffers that are a multiple of 32 bits may be decomposed into 32-bit accesses that are individually bounds-checked.
  - If the access is to an index buffer and robustBufferAccess2 is enabled, zero values must be returned.
  - If the access is to a uniform texel buffer or storage texel buffer and robustBufferAccess2 is enabled, zero values must be returned, and then Conversion to RGBA is applied based on the buffer view's format.
  - Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
  - Zero values, or (0,0,0,x) vectors for vector reads where x is a valid value represented in the type of the vector components and may be any of:
    - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
    - 0.0 or 1.0, for floating-point components
  - Out-of-bounds writes may modify values within the memory range(s) bound to the buffer, but must not modify any other memory.
    - If robustBufferAccess2 is enabled, out of bounds writes must not modify any memory.
  - Out-of-bounds atomics may modify values within the memory range(s) bound to the buffer, but must not modify any other memory, and return an undefined value.
- If `robustBufferAccess2` is enabled, out of bounds atomics **must** not modify any memory, and return an undefined value.

- If `robustBufferAccess2` is disabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:
  - `vertexBufferRangeSize, if bindingStride == 0; or`
  - `(vertexBufferRangeSize - (vertexBufferRangeSize % bindingStride))`

  where `vertexBufferRangeSize` is the byte size of the memory range bound to the vertex buffer binding and `bindingStride` is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

- If a vertex input attribute is out of bounds, it will be assigned one of the following values:
  - Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.
  - Zero values, format converted according to the format of the attribute.
  - Zero values, or (0,0,0,x) vectors, as described above.

- If `robustBufferAccess2` is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.

- If a vertex input attribute is out of bounds, the raw data extracted are zero values, and missing G, B, or A components are filled with (0,0,1).

- If `robustBufferAccess` is not enabled, applications **must** not perform out of bounds accesses except under the conditions enabled by the `pipelineRobustness` feature.

- `fullDrawIndexUint32` specifies the full 32-bit range of indices is supported for indexed draw calls when using a `VkIndexType` of `VK_INDEX_TYPE_UINT32`. `maxDrawIndexedIndexValue` is the maximum index value that **may** be used (aside from the primitive restart index, which is always $2^{32} - 1$ when the `VkIndexType` is `VK_INDEX_TYPE_UINT32`). If this feature is supported, `maxDrawIndexedIndexValue` **must** be $2^{32} - 1$; otherwise it **must** be no smaller than $2^{24} - 1$. See `maxDrawIndexedIndexValue`.

- `imageCubeArray` specifies whether image views with a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` can be created, and that the corresponding `SampledCubeArray` and `ImageCubeArray` SPIR-V capabilities can be used in shader code.

- `independentBlend` specifies whether the `VkPipelineColorBlendAttachmentState` settings are controlled independently per-attachment. If this feature is not enabled, the `VkPipelineColorBlendAttachmentState` settings for all color attachments **must** be identical. Otherwise, a different `VkPipelineColorBlendAttachmentState` can be provided for each bound color attachment.

- `geometryShader` specifies whether geometry shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_GEOMETRY_BIT` and `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT` enum values **must** 
not be used. This also specifies whether shader modules can declare the Geometry capability.

- **tessellationShader** specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT`, `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`, and `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO` enum values must not be used. This also specifies whether shader modules can declare the Tessellation capability.

- **sampleRateShading** specifies whether Sample Shading and multisample interpolation are supported. If this feature is not enabled, the `sampleShadingEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure must be set to `VK_FALSE` and the `minSampleShading` member is ignored. This also specifies whether shader modules can declare the SampleRateShading capability.

- **dualSrcBlend** specifies whether blend operations which take two sources are supported. If this feature is not enabled, the `VK_BLEND_FACTOR_SRC1_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR`, `VK_BLEND_FACTOR_SRC1_ALPHA`, and `VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA` enum values must not be used as source or destination blending factors. See Dual-Source Blending.

- **logicOp** specifies whether logic operations are supported. If this feature is not enabled, the `logicOpEnable` member of the `VkPipelineColorBlendStateCreateInfo` structure must be set to `VK_FALSE`, and the `logicOp` member is ignored.

- **multiDrawIndirect** specifies whether multiple draw indirect is supported. If this feature is not enabled, the `drawCount` parameter to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands must be 0 or 1. The `maxDrawIndirectCount` member of the `VkPhysicalDeviceLimits` structure must also be 1 if this feature is not supported. See maxDrawIndirectCount.

- **drawIndirectFirstInstance** specifies whether indirect drawing calls support the `firstInstance` parameter. If this feature is not enabled, the `firstInstance` member of all `VkDrawIndirectCommand` and `VkDrawIndexedIndirectCommand` structures that are provided to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands must be 0.

- **depthClamp** specifies whether depth clamping is supported. If this feature is not enabled, the `depthClampEnable` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to `VK_FALSE`. Otherwise, setting `depthClampEnable` to `VK_TRUE` will enable depth clamping.

- **depthBiasClamp** specifies whether depth bias clamping is supported. If this feature is not enabled, the `depthBiasClamp` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to 0.0 unless the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state is enabled, and the `depthBiasClamp` parameter to `vkCmdSetDepthBias` must be set to 0.0.

- **fillModeNonSolid** specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the `VK_POLYGON_MODE_POINT` and `VK_POLYGON_MODE_LINE` enum values must not be used.

- **depthBounds** specifies whether depth bounds tests are supported. If this feature is not enabled, the `depthBoundsTestEnable` member of the `VkPipelineDepthStencilStateCreateInfo` structure must be set to `VK_FALSE`. When `depthBoundsTestEnable` is set to `VK_FALSE`, the `minDepthBounds` and `maxDepthBounds` members of the `VkPipelineDepthStencilStateCreateInfo` structure are ignored.

- **wideLines** specifies whether lines with width other than 1.0 are supported. If this feature is not
enabled, the `lineWidth` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to 1.0 unless the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state is enabled, and the `lineWidth` parameter to `vkCmdSetLineWidth` must be set to 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the `lineWidthRange` and `lineWidthGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- **largePoints** specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the `pointSizeRange` and `pointSizeGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- **alphaToOne** specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the `Multisample Coverage` fragment operation. If this feature is not enabled, then the `alphaToOneEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure must be set to `VK_FALSE`. Otherwise setting `alphaToOneEnable` to `VK_TRUE` will enable alpha-to-one behavior.

- **multiViewport** specifies whether more than one viewport is supported. If this feature is not enabled:
  - The `viewportCount` and `scissorCount` members of the `VkPipelineViewportStateCreateInfo` structure must be set to 1.
  - The `firstViewport` and `viewportCount` parameters to the `vkCmdSetViewport` command must be set to 0 and 1, respectively.
  - The `firstScissor` and `scissorCount` parameters to the `vkCmdSetScissor` command must be set to 0 and 1, respectively.
  - The `exclusiveScissorCount` member of the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure must be set to 0 or 1.
  - The `firstExclusiveScissor` and `exclusiveScissorCount` parameters to the `vkCmdSetExclusiveScissorNV` command must be set to 0 and 1, respectively.

- **samplerAnisotropy** specifies whether anisotropic filtering is supported. If this feature is not enabled, the `anisotropyEnable` member of the `VkSamplerCreateInfo` structure must be `VK_FALSE`.

- **textureCompressionETC2** specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11_SNORM_BLOCK`
• **VK_FORMAT_EAC_R11G11_UNORM_BLOCK**
  • **VK_FORMAT_EAC_R11G11_SNORM_BLOCK**

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

• `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

  • **VK_FORMAT_ASTC_4x4_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_4x4_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_5x4_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_5x4_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_5x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_5x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_6x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_6x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_6x6_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_6x6_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x6_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x6_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_8x8_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_8x8_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_10x5_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_10x5_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_10x6_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_10x6_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_10x8_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_10x8_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_10x10_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_10x10_SRGB_BLOCK**
  • **VK_FORMAT_ASTC_12x10_UNORM_BLOCK**
  • **VK_FORMAT_ASTC_12x10_SRGB_BLOCK**
• `VK_FORMAT_ASTC_12x12_UNORM_BLOCK`
• `VK_FORMAT_ASTC_12x12_SRGB_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `textureCompressionBC` specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_BC1_RGB_UNORM_BLOCK`
  - `VK_FORMAT_BC1_RGB_SRGB_BLOCK`
  - `VK_FORMAT_BC1_RGBA_UNORM_BLOCK`
  - `VK_FORMAT_BC1_RGBA_SRGB_BLOCK`
  - `VK_FORMAT_BC2_UNORM_BLOCK`
  - `VK_FORMAT_BC2_SRGB_BLOCK`
  - `VK_FORMAT_BC3_UNORM_BLOCK`
  - `VK_FORMAT_BC3_SRGB_BLOCK`
  - `VK_FORMAT_BC4_UNORM_BLOCK`
  - `VK_FORMAT_BC4_SNORM_BLOCK`
  - `VK_FORMAT_BC5_UNORM_BLOCK`
  - `VK_FORMAT_BC5_SNORM_BLOCK`
  - `VK_FORMAT_BC6H_UFLOAT_BLOCK`
  - `VK_FORMAT_BC6H_SFLOAT_BLOCK`
  - `VK_FORMAT_BC7_UNORM_BLOCK`
  - `VK_FORMAT_BC7_SRGB_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `occlusionQueryPrecise` specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a `VkQueryPool` by specifying the `queryType` of `VK_QUERY_TYPE_OCCLUSION` in the `VkQueryPoolCreateInfo` structure which is passed to `vkCreateQueryPool`. If this feature is enabled, queries of this type can enable `VK_QUERY_CONTROL_PRECISE_BIT` in the `flags` parameter to `vkCmdBeginQuery`. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and `VK_QUERY_CONTROL_PRECISE_BIT` is set, occlusion queries will report the actual number of samples passed.

- `pipelineStatisticsQuery` specifies whether the pipeline statistics queries are supported. If this
feature is not enabled, queries of type `VK_QUERY_TYPE_PIPELINE_STATISTICS` cannot be created, and none of the `VkQueryPipelineStatisticFlagBits` bits can be set in the `pipelineStatistics` member of the `VkQueryPoolCreateInfo` structure.

- **vertexPipelineStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **fragmentStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **shaderTessellationAndGeometryPointSize** specifies whether the `PointSize` built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the `PointSize` built-in decoration must not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules can declare the `TessellationPointSize` capability for tessellation control and evaluation shaders, or if the shader modules can declare the `GeometryPointSize` capability for geometry shaders. An implementation supporting this feature must also support one or both of the `tessellationShader` or `geometryShader` features.

- **shaderImageGatherExtended** specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules can declare the `ImageGatherExtended` capability.

- **shaderStorageImageExtendedFormats** specifies whether all the "storage image extended formats" below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` must be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_R16G16_SFLOAT`
  - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
  - `VK_FORMAT_R16_SFLOAT`
  - `VK_FORMAT_R16G16B16A16_UNORM`
  - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
  - `VK_FORMAT_R16G16B16A16_SNORM`
  - `VK_FORMAT_R16G16_SNORM`
  - `VK_FORMAT_R8G8_SNORM`
  - `VK_FORMAT_R16_SNORM`
  - `VK_FORMAT_R16G16B16A16_SNORM`
  - `VK_FORMAT_R16G16_SNORM`
  - `VK_FORMAT_R8G8_SNORM`
  - `VK_FORMAT_R16_SNORM`
VK_FORMAT_R8_SNORM
VK_FORMAT_R16G16_SINT
VK_FORMAT_R8G8_SINT
VK_FORMAT_R16_SINT
VK_FORMAT_R8_SINT
VK_FORMAT_A2B10G10R10_UINT_PACK32
VK_FORMAT_R16G16_UINT
VK_FORMAT_R8G8_UINT
VK_FORMAT_R16_UINT
VK_FORMAT_R8_UINT

Note

shaderStorageImageExtendedFormats feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via vkCreateDevice has no practical effect.

To query for additional properties, or if the feature is not supported, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties can be used to check for supported properties of individual formats, as usual rules allow.

VK_FORMAT_R32G32_UINT, VK_FORMAT_R32G32_SINT, and VK_FORMAT_R32G32_SFLOAT from StorageImageExtendedFormats SPIR-V capability, are already covered by core Vulkan mandatory format support.

• shaderStorageImageMultisample specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a usage that includes VK_IMAGE_USAGE_STORAGE_BIT must be created with samples equal to VK_SAMPLE_COUNT_1_BIT. This also specifies whether shader modules can declare the StorageImageMultisample and ImageMSArray capabilities.

• shaderStorageImageReadWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when reading. shaderStorageImageReadWithoutFormat applies only to formats listed in the storage without format list.

• shaderStorageImageWriteWithoutFormat specifies whether storage images and storage texel buffers require a format qualifier to be specified when writing. shaderStorageImageWriteWithoutFormat applies only to formats listed in the storage without format list.

• shaderUniformBufferArrayDynamicIndexing specifies whether arrays of uniform buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the UniformBufferArrayDynamicIndexing capability.
• **shaderSampledImageArrayDynamicIndexing** specifies whether arrays of samplers or sampled images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `SampledImageArrayDynamicIndexing` capability.

• **shaderStorageBufferArrayDynamicIndexing** specifies whether arrays of storage buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageBufferArrayDynamicIndexing` capability.

• **shaderStorageImageArrayDynamicIndexing** specifies whether arrays of storage images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageImageArrayDynamicIndexing` capability.

• **shaderClipDistance** specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the `ClipDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `ClipDistance` capability.

• **shaderCullDistance** specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the `CullDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `CullDistance` capability.

• **shaderFloat64** specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types must not be used in shader code. This also specifies whether shader modules can declare the `Float64` capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the `Float64` capability.

• **shaderInt64** specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int64` capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the `Int64` capability.

• **shaderInt16** specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int16` SPIR-V capability: Declaring and using 16-bit integers in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

• **shaderResourceResidency** specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the `OpImageSparse*` instructions must not be used in shader code. This also specifies whether shader modules can declare the `SparseResidency` capability. The feature requires at least one of the `sparseResidency*`
features to be supported.

- **shaderResourceMinLod** specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the `MinLod` image operand must not be used in shader code. This also specifies whether shader modules can declare the `MinLod` capability.

- **sparseBinding** specifies whether resource memory can be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory must be bound only on a per-object basis using the `vkBindBufferMemory` and `vkBindImageMemory` commands. In this case, buffers and images must not be created with `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in the `flags` member of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively. Otherwise resource memory can be managed as described in Sparse Resource Features.

- **sparseResidencyBuffer** specifies whether the device can access partially resident buffers. If this feature is not enabled, buffers must not be created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkBufferCreateInfo` structure.

- **sparseResidencyImage2D** specifies whether the device can access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_1_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.

- **sparseResidencyImage3D** specifies whether the device can access partially resident 3D images. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_3D` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.

- **sparseResidency2Samples** specifies whether the physical device can access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_2_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.

- **sparseResidency4Samples** specifies whether the physical device can access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_4_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.

- **sparseResidency8Samples** specifies whether the physical device can access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_8_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.

- **sparseResidency16Samples** specifies whether the physical device can access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_16_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the `flags` member of the `VkImageCreateInfo` structure.
• **sparseResidencyAliased** specifies whether the physical device can correctly access data aliased into multiple locations. If this feature is not enabled, the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` enum values must not be used in flags members of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively.

• **variableMultisampleRate** specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments must have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. If set to `VK_TRUE`, the implementation supports variable multisample rates in a subpass which uses no attachments. If set to `VK_FALSE`, then all pipelines bound in such a subpass must have the same multisample rate. This has no effect in situations where a subpass uses any attachments.

• **inheritedQueries** specifies whether a secondary command buffer may be executed while a query is active.

The `VkPhysicalDeviceVulkan11Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer16BitAccess;
    VkBool32 uniformAndStorageBuffer16BitAccess;
    VkBool32 storagePushConstant16;
    VkBool32 storageInputOutput16;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
    VkBool32 protectedMemory;
    VkBool32 samplerYcbcrConversion;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **storageBuffer16BitAccess** specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `StorageBuffer16BitAccess` capability.

• **uniformAndStorageBuffer16BitAccess** specifies whether objects in the `Uniform` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `UniformAndStorageBuffer16BitAccess` capability.
• **storagePushConstant16** specifies whether objects in the **PushConstant** storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the **StoragePushConstant16** capability.

• **storageInputOutput16** specifies whether objects in the **Input** and **Output** storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the **StorageInputOutput16** capability.

• **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass must always be zero.

• **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with **geometry shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.

• **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with **tessellation shaders**. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

• **variablePointersStorageBuffer** specifies whether the implementation supports the SPIR-V **VariablePointersStorageBuffer** capability. When this feature is not enabled, shader modules must not declare the **SPV_KHR_variable_pointers** extension or the **VariablePointersStorageBuffer** capability.

• **variablePointers** specifies whether the implementation supports the SPIR-V **VariablePointers** capability. When this feature is not enabled, shader modules must not declare the **VariablePointers** capability.

• **protectedMemory** specifies whether **protected memory** is supported.

• **samplerYcbcrConversion** specifies whether the implementation supports **sampler Y’CbCr conversion**. If **samplerYcbcrConversion** is **VK_FALSE**, sampler Y’C_bC_r conversion is not supported, and samplers using sampler Y’C_bC_r conversion must not be used.

• **shaderDrawParameters** specifies whether the implementation supports the SPIR-V **DrawParameters** capability. When this feature is not enabled, shader modules must not declare the **SPV_KHR_shader_draw_parameters** extension or the **DrawParameters** capability.

If the **VkPhysicalDeviceVulkan11Features** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceVulkan11Features** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Features-sType-sType
  - sType must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES**
The `VkPhysicalDeviceVulkan12Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 samplerMirrorClampToEdge;
    VkBool32 drawIndirectCount;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 shaderSharedInt64Atomics;
    VkBool32 shaderFloat16;
    VkBool32 shaderInt8;
    descriptorIndexing;
    VkBool32 shaderInputAttachmentArrayDynamicIndexing;
    VkBool32 shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32 shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32 shaderUniformBufferArrayNonUniformIndexing;
    VkBool32 shaderSampledImageArrayNonUniformIndexing;
    VkBool32 descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32 descriptorBindingSampledImageUpdateAfterBind;
    VkBool32 runtimeDescriptorArray;
    VkBool32 descriptorBindingVariableDescriptorCount;
    VkBool32 samplerFilterMinMax;
    VkBool32 scalarBlockLayout;
    VkBool32 imagelessFramebuffer;
    VkBool32 uniformBufferStandardLayout;
    VkBool32 shaderSubgroupExtendedTypes;
    VkBool32 separateDepthStencilLayouts;
    VkBool32 hostQueryReset;
    VkBool32 timelineSemaphore;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
    VkBool32 vulkanMemoryModel;
    VkBool32 vulkanMemoryModelDeviceScope;
    VkBool32 vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkan12Features;
```
VkBool32 shaderOutputViewportIndex;
VkBool32 shaderOutputLayer;
VkBool32 subgroupBroadcastDynamicId;
} VkPhysicalDeviceVulkan12Features;

This structure describes the following features:

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **samplerMirrorClampToEdge** indicates whether the implementation supports the VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE sampler address mode. If this feature is not enabled, the VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE sampler address mode must not be used.

• **drawIndirectCount** indicates whether the implementation supports the vkCmdDrawIndirectCount and vkCmdDrawIndexedIndirectCount functions. If this feature is not enabled, these functions must not be used.

• **storageBuffer8BitAccess** indicates whether objects in the StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer storage class with the Block decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the StorageBuffer8BitAccess capability.

• **uniformAndStorageBuffer8BitAccess** indicates whether objects in the Uniform storage class with the Block decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the UniformAndStorageBuffer8BitAccess capability.

• **storagePushConstant8** indicates whether objects in the PushConstant storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the StoragePushConstant8 capability.

• **shaderBufferInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.

• **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

• **shaderFloat16** indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules can declare the Float16 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Float16 SPIR-V capability: Declaring and using 16-bit floats in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

• **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the Int8 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int8 SPIR-V capability: Declaring and using 8-bit integers in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g.,
UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- **descriptorIndexing** indicates whether the implementation supports the minimum set of descriptor indexing features as described in the Feature Requirements section. Enabling the descriptorIndexing member when `vkCreateDevice` is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features must be enabled individually as needed by the application.

- **shaderInputAttachmentArrayDynamicIndexing** indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayDynamicIndexing` capability.

- **shaderUniformTexelBufferArrayDynamicIndexing** indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayDynamicIndexing` capability.

- **shaderStorageTexelBufferArrayDynamicIndexing** indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayDynamicIndexing` capability.

- **shaderUniformBufferArrayNonUniformIndexing** indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformBufferArrayNonUniformIndexing` capability.

- **shaderSampledImageArrayNonUniformIndexing** indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `SampledImageArrayNonUniformIndexing` capability.

- **shaderStorageBufferArrayNonUniformIndexing** indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageBufferArrayNonUniformIndexing` capability.

- **shaderStorageImageArrayNonUniformIndexing** indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled,
resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageImageArrayNonUniformIndexing capability.

- shaderInputAttachmentArrayNonUniformIndexing indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the InputAttachmentArrayNonUniformIndexing capability.

- shaderUniformTexelBufferArrayNonUniformIndexing indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformTexelBufferArrayNonUniformIndexing capability.

- shaderStorageTexelBufferArrayNonUniformIndexing indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageTexelBufferArrayNonUniformIndexing capability.

- descriptorBindingUniformBufferUpdateAfterBind indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER.

- descriptorBindingSampledImageUpdateAfterBind indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE.

- descriptorBindingStorageImageUpdateAfterBind indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.

- descriptorBindingStorageBufferUpdateAfterBind indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_BUFFER.

- descriptorBindingUniformTexelBufferUpdateAfterBind indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

- descriptorBindingStorageTexelBufferUpdateAfterBind indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.
supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

- descriptorBindingUpdateUnusedWhilePending indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT must not be used.

- descriptorBindingPartiallyBound indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT must not be used.

- descriptorBindingVariableDescriptorCount indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT must not be used.

- runtimeDescriptorArray indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

- samplerFilterMinmax indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the filterMinmaxSingleComponentFormats property minimum requirements. If this feature is not enabled, then VkSamplerReductionModeCreateInfo must only use VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

- scalarBlockLayout indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.

- imagelessFramebuffer indicates that the implementation supports specifying the image view for attachments at render pass begin time via VkRenderPassAttachmentBeginInfo.

- uniformBufferStandardLayout indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

- shaderSubgroupExtendedTypes is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

- separateDepthStencilLayouts indicates whether the implementation supports a VkImageMemoryBarrier for a depth/stencil image with only one of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT set, and whether VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL can be used.

- hostQueryReset indicates that the implementation supports resetting queries from the host with vkResetQueryPool.

- timelineSemaphore indicates whether semaphores created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE are supported.

- bufferDeviceAddress indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from vkGetBufferDeviceAddress.

- bufferDeviceAddressCaptureReplay indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
• bufferDeviceAddressMultiDevice indicates that the implementation supports the bufferDeviceAddress, rayTracingPipeline and rayQuery features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses must not be queried on a logical device created with more than one physical device.

• vulkanMemoryModel indicates whether shader modules can declare the VulkanMemoryModel capability.

• vulkanMemoryModelDeviceScope indicates whether the Vulkan Memory Model can use Device scope synchronization. This also indicates whether shader modules can declare the VulkanMemoryModelDeviceScope capability.

• vulkanMemoryModelAvailabilityVisibilityChains indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

• shaderOutputViewportIndex indicates whether the implementation supports the ShaderViewportIndex SPIR-V capability enabling variables decorated with the ViewportIndex built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the ViewportIndex built-in decoration must not be used on outputs in mesh, vertex or tessellation evaluation shaders.

• shaderOutputLayer indicates whether the implementation supports the ShaderLayer SPIR-V capability enabling variables decorated with the Layer built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the Layer built-in decoration must not be used on outputs in mesh, vertex or tessellation evaluation shaders.

• If subgroup broadcastDynamicId is VK_TRUE, the “Id” operand of OpGroupNonUniformBroadcast can be dynamically uniform within a subgroup, and the “Index” operand of OpGroupNonUniformQuadBroadcast can be dynamically uniform within the derivative group. If it is VK_FALSE, these operands must be constants.

If the VkPhysicalDeviceVulkan12Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan12Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceVulkan12Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL DEVICE_VULKAN_1_2_FEATURES

The VkPhysicalDeviceVulkan13Features structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceVulkan13Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
    VkBool32 pipelineCreationCacheControl;
} VkPhysicalDeviceVulkan13Features;
```
VkBool32 privateData;
VkBool32 shaderDemoteToHelperInvocation;
VkBool32 shaderTerminateInvocation;
VkBool32 subgroupSizeControl;
VkBool32 computeFullSubgroups;
VkBool32 synchronization2;
VkBool32 textureCompressionASTC_HDR;
VkBool32 shaderZeroInitializeWorkgroupMemory;
VkBool32 dynamicRendering;
VkBool32 shaderIntegerDotProduct;
VkBool32 maintenance4;
} VkPhysicalDeviceVulkan13Features;

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Invalid texels resulting from out of bounds image loads will be replaced as described in [Texel Replacement](#), with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.
- **inlineUniformBlock** indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK* must not be used.
- **descriptorBindingInlineUniformBlockUpdateAfterBind** indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, *VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT* must not be used with *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK*.
- **pipelineCreationCacheControl** indicates that the implementation supports:
  - The following can be used in *VkPipelineCreateInfo::flags*:
    - *VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT*
    - *VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT*
  - The following can be used in *VkPipelineCacheCreateInfo::flags*:
    - *VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT*
- **privateData** indicates whether the implementation supports private data. See [Private Data](#).
- **shaderDemoteToHelperInvocation** indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.
- **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that use the SPV_KHR_terminate_invocation extension.
- **subgroupSizeControl** indicates whether the implementation supports controlling shader subgroup sizes via the *VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT* flag and the *VkPipelineShaderStageRequiredSubgroupSizeCreateInfo* structure.
• **computeFullSubgroups** indicates whether the implementation supports requiring full subgroups in compute, mesh, or task shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.

• **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in `VK_KHR_synchronization2`.

• **textureCompressionASTC_HDR** indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

• **shaderZeroInitializeWorkgroupMemory** specifies whether the implementation supports initializing a variable in Workgroup storage class.

• **dynamicRendering** specifies that the implementation supports dynamic render pass instances using the `vkCmdBeginRendering` command.

• **shaderIntegerDotProduct** specifies whether shader modules can declare the `DotProductInputAllKHR`, `DotProductInput4x8BitKHR`, `DotProductInput4x8BitPackedKHR` and `DotProductKHR` capabilities.

• **maintenance4** indicates that the implementation supports the following:
  - The application may destroy a `VkPipelineLayout` object immediately after using it to create another object.
  - `LocalSizeId` can be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
Images created with identical creation parameters will always have the same alignment requirements.

The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.

Push constants do not have to be initialized before they are dynamically accessed.

The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the `VkPhysicalDeviceVulkan13Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan13Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceVulkan13Features-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_FEATURES`

The `VkPhysicalDeviceVariablePointersFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

or the equivalent

```c
// Provided by VK_VERSION_1_1
typedef VkPhysicalDeviceVariablePointersFeatures
VkPhysicalDeviceVariablePointersFeatures;
```

This structure describes the following features:
• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **variablePointersStorageBuffer** specifies whether the implementation supports the SPIR-V **VariablePointersStorageBuffer** capability. When this feature is not enabled, shader modules **must** not declare the **SPV_KHR_variable_pointers** extension or the **VariablePointersStorageBuffer** capability.

• **variablePointers** specifies whether the implementation supports the SPIR-V **VariablePointers** capability. When this feature is not enabled, shader modules **must** not declare the **VariablePointers** capability.

If the **VkPhysicalDeviceVariablePointersFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceVariablePointersFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

---

**Valid Usage**

- VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431
  If **variablePointers** is enabled then **variablePointersStorageBuffer** must also be enabled

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES**

The **VkPhysicalDeviceMultiviewFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewFeatures VkPhysicalDeviceMultiviewFeaturesKHR;
```

This structure describes the following features:
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass must always be zero.
- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.
- **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

If the `VkPhysicalDeviceMultiviewFeatures` structure is included in the **pNext** chain of the `VkPhysicalDevice Features2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiviewFeatures` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
  If **multiviewGeometryShader** is enabled then **multiview must also be enabled**

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
  If **multiviewTessellationShader** is enabled then **multiview must also be enabled**

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType
  **sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES**

The `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_atomic_float
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferFloat32Atomics;
    VkBool32 shaderBufferFloat32AtomicAdd;
    VkBool32 shaderBufferFloat64Atomics;
    VkBool32 shaderBufferFloat64AtomicAdd;
    VkBool32 shaderSharedFloat32Atomics;
    VkBool32 shaderSharedFloat32AtomicAdd;
    VkBool32 shaderSharedFloat64Atomics;
    VkBool32 shaderSharedFloat64AtomicAdd;
    VkBool32 shaderImageFloat32Atomics;
    VkBool32 shaderImageFloat32AtomicAdd;
    VkBool32 shaderImageFloat64Atomics;
    VkBool32 shaderImageFloat64AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **shaderBufferFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat32AtomicAdd** indicates whether shaders **can** perform 32-bit floating-point add atomic operations on storage buffers.
- **shaderBufferFloat64Atomics** indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat64AtomicAdd** indicates whether shaders **can** perform 64-bit floating-point add atomic operations on storage buffers.
- **shaderSharedFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat32AtomicAdd** indicates whether shaders **can** perform 32-bit floating-point add atomic operations on shared and payload memory.
- **shaderSharedFloat64Atomics** indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat64AtomicAdd** indicates whether shaders **can** perform 64-bit floating-point add atomic operations on shared and payload memory.
- **shaderImageFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic image operations.
- **shaderImageFloat32AtomicAdd** indicates whether shaders **can** perform 32-bit floating-point add atomic image operations.
- **sparseImageFloat32Atomics** indicates whether 32-bit floating-point load, store and exchange atomic operations **can** be used on sparse images.
- **sparseImageFloat32AtomicAdd** indicates whether 32-bit floating-point add atomic operations **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` **can** also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT**

The **VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_shader_atomic_float2
typedef struct VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            shaderBufferFloat16Atomics;
    VkBool32            shaderBufferFloat16AtomicAdd;
    VkBool32            shaderBufferFloat16AtomicMinMax;
    VkBool32            shaderBufferFloat32AtomicMinMax;
    VkBool32            shaderBufferFloat64AtomicMinMax;
    VkBool32            shaderSharedFloat16Atomics;
    VkBool32            shaderSharedFloat16AtomicAdd;
    VkBool32            shaderSharedFloat16AtomicMinMax;
    VkBool32            shaderSharedFloat32AtomicMinMax;
    VkBool32            shaderSharedFloat64AtomicMinMax;
    VkBool32            shaderImageFloat32AtomicMinMax;
    VkBool32            sparseImageFloat32AtomicMinMax;
} VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT;
```

This structure describes the following features:

- *sType* is a **VkStructureType** value identifying this structure.
- *pNext* is **NULL** or a pointer to a structure extending this structure.
- **shaderBufferFloat16Atomics** indicates whether shaders **can** perform 16-bit floating-point load, store, and exchange atomic operations on storage buffers.
- **shaderBufferFloat16AtomicAdd** indicates whether shaders **can** perform 16-bit floating-point add atomic operations on storage buffers.
- **shaderBufferFloat16AtomicMinMax** indicates whether shaders **can** perform 16-bit floating-point min and max atomic operations on storage buffers.
- **shaderBufferFloat32AtomicMinMax** indicates whether shaders **can** perform 32-bit floating-point min and max atomic operations on storage buffers.
- **shaderBufferFloat64AtomicMinMax** indicates whether shaders **can** perform 64-bit floating-point min and max atomic operations on storage buffers.
- **shaderSharedFloat16Atomics** indicates whether shaders **can** perform 16-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat16AtomicAdd** indicates whether shaders **can** perform 16-bit floating-point add atomic operations on shared and payload memory.
• `shaderSharedFloat16AtomicMinMax` indicates whether shaders can perform 16-bit floating-point min and max atomic operations on shared and payload memory.

• `shaderSharedFloat32AtomicMinMax` indicates whether shaders can perform 32-bit floating-point min and max atomic operations on shared and payload memory.

• `shaderSharedFloat64AtomicMinMax` indicates whether shaders can perform 64-bit floating-point min and max atomic operations on shared and payload memory.

• `shaderImageFloat32AtomicMinMax` indicates whether shaders can perform 32-bit floating-point min and max atomic image operations.

• `sparseImageFloat32AtomicMinMax` indicates whether 32-bit floating-point min and max atomic operations can be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT`

The `VkPhysicalDeviceShaderAtomicInt64Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderAtomicInt64Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferInt64Atomics;
    VkBool32 shaderSharedInt64Atomics;
} VkPhysicalDeviceShaderAtomicInt64Features;
```

or the equivalent

```c
// Provided by VK_KHR_shader_atomic_int64
typedef VkPhysicalDeviceShaderAtomicInt64Features
    VkPhysicalDeviceShaderAtomicInt64FeaturesKHR;
```

This structure describes the following features:

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `shaderBufferInt64Atomics` indicates whether shaders can perform 64-bit unsigned and signed
integer atomic operations on buffers.

- **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

If the `VkPhysicalDeviceShaderAtomicInt64Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES`.

The `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderImageInt64Atomics;
    VkBool32 sparseImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderImageInt64Atomics** indicates whether shaders can support 64-bit unsigned and signed integer atomic operations on images.
- **sparseImageInt64Atomics** indicates whether 64-bit integer atomics can be used on sparse images.

If the `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`.

3280
The `VkPhysicalDevice8BitStorageFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_8bit_storage
typedef VkPhysicalDevice8BitStorageFeatures VkPhysicalDevice8BitStorageFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StorageBuffer8BitAccess` capability.
- **uniformAndStorageBuffer8BitAccess** indicates whether objects in the `Uniform` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `UniformAndStorageBuffer8BitAccess` capability.
- **storagePushConstant8** indicates whether objects in the `PushConstant` storage class **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the `StoragePushConstant8` capability.

If the `VkPhysicalDevice8BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice8BitStorageFeatures` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType
  
  **sType** **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES`

The `VkPhysicalDevice16BitStorageFeatures` structure is defined as:
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **storageBuffer16BitAccess** specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `StorageBuffer16BitAccess` capability.

- **uniformAndStorageBuffer16BitAccess** specifies whether objects in the `Uniform` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `UniformAndStorageBuffer16BitAccess` capability.

- **storagePushConstant16** specifies whether objects in the `PushConstant` storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `StoragePushConstant16` capability.

- **storageInputOutput16** specifies whether objects in the `Input` and `Output` storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `StorageInputOutput16` capability.

If the `VkPhysicalDevice16BitStorageFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevice16BitStorageFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES

The VkPhysicalDeviceShaderFloat16Int8Features structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderFloat16;
    VkBool32 shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

or the equivalent

```c
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
    VkPhysicalDeviceShaderFloat16Int8FeaturesKHR;
```

```c
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
    VkPhysicalDeviceFloat16Int8FeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `shaderFloat16` indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules can declare the Float16 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Float16 SPIR-V capability: Declaring and using 16-bit floats in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.
- `shaderInt8` indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the Int8 capability. However, this only enables a subset of the storage classes that SPIR-V allows for the Int8 SPIR-V capability: Declaring and using 8-bit integers in the Private, Workgroup (for non-Block variables), and Function storage classes is enabled, while declaring them in the interface storage classes (e.g., UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

If the VkPhysicalDeviceShaderFloat16Int8Features structure is included in the `pNext` chain of the
VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderFloat16Int8Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES

The VkPhysicalDeviceShaderClockFeaturesKHR structure is defined as:

// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupClock;
    VkBool32 shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- shaderSubgroupClock indicates whether shaders can perform Subgroup scoped clock reads.
- shaderDeviceClock indicates whether shaders can perform Device scoped clock reads.

If the VkPhysicalDeviceShaderClockFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderClockFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR

The VkPhysicalDeviceSamplerYcbcrConversionFeatures structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkPhysicalDeviceSamplerYcbcrConversionFeatures
    VkPhysicalDeviceSamplerYcbcrConversionFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **samplerYcbcrConversion** specifies whether the implementation supports sampler Y’C_bC_r conversion. If `samplerYcbcrConversion` is `VK_FALSE`, sampler Y’C_bC_r conversion is not supported, and samplers using sampler Y’C_bC_r conversion must not be used.

If the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSamplerYcbcrConversionFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES`

The `VkPhysicalDeviceProtectedMemoryFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **protectedMemory** specifies whether protected memory is supported.

If the `VkPhysicalDeviceProtectedMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to
indicate whether each corresponding feature is supported. 

VkPhysicalDeviceProtectedMemoryFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES

The VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT structure is defined as:

```c
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **advancedBlendCoherentOperations** specifies whether blending using advanced blend operations is guaranteed to execute atomically and in primitive order. If this is VK_TRUE, VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT is treated the same as VK_ACCESS_COLOR_ATTACHMENT_READ_BIT, and advanced blending needs no additional synchronization over basic blending. If this is VK_FALSE, then memory dependencies are required to guarantee order between two advanced blending operations that occur on the same sample.

If the VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT

The VkPhysicalDeviceConditionalRenderingFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkPhysicalDeviceConditionalRenderingFeaturesEXT {
    
} VkPhysicalDeviceConditionalRenderingFeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **conditionalRendering** specifies whether conditional rendering is supported.
- **inheritedConditionalRendering** specifies whether a secondary command buffer can be executed while conditional rendering is active in the primary command buffer.

If the `VkPhysicalDeviceConditionalRenderingFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceConditionalRenderingFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceConditionalRenderingFeaturesEXT-sType-sType**
  
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT`

The `VkPhysicalDeviceShaderDrawParametersFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceShaderDrawParametersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceShaderDrawParametersFeatures;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderDrawParameters** specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules must not declare the
The `VkPhysicalDeviceShaderDrawParametersFeatures` extension or the `DrawParameters` capability.

If the `VkPhysicalDeviceShaderDrawParametersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDrawParametersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDrawParametersFeatures-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETERS_FEATURES`.

The `VkPhysicalDeviceMeshShaderFeaturesNV` structure is defined as:

```
// Provided by VK_NV_mesh_shader
typedef struct VkPhysicalDeviceMeshShaderFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 taskShader;
    VkBool32 meshShader;
} VkPhysicalDeviceMeshShaderFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `taskShader` specifies whether task shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TASK_BIT_NV` and `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV` enum values must not be used.
- `meshShader` specifies whether mesh shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_MESH_BIT_NV` and `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` enum values must not be used.

If the `VkPhysicalDeviceMeshShaderFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMeshShaderFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMeshShaderFeaturesNV-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_NV`.

The `VkPhysicalDeviceMeshShaderFeaturesEXT` structure is defined as:

3288
// Provided by VK_EXT_mesh_shader

typedef struct VkPhysicalDeviceMeshShaderFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 taskShader;
    VkBool32 meshShader;
    VkBool32 multiviewMeshShader;
    VkBool32 primitiveFragmentShadingRateMeshShader;
    VkBool32 meshShaderQueries;
} VkPhysicalDeviceMeshShaderFeaturesEXT;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **taskShader** specifies whether task shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TASK_BIT_EXT` and `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT` enum values must not be used.

• **meshShader** specifies whether mesh shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_MESH_BIT_EXT` and `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT` enum values must not be used.

• **multiviewMeshShader** specifies whether the implementation supports multiview rendering within a render pass, with mesh shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a mesh shader.

• **primitiveFragmentShadingRateMeshShader** indicates that the implementation supports the primitive fragment shading rate in mesh shaders.

• **meshShaderQueries** indicates that the implementation supports creating query pools using the `VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT` query type and statistic queries containing the `VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT` and `VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT` flags

If the `VkPhysicalDeviceMeshShaderFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMeshShaderFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The corresponding features of the `VkPhysicalDeviceMeshShaderFeaturesNV` structure must match those in `VkPhysicalDeviceMeshShaderFeaturesEXT`.

### Valid Usage

• **VUID-VkPhysicalDeviceMeshShaderFeaturesEXT-multiviewMeshShader-07032**
  If multiviewMeshShader is enabled then `VkPhysicalDeviceMultiviewFeaturesKHR::multiview` must also be enabled

• **VUID-VkPhysicalDeviceMeshShaderFeaturesEXT-primitiveFragmentShadingRateMeshShader-07033**
  If `primitiveFragmentShadingRateMeshShader` is enabled then
The `VkPhysicalDeviceMemoryDecompressionFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceMemoryDecompressionFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 memoryDecompression;
} VkPhysicalDeviceMemoryDecompressionFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryDecompression` indicates whether memory decompression is supported.

If the `VkPhysicalDeviceMemoryDecompressionFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMemoryDecompressionFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceDescriptorIndexingFeatures` structure is defined as:

```c
typedef struct VkPhysicalDeviceDescriptorIndexingFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderInputAttachmentArrayDynamicIndexing;
    VkBool32 shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32 shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32 shaderUniformBufferArrayNonUniformIndexing;
} VkPhysicalDeviceDescriptorIndexingFeatures;
```
VkBool32 shaderSampledImageArrayNonUniformIndexing;
VkBool32 shaderStorageBufferArrayNonUniformIndexing;
VkBool32 shaderStorageImageArrayNonUniformIndexing;
VkBool32 shaderInputAttachmentArrayNonUniformIndexing;
VkBool32 shaderUniformTexelBufferArrayNonUniformIndexing;
VkBool32 shaderStorageTexelBufferArrayNonUniformIndexing;
VkBool32 descriptorBindingUniformBufferUpdateAfterBind;
VkBool32 descriptorBindingSampledImageUpdateAfterBind;
VkBool32 descriptorBindingStorageImageUpdateAfterBind;
VkBool32 descriptorBindingStorageBufferUpdateAfterBind;
VkBool32 descriptorBindingUniformTexelBufferUpdateAfterBind;
VkBool32 descriptorBindingStorageTexelBufferUpdateAfterBind;
VkBool32 descriptorBindingUpdateUnusedWhilePending;
VkBool32 descriptorBindingPartiallyBound;
VkBool32 descriptorBindingVariableDescriptorCount;
VkBool32 runtimeDescriptorArray;
}
} VkPhysicalDeviceDescriptorIndexingFeatures;

or the equivalent

// Provided by VK_EXT_descriptor_indexing
typedef VkPhysicalDeviceDescriptorIndexingFeatures
VkPhysicalDeviceDescriptorIndexingFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **shaderInputAttachmentArrayDynamicIndexing** indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayDynamicIndexing` capability.

- **shaderUniformTexelBufferArrayDynamicIndexing** indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayDynamicIndexing` capability.

- **shaderStorageTexelBufferArrayDynamicIndexing** indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayDynamicIndexing` capability.
• `shaderUniformBufferArrayNonUniformIndexing` indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformBufferArrayNonUniformIndexing` capability.

• `shaderSampledImageArrayNonUniformIndexing` indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `SampledImageArrayNonUniformIndexing` capability.

• `shaderStorageBufferArrayNonUniformIndexing` indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageBufferArrayNonUniformIndexing` capability.

• `shaderStorageImageArrayNonUniformIndexing` indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageImageArrayNonUniformIndexing` capability.

• `shaderInputAttachmentArrayNonUniformIndexing` indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayNonUniformIndexing` capability.

• `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayNonUniformIndexing` capability.

• `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayNonUniformIndexing` capability.

• `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled,
VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER.

• descriptorBindingSampledImageUpdateAfterBind indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE.

• descriptorBindingStorageImageUpdateAfterBind indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_IMAGE.

• descriptorBindingStorageBufferUpdateAfterBind indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_BUFFER.

• descriptorBindingUniformTexelBufferUpdateAfterBind indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER.

• descriptorBindingStorageTexelBufferUpdateAfterBind indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER.

• descriptorBindingUpdateUnusedWhilePending indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT must not be used.

• descriptorBindingPartiallyBound indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT must not be used.

• descriptorBindingVariableDescriptorCount indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT must not be used.

• runtimeDescriptorArray indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

If the VkPhysicalDeviceDescriptorIndexingFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDescriptorIndexingFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorIndexingFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES

The VkPhysicalDeviceCopyMemoryIndirectFeaturesNV structure is defined as:

```c
// Provided by VK_NV_copy_memory_indirect
typedef struct VkPhysicalDeviceCopyMemoryIndirectFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 indirectCopy;
} VkPhysicalDeviceCopyMemoryIndirectFeaturesNV;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `indirectCopy` indicates whether indirect copies are supported.

If the VkPhysicalDeviceCopyMemoryIndirectFeaturesNV structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCopyMemoryIndirectFeaturesNV can also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCopyMemoryIndirectFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COPY_MEMORY_INDIRECT_FEATURES_NV

The VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexAttributeInstanceRateDivisor;
    VkBool32 vertexAttributeInstanceRateZeroDivisor;
} VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT;
```

This structure describes the following features:

- `sType` is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **vertexAttributeInstanceRateDivisor** specifies whether vertex attribute fetching may be repeated in case of instanced rendering.

• **vertexAttributeInstanceRateZeroDivisor** specifies whether a zero value for VkVertexInputBindingDivisorDescriptionEXT::divisor is supported.

If the VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT structure is included in the **pNext** chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT can also be used in the **pNext** chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_EXT**

The VkPhysicalDeviceASTCDecodeFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_astc_decode_mode
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;
```

This structure describes the following feature:

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **decodeModeSharedExponent** indicates whether the implementation supports decoding ASTC compressed formats to **VK_FORMAT_E5B9G9R9_UFLOAT_PACK32** internal precision.

If the VkPhysicalDeviceASTCDecodeFeaturesEXT structure is included in the **pNext** chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceASTCDecodeFeaturesEXT can also be used in the **pNext** chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT**

The VkPhysicalDeviceTransformFeedbackFeaturesEXT structure is defined as:
typedef struct VkPhysicalDeviceTransformFeedbackFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 transformFeedback;
    VkBool32 geometryStreams;
} VkPhysicalDeviceTransformFeedbackFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **transformFeedback** indicates whether the implementation supports transform feedback and shader modules can declare the `TransformFeedback` capability.
- **geometryStreams** indicates whether the implementation supports the `GeometryStreams` SPIR-V capability.

If the `VkPhysicalDeviceTransformFeedbackFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTransformFeedbackFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTransformFeedbackFeaturesEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT`

The `VkPhysicalDeviceVulkanMemoryModelFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 vulkanMemoryModel;
    VkBool32 vulkanMemoryModelDeviceScope;
    VkBool32 vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_vulkan_memory_model
typedef VkPhysicalDeviceVulkanMemoryModelFeatures
    VkPhysicalDeviceVulkanMemoryModelFeaturesKHR;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **vulkanMemoryModel** indicates whether shader modules can declare the `VulkanMemoryModel` capability.

- **vulkanMemoryModelDeviceScope** indicates whether the Vulkan Memory Model can use Device scope synchronization. This also indicates whether shader modules can declare the `VulkanMemoryModelDeviceScope` capability.

- **vulkanMemoryModelAvailabilityVisibilityChains** indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

If the `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkanMemoryModelFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType**
  - The `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES`.

The `VkPhysicalDeviceInlineUniformBlockFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceInlineUniformBlockFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
} VkPhysicalDeviceInlineUniformBlockFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
typedef VkPhysicalDeviceInlineUniformBlockFeatures
    VkPhysicalDeviceInlineUniformBlockFeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• `inlineUniformBlock` indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` must not be used.

• `descriptorBindingInlineUniformBlockUpdateAfterBind` indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

If the `VkPhysicalDeviceInlineUniformBlockFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceInlineUniformBlockFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceInlineUniformBlockFeatures-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES`.

---

The `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 representativeFragmentTest;
} VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTest` indicates whether the implementation supports the representative fragment test. See [Representative Fragment Test](#).

If the `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV`.

---
The `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPhysicalDeviceExclusiveScissorFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 exclusiveScissor;
} VkPhysicalDeviceExclusiveScissorFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exclusiveScissor` indicates that the implementation supports the exclusive scissor test.

See [Exclusive Scissor Test](#) for more information.

If the `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExclusiveScissorFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExclusiveScissorFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXCLUSIVE_SCISSOR_FEATURES_NV`

The `VkPhysicalDeviceCornerSampledImageFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_corner_sampled_image
typedef struct VkPhysicalDeviceCornerSampledImageFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 cornerSampledImage;
} VkPhysicalDeviceCornerSampledImageFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cornerSampledImage` specifies whether images can be created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`. See [Corner-Sampled Images](#).

---

3299
If the `VkPhysicalDeviceCornerSamplerdImageFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCornerSamplerdImageFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCornerSamplerdImageFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLERED_IMAGE_FEATURES_NV`

The `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_compute_shader_derivatives
typedef struct VkPhysicalDeviceComputeShaderDerivativesFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 computeDerivativeGroupQuads;
    VkBool32 computeDerivativeGroupLinear;
} VkPhysicalDeviceComputeShaderDerivativesFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `computeDerivativeGroupQuads` indicates that the implementation supports the `ComputeDerivativeGroupQuadsNV` SPIR-V capability.
- `computeDerivativeGroupLinear` indicates that the implementation supports the `ComputeDerivativeGroupLinearNV` SPIR-V capability.

See [Quad shader scope](#) for more information.

If the `VkPhysicalDeviceComputeShaderDerivativesFeaturesNVfeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceComputeShaderDerivativesFeaturesNVfeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceComputeShaderDerivativesFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

The `VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR` structure is defined as:
This structure describes the following feature:

- \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textit{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \textit{fragmentShaderBarycentric} indicates that the implementation supports the \texttt{BaryCoordKHR} and \texttt{BaryCoordNoPerspKHR} SPIR-V fragment shader built-ins and supports the \texttt{PerVertexKHR} SPIR-V decoration on fragment shader input variables.

See \textit{Barycentric Interpolation} for more information.

If the \texttt{VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR} structure is included in the \textit{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR} can also be used in the \textit{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

### Valid Usage (Implicit)

- \textbf{VUID-VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR-sType-sType} \texttt{sType} \textit{must} be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_KHR}.

The \texttt{VkPhysicalDeviceShaderImageFootprintFeaturesNV} structure is defined as:

```c
// Provided by VK_NV_shader_image_footprint
typedef struct VkPhysicalDeviceShaderImageFootprintFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageFootprint;
} VkPhysicalDeviceShaderImageFootprintFeaturesNV;
```

This structure describes the following feature:
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **imageFootprint** specifies whether the implementation supports the `ImageFootprintNV` SPIR-V capability.

See [Texel Footprint Evaluation](#) for more information.

If the `VkPhysicalDeviceShaderImageFootprintFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderImageFootprintFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderImageFootprintFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINTFEATURES_NV`

The `VkPhysicalDeviceShadingRateImageFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceShadingRateImageFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 shadingRateImage;
    VkBool32 shadingRateCoarseSampleOrder;
} VkPhysicalDeviceShadingRateImageFeaturesNV;
```

This structure describes the following features:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **shadingRateImage** indicates that the implementation supports the use of a shading rate image to derive an effective shading rate for fragment processing. It also indicates that the implementation supports the `ShadingRateNV` SPIR-V execution mode.

• **shadingRateCoarseSampleOrder** indicates that the implementation supports a user-configurable ordering of coverage samples in fragments larger than one pixel.

See [Shading Rate Image](#) for more information.

If the `VkPhysicalDeviceShadingRateImageFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShadingRateImageFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

3302
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShadingRateImageFeaturesNV-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADING_RATE_IMAGE_FEATURES_NV

The VkPhysicalDeviceFragmentDensityMapFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_fragment_density_map
typedef struct VkPhysicalDeviceFragmentDensityMapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMap;
    VkBool32 fragmentDensityMapDynamic;
    VkBool32 fragmentDensityMapNonSubsampledImages;
} VkPhysicalDeviceFragmentDensityMapFeaturesEXT;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- fragmentDensityMap specifies whether the implementation supports render passes with a fragment density map attachment. If this feature is not enabled and the pNext chain of VkRenderPassCreateInfo includes a VkRenderPassFragmentDensityMapCreateInfoEXT structure, fragmentDensityMapAttachment must be VK_ATTACHMENT_UNUSED.
- fragmentDensityMapDynamic specifies whether the implementation supports dynamic fragment density map image views. If this feature is not enabled, VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT must not be included in VkImageViewCreateInfo::flags.
- fragmentDensityMapNonSubsampledImages specifies whether the implementation supports regular non-subsampled image attachments with fragment density map render passes. If this feature is not enabled, render passes with a fragment density map attachment must only have subsampled attachments bound.

If the VkPhysicalDeviceFragmentDensityMapFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentDensityMapFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMapFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_FEATURES_EXT
The `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_fragment_density_map2
typedef struct VkPhysicalDeviceFragmentDensityMap2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMapDeferred;
} VkPhysicalDeviceFragmentDensityMap2FeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapDeferred` specifies whether the implementation supports deferred reads of fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` must not be included in `VkImageViewCreateInfo::flags`.

If the `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentDensityMap2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentDensityMap2FeaturesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_FEATURES_EXT`.

The `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMapOffset;
} VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityMapOffset` specifies whether the implementation supports fragment density map offsets.
If the `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_OFFSET_FEATURES_QCOM`

The `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_invocation_mask
typedef struct VkPhysicalDeviceInvocationMaskFeaturesHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkBool32 invocationMask;
} VkPhysicalDeviceInvocationMaskFeaturesHUAWEI;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `invocationMask` indicates that the implementation supports the use of an invocation mask image to optimize the ray dispatch.

If the `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceInvocationMaskFeaturesHUAWEI` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceInvocationMaskFeaturesHUAWEI-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI`

The `VkPhysicalDeviceScalarBlockLayoutFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceScalarBlockLayoutFeatures {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceScalarBlockLayoutFeatures;
```
VkBool32 scalarBlockLayout;
} VkPhysicalDeviceScalarBlockLayoutFeatures;

or the equivalent

// Provided by VK_EXT_scalar_block_layout
typedef VkPhysicalDeviceScalarBlockLayoutFeatures
VkPhysicalDeviceScalarBlockLayoutFeaturesEXT;

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• scalarBlockLayout indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.

If the VkPhysicalDeviceScalarBlockLayoutFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceScalarBlockLayoutFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceScalarBlockLayoutFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES

The VkPhysicalDeviceUniformBufferStandardLayoutFeatures structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
  VkStructureType     sType;
  void*                pNext;
  VkBool32             uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;

or the equivalent

// Provided by VK_KHR_uniform_buffer_standard_layout
typedef VkPhysicalDeviceUniformBufferStandardLayoutFeatures
VkPhysicalDeviceUniformBufferStandardLayoutFeaturesKHR;

This structure describes the following feature:

3306
- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **uniformBufferStandardLayout** indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

If the *VkPhysicalDeviceUniformBufferStandardLayoutFeatures* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceUniformBufferStandardLayoutFeatures* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType

**sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_UNIFORM_BUFFER_STANDARD_LAYOUT_FEATURES`

The *VkPhysicalDeviceDepthClipEnableFeaturesEXT* structure is defined as:

```c
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClipEnable;
} VkPhysicalDeviceDepthClipEnableFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthClipEnable** indicates that the implementation supports setting the depth clipping operation explicitly via the *VkPipelineRasterizationDepthClipStateCreateInfoEXT* pipeline state. Otherwise depth clipping is only enabled when *VkPipelineRasterizationStateCreateInfo::depthClampEnable* is set to *VK_FALSE*.

If the *VkPhysicalDeviceDepthClipEnableFeaturesEXT* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceDepthClipEnableFeaturesEXT* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType

**sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT`
The \texttt{VkPhysicalDeviceMemoryPriorityFeaturesEXT} structure is defined as:

\begin{verbatim}
// Provided by VK_EXT_memory_priority
typedef struct VkPhysicalDeviceMemoryPriorityFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 memoryPriority;
} VkPhysicalDeviceMemoryPriorityFeaturesEXT;
\end{verbatim}

This structure describes the following feature:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{memoryPriority} indicates that the implementation supports memory priorities specified at memory allocation time via \texttt{VkMemoryPriorityAllocateInfoEXT}.

If the \texttt{VkPhysicalDeviceMemoryPriorityFeaturesEXT} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceMemoryPriorityFeaturesEXT} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

\textbf{Valid Usage (Implicit)}

- VUID-VkPhysicalDeviceMemoryPriorityFeaturesEXT-sType-sType \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PRIORITY_FEATURES_EXT}

The \texttt{VkPhysicalDeviceBufferDeviceAddressFeatures} structure is defined as:

\begin{verbatim}
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
\end{verbatim}

or the equivalent

\begin{verbatim}
// Provided by VK_KHR_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeatures
VkPhysicalDeviceBufferDeviceAddressFeaturesKHR;
\end{verbatim}

This structure describes the following features:
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.

• **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.

• **bufferDeviceAddressMultiDevice** indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses **must** not be queried on a logical device created with more than one physical device.

**Note**

`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See `vkGetBufferDeviceAddress` for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType**
  
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES`  

The `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_buffer_device_address
typedef struct VkPhysicalDeviceBufferDeviceAddressFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeaturesEXT;
```

```c
// Provided by VK_EXT_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeaturesEXT
VkPhysicalDeviceBufferDeviceAddressFeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddressEXT`.
- **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer addresses, e.g. for trace capture and replay.
- **bufferDeviceAddressMultiDevice** indicates that the implementation supports the `bufferDeviceAddress` feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.

If the `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Note**
The `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT` structure has the same members as the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure, but the functionality indicated by the members is expressed differently. The features indicated by the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure requires additional flags to be passed at memory allocation time, and the capture and replay mechanism is built around opaque capture addresses for buffer and memory objects.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceBufferDeviceAddressFeaturesEXT-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BUFFER_DEVICE_ADDRESS_FEATURES_EXT`.

The `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 dedicatedAllocationImageAliasing;
} VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `dedicatedAllocationImageAliasing` indicates that the implementation supports aliasing of compatible image objects on a dedicated allocation.

If the `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEDICATED_ALLOCATION_IMAGE_ALIASING_FEATURES_NV`

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 imagelessFramebuffer;
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_imageless_framebuffer
typedef VkPhysicalDeviceImagelessFramebufferFeatures
    VkPhysicalDeviceImagelessFramebufferFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.

If the `VkPhysicalDeviceImagelessFramebufferFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImagelessFramebufferFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES

TheVkPhysicalDeviceFragmentShaderInterlockFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShaderSampleInterlock;
    VkBool32 fragmentShaderPixelInterlock;
    VkBool32 fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentShaderSampleInterlock** indicates that the implementation supports the FragmentShaderSampleInterlockEXT SPIR-V capability.
- **fragmentShaderPixelInterlock** indicates that the implementation supports the FragmentShaderPixelInterlockEXT SPIR-V capability.
- **fragmentShaderShadingRateInterlock** indicates that the implementation supports the FragmentShaderShadingRateInterlockEXT SPIR-V capability.

If theVkPhysicalDeviceFragmentShaderInterlockFeaturesEXT structure is included in the **pNext** chain of theVkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT can also be used in the **pNext** chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT

TheVkPhysicalDeviceCooperativeMatrixFeaturesNV structure is defined as:

```c
// Provided by VK_NV_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesNV {
    VkStructureType sType;
} VkPhysicalDeviceCooperativeMatrixFeaturesNV;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **cooperativeMatrix** indicates that the implementation supports the `CooperativeMatrixNV` SPIR-V capability.
- **cooperativeMatrixRobustBufferAccess** indicates that the implementation supports robust buffer access for SPIR-V `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` instructions.

If the `VkPhysicalDeviceCooperativeMatrixFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCooperativeMatrixFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceCooperativeMatrixFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_NV`

The `VkPhysicalDeviceCooperativeMatrixFeaturesKHR` structure is defined as:

```c
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 cooperativeMatrix;
    VkBool32 cooperativeMatrixRobustBufferAccess;
} VkPhysicalDeviceCooperativeMatrixFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **cooperativeMatrix** indicates that the implementation supports the `CooperativeMatrixKHR` SPIR-V capability.
- **cooperativeMatrixRobustBufferAccess** indicates that the implementation supports robust buffer access for SPIR-V `OpCooperativeMatrixLoadKHR` and `OpCooperativeMatrixStoreKHR` instructions.

If the `VkPhysicalDeviceCooperativeMatrixFeaturesKHR` structure is included in the `pNext` chain of the
The `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCooperativeMatrixFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceCooperativeMatrixFeaturesKHR-sType-sType**
  
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_KHR`

The `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is defined as:

// Provided by VK_EXT_ycbcr_image_arrays

typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
  VkStructureType sType;
  void* pNext;
  VkBool32 ycbcrImageArrays;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ycbcrImageArrays` indicates that the implementation supports creating images with a format that requires $Y'CbCr$ conversion and has multiple array layers.

If the `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType**
  
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE_ARRAYS_FEATURES_EXT`

The `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is defined as:

// Provided by VK_VERSION_1_2

typedef struct VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures {
  VkStructureType sType;
  void* pNext;
  VkBool32 shaderSubgroupExtendedTypes;
} VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures;
The `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderSubgroupExtendedTypes** is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

If the `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_EXTENDED_TYPES_FEATURES`

The `VkPhysicalDeviceHostQueryResetFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceHostQueryResetFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 hostQueryReset;
} VkPhysicalDeviceHostQueryResetFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_host_query_reset
typedef VkPhysicalDeviceHostQueryResetFeatures
    VkPhysicalDeviceHostQueryResetFeaturesEXT;
```

This structure describes the following feature:
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **hostQueryReset** indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

If the `VkPhysicalDeviceHostQueryResetFeatures` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceHostQueryResetFeatures` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceHostQueryResetFeatures-sType-sType**
  
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_QUERY_RESET_FEATURES`

The `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL` structure is defined as:

```c
// Provided by VK_INTEL_shader_integer_functions2
typedef struct VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderIntegerFunctions2;
} VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL;
```

This structure describes the following feature:

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **shaderIntegerFunctions2** indicates that the implementation supports the `IntegerFunctions2INTEL` SPIR-V capability.

If the `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL-sType-sType**
  
sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_FUNCTIONS_2_FEATURES_INTEL`

The `VkPhysicalDeviceCoverageReductionModeFeaturesNV` structure is defined as:
typedef struct VkPhysicalDeviceCoverageReductionModeFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 coverageReductionMode;
} VkPhysicalDeviceCoverageReductionModeFeaturesNV;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **coverageReductionMode** indicates whether the implementation supports coverage reduction modes. See Coverage Reduction.

If the VkPhysicalDeviceCoverageReductionModeFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCoverageReductionModeFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCoverageReductionModeFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COVERAGE_REDUCTION_MODE_FEATURES_NV

The VkPhysicalDeviceTimelineSemaphoreFeatures structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;

or the equivalent

// Provided by VK_KHR_timeline_semaphore
typedef VkPhysicalDeviceTimelineSemaphoreFeatures VkPhysicalDeviceTimelineSemaphoreFeaturesKHR;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
• **timelineSemaphore** indicates whether semaphores created with a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_TIMELINE** are supported.

If the **VkPhysicalDeviceTimelineSemaphoreFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceTimelineSemaphoreFeatures** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES**

The **VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX** structure is defined as:

```c
// Provided by VK_QNX_external_memory_screen_buffer
typedef struct VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX {
    VkStructureType sType;
    void* pNext;
    VkBool32 screenBufferImport;
} VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX;
```

The members of the **VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX** structure describe the following features:

- **screenBufferImport** indicates whether QNX Screen buffer import functionality is supported. If **screenBufferImport** is set to **VK_TRUE**, **VkDeviceMemory** supports importing _screen_buffer_ from applications. In this case, the application is responsible for the resource management of the _screen_buffer_.

### Table 55. Functionality supported for QNX Screen Buffer features

<table>
<thead>
<tr>
<th>Features</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>screenBufferImport</strong></td>
<td><strong>VkImportScreenBufferInfoQNX</strong></td>
</tr>
</tbody>
</table>
| **Always supported**\(^1\) | **vkGetScreenBufferPropertiesQNX**,  
                            **VkScreenBufferPropertiesQNX**,  
                            **VkScreenBufferFormatPropertiesQNX**,  
                            **VkExternalFormatQNX** |

\(^1\) Functionality in this row is always available.

The **Functionality supported for QNX Screen buffer features** table summarizes the functionality enabled by the **VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX** structure. Each entry in the body of the table summarizes the functionality that **can** be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this
If the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX-sType-sType` 
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCREEN_BUFFER_FEATURES_QNX`

The `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_index_type_uint8
typedef struct VkPhysicalDeviceIndexTypeUint8FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 indexTypeUint8;
} VkPhysicalDeviceIndexTypeUint8FeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **indexTypeUint8** indicates that `VK_INDEX_TYPE_UINT8_EXT` can be used with `vkCmdBindIndexBuffer`.

If the `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceIndexTypeUint8FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceIndexTypeUint8FeaturesEXT-sType-sType` 
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INDEX_TYPE_UINT8_FEATURES_EXT`

The `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_primitive_topology_list_restart
typedef struct VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT {
    VkStructureType sType;
} VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT;
```
This structure describes the following features:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **primitiveTopologyListRestart** indicates that list type primitives, `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, can use the primitive restart index value in index buffers.

• **primitiveTopologyPatchListRestart** indicates that the `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` topology can use the primitive restart index value in index buffers.

If the `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVE_TOPOLOGY_LIST_RESTART_FEATURES_EXT`.

The `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_shader_sm_builtins
typedef struct VkPhysicalDeviceShaderSMBuiltinsFeaturesNV {
  VkStructureType sType;
  void* pNext;
  VkBool32 shaderSMBuiltins;
} VkPhysicalDeviceShaderSMBuiltinsFeaturesNV;
```

This structure describes the following feature:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **shaderSMBuiltins** indicates whether the implementation supports the SPIR-V `ShaderSMBuiltinsNV` capability.
If the `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSMBuiltinsFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_FEATURES_NV`

The `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_separate_depth_stencil_layouts
typedef VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures
    VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.

If the `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)
The `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_pipeline_executable_properties
typedef struct VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineExecutableInfo;
} VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineExecutableInfo** indicates that the implementation supports reporting properties and statistics about the pipeline executables associated with a compiled pipeline.

If the `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR`

The `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDemoteToHelperInvocation;
} VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures;
```

or the equivalent

```
// Provided by VK_EXT_shader_demote_to_helper_invocation
typedef VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures
```

3322
VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- `shaderDemoteToHelperInvocation` indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.

If the `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES`

The `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_texel_buffer_alignment
typedef struct VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            texelBufferAlignment;
} VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- `texelBufferAlignment` indicates whether the implementation uses more specific alignment requirements advertised in `VkPhysicalDeviceTexelBufferAlignmentProperties` rather than `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.

If the `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
typedef struct VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 attachmentFeedbackLoopDynamicState;
} VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentFeedbackLoopDynamicState` specifies whether dynamic feedback loops are supported.

If the `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceTextureCompressionASTCHDRFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureCompressionASTC_HDR;
} VkPhysicalDeviceTextureCompressionASTCHDRFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_texture_compression_astc_hdr
```
This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.

`textureCompressionASTC_HDR` indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

- `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK`
- `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

If the `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceTextureCompressionASTCHDRFeatures-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES`
The `VkPhysicalDeviceLineRasterizationFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 rectangularLines;
    VkBool32 bresenhamLines;
    VkBool32 smoothLines;
    VkBool32 stippledRectangularLines;
    VkBool32 stippledBresenhamLines;
    VkBool32 stippledSmoothLines;
} VkPhysicalDeviceLineRasterizationFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rectangularLines` indicates whether the implementation supports rectangular line rasterization.
- `bresenhamLines` indicates whether the implementation supports Bresenham-style line rasterization.
- `smoothLines` indicates whether the implementation supports smooth line rasterization.
- `stippledRectangularLines` indicates whether the implementation supports stippled line rasterization with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines.
- `stippledBresenhamLines` indicates whether the implementation supports stippled line rasterization with `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT` lines.
- `stippledSmoothLines` indicates whether the implementation supports stippled line rasterization with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT` lines.

If the `VkPhysicalDeviceLineRasterizationFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLineRasterizationFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceLineRasterizationFeaturesEXT-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_EXT`

The `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSubgroupSizeControlFeatures {
```
VkStructureType sType;
void* pNext;
VkBool32 subgroupSizeControl;
VkBool32 computeFullSubgroups;
} VkPhysicalDeviceSubgroupSizeControlFeatures;

or the equivalent

// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlFeatures
VkPhysicalDeviceSubgroupSizeControlFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **subgroupSizeControl** indicates whether the implementation supports controlling shader subgroup sizes via the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag and the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure.
- **computeFullSubgroups** indicates whether the implementation supports requiring full subgroups in compute, mesh, or task shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.

If the `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSubgroupSizeControlFeatures` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Note**

The `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure was added in version 2 of the `VK_EXT_subgroup_size_control` extension. Version 1 implementations of this extension will not fill out the features structure but applications may assume that both `subgroupSizeControl` and `computeFullSubgroups` are supported if the extension is supported. (See also the Feature Requirements section.) Applications are advised to add a `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure to the **pNext** chain of `VkDeviceCreateInfo` to enable the features regardless of the version of the extension supported by the implementation. If the implementation only supports version 1, it will safely ignore the `VkPhysicalDeviceSubgroupSizeControlFeaturesEXT` structure.

Vulkan 1.3 implementations always support the features structure.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES

The VkPhysicalDeviceCoherentMemoryFeaturesAMD structure is defined as:

```c
// Provided by VK_AMD_device_coherent_memory
typedef struct VkPhysicalDeviceCoherentMemoryFeaturesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceCoherentMemory;
} VkPhysicalDeviceCoherentMemoryFeaturesAMD;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceCoherentMemory** indicates that the implementation supports device coherent memory.

If the VkPhysicalDeviceCoherentMemoryFeaturesAMD structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCoherentMemoryFeaturesAMD can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCoherentMemoryFeaturesAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COHERENT_MEMORY_FEATURES_AMD

The VkPhysicalDeviceAccelerationStructureFeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkPhysicalDeviceAccelerationStructureFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 accelerationStructure;
    VkBool32 accelerationStructureCaptureReplay;
    VkBool32 accelerationStructureIndirectBuild;
    VkBool32 accelerationStructureHostCommands;
    VkBool32 descriptorBindingAccelerationStructureUpdateAfterBind;
} VkPhysicalDeviceAccelerationStructureFeaturesKHR;
```

This structure describes the following features:
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **accelerationStructure** indicates whether the implementation supports the acceleration structure functionality. See **Acceleration Structures**.

• **accelerationStructureCaptureReplay** indicates whether the implementation supports saving and reusing acceleration structure device addresses, e.g. for trace capture and replay.

• **accelerationStructureIndirectBuild** indicates whether the implementation supports indirect acceleration structure build commands, e.g. `vkCmdBuildAccelerationStructuresIndirectKHR`.

• **accelerationStructureHostCommands** indicates whether the implementation supports host side acceleration structure commands, e.g. `vkBuildAccelerationStructuresKHR`, `vkCopyAccelerationStructureKHR`, `vkCopyMemoryToAccelerationStructureKHR`, `vkCopyAccelerationStructureToMemoryKHR`, `vkWriteAccelerationStructuresPropertiesKHR`.

• **descriptorBindingAccelerationStructureUpdateAfterBind** indicates whether the implementation supports updating acceleration structure descriptors after a set is bound. If this feature is not enabled, **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** must not be used with **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**.

If the **VkPhysicalDeviceAccelerationStructureFeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceAccelerationStructureFeaturesKHR** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAccelerationStructureFeaturesKHR-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_FEATURES_KHR**

The **VkPhysicalDeviceRayTracingPipelineFeaturesKHR** structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkPhysicalDeviceRayTracingPipelineFeaturesKHR {
    VkStructureType          sType;
    void*                    pNext;
    VkBool32                 rayTracingPipeline;
    VkBool32                 rayTracingPipelineShaderGroupHandleCaptureReplay;
    VkBool32                 rayTracingPipelineShaderGroupHandleCaptureReplayMixed;
    VkBool32                 rayTracingPipelineTraceRaysIndirect;
    VkBool32                 rayTraversalPrimitiveCulling;
} VkPhysicalDeviceRayTracingPipelineFeaturesKHR;
```

This structure describes the following features:

• **sType** is a **VkStructureType** value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `rayTracingPipeline` indicates whether the implementation supports the ray tracing pipeline functionality. See Ray Tracing.
• `rayTracingPipelineShaderGroupHandleCaptureReplay` indicates whether the implementation supports saving and reusing shader group handles, e.g. for trace capture and replay.
• `rayTracingPipelineShaderGroupHandleCaptureReplayMixed` indicates whether the implementation supports reuse of shader group handles being arbitrarily mixed with creation of non-reused shader group handles. If this is `VK_FALSE`, all reused shader group handles **must** be specified before any non-reused handles **may** be created.
• `rayTracingPipelineTraceRaysIndirect` indicates whether the implementation supports indirect ray tracing commands, e.g. `vkCmdTraceRaysIndirectKHR`.
• `rayTraversalPrimitiveCulling` indicates whether the implementation supports primitive culling during ray traversal.

If the `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-rayTracingPipelineShaderGroupHandleCaptureReplayMixed-03575
  
  If `rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_TRUE`, `rayTracingPipelineShaderGroupHandleCaptureReplay` **must** also be `VK_TRUE`

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY Tracing_PIPELINE FEATURES_KHR`

The `VkPhysicalDeviceRayQueryFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_query
typedef struct VkPhysicalDeviceRayQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayQuery;
} VkPhysicalDeviceRayQueryFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `rayQuery` indicates whether the implementation supports ray query (`OpRayQueryProceedKHR`) functionality.

If the `VkPhysicalDeviceRayQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRayQueryFeaturesKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERY_FEATURES_KHR`

The `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1
typedef struct VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingMaintenance1;
    VkBool32 rayTracingPipelineTraceRaysIndirect2;
} VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR;
```

This structure describes the following features:

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is NULL or a pointer to a structure extending this structure.

• `rayTracingMaintenance1` indicates that the implementation supports the following:
  
  - The `CullMaskKHR` SPIR-V builtin using the `SPV_KHR_ray_cull_mask` SPIR-V extension.
  
  - Additional acceleration structure property queries:
    
    `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR` and `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`.
  
  - A new access flag `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`.
  
  - A new pipeline stage flag bit `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR`.

• `rayTracingPipelineTraceRaysIndirect2` indicates whether the implementation supports the extended indirect ray tracing command `vkCmdTraceRaysIndirect2KHR`.

If the `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR-sType-sType must be
  `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MAINTENANCE_1_FEATURES_KHR`.

The `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state
typedef struct VkPhysicalDeviceExtendedDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState;
} VkPhysicalDeviceExtendedDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `extendedDynamicState` indicates that the implementation supports the following dynamic states:
  - `VK_DYNAMIC_STATE_CULL_MODE`
  - `VK_DYNAMIC_STATE_FRONT_FACE`
  - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`
  - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`
  - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`
  - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`
  - `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_OP`

If the `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state2
typedef struct VkPhysicalDeviceExtendedDynamicState2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState2;
    VkBool32 extendedDynamicState2LogicOp;
    VkBool32 extendedDynamicState2PatchControlPoints;
} VkPhysicalDeviceExtendedDynamicState2FeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedDynamicState2` indicates that the implementation supports the following dynamic states:
  - `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE`
  - `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE`
  - `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE`
- `extendedDynamicState2LogicOp` indicates that the implementation supports the following dynamic state:
  - `VK_DYNAMIC_STATE_LOGIC_OP_EXT`
- `extendedDynamicState2PatchControlPoints` indicates that the implementation supports the following dynamic state:
  - `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT`

If the `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExtendedDynamicState2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceExtendedDynamicState2FeaturesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT`
The `VkPhysicalDeviceExtendedDynamicState3FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3
typedef struct _ VkPhysicalDeviceExtendedDynamicState3FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState3TessellationDomainOrigin;
    VkBool32 extendedDynamicState3DepthClampEnable;
    VkBool32 extendedDynamicState3PolygonMode;
    VkBool32 extendedDynamicState3RasterizationSamples;
    VkBool32 extendedDynamicState3SampleMask;
    VkBool32 extendedDynamicState3AlphaToCoverageEnable;
    VkBool32 extendedDynamicState3AlphaToOneEnable;
    VkBool32 extendedDynamicState3LogicOpEnable;
    VkBool32 extendedDynamicState3ColorBlendEnable;
    VkBool32 extendedDynamicState3ColorBlendEquation;
    VkBool32 extendedDynamicState3ColorWriteMask;
    VkBool32 extendedDynamicState3RasterizationStream;
    VkBool32 extendedDynamicState3ConservativeRasterizationMode;
    VkBool32 extendedDynamicState3ExtraPrimitiveOverestimationSize;
    VkBool32 extendedDynamicState3DepthClipEnable;
    VkBool32 extendedDynamicState3SampleLocationsEnable;
    VkBool32 extendedDynamicState3ColorBlendAdvanced;
    VkBool32 extendedDynamicState3ProvokingVertexMode;
    VkBool32 extendedDynamicState3LineRasterizationMode;
    VkBool32 extendedDynamicState3LineStippleEnable;
    VkBool32 extendedDynamicState3DepthClipNegativeOneToOne;
    VkBool32 extendedDynamicState3ViewportWScalingEnable;
    VkBool32 extendedDynamicState3ViewportSwizzle;
    VkBool32 extendedDynamicState3CoverageToColorEnable;
    VkBool32 extendedDynamicState3CoverageToColorLocation;
    VkBool32 extendedDynamicState3CoverageModulationMode;
    VkBool32 extendedDynamicState3CoverageModulationTableEnable;
    VkBool32 extendedDynamicState3CoverageModulationTable;
    VkBool32 extendedDynamicState3CoverageReductionMode;
    VkBool32 extendedDynamicState3RepresentativeFragmentTestEnable;
    VkBool32 extendedDynamicState3ShadingRateImageEnable;
} VkPhysicalDeviceExtendedDynamicState3FeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedDynamicState3TessellationDomainOrigin` indicates that the implementation supports the following dynamic state:
  - `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT`
- `extendedDynamicState3DepthClampEnable` indicates that the implementation supports the following dynamic state:
• `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT`

*extendedDynamicState3PolygonMode* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_POLYGON_MODE_EXT`

*extendedDynamicState3RasterizationSamples* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT`

*extendedDynamicState3SampleMask* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT`

*extendedDynamicState3AlphaToCoverageEnable* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT`

*extendedDynamicState3AlphaToOneEnable* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT`

*extendedDynamicState3LogicOpEnable* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT`

*extendedDynamicState3ColorBlendEnable* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`

*extendedDynamicState3ColorBlendEquation* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`

*extendedDynamicState3ColorWriteMask* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`

*extendedDynamicState3RasterizationStream* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT`

*extendedDynamicState3ConservativeRasterizationMode* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT`

*extendedDynamicState3ExtraPrimitiveOverestimationSize* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT`

*extendedDynamicState3DepthClipEnable* indicates that the implementation supports the following dynamic state:

  • `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT`
dynamic state:
  ◦ **VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT**

• extendedDynamicState3SampleLocationsEnable indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT**

• extendedDynamicState3ColorBlendAdvanced indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**

• extendedDynamicState3ProvokingVertexMode indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT**

• extendedDynamicState3LineRasterizationMode indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT**

• extendedDynamicState3LineStippleEnable indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT**

• extendedDynamicState3DepthClipNegativeOneToOne indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT**

• extendedDynamicState3ViewportWScalingEnable indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV**

• extendedDynamicState3ViewportSwizzle indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV**

• extendedDynamicState3CoverageToColorEnable indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV**

• extendedDynamicState3CoverageToColorLocation indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV**

• extendedDynamicState3CoverageModulationMode indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV**

• extendedDynamicState3CoverageModulationTableEnable indicates that the implementation supports the following dynamic state:
  ◦ **VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV**
• \textit{extendedDynamicState3CoverageModulationTable} indicates that the implementation supports the following dynamic state:
  
  ◦ \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_MODULATION\_TABLE\_NV}

• \textit{extendedDynamicState3CoverageReductionMode} indicates that the implementation supports the following dynamic state:
  
  ◦ \texttt{VK\_DYNAMIC\_STATE\_COVERAGE\_REDUCTION\_MODE\_NV}

• \textit{extendedDynamicState3RepresentativeFragmentTestEnable} indicates that the implementation supports the following dynamic state:
  
  ◦ \texttt{VK\_DYNAMIC\_STATE\_REPRESENTATIVE\_FRAGMENT\_TEST\_ENABLE\_NV}

• \textit{extendedDynamicState3ShadingRateImageEnable} indicates that the implementation supports the following dynamic state:
  
  ◦ \texttt{VK\_DYNAMIC\_STATE\_SHADING\_RATE\_IMAGE\_ENABLE\_NV}

If the \texttt{VkPhysicalDeviceExtendedDynamicState3FeaturesEXT} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceExtendedDynamicState3FeaturesEXT} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceExtendedDynamicState3FeaturesEXT-sType-sType

  \textbf{sType} must be \texttt{VK\_STRUCTURE\_TYPE\_PHYSICAL\_DEVICE\_EXTENDED\_DYNAMIC\_STATE\_3\_FEATURES\_EXT}

The \texttt{VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV} structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceGeneratedCommands;
} VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV;
```

This structure describes the following feature:

• \textbf{sType} is a \texttt{VkStructureType} value identifying this structure.

• \textbf{pNext} is NULL or a pointer to a structure extending this structure.

• \textbf{deviceGeneratedCommands} indicates whether the implementation supports functionality to generate commands on the device. See Device-Generated Commands.

If the \texttt{VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_FEATURES_NV

The VkPhysicalDeviceDiagnosticsConfigFeaturesNV structure is defined as:

```
// Provided by VK_NV_device_diagnostics_config
typedef struct VkPhysicalDeviceDiagnosticsConfigFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 diagnosticsConfig;
} VkPhysicalDeviceDiagnosticsConfigFeaturesNV;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- diagnosticsConfig indicates whether the implementation supports the ability to configure diagnostic tools.

If the VkPhysicalDeviceDiagnosticsConfigFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDiagnosticsConfigFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDiagnosticsConfigFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DIAGNOSTICS_CONFIG_FEATURES_NV

The VkPhysicalDeviceDeviceMemoryReportFeaturesEXT structure is defined as:

```
// Provided by VK_EXT_device_memory_report
typedef struct VkPhysicalDeviceDeviceMemoryReportFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceMemoryReport;
} VkPhysicalDeviceDeviceMemoryReportFeaturesEXT;
```

This structure describes the following feature:
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **deviceMemoryReport** indicates whether the implementation supports the ability to register device memory report callbacks.

If the `VkPhysicalDeviceDeviceMemoryReportFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDeviceMemoryReportFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDeviceMemoryReportFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_MEMORY_REPORT_FEATURES_EXT

The `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR` structure is defined as:

```c
typedef struct VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 globalPriorityQuery;
} VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR;
```

or the equivalent

```c
typedef VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR
VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT;
```

This structure describes the following feature:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **globalPriorityQuery** indicates whether the implementation supports the ability to query global queue priorities.

If the `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePipelineCreationCacheControlFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineCreationCacheControl;
} VkPhysicalDevicePipelineCreationCacheControlFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_cache_control
typedef VkPhysicalDevicePipelineCreationCacheControlFeatures
    VkPhysicalDevicePipelineCreationCacheControlFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineCreationCacheControl** indicates that the implementation supports:
  - The following can be used in `Vk*PipelineCreateInfo::flags`:
    - `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`
    - `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`
  - The following can be used in `VkPipelineCacheCreateInfo::flags`:
    - `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`

If the `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineCreationCacheControlFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderZeroInitializeWorkgroupMemory;
} VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_zero_initialize_workgroup_memory
typedef VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures
    VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderZeroInitializeWorkgroupMemory** specifies whether the implementation supports initializing a variable in Workgroup storage class.

If the `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ZERO_INITIALIZE_WORKGROUP_MEMORY_FEATURES`

The `VkPhysicalDevicePrivateDataFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePrivateDataFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 privateData;
} VkPhysicalDevicePrivateDataFeatures;
```

or the equivalent
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **privateData** indicates whether the implementation supports private data. See Private Data.

If the `VkPhysicalDevicePrivateDataFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrivateDataFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePrivateDataFeatures-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIVATE_DATA_FEATURES`

---

The `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_shader_subgroup_uniform_control_flow
typedef struct VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupUniformControlFlow;
} VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderSubgroupUniformControlFlow** specifies whether the implementation supports the shader execution mode `SubgroupUniformControlFlowKHR`

If the `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR-sType-sType
  
  3342
sType must be
VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_UNIFORM_CONTROL_FLOW_FEATURES_KHR

The `VkPhysicalDeviceRobustness2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_robustness2
typedef struct VkPhysicalDeviceRobustness2FeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          robustBufferAccess2;
    VkBool32          robustImageAccess2;
    VkBool32          nullDescriptor;
} VkPhysicalDeviceRobustness2FeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **robustBufferAccess2** indicates whether buffer accesses are tightly bounds-checked against the range of the descriptor. Uniform buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustUniformBufferAccessSizeAlignment`. Storage buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustStorageBufferAccessSizeAlignment`. Out of bounds buffer loads will return zero values, and **image load, sample, and atomic operations** from texel buffers will have \((0,0,1)\) values **inserted for missing G, B, or A components** based on the format.
- **robustImageAccess2** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Out of bounds **image load, sample, and atomic operations** from images will return zero values, with \((0,0,1)\) values **inserted for missing G, B, or A components** based on the format.
- **nullDescriptor** indicates whether descriptors **can** be written with a `VK_NULL_HANDLE` resource or view, which are considered valid to access and act as if the descriptor were bound to nothing.

If the `VkPhysicalDeviceRobustness2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRobustness2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage**

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-robustBufferAccess2-04000
  If `robustBufferAccess2` is enabled then `robustBufferAccess` **must** also be enabled
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_FEATURES_EXT

The VkPhysicalDeviceImageRobustnessFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceImageRobustnessFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
} VkPhysicalDeviceImageRobustnessFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_image_robustness
typedef VkPhysicalDeviceImageRobustnessFeatures
VkPhysicalDeviceImageRobustnessFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Invalid texels resulting from out of bounds image loads will be replaced as described in Texel Replacement, with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

If the VkPhysicalDeviceImageRobustnessFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageRobustnessFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
typedef struct VkPhysicalDeviceShaderTerminateInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTerminateInvocation;
} VkPhysicalDeviceShaderTerminateInvocationFeatures;

or the equivalent

// Provided by VK_KHR_shader_terminate_invocation
typedef VkPhysicalDeviceShaderTerminateInvocationFeatures
VkPhysicalDeviceShaderTerminateInvocationFeaturesKHR;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that use the `SPV_KHR_terminate_invocation` extension.

If the `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderTerminateInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTerminateInvocationFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES`

The `VkPhysicalDeviceCustomBorderColorFeaturesEXT` structure is defined as:

// Provided by VK_EXT_custom_border_color
typedef struct VkPhysicalDeviceCustomBorderColorFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 customBorderColors;
    VkBool32 customBorderColorWithoutFormat;
} VkPhysicalDeviceCustomBorderColorFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
customBorderColors indicates that the implementation supports providing a borderColor value with one of the following values at sampler creation time:

- VK_BORDER_COLOR_FLOAT_CUSTOM_EXT
- VK_BORDER_COLOR_INT_CUSTOM_EXT

customBorderColorWithoutFormat indicates that explicit formats are not required for custom border colors and the value of the format member of the VkSamplerCustomBorderColorCreateInfoEXT structure may be VK_FORMAT_UNDEFINED. If this feature bit is not set, applications must provide the VkFormat of the image view(s) being sampled by this sampler in the format member of the VkSamplerCustomBorderColorCreateInfoEXT structure.

If the VkPhysicalDeviceCustomBorderColorFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCustomBorderColorFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCustomBorderColorFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT

The VkPhysicalDeviceBorderColorSwizzleFeaturesEXT structure is defined as:

```c
typedef struct VkPhysicalDeviceBorderColorSwizzleFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 borderColorSwizzle;
    VkBool32 borderColorSwizzleFromImage;
} VkPhysicalDeviceBorderColorSwizzleFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **borderColorSwizzle** indicates that defined values are returned by sampled image operations when used with a sampler that uses a VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK, VK_BORDER_COLOR_INT_OPAQUE_BLACK, VK_BORDER_COLOR_FLOAT_CUSTOM_EXT, or VK_BORDER_COLOR_INT_CUSTOM_EXT borderColor and an image view that uses a non-identity component mapping, when either borderColorSwizzleFromImage is enabled or the VkSamplerBorderColorComponentMappingCreateInfoEXT is specified.
- **borderColorSwizzleFromImage** indicates that the implementation will return the correct border color values from sampled image operations under the conditions expressed above, without the
application having to specify the border color component mapping when creating the sampler object. If this feature bit is not set, applications can chain a `VkSamplerBorderColorComponentMappingCreateInfoEXT` structure when creating samplers for use with image views that do not have an identity swizzle and, when those samplers are combined with image views using the same component mapping, sampled image operations that use opaque black or custom border colors will return the correct border color values.

If the `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBorderColorSwizzleFeaturesEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BORDER_COLOR_SWIZZLE_FEATURES_EXT`

The `VkPhysicalDevicePortabilitySubsetFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_portability_subset
typedef struct VkPhysicalDevicePortabilitySubsetFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 constantAlphaColorBlendFactors;
    VkBool32 events;
    VkBool32 imageViewFormatReinterpretation;
    VkBool32 imageViewFormatSwizzle;
    VkBool32 imageView2DOn3DImage;
    VkBool32 multisampleArrayImage;
    VkBool32 mutableComparisonSamplers;
    VkBool32 pointPolygons;
    VkBool32 samplerMipLodBias;
    VkBool32 separateStencilMaskRef;
    VkBool32 shaderSampleRateInterpolationFunctions;
    VkBool32 tessellationIsolines;
    VkBool32 tessellationPointMode;
    VkBool32 triangleFans;
    VkBool32 vertexAttributeAccessBeyondStride;
} VkPhysicalDevicePortabilitySubsetFeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantAlphaColorBlendFactors` indicates whether this implementation supports constant alpha Blend Factors used as source or destination color Blending.
• events indicates whether this implementation supports synchronization using Events.

• imageViewFormatReinterpretation indicates whether this implementation supports a VkImageView being created with a texel format containing a different number of components, or a different number of bits in each component, than the texel format of the underlying VkImage.

• imageViewFormatSwizzle indicates whether this implementation supports remapping format components using VkImageViewCreateInfo::components.

• imageView2DOn3DImage indicates whether this implementation supports a VkImage being created with the VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT flag set, permitting a 2D or 2D array image view to be created on a 3D VkImage.

• multisampleArrayImage indicates whether this implementation supports a VkImage being created as a 2D array with multiple samples per texel.

• mutableComparisonSamplers indicates whether this implementation allows descriptors with comparison samplers to be updated.

• pointPolygons indicates whether this implementation supports Rasterization using a point Polygon Mode.

• samplerMipLodBias indicates whether this implementation supports setting a mipmap LOD bias value when creating a sampler.

• separateStencilMaskRef indicates whether this implementation supports separate front and back Stencil Test reference values.

• shaderSampleRateInterpolationFunctions indicates whether this implementation supports fragment shaders which use the InterpolationFunction capability and the extended instructions InterpolateAtCentroid, InterpolateAtOffset, and InterpolateAtSample from the GLSL.std.450 extended instruction set. This member is only meaningful if the sampleRateShading feature is supported.

• tessellationIsolines indicates whether this implementation supports isoline output from the Tessellation stage of a graphics pipeline. This member is only meaningful if tessellationShader are supported.

• tessellationPointMode indicates whether this implementation supports point output from the Tessellation stage of a graphics pipeline. This member is only meaningful if tessellationShader are supported.

• triangleFans indicates whether this implementation supports Triangle Fans primitive topology.

• vertexAttributeAccessBeyondStride indicates whether this implementation supports accessing a vertex input attribute beyond the stride of the corresponding vertex input binding.

If the VkPhysicalDevicePortabilitySubsetFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevicePortabilitySubsetFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDevicePortabilitySubsetFeaturesKHR-sType-sType 3348
The `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is defined as:

```c
typedef struct VkPhysicalDevicePerformanceQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 performanceCounterQueryPools;
    VkBool32 performanceCounterMultipleQueryPools;
} VkPhysicalDevicePerformanceQueryFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **performanceCounterQueryPools** indicates whether the implementation supports performance counter query pools.
- **performanceCounterMultipleQueryPools** indicates whether the implementation supports using multiple performance query pools in a primary command buffer and secondary command buffers executed within it.

If the `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePerformanceQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevicePerformanceQueryFeaturesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_FEATURES_KHR`

The `VkPhysicalDevice4444FormatsFeaturesEXT` structure is defined as:

```c
typedef struct VkPhysicalDevice4444FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 formatA4R4G4B4;
    VkBool32 formatA4B4G4R4;
} VkPhysicalDevice4444FormatsFeaturesEXT;
```

This structure describes the following features:
• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkStructureType.html) value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **formatA4R4G4B4** indicates that the implementation must support using a [VkFormat](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkFormat.html) of `VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT` with at least the following [VkFormatFeatureFlagBits](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkFormatFeatureFlagBits.html):
  - VK_FORMAT_FEATURE_SAMPLERD_IMAGE_BIT
  - VK_FORMAT_FEATURE_BLIT_SRC_BIT
  - VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• **formatA4B4G4R4** indicates that the implementation must support using a [VkFormat](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkFormat.html) of `VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT` with at least the following [VkFormatFeatureFlagBits](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkFormatFeatureFlagBits.html):
  - VK_FORMAT_FEATURE_SAMPLERD_IMAGE_BIT
  - VK_FORMAT_FEATURE_BLIT_SRC_BIT
  - VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

If the [VkPhysicalDevice4444FormatsFeaturesEXT](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPhysicalDevice4444FormatsFeaturesEXT.html) structure is included in the **pNext** chain of the [VkPhysicalDeviceFeatures2](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPhysicalDeviceFeatures2.html) structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. [VkPhysicalDevice4444FormatsFeaturesEXT](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPhysicalDevice4444FormatsFeaturesEXT.html) can also be used in the **pNext** chain of [VkDeviceCreateInfo](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkDeviceCreateInfo.html) to selectively enable these features.

## Valid Usage (Implicit)

- **VUID-VkPhysicalDevice4444FormatsFeaturesEXT-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT`

---

**Note**

Although the formats defined by the [VK_EXT_4444_formats](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VK_EXT_4444_formats.html) extension were promoted to Vulkan 1.3 as optional formats, the [VkPhysicalDevice4444FormatsFeaturesEXT](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPhysicalDevice4444FormatsFeaturesEXT.html) structure was not promoted to Vulkan 1.3.

The [VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT.html) structure is defined as:

```c
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          mutableDescriptorType;
} VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT;
```

or the equivalent

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT
        VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE;
```

3350
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **mutableDescriptorType** indicates that the implementation must support using the `VkDescriptorType` of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` with at least the following descriptor types, where any combination of the types must be supported:
  - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
  - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`

- Additionally, **mutableDescriptorType** indicates that:
  - Non-uniform descriptor indexing must be supported if all descriptor types in a `VkMutableDescriptorTypeListEXT` for `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` have the corresponding non-uniform indexing features enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.
  - `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` with `descriptorType` of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` relaxes the list of required descriptor types to the descriptor types which have the corresponding update-after-bind feature enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.
  - Dynamically uniform descriptor indexing must be supported if all descriptor types in a `VkMutableDescriptorTypeListEXT` for `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` have the corresponding dynamic indexing features enabled.
  - `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` must be supported.
  - `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` must be supported.

If the `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MUTABLE_DESCRIPTOR_TYPE_FEATURES_EXT`

The `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
```
typedef struct VkPhysicalDeviceDepthClipControlFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClipControl;
} VkPhysicalDeviceDepthClipControlFeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthClipControl** indicates that the implementation supports setting
  `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` to `VK_TRUE`.

If the `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDepthClipControlFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipControlFeaturesEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_CONTROL_FEATURES_EXT`

The `VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_workgroup_memory_explicit_layout
typedef struct VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 workgroupMemoryExplicitLayout;
    VkBool32 workgroupMemoryExplicitLayoutScalarBlockLayout;
    VkBool32 workgroupMemoryExplicitLayout8BitAccess;
    VkBool32 workgroupMemoryExplicitLayout16BitAccess;
} VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **workgroupMemoryExplicitLayout** indicates whether the implementation supports the SPIR-V `WorkgroupMemoryExplicitLayoutKHR` capability.
- **workgroupMemoryExplicitLayoutScalarBlockLayout** indicates whether the implementation supports scalar alignment for laying out Workgroup Blocks.
- **workgroupMemoryExplicitLayout8BitAccess** indicates whether objects in the Workgroup storage...
class with the Block decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the WorkgroupMemoryExplicitLayout8BitAccessKHR capability.

- workgroupMemoryExplicitLayout16BitAccess indicates whether objects in the Workgroup storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also indicates whether shader modules can declare the WorkgroupMemoryExplicitLayout16BitAccessKHR capability.

If the VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR

The VkPhysicalDeviceSynchronization2Features structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSynchronization2Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 synchronization2;
} VkPhysicalDeviceSynchronization2Features;
```

or the equivalent

```c
// Provided by VK_KHR_synchronization2
typedef VkPhysicalDeviceSynchronization2Features VkPhysicalDeviceSynchronization2FeaturesKHR;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in VK_KHR_synchronization2.

If the VkPhysicalDeviceSynchronization2Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to
indicate whether each corresponding feature is supported. VkPhysicalDeviceSynchronization2Features can also be used in the pNext chain of 
VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSynchronization2Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES

The VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexInputDynamicState;
} VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **vertexInputDynamicState** indicates that the implementation supports the following dynamic states:
  - VK_DYNAMIC_STATE_VERTEX_INPUT_EXT

If the VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT-sType-sType
  sType must be VKSTRUCTURETYPE_PHYSICALDEVICEVERTEXINPUTDYNAMICSTATEFEATURES_EXT

The VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_primitives_generated_query
typedef struct VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 primitivesGeneratedQuery;
} VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT;
```
VkBool32 primitivesGeneratedQueryWithRasterizerDiscard;
VkBool32 primitivesGeneratedQueryWithNonZeroStreams;
} VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **primitivesGeneratedQuery** indicates whether the implementation supports the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query type.
- **primitivesGeneratedQueryWithRasterizerDiscard** indicates whether the implementation supports this query when rasterization discard is enabled.
- **primitivesGeneratedQueryWithNonZeroStreams** indicates whether the implementation supports this query with a non-zero index in `vkCmdBeginQueryIndexedEXT`.

If the `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT-sType-sType**

  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVES_GENERATED_QUERY_FEATURES_EXT`.

The `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineFragmentShadingRate;
    VkBool32 primitiveFragmentShadingRate;
    VkBool32 attachmentFragmentShadingRate;
} VkPhysicalDeviceFragmentShadingRateFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineFragmentShadingRate** indicates that the implementation supports the pipeline fragment shading rate.
• `primitiveFragmentShadingRate` indicates that the implementation supports the primitive fragment shading rate.

• `attachmentFragmentShadingRate` indicates that the implementation supports the attachment fragment shading rate.

If the `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentShadingRateFeaturesKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_FEATURES_KHR`

The `VkPhysicalDeviceLegacyDitheringFeaturesEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceLegacyDitheringFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 legacyDithering;
} VkPhysicalDeviceLegacyDitheringFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `legacyDithering` indicates whether the implementation supports Legacy Dithering.

If the `VkPhysicalDeviceLegacyDitheringFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLegacyDitheringFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceLegacyDitheringFeaturesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_DITHERING_FEATURES_EXT`

The `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rateEnums
```
typedef struct VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShadingRate Enums;
    VkBool32 supersampleFragmentShadingRates;
    VkBool32 noInvocationFragmentShadingRates;
} VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV;

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentShadingRate Enums** indicates that the implementation supports specifying fragment shading rates using the VkFragmentShadingRateNV enumerated type.
- **supersampleFragmentShadingRates** indicates that the implementation supports fragment shading rate enum values indicating more than one invocation per fragment.
- **noInvocationFragmentShadingRates** indicates that the implementation supports a fragment shading rate enum value indicating that no fragment shaders should be invoked when that shading rate is used.

If the VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV-sType-sType

    sType must be

    VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE.Enums_FEATURES_NV

The VkPhysicalDeviceInheritedViewportScissorFeaturesNV structure is defined as:

```c
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkPhysicalDeviceInheritedViewportScissorFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 inheritedViewportScissor2D;
} VkPhysicalDeviceInheritedViewportScissorFeaturesNV;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
• inheritedViewportScissor2D indicates whether secondary command buffers can inherit most of the dynamic state affected by VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT, VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT, VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT, VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT, VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT, VK_DYNAMIC_STATE_VIEWPORT or VK_DYNAMIC_STATE_SCISSOR, from a primary command buffer.

If the VkPhysicalDeviceInheritedViewportScissorFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceInheritedViewportScissorFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceInheritedViewportScissorFeaturesNV-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INHERITED_VIEWPORT_SCISSOR_FEATURES_NV

The VkPhysicalDevicePipelineProtectedAccessFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_pipeline_protected_access
typedef struct VkPhysicalDevicePipelineProtectedAccessFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineProtectedAccess;
} VkPhysicalDevicePipelineProtectedAccessFeaturesEXT;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pipelineProtectedAccess indicates whether the implementation supports specifying protected access on individual pipelines.

If the VkPhysicalDevicePipelineProtectedAccessFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevicePipelineProtectedAccessFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage ( Implicit )

• VUID-VkPhysicalDevicePipelineProtectedAccessFeaturesEXT-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_PROTECTED_ACCESS_FEATURES_EXT
The \texttt{VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT} structure is defined as:

```c
// Provided by VK_EXT_ycbcr_2plane_444_formats
typedef struct VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 ycbcr2plane444Formats;
} VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT;
```

This structure describes the following feature:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{ycbcr2plane444Formats} indicates that the implementation supports the following 2-plane 444 YCbCr formats:
  - \texttt{VK_FORMAT_G8_B8R8_2PLANE_444_UNORM}
  - \texttt{VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16}
  - \texttt{VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16}
  - \texttt{VK_FORMAT_G16_B16R16_2PLANE_444_UNORM}

If the \texttt{VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT-sType-sType must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT}

**Note**

Although the formats defined by the \texttt{VK_EXT_ycbcr_2plane_444_formats} were promoted to Vulkan 1.3 as optional formats, the \texttt{VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT} structure was not promoted to Vulkan 1.3.

The \texttt{VkPhysicalDeviceColorWriteEnableFeaturesEXT} structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPhysicalDeviceColorWriteEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;
```
VkBool32 colorWriteEnable;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **colorWriteEnable** indicates that the implementation supports the dynamic state `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

If the `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceColorWriteEnableFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceColorWriteEnableFeaturesEXT-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COLOR_WRITE_ENABLE_FEATURES_EXT`.

The `VkPhysicalDevicePipelinePropertiesFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_properties
typedef struct VkPhysicalDevicePipelinePropertiesFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelinePropertiesIdentifier;
} VkPhysicalDevicePipelinePropertiesFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelinePropertiesIdentifier** indicates that the implementation supports querying a unique pipeline identifier.

If the `VkPhysicalDevicePipelinePropertiesFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelinePropertiesFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPhysicalDeviceProvokingVertexFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 provokingVertexLast;
    VkBool32 transformFeedbackPreservesProvokingVertex;
} VkPhysicalDeviceProvokingVertexFeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **provokingVertexLast** indicates whether the implementation supports the VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT provoking vertex mode for flat shading.
- **transformFeedbackPreservesProvokingVertex** indicates that the order of vertices within each primitive written by transform feedback will preserve the provoking vertex. This does not apply to triangle fan primitives when `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`. `transformFeedbackPreservesProvokingVertex` must be `VK_FALSE` when the VK_EXT_transform_feedback extension is not supported.

If the `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceProvokingVertexFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

When `VkPhysicalDeviceProvokingVertexFeaturesEXT` is in the `pNext` chain of `VkDeviceCreateInfo` but the `transformFeedback` feature is not enabled, the value of `transformFeedbackPreservesProvokingVertex` is ignored.

The `VkPhysicalDeviceDescriptorBufferFeaturesEXT` structure is defined as:
This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **descriptorBuffer** indicates that the implementation supports putting shader-accessible descriptors directly in memory.
- **descriptorBufferCaptureReplay** indicates that the implementation supports capture and replay when using descriptor buffers. If this is **VK_TRUE**, all resources created with
  - `VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`,
  - `VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`,
  - `VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`,
  - `VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`,
  - `VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT` must be created before resources of the same types without those flags.
- **descriptorBufferImageLayoutIgnored** indicates that the implementation will ignore `imageLayout` in `VkDescriptorImageInfo` when calling `vkGetDescriptorEXT`.
- **descriptorBufferPushDescriptors** indicates that the implementation supports using push descriptors with descriptor buffers.

If the **VkPhysicalDeviceDescriptorBufferFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceDescriptorBufferFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceDescriptorBufferFeaturesEXT-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_BUFFER_FEATURES_EXT**
This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pageableDeviceLocalMemory** indicates that the implementation supports pageable device-local memory and **may** transparently move device-local memory allocations to host-local memory to better share device-local memory with other applications.

If the VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT structure is included in the **pNext** chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT can also be used in the **pNext** chain of VkDeviceCreateInfo to selectively enable these features.

---

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT-sType-sType
  
  **sType** must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PAGEABLE_DEVICE_LOCAL_MEMORY_FEATURES_EXT

---

The VkPhysicalDeviceMultiDrawFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkPhysicalDeviceMultiDrawFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiDraw;
} VkPhysicalDeviceMultiDrawFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **multiDraw** indicates that the implementation supports vkCmdDrawMultiEXT and vkCmdDrawMultiIndexedEXT.

If the VkPhysicalDeviceMultiDrawFeaturesEXT structure is included in the **pNext** chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMultiDrawFeaturesEXT can also be used in the **pNext** chain of VkDeviceCreateInfo to selectively enable these features.
The \texttt{VkPhysicalDeviceRayTracingMotionBlurFeaturesNV} structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkPhysicalDeviceRayTracingMotionBlurFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingMotionBlur;
    VkBool32 rayTracingMotionBlurPipelineTraceRaysIndirect;
} VkPhysicalDeviceRayTracingMotionBlurFeaturesNV;
```

This structure describes the following features:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{rayTracingMotionBlur} indicates whether the implementation supports the motion blur feature.
- \texttt{rayTracingMotionBlurPipelineTraceRaysIndirect} indicates whether the implementation supports indirect ray tracing commands with the motion blur feature enabled.

If the \texttt{VkPhysicalDeviceRayTracingMotionBlurFeaturesNV} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceRayTracingMotionBlurFeaturesNV} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

The \texttt{VkPhysicalDeviceOpacityMicromapFeaturesEXT} structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkPhysicalDeviceOpacityMicromapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 micromap;
    VkBool32 micromapCaptureReplay;
    VkBool32 micromapHostCommands;
} VkPhysicalDeviceOpacityMicromapFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **micromap** indicates whether the implementation supports the micromap array feature.
- **micromapCaptureReplay** indicates whether the implementation supports capture and replay of addresses for micromap arrays.
- **micromapHostCommands** indicates whether the implementation supports host side micromap array commands.

If the `VkPhysicalDeviceOpacityMicromapFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceOpacityMicromapFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpacityMicromapFeaturesEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPACITY_MICROMAP_FEATURES_EXT`

The `VkPhysicalDeviceDisplacementMicromapFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
typedef struct VkPhysicalDeviceDisplacementMicromapFeaturesNV {
  VkStructureType sType;
  void* pNext;
  VkBool32 displacementMicromap;
} VkPhysicalDeviceDisplacementMicromapFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **displacementMicromap** indicates whether the implementation supports the displacement micromap feature.

If the `VkPhysicalDeviceDisplacementMicromapFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDisplacementMicromapFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceSubpassShadingFeaturesHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkPhysicalDeviceSubpassShadingFeaturesHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkBool32 subpassShading;
} VkPhysicalDeviceSubpassShadingFeaturesHUAWEI;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **subpassShading** specifies whether subpass shading is supported.

If the `VkPhysicalDeviceSubpassShadingFeaturesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSubpassShadingFeaturesHUAWEI` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceExternalMemoryRDMAFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_external_memory_rdma
typedef struct VkPhysicalDeviceExternalMemoryRDMAFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 externalMemoryRDMA;
} VkPhysicalDeviceExternalMemoryRDMAFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• `externalMemoryRDMA` indicates whether the implementation has support for the `VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV` memory property and the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV` external memory handle type.

If the `VkPhysicalDeviceExternalMemoryRDMAFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExternalMemoryRDMAFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceExternalMemoryRDMAFeaturesNV-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_RDMA_FEATURES_NV`

The `VkPhysicalDevicePresentIdFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_present_id
typedef struct VkPhysicalDevicePresentIdFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentId;
} VkPhysicalDevicePresentIdFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `presentId` indicates that the implementation supports specifying present ID values in the `VkPresentIdKHR` extension to the `VkPresentInfoKHR` struct.

If the `VkPhysicalDevicePresentIdFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePresentIdFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePresentIdFeaturesKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_ID_FEATURES_KHR`

The `VkPhysicalDevicePresentWaitFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_present_wait
typedef struct VkPhysicalDevicePresentWaitFeaturesKHR {
```
VkStructureType sType;
void* pNext;
VkBool32 presentWait;
} VkPhysicalDevicePresentWaitFeaturesKHR;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentWait** indicates that the implementation supports *vkWaitForPresentKHR*.

If the *VkPhysicalDevicePresentWaitFeaturesKHR* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDevicePresentWaitFeaturesKHR* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePresentWaitFeaturesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR

The *VkPhysicalDevicePresentBarrierFeaturesNV* structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkPhysicalDevicePresentBarrierFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrier;
} VkPhysicalDevicePresentBarrierFeaturesNV;
```

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentBarrier** indicates that the implementation supports the present barrier feature.

If the *VkPhysicalDevicePresentBarrierFeaturesNV* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDevicePresentBarrierFeaturesNV* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePresentBarrierFeaturesNV-sType-sType
The **VkPhysicalDeviceShaderIntegerDotProductFeatures** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderIntegerDotProductFeatures {
    VkStructureType   sType;
    void*              pNext;
    VkBool32           shaderIntegerDotProduct;
} VkPhysicalDeviceShaderIntegerDotProductFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_shader_integer_dot_product
typedef VkPhysicalDeviceShaderIntegerDotProductFeatures
VkPhysicalDeviceShaderIntegerDotProductFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **shaderIntegerDotProduct** specifies whether shader modules can declare the `DotProductInputAllKHR`, `DotProductInput4x8BitKHR`, `DotProductInput4x8BitPackedKHR` and `DotProductKHR` capabilities.

If the **VkPhysicalDeviceShaderIntegerDotProductFeatures** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderIntegerDotProductFeatures** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderIntegerDotProductFeatures-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_FEATURES**

The **VkPhysicalDeviceMaintenance4Features** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceMaintenance4Features {
    VkStructureType   sType;
    void*              pNext;
    VkBool32           maintenance4;
} VkPhysicalDeviceMaintenance4Features;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maintenance4** indicates that the implementation supports the following:
  - The application **may** destroy a `VkPipelineLayout` object immediately after using it to create another object.
  - `LocalSizeId` can be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
  - Images created with identical creation parameters will always have the same alignment requirements.
  - The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
  - Push constants do not have to be initialized before they are dynamically accessed.
  - The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the `VkPhysicalDeviceMaintenance4Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMaintenance4Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMaintenance4Features-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_FEATURES`

The `VkPhysicalDeviceDynamicRenderingFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceDynamicRenderingFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 dynamicRendering;
} VkPhysicalDeviceDynamicRenderingFeatures;
```

or the equivalent
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **dynamicRendering** specifies that the implementation supports dynamic render pass instances using the `vkCmdBeginRendering` command.

If the `VkPhysicalDeviceDynamicRenderingFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDynamicRenderingFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceDynamicRenderingFeatures-sType-sType`  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_FEATURES`

The `VkPhysicalDeviceRGBA10x6FormatsFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_rgba10x6_formats
typedef struct VkPhysicalDeviceRGBA10x6FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 formatRgba10x6WithoutYCbCrSampler;
} VkPhysicalDeviceRGBA10x6Formats Features EXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **formatRgba10x6WithoutYCbCrSampler** indicates that `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` can be used with a `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT` without a sampler Y’C’C’B’R conversion enabled.

If the `VkPhysicalDeviceRGBA10x6FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRGBA10x6FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDevicePipelineRobustnessFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPhysicalDevicePipelineRobustnessFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineRobustness;
} VkPhysicalDevicePipelineRobustnessFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineRobustness** indicates that robustness can be requested on a per-pipeline-stage granularity.

**Note**

Enabling `pipelineRobustness` may, on some platforms, incur a minor performance cost when `robustBufferAccess` is disabled, even for pipelines which do not make use of any robustness features. If robustness is not needed, `pipelineRobustness` should not be enabled by an application.

If the `VkPhysicalDevicePipelineRobustnessFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineRobustnessFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceImageViewMinLodFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_image_view_min_lod
typedef struct VkPhysicalDeviceImageViewMinLodFeaturesEXT {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceImageViewMinLodFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **minLod** indicates whether the implementation supports clamping the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations with a given *VkImageView* by *VkImageViewMinLodCreateInfoEXT::minLod*.

If the *VkPhysicalDeviceImageViewMinLodFeaturesEXT* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceImageViewMinLodFeaturesEXT* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceImageViewMinLodFeaturesEXT-sType-sType**
  
  *sType* **must be** `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_MIN_LOD_FEATURES_EXT`.

---

The *VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT* structure is defined as:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef struct VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 rasterizationOrderColorAttachmentAccess;
    VkBool32 rasterizationOrderDepthAttachmentAccess;
    VkBool32 rasterizationOrderStencilAttachmentAccess;
} VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT;
```

or the equivalent

```c
// Provided by VK_ARM_rasterization_order_attachment_access
typedef VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT
    VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesARM;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **rasterizationOrderColorAttachmentAccess** indicates that rasterization order access to color and
input attachments is supported by the implementation.

- **rasterizationOrderDepthAttachmentAccess** indicates that rasterization order access to the depth aspect of depth/stencil and input attachments is supported by the implementation.

- **rasterizationOrderStencilAttachmentAccess** indicates that rasterization order access to the stencil aspect of depth/stencil and input attachments is supported by the implementation.

If the **VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT** structure is included in the `pNext` chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT** can also be used in the `pNext` chain of **VkDeviceCreateInfo** to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT-sType-sType**

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_EXT**

---

The **VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT** structure is defined as:

```c
typedef struct VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 subpassMergeFeedback;
} VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **subpassMergeFeedback** indicates whether the implementation supports feedback of subpass merging.

If the **VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT** structure is included in the `pNext` chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT** can also be used in the `pNext` chain of **VkDeviceCreateInfo** to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT-sType-sType**

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_MERGE_FEEDBACK_FEATURES_EXT**
The `VkPhysicalDeviceLinearColorAttachmentFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_linear_color_attachment
typedef struct VkPhysicalDeviceLinearColorAttachmentFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 linearColorAttachment;
} VkPhysicalDeviceLinearColorAttachmentFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `linearColorAttachment` indicates whether the implementation supports renderable **Linear Color Attachment**

If the `VkPhysicalDeviceLinearColorAttachmentFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLinearColorAttachmentFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceLinearColorAttachmentFeaturesNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINEAR_COLOR_ATTACHMENT_FEATURES_NV`

The `VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_attachment_feedback_loop_layout
typedef struct VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 attachmentFeedbackLoopLayout;
} VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `attachmentFeedbackLoopLayout` indicates whether the implementation supports using `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout for images created with `VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT`. 
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ATTACHMENT_FEEDBACK_LOOP_LAYOUT_FEATURES_EXT

The `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            graphicsPipelineLibrary;
} VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `graphicsPipelineLibrary` indicates that the implementation supports graphics pipeline libraries.

If the `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_FEATURES_EXT

The `VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            multisampledRenderToSingleSampled;
} VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• multisampledRenderToSingleSampled indicates that the implementation supports multisampled rendering to single-sampled render pass attachments.

If the VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_FEATURES_EXT

The VkPhysicalDeviceImage2DViewOf3DFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_image_2d_view_of_3d
typedef struct VkPhysicalDeviceImage2DViewOf3DFeaturesEXT {  
    VkStructureType sType;  
    void* pNext;  
    VkBool32 image2DViewOf3D;  
    VkBool32 sampler2DViewOf3D;  
} VkPhysicalDeviceImage2DViewOf3DFeaturesEXT;  
```

This structure describes the following features:

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• image2DViewOf3D indicates that the implementation supports using a 2D view of a 3D image in a descriptor of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE if the image is created using VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT.

• sampler2DViewOf3D indicates that the implementation supports using a 2D view of a 3D image in a descriptor of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the image is created using VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT.

If the VkPhysicalDeviceImage2DViewOf3DFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImage2DViewOf3DFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
The `VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_image_sliced_view_of_3d
typedef struct VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageSlicedViewOf3D;
} VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT;
```

The members of the `VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT` structure describe the following features:

- `imageSlicedViewOf3D` indicates that the implementation supports using a sliced view of a 3D image in a descriptor of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` by using a `VkImageViewSlicedCreateInfoEXT` structure when creating the view.

If the `VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceImageCompressionControlFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_image_compression_control
typedef struct VkPhysicalDeviceImageCompressionControlFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageCompressionControl;
} VkPhysicalDeviceImageCompressionControlFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• imageCompressionControl indicates that the implementation supports providing controls for image compression at image creation time.

If the VkPhysicalDeviceImageCompressionControlFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageCompressionControlFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageCompressionControlFeaturesEXT-sType-sType

The VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT structure is defined as:

```cpp
// Provided by VK_EXT_image_compression_control_swapchain
typedef struct VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageCompressionControlSwapchain;
} VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- imageCompressionControlSwapchain indicates that the implementation supports controlling image controls per swapchain and querying image compression properties per surface.

If the VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT-sType-sType

The VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR structure is defined as:
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **rayTracingPositionFetch** indicates that the implementation supports fetching the object space vertex positions of a hit triangle.

If the `VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR-sType-sType**

The `VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD` structure is defined as:

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderEarlyAndLateFragmentTests** indicates whether the implementation supports the `EarlyAndLateFragmentTestsAMD` Execution Mode.

If the `VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD-sType-sType

sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_EARLY_AND_LATE_FRAGMENT_TESTS_FEATURES_AMD

The VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_non_seamless_cube_map
typedef struct VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 nonSeamlessCubeMap;
} VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- nonSeamlessCubeMap indicates that the implementation supports
  VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT.

If the VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT-sType-sType

sType must be VK_STRUCTURE_TYPE_PHYSICALDEVICE_NON_SEAMLESS_CUBE_MAP_FEATURES_EXT

The VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_shader_module_identifier
typedef struct VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderModuleIdentifier;
} VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderModuleIdentifier** indicates whether the implementation supports querying an identifier of a `VkShaderModule` or `VkShaderModuleCreateInfo` structure, and creating pipelines from identifiers only.

If the `VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_MODULE_IDENTIFIER_FEATURES_EXT`

The `VkPhysicalDeviceTilePropertiesFeaturesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_tile_properties
typedef struct VkPhysicalDeviceTilePropertiesFeaturesQCOM {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          tileProperties;
} VkPhysicalDeviceTilePropertiesFeaturesQCOM;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **tileProperties** indicates that the implementation supports queries for returning tile properties.

If the `VkPhysicalDeviceTilePropertiesFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTilePropertiesFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTilePropertiesFeaturesQCOM-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TILE_PROPERTIES_FEATURES_QCOM`
The `VkPhysicalDeviceImageProcessingFeaturesQCOM` structure is defined as:

```
// Provided by VK_QCOM_image_processing
typedef struct VkPhysicalDeviceImageProcessingFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureSampleWeighted;
    VkBool32 textureBoxFilter;
    VkBool32 textureBlockMatch;
} VkPhysicalDeviceImageProcessingFeaturesQCOM;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `textureSampleWeighted` indicates that the implementation supports shader modules that declare the `TextureSampleWeightedQCOM` capability.
- `textureBoxFilter` indicates that the implementation supports shader modules that declare the `TextureBoxFilterQCOM` capability.
- `textureBlockMatch` indicates that the implementation supports shader modules that declare the `TextureBlockMatchQCOM` capability.

If the `VkPhysicalDeviceImageProcessingFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageProcessingFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceImageProcessingFeaturesQCOM-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_FEATURES_QCOM`

The `VkPhysicalDeviceDepthClampZeroOneFeaturesEXT` structure is defined as:

```
// Provided by VK_EXT_depth_clamp_zero_one
typedef struct VkPhysicalDeviceDepthClampZeroOneFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClampZeroOne;
} VkPhysicalDeviceDepthClampZeroOneFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.

• depthClampZeroOne indicates that the implementation supports clamping the depth to a range of 0 to 1.

If the VkPhysicalDeviceDepthClampZeroOneFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDepthClampZeroOneFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceDepthClampZeroOneFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLAMP_ZERO_ONE_FEATURES_EXT

The VkPhysicalDeviceShaderTileImageFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_shader_tile_image
typedef struct VkPhysicalDeviceShaderTileImageFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTileImageColorReadAccess;
    VkBool32 shaderTileImageDepthReadAccess;
    VkBool32 shaderTileImageStencilReadAccess;
} VkPhysicalDeviceShaderTileImageFeaturesEXT;
```

The members of the VkPhysicalDeviceShaderTileImageFeaturesEXT structure describe the following features:

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• shaderTileImageColorReadAccess indicates that the implementation supports the TileImageColorReadAccessEXT SPIR-V capability.

• shaderTileImageDepthReadAccess indicates that the implementation supports the TileImageDepthReadAccessEXT SPIR-V capability.

• shaderTileImageStencilReadAccess indicates that the implementation supports the TileImageStencilReadAccessEXT SPIR-V capability.

If the VkPhysicalDeviceShaderTileImageFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderTileImageFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTileImageFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_FEATURES_EXT

The VkPhysicalDeviceDepthBiasControlFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkPhysicalDeviceDepthBiasControlFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthBiasControl;
    VkBool32 leastRepresentableValueForceUnormRepresentation;
    VkBool32 floatRepresentation;
    VkBool32 depthBiasExact;
} VkPhysicalDeviceDepthBiasControlFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthBiasControl** indicates whether the implementation supports the vkCmdSetDepthBias2EXT command and the VkDepthBiasRepresentationInfoEXT structure.
- **leastRepresentableValueForceUnormRepresentation** indicates whether the implementation supports using the VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT depth bias representation.
- **floatRepresentation** indicates whether the implementation supports using the VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT depth bias representation.
- **depthBiasExact** indicates whether the implementation supports forcing depth bias to not be scaled to ensure a minimum resolvable difference using VkDepthBiasRepresentationInfoEXT ::depthBiasExact.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthBiasControlFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_BIAS_CONTROL_FEATURES_EXT

The VkPhysicalDeviceAddressBindingReportFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_device_address_binding_report
typedef struct VkPhysicalDeviceAddressBindingReportFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 reportAddressBinding;
} VkPhysicalDeviceAddressBindingReportFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- reportAddressBinding indicates whether this implementation supports reporting the binding of GPU virtual address ranges to Vulkan objects.

If the `VkPhysicalDeviceAddressBindingReportFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceAddressBindingReportFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAddressBindingReportFeaturesEXT-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ADDRESS_BINDING_REPORT_FEATURES_EXT`

The `VkPhysicalDeviceOpticalFlowFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkPhysicalDeviceOpticalFlowFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 opticalFlow;
} VkPhysicalDeviceOpticalFlowFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **opticalFlow** indicates whether the implementation supports optical flow.

If the `VkPhysicalDeviceOpticalFlowFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceOpticalFlowFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpticalFlowFeaturesNV-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPTICAL_FLOW_FEATURES_NV`
The **VkPhysicalDeviceFaultFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkPhysicalDeviceFaultFeaturesEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkBool32                 deviceFault;
    VkBool32                 deviceFaultVendorBinary;
} VkPhysicalDeviceFaultFeaturesEXT;
```

The members of the **VkPhysicalDeviceFaultFeaturesEXT** structure describe the following features:

- **deviceFault** indicates that the implementation supports the reporting of device fault information.
- **deviceFaultVendorBinary** indicates that the implementation supports the generation of vendor-specific binary crash dumps. These may provide additional information when imported into vendor-specific external tools.

If the **VkPhysicalDeviceFaultFeaturesEXT** structure is included in the `pNext` chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceFaultFeaturesEXT** can also be used in the `pNext` chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFaultFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FAULT_FEATURES_EXT`

The **VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_pipeline_library_group_handles
typedef struct VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT {
    VkStructureType          sType;
    void*                    pNext;
    VkBool32                 pipelineLibraryGroupHandles;
} VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT;
```

This structure describes the following features:

- **pipelineLibraryGroupHandles** indicates whether the implementation supports querying group handles directly from a ray tracing pipeline library, and guarantees bitwise identical group handles for such libraries when linked into other pipelines.

If the **VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT** structure is included in the `pNext` chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_LIBRARY_GROUP_HANDLES_FEATURES_EXT

The VkPhysicalDeviceShaderObjectFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkPhysicalDeviceShaderObjectFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderObject;
} VkPhysicalDeviceShaderObjectFeaturesEXT;
```

This structure describes the following feature:

- shaderObject indicates whether the implementation supports shader objects.

If the VkPhysicalDeviceShaderObjectFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderObjectFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderObjectFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_OBJECT_FEATURES_EXT

The VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM structure is defined as:

```c
// Provided by VK_ARM_shader_core_builtins
typedef struct VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderCoreBuiltins;
} VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **shaderCoreBuiltins** indicates whether the implementation supports the SPIR-V CoreBuiltinsARM capability.

If the `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_BUILTINS_FEATURES_ARM`

The `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 swapchainMaintenance1;
} VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **swapchainMaintenance1** indicates that the implementation supports the following:
  
  - `VkSwapchainPresentFenceInfoEXT`, specifying a fence that is signaled when the resources associated with a present operation can be safely destroyed.
  
  - `VkSwapchainPresentModesCreateInfoEXT` and `VkSwapchainPresentModeInfoEXT`, allowing the swapchain to switch present modes without a need for recreation.
  
  - `VkSwapchainPresentScalingCreateInfoEXT`, specifying the scaling behavior of the swapchain in presence of window resizing.
  
  - The `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, allowing the implementation to defer the allocation of swapchain image memory until first acquisition.
  
  - `vkReleaseSwapchainImagesEXT`, allowing acquired swapchain images to be released without presenting them.

If the `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` can also be used in the `pNext` chain of
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SWAPCHAIN_MAINTENANCE_1_FEATURES_EXT

The VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_dynamic_rendering_unused_attachments
typedef struct VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 dynamicRenderingUnusedAttachments;
} VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• dynamicRenderingUnusedAttachments indicates that the implementation supports binding graphics pipelines within a render pass instance where any pipeline VkPipelineRenderingCreateInfo::pColorAttachmentFormats element with a format other than VK_FORMAT_UNDEFINED is allowed with a corresponding VkRenderingInfo::pColorAttachments element with a imageView equal to VK_NULL_HANDLE, or any pipeline VkPipelineRenderingCreateInfo::pColorAttachmentFormats element with a VK_FORMAT_UNDEFINED format is allowed with a corresponding VkRenderingInfo::pColorAttachments element with a non-VK_NULL_HANDLE imageView. Also a VkPipelineRenderingCreateInfo::depthAttachmentFormat other than VK_FORMAT_UNDEFINED is allowed with a VK_NULL_HANDLE VkRenderingInfo::pDepthAttachment, or a VkPipelineRenderingCreateInfo::depthAttachmentFormat of VK_FORMAT_UNDEFINED is allowed with a non-VK_NULL_HANDLE VkRenderingInfo::pDepthAttachment. Also a VkPipelineRenderingCreateInfo::stencilAttachmentFormat other than VK_FORMAT_UNDEFINED is allowed with a VK_NULL_HANDLE VkRenderingInfo::pStencilAttachment, or a VkPipelineRenderingCreateInfo::stencilAttachmentFormat of VK_FORMAT_UNDEFINED is allowed with a non-VK_NULL_HANDLE VkRenderingInfo::pStencilAttachment. Any writes to a VkRenderingInfo::pColorAttachments, VkRenderingInfo::pDepthAttachment, or VkRenderingInfo::pStencilAttachment with VK_NULL_HANDLE are discarded.

If the VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

• VUID-VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_UNUSED_ATTACHMENTS_FEATURES_EXT

The VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV structure is defined as:

```
// Provided by VK_NV_ray_tracing_invocation_reorder
typedef struct VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingInvocationReorder;
} VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• rayTracingInvocationReorder indicates that the implementation supports SPV_NV_shader_invocation_reorder.

If the VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_FEATURES_NV

The VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM structure is defined as:

```
// Provided by VK_QCOM_multiview_per_view_viewports
typedef struct VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiviewPerViewViewports;
} VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM;
```

This structure describes the following features:
• **multiviewPerViewViewports** indicates that the implementation supports multiview per-view viewports.

If the `VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_VIEWPORTS_FEATURES_QCOM`

The `VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_multiview_per_view_render_areas
typedef struct VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM {
    VkStructureType         sType;
    void*                   pNext;
    VkBool32                multiviewPerViewRenderAreas;
} VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM;
```

This structure describes the following features:

- **multiviewPerViewRenderAreas** indicates that the implementation supports multiview per-view render areas.

If the `VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_RENDER_AREAS_FEATURES_QCOM`

The `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
typedef struct VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI {
    VkStructureType         sType;
} VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI;
```
void* pNext;
VkBool32 clustercullingShader;
VkBool32 multiviewClusterCullingShader;
} VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• clustercullingShader specifies whether cluster culling shader is supported.
• multiviewClusterCullingShader specifies whether multiview is supported.

If the VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage ( Implicit)

• VUID-VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI-sType-sType sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CLUSTER_CULLING_SHADER_FEATURES_HUAWEI

45.1. Feature Requirements

All Vulkan graphics implementations must support the following features:

• robustBufferAccess, unless the VK_KHR_portability_subset extension is enabled.
• multiview, if Vulkan 1.1 is supported.
• shaderDrawParameters, if the VK_KHR_shader_draw_parameters extension is supported.
• uniformBufferStandardLayout, if Vulkan 1.2 or the VK_KHR_uniform_buffer_standard_layout extension is supported.
• variablePointersStorageBuffer, if the VK_KHR_variable_pointers extension is supported.
• storageBuffer8BitAccess, if the VK_KHR_8bit_storage extension is supported.
• storageBuffer8BitAccess, if uniformAndStorageBuffer8BitAccess is enabled.
• If the descriptorIndexing feature is supported, or if the VK_EXT_descriptor_indexing extension is supported:
  ◦ shaderSampledImageArrayDynamicIndexing
  ◦ shaderStorageBufferArrayDynamicIndexing
  ◦ shaderUniformTexelBufferArrayDynamicIndexing
  ◦ shaderStorageTexelBufferArrayDynamicIndexing
  ◦ shaderSampledImageArrayNonUniformIndexing
- shaderStorageBufferArrayNonUniformIndexing
- shaderUniformTexelBufferArrayNonUniformIndexing
- descriptorBindingSampledImageUpdateAfterBind
- descriptorBindingStorageImageUpdateAfterBind
- descriptorBindingStorageBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
- descriptorBindingUniformTexelBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
- descriptorBindingStorageTexelBufferUpdateAfterBind (see also robustBufferAccessUpdateAfterBind)
- descriptorBindingUpdateUnusedWhilePending
- descriptorBindingPartiallyBound
- descriptorBindingInlineUniformBlockUpdateAfterBind
- descriptorBindingInlineUniformBlockUpdateAfterBind
- descriptorBindingInlineUniformBlockUpdateAfterBind
- descriptorBindingInlineUniformBlockUpdateAfterBind
- runtimeDescriptorArray

If Vulkan 1.3 is supported:
- vulkanMemoryModel
- vulkanMemoryModelDeviceScope

- inlineUniformBlock, if Vulkan 1.3 or the VK_EXT_inline_uniform_block extension is supported.
- descriptorBindingInlineUniformBlockUpdateAfterBind, if Vulkan 1.3 or the VK_EXT_inline_uniform_block extension is supported; and if the descriptorIndexing feature is supported, or the VK_EXT_descriptor_indexing extension is supported.
- scalarBlockLayout, if the VK_EXT_scalar_block_layout extension is supported.
- subgroupBroadcastDynamicId, if Vulkan 1.2 is supported.
- samplerMirrorClampToEdge, if the VK_KHR_sampler_mirror_clamp_to_edge extension is supported.
- drawIndirectCount, if the VK_KHR_draw_indirect_count extension is supported.
- samplerFilterMinmax, if the VK_EXT_sampler_filter_minmax extension is supported.
- shaderOutputViewportIndex, if the VK_EXT_shader_viewport_index_layer extension is supported.
- shaderOutputLayer, if the VK_EXT_shader_viewport_index_layer extension is supported.
- subgroupSizeControl, if Vulkan 1.3 or the VK_EXT_subgroup_size_control extension is supported.
- computeFullSubgroups, if Vulkan 1.3 or the VK_EXT_subgroup_size_control extension is supported.
- deviceMemoryReport, if the VK_EXT_device_memory_report extension is supported.
- globalPriorityQuery, if the VK_EXT_global_priority_query extension is supported.
- globalPriorityQuery, if the VK_KHR_global_priority extension is supported.
- imagelessFramebuffer, if Vulkan 1.2 or the VK_KHR_imageless_framebuffer extension is supported.
- separateDepthStencilLayouts, if Vulkan 1.2 or the VK_KHR_separate_depth_STENCIL_layouts extension is supported.
- hostQueryReset, if Vulkan 1.2 or the VK_EXT_host_query_reset extension is supported.
- timelineSemaphore, if Vulkan 1.2 or the VK_KHR_timeline_semaphore extension is supported.
If the `VK_KHR_acceleration_structure` extension is supported:
- `accelerationStructure`
- All the features required by the `descriptorIndexing` feature if Vulkan 1.2 is supported, or the `VK_EXT_descriptor_indexing` extension.
- `descriptorBindingAccelerationStructureUpdateAfterBind`
- `bufferDeviceAddress` from Vulkan 1.2 or the `VK_KHR_buffer_device_address` extension.

If the `VK_KHR_ray_tracing_pipeline` extension is supported:
- `rayTracingPipeline`
- `rayTracingPipelineTraceRaysIndirect`
- `rayTraversalPrimitiveCulling`, if `rayQuery` is supported
- the `VK_KHR_pipeline_library` extension must be supported.

- `rayQuery`, if the `VK_KHR_ray_query` extension is supported.
- `pipelineCreationCacheControl`, if Vulkan 1.3 or the `VK_EXT_pipeline_creation_cache_control` extension is supported.
- `shaderSubgroupExtendedTypes`, if Vulkan 1.2 or the `VK_KHR_shader_subgroup_extended_types` extension is supported.
- `samplerYcbcrConversion`, if the `VK_KHR_sampler_ycbcr_conversion` extension is supported.
- `pipelineExecutableInfo`, if the `VK_KHR_pipeline_executable_properties` extension is supported.
- `textureCompressionASTC_HDR`, if the `VK_EXT_texture_compression_astc_hdr` extension is supported.
- `depthClipEnable`, if the `VK_EXT_depth_clip_enable` extension is supported.
- `memoryPriority`, if the `VK_EXT_memory_priority` extension is supported.
- `ycbcrImageArrays`, if the `VK_EXT_ycbcr_image_arrays` extension is supported.
- `indexTypeUint8`, if the `VK_EXT_index_type_uint8` extension is supported.
- `primitiveTopologyListRestart`, if the `VK_EXT_primitive_topology_list_restart` extension is supported.
- `shaderDemoteToHelperInvocation`, if Vulkan 1.3 or the `VK_EXT_shader_demote_to_helper_invocation` extension is supported.
- `texelBufferAlignment`, if Vulkan 1.3 or the `VK_EXT_texel_buffer_alignment` extension is supported.
- `vulkanMemoryModel`, if the `VK_KHR_vulkan_memory_model` extension is supported.
- `bufferDeviceAddress`, if Vulkan 1.3 or the `VK_KHR_buffer_device_address` extension is supported.
- `performanceCounterQueryPools`, if the `VK_KHR_performance_query` extension is supported.
- `transformFeedback`, if the `VK_EXT_transform_feedback` extension is supported.
- `conditionalRendering`, if the `VK_EXT_conditional_rendering` extension is supported.
- `vertexAttributeInstanceRateDivisor`, if the `VK_EXT_vertex_attribute_divisor` extension is supported.
- `fragmentDensityMap`, if the `VK_EXT_fragment_density_map` extension is supported.
• shaderSubgroupClock, if the VK_KHR_shader_clock extension is supported.
• shaderBufferInt64Atomics, if the VK_KHR_shader_atomic_int64 extension is supported.
• shaderInt64, if the shaderSharedInt64Atomics or shaderBufferInt64Atomics features are supported.
• shaderFloat16 or shaderInt8, if the VK_KHR_shader_float16_int8 extension is supported.
• fragmentShaderSampleInterlock or fragmentShaderPixelInterlock or fragmentShaderShadingRateInterlock, if the VK_EXT_fragment_shader_interlock extension is supported.
• rectangularLines or bresenhamLines or smoothLines or stippledRectangularLines or stippledBresenhamLines or stippledSmoothLines, if the VK_EXT_line_rasterization extension is supported.
• storageBuffer16BitAccess, if the VK_KHR_16bit_storage extension is supported.
• storageBuffer16BitAccess, if uniformAndStorageBuffer16BitAccess is enabled.
• robustImageAccess, if Vulkan 1.3 or the VK_EXT_image_robustness extension is supported.
• formatA4R4G4B4, if the VK_EXT_4444_formats extension is supported.
• mutableDescriptorType, if the VK_EXT_mutable_descriptor_type or VK_VALVE_mutable_descriptor_type extension is supported.
• shaderInt64 and shaderImageInt64Atomics, if the VK_EXT_shader_image_atomic_int64 extension is supported.
• shaderImageInt64Atomics, if the sparseImageInt64Atomics feature is supported.
• shaderImageFloat32Atomics, if the sparseImageFloat32Atomics feature is supported.
• shaderImageFloat32AtomicAdd, if the sparseImageFloat32AtomicAdd feature is supported.
• primitivesGeneratedQuery, if the VK_EXT_primitives_generated_query extension is supported.
• pipelineFragmentShadingRate, if the VK_KHR_fragment_shading_rate extension is supported.
• pipelineProtectedAccess, if the VK_EXT_pipeline_protected_access extension is supported.
• legacyDithering, if the VK_EXT_legacy_dithering extension is supported.
• shaderTerminateInvocation if Vulkan 1.3 or the VK_KHR_shader_terminate_invocation extension is supported.
• shaderZeroInitializeWorkgroupMemory, if Vulkan 1.3 or the VK_KHR_zero_initialize_workgroup_memory extension is supported.
• workgroupMemoryExplicitLayout, if the VK_KHR_workgroup_memory_explicit_layout extension is supported.
• vertexInputDynamicState, if the VK_EXT_vertex_input_dynamic_state extension is supported.
• synchronization2 if Vulkan 1.3 or the VK_KHR_synchronization2 extension is supported.
• provokingVertexLast, if the VK_EXT_provoking_vertex extension is supported.
• descriptorBuffer, if the VK_EXT_descriptor_buffer extension is supported.
• shaderSubgroupUniformControlFlow, if the VK_KHR_shader_subgroup_uniform_control_flow extension is supported.
- `borderColorSwizzle` if the `VK_EXT_border_color_swizzle` extension is supported.
- `multiDraw`, if the `VK_EXT_multi_draw` extension is supported.
- `shaderImageFloat32AtomicMinMax`, if the `sparseImageFloat32AtomicMinMax` feature is supported.
- `presentId`, if the `VK_KHR_present_id` extension is supported.
- `presentWait`, if the `VK_KHR_present_wait` extension is supported.
- `shaderIntegerDotProduct`, if Vulkan 1.3 or the `VK_KHR_shader_integer_dot_product` extension is supported.
- `maintenance4`, if Vulkan 1.3 or the `VK_KHR_maintenance4` extension is supported.
- `image2DViewOf3D`, if the `VK_EXT_image_2d_view_of_3d` extension is supported.
- `imageSlicedViewOf3D`, if the `VK_EXT_image_sliced_view_of_3d` extension is supported.
- `privateData`, if Vulkan 1.3 or the `VK_EXT_private_data` extension is supported.
- `extendedDynamicState`, if the `VK_EXT_extended_dynamic_state` extension is supported.
- `extendedDynamicState2`, if the `VK_EXT_extended_dynamic_state2` extension is supported.
- `depthClipControl`, if the `VK_EXT_depth_clip_control` extension is supported.
- `minLod`, if the `VK_EXT_image_view_min_lod` extension is supported.
- `linearColorAttachment`, if the `VK_NV_linear_color_attachment` extension is supported.
- `presentBarrier`, if the `VK_NV_present_barrier` extension is supported.
- `graphicsPipelineLibrary`, if the `VK_EXT_graphics_pipeline_library` extension is supported.
- `dynamicRendering`, if Vulkan 1.3 or the `VK_KHR_dynamic_rendering` extension is supported.
- `taskShader` and `meshShader`, if the `VK_EXT_mesh_shader` extension is supported.
- `primitiveFragmentShadingRate` if the `VK_KHR_primitive_fragment_shading_rate` feature is supported.
- `subpassMergeFeedback`, if the `VK_EXT_subpass_merge_feedback` extension is supported.
- `rayTracingMaintenance1`, if the `VK_KHR_ray_tracing_maintenance1` extension is supported.
- `colorWriteEnable`, if the `VK_EXT_color_write_enable` extension is supported.
- `multisampledRenderToSingleSampled`, if the `VK_EXT_multisampled_render_to_single_sampled` extension is supported.
- `imageCompressionControl`, if the `VK_EXT_image_compression_control` extension is supported.
- `imageCompressionControlSwapchain`, if the `VK_EXT_image_compression_control_swapchain` extension is supported.
- `shaderEarlyAndLateFragmentTests`, if the `VK_AMD_shader_early_and_late_fragment_tests` extension is supported.
- `nonSeamlessCubeMap`, if the `VK_EXT_non_seamless_cube_map` extension is supported.
- `shaderModuleIdentifier`, if the `VK_EXT_shader_module_identifier` extension is supported.
- `pipelineRobustness`, if the `VK_EXT_pipeline_robustness` extension is supported.
- `textureSampleWeighted`, `TextureBlockMatch`, and `TextureBoxFilter` if the `VK_QCOM_image_processing` extension is supported.
• tileProperties if VK_QCOM_tile_properties extension is supported.
• attachmentFeedbackLoopLayout, if the VK_EXT_attachment_feedback_loop_layout extension is supported.
• depthClampZeroOne, if the VK_EXT_depth_clamp_zero_one extension is supported.
• deviceFault, if the VK_EXT_device_fault extension is supported.
• reportAddressBinding, if the VK_EXT_device_address_binding_report extension is supported.
• micromap, if the VK_EXT_opacity_micromap extension is supported.
• displacementMicromap, if the VK_NV_displacement_micromap extension is supported.
• pipelineLibraryGroupHandles, if the VK_EXT_pipeline_library_group_handles extension is supported.
• swapchainMaintenance1, if the VK_EXT_swapchain_maintenance1 extension is supported.
• tessellationShader, if the extendedDynamicState3TessellationDomainOrigin feature is supported.
• depthClamp, if the extendedDynamicState3DepthClampEnable feature is supported.
• fillModeNonSolid, if the extendedDynamicState3PolygonMode feature is supported.
• alphaToOne, if the extendedDynamicState3AlphaToOneEnable feature is supported.
• logicOp, if the extendedDynamicState3LogicOpEnable feature is supported.
• geometryStreams, if the extendedDynamicState3RasterizationStream feature is supported.
• VK_EXT_conservative_rasterization extension, if the extendedDynamicState3ConservativeRasterizationMode feature is supported.
• depthClipControl, if the extendedDynamicState3DepthClipNegativeOneToOne feature is supported.
• VK_NV_clip_space_w_scaling extension, if the extendedDynamicState3ViewportWScalingEnable feature is supported.
• VK_NV_fragment_coverage_to_color extension, if the extendedDynamicState3CoverageToColorEnable feature is supported.
•VK_NV_fragment_coverage_to_color extension, if the extendedDynamicState3ColorBlendAdvanced feature is supported.
• provokingVertexLast, if the extendedDynamicState3ProvokingVertexMode feature is supported.
• VK_EXT_line_rasterization extension, if the extendedDynamicState3LineRasterizationMode feature is supported.
• depthClipControl, if the extendedDynamicState3DepthClipNegativeOneToOne feature is supported.
• VK_NV_viewport_swizzle extension, if the extendedDynamicState3ViewportSwizzle feature is supported.
The `extendedDynamicState3CoverageToColorLocation` feature is supported.

- **VK_NV_framebuffer_mixed_samples** extension, if the `extendedDynamicState3CoverageModulationMode` feature is supported.
- **VK_NV_framebuffer_mixed_samples** extension, if the `extendedDynamicState3CoverageModulationTableEnable` feature is supported.
- **VK_NV_framebuffer_mixed_samples** extension, if the `extendedDynamicState3CoverageModulationTable` feature is supported.
- `coverageReductionMode`, if the `extendedDynamicState3CoverageReductionMode` feature is supported.
- `representativeFragmentTest`, if the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is supported.
- `shadingRateImage`, if the `extendedDynamicState3ShadingRateImageEnable` feature is supported.
- `multiviewPerViewViewports`, if the `VK_QCOM_multiview_per_view_viewports` extension is supported.
- `attachmentFeedbackLoopDynamicState`, if the `VK_EXT_attachment_feedback_loop_dynamic_state` extension is supported.
- `rayTracingPositionFetch`, if the `VK_KHR_ray_tracing_position_fetch` extension is supported.
- `shaderObject`, if the `VK_EXT_shader_object` extension is supported.
- `shaderTileImageColorReadAccess`, if the `VK_EXT_shader_tile_image` extension is supported.
- `depthBiasControl`, if the `VK_EXT_depth_bias_control` extension is supported.

All other features defined in the Specification are **optional**.

### 45.2. Profile Features

#### 45.2.1. Roadmap 2022

Implementations that claim support for the **Roadmap 2022** profile **must** support the following features:

- `fullDrawIndexUint32`
- `imageCubeArray`
- `independentBlend`
- `sampleRateShading`
- `drawIndirectFirstInstance`
- `depthClamp`
- `depthBiasClamp`
- `samplerAnisotropy`
- `occlusionQueryPrecise`
- `fragmentStoresAndAtomics`
- `shaderStorageImageExtendedFormats`
• shaderUniformBufferArrayDynamicIndexing
• shaderSampledImageArrayDynamicIndexing
• shaderStorageBufferArrayDynamicIndexing
• shaderStorageImageArrayDynamicIndexing
• samplerYcbcrConversion
• samplerMirrorClampToEdge
• descriptorIndexing
• shaderUniformTexelBufferArrayDynamicIndexing
• shaderStorageTexelBufferArrayDynamicIndexing
• shaderUniformBufferArrayNonUniformIndexing
• shaderSampledImageArrayNonUniformIndexing
• shaderStorageBufferArrayNonUniformIndexing
• shaderStorageImageArrayNonUniformIndexing
• shaderUniformTexelBufferArrayNonUniformIndexing
• shaderStorageTexelBufferArrayNonUniformIndexing
• descriptorBindingSampledImageUpdateAfterBind
• descriptorBindingStorageImageUpdateAfterBind
• descriptorBindingStorageBufferUpdateAfterBind
• descriptorBindingUniformTexelBufferUpdateAfterBind
• descriptorBindingStorageTexelBufferUpdateAfterBind
• descriptorBindingUpdateUnusedWhilePending
• descriptorBindingPartiallyBound
• descriptorBindingVariableDescriptorCount
• runtimeDescriptorArray
• scalarBlockLayout
Chapter 46. Limits

Limits are implementation-dependent minimums, maximums, and other device characteristics that an application may need to be aware of.

Note
Limits are reported via the basic `VkPhysicalDeviceLimits` structure as well as the extensible structure `VkPhysicalDeviceProperties2`, which was added in `VK_KHR_get_physical_device_properties2` and included in Vulkan 1.1. When limits are added in future Vulkan versions or extensions, each extension should introduce one new limit structure, if needed. This structure can be added to the `pNext` chain of the `VkPhysicalDeviceProperties2` structure.

The `VkPhysicalDeviceLimits` structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceLimits {
    uint32_t maxImageDimension1D;
    uint32_t maxImageDimension2D;
    uint32_t maxImageDimension3D;
    uint32_t maxImageDimensionCube;
    uint32_t maxImageArrayLayers;
    uint32_t maxTexelBufferElements;
    uint32_t maxUniformBufferRange;
    uint32_t maxStorageBufferRange;
    uint32_t maxPushConstantsSize;
    uint32_t maxMemoryAllocationCount;
    uint32_t maxSamplerAllocationCount;
    VkDeviceSize bufferImageGranularity;
    VkDeviceSize sparseAddressSpaceSize;
    uint32_t maxBoundDescriptorSets;
    uint32_t maxPerStageDescriptorSamplers;
    uint32_t maxPerStageDescriptorUniformBuffers;
    uint32_t maxPerStageDescriptorStorageBuffers;
    uint32_t maxPerStageDescriptorSampledImages;
    uint32_t maxPerStageDescriptorStorageImages;
    uint32_t maxPerStageDescriptorInputAttachments;
    uint32_t maxPerStageResources;
    uint32_t maxDescriptorSetSamplers;
    uint32_t maxDescriptorSetUniformBuffers;
    uint32_t maxDescriptorSetUniformBuffersDynamic;
    uint32_t maxDescriptorSetStorageBuffers;
    uint32_t maxDescriptorSetStorageBuffersDynamic;
    uint32_t maxDescriptorSetSampledImages;
    uint32_t maxDescriptorSetStorageImages;
    uint32_t maxDescriptorSetInputAttachments;
    uint32_t maxVertexInputAttributes;
    uint32_t maxVertexInputBindings;
    uint32_t maxVertexInputAttributeOffset;
};
```
uint32_t maxVertexInputBindingStride;
uint32_t maxVertexOutputComponents;
uint32_t maxTessellationGenerationLevel;
uint32_t maxTessellationPatchSize;
uint32_t maxTessellationControlPerVertexInputComponents;
uint32_t maxTessellationControlPerVertexOutputComponents;
uint32_t maxTessellationControlPerPatchOutputComponents;
uint32_t maxTessellationControlTotalOutputComponents;
uint32_t maxTessellationEvaluationInputComponents;
uint32_t maxTessellationEvaluationOutputComponents;
uint32_t maxGeometryShaderInvocations;
uint32_t maxGeometryInputComponents;
uint32_t maxGeometryOutputComponents;
uint32_t maxGeometryTotalOutputComponents;
uint32_t maxTessellationGenerationLevel;
uint32_t maxTessellationPatchSize;
uint32_t maxTessellationControlPerVertexInputComponents;
uint32_t maxTessellationControlPerVertexOutputComponents;
uint32_t maxTessellationControlPerPatchOutputComponents;
uint32_t maxTessellationControlTotalOutputComponents;
uint32_t maxTessellationEvaluationInputComponents;
uint32_t maxTessellationEvaluationOutputComponents;
uint32_t maxGeometryShaderInvocations;
uint32_t maxGeometryInputComponents;
uint32_t maxGeometryOutputComponents;
uint32_t maxGeometryTotalOutputComponents;
uint32_t maxFragmentInputComponents;
uint32_t maxFragmentOutputAttachments;
uint32_t maxFragmentDualSrcAttachments;
uint32_t maxFragmentCombinedOutputResources;
uint32_t maxComputeSharedMemorySize;
uint32_t maxComputeWorkGroupCount[3];
uint32_t maxComputeWorkGroupInvocations;
uint32_t maxComputeWorkGroupSize[3];
uint32_t subPixelPrecisionBits;
uint32_t subTexelPrecisionBits;
uint32_t.mipmapPrecisionBits;
uint32_t maxDrawIndexedIndexValue;
uint32_t maxDrawIndirectCount;
float maxSamplerLodBias;
float maxSamplerAnisotropy;
uint32_t maxViewports;
uint32_t maxViewportDimensions[2];
float viewportBoundsRange[2];
uint32_t viewportSubPixelBits;
size_t minMemoryMapAlignment;
VkDeviceSize minTexelBufferOffsetAlignment;
VkDeviceSize minUniformBufferOffsetAlignment;
VkDeviceSize minStorageBufferOffsetAlignment;
int32_t minTexelOffset;
uint32_t max TexelOffset;
int32_t minTexelGatherOffset;
uint32_t max TexelGatherOffset;
float minInterpolationOffset;
float maxInterpolationOffset;
uint32_t subPixelInterpolationOffsetBits;
uint32_t maxFramebufferWidth;
uint32_t maxFramebufferHeight;
uint32_t maxFramebufferLayers;
VkSampleCountFlags framebufferColorSampleCounts;
VkSampleCountFlags framebufferDepthSampleCounts;
VkSampleCountFlags framebufferStencilSampleCounts;
The `VkPhysicalDeviceLimits` are properties of the physical device. These are available in the `limits` member of the `VkPhysicalDeviceProperties` structure which is returned from `vkGetPhysicalDeviceProperties`.

- **maxImageDimension1D** is the largest dimension (width) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_1D`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension2D** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and without `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension3D** is the largest dimension (width, height, or depth) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_3D`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimensionCube** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of `VK_IMAGE_TYPE_2D` and with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` set in `flags`. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`. 
• **maxImageArrayLayers** is the maximum number of layers (arrayLayers) for an image.

• **maxTexelBufferElements** is the maximum number of addressable texels for a buffer view created on a buffer which was created with the `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set in the `usage` member of the `VkBufferCreateInfo` structure.

• **maxUniformBufferRange** is the maximum value that can be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.

• **maxStorageBufferRange** is the maximum value that can be specified in the `range` member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

• **maxPushConstantsSize** is the maximum size, in bytes, of the pool of push constant memory. For each of the push constant ranges indicated by the `pPushConstantRanges` member of the `VkPipelineLayoutCreateInfo` structure, \((\text{offset} + \text{size})\) must be less than or equal to this limit.

• **maxMemoryAllocationCount** is the maximum number of device memory allocations, as created by `vkAllocateMemory`, which can simultaneously exist.

• **maxSamplerAllocationCount** is the maximum number of sampler objects, as created by `vkCreateSampler`, which can simultaneously exist on a device.

• **bufferImageGranularity** is the granularity, in bytes, at which buffer or linear image resources, and optimal image resources can be bound to adjacent offsets in the same `VkDeviceMemory` object without aliasing. See Buffer-Image Granularity for more details.

• **sparseAddressSpaceSize** is the total amount of address space available, in bytes, for sparse memory resources. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.

• **maxBoundDescriptorSets** is the maximum number of descriptor sets that can be simultaneously used by a pipeline. All `DescriptorSet` decorations in shader modules must have a value less than `maxBoundDescriptorSets`. See Descriptor Sets.

• **maxPerStageDescriptorSamplers** is the maximum number of samplers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See Sampler and Combined Image Sampler.

• **maxPerStageDescriptorUniformBuffers** is the maximum number of uniform buffers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the `stageFlags` member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See Uniform Buffer and Dynamic Uniform Buffer.
