  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07485**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` **must** evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling
rasterizationSamples

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07486
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state enabled and the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, then the sampleLocationsInfo.sampleLocationGridSize.height in the last call to vkCmdSetSampleLocationsEXT must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling rasterizationSamples

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07487
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, or the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, and if sampleLocationsEnable was VK_TRUE in the last call to vkCmdSetSampleLocationsEnableEXT, the fragment shader code must not statically use the extended instruction InterpolateAtSample

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07936
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.width must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.width as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07937
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationGridSize.height must evenly divide VkMultisamplePropertiesEXT::sampleLocationGridSize.height as returned by vkGetPhysicalDeviceMultisamplePropertiesEXT with a samples parameter equaling the value of rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT

• VUID-vkCmdDrawClusterHUAWEI-sampleLocationsEnable-07938
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT state disabled and the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, the sampleLocationsEnable member of a VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable in the bound graphics pipeline is VK_TRUE or VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT state enabled, then, sampleLocationsInfo.sampleLocationsPerPixel must equal rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT
If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled, and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current coverage reduction mode `coverageReductionMode` state is enabled, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV` `viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.
If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} and \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SWIZZLE\_NV} dynamic

states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportSwizzleNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}.

If the \texttt{VK\_NV\_viewport\_swizzle} extension is enabled, and a shader object is bound to any

graphics stage, then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportSwizzleNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}.

If the \texttt{VK\_NV\_ framebuffer\_mixed\_samples} extension is enabled, and if the current subpass

has any color attachments and \texttt{rasterizationSamples} of the last call to \texttt{vkCmdSetRasterizationSamplesEXT} is greater than the number of color samples, then the pipeline \texttt{sampleShadingEnable} must be \texttt{VK\_FALSE}.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_KHR}, then the \texttt{stippledRectangularLines} feature

must be enabled.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_BRESENHAM\_KHR}, then the \texttt{stippledBresenhamLines} feature

must be enabled.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_SMOOTH\_KHR}, then the \texttt{stippledSmoothLines} feature

must be enabled.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_KHR}, then the \texttt{stippledRectangularLines} feature

must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK\_TRUE}.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_KHR}, then the \texttt{stippledRectangularLines} feature

must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK\_TRUE}.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_KHR}, then the \texttt{stippledRectangularLines} feature

must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK\_TRUE}.

If the bound graphics pipeline state was created with the

\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or

\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current

\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is

\texttt{VK\_LINE\_RASTERIZATION\_MODE\_DEFAULT\_KHR}, then the \texttt{stippledRectangularLines} feature

must be enabled and \texttt{VkPhysicalDeviceLimits::strictLines} must be \texttt{VK\_TRUE}.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT` dynamic state enabled, `conservativePointAndLineRasterization` is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the `conservativeRasterizationMode` set by the last call to `vkCmdSetConservativeRasterizationModeEXT` must be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

- **VUID-vkCmdDrawClusterHUAWEI-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

- **VUID-vkCmdDrawClusterHUAWEI-None-08877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` dynamic state `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-07850**
  If dynamic state was inherited from `VkCommandBufferInheritanceViewportScissorInfoNV`, it must be set in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterHUAWEI-None-08684**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_VERTEX_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-None-08685**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-None-08686**
  If there is no bound graphics pipeline, and the `tessellationShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-None-08687**
  If there is no bound graphics pipeline, and the `geometryShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_GEOMETRY_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-None-08688**
  If there is no bound graphics pipeline, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-vkCmdDrawClusterHUAWEI-None-08689**
  If there is no bound graphics pipeline, and the `taskShader` feature is enabled, `vkCmdBindShadersEXT` must have been called in the current command buffer with `pStages` with an element of `VK_SHADER_STAGE_TASK_BIT_EXT`.
If there is no bound graphics pipeline, and the meshShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_MESH_BIT_EXT

If there is no bound graphics pipeline, and at least one of the taskShader and meshShader features is enabled, one of the VK_SHADER_STAGE_VERTEX_BIT or VK_SHADER_STAGE_MESH_BIT_EXT stages must have a valid VkShaderEXT bound, and the other must have no VkShaderEXT bound.

If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created without the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, a valid VkShaderEXT must be bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage.

If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created with the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, there must be no VkShaderEXT bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage.

If there is no bound graphics pipeline, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, there must be no VkShaderEXT bound to either the VK_SHADER_STAGE_TASK_BIT_EXT stage or the VK_SHADER_STAGE_MESH_BIT_EXT stage.

If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also be bound.

If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of the same vkCreateShadersEXT call must not have any VkShaderEXT bound.

All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

If the current render pass instance was begun with vkCmdBeginRendering and a VkRenderingInfo::colorAttachmentCount equal to 1, a color attachment with a resolve mode of VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, and a fragment shader is
bound, it **must** not declare the DepthReplacing orStencilRefReplacingEXT execution modes

- **VUID-vkCmdDrawClusterHUAWEI-None-08880**
  If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable toVK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterHUAWEI-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created withVK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must beVK_FALSE

- **VUID-vkCmdDrawClusterHUAWEI-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created withVK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be0

- **VUID-vkCmdDrawClusterHUAWEI-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created withVK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment isVK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all ofVK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, andVK_COLOR_COMPONENT_B_BIT, or none of them

- **VUID-vkCmdDrawClusterHUAWEI-maxFragmentDualSrcAttachments-09239**
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value ofLocation for any output attachment statically used in the Fragment Execution Model executed by this command must be less than maxFragmentDualSrcAttachments

- **VUID-vkCmdDrawClusterHUAWEI-None-09548**
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, the value of each element of VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations set by vkCmdSetRenderingAttachmentLocationsKHR must match the value set for the corresponding element in the currently bound pipeline

- **VUID-vkCmdDrawClusterHUAWEI-None-09549**
  If the current render pass was begun with vkCmdBeginRendering, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via VkRenderingInputAttachmentIndexInfoKHR

- **VUID-vkCmdDrawClusterHUAWEI-stage-06480**
  The bound graphics pipeline must not have been created with the
VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdDrawClusterHUAWEI-None-07074
  Transform Feedback Queries must not be active

- VUID-vkCmdDrawClusterHUAWEI-None-07075
  Primitives Generated Queries must not be active

- VUID-vkCmdDrawClusterHUAWEI-pipelineStatistics-07076
  The pipelineStatistics member used to create any active Pipeline Statistics Query must not contain VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT, VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT, VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT, VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT, or VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT

- VUID-vkCmdDrawClusterHUAWEI-None-07819
  The pipelineStatistics member used to create any active Pipeline Statistics Query must not contain VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT, or VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT

- VUID-vkCmdDrawClusterHUAWEI-groupCountX-07820
  groupCountX must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[0]

- VUID-vkCmdDrawClusterHUAWEI-groupCountY-07821
  groupCountY must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[1]

- VUID-vkCmdDrawClusterHUAWEI-groupCountZ-07822
  groupCountZ must be less than or equal to VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::maxWorkGroupCount[2]

- VUID-vkCmdDrawClusterHUAWEI-ClusterCullingHUAWEI-07823
  The current pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS must contain a shader stage using the ClusterCullingHUAWEI Execution Model.

Valid Usage (Implicit)

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawClusterHUAWEI-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawClusterHUAWEI-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawClusterHUAWEI-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

To record an indirect cluster culling drawing command, call:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
void vkCmdDrawClusterIndirectHUAWEI(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDrawClusterIndirectHUAWEI` behaves similarly to `vkCmdDrawClusterHUAWEI` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from buffer starting at `offset`. Note the cluster culling shader pipeline only accepts `vkCmdDrawClusterHUAWEI` and `vkCmdDrawClusterIndirectHUAWEI` as drawing commands.

**Valid Usage**

- VUID-vkCmdDrawClusterIndirectHUAWEI-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and
compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDrawClusterIndirectHUAWEI-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawClusterIndirectHUAWEI-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawClusterIndirectHUAWEI-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo
::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL-ROM_QCOM

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility
bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08119**
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08605**
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08609**
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawClusterIndirectHUAWEI-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08613**
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawClusterIndirectHUAWEI-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-06550
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC_aC_b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- VUID-vkCmdDrawClusterIndirectHUAWEI-ConstOffset-06551
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler YC_aC_b conversion, that object must not use the ConstOffset and Offset operands.

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewType-07752
  If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

- VUID-vkCmdDrawClusterIndirectHUAWEI-format-07753
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-08795
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-08796
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

- VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- VUID-vkCmdDrawClusterIndirectHUAWEI-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- VUID-vkCmdDrawClusterIndirectHUAWEI-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- VUID-vkCmdDrawClusterIndirectHUAWEI-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 64

- **VUID-vkCmdDrawClusterIndirectHUAWEI-SampledType-04473**
  If a \texttt{VkBufferView} with a \texttt{VkFormat} that has a component width less than 64-bit is accessed as a result of this command, the \texttt{SampledType} of the \texttt{OpTypeImage} operand of that instruction \textbf{must} have a \texttt{Width} of 32

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sparseImageInt64Atomics-04474**
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkImage} objects created with the \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sparseImageInt64Atomics-04475**
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkBuffer} objects created with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag \textbf{must} not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a \texttt{Width} of 64 by this command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWeightedSampleQCOM-06971**
  If \texttt{OpImageWeightedSampleQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWeightedSampleQCOM-06972**
  If \texttt{OpImageWeightedSampleQCOM} uses a \texttt{VkImageView} as a sample weight image as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBoxFilterQCOM-06973**
  If \texttt{OpImageBoxFilterQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBlockMatchSSDQCOM-06974**
  If \texttt{OpImageBlockMatchSSDQCOM} is used to read from an \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBlockMatchSADQCOM-06975**
  If \texttt{OpImageBlockMatchSADQCOM} is used to read from an \texttt{VkImageView} as a result of this command, then the specified reference coordinates \textbf{must} not fail integer texel coordinate validation

- **VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWeightedSampleQCOM-06977**
  If \texttt{OpImageWeightedSampleQCOM}, \texttt{OpImageBoxFilterQCOM}, \texttt{OpImageBlockMatchWindowSSDQCOM}, \texttt{OpImageBlockMatchWindowSADQCOM}, \texttt{OpImageBlockMatchGatherSSDQCOM}, \texttt{OpImageBlockMatchGatherSADQCOM}, \texttt{OpImageBlockMatchSSDQCOM}, or \texttt{OpImageBlockMatchSADQCOM} uses a \texttt{VkSampler} as a result of this command, then the sampler \textbf{must} have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}
• VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageWeightedSampleQCOM-06978
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, or `OpImageBlockMatchGatherSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

• VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBlockMatchWindow-09215
If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBlockMatchWindow-09216
If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's `format` must be a single-component format.

• VUID-vkCmdDrawClusterIndirectHUAWEI-OpImageBlockMatchWindow-09217
If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07288
Any shader invocation executed by this command must terminate.

• VUID-vkCmdDrawClusterIndirectHUAWEI-renderPass-02684
The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

• VUID-vkCmdDrawClusterIndirectHUAWEI-subpass-02685
The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07748
If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.

• VUID-vkCmdDrawClusterIndirectHUAWEI-OpTypeImage-07468
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it must be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07469
Input attachment views accessed in a subpass must be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments [InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06537
Memory backing image subresources used as attachments in the current render pass.
must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09000
  If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  - the VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_COLOR_BIT and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09001
  If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  - the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_DEPTH_BIT and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09002
  If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout, and either:
  - the VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT is set on the currently bound pipeline or
  - the last call to vkCmdSetAttachmentFeedbackLoopEnableEXT included VK_IMAGE_ASPECT_STENCIL_BIT and
    - there is no currently bound graphics pipeline or
    - the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06539
  If any previously recorded command in the current subpass accessed an image
  subresource used as an attachment in this subpass in any way other than as an
  attachment, this command **must** not write to that image subresource as an attachment.

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the depth aspect, **depth writes must be disabled**

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the stencil aspect, both front and back **writeMask are not zero**, and stencil test is
  enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07831
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT**
  dynamic state enabled then **vkCmdSetViewport must** have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07832
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR**
  dynamic state enabled then **vkCmdSetScissor must** have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07833
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_LINE_WIDTH**
  dynamic state enabled then **vkCmdSetLineWidth must** have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to
  **vkCmdSetRasterizerDiscardEnable** in the current command buffer set
  **rasterizerDiscardEnable to VK_FALSE**, and the most recent call to
  **vkCmdSetPolygonModeEXT** in the current command buffer set **polygonMode to
  VK_POLYGON_MODE_LINE**, **vkCmdSetLineWidth must** have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to
  **vkCmdSetRasterizerDiscardEnable** in the current command buffer set
  **rasterizerDiscardEnable to VK_FALSE**, and the most recent call to
  **vkCmdSetPrimitiveTopology** in the current command buffer set **primitiveTopology to any
  line topology**, **vkCmdSetLineWidth must** have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-08619
  If a shader object that outputs line primitives is bound to the
  **VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT** or **VK_SHADER_STAGE_GEOMETRY_BIT** stage, and
  the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set
  **rasterizerDiscardEnable to VK_FALSE**, **vkCmdSetLineWidth must** have been called in the current
  command buffer prior to this drawing command

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07834

2500
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state enabled then `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08620**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBiasEnable` in the current command buffer set `depthBiasEnable` to `VK_TRUE`, `vkCmdSetDepthBias` or `vkCmdSetDepthBias2EXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07835**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_BLEND_CONSTANTS` dynamic state enabled then `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08621**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` in the current command buffer set any element of `pColorBlendEnables` to `VK_TRUE`, and the most recent call to `vkCmdSetColorBlendEquationEXT` in the current command buffer set the same element of `pColorBlendEquations` to a `VkColorBlendEquationEXT` structure with any `VkBlendFactor` member with a value of `VK_BLEND_FACTOR_CONSTANT_COLOR`, `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR`, `VK_BLEND_FACTOR_CONSTANT_ALPHA`, or `VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA`, `vkCmdSetBlendConstants` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07836**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS` dynamic state enabled, and if the current `depthBoundsTestEnable` state is `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08622**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthBoundsTestEnable` in the current command buffer set `depthBoundsTestEnable` to `VK_TRUE`, then `vkCmdSetDepthBounds` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07837**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` dynamic state enabled, and if the current `stencilTestEnable` state is `VK_TRUE`, then `vkCmdSetStencilCompareMask` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07838
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08624
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08625
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLELOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLELOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08626
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetSampleLocationsEnableEXT in the current command buffer set sampleLocationsEnable to VK_TRUE, then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07840**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CULL_MODE dynamic state enabled then vkCmdSetCullMode must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08627**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCullMode must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07841**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_FRONT_FACE dynamic state enabled then vkCmdSetFrontFace must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08628**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFrontFace must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07843**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE dynamic state enabled then vkCmdSetDepthTestEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08629**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthTestEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07844**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE dynamic state enabled then vkCmdSetDepthWriteEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08630**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetDepthWriteEnable must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07845**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08631**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07846**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08632**
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07847**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08633**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07848**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08634**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, then **vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **VkPipelineViewportStateCreateInfo** ::**scissorCount** of the pipeline

- **VUID-vkCmdDrawClusterIndirectHUAWEI-scissorCount-03418**
  
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **scissorCount** parameter of **vkCmdSetScissorWithCount** must match the **VkPipelineViewportStateCreateInfo** ::**viewportCount** of the pipeline

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-03419**
  
  If the bound graphics pipeline state was created with both the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04135**
  
  If a shader object is bound to any graphics stage, then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04137**
  
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline must have been created with **VkPipelineViewportWScalingStateCreateInfoNV** ::**viewportCount** greater or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04138**
  
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic states enabled then the **viewportCount** parameter in the last call to **vkCmdSetViewportWScalingNV** must be greater than or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08635**
  
  If the **VK_NV_clip_space_w_scaling** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetViewportWScalingEnableNV** in the current command buffer set **viewportWScalingEnable** to **VK_TRUE**, then **vkCmdSetViewportWScalingNV** must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08636**
If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetViewportWScalingEnableNV` in the current command buffer set `viewportWScalingEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-shadingRateImage-09233**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoarseSampleOrderNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-shadingRateImage-09234**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then `vkCmdSetViewportShadingRatePaletteNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08637**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnableNV` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been...
created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-VkPipelineVieportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` dynamic state enabled and `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state enabled then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07879**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08638**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08640**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command
If a shader object is bound to any graphics stage, and the most recent call to 
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set 
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then \texttt{vkCmdSetDepthBiasEnable} must have been 
called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-logicOp-04878**
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_LOGIC_OP_EXT} 
dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current 
command buffer prior to this drawing command and the \texttt{logicOp} must be a valid 
\texttt{VkLogicOp} value.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08641**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent 
call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set 
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and the most recent call to 
\texttt{vkCmdSetLogicOpEnableEXT} set \texttt{logicOpEnable} to \texttt{VK_TRUE}, then \texttt{vkCmdSetLogicOpEXT} 
must have been called in the current command buffer prior to this drawing command 
and the \texttt{logicOp} must be a valid \texttt{VkLogicOp} value.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the 
bound graphics pipeline was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} 
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write 
to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCount} must have 
been called in the current command buffer prior to this drawing command, and the 
\texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must be 1.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, and any 
shader object bound to a graphics stage writes to the \texttt{PrimitiveShadingRateKHR} built-in, 
then \texttt{vkCmdSetViewportWithCount} must have been called in the current command 
buffer prior to this drawing command, and the \texttt{viewportCount} parameter of 
\texttt{vkCmdSetViewportWithCount} must be 1.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color 
attachment in the subpass, if the corresponding image view’s \texttt{format features} do not 
contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the 
corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be 
\texttt{VK_FALSE}.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08643**
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent 
call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set 
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then for each color attachment in the render pass, if 
the corresponding image view’s \texttt{format features} do not contain 
\texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the corresponding member of 
\texttt{pColorBlendEnables} in the most recent call to \texttt{vkCmdSetColorBlendEnableEXT} in the current 
command buffer that affected that attachment index must have been \texttt{VK_FALSE}.
If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then `rasterizationSamples` for the currently bound graphics pipeline **must** be the same as the current subpass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and none of the following is enabled:

- the `VK_AMD_mixed_attachment_samples` extension
- the `VK_NV_framebuffer_mixed_samples` extension
- the `multisampledRenderToSingleSampled` feature

then the most recent call to `vkCmdSetRasterizationSamplesEXT` in the current command buffer **must** have set `rasterizationSamples` to be the same as the number of samples for the current render pass color and/or depth/stencil attachments.

If a shader object is bound to any graphics stage, the current render pass instance **must** have been begun with `vkCmdBeginRendering`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline equal to `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`.

If the `dynamicRenderingUnusedAttachments` feature is enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` **must** have the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline, or the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats`, if it exists, **must** be `VK_FORMAT_UNDEFINED`.
If the current render pass instance was begun with `vkCmdBeginRendering`, with a `VkRenderingInfo::colorAttachmentCount` equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `resolveImageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09363
  If there is no shader object bound to any graphics stage, the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo::colorAttachmentCount` equal to 1, and a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with an image created with a `VkExternalFormatANDROID::externalFormat` value equal to the `VkExternalFormatANDROID::externalFormat` value used to create the currently bound graphics pipeline

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09364
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled, then `vkCmdSetColorBlendEnableEXT` must have set the blend enable to `VK_FALSE` prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09365
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-09366
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetColorBlendEnableEXT` must have set blend enable to `VK_FALSE` prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-09367
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetRasterizationSamplesEXT` must have set `rasterizationSamples` to `VK_SAMPLE_COUNT_1_BIT` prior to this drawing command
If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero `VkExternalFormatANDROID::externalFormat` value and with the `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` dynamic state enabled, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->width` to 1 prior to this drawing command.

If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID` resolve mode, then `vkCmdSetFragmentShadingRateKHR` must have set `pFragmentSize->height` to 1 prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the
the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to
\texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set
\texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then the \texttt{attachmentCount} parameter of most recent
call to \texttt{vkCmdSetColorWriteEnableEXT} in the current command buffer must be greater than
or equal to the number of color attachments in the current render pass instance.

\begin{itemize}
  \item \textbf{VUID-vkCmdDrawClusterIndirectHUAWEI-None-07751}
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT} dynamic state enabled then
  \texttt{vkCmdSetDiscardRectangleEXT \textbf{must}} have been called in the current command buffer
  prior to this drawing command for each discard rectangle in
  \texttt{VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount}
  
  \item \textbf{VUID-vkCmdDrawClusterIndirectHUAWEI-None-07880}
  If the bound graphics pipeline state was created with the
  \texttt{VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT} dynamic state enabled then

  called in the current command buffer prior to this drawing command.
  
  \item \textbf{VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08913}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the
  \texttt{dynamicRenderingUnusedAttachments} feature is not enabled, and \texttt{VkRenderingInfo::pDepthAttachment->imageView}
  was \texttt{VK_NULL_HANDLE}, the value of
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08914 If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08915 If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08916 If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08917 If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAWEI-dynamicRenderingUnusedAttachments-08918 If current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06183 If current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawClusterIndirectHUAWEI-imageView-06184 If current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with
If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.
The multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of rasterizationSamples for the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawClusterIndirectHUAEI-pNext-07935
  If this command has been called inside a render pass instance started with vkCmdBeginRendering, and the pNext chain of VkRenderingInfo includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the value of rasterizationSamples for the currently bound graphics pipeline must be equal to VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples

- VUID-vkCmdDrawClusterIndirectHUAEI-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawClusterIndirectHUAEI-pColorAttachments-08963
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the VkRenderingInfo::pColorAttachments->imageView was not VK_NULL_HANDLE, then the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAEI-pDepthAttachment-08964
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAEI-pStencilAttachment-08965
  If the current render pass instance was begun with vkCmdBeginRendering, there is a graphics pipeline bound, stencil test is enabled and the VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, then the VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the pipeline must not be VK_FORMAT_UNDEFINED

- VUID-vkCmdDrawClusterIndirectHUAEI-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled

- VUID-vkCmdDrawClusterIndirectHUAEI-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.
If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07624**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-alphaToCoverageEnable-08919**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08654**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-alphaToCoverageEnable-08920**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set `alphaToCoverageEnable` to `VK_TRUE`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07625**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08655**
  If the `alphaToOne` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToOneEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07626**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` dynamic state enabled then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08656**
  If the `logicOp` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLogicOpEnableEXT` must have been called in the current command buffer prior to this drawing command
called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07627**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08657**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07628**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08658**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetColorBlendEnableEXT` for any attachment set that attachment’s value in `pColorBlendEnables` to `VK_TRUE`, then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07629**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08659**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07630**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` dynamic state enabled then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08660**
  If the `geometryStreams` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_GEOMETRY_BIT` stage, then `vkCmdSetRasterizationStreamEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07631**
  If the bound graphics pipeline state was created with the
If the `VK_EXT_conservative_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetConservativeRasterizationModeEXT` in the current command buffer set `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, then `vkCmdSetExtraPrimitiveOverestimationSizeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command.
If the `VK_EXT_blend_operation_advanced` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then at least one of `vkCmdSetColorBlendEquationEXT` and `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then `vkCmdSetLineRasterizationModeEXT` must have been called in the current command buffer prior to this drawing command.
VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07638
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08671
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07849
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_KHR dynamic state enabled then vkCmdSetLineStippleKHR must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08672
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetLineStippleEnableEXT in the current command buffer set stippledLineEnable to VK_TRUE, then vkCmdSetLineStippleEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07639
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATEDEPTH_CLIP_NEGATIVE_ONETO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08673**
  If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07640**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08674**
  If the `VK_NV_viewport_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08675**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07641**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07642**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08676**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer prior to this drawing command
bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07644**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08678**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07645**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08679**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to any value other than `VK_COVERAGE_MODULATION_MODE_NONE_NV`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07646**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-08680**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-07647**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then
vkCmdSetShadingRateImageEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-pipelineFragmentShadingRate-09238
  If the pipelineFragmentShadingRate feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetFragmentShadingRateKHR must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08681
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetShadingRateImageEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07648
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV dynamic state enabled then vkCmdSetRepresentativeFragmentTestEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08682
  If the representativeFragmentTest feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetRepresentativeFragmentTestEnableNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07649
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV dynamic state enabled then vkCmdSetCoverageReductionModeNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08683
  If the coverageReductionMode feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCoverageReductionModeNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT state enabled and the last call to vkCmdSetColorBlendEnableEXT set pColorBlendEnables for any attachment to VK_TRUE, then for those attachments in the subpass the corresponding image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, and the current subpass does
not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-samples-07472**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-samples-07473**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07474**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-09211**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the `rasterizationSamples` member of that structure.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07476**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorBlendEnableEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments in the current subpass.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09417**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorBlendEnableEXT` calls must specify an enable for all active color attachments.
in the current subpass

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07477**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` dynamic state enabled then `vkCmdSetColorBlendEquationEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendEquationEXT` calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07478**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic state enabled then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-firstAttachment-07479**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendAdvancedEXT` calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-advancedBlendMaxColorAttachments-07480**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` and `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of
active color attachments in the current subpass must not exceed advancedBlendMaxColorAttachments

- **VUID-vkCmdDrawClusterIndirectHUAWEI-primitivesGeneratedQueryWithNonZeroStreams-07481**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, and the bound graphics pipeline was created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsPerPixel-07482**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsPerPixel-07483**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07484**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07485**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the `rasterizationSamples`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07486**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if...
sampleLocationsEnable was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.height` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07487**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07936**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07937**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-sampleLocationsEnable-07938**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationsPerPixel` must equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`

- **VUID-vkCmdDrawClusterIndirectHUAWEI-coverageModulationTableEnable-07488**
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled, and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount`
parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07489**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-coverageToColorEnable-07490**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizerDiscardEnable-09420**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-coverageReductionMode-07491**
  If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current coverage reduction mode `coverageReductionMode`, then the current `rasterizationSamples`, and the sample counts for the color and depth/stencil attachments (if the subpass has them) must be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-07492**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV` `::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-07493**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to
vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-viewportCount-09421
  If the VK_NV_viewport_swizzle extension is enabled, and a shader object is bound to any graphics stage, then the viewportCount parameter in the last call to vkCmdSetViewportSwizzleNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawClusterIndirectHUAWEI-rasterizationSamples-07494
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the current subpass has any color attachments and rasterizationSamples of the last call to vkCmdSetRasterizationSamplesEXT is greater than the number of color samples, then the pipeline sampleShadingEnable must be VK_FALSE

- VUID-vkCmdDrawClusterIndirectHUAWEI-stippledLineEnable-07495
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, then the stippledRectangularLines feature must be enabled

- VUID-vkCmdDrawClusterIndirectHUAWEI-stippledLineEnable-07496
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR, then the stippledBresenhamLines feature must be enabled

- VUID-vkCmdDrawClusterIndirectHUAWEI-stippledLineEnable-07497
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the stippledSmoothLines feature must be enabled

- VUID-vkCmdDrawClusterIndirectHUAWEI-stippledLineEnable-07498
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT or VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT dynamic states enabled, and if the current stippledLineEnable state is VK_TRUE and the current lineRasterizationMode state is VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR, then the stippledRectangularLines feature must be enabled and VkPhysicalDeviceLimits::strictLines must be VK_TRUE

- VUID-vkCmdDrawClusterIndirectHUAWEI-conservativePointAndLineRasterization-07499
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled, conservativePointAndLineRasterization is not supported, and the effective primitive topology output by the last pre-rasterization shader stage is a line or point, then the
conservativeRasterizationMode set by the last call to
vkCmdSetConservativeRasterizationModeEXT must be
VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo
  ::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to
  VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT,
  VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh
  Shader Queries must not be active

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08877
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT dynamic state
  vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current
  command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-07850
  If dynamic state was inherited from
  VkCommandBufferInheritanceViewportScissorInfoNV, it must be set in the current
  command buffer prior to this drawing command

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08684
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
  current command buffer with pStages with an element of VK_SHADER_STAGE_VERTEX_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08685
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the
  current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08689
  If there is no bound graphics pipeline, and the taskShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_TASK_BIT_EXT

- VUID-vkCmdDrawClusterIndirectHUAWEI-None-08690
  If there is no bound graphics pipeline, and the meshShader feature is enabled,
  vkCmdBindShadersEXT must have been called in the current command buffer with pStages
  with an element of VK_SHADER_STAGE_MESH_BIT_EXT
If there is no bound graphics pipeline, and at least one of the taskShader and meshShader features is enabled, one of the `VK_SHADER_STAGE_VERTEX_BIT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages must have a valid `VkShaderEXT` bound, and the other must have no `VkShaderEXT` bound.

If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created without the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, a valid `VkShaderEXT` must be bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_MESH_BIT_EXT` stage, and that `VkShaderEXT` was created with the `VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT` flag, there must be no `VkShaderEXT` bound to the `VK_SHADER_STAGE_TASK_BIT_EXT` stage.

If there is no bound graphics pipeline, and a valid `VkShaderEXT` is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, there must be no `VkShaderEXT` bound to either the `VK_SHADER_STAGE_TASK_BIT_EXT` stage or the `VK_SHADER_STAGE_MESH_BIT_EXT` stage.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, then all shaders created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag in the same `vkCreateShadersEXT` call must also be bound.

If any graphics shader is bound which was created with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag, any stages in between stages whose shaders did not create a shader with the `VK_SHADER_CREATE_LINK_STAGE_BIT_EXT` flag as part of the same `vkCreateShadersEXT` call must not have any `VkShaderEXT` bound.

All bound graphics shader objects must have been created with identical or identically defined push constant ranges.

All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts.

If the current render pass instance was begun with `vkCmdBeginRendering` and a `VkRenderingInfo.colorAttachmentCount` equal to 1, a color attachment with a resolve mode of `VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID`, and a fragment shader is bound, it must not declare the `DepthReplacing` or `StencilRefReplacingEXT` execution modes.

If the `attachmentFeedbackLoopDynamicState` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call
to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAttachmentFeedbackLoopEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-pDynamicStates-08715**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpDepthAttachmentReadEXT`, the `depthWriteEnable` parameter in the last call to `vkCmdSetDepthWriteEnable` must be `VK_FALSE`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with `VK_DYNAMIC_STATE_STENCIL_WRITE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and the fragment shader declares the `EarlyFragmentTests` execution mode and uses `OpStencilAttachmentReadEXT`, the `writeMask` parameter in the last call to `vkCmdSetStencilWriteMask` must be `0`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT`, and the format of any color attachment is `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, the corresponding element of the `pColorWriteMasks` parameter of `vkCmdSetColorWriteMaskEXT` must either include all of `VK_COLOR_COMPONENT_R_BIT`, `VK_COLOR_COMPONENT_G_BIT`, and `VK_COLOR_COMPONENT_B_BIT`, or none of them.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-maxFragmentDualSrcAttachments-09239**
  If blending is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of `Location` for any output attachment statically used in the Fragment Execution Model executed by this command must be less than `maxFragmentDualSrcAttachments`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-09548**
  If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, the value of each element of `VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations` set by `vkCmdSetRenderingAttachmentLocationsKHR` must match the value set for the corresponding element in the currently bound pipeline.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-None-09549**
  If the current render pass was begun with `vkCmdBeginRendering`, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline must match those set for the current render pass instance via `VkRenderingInputAttachmentIndexInfoKHR`.

- **VUID-vkCmdDrawClusterIndirectHUAWEI-stage-06480**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`.
• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07074
  Transform Feedback Queries must not be active

• VUID-vkCmdDrawClusterIndirectHUAWEI-None-07075
  Primitives Generated Queries must not be active

• VUID-vkCmdDrawClusterIndirectHUAWEI-pipelineStatistics-07076
  The pipelineStatistics member used to create any active Pipeline Statistics Query must not contain
  VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT,
  VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT,
  VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT,
  VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT,
  VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT,
  VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT,
  VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT,
  VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT,
  or
  VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT

• VUID-vkCmdDrawClusterIndirectHUAWEI-drawCount-02718
  If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1

• VUID-vkCmdDrawClusterIndirectHUAWEI-drawCount-02719
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawClusterIndirectHUAWEI-ClusterCullingHUAWEI-07824
  The current pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS must contain a shader stage using the ClusterCullingHUAWEI Execution Model.

• VUID-vkCmdDrawClusterIndirectHUAWEI-offset-07918
  offset must be a multiple of VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI::indirectBufferOffsetAlignment

Valid Usage (Implicit)

• VUID-vkCmdDrawClusterIndirectHUAWEI-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawClusterIndirectHUAWEI-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawClusterIndirectHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDrawClusterIndirectHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawClusterIndirectHUAWEI-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdDrawClusterIndirectHUAWEI-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDrawClusterIndirectHUAWEI-commonparent
Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The Component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

**SPIR-V example**

```spir-v
...%1 = OpExtInstImport "GLSL.std.450"
...
// Assign location M to variableName
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```
22.1.1. Attribute Location and Component Assignment

The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a Location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single Location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

If an implementation supports storageInputOutput16, vertex shader input variables can have a width of 16 bits.

Table 32. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>1</td>
<td>(o, y, o, o)</td>
</tr>
<tr>
<td>scalar</td>
<td>2</td>
<td>(o, o, z, o)</td>
</tr>
<tr>

<td>0 or unspecified</td>
<td>(x, y, o, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>1</td>
<td>(o, y, z, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>2</td>
<td>(o, o, z, w)</td>
</tr>
</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The Component decoration must not be used with matrix types.

Table 33. Input attributes accessed by 32-bit input matrix variables

<table>
<thead>
<tr>
<th>Data type</th>

</tr>
<tr>
<td>mat4x3</td>
<td>three-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a Location $i$, its values are taken from consecutive input attributes starting with the corresponding
VkVertexInputAttributeDescription::location. The Location slots and Component words used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute locations and components accessed by 64-bit input variables. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute.

Table 34. Input attribute locations and components accessed by 64-bit input variables

</tbody>
</table>
Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a Location \( i \), its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the Location immediately following the last Location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding VkVertexInputAttributeDescription::location. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Two variables are allowed to share the same Location slot only if their Component words do not overlap. If multiple variables share the same Location slot, they must all have the same SPIR-V floating-point component type or all have the same width scalar type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the VkGraphicsPipelineCreateInfo::pVertexInputState pointer to a VkPipelineVertexInputStateCreateInfo structure. Alternatively, if the graphics pipeline is created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with vkCmdSetVertexInputEXT, and the VkGraphicsPipelineCreateInfo::pVertexInputState pointer is ignored.

The VkPipelineVertexInputStateCreateInfo structure is defined as:

```c
#ifndef _VK_STRUCTURE_TYPE_VK_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO
#define _VK_STRUCTURE_TYPE_VK_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO

typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType          sType;         
    const void*              pNext;        
    VkPipelineVertexInputStateCreateFlags flags;  
    uint32_t                 vertexBindingDescriptionCount; 
    const VkVertexInputBindingDescription* pVertexXBindingDescriptions; 
    uint32_t                 vertexAttributeDescriptionCount; 
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions; 
} VkPipelineVertexInputStateCreateInfo;

• sType is a VkStructureType value identifying this structure.
```
• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is reserved for future use.

• **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in **pVertexBindingDescriptions**.

• **pVertexBindingDescriptions** is a pointer to an array of **VkVertexInputBindingDescription** structures.

• **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in **pVertexAttributeDescriptions**.

• **pVertexAttributeDescriptions** is a pointer to an array of **VkVertexInputAttributeDescription** structures.

### Valid Usage

• **VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613**
  
  **vertexBindingDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindings**

• **VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614**
  
  **vertexAttributeDescriptionCount** must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputAttributes**

• **VUID-VkPipelineVertexInputStateCreateInfo-binding-00615**
  
  For every binding specified by each element of **pVertexAttributeDescriptions**, a **VkVertexInputBindingDescription** must exist in **pVertexBindingDescriptions** with the same value of binding

• **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616**
  
  All elements of **pVertexBindingDescriptions** must describe distinct binding numbers

• **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617**
  
  All elements of **pVertexAttributeDescriptions** must describe distinct attribute locations

### Valid Usage (Implicit)

• **VUID-VkPipelineVertexInputStateCreateInfo-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO**

• **VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext**
  
  **pNext** must be NULL or a pointer to a valid instance of **VkPipelineVertexInputDividerStateCreateInfoKHR**

• **VUID-VkPipelineVertexInputStateCreateInfo-sType-unique**
  
  The **sType** value of each struct in the **pNext** chain must be unique

• **VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask**
  
  **flags** must be 0

• **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter**
  
  If **vertexBindingDescriptionCount** is not 0, **pVertexBindingDescriptions** must be a valid
pointer to an array of `vertexBindingDescriptionCount` valid
`VkVertexInputBindingDescription` structures

- VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid
  pointer to an array of `vertexAttributeDescriptionCount` valid
  `VkVertexInputAttributeDescription` structures

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently
reserved for future use.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;
```

- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a
  function of the vertex index or of the instance index.

### Valid Usage

- VUID-VkVertexInputBindingDescription-binding-00618
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputBindingDescription-stride-00619
  `stride` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-VkVertexInputBindingDescription-stride-04456
  If the `VK_KHR_portability_subset` extension is enabled, `stride` must be a multiple of, and at
  least as large as, `VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment`

### Valid Usage (Implicit)

- VUID-VkVertexInputBindingDescription-inputRate-parameter
  `inputRate` must be a valid `VkVertexInputRate` value
Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- `VK_VERTEX_INPUT_RATE_VERTEX` specifies that vertex attribute addressing is a function of the vertex index.
- `VK_VERTEX_INPUT_RATE_INSTANCE` specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription;
```

- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

**Valid Usage**

- VUID-VkVertexInputAttributeDescription-location-00620
  
  `location` must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-VkVertexInputAttributeDescription-binding-00621
  
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputAttributeDescription-offset-00622
  
  `offset` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- VUID-VkVertexInputAttributeDescription-format-00623
  
  The format features of `format` must contain `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT`

- VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription` referenced in `binding`.

### Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription-format-parameter
  
  `format` must be a valid `VkFormat` value

To **dynamically set** the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer,         commandBuffer,
    uint32_t vertexBindingDescriptionCount, vertexBindingDescriptionCount,
    const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,    pVertexBindingDescriptions,
    uint32_t vertexAttributeDescriptionCount, vertexAttributeDescriptionCount,
    const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);    pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If drawing using **shader objects**, or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the `stride`. 2545
Valid Usage

- **VUID-vkCmdSetVertexInputEXT-None-08546**
  Either the `vertexInputDynamicState` feature or the `shaderObject` feature or both **must** be enabled

- **VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791**
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792**
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- **VUID-vkCmdSetVertexInputEXT-binding-04793**
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` **must** exist in `pVertexBindingDescriptions` with the same value of binding

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794**
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795**
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations

Valid Usage (Implicit)

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter**
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` **must** be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT` structures

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter**
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` **must** be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT` structures

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetVertexInputEXT-videocoding**
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The VkVertexInputBindingDescription2EXT structure is defined as:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
    VkVertexInputRate inputRate;
    uint32_t divisor;
} VkVertexInputBindingDescription2EXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the vertexAttributeInstanceRateDivisor feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor. A value of 0 can be used for the divisor if the vertexAttributeInstanceRateZeroDivisor feature is enabled. In this case, the same vertex attribute will be applied to all instances.
Valid Usage

- **VUID-VkVertexInputBindingDescription2EXT-binding-04796**
  Binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDescription2EXT-stride-04797**
  Stride must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04798**
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04799**
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06226**
  Divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06227**
  If divisor is not 1 then inputRate must be of type `VK_VERTEX_INPUT_RATE_INSTANCE`

Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription2EXT-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT`

- **VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter**
  inputRate must be a valid `VkVertexInputRate` value

The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object, VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
• offset is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
  location must be less than VkPhysicalDeviceLimits::maxVertexInputAttributes

- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
  offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

- VUID-VkVertexInputAttributeDescription2EXT-format-04805
  The format features of format must contain VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT

- VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is VK_FALSE,
  the sum of offset plus the size of the vertex attribute data described by format
  must not be greater than stride in the VkVertexInputBindingDescription2EXT referenced
  in binding

### Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  format must be a valid VkFormat value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets);
```

- commandBuffer is the command buffer into which the command is recorded.
- firstBinding is the index of the first vertex input binding whose state is updated by the command.
- bindingCount is the number of vertex input bindings whose state is updated by the command.
• `pBuffers` is a pointer to an array of buffer handles.
• `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

**Valid Usage**

- VUID-vkCmdBindVertexBuffers-firstBinding-00624  
  `firstBinding` **must** be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-firstBinding-00625  
  The sum of `firstBinding` and `bindingCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-pOffsets-00626  
  All elements of `pOffsets` **must** be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindVertexBuffers-pBuffers-00627  
  All elements of `pBuffers` **must** have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag

- VUID-vkCmdBindVertexBuffers-pBuffers-00628  
  Each element of `pBuffers` that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindVertexBuffers-pBuffers-04001  
  If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` **must** not be `VK_NULL_HANDLE`

- VUID-vkCmdBindVertexBuffers-pBuffers-04002  
  If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` **must** be zero

**Valid Usage (Implicit)**

- VUID-vkCmdBindVertexBuffers-commandBuffer-parameter  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindVertexBuffers-pBuffers-parameter  
  `pBuffers` **must** be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles

- VUID-vkCmdBindVertexBuffers-pOffsets-parameter
**pOffsets** must be a valid pointer to an array of **bindingCount** `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers-commandBuffer-recording
  `commandBuffer` must be in the **recording** state

- VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
  `bindingCount` must be greater than 0

- VUID-vkCmdBindVertexBuffers-commonparent
  Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

#### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

or the equivalent command
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object

```c
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements \(i\) of `pBuffers` and `pOffsets` replace the current state for the vertex input binding \(\text{firstBinding} + i\), for \(i\) in \([0, \text{bindingCount})\). The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. If `pSizes` is not `NULL` then `pSizes[i]` specifies the bound size of the vertex buffer starting from the corresponding elements of `pBuffers[i]` plus `pOffsets[i]`. If `pSizes[i]` is `VK_WHOLE_SIZE` then the bound size is from `pBuffers[i]` plus `pOffsets[i]` to the end of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with `(0,0,1)`.

This command also dynamically sets the byte strides between consecutive elements within buffer `pBuffers[i]` to the corresponding `pStrides[i]` value when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, strides are specified by the `VkVertexInputBindingDescription::stride` values used to create the currently active pipeline.

If drawing using shader objects or if the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` can be used instead of `vkCmdBindVertexBuffers2` to set the stride.

**Note**

Unlike the static state to set the same, `pStrides` must be between 0 and the maximum extent of the attributes in the binding. `vkCmdSetVertexInputEXT` does not have this restriction so can be used if other stride values are desired.
**Valid Usage**

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03355**
  
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03356**
  
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers2-pOffsets-03357**
  
  If `pSizes` is not `NULL`, all elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- **VUID-vkCmdBindVertexBuffers2-pSizes-03358**
  
  If `pSizes` is not `NULL`, all elements of `pOffsets` plus `pSizes`, where `pSizes` is not `VK_WHOLE_SIZE`, must be less than or equal to the size of the corresponding element in `pBuffers`

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03359**
  
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` flag

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03360**
  
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04111**
  
  If the `nullDescriptor` feature is not enabled, all elements of `pBuffers` must not be `VK_NULL_HANDLE`

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04112**
  
  If an element of `pBuffers` is `VK_NULL_HANDLE`, then the corresponding element of `pOffsets` must be zero

- **VUID-vkCmdBindVertexBuffers2-pStrides-03362**
  
  If `pStrides` is not `NULL` each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- **VUID-vkCmdBindVertexBuffers2-pStrides-06209**
  
  If `pStrides` is not `NULL` each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

**Valid Usage (Implicit)**

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindVertexBuffers2-pBuffers-parameter**
  
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles
- **VUID-vkCmdBindVertexBuffers2-pOffsets-parameter**
  \[pOffsets\] must be a valid pointer to an array of \[bindingCount\] \[VkDeviceSize\] values

- **VUID-vkCmdBindVertexBuffers2-pSizes-parameter**
  If \[pSizes\] is not \[NULL\], \[pSizes\] must be a valid pointer to an array of \[bindingCount\] \[VkDeviceSize\] values

- **VUID-vkCmdBindVertexBuffers2-pStrides-parameter**
  If \[pStrides\] is not \[NULL\], \[pStrides\] must be a valid pointer to an array of \[bindingCount\] \[VkDeviceSize\] values

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-recording**
  \[commandBuffer\] must be in the \[recording\] state

- **VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool**
The \[VkCommandPool\] that \[commandBuffer\] was allocated from must support graphics operations

- **VUID-vkCmdBindVertexBuffers2-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength**
  If any of \[pSizes\], or \[pStrides\] are not \[NULL\], \[bindingCount\] must be greater than 0

- **VUID-vkCmdBindVertexBuffers2-commonparent**
  Both of \[commandBuffer\], and the elements of \[pBuffers\] that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same \[VkDevice\]

---

**Host Synchronization**

- Host access to \[commandBuffer\] must be externally synchronized

- Host access to the \[VkCommandPool\] that \[commandBuffer\] was allocated from must be externally synchronized

---

**22.3. Vertex Attribute Divisor in Instanced Rendering**

If the \[vertexAttributeInstanceRateDivisor\] feature is enabled and the \[pNext\] chain of \[VkPipelineVertexInputStateCreateInfo\] includes a \[VkPipelineVertexInputDivisorStateCreateInfoKHR\] structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.
The `VkPipelineVertexInputDivisorStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionKHR* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef VkPipelineVertexInputDivisorStateCreateInfoKHR
    VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **vertexBindingDivisorCount** is the number of elements in the `pVertexBindingDivisors` array.
- **pVertexBindingDivisors** is a pointer to an array of `VkVertexInputBindingDivisorDescriptionKHR` structures specifying the divisor value for each binding.

**Valid Usage (Implicit)**

- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_KHR`
- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-pVertexBindingDivisors-parameter
  pVertexBindingDivisors must be a valid pointer to an array of vertexBindingDivisorCount `VkVertexInputBindingDivisorDescriptionKHR` structures
- VUID-VkPipelineVertexInputDivisorStateCreateInfoKHR-vertexBindingDivisorCount-arraylength
  vertexBindingDivisorCount must be greater than 0

The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionKHR` structure which is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionKHR {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionKHR;
```
or the equivalent

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef VkVertexInputBindingDivisorDescriptionKHR
    VkVertexInputBindingDivisorDescriptionEXT;
```

- **binding** is the binding number for which the divisor is specified.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of **divisor** is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR:maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- VUID-VkVertexInputBindingDivisorDescriptionKHR-binding-01869
  
  binding must be less than `VkPhysicalDeviceLimits:maxVertexInputBindings`

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateZeroDivisor-02228
  
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- VUID-VkVertexInputBindingDivisorDescriptionKHR-vertexAttributeInstanceRateDivisor-02229
  
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- VUID-VkVertexInputBindingDivisorDescriptionKHR-divisor-01870
  
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR:maxVertexAttribDivisor`, inclusive

- VUID-VkVertexInputBindingDivisorDescriptionKHR-inputRate-01871
  
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

### 22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo::pVertexAttributeDescriptions` with `VkVertexInputAttributeDescription::location` equal to the vertex input attribute number.
- Let `bindingDesc` be the member of `VkPipelineVertexInputStateCreateInfo`
Let \( \text{vertexIndex} \) be the index of the vertex within the draw (a value between \( \text{firstVertex} \) and \( \text{firstVertex} + \text{vertexCount} \) for \( \text{vkCmdDraw} \), or a value taken from the index buffer plus \( \text{vertexOffset} \) for \( \text{vkCmdDrawIndexed} \)), and let \( \text{instanceIndex} \) be the instance number of the draw (a value between \( \text{firstInstance} \) and \( \text{firstInstance} + \text{instanceCount} \)).

Let \( \text{offset} \) be an array of offsets into the currently bound vertex buffers specified during \( \text{vkCmdBindVertexBuffers} \) or \( \text{vkCmdBindVertexBuffers2} \) with \( \text{pOffsets} \).

Let \( \text{divisor} \) be the member of \( \text{VkPipelineVertexInputDivisorStateCreateInfoKHR} \) \( \text{::pVertexBindingDivisors} \) with \( \text{VkVertexInputBindingDivisorDescriptionKHR} \) \( \text{::binding} \) equal to \( \text{attribDesc.binding} \). If the vertex binding state is dynamically set, instead let \( \text{divisor} \) be the member of the \( \text{pVertexBindingDescriptions} \) parameter to the \( \text{vkCmdSetVertexInputEXT} \) call with \( \text{VkVertexInputBindingDescription2EXT} \) \( \text{::binding} \) equal to \( \text{attribDesc.binding} \).

Let \( \text{stride} \) be the member of \( \text{VkPipelineVertexInputStateCreateInfo} \) \( \text{::pVertexBindingDescriptions->stride} \) unless there is dynamic state causing the value to be ignored. In this case the value is set from the last value from one of the following

- \( \text{vkCmdSetVertexInputEXT} \) \( \text{::pVertexBindingDescriptions->stride} \)
- \( \text{vkCmdBindVertexBuffers2EXT} \) \( \text{::pStride}, \text{if not NULL} \)

```plaintext
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

### 22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at \( \text{attribAddress} \) and is converted from the \( \text{VkVertexInputAttributeDescription} \)'s \( \text{format} \) to either floating-point, unsigned integer, or signed integer based on the numeric type of \( \text{format} \). The numeric type of \( \text{format} \) must match the numeric type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if \( \text{format} \) is a 64-bit data type. If \( \text{format} \) is a packed format, \( \text{attribAddress} \) must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, \( \text{attribAddress} \) must be a multiple of the size in bytes of the component type indicated by \( \text{format} \) (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each \( \text{VkFormat} \)), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-
Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a **tessellation control shader** transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a **tessellation evaluation shader** transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an `OpExecutionMode` instruction using one of the `Triangles`, `Quads`, or `IsoLines` execution modes. When using shader objects, this instruction must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. When using pipelines, this instruction may be specified in either the tessellation evaluation or tessellation control shader. When using shader objects, tessellation-related modes that are required must be specified in the tessellation evaluation shader, and may also be specified in the tessellation control shader. Other tessellation-related modes may be specified in the tessellation evaluation shader. When using pipelines, other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders.

Any tessellation-related modes specified in both the tessellation control and tessellation evaluation shaders must be the same.

Tessellation execution modes include:

- **Triangles, Quads, and IsoLines.** These control the type of subdivision and topology of the output primitives. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation shader stages. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation, and `IsoLines` must not be used in either tessellation shader stage.

- **VertexOrderCw** and **VertexOrderCcw.** These control the orientation of triangles generated by the tessellator. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation
shader stages.

- **PointMode.** Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. When using shader objects, if PointMode is set in the tessellation control stage, it must be identically set in the tessellation evaluation stage. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode is VK_FALSE, then point mode tessellation is not supported by the implementation, and PointMode must not be used in either tessellation shader stage.

- **SpacingEqual, SpacingFractionalEven, and SpacingFractionalOdd.** Controls the spacing of segments on the edges of tessellated primitives. When using shader objects, one mode must be set in at least the tessellation evaluation stage. When using pipelines, one mode must be set in at least one of the tessellation shader stages.

- **OutputVertices.** Controls the size of the output patch of the tessellation control shader. When using shader objects, one value must be set in at least the tessellation control stage. When using pipelines, one value must be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in TessCoord are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures Domain parameterization for tessellation primitive modes (upper-left origin) and Domain parameterization for tessellation primitive modes (lower-left origin). The domain space can have either an upper-left or lower-left origin, selected by the domainOrigin member of VkPipelineTessellationDomainOriginStateCreateInfo.
Figure 15. Domain parameterization for tessellation primitive modes (upper-left origin)
In the domain parameterization diagrams, the coordinates illustrate the value of \texttt{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex’s position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point...
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For **Quads**, all four outer levels are relevant. For **Triangles** and **IsoLines**, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an [OpExecutionMode](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-1.3-extensions.html#OpExecutionMode) in the tessellation control or tessellation evaluation shader using one of the identifiers **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd**.

If **SpacingEqual** is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where `maxLevel` is the implementation-dependent maximum tessellation level (VkPhysicalDeviceLimits::maxTessellationGenerationLevel). The result is rounded up to the nearest integer `n`, and the corresponding edge is divided into `n` segments of equal length in \((u,v)\) space.

If **SpacingFractionalEven** is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer `n`. If **SpacingFractionalOdd** is used, the tessellation level is clamped to \([1, \text{maxLevel} - 1]\) and then rounded up to the nearest odd integer `n`. If `n` is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into `n - 2` segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with `n - f`, where `f` is the clamped floating-point tessellation level. When `n - f` is zero, the additional segments will have equal length to the other segments. As `n - f` approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments **must** be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but **must** be identical for any pair of subdivided edges with identical values of `f`.

When tessellating triangles or quads using **point mode** with fractional odd spacing, the tessellator **may** produce **interior vertices** that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to [primitive order](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-1.3-extensions.html#PrimitiveOrdering).

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an `OpExecutionMode` of `VertexOrderCw` or `VertexOrderCcw` in the tessellation control or tessellation evaluation shaders. If the order is `VertexOrderCw`, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is `VertexOrderCcw`, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if \( a \) is positive. \( u_i \) and \( v_i \) are the u and v coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

\[ \text{Note} \]

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

23.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate—a single point at the center of the triangle—if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in [Inner Triangle Tessellation](#).

![Inner Triangle Tessellation](image)

**Figure 17. Inner Triangle Tessellation**

**Caption**

In the [Inner Triangle Tessellation](#) diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge passing through each inner vertex of the subdivided outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the $u = 0$, $v = 0$, and $w = 0$ edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric $(u,v,w)$ coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in $(u,v,w)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

## 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the $u = 0$ and $u = 1$ (vertical) and $v = 0$ and $v = 1$ (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the $u = 0$ (left), $v = 0$ (bottom), $u = 1$ (right), and $v = 1$ (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as $1 + \varepsilon$ and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the $u = 0$ and $u = 1$ edges of the outer rectangle into $m$ segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The $v = 0$ and $v = 1$ edges are subdivided into $n$ segments using the second inner tessellation level. Each vertex on the $u = 0$ and $v = 0$ edges are joined with the corresponding vertex on the $u = 1$ and $v = 1$ edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either \( m \) or \( n \) is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure \textit{Inner Quad Tessellation}.

\begin{figure}[h]
\centering
\includegraphics[width=\textwidth]{inner_quad_tessellation.png}
\caption{\textit{Inner Quad Tessellation}}
\end{figure}

\textbf{Caption}

In the \textit{Inner Quad Tessellation} diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator \textbf{must} produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0, v = 0, u = 1, \) and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the \textit{inner edge}.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to \textit{triangle lists}, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.8. Isoline Tessellation

If the tessellation primitive mode is *IsoLines*, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The u = 0 and u = 1 edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the u = 0 rectangle edge to the corresponding vertex on the u = 1 rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided u = 0 and u = 1 edges is n, this process will result in n equally spaced lines with constant v coordinates of 0, \( \frac{1}{n}, \frac{2}{n}, ..., \frac{n-1}{n} \).

Each of the n isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in m line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

**Note**

If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines* is *VK_FALSE*, then isoline tessellation is not supported by the implementation.

### 23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

**Note**

If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode* is *VK_FALSE*, then tessellation point mode is not supported by the implementation.
23.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

**Valid Usage**

- `VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214` patchControlPoints must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

**Valid Usage (Implicit)**

- `VUID-VkPipelineTessellationStateCreateInfo-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`
- `VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext` `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`
- `VUID-VkPipelineTessellationStateCreateInfo-sType-unique` The `sType` value of each struct in the `pNext` chain must be unique
- `VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask` flags must be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
reserved for future use.

The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
    VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR = VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR = 2570
} VkTessellationDomainOrigin;
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT` specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).
- `VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT` specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.

To **dynamically set** the origin of the tessellation domain space, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_KHR_maintenance2 or
// VK_VERSION_1_1, VK_EXT_shader_object
void vkCmdSetTessellationDomainOriginEXT(
  VkCommandBuffer commandBuffer,
  VkTessellationDomainOrigin domainOrigin);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `domainOrigin` specifies the origin of the tessellation domain space.

This command sets the origin of the tessellation domain space for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineTessellationDomainOriginStateCreateInfo::domainOrigin` value used to create the currently active pipeline.

---

**Valid Usage**

- **VUID-vkCmdSetTessellationDomainOriginEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3TessellationDomainOrigin` feature is enabled
  - The `shaderObject` feature is enabled
### Valid Usage (Implicit)

- **VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetTessellationDomainOriginEXT-domainOrigin-parameter**
  - `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

- **VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetTessellationDomainOriginEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetTessellationDomainOriginEXT-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline's primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `Isolines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with `mode` specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least \( n \) times for each input primitive, where \( n \) is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the PassthroughNV decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. PassthroughNV Decoration

Decorating a geometry shader input variable with the PassthroughNV decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the PassthroughNV decoration are consumed by the geometry shader without being passed through to subsequent stages.

The PassthroughNV decoration must only be used within a geometry shader.

Any variable decorated with PassthroughNV must be declared using the Input storage class.

The PassthroughNV decoration must not be used with any of:

- an input primitive type other than InputPoints, InputLines, or Triangles, as specified by the mode for OpExecutionMode.
- an invocation count other than one, as specified by the Invocations mode for OpExecutionMode.
- an OpEntryPoint which statically uses the OpEmitVertex or OpEndPrimitive instructions.
- a variable decorated with the InvocationId built-in decoration.
- a variable decorated with the PrimitiveId built-in decoration that is declared using the Input storage class.

### 24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the PassthroughNV decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the PassthroughNV decoration is considered to add an equivalent output variable with the same type, decoration (other than PassthroughNV), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with PassthroughNV or having members decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with PassthroughNV, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with *PassthroughNV*. All members of the corresponding output block are assigned *Location* and *Component* decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with *PassthroughNV* will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the *PassthroughNV* decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated. Shaders using the TaskNV Execution Model can do so using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount. Shaders using the TaskEXT Execution Model can do so using the OpEmitMeshTasksEXT instruction. The groupCountX, groupCountY and groupCountZ arguments passed to this instruction must be less than or equal to the respective dimension within VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount. The product of these arguments must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount.

The task shader can also pass user-defined data to all mesh shader invocations that it creates. Shaders using the TaskNV Execution Model can do so by writing to output variables that are decorated with PerTaskNV. They are available as inputs in mesh shaders. Shaders using the TaskEXT Execution Model can do so by writing to a payload variable with TaskPayloadWorkgroupEXT storage class that is passed to the OpEmitMeshTasksEXT instruction.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV or the payload variable passed to the
The OpEmitMeshTasksEXT instruction by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

### 25.5. Mesh Shader Output

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. For shaders using the MeshNV Execution Model, the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. For shaders using the MeshEXT Execution Model, the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesEXT, or OutputTrianglesEXT modes, respectively. Each mesh shader must include exactly one output primitive mode.

For shaders using the MeshNV Execution Model, the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices. For shaders using the MeshEXT Execution Model, the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices, and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputVertices.

For shaders using the MeshNV Execution Model, the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesNV and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives. For shaders using the MeshEXT Execution Model, the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesEXT, and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives.

For shaders using the MeshNV Execution Model, the number of primitives output by the mesh shader is provided via writing to the built-in variable PrimitiveCountNV and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with PrimitiveIndicesNV is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. For shaders using the MeshEXT Execution Model, the number of vertices and primitives output by the mesh shader is provided via calling the OpSetMeshOutputsEXT instruction. The vertexCount argument must be less than or equal to the maximum output vertex count specified in the shader. The primitiveCount argument must be less than or equal to the maximum output primitive count specified in the shader.

Depending on the output primitive mode, an appropriately-decorated variable is the output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type:

- OutputPoints uses the PrimitivePointIndicesEXT decoration.
- OutputLinesEXT uses the PrimitiveLineIndicesEXT decoration.
- OutputTrianglesEXT uses the PrimitiveTriangleIndicesEXT decoration.

These resulting primitives are then further processed as described in Rasterization.
With the exception of primitive indices, all output built-ins and custom attributes count towards the total storage size occupied by output variables in mesh shaders. This size can be calculated as follows, taking into account the fact that the number of effective scalar attributes is 4 times the number of effective locations used according to the location assignment rules. Let \( v \) be the number of views, \( n_v \) be the number of effective scalar per-vertex attributes not dependent on \( \text{ViewIndex} \), \( n_{vpv} \) be the number of effective scalar per-vertex attributes dependent on \( \text{ViewIndex} \), \( m_v \) be the maximum number of vertices specified by the \text{OutputVertices Execution Mode} \( g_v \) be \text{meshOutputPerVertexGranularity}, \( n_p \) be the number of effective scalar per-primitive attributes not dependent on \( \text{ViewIndex} \), \( n_{ppv} \) be the number of effective scalar per-primitive attributes dependent on \( \text{ViewIndex} \), \( m_p \) be the maximum number of primitives specified by the \text{OutputPrimitivesEXT Execution Mode} and \( g_p \) be \text{meshOutputPerPrimitiveGranularity}:

\[(n_v + (n_{vpv} \times v)) \times 4 \times \text{align}(m_v, g_v) + (n_p + (n_{ppv} \times v)) \times 4 \times \text{align}(m_p, g_p)\]

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the \text{PositionPerViewNV} \text{, ClipDistancePerViewNV} \text{, CullDistancePerViewNV} \text{, LayerPerViewNV} \text{, and ViewportMaskPerViewNV} built-in decorations are the per-view versions of the single-view variables with equivalent names (that is \text{Position} \text{, ClipDistance} \text{, CullDistance} \text{, Layer} \text{, and ViewportMaskNV}, respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the \text{ClipDistancePerViewNV} \text{, and CullDistancePerViewNV} arrays have the same requirements as the \text{ClipDistance} \text{, and CullDistance} arrays.

If a mesh shader output is per-view, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

These per-view outputs are available only in shaders using the \text{MeshNV Execution Model}. They are not available in shaders using the \text{MeshEXT Execution Model}.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Cluster Culling Shading

This shader type has an execution environment similar to that of a compute shader, where a collection of shader invocations form a workgroup and cooperate to perform coarse level geometry culling and LOD selection. A shader invocation can emit a set of built-in output variables via a new built-in function. The cluster culling shader organizes these emitted variables into a drawing command used by the subsequent rendering pipeline.

26.1. Cluster Culling Shader Input

The only inputs available to the cluster culling shader are variables identifying the specific workgroup and invocation.

26.2. Cluster Culling Shader Output

If a cluster survives after culling in a cluster culling shader invocation, a drawing command to draw this cluster should be emitted by this shader invocation for further rendering processing. There are two types of drawing command, indexed mode and non-indexed mode. Both type of drawing commands consist of a set of built-in output variables which have a similar definition to VkDrawIndexedIndirectCommand and VkDrawIndirectCommand members.

Cluster culling shaders have the following built-in output variables:

- **built-in variable IndexCountHUAWEI** is the number of vertices to draw.
- **built-in variable VertexCountHUAWEI** is the number of vertices to draw.
- **built-in variable InstanceCountHUAWEI** is the number of instances to draw.
- **built-in variable FirstIndexHUAWEI** is the base index within the index buffer.
- **built-in variable FirstVertexHUAWEI** is the index of the first vertex to draw
- **built-in variable VertexOffsetHUAWEI** is the value added to the vertex index before indexing into the vertex buffer.
- **built-in variable FirstInstanceHUAWEI** is the instance ID of the first instance to draw.
- **built-in variable ClusterIDHUAWEI** is the index of the cluster being rendered by this drawing command. When cluster culling shader is enabled, ClusterIDHUAWEI will replace gl_DrawID pass to vertex shader.
- **built-in variable ClusterShadingRate** is the shading rate of cluster being rendered by this drawing command.

26.3. Cluster Culling Shader Cluster Ordering

- When a cluster culling shader is used, all output clusters generated by DispatchClusterHUAWEI() in a given workgroup are passed to subsequent pipeline stage before any cluster generated from subsequent workgroup.
- In a workgroup, the order of output clusters generated by DispatchClusterHUAWEI() is specified by
the local invocation id, from lower to higher values.

• If any cluster culling invocation in the workgroup does not call \texttt{DispatchClusterHUWEI()}, no cluster will be sent to the subsequent rendering pipeline.

• Any cluster culling shader invocation may also call \texttt{DispatchClusterHUWEI()} many times as shown below:

\begin{quote}
\texttt{// Cluster Culling Shader sample code:}
\[
......
\texttt{DispatchClusterHUWEI();} \quad \texttt{// dispatch 0}
\]
\[
......
\texttt{DispatchClusterHUWEI();} \quad \texttt{// dispatch 1}
\]
\[
......
\texttt{DispatchClusterHUWEI();} \quad \texttt{// dispatch 2}
\]
\end{quote}

In this case, the output sequence of clusters in a workgroup are specified as shown below (in case of 32 shader invocations in a workgroup):

\begin{quote}
\begin{enumerate}
\item shader invocation0.dispatch0
\item shader invocation1.dispatch0,
\item shader invocation2.dispatch0,
\item \ldots\ldots \item shader invocation31.dispatch0
\item shader invocation0.dispatch1
\item shader invocation1.dispatch1
\item \ldots\ldots \item shader invocation31.dispatch1
\item shader invocation0.dispatch2
\item shader invocation1.dispatch2
\item \ldots\ldots \item shader Invocation31.dispatch2
\end{enumerate}
\end{quote}

\section{26.4. Cluster Culling Shader Primitive Ordering}

Following guarantees are provided for the relative ordering of primitives produced by a cluster culling shader, as they pertain to \textit{primitive order}.

• Limited guarantees are provided for the relative ordering of primitives produced by a cluster culling shader, as they pertain to primitive order.

• The order of primitives in a given cluster is specified by the content of:
  \begin{itemize}
  \item \texttt{DispatchClusterHUWEI()} with indexed output built-in variables, vertices sourced from a lower index buffer addresses to higher addresses.
  \item \texttt{DispatchClusterHUWEI()} with non-indexed output built-in variables, from vertices with a lower numbered \texttt{vertexIndex} to a higher numbered \texttt{vertexIndex}.
  \end{itemize}
Chapter 27. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

27.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.
- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` execution mode.
- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.
- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither geometry nor tessellation shading is active, and the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with an `Offset` decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,    // Provided by VK_EXT_transform_feedback
    uint32_t firstBinding,             // Provided by VK_EXT_transform_feedback
    uint32_t bindingCount,             // Provided by VK_EXT_transform_feedback
    const VkBuffer* pBuffers,         // Provided by VK_EXT_transform_feedback
    const VkDeviceSize* pOffsets,     // Provided by VK_EXT_transform_feedback
    const VkDeviceSize* pSizes);       // Provided by VK_EXT_transform_feedback
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is NULL or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is NULL, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements `i` of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. 
Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  
  `firstBinding` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  
  All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  
  All elements of `pOffsets` must be a multiple of 4

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  
  All elements of `pBuffers` must have been created with the `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT` flag

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  
  If the optional `pSize` array is specified, each element of `pSizes` must either be `VK_WHOLE_SIZE`, or be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  
  All elements of `pSizes` must be either `VK_WHOLE_SIZE`, or less than or equal to the size of the corresponding buffer in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  
  All elements of `pOffsets` plus `pSizes`, where the `pSizes` element is not `VK_WHOLE_SIZE`, must be less than or equal to the size of the corresponding buffer in `pBuffers`

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  
  Each element of `pBuffers` that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  
  Transform feedback must not be active when the `vkCmdBindTransformFeedbackBuffersEXT` command is recorded

Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid `VkBuffer` handles
• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindTransformFeedbackBuffersEXT-videocoding
This command must only be called outside of a video coding scope

• VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
bindingCount must be greater than 0

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
Both of commandBuffer, and the elements of pBuffers must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

• commandBuffer is the command buffer into which the command is recorded.

• firstCounterBuffer is the index of the first transform feedback buffer corresponding to pCounterBuffers[0] and pCounterBufferOffsets[0].
• *counterBufferCount* is the size of the *pCounterBuffers* and *pCounterBufferOffsets* arrays.

• *pCounterBuffers* is **NULL** or a pointer to an array of *VkBuffer* handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using *vkCmdEndTransformFeedbackEXT* it can be used to resume transform feedback from the previous location. If *pCounterBuffers* is **NULL**, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of *pCounterBuffers* that is **VK_NULL_HANDLE**, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• *pCounterBufferOffsets* is **NULL** or a pointer to an array of *VkDeviceSize* values specifying offsets within each of the *pCounterBuffers* where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If *pCounterBufferOffsets* is **NULL**, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding *XfbBuffer* in the bound graphics pipeline. Any *XfbBuffer* emitted that does not output to an active transform feedback buffer will not be captured.

---

**Valid Usage**

- VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  
  *VkPhysicalDeviceTransformFeedbackFeaturesEXT::*::transformFeedback must be enabled

- VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  
  Transform feedback must not be active

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  
  *firstCounterBuffer* must be less than *VkPhysicalDeviceTransformFeedbackPropertiesEXT::*::maxTransformFeedbackBuffers

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  
  The sum of *firstCounterBuffer* and *counterBufferCount* must be less than or equal to *VkPhysicalDeviceTransformFeedbackPropertiesEXT::*::maxTransformFeedbackBuffers

- VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  
  If *counterBufferCount* is not 0, and *pCounterBuffers* is not **NULL**, *pCounterBuffers* must be a valid pointer to an array of *counterBufferCount* *VkBuffer* handles that are either valid or **VK_NULL_HANDLE**

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  
  For each buffer handle in the array, if it is not **VK_NULL_HANDLE** it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the *pCounterBufferOffsets* array

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  
  If *pCounterBuffer* is **NULL**, then *pCounterBufferOffsets* must also be **NULL**

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  
  For each buffer handle in the *pCounterBuffers* array that is not **VK_NULL_HANDLE** it must
have been created with a usage value containing
VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT

• VUID-vkCmdBeginTransformFeedbackEXT-None-06233
  If the shaderObject feature is not enabled, a valid graphics pipeline must be bound to
  VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  The last pre-rasterization shader stage of the bound graphics pipeline must have been
  declared with the Xfb execution mode

• VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  Transform feedback must not be made active in a render pass instance with multiview
  enabled

Valid Usage (Implicit)

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter
  If counterBufferCount is not 0, and pCounterBufferOffsets is not NULL, pCounterBufferOffsets
  must be a valid pointer to an array of counterBufferCount VkDeviceSize values

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

• VUID-vkCmdBeginTransformFeedbackEXT-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdBeginTransformFeedbackEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBeginTransformFeedbackEXT-commonparent
  Both of commandBuffer, and the elements of pCounterBuffers that are valid handles of non-
  ignored parameters must have been created, allocated, or retrieved from the same
  VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized
Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0].`
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

### Valid Usage

- VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled
- VUID-vkCmdEndTransformFeedbackEXT-None-02375
  Transform feedback must be active
- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376
  `firstCounterBuffer` must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers
The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`.

If `counterBufferCount` is not 0, and `pCounterBuffers` is not NULL, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`.

For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array.

If `pCounterBuffer` is NULL, then `pCounterBufferOffsets` must also be NULL.

For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- This command must only be called outside of a video coding scope.
- Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

#### 27.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the VkPipelineViewportSwizzleStateCreateInfoNV pipeline state:

```c
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewport swizzles used by the pipeline.
- **pViewportSwizzles** is a pointer to an array of VkViewportSwizzleNV structures, defining the viewport swizzles.

### Valid Usage

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215: viewportCount must be greater than or equal to the viewportCount set in VkPipelineViewportStateCreateInfo.

### Valid Usage (Implicit)

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid VkViewportSwizzleNV structures

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  viewportCount must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

VkPipelineViewportSwizzleStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

The VkPipelineViewportSwizzleStateCreateInfoNV state is set by adding this structure to the pNext chain of a VkPipelineViewportStateCreateInfo structure and setting the graphics pipeline state with vkCreateGraphicsPipelines.

To dynamically set the viewport swizzle state, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_viewport_swizzle,
// VK_EXT_shader_object with VK_NV_viewport_swizzle
void vkCmdSetViewportSwizzleNV(
  VkCommandBuffer commandBuffer,
  uint32_t firstViewport,
  uint32_t viewportCount,
  const VkViewportSwizzleNV* pViewportSwizzles);

- commandBuffer is the command buffer into which the command will be recorded.
- firstViewport is the index of the first viewport whose parameters are updated by the command.
- viewportCount is the number of viewports whose parameters are updated by the command.
- pViewportSwizzles is a pointer to an array of VkViewportSwizzleNV structures specifying viewport swizzles.

This command sets the viewport swizzle state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount, and VkPipelineViewportSwizzleStateCreateInfoNV::pViewportSwizzles values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetViewportSwizzleNV-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3ViewportSwizzle feature is enabled
  - The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetViewportSwizzleNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid VkViewportSwizzleNV structures
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetViewportSwizzleNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetViewportSwizzleNV-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportSwizzleNV-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Each viewport specified from 0 to viewportCount - 1 has its x,y,z,w swizzle state set to the corresponding x, y, z and w in the VkViewportSwizzleNV structure. Each component is of type
**VkViewportCoordinateSwizzleNV**, which determines the type of swizzle for that component. The value of \( x \) computes the new \( x \) component of the position as:

```c
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV) x' = x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV) x' = -x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV) x' = y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV) x' = -y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV) x' = z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV) x' = -z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV) x' = w;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV) x' = -w;
```

Similar selections are performed for the \( y \), \( z \), and \( w \) coordinates. This swizzling is applied before clamping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for \( x \) is \( VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV \), \( y \) is \( VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV \), \( z \) is \( VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV \) and \( w \) is \( VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV \).

Viewport swizzle parameters are specified by setting the `pNext` pointer of `VkGraphicsPipelineCreateInfo` to point to a `VkPipelineViewportSwizzleStateCreateInfoNV` structure. `VkPipelineViewportSwizzleStateCreateInfoNV` uses `VkViewportSwizzleNV` to set the viewport swizzle parameters.

The `VkViewportSwizzleNV` structure is defined as:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;
```

- \( x \) is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the \( x \) component of the primitive
- \( y \) is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the \( y \) component of the primitive
- \( z \) is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the \( z \) component of the primitive
- \( w \) is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the \( w \) component of the primitive

**Valid Usage (Implicit)**

- VUID-VkViewportSwizzleNV-x-parameter
  - \( x \) must be a valid `VkViewportCoordinateSwizzleNV` value
Possible values of the `VkViewportSwizzleNV::x, y, z, and w` members, specifying swizzling of the corresponding components of primitives, are:

```
// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;
```

These values are described in detail in Viewport Swizzle.

### 27.3. Flat Shading

*Flat shading* a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the *provoking vertex* of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as `Flat`.

If neither *mesh*, *geometry* nor *tessellation shading* is active, the provoking vertex is determined by the *primitive topology* defined by `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the *drawing command*.

If a shader using *MeshNV Execution Model* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints`, `OutputLinesNV`, or `OutputTrianglesNV` execution mode.

If a shader using *MeshEXT Execution Model* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints`, `OutputLinesEXT`, or `OutputTrianglesEXT` execution mode.

If *geometry shading* is active, the provoking vertex is determined by the *primitive topology* defined by the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` execution mode.

If *tessellation shading* is active but *geometry shading* is not, the provoking vertex *may* be any of the
For a given primitive topology, the pipeline's provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure in the `VkPipelineRasterizationStateCreateInfo::pNext` chain when creating the pipeline.

The `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexMode` is a `VkProvokingVertexModeEXT` value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` mode.

If the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then all pipelines bound within a render pass instance must have the same `provokingVertexMode`.

### Valid Usage

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature must be enabled

### Valid Usage (Implicit)

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter
  `provokingVertexMode` must be a valid `VkProvokingVertexModeEXT` value

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` are:
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;

- **VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT** specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT** specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in **Primitive Topologies**.

To **dynamically set** the **provokingVertexMode** state, call:

```c
void vkCmdSetProvokingVertexModeEXT(
    VkCommandBuffer commandBuffer,
    VkProvokingVertexModeEXT provokingVertexMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **provokingVertexMode** specifies the **provokingVertexMode** state.

This command sets the **provokingVertexMode** state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VkPipelineDynamicStateCreateInfo::pDynamicStates** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode** value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetProvokingVertexModeEXT-None-09423**
  At least one of the following **must** be true:
  - The **extendedDynamicState3ProvokingVertexMode** feature is enabled
  - The **shaderObject** feature is enabled
- **VUID-vkCmdSetProvokingVertexModeEXT-provokingVertexMode-07447**
  If **provokingVertexMode** is **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT**, then the **provokingVertexLast** feature **must** be enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdSetProvokingVertexModeEXT-commandBuffer-parameter**
**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>

**27.4. Primitive Clipping**

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[
\begin{align*}
-w_c & \leq x_c \leq w_c \\
-w_c & \leq y_c \leq w_c \\
z_m & \leq z_c \leq w_c
\end{align*}
\]

where if `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` is `VK_TRUE` \( z_m \) is equal to \(-w_c\) otherwise \( z_m \) is equal to zero.

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).
A shader must write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader must write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space \( i \) is then given by the set of points satisfying the inequality

\[
c_i(P) \geq 0
\]

where \( c_i(P) \) is the clip distance \( i \) at point \( P \). For point primitives, \( c_i(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections `Basic Line Segment Rasterization` and `Basic Polygon Rasterization`, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays `ClipDistance` and `CullDistance`, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is present in the graphics pipeline state then depth clipping is disabled if `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` is `VK_FALSE`. Otherwise, if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not present, depth clipping is disabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_TRUE`.

To dynamically set enable or disable depth clamping, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetDepthClampEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthClampEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClampEnable` specifies whether depth clamping is enabled.

This command sets whether depth clamping is enabled or disabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthClampEnable` value used to create the currently active pipeline.

If the depth clamping state is changed dynamically, and the pipeline was not created with
VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT enabled, then depth clipping is enabled when depth clamping is disabled and vice versa.

Valid Usage

- VUID-vkCmdSetDepthClampEnableEXT-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3DepthClampEnable feature is enabled
  - The shaderObject feature is enabled

- VUID-vkCmdSetDepthClampEnableEXT-depthClamp-07449
  If the depthClamp feature is not enabled, depthClampEnable must be VK_FALSE

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetDepthClampEnableEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetDepthClampEnableEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set enable or disable depth clipping, call:

```c
// Provided by VK_EXT_depth_clip_enable with VK_EXT_extended_dynamic_state3,
```
VK_EXT_depth_clip_enable with VK_EXT_shader_object

```c
void vkCmdSetDepthClipEnableEXT(
    VkCommandBuffer commandBuffer,          commandBuffer,
    VkBool32 depthClipEnable);             depthClipEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthClipEnable` specifies whether depth clipping is enabled.

This command sets whether depth clipping is enabled or disabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` value used to create the currently active pipeline, or is set to the inverse of `VkPipelineRasterizationStateCreateInfo::depthClampEnable` if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not specified.

### Valid Usage

- VUID-vkCmdSetDepthClipEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3DepthClipEnable` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetDepthClipEnableEXT-depthClipEnable-07451
  The `depthClipEnable` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthClipEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthClipEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

</tbody>
</table>

When depth clipping is disabled, the plane equation

\[
z_m \leq z_c \leq w_c
\]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR = VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR = VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- `VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES` specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- `VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY` specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment's vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped
line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, \(0 \leq t \leq 1\), for each clipped vertex. If the coordinates of a clipped vertex are \(P\) and the unclipped line segment’s vertex coordinates are \(P_1\) and \(P_2\), then \(t\) satisfies the following equation

\[
P = tP_1 + (1-t)P_2.
\]

\(t\) is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex \(i\) has a single specified clip distance \(d_i\) (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by \(-d_i\) (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

The VkPipelineViewportDepthClipControlCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;
```

- \(sType\) is a \text{VkStructureType} value identifying this structure.
- \(pNext\) is \text{NULL} or a pointer to a structure extending this structure.
- \(negativeOneToOne\) sets the \(z_m\) in the view volume to \(-w_c\).

### Valid Usage

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470

If depthClipControl is not enabled, \(negativeOneToOne\) must be \text{VK_FALSE}
Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT

To dynamically set negativeOneToOne, call:

```c
// Provided by VK_EXT_depth_clip_control with VK_EXT_extended_dynamic_state3,
// VK_EXT_depth_clip_control with VK_EXT_shader_object
void vkCmdSetDepthClipNegativeOneToOneEXT(
  VkCommandBuffer commandBuffer,
  VkBool32 negativeOneToOne);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `negativeOneToOne` specifies the negativeOneToOne state.

This command sets the negativeOneToOne state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3DepthClipNegativeOneToOne` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-depthClipControl-07453
  The depthClipControl feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthClipNegativeOneToOneEXT-videocoding

2604
This command **must** only be called outside of a video coding scope

---

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

### 27.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices $P_1$ and $P_2$ of an unclipped edge be $c_1$ and $c_2$. The value of $t$ (see **Primitive Clipping**) for a clipped point $P$ is used to obtain the output value associated with $P$ as

$$c = t c_1 + (1-t) c_2.$$  

(Multiplying an output value by a scalar means multiplying each of $x, y, z,$ and $w$ by the scalar.)

Since this computation is performed in clip space before division by $w$, clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with **NoPerspective**, the value of $t$ used to obtain the output value associated with $P$ will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type **must** always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see **Basic Line Segment Rasterization** and **Basic Polygon Rasterization**), and no interpolation is performed. The output value $c$ is taken
from either \( c_1 \) or \( c_2 \), since flat shading has already occurred and the two values are identical.

## 27.6. Controlling Viewport W Scaling

If viewport \( W \) scaling is enabled, the \( W \) component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
w'_c = x_{coeff} x_c + y_{coeff} y_c + w_c
\]

The `VkPipelineViewportWScalingStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewportWScalingEnable` controls whether viewport \( W \) scaling is enabled.
- `viewportCount` is the number of viewports used by \( W \) scaling, and **must** match the number of viewports in the pipeline if viewport \( W \) scaling is enabled.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures defining the \( W \) scaling parameters for the corresponding viewports. If the viewport \( W \) scaling state is dynamic, this member is ignored.

### Valid Usage (Implicit)

- `VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType`:
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`

- `VUID-VkPipelineViewportWScalingStateCreateInfoNV-viewportCount-arraylength`:
  `viewportCount` **must** be greater than 0

The `VkPipelineViewportWScalingStateCreateInfoNV` state is set by adding this structure to the `pNext` chain of a `VkPipelineViewportStateCreateInfo` structure and setting the graphics pipeline state with `vkCreateGraphicsPipelines`.

To **dynamically set** the `viewportWScalingEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_clip_space_w_scaling,
```
VK_EXT_shader_object with VK_NV_clip_space_w_scaling

```c
void vkCmdSetViewportWScalingEnableNV(
    VkCommandBuffer commandBuffer, 
    VkBool32 viewportWScalingEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportWScalingEnable` specifies the `viewportWScalingEnable` state.

This command sets the `viewportWScalingEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::*pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::*viewportWScalingEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWScalingEnableNV-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ViewportWScalingEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetViewportWScalingEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetViewportWScalingEnableNV-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
To dynamically set the viewport W scaling parameters, call:

```c
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewportWScalingNV* pViewportWScalings);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures specifying viewport parameters.

The viewport parameters taken from element i of `pViewportWScalings` replace the current state for the viewport index `firstViewport + i`, for i in [0, `viewportCount`).

This command sets the viewport W scaling for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::pViewportWScalings` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWScalingNV-firstViewport-01324**
  The sum of `firstViewport` and `viewportCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter**
  `pViewportWScalings` **must** be a valid pointer to an array of `viewportCount`
**VkViewportWScalingNV** structures

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording
  - **commandBuffer** must be in the recording state
- VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool
  - The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations
- VUID-vkCmdSetViewportWScalingNV-videocoding
  - This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength
  - **viewportCount** must be greater than 0

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both **VkPipelineViewportWScalingStateCreateInfoNV** and **vkCmdSetViewportWScalingNV** use **VkViewportWScalingNV** to set the viewport transformation parameters.

The **VkViewportWScalingNV** structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
  float xcoeff;
  float ycoeff;
} VkViewportWScalingNV;
```

- **xcoeff** and **ycoeff** are the viewport’s W scaling factor for x and y respectively.

### 27.7. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*. 

---

2609
Perspective division on clip coordinates yields normalized device coordinates, followed by a viewport transformation (see Controlling the Viewport) to convert these coordinates into framebuffer coordinates.

If a vertex in clip coordinates has a position given by

$$\begin{pmatrix} x_c \\ y_c \\ z_c \\ w_c \end{pmatrix}$$

then the vertex's normalized device coordinates are

$$\begin{pmatrix} x_d \\ y_d \\ z_d \end{pmatrix} = \begin{pmatrix} x_c \\ w_c \\ y_c \\ w_c \\ z_c \\ w_c \end{pmatrix}$$

### 27.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When Render pass transform is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

$$\begin{pmatrix} x_{c_{trans}} \\ y_{c_{trans}} \\ z_{c_{trans}} \end{pmatrix} = \begin{pmatrix} x_c \cos \theta - y_c \sin \theta \\ x_c \sin \theta + y_c \cos \theta \\ z_c \end{pmatrix}$$

where

- \(\theta\) is 0 degrees for VK_SURFACE_TRANSFORM.IDENTITY_BIT_KHR
- \(\theta\) is 90 degrees for VK_SURFACE_TRANSFORM.ROTATE_90_BIT_KHR
- \(\theta\) is 180 degrees for VK_SURFACE_TRANSFORM.ROTATE_180_BIT_KHR
- \(\theta\) is 270 degrees for VK_SURFACE_TRANSFORM.ROTATE_270_BIT_KHR

The transformed vertex's normalized device coordinates are

$$\begin{pmatrix} x_d \\ y_d \\ z_d \end{pmatrix} = \begin{pmatrix} x_{c_{trans}} \\ w_c \\ y_{c_{trans}} \\ w_c \\ z_{c_{trans}} \\ w_c \end{pmatrix}$$
When render pass transform is enabled for a render pass instance, the following additional features are enabled:

- Each VkViewport specified by either VkPipelineViewportStateCreateInfo::pViewports or vkCmdSetViewport will have its width/height \((p_x, p_y)\) and its center \((o_x, o_y)\) similarly transformed by the implementation.
- Each scissor specified by VkPipelineViewportStateCreateInfo::pScissors or vkCmdSetScissor will have its \((\text{offset}_x, \text{offset}_y)\) and \((\text{extent}_x, \text{extent}_y)\) similarly transformed by the implementation.
- The renderArea specified in VkCommandBufferInheritanceRenderPassTransformInfoQCOM and VkRenderPassBeginInfo will be similarly transformed by the implementation.
- The \((x, y)\) components of shader variables with built-in decorations FragCoord, SamplePosition, or PointCoord will be similarly transformed by the implementation.
- The \((x,y)\) components of the \text{offset} operand of the \text{InterpolateAtOffset} extended instruction will be similarly transformed by the implementation.
- The values returned by SPIR-V derivative instructions OpDPdx, OpDPdy, OpDPdxCourse, OpDPdyCourse, OpDPdxFine, OpDPdyFine will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the VkSurfaceCapabilitiesKHR::currentTransform. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

### 27.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, \(p_x\) and \(p_y\), respectively, and its center \((o_x, o_y)\) (also in pixels), as well as its depth range min and max determining a depth range scale value \(p_z\) and a depth range bias value \(o_z\) (defined below). The vertex's framebuffer coordinates \((x_f, y_f, z_f)\) are given by

\[
x_f = \left(\frac{p_x}{2}\right) x_d + o_x
\]

\[
y_f = \left(\frac{p_y}{2}\right) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to VkPhysicalDeviceLimits::maxViewports minus one. The number of viewports used by a pipeline is controlled by the \text{viewportCount} member of the VkPipelineViewportStateCreateInfo structure used in pipeline creation.

\(x_f\) and \(y_f\) have limited precision, where the number of fractional bits retained is specified by VkPhysicalDeviceLimits::subPixelPrecisionBits. When rasterizing line segments, the number of fractional bits is specified by VkPhysicalDeviceLineRasterizationPropertiesKHR
The `VkPipelineViewportStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of scissors and must match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

### Valid Usage

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216**
  If the `multiViewport` feature is not enabled, `viewportCount` must not be greater than 1

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217**
  If the `multiViewport` feature is not enabled, `scissorCount` must not be greater than 1

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218**
  `viewportCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219**
  `scissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- **VUID-VkPipelineViewportStateCreateInfo-x-02821**
  The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0

- **VUID-VkPipelineViewportStateCreateInfo-offset-02822**
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

- **VUID-VkPipelineViewportStateCreateInfo-offset-02823**
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`
overflow for any element of \texttt{pScissors}

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134**
  If \texttt{scissorCount} and \texttt{viewportCount} are both not dynamic, then \texttt{scissorCount} and \texttt{viewportCount} must be identical.

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135**
  If the graphics pipeline is being created with \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} set then \texttt{viewportCount} must be 0, otherwise \texttt{viewportCount} must be greater than 0.

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-04136**
  If the graphics pipeline is being created with \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} set then \texttt{scissorCount} must be 0, otherwise \texttt{scissorCount} must be greater than 0.

- **VUID-VkPipelineViewportStateCreateInfo-viewportWScalingEnable-01726**
  If the \texttt{viewportWScalingEnable} member of a \texttt{VkPipelineViewportWScalingStateCreateInfoNV} structure included in the \texttt{pNext} chain is \texttt{VK_TRUE}, the \texttt{viewportCount} member of the \texttt{VkPipelineViewportWScalingStateCreateInfoNV} structure must be greater than or equal to \texttt{VkPipelineViewportStateCreateInfo::viewportCount}.

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineViewportStateCreateInfo-sType-sType**
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO}.

- **VUID-VkPipelineViewportStateCreateInfo-pNext-pNext**
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either NULL or a pointer to a valid instance of

  - \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV},
  - \texttt{VkPipelineViewportDepthClipControlCreateInfoEXT},
  - \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV},
  - \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV},
  - \texttt{VkPipelineViewportSwizzleStateCreateInfoNV},
  - \texttt{VkPipelineViewportWScalingStateCreateInfoNV}.

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**
  The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique.

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**
  \texttt{flags} must be 0.

To **dynamically set** the viewport count and viewports, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(
  VkCommandBuffer commandBuffer,
  uint32_t viewportCount,
  const VkViewport* pViewports);
```
or the equivalent command

```c
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportWithCount-None-08971**
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

- **VUID-vkCmdSetViewportWithCount-viewportCount-03394**
  `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetViewportWithCount-viewportCount-03395**
  If the multiViewport feature is not enabled, `viewportCount` must be 1

- **VUID-vkCmdSetViewportWithCount-commandBuffer-04819**
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportWithCount-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetViewportWithCount-pViewports-parameter**
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- **VUID-vkCmdSetViewportWithCount-commandBuffer-recording**
  2614
**commandBuffer** must be in the recording state

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics operations
- VUID-vkCmdSetViewportWithCount-videcoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  *viewportCount* must be greater than 0

**Host Synchronization**

- Host access to *commandBuffer* must be externally synchronized
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *scissorCount* specifies the scissor count.
- *pScissors* specifies the scissors to use for drawing.
This command sets the scissor count and scissor rectangular bounds state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the corresponding \texttt{VkPipelineViewportStateCreateInfo::scissorCount} and \texttt{pScissors} values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetScissorWithCount-None-08971**  
  At least one of the following must be true:
  - the \texttt{extendedDynamicState} feature is enabled
  - the \texttt{shaderObject} feature is enabled
  - the value of \texttt{VkApplicationInfo::apiVersion} used to create the \texttt{VkInstance} parent of \texttt{commandBuffer} is greater than or equal to Version 1.3

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**  
  \texttt{scissorCount} must be between 1 and \texttt{VkPhysicalDeviceLimits::maxViewports}, inclusive

- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**  
  If the \texttt{multiViewport} feature is not enabled, \texttt{scissorCount} must be 1

- **VUID-vkCmdSetScissorWithCount-x-03399**  
  The \texttt{x} and \texttt{y} members of \texttt{offset} member of any element of \texttt{pScissors} must be greater than or equal to 0

- **VUID-vkCmdSetScissorWithCount-offset-03400**  
  Evaluation of (\texttt{offset.x + extent.width}) must not cause a signed integer addition overflow for any element of \texttt{pScissors}

- **VUID-vkCmdSetScissorWithCount-offset-03401**  
  Evaluation of (\texttt{offset.y + extent.height}) must not cause a signed integer addition overflow for any element of \texttt{pScissors}

- **VUID-vkCmdSetScissorWithCount-commandBuffer-04820**  
  \texttt{commandBuffer} must not have \texttt{VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D} enabled

**Valid Usage (Implicit)**

- **VUID-vkCmdSetScissorWithCount-commandBuffer-parameter**  
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- **VUID-vkCmdSetScissorWithCount-pScissors-parameter**  
  \texttt{pScissors} must be a valid pointer to an array of \texttt{scissorCount} \texttt{VkRect2D} structures

- **VUID-vkCmdSetScissorWithCount-commandBuffer-recording**  
  \texttt{commandBuffer} must be in the recording state

- **VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool**  
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations
This command **must** only be called outside of a video coding scope.

-scissorCount **must** be greater than 0

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;
```

`VkPipelineViewportStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

A **pre-rasterization shader stage** can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active **pre-rasterization shader stage** that has an output variable decorated with `ViewportIndex` (selecting a single viewport) or `ViewportMaskNV` (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to `ViewportIndex` or one of the bits set in `ViewportMaskNV`, and taken from an implementation-dependent vertex of each primitive. If `ViewportIndex` or any of the bits in `ViewportMaskNV` are outside the range zero to `viewportCount` minus one for a primitive, or if the last active **pre-rasterization shader stage** did not assign a value to either `ViewportIndex` or `ViewportMaskNV` for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last **pre-rasterization shader stage** does not have an output decorated with `ViewportIndex` or `ViewportMaskNV`, the viewport numbered zero is used by the viewport transformation.

A single vertex **can** be used in more than one individual primitive, in primitives such as **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP**. In this case, the viewport transformation is applied separately for each primitive.

To **dynamically set** the viewport transformation parameters, call:
```c
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of `VkViewport` structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element `i` of `pViewports` replace the current state for the viewport index `firstViewport + i`, for `i` in `[0, viewportCount)`.

---

**Valid Usage**

- **VUID-vkCmdSetViewport-firstViewport-01223**
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetViewport-firstViewport-01224**
  If the `multiViewport` feature is not enabled, `firstViewport` must be 0

- **VUID-vkCmdSetViewport-viewportCount-01225**
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1

- **VUID-vkCmdSetViewport-commandBuffer-04821**
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

---

**Valid Usage (Implicit)**

- **VUID-vkCmdSetViewport-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetViewport-pViewports-parameter**
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- **VUID-vkCmdSetViewport-commandBuffer-recording**
  `commandBuffer` must be in the recording state
• VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetViewport-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdSetViewport-viewportCount-arraylength
  viewportCount must be greater than 0

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Both VkPipelineViewportStateCreateInfo and vkCmdSetViewport use VkViewport to set the viewport transformation parameters.

The VkViewport structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
  float  x;
  float  y;
  float  width;
  float  height;
  float  minDepth;
  float  maxDepth;
} VkViewport;
```

• x and y are the viewport's upper left corner (x, y).

• width and height are the viewport's width and height, respectively.

• minDepth and maxDepth are the depth range for the viewport.

**Note**

Despite their names, minDepth can be less than, equal to, or greater than maxDepth.
The framebuffer depth coordinate \( z \) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an \( m \)-bit fixed-point representation is used, we assume that it represents each value \( k \in \{0, 1, \ldots, 2^m-1\} \), as \( k \) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
\begin{align*}
o_x &= x + \text{width} / 2 \\
o_y &= y + \text{height} / 2 \\
o_z &= \text{minDepth} \text{ (or } (\text{maxDepth} + \text{minDepth}) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE)}
\end{align*}
\]

\[
\begin{align*}
p_x &= \text{width} \\
p_y &= \text{height} \\
p_z &= \text{maxDepth} - \text{minDepth} \text{ (or } (\text{maxDepth} - \text{minDepth}) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE)}
\end{align*}
\]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_y)\) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.

The application can specify a negative term for \( \text{height} \), which has the effect of negating the \( y \) coordinate in clip space before performing the transform. When using a negative \( \text{height} \), the application should also adjust the \( y \) value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative \( \text{height} \) allows the application to avoid having to negate the \( y \) component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

### Valid Usage

- VUID-VkViewport-width-01770
  
  \( width \) must be greater than \( 0.0 \)

- VUID-VkViewport-width-01771
width must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxViewportDimensions}[0] \)

- VUID-VkViewport-apiVersion-07917
  If the \text{VK_KHR_maintenance1} extension is not enabled, the \text{VK_AMD_negative_viewport_height} extension is not enabled, and \text{VkPhysicalDeviceProperties::apiVersion} is less than Vulkan 1.1, height must be greater than 0.0

- VUID-VkViewport-height-01773
  The absolute value of height must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxViewportDimensions}[1] \)

- VUID-VkViewport-x-01774
  x must be greater than or equal to \( \text{viewportBoundsRange}[0] \)

- VUID-VkViewport-x-01232
  \((x + width)\) must be less than or equal to \( \text{viewportBoundsRange}[1] \)

- VUID-VkViewport-y-01775
  y must be greater than or equal to \( \text{viewportBoundsRange}[0] \)

- VUID-VkViewport-y-01776
  y must be less than or equal to \( \text{viewportBoundsRange}[1] \)

- VUID-VkViewport-y-01777
  \((y + height)\) must be greater than or equal to \( \text{viewportBoundsRange}[0] \)

- VUID-VkViewport-y-01233
  \((y + height)\) must be less than or equal to \( \text{viewportBoundsRange}[1] \)

- VUID-VkViewport-minDepth-01234
  If the \text{VK_EXT_depth_range_unrestricted} extension is not enabled, \text{minDepth} must be between 0.0 and 1.0, inclusive

- VUID-VkViewport-maxDepth-01235
  If the \text{VK_EXT_depth_range_unrestricted} extension is not enabled, \text{maxDepth} must be between 0.0 and 1.0, inclusive
Chapter 28. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;          // VkStructureType value identifying this structure.
    const void* pNext;              // NULL or a pointer to a structure extending this structure.
    VkPipelineRasterizationStateCreateFlags flags;  // reserved for future use.
    VkBool32 depthClampEnable;      // whether to clamp depth values.
    VkBool32 rasterizerDiscardEnable;  // whether to discard fragments.
    VkPolygonMode polygonMode;      // polygon drawing mode.
    VkCullModeFlags cullMode;       // culling mode.
    VkFrontFace frontFace;          // front face.
    float depthBiasConstantFactor;  // constant depth bias factor.
    float depthBiasClamp;           // depth bias clamp value.
    float depthBiasSlopeFactor;     // slope factor for depth bias.
    float lineWidth;                // line width.
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in Depth Test. If the pipeline is not created with `VkPipelineRasterizationDepthClipStateCreateInfoEXT` present then enabling depth clamp will also disable clipping primitives to the z planes of the frustum as described in Primitive Clipping. Otherwise depth clipping is controlled by the state set in `VkPipelineRasterizationDepthClipStateCreateInfoEXT`.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See `VkPolygonMode`.

• **cullMode** is the triangle facing direction used for primitive culling. See `VkCullModeFlagBits`.

• **frontFace** is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

The application can also add a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in Rasterization Order.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the `depthClamp` feature is not enabled, `depthClampEnable` must be `VK_FALSE`.

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL` or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`.

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  If the `VK_NV_fill_rectangle` extension is not enabled, `polygonMode` must not be `VK_POLYGON_MODE_FILL_RECTANGLE_NV`.

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons` is `VK_FALSE`, and `rasterizerDiscardEnable` is `VK_FALSE`, `polygonMode` must not be `VK_POLYGON_MODE_POINT`.

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO`.
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDepthBiasRepresentationInfoEXT`, `VkPipelineRasterizationConservativeStateCreateInfoEXT`, `VkPipelineRasterizationDepthClipStateCreateInfoEXT`, `VkPipelineRasterizationLineStateCreateInfoKHR`, `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`, `VkPipelineRasterizationStateRasterizationOrderAMD`, or `VkPipelineRasterizationStateStreamCreateInfoEXT`.

The `sType` value of each struct in the `pNext` chain must be unique.

The `flags` must be 0.

The `cullMode` must be a valid combination of `VkCullModeFlagBits` values.

The `frontFace` must be a valid `VkFrontFace` value.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateFlags;

VkPipelineRasterizationStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure, then that structure controls whether depth clipping is enabled or disabled.

The `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• `depthClipEnable` controls whether depth clipping is enabled as described in Primitive Clipping.

### Valid Usage (Implicit)

- `VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`
- `VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask` flags must be 0

```cpp
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

`VkPipelineRasterizationDepthClipStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineMultisampleStateCreateInfo` structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rasterizationSamples` is a `VkSampleCountFlagBits` value specifying the number of samples used in rasterization. This value is ignored for the purposes of setting the number of samples used in rasterization if the pipeline is created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state set, but if `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state is not set, it is still used to define the size of the `pSampleMask` array as described below.
- `sampleShadingEnable` can be used to enable Sample Shading.
- `minSampleShading` specifies a minimum fraction of sample shading if `sampleShadingEnable` is set to `VK_TRUE`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values used in the sample mask test.
• **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.

• **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in Multisample Coverage.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit b for mask word w in the sample mask corresponds to sample index i, where \( i = 32 \times w + b \). pSampleMask has a length equal to \( \lceil \frac{\text{rasterizationSamples}}{32} \rceil \) words.

If pSampleMask is NULL, it is treated as if the mask has all bits set to 1.

---

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sampleRateShading feature is not enabled, sampleShadingEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alphaToOne feature is not enabled, alphaToOneEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  minSampleShading must be in the range [0,1]

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the subpass has any color attachments and rasterizationSamples is greater than the number of color samples, then sampleShadingEnable must be VK_FALSE

---

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCoverageModulationStateCreateInfoNV, VkPipelineCoverageReductionStateCreateInfoNV, VkPipelineCoverageToColorStateCreateInfoNV, or VkPipelineSampleLocationsStateCreateInfoEXT

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  flags must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  rasterizationSamples must be a valid VkSampleCountFlagBits value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  If pSampleMask is not NULL, pSampleMask must be a valid pointer to an array of
 VkSampleMask values

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineMultisampleStateCreateFlags;

VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

// Provided by VK_VERSION_1_0
typedef uint32_t VkSampleMask;

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

28.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the rasterizerDiscardEnable member of VkPipelineRasterizationStateCreateInfo is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically enable whether primitives are discarded before the rasterization stage, call:

// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);

or the equivalent command

// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);

- commandBuffer is the command buffer into which the command will be recorded.
• `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.

This command sets the discard enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetRasterizerDiscardEnable-None-08970**
  At least one of the following must be true:
  - the `extendedDynamicState2` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetRasterizerDiscardEnable-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
28.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams` streams, which is at least 1. The individual streams are numbered 0 through `maxTransformFeedbackStreams` minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize` and `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize` limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader's `XfbBuffer`, `XfbStride`, and `Offsets` decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the `GeometryStreams` capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the `OutputPoints` output primitive type. If the implementation supports the `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles` property it is possible to emit `OutputLineStrip` or `OutputTriangleStrip` in addition to `OutputPoints`.

The vertex stream used for rasterization is specified by adding a `VkPipelineRasterizationStateStreamCreateInfoEXT` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateStreamCreateInfoEXT` structure is defined as:
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• rasterizationStream is the vertex stream selected for rasterization.

If this structure is not present, rasterizationStream is assumed to be zero.

Valid Usage

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams must be enabled

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325
  rasterizationStream must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326
  rasterizationStream must be zero if VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect is VK_FALSE

Valid Usage (Implicit)

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT

• VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask
  flags must be 0

// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;

VkPipelineRasterizationStateStreamCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the rasterizationStream state, call:

// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_transform_feedback,
VK_EXT_shader_object with VK_EXT_transform_feedback

```c
void vkCmdSetRasterizationStreamEXT(
    VkCommandBuffer commandBuffer,
    uint32_t rasterizationStream);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationStream` specifies the `rasterizationStream` state.

This command sets the `rasterizationStream` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetRasterizationStreamEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3RasterizationStream` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetRasterizationStreamEXT-transformFeedback-07411**
  The `transformFeedback` feature must be enabled

- **VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07412**
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

- **VUID-vkCmdSetRasterizationStreamEXT-rasterizationStream-07413**
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetRasterizationStreamEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetRasterizationStreamEXT-videocoding**
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

28.3. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. Fragment operations, in the order defined
2. Blending, logic operations, and color writes

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
// Provided by VK_AMD_rasterization_order
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rasterizationOrder` is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD

- VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter
  rasterizationOrder must be a valid VkRasterizationOrderAMD value

If the VK_AMD_rasterization_order device extension is not enabled or the application does not request a particular rasterization order through specifying a VkPipelineRasterizationStateRasterizationOrderAMD structure then the rasterization order used by the graphics pipeline defaults to VK_RASTERIZATION_ORDER_STRICT_AMD.

Possible values of VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder, specifying the primitive rasterization order, are:

```cpp
// Provided by VK_AMD_rasterization_order
typedef enum VkRasterizationOrderAMD {
  VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
  VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- **VK_RASTERIZATION_ORDER_STRICT_AMD** specifies that operations for each primitive in a subpass must occur in primitive order.
- **VK_RASTERIZATION_ORDER_RELAXED_AMD** specifies that operations for each primitive in a subpass may not occur in primitive order.

### 28.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a coverage mask with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.

It is understood that each pixel has rasterizationSamples locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel must be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points may be identical for each pixel in the framebuffer, or they may differ.
If the render pass has a fragment density map attachment, each fragment only has `rasterizationSamples` locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points must be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with `Sample` and `Input`, the data associated with those variables will be assigned independently for each sample. The values for each sample must be evaluated at the location of the sample. The data associated with any other variables not decorated with `Sample` and `Input` need not be evaluated independently for each sample.

A coverage mask is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a fragment density map have one set of samples. Multi-pixel fragments defined by a shading rate image have one set of samples per pixel. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. Each sample in a set is assigned a unique `sample index` \(i\) in the range \([0, \text{rasterizationSamples})\).

To dynamically set the `rasterizationSamples`, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetRasterizationSamplesEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits rasterizationSamples);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizationSamples` specifies `rasterizationSamples`.

This command sets the `rasterizationSamples` for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRasterizationSamplesEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3RasterizationSamples` feature is enabled
  - The `shaderObject` feature is enabled
Valid Usage (Implicit)

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetRasterizationSamplesEXT-rasterizationSamples-parameter
  rasterizationSamples must be a valid VkSampleCountFlagBits value

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetRasterizationSamplesEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetRasterizationSamplesEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

Each sample in a fragment is also assigned a unique coverage index $j$ in the range $[0, n \times \text{rasterizationSamples}]$, where $n$ is the number of sets in the fragment. If the fragment contains a single set of samples, the coverage index is always equal to the sample index. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or vkCmdSetCoarseSampleOrderNV.

If the fragment shading rate is set, the coverage index $j$ is determined as a function of the pixel index $p$, the sample index $i$, and the number of rasterization samples $r$ as:

$$j = i + r \times ((f_w \times f_h) - 1 - p)$$

where the pixel index $p$ is determined as a function of the pixel's framebuffer location $(x, y)$ and the fragment size $(f_w, f_h)$.
\[ p_x = x \mod f_w \]

\[ p_y = y \mod f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 35. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Image" /></td>
<td><img src="image2.png" alt="Image" /></td>

<td><img src="image8.png" alt="Image" /></td>
<td><img src="image9.png" alt="Image" /></td>
</tr>
</tbody>
</table>
The coverage mask includes \( B \) bits packed into \( W \) words, defined as:

\[
B = n \times \text{rasterizationSamples}
\]

\[
W = \lceil B/32 \rceil
\]

Bit \( b \) in coverage mask word \( w \) is \( 1 \) if the sample with coverage index \( j = 32 \times w + b \) is covered, and \( 0 \) otherwise.

If the \texttt{standardSampleLocations} member of \texttt{VkPhysicalDeviceLimits} is \texttt{VK_TRUE}, then the sample counts \texttt{VK_SAMPLE_COUNT_1_BIT}, \texttt{VK_SAMPLE_COUNT_2_BIT}, \texttt{VK_SAMPLE_COUNT_4_BIT}, \texttt{VK_SAMPLE_COUNT_8_BIT}, and \texttt{VK_SAMPLE_COUNT_16_BIT} have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). \texttt{VK_SAMPLE_COUNT_32_BIT} and \texttt{VK_SAMPLE_COUNT_64_BIT} do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Fragment Mask](image)

**Figure 19. Fragment Mask**

### 28.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationsEnable** controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- **sampleLocationsInfo** is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

• VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT

• VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSampleLocationsInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• sampleLocationsPerPixel is a VkSampleCountFlagBits value specifying the number of sample locations per pixel.
• sampleLocationGridSize is the size of the sample location grid to select custom sample locations for.
• sampleLocationsCount is the number of sample locations in pSampleLocations.
• pSampleLocations is a pointer to an array of sampleLocationsCount VkSampleLocationEXT structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT.

The sample locations in pSampleLocations specify sampleLocationsPerPixel number of sample locations for each pixel in the grid of the size specified in sampleLocationGridSize. The sample location for sample i at the pixel grid location (x,y) is taken from pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i].

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of pSampleLocations may be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  `sampleLocationsPerPixel` must be a valid `VkSampleCountFlagBits` value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  `sampleLocationsCount` must equal `sampleLocationsPerPixel \times sampleLocationGridSize.width \times sampleLocationGridSize.height`

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If `sampleLocationsCount` is not 0, `pSampleLocations` must be a valid pointer to an array of `VkSampleLocationEXT` structures

The `VkSampleLocationEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

- `x` is the horizontal coordinate of the sample's location.
- `y` is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range `[sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]]` that can be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

To dynamically set the `sampleLocationsEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_sample_locations, VK_EXT_sample_locations with VK_EXT_shader_object
void vkCmdSetSampleLocationsEnableEXT(
    VkCommandBuffer commandBuffer,            commandBuffer,
    VkBool32 sampleLocationsEnable);
```
- `commandBuffer` is the command buffer into which the command will be recorded.
- `sampleLocationsEnable` specifies the `sampleLocationsEnable` state.

This command sets the `sampleLocationsEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetSampleLocationsEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3SampleLocationsEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetSampleLocationsEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetSampleLocationsEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>

2642
To dynamically set the sample locations used for rasterization, call:

```c
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pSampleLocationsInfo` is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530**
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`.

### Valid Usage (Implicit)

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetSampleLocationsEXT-videocoding**
  This command must only be called outside of a video coding scope.
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

28.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with `Multisampling`, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.
The returned array of fragment shading rates must be ordered from largest \texttt{fragmentSize.width} value to smallest, and each set of fragment shading rates with the same \texttt{fragmentSize.width} value must be ordered from largest \texttt{fragmentSize.height} to smallest. Any two entries in the array must not have the same \texttt{fragmentSize} values.

For any entry in the array, the following rules also apply:

- The value of \texttt{fragmentSize.width} must be less than or equal to \texttt{maxFragmentSize.width}.
- The value of \texttt{fragmentSize.width} must be greater than or equal to 1.
- The value of \texttt{fragmentSize.width} must be a power-of-two.
- The value of \texttt{fragmentSize.height} must be less than or equal to \texttt{maxFragmentSize.height}.
- The value of \texttt{fragmentSize.height} must be greater than or equal to 1.
- The value of \texttt{fragmentSize.height} must be a power-of-two.
- The highest sample count in \texttt{sampleCounts} must be less than or equal to \texttt{maxFragmentShadingRateRasterizationSamples}.
- The product of \texttt{fragmentSize.width}, \texttt{fragmentSize.height}, and the highest sample count in \texttt{sampleCounts} must be less than or equal to \texttt{maxFragmentShadingRateCoverageSamples}.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th>\texttt{sampleCounts}</th>
<th>\texttt{fragmentSize}</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{VK_SAMPLE_COUNT_1_BIT} \texttt{\textbar} \texttt{VK_SAMPLE_COUNT_4_BIT}</td>
<td>{2,2}</td>
</tr>
<tr>
<td>\texttt{VK_SAMPLE_COUNT_1_BIT} \texttt{\textbar} \texttt{VK_SAMPLE_COUNT_4_BIT}</td>
<td>{2,1}</td>
</tr>
<tr>
<td>~0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If \texttt{framebufferColorSampleCounts} includes \texttt{VK_SAMPLE_COUNT_2_BIT}, the required rates must also include \texttt{VK_SAMPLE_COUNT_2_BIT}.

\textbf{Note}

Including the \{1,1\} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates must be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to \texttt{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR}, the application must transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

\textbf{Note}

For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms \texttt{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR} and \texttt{VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR}, 2x4 is a supported rate, but 4x2 is an
Unsupported rate.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  `pFragmentShadingRateCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by `pFragmentShadingRateCount` is not 0, and `pFragmentShadingRates` is not NULL, `pFragmentShadingRates` must be a valid pointer to an array of `pFragmentShadingRateCount` `VkPhysicalDeviceFragmentShadingRateKHR` structures

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPhysicalDeviceFragmentShadingRateKHR` structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a `VkExtent2D` describing the width and height of a supported shading rate.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
  pNext must be NULL

Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.

### 28.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentSize** specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the **pNext** chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, **fragmentSize** is considered to be equal to (1,1), and both elements of **combinerOps** are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

### Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_KHR_fragment_shading_rate
```
```c
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pFragmentSize** specifies the pipeline fragment shading rate for subsequent drawing commands.
- **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507
  If pipelineFragmentShadingRate is not enabled, `pFragmentSize->width` must be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508
  If pipelineFragmentShadingRate is not enabled, `pFragmentSize->height` must be 1
- VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` must be enabled
- VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` must be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` must be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513
  `pFragmentSize->width` must be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514
  `pFragmentSize->height` must be greater than or equal to 1
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515
  `pFragmentSize->width` must be a power-of-two value
• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516
  pFragmentSize->height must be a power-of-two value

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517
  pFragmentSize->width must be less than or equal to 4

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518
  pFragmentSize->height must be less than or equal to 4

Valid Usage (Implicit)

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  pFragmentSize must be a valid pointer to a valid VkExtent2D structure

• VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Each element of combinerOps must be a valid VkFragmentShadingRateCombinerOpKHR value

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

28.6.2. Primitive Fragment Shading Rate

The primitive fragment shading rate can be set via the PrimitiveShadingRateKHR built-in in the last
active pre-rasterization shader stage. If the last pre-rasterization shader stage is using the MeshEXT Execution Model, the rate associated with a given primitive is sourced from the value written to the per-primitive PrimitiveShadingRateKHR. Otherwise the rate associated with a given primitive is sourced from the value written to PrimitiveShadingRateKHR by that primitive’s provoking vertex.

### 28.6.3. Attachment Fragment Shading Rate

The attachment shading rate can be set by including VkFragmentShadingRateAttachmentInfoKHR in a subpass to define a fragment shading rate attachment. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate attachment, according to:

\[ x' = \text{floor}(x / \text{region}_x) \]

\[ y' = \text{floor}(y / \text{region}_y) \]

where \( x' \) and \( y' \) are the coordinates of a texel in the fragment shading rate attachment, \( x \) and \( y \) are the coordinates of the pixel in the framebuffer, and \( \text{region}_x \) and \( \text{region}_y \) are the size of the region each texel corresponds to, as defined by the shadingRateAttachmentTexelSize member of VkFragmentShadingRateAttachmentInfoKHR.

If multiview is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the ViewIndex built-in. If multiview is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the Layer built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[ \text{size}_w = 2^{((\text{texel} / 4) \& 3)} \]

\[ \text{size}_h = 2^{(\text{texel} \& 3)} \]

where texel is the value in the first component of the identified texel, and \( \text{size}_w \) and \( \text{size}_h \) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \( \text{size}_w = \text{size}_h = 1 \). Applications must not specify a width or height greater than 4 by this method.

The Fragment Shading Rate enumeration in SPIR-V adheres to the above encoding.

### 28.6.4. Combining the Fragment Shading Rates

The final rate \( (C_{xy})' \) used for fragment shading must be one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform
used by rasterization.

If any of the following conditions are met, \( C_{xy} \) must be set to \( \{1,1\} \):

- If **Sample Shading** is enabled.
- The \( \text{fragmentShadingRateWithSampleMask} \) limit is not supported, and \( \text{VkPipelineMultisampleStateCreateInfo}::pSampleMask \) contains a zero value in any bit used by fragment operations.
- The \( \text{fragmentShadingRateWithShaderSampleMask} \) is not supported, and the fragment shader has \( \text{SampleMask} \) in the input or output interface.
- The \( \text{fragmentShadingRateWithShaderDepthStencilWrites} \) limit is not supported, and the fragment shader declares the \( \text{FragDepth} \) or \( \text{FragStencilRefEXT} \) built-in.
- The \( \text{fragmentShadingRateWithConservativeRasterization} \) limit is not supported, and \( \text{VkPipelineRasterizationConservativeStateCreateInfoEXT}::\text{conservativeRasterizationMode} \) is not \( \text{VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT} \).
- The \( \text{fragmentShadingRateWithFragmentShaderInterlock} \) limit is not supported, and the fragment shader declares any of the \( \text{fragment shader interlock} \) execution modes.
- The \( \text{fragmentShadingRateWithCustomSampleLocations} \) limit is not supported, and \( \text{VkPipelineSampleLocationsStateCreateInfoEXT}::\text{sampleLocationsEnable} \) is \( \text{VK_TRUE} \).
- The fragment shader declares any of the \( \text{TileImageColorReadAccessEXT} \), \( \text{TileImageDepthReadAccessEXT} \), or \( \text{TileImageStencilReadAccessEXT} \) capabilities.

Otherwise, each of the specified shading rates are combined and then used to derive the value of \( C_{xy} \). As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by **VkFragmentShadingRateCombinerOpKHR**:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = A_{xy} \).
- **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = B_{xy} \).
- **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR** specifies a combiner operation of \( \text{combine}(A_{xy}, B_{xy}) = \text{min}(A_{xy}, B_{xy}) \).
• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR** specifies a combiner operation of \(\text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})\).

• **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** specifies a combiner operation of \(\text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy}\).

where \(\text{combine}(A_{xy}, B_{xy})\) is the combine operation, and \(A_{xy}\) and \(B_{xy}\) are the inputs to the operation.

If \(\text{fragmentShadingRateStrictMultiplyCombiner}\) is \(VK\_FALSE\), using **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR** with values of 1 for both \(A\) and \(B\) in the same dimension results in the value 2 being produced for that dimension. See the definition of **fragmentShadingRateStrictMultiplyCombiner** for more information.

These operations are performed in a component-wise fashion.

This is used to generate a combined fragment area using the equation:

\[
C_{xy} = \text{combine}(A_{xy}, B_{xy})
\]

where \(C_{xy}\) is the combined fragment area result, and \(A_{xy}\) and \(B_{xy}\) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \(A_{xy}\) equal to the pipeline fragment shading rate and \(B_{xy}\) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \(A_{xy}\) equal to the result of the first combination and \(B_{xy}\) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the **ShadingRateKHR** built-in.

Implementations should clamp the inputs to the combiner operations \(A_{xy}\) and \(B_{xy}\), and must do so if **VkPhysicalDeviceMaintenance6PropertiesKHR::fragmentShadingRateClampCombinerInputs** is set to **VK_TRUE**. All implementations must clamp the result of the second combiner operation.

A fragment shading rate \(R_{xy}\) representing any of \(A_{xy}\), \(B_{xy}\) or \(C_{xy}\) is clamped as follows. If \(R_{xy}\) is one of the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count and render pass transform used by rasterization, the clamped shading rate \(R'_{xy}\) is \(R_{xy}\). Otherwise, the clamped shading rate \(R'_{xy}\) is selected from the rates returned by **vkGetPhysicalDeviceFragmentShadingRatesKHR** for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \(R'_x \leq R_x\) and \(R'_y \leq R_y\).
   - Implementations may also keep rates where \(R'_x \leq R_y\) and \(R'_y \leq R_x\).
2. Keep only rates with the highest area (\(R'_x \times R'_y\)).
3. Keep only rates with the lowest aspect ratio (\(R'_x + R'_y\)).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the **VkDevice**.
28.6.5. Extended Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the fragmentShadingRateEnums feature is enabled, fragment shading rates may be specified using the VkFragmentShadingRateNV enumerated type defined as:

```c
// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateNV {
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV = 6,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV = 10,
    VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV = 11,
    VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV = 12,
    VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV = 13,
    VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV = 14,
    VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV = 15,
} VkFragmentShadingRateNV;
```

- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV specifies a fragment size of 1x1 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV specifies a fragment size of 1x2 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV specifies a fragment size of 2x1 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV specifies a fragment size of 2x2 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV specifies a fragment size of 2x4 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV specifies a fragment size of 4x2 pixels.
- VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV specifies a fragment size of 4x4 pixels.
- VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.
- VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.
- VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.
• **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.

• **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates **VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV**, **VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV**, and **VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV** as a pipeline, primitive, or attachment shading rate, the *supersampleFragmentShadingRates* feature must be enabled. To use the shading rate **VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV** as a pipeline, primitive, or attachment shading rate, the *noInvocationFragmentShadingRates* feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via *vkCmdSetFragmentShadingRateEnumNV*.

The *VkPipelineFragmentShadingRateEnumStateCreateInfoNV* structure is defined as:

```
// Provided by VK_NV_fragment_shading_rateEnums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shadingRateType** specifies a *VkFragmentShadingRateTypeNV* value indicating whether fragment shading rates are specified using fragment sizes or *VkFragmentShadingRateNV* enums.
- **shadingRate** specifies a *VkFragmentShadingRateNV* value indicating the pipeline fragment shading rate.
- **combinerOps** specifies *VkFragmentShadingRateCombinerOpKHR* values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the *pNext* chain of *VkGraphicsPipelineCreateInfo* includes a *VkPipelineFragmentShadingRateEnumStateCreateInfoNV* structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, **shadingRateType** is considered to be equal to **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV**, **shadingRate** is considered to be equal to **VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV**, and both elements of **combinerOps** are considered to be equal to **VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR**.
Valid Usage (Implicit)

• VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType
  must be
  VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV

The VkFragmentShadingRateTypeNV enumerated type specifies whether a graphics pipeline gets its pipeline fragment shading rates and combiners from the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure or the VkPipelineFragmentShadingRateStateCreateInfoKHR structure.

// Provided by VK_NV_fragment_shading_rateEnums
typedef enum VkFragmentShadingRateTypeNV {
  VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV = 0,
  VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV = 1,
} VkFragmentShadingRateTypeNV;

• VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the VkPipelineFragmentShadingRateStateCreateInfoKHR structure and that any state specified by the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure should be ignored.

• VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the VkPipelineFragmentShadingRateEnumStateCreateInfoNV structure and that any state specified by the VkPipelineFragmentShadingRateStateCreateInfoKHR structure should be ignored.

To dynamically set the pipeline fragment shading rate and combiner operation, call:

// Provided by VK_NV_fragment_shading_rateEnums
void vkCmdSetFragmentShadingRateEnumNV(
  VkCommandBuffer commandBuffer,
  VkFragmentShadingRateNV shadingRate,
  const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);

• commandBuffer is the command buffer into which the command will be recorded.

• shadingRate specifies a VkFragmentShadingRateNV enum indicating the pipeline fragment shading rate for subsequent drawing commands.

• combinerOps specifies a VkFragmentShadingRateCombinerOpKHR determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the
 VkPipelineFragmentShadingRateEnumStateCreateInfoNV values used to create the currently active pipeline.

**Note**

This command allows specifying additional shading rates beyond those supported by `vkCmdSetFragmentShadingRateKHR`. For more information, refer to the `VK_NV_fragment_shading_rate Enums` appendix.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  
  If `pipelineFragmentShadingRate` is not enabled, `shadingRate` **must** be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577**
  
  If `supersampleFragmentShadingRates` is not enabled, `shadingRate` **must not** be `VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV`, `VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV`, or `VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578**
  
  If `noInvocationFragmentShadingRates` is not enabled, `shadingRate` **must not** be `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579**
  
  The `fragmentShadingRateEnums` feature **must** be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580**
  
  One of the `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` features **must** be enabled.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581**
  
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582**
  
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

- **VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583**
  
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` **must** be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`. 
Valid Usage (Implicit)

- **VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter**
  `shadingRate` **must** be a valid `VkFragmentShadingRateNV` value

- **VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter**
  Each element of `combinerOps` **must** be a valid `VkFragmentShadingRateCombinerOpKHR` value

- **VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetFragmentShadingRateEnumNV-videocoding**
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

When the `supersampleFragmentShadingRates` or `noInvocationFragmentShadingRates` features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as `VkFragmentShadingRateNV` values and the behavior of the combiners is modified as follows:

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, and `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, if either $A_{xy}$ or $B_{xy}$ is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, combine($A_{xy}, B_{xy}$) produces a shading rate of `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, regardless of the other input shading rate.
- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, combine($A_{xy}, B_{xy}$) produces a shading rate
whose fragment size is the smaller of the fragment sizes of \( A_{xy} \) and \( B_{xy} \) and whose invocation count is the larger of the invocation counts of \( A_{xy} \) and \( B_{xy} \).

- For \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR} \), \( \text{combine}(A_{xy}, B_{xy}) \) produces a shading rate whose fragment size is the larger of the fragment sizes of \( A_{xy} \) and \( B_{xy} \) and whose invocation count is the smaller of the invocation counts of \( A_{xy} \) and \( B_{xy} \).

- For \( \text{VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR} \), \( \text{combine}(A_{xy}, B_{xy}) \) produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of \( A_{xy} \) and \( B_{xy} \). If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation may adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is \( \text{VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV} \), no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in sample shading, where the total number the total number of invocations is taken from the shading rate and then clamped to \( \text{rasterizationSamples} \) and \( \text{maxFragmentShadingRateInvocationCount} \).

### 28.7. Shading Rate Image

The \text{shadingRateImage} feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the \text{pNext} chain of \text{VkPipelineViewportStateCreateInfo} includes a \text{VkPipelineViewportShadingRateImageStateCreateInfoNV} structure, then that structure includes parameters controlling the shading rate.

The \text{VkPipelineViewportShadingRateImageStateCreateInfoNV} structure is defined as:

```
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- \text{sType} is a \text{VkStructureType} value identifying this structure.
- \text{pNext} is \text{NULL} or a pointer to a structure extending this structure.
• **shadingRateImageEnable** specifies whether shading rate image and palettes are used during rasterization.

• **viewportCount** specifies the number of per-viewport palettes used to translate values stored in shading rate images.

• **pShadingRatePalettes** is a pointer to an array of *VkShadingRatePaletteNV* structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, **shadingRateImageEnable** is considered to be *VK_FALSE*, and the shading rate image and palettes are not used.

---

**Valid Usage**

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054**
  If the multiViewport feature is not enabled, **viewportCount** must be 0 or 1

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055**
  **viewportCount** must be less than or equal to *VkPhysicalDeviceLimits::maxViewports*

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056**
  If **shadingRateImageEnable** is *VK_TRUE*, **viewportCount** must be greater or equal to the **viewportCount** member of *VkPipelineViewportStateCreateInfo*

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType**
  **sType** must be *VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV*

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdBindShadingRateImageNV(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkImageView imageView,         // imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.
    VkImageLayout imageLayout);     // imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.
```
Valid Usage

- **VUID-vkCmdBindShadingRateImageNV-None-02058**
  The `shadingRateImage` feature must be enabled

- **VUID-vkCmdBindShadingRateImageNV-imageView-02059**
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

- **VUID-vkCmdBindShadingRateImageNV-imageView-02060**
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`

- **VUID-vkCmdBindShadingRateImageNV-imageView-02061**
  If `imageView` is not `VK_NULL_HANDLE`, it must have a format of `VK_FORMAT_R8_UINT`

- **VUID-vkCmdBindShadingRateImageNV-imageView-02062**
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must match the actual `VkImageLayout` of each subresource accessible from `imageView` at the time the subresource is accessed

- **VUID-vkCmdBindShadingRateImageNV-imageView-02063**
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` or `VK_IMAGE_LAYOUT_GENERAL`

Valid Usage (Implicit)

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBindShadingRateImageNV-imageView-parameter**
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle

- **VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter**
  `imageLayout` must be a valid `VkImageLayout` value

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording**
  `commandBuffer` must be in the `recording state`

- **VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBindShadingRateImageNV-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBindShadingRateImageNV-commonparent**
  Both of `commandBuffer`, and `imageView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates \((x,y)\) will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates \((u,v)\) where \(u = \lfloor \frac{x}{\text{twidth}} \rfloor\), \(v = \lfloor \frac{y}{\text{theight}} \rfloor\), and `twidth` and `theight` are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, the lookup will use texel coordinates \((u,v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not `VK_NULL_HANDLE` and contains a texel with coordinates \((u,v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u,v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is `VK_NULL_HANDLE`, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by `VkImageSubresourceRange::baseMipLevel` will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

To dynamically set the `shadingRateImageEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_shading_rate_image,
// VK_EXT_shader_object with VK_NV_shading_rate_image
void vkCmdSetShadingRateImageEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 shadingRateImageEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `shadingRateImageEnable` specifies the `shadingRateImageEnable` state.

This command sets the `shadingRateImageEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo`.
Otherwise, this state is specified by the `VkPipelineViewportShadingRateImageStateCreateInfoNV::shadingRateImageEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetShadingRateImageEnableNV-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3ShadingRateImageEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdSetShadingRateImageEnableNV-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetShadingRateImageEnableNV-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

To dynamically set the per-viewport shading rate image palettes, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetViewportShadingRatePaletteNV(
```
VkCommandBuffer commandBuffer,
uint32_t firstViewport,
uint32_t viewportCount,
const VkShadingRatePaletteNV* pShadingRatePalettes);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstViewport** is the index of the first viewport whose shading rate palette is updated by the command.
- **viewportCount** is the number of viewports whose shading rate palettes are updated by the command.
- **pShadingRatePalettes** is a pointer to an array of **VkShadingRatePaletteNV** structures defining the palette for each viewport.

This command sets the per-viewport shading rate image palettes for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** set in **VkPipelineDynamicStateCreateInfo**::*pDynamicStates*. Otherwise, this state is specified by the **VkPipelineViewportShadingRateImageStateCreateInfoNV**::*pShadingRatePalettes* values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064**
  The shadingRateImage feature **must** be enabled

- **VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067**
  The sum of **firstViewport** and **viewportCount** **must** be between 1 and **VkPhysicalDeviceLimits::maxViewports**, inclusive

- **VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068**
  If the multiViewport feature is not enabled, **firstViewport** **must** be 0

- **VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069**
  If the multiViewport feature is not enabled, **viewportCount** **must** be 1

### Valid Usage (Implicit)

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter**
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- **VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter**
  **pShadingRatePalettes** **must** be a valid pointer to an array of **viewportCount** valid **VkShadingRatePaletteNV** structures

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording**
  **commandBuffer** **must** be in the recording state

- **VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmpool**
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics
• VUID-vkCmdSetViewportShadingRatePaletteNV-vidocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkShadingRatePaletteNV structure specifies the contents of a single shading rate image palette and is defined as:

```
// Provided by VK_NV_shading_rate_image
typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;
```

• shadingRatePaletteEntryCount specifies the number of entries in the shading rate image palette.
• pShadingRatePaletteEntries is a pointer to an array of VkShadingRatePaletteEntryNV enums defining the shading rate for each palette entry.

Valid Usage

• VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071
  shadingRatePaletteEntryCount must be between 1 and VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize, inclusive

Valid Usage (Implicit)

• VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter
pShadingRatePaletteEntries must be a valid pointer to an array of shadingRatePaletteEntryCount valid VkShadingRatePaletteEntryNV values

- VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength shadingRatePaletteEntryCount must be greater than 0

To determine the base shading rate image, a shading rate index \( i \) is mapped to array element \( i \) in the array pShadingRatePaletteEntries for the palette corresponding to the viewport used for the fragment. If \( i \) is greater than or equal to the palette size shadingRatePaletteEntryCount, the base shading rate is undefined.

The supported shading rate image palette entries are defined by VkShadingRatePaletteEntryNV:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkShadingRatePaletteEntryNV {  
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,  
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,  
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,  
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,  
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,  
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,  
} VkShadingRatePaletteEntryNV;
```

The following table indicates the width and height (in pixels) of each fragment generated using the indicated shading rate, as well as the maximum number of fragment shader invocations launched for each fragment. When processing regions of a primitive that have a shading rate of VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV, no fragments will be generated in that region.

</tbody>
</table>

When the shading rate image is disabled, a shading rate of `VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV` will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n \) (\( n > 1 \)) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( f_s \) pixels per fragment and \( f_s \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( f_s \frac{n}{f_s} \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{2}{f_s} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with `SampleId` or `SamplePosition`, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to `rasterizationSamples` fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than `rasterizationSamples`. 
When the final shading rate for a primitive covering pixel \((x,y)\) has a fragment area of \(fw \times fh\), the fragment for that pixel will cover all pixels with coordinates \((x',y')\) that satisfy the equations:

\[
\left\lfloor \frac{x}{fw} \right\rfloor = \left\lfloor \frac{x'}{fw} \right\rfloor
\]

\[
\left\lfloor \frac{y}{fh} \right\rfloor = \left\lfloor \frac{y'}{fh} \right\rfloor
\]

This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by \(\text{samples} = fw \times fh \times rs\) where \(rs\) indicates the value of \(VkPipelineMultisampleStateCreateInfo::rasterizationSamples\) specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment’s pixels. The location and order of coverage samples within each pixel in the combined fragment are assigned as described in Multisampling and Custom Sample Locations. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, \text{samples}-1]\). If the shadingRateCoarseSampleOrder feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the pNext chain of \(VkPipelineViewportStateCreateInfo\) includes a \(VkPipelineViewportCoarseSampleOrderStateCreateInfoNV\) structure, then that structure includes parameters controlling the order of coverage samples in fragments larger than one pixel.

The \(VkPipelineViewportCoarseSampleOrderStateCreateInfoNV\) structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCoarseSampleOrderTypeNV sampleOrderType;
    uint32_t customSampleOrderCount;
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```

- \(sType\) is a \(VkStructureType\) value identifying this structure.
- \(pNext\) is NULL or a pointer to a structure extending this structure.
- \(sampleOrderType\) specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- \(customSampleOrderCount\) specifies the number of custom sample orderings to use when ordering coverage samples.
- \(pCustomSampleOrders\) is a pointer to an array of \(customSampleOrderCount\) \(VkCoarseSampleOrderCustomNV\) structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, \(sampleOrderType\) is considered to be
VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If `sampleOrderType` is `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in `pCustomSampleOrders` will be identical to that used for `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV`.

If the pipeline was created with `VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV`, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by `vkCmdSetCoarseSampleOrderNV`.

### Valid Usage

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount` must be 0
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234
  The array `pCustomSampleOrders` must not contain two structures with matching values for both the `shadingRate` and `sampleCount` members

### Valid Usage (Implicit)

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV`
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value
- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-parameter If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

The type `VkCoarseSampleOrderTypeNV` specifies the technique used to order coverage samples in fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV` specifies that coverage samples will be ordered in an
implementation-dependent manner.

- **VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV** specifies that coverage samples will be ordered according to the array of custom orderings provided in either the pCustomSampleOrders member of VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or the pCustomSampleOrders member of vkCmdSetCoarseSampleOrderNV.

- **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.

- **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV** specifies that coverage samples will be ordered sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV** for a fragment with an upper-left corner of \((fx, fy)\) with a width of \(fw \times fh\) and \(fsc\) samples per pixel, coverage index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = fx + \left\lfloor \frac{cs}{fsc} \right\rfloor fw \\
py = fy + \left\lfloor \frac{s}{fsc \times fw} \right\rfloor \\
fs = cs \times fsc
\]

When using a coarse sample order of **VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV**, coverage index \(cs\) will be assigned as follows:

\[
px = fx + cs \times fw \\
py = (fy + \left\lfloor \frac{s}{fw} \right\rfloor fh) \\
fs = \left\lfloor \frac{s}{fw \times fh} \right\rfloor
\]

The **VkCoarseSampleOrderCustomNV** structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

- **shadingRate** is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.

- **sampleCount** identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.

- **sampleLocationCount** specifies the number of sample locations in the custom ordering.

- **pSampleLocations** is a pointer to an array of **VkCoarseSampleLocationNV** structures specifying the location of each sample in the custom ordering.
The `VkCoarseSampleOrderCustomNV` structure is used with a coverage sample ordering type of `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV` to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count.

When using a custom sample ordering, element $j$ in `pSampleLocations` specifies a specific pixel location and sample index that corresponds to coverage index $j$ in the multi-pixel fragment.

---

**Valid Usage**

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073**
  - `shadingRate` must be a shading rate that generates fragments with more than one pixel

- **VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074**
  - `sampleCount` must correspond to a sample count enumerated in `VkSampleCountFlags` whose corresponding bit is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075**
  - `sampleLocationCount` must be equal to the product of `sampleCount`, the fragment width for `shadingRate`, and the fragment height for `shadingRate`

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076**
  - `sampleLocationCount` must be less than or equal to the value of `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples`

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077**
  - The array `pSampleLocations` must contain exactly one entry for every combination of valid values for `pixelX`, `pixelY`, and sample in the structure `VkCoarseSampleOrderCustomNV`

---

**Valid Usage (Implicit)**

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter**
  - `shadingRate` must be a valid `VkShadingRatePaletteEntryNV` value

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter**
  - `pSampleLocations` must be a valid pointer to an array of `sampleLocationCount` `VkCoarseSampleLocationNV` structures

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength**
  - `sampleLocationCount` must be greater than 0

---

The `VkCoarseSampleLocationNV` structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t pixelX;
    uint32_t pixelY;
    uint32_t sample;
};
```
• *pixelX* is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.

• *pixelY* is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.

• *sample* is the number of the coverage sample in the pixel identified by *pixelX* and *pixelY*.

### Valid Usage

- **VUID-VkCoarseSampleLocationNV-pixelX-02078**
  
  *pixelX* must be less than the width (in pixels) of the fragment

- **VUID-VkCoarseSampleLocationNV-pixelY-02079**
  
  *pixelY* must be less than the height (in pixels) of the fragment

- **VUID-VkCoarseSampleLocationNV-sample-02080**
  
  *sample* must be less than the number of coverage samples in each pixel belonging to the fragment

To **dynamically set** the order of coverage samples in fragments larger than one pixel, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer commandBuffer,
    VkCoarseSampleOrderTypeNV sampleOrderType,
    uint32_t customSampleOrderCount,
    const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);
```

- *commandBuffer* is the command buffer into which the command will be recorded.

- *sampleOrderType* specifies the mechanism used to order coverage samples in fragments larger than one pixel.

- *customSampleOrderCount* specifies the number of custom sample orderings to use when ordering coverage samples.

- *pCustomSampleOrders* is a pointer to an array of *VkCoarseSampleOrderCustomNV* structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If *sampleOrderType* is *VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV*, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in *pCustomSampleOrders* will be identical to that used for *VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV*.

This command sets the order of coverage samples for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV** set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the
VkPipelineViewportCoarseSampleOrderStateCreateInfoNV values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount` must be 0
- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array `pCustomSampleOrders` must not contain two structures with matching values for both the `shadingRate` and `sampleCount` members

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value
- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures
- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetCoarseSampleOrderNV-videocoding This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

If the final shading rate for a primitive covering pixel \((x, y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x, y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.

### 28.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation must invoke the fragment shader at least 

\[
\text{max}(\lceil \text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \rceil, 1)
\]

times per fragment. If \text{VkPipelineMultisampleStateCreateInfo::sampleShadingEnable} is set to \text{VK_TRUE}, sample shading is enabled.

If a fragment shader entry point statically uses an input variable decorated with a \text{BuiltIn} of \text{SampleId} or \text{SamplePosition}, sample shading is enabled and a value of 1.0 is used instead of \text{minSampleShading}. If a fragment shader entry point statically uses an input variable decorated with \text{Sample}, sample shading may be enabled and a value of 1.0 will be used instead of \text{minSampleShading} if it is. If the \text{VK_AMD_mixed_attachment_samples} extension is enabled and the subpass uses color attachments, the \text{samples} value used to create each color attachment is used instead of \text{rasterizationSamples}.

**Note**

If a shader decorates an input variable with \text{Sample} and that value meaningfully impacts the output of a shader, sample shading will be enabled to ensure that the input is in fact interpolated per-sample. This is inherent to the specification and not spelled out here - if an application simply declares such a variable it is implementation-defined whether sample shading is enabled or not. It is possible to see the effects of this by using atomics in the shader or using a pipeline statistics query to query the number of fragment invocations, even if the shader itself does not use any per-sample variables.

If there are fewer fragment invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once, and each invocation that is not a helper invocation covers at least one sample.
28.9. Barycentric Interpolation

When the `fragmentShaderBarycentric` feature is enabled, the `PerVertexKHR` interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with `PerVertexKHR` will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the \( n \) vertices passed to a draw call are numbered 0 through \( n-1 \), and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` for index values of 0, 1, and 2. If an input decorated with `PerVertexKHR` is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`, an undefined value is returned.

</tbody>
</table>

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with **PerVertexKHR** are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with **PerVertexKHR**, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with **BaryCoordKHR** or **BaryCoordNoPerspKHR**.

Fragment shader inputs decorated with **BaryCoordKHR** or **BaryCoordNoPerspKHR** hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For **BaryCoordKHR**, the values are obtained using perspective interpolation. For **BaryCoordNoPerspKHR**, the values are obtained using linear interpolation. The values of **BaryCoordKHR** and **BaryCoordNoPerspKHR** are undefined while rasterizing a
28.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range \([\text{pointSizeRange}[0], \text{pointSizeRange}[1]]\). The value written to `PointSize` must be greater than zero. If maintenance\(^5\) is enabled, and a value is not written to `PointSize`, the point size takes a default value of 1.0.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pointSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment’s width or height.

28.10.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):

\[
\begin{align*}
  s &= \frac{1}{2} + \frac{(x_p - x_f)}{\text{size}} \\
  t &= \frac{1}{2} + \frac{(y_p - y_f)}{\text{size}}
\end{align*}
\]

where `size` is the point’s size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.
28.11. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoKHR` structure.

The `VkPipelineRasterizationLineStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeKHR lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_line_rasterization
typedef VkPipelineRasterizationLineStateCreateInfoKHR
    VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeKHR` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

### Valid Usage

- **VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02768**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `rectangularLines` feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02769**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `bresenhamLines` feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-02770**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the
**smoothLines** feature **must** be enabled

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02771**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `stippledRectangularLines` feature **must** be enabled

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02772**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the `stippledBresenhamLines` feature **must** be enabled

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02773**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then the `stippledSmoothLines` feature **must** be enabled

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-stippledLineEnable-02774**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, then the `stippledRectangularLines` feature **must** be enabled and `VkPhysicalDeviceLimits::strictLines` **must** be `VK_TRUE`

### Valid Usage (Implicit)

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_KHR`

- **UUID-VkPipelineRasterizationLineStateCreateInfoKHR-lineRasterizationMode-parameter**
  `lineRasterizationMode` **must** be a valid `VkLineRasterizationModeKHR` value

Possible values of `VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode` are:

```c
// Provided by VK_KHR_line_rasterization
typedef enum VkLineRasterizationModeKHR {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR = 3,
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR,
} VkLineRasterizationModeKHR;
```

or the equivalent
typedef VkLineRasterizationModeKHR VkLineRasterizationModeEXT;

- **VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR** is equivalent to **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR** if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-`strictLines` parallelograms. Both of these modes are defined in Basic Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR** specifies lines drawn as if they were rectangles extruded from the line.

- **VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR** specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in Bresenham Line Segment Rasterization.

- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR** specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To **dynamically set** the `lineRasterizationMode` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_line_rasterization, VK_EXT_line_rasterization with VK_EXT_shader_object
void vkCmdSetLineRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkLineRasterizationModeEXT lineRasterizationMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `lineRasterizationMode` specifies the `lineRasterizationMode` state.

This command sets the `lineRasterizationMode` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoKHR::lineRasterizationMode` value used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetLineRasterizationModeEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3LineRasterizationMode` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07418**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `rectangularLines` feature **must** be enabled

- **VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07419**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the
bresenhamLines feature must be enabled

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-07420
  If lineRasterizationMode is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR, then the smoothlines feature must be enabled

Valid Usage (Implicit)

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetLineRasterizationModeEXT-lineRasterizationMode-parameter
  lineRasterizationMode must be a valid VkLineRasterizationModeEXT value

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetLineRasterizationModeEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetLineRasterizationModeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

To dynamically set the stippledLineEnable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_EXT_line_rasterization,
// VK_EXT_line_rasterization with VK_EXT_shader_object
void vkCmdSetLineStippleEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stippledLineEnable);
```
- `commandBuffer` is the command buffer into which the command will be recorded.
- `stippledLineEnable` specifies the `stippledLineEnable` state.

This command sets the `stippledLineEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoKHR::stippledLineEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLineStippleEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3LineStippleEnable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLineStippleEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>

</tbody>
</table>
To dynamically set the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer,
    float lineWidth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineWidth` is the width of rasterized line segments.

This command sets the line width for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_WIDTH` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLineWidth-lineWidth-00788**
  If the `widelines` feature is not enabled, `lineWidth` must be 1.0

### Valid Usage (Implicit)

- **VUID-vkCmdSetLineWidth-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetLineWidth-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetLineWidth-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetLineWidth-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the lineWidthRange and lineWidthGranularity members of VkPhysicalDeviceLimits. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment's width or height.

### 28.11.1. Basic Line Segment Rasterization

If the lineRasterizationMode member of VkPipelineRasterizationLineStateCreateInfoKHR is VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When rasterizationSamples is VK_SAMPLE_COUNT_1_BIT, the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{\| p_b - p_a \|^2}
\]

(Note that \( t = 0 \) at \( p_a \) and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If strictLines is VK_TRUE, line segments are rasterized using perspective or linear interpolation.

**Perspective interpolation** for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{(1 - t)f_a / w_a + tf_b / w_b}{(1 - t)/w_a + t/w_b}
\]
where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

*Linear interpolation* for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
f = (1 - t) f_a + t f_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

The above description documents the preferred method of line rasterization, and **must** be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`.

By default, when `strictLines` is `VK_FALSE`, or the relaxedLineRasterization feature is enabled, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_KHR`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in Non strict lines, and each is `lineWidth` long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.
When `strictLines` is `VK_FALSE` or when the `relaxedLineRasterization` feature is enabled, and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictSinglePixelWideLinesUseParallelogram` is `VK_TRUE`, the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, and `strictLines` is `VK_FALSE`, non-strict lines of width 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

If `VkPhysicalDeviceMaintenance5PropertiesKHR::nonStrictWideLinesUseParallelogram` is `VK_TRUE`, the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, and `strictLines` is `VK_FALSE`, non-strict lines of width greater than 1.0 are rasterized as parallelograms, otherwise they are rasterized using Bresenham’s algorithm.

### 28.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR`, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

If the `relaxedLineRasterization` feature is enabled, and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` implementations must follow these rasterization rules for non-antialiased lines of width 1.0.

Line segment rasterization begins by characterizing the segment as either *x-major* or *y-major*. *x*-major line segments have slope in the closed interval [-1,1]; all other line segments are *y-major*.
(slope is determined by the segment’s endpoints). We specify rasterization only for x-major segments except in cases where the modifications for y-major segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \( f \) with center at framebuffer coordinates \( x_f \) and \( y_f \), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{ (x, y) \mid |x - x_f| + |y - y_f| \leq \frac{1}{2} \}
\]

Essentially, a line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment intersects \( R_f \), except if \( p_b \) is contained in \( R_f \).

---

![Figure 21. Visualization of Bresenham’s algorithm](image)

To avoid difficulties when an endpoint lies on a boundary of \( R_f \) we (in principle) perturb the supplied endpoints by a tiny amount. Let \( p_a \) and \( p_b \) have framebuffer coordinates \( (x_a, y_a) \) and \( (x_b, y_b) \), respectively. Obtain the perturbed endpoints \( p_a' \) given by \( (x_a, y_a) - (\varepsilon, \varepsilon^2) \) and \( p_b' \) given by \( (x_b, y_b) - (\varepsilon, \varepsilon^2) \). Rasterizing the line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment starting at \( p_a' \) and ending on \( p_b' \) intersects \( R_f \), except if \( p_b' \) is contained in \( R_f \). \( \varepsilon \) is chosen to be so small that rasterizing the line segment produces the same fragments when \( \delta \) is substituted for \( \varepsilon \) for any \( 0 < \delta \leq \varepsilon \).

When \( p_a \) and \( p_b \) lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to \( p_b \)) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).
Implementations **may** use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm **must** not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.

- The total number of fragments produced by the algorithm **must** not differ from that produced by the diamond-exit rule by more than one.

- For an x-major line, two fragments that lie in the same framebuffer-coordinate column **must** not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row **must** not be produced).

- If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments **must** not produce duplicate fragments. Fragments also **must** not be omitted so as to interrupt continuity of the connected segments.

The actual width $w$ of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent lineWidthRange (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by $(x_0, y_0)$ and $(x_1, y_1)$ in framebuffer coordinates, the segment with endpoints $(x_0, y_0 - \frac{w-1}{2})$ and $(x_1, y_1 - \frac{w-1}{2})$ is rasterized, but instead of a single fragment, a column of fragments of height $w$ (a row of fragments of length $w$ for a y-major segment) is produced at each $x$ (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for FragCoord which is interpolated as usual. Implementations **may** instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations **may** all be treated as being at the pixel center (this **may** affect attribute and depth interpolation).

**Note**

The sample locations described above are **not** used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).
28.11.3. Line Stipple

If the `stippledLineEnable` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_TRUE`, then lines are rasterized with a line stipple determined by `lineStippleFactor` and `lineStipplePattern`. `lineStipplePattern` is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. `lineStippleFactor` is a count that is used to modify the effective line stipple by causing each bit in `lineStipplePattern` to be used `lineStippleFactor` times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern $p$, the line stipple factor $r$, and an integer stipple counter $s$. Let

$$ b = \lfloor \frac{s}{r} \rfloor \mod 16 $$

Then a fragment is produced if the $b$’th bit of $p$ is 1, and discarded otherwise. The bits of $p$ are numbered with 0 being the least significant and 15 being the most significant.

The initial value of $s$ is zero. For `VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR` lines, $s$ is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` and `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` lines, the rectangular region is subdivided into adjacent unit-length rectangles, and $s$ is incremented once for each rectangle. Rectangles with a value of $s$ such that the $b$’th bit of $p$ is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder may carry over to the next line segment in the line strip using the same value of $s$ (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

$s$ is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of $s$ at the beginning of the line segment is implementation-dependent.

To dynamically set the line stipple state, call:

```c
// Provided by VK_KHR_line_rasterization
void vkCmdSetLineStippleKHR(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

or the equivalent command

```c
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
```

2688
uint32_t lineStippleFactor,
uint16_t lineStipplePattern);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LINE_STIPPLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationLineStateCreateInfoKHR::lineStippleFactor` and `VkPipelineRasterizationLineStateCreateInfoKHR::lineStipplePattern` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetLineStippleKHR-lineStippleFactor-02776
  lineStippleFactor must be in the range [1,256]

**Valid Usage (Implicit)**

- VUID-vkCmdSetLineStippleKHR-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetLineStippleKHR-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleKHR-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

#### 28.11.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoKHR` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR` lines. The rules for determining which pixels are covered are implementation-dependent, and **may** include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in [Multisample Coverage](#).

**Note**

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.

#### 28.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the `VkPipelineRasterizationStateCreateInfo` structure.

##### 28.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is *back-facing* or *front-facing*. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i^f y_i^{f\oplus1} - x_i^{f\oplus1} y_i^f
\]

where \(x_i^f\) and \(y_i^f\) are the x and y framebuffer coordinates of the ith vertex of the n-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1\) is \((i + 1) \bmod n\).

The interpretation of the sign of \(a\) is determined by the `VkPipelineRasterizationStateCreateInfo` ::`frontFace` property of the currently active pipeline. Possible values are:
typedef enum VkFrontFace {
    VK_FRONT_FACE_COUNTER_CLOCKWISE = 0,
    VK_FRONT_FACE_CLOCKWISE = 1,
} VkFrontFace;

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
- **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To **dynamically set** the front face orientation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **frontFace** is a `VkFrontFace` value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRONT_FACE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::frontFace` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetFrontFace-None-08971
  At least one of the following **must** be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3
Valid Usage (Implicit)

- VUID-vkCmdSetFrontFace-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \textit{VkCommandBuffer} handle

- VUID-vkCmdSetFrontFace-frontFace-parameter
  \textit{frontFace} must be a valid \textit{VkFrontFace} value

- VUID-vkCmdSetFrontFace-commandBuffer-recording
  \textit{commandBuffer} must be in the recording state

- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool
  The \textit{VkCommandPool} that \textit{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetFrontFace-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to \textit{commandBuffer} must be externally synchronized

- Host access to the \textit{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

Once the orientation of triangles is determined, they are culled according to the \textit{VkPipelineRasterizationStateCreateInfo}::\textit{cullMode} property of the currently active pipeline. Possible values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- \textit{VK_CULL_MODE_NONE} specifies that no triangles are discarded
- \textit{VK_CULL_MODE_FRONT_BIT} specifies that front-facing triangles are discarded
• **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
• **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

To **dynamically set** the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **cullMode** specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_CULL_MODE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::cullMode** value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCullMode-None-08971**
  At least one of the following **must** be true:
  - the **extendedDynamicState** feature is enabled
  - the **shaderObject** feature is enabled
  - the value of **VkApplicationInfo::apiVersion** used to create the **VkInstance** parent of **commandBuffer** is greater than or equal to Version 1.3
Valid Usage (Implicit)

- VUID-vkCmdSetCullMode-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCullMode-cullMode-parameter
  `cullMode` must be a valid combination of `VkCullModeFlagBits` values

- VUID-vkCmdSetCullMode-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCullMode-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetCullMode-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

</tbody>
</table>

The rule for determining which fragments are produced by polygon rasterization is called point sampling. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons must result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

Barycentric coordinates are a set of three numbers, a, b, and c, each in the range [0,1], with \(a + b + c = 1\). These coordinates uniquely specify any point \(p\) within the triangle or on the triangle’s boundary as
\[ p = a p_a + b p_b + c p_c. \]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. \( a, b, \) and \( c \) are determined by:

\[
\begin{align*}
  a &= \frac{A(p p_b p_c)}{A(p a p_b p_c)}, \\
  b &= \frac{A(p p_a p_c)}{A(p a p_b p_c)}, \\
  c &= \frac{A(p p_a p_b)}{A(p a p_b p_c)},
\end{align*}
\]

where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n. \)

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c, \) respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle’s clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{a f_a / w_a + b f_b / w_b + c f_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c, \) respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a f_a + b f_b + c f_c
\]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by **Interpolation decorations**.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon’s vertices **must** be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it **must** be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i. \) For each \( i, 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1. \) The values of \( a_i \) **may** differ from fragment to fragment, but at vertex \( i, a_i = 1 \) and \( a_j = 0 \) for \( j \neq i. \)

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge.
and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

28.12.2. Polygon Mode

Possible values of the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range \([0,1]\) when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for **VK_POLYGON_MODE_FILL_RECTANGLE_NV** mode using the triangle's vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon's vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

If VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize is set to VK_TRUE, the point size of the final rasterization of polygons is taken from PointSize when polygon mode is **VK_POLYGON_MODE_POINT**.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::polygonModePointSize is set to VK_FALSE, the point size of the final rasterization of polygons is 1.0 when polygon mode is
VK_POLYGON_MODE_POINT.

To dynamically set the polygon mode, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetPolygonModeEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
    VkPolygonMode polygonMode       // Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `polygonMode` specifies polygon mode.

This command sets the polygon mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::polygonMode` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetPolygonModeEXT-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3PolygonMode` feature is enabled
  - The `shaderObject` feature is enabled

- **VUID-vkCmdSetPolygonModeEXT-fillModeNonSolid-07424**
  If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be `VK_POLYGON_MODE_FILL` or `VK_POLYGON_MODE_FILL_RECTANGLE_NV`

- **VUID-vkCmdSetPolygonModeEXT-polygonMode-07425**
  If the `VK_NV_fill_rectangle` extension is not enabled, `polygonMode` must not be `VK_POLYGON_MODE_FILL_RECTANGLE_NV`

### Valid Usage (Implicit)

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetPolygonModeEXT-polygonMode-parameter**
  `polygonMode` must be a valid `VkPolygonMode` value

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetPolygonModeEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetPolygonModeEXT-videocoding**
This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### 28.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon **can** be biased (offset) by a single depth bias value $o$ that is computed for that polygon.

#### Depth Bias Enable

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo`::`depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment’s depth values are unchanged.

To **dynamically enable** whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

or the equivalent command:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.
This command sets the depth bias enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBiasEnable-None-08970**
  At least one of the following **must** be true:
  - the `extendedDynamicState2` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state
- **VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetDepthBiasEnable-videocoding**
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

</tbody>
</table>
Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope `m` of the polygon
- `depthBiasConstantFactor` scales the parameter `r` of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

depthBiasSlopeFactor, depthBiasConstantFactor, and depthBiasClamp can each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` and `vkCmdSetDepthBias2EXT` below.

The maximum depth slope `m` of a triangle is

\[ m = \sqrt{\left(\frac{\partial z_f}{\partial x_f}\right)^2 + \left(\frac{\partial z_f}{\partial y_f}\right)^2} \]

where \((x_0, y_0, z_0)\) is a point on the triangle. `m` may be approximated as

\[ m = \max\left(\frac{\partial z_f}{\partial x_f}, \frac{\partial z_f}{\partial y_f}\right). \]

In a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`, `r`, for the given primitive is defined as

\[ r = 1 \]

Otherwise `r` is the minimum resolvable difference that depends on the depth attachment representation. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_FALSE` it is the smallest difference in framebuffer coordinate `z` values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but `z` values that differ by `r`, will have distinct depth values.

For fixed-point depth attachment representations, or in a pipeline with a depth bias representation of `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`, `r` is constant throughout the range of the entire depth attachment. If `VkDepthBiasRepresentationInfoEXT::depthBiasExact` is `VK_TRUE`, then its value must be

\[ r = 2^a \]

Otherwise its value is implementation-dependent but must be at most

\[ r = 2 \times 2^a \]
where \( n \) is the number of bits used for the depth aspect when using a fixed-point attachment, or the number of mantissa bits plus one when using a floating-point attachment.

Otherwise for floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as

\[
    r = 2^e n
\]

If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference may not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
    o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})
\]

where \( \text{dbclamp}(x) = \begin{cases} 
    x & \text{depthBiasClamp} = 0 \text{ or } NaN \\
    \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
    \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 
\end{cases} \)

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.

This command sets the depth bias parameters for subsequent drawing commands when drawing
using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DEPTH_BIAS set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the corresponding VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor, depthBiasClamp, and depthBiasSlopeFactor values used to create the currently active pipeline.

Calling this function is equivalent to calling vkCmdSetDepthBias2EXT without a VkDepthBiasRepresentationInfoEXT in the pNext chain of VkDepthBiasInfoEXT.

Valid Usage

• VUID-vkCmdSetDepthBias-depthBiasClamp-00790
  If the depthBiasClamp feature is not enabled, depthBiasClamp must be 0.0

Valid Usage (Implicit)

• VUID-vkCmdSetDepthBias-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetDepthBias-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetDepthBias-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetDepthBias-videoencoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

The VkDepthBiasRepresentationInfoEXT structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
```
typedef struct VkDepthBiasRepresentationInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDepthBiasRepresentationEXT depthBiasRepresentation;
    VkBool32 depthBiasExact;
} VkDepthBiasRepresentationInfoEXT;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **depthBiasRepresentation** is a `VkDepthBiasRepresentationEXT` value specifying the depth bias representation.
• **depthBiasExact** specifies that the implementation is not allowed to scale the depth bias value to ensure a minimum resolvable distance.

### Valid Usage

- **VUID-VkDepthBiasRepresentationInfoEXT-leastRepresentableValueForceUnormRepresentation-08947**
  If the `leastRepresentableValueForceUnormRepresentation` feature is not enabled, **depthBiasRepresentation must not be** `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-floatRepresentation-08948**
  If the `floatRepresentation` feature is not enabled, **depthBiasRepresentation must not be** `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasExact-08949**
  If the `depthBiasExact` feature is not enabled, **depthBiasExact must be** `VK_FALSE`

### Valid Usage (Implicit)

- **VUID-VkDepthBiasRepresentationInfoEXT-sType-sType**
  **sType must be** `VK_STRUCTURE_TYPE_DEPTH_BIAS_REPRESENTATION_INFO_EXT`

- **VUID-VkDepthBiasRepresentationInfoEXT-depthBiasRepresentation-parameter**
  **depthBiasRepresentation must be a valid`VkDepthBiasRepresentationEXT value**

Possible values of `VkDepthBiasRepresentationInfoEXT::depthBiasRepresentation`, specifying the depth bias representation are:

```c
// Provided by VK_EXT_depth_bias_control
typedef enum VkDepthBiasRepresentationEXT {
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT = 0,
    VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT = 1,
    VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT = 2,
} VkDepthBiasRepresentationEXT;
```
• **`VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT`** specifies that the depth bias representation is a factor of the format’s \( r \) as described in *Depth Bias Computation*.

• **`VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT`** specifies that the depth bias representation is a factor of a constant \( r \) defined by the bit-size or mantissa of the format as described in *Depth Bias Computation*.

• **`VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT`** specifies that the depth bias representation is a factor of constant \( r \) equal to 1.

The *VkDepthBiasInfoEXT* structure is defined as:

```c
// Provided by VK_EXT_depth_bias_control
typedef struct VkDepthBiasInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkDepthBiasInfoEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.
- **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.
- **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

If **pNext** does not contain a *VkDepthBiasRepresentationInfoEXT* structure, then this command is equivalent to including a *VkDepthBiasRepresentationInfoEXT* with **depthBiasExact** set to **VK_FALSE** and **depthBiasRepresentation** set to **VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORMAT_EXT**.

**Valid Usage**

- **VUID-VkDepthBiasInfoEXT-depthBiasClamp-08950** If the **depthBiasClamp** feature is not enabled, **depthBiasClamp** must be 0.0

**Valid Usage (Implicit)**

- **VUID-VkDepthBiasInfoEXT-sType-sType** **sType** must be **VK_STRUCTURE_TYPE_DEPTH_BIAS_INFO_EXT**
- **VUID-VkDepthBiasInfoEXT-pNext-pNext** **pNext** must be NULL or a pointer to a valid instance of *VkDepthBiasRepresentationInfoEXT*
The `sType` value of each struct in the `pNext` chain must be unique

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_EXT_depth_bias_control
void vkCmdSetDepthBias2EXT(
    VkCommandBuffer commandBuffer, 
    const VkDepthBiasInfoEXT* pDepthBiasInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pDepthBiasInfo` is a pointer to a `VkDepthBiasInfoEXT` structure specifying depth bias parameters.

This command is functionally identical to `vkCmdSetDepthBias`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBias2EXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBias2EXT-pDepthBiasInfo-parameter `pDepthBiasInfo` must be a valid pointer to a valid `VkDepthBiasInfoEXT` structure
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBias2EXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBias2EXT-videocoding This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
28.12.4. Conservative Rasterization

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.

`VkPipelineRasterizationConservativeStateCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in X and Y equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and and conservative rasterization is disabled.

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

Note 2706
If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

### Valid Usage

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769**
  - `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT:maxExtraPrimitiveOverestimationSize` inclusive.

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT`.

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zeroBitmask**
  - `flags` must be 0.

- **VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter**
  - `conservativeRasterizationMode` must be a valid `VkConservativeRasterizationModeEXT` value.

```cpp
// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode`, specifying the conservative rasterization mode are:

```cpp
// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;
```

- `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT` specifies that conservative rasterization is disabled and rasterization proceeds as normal.

- `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` specifies that conservative rasterization is enabled in overestimation mode.
• **VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT** specifies that conservative rasterization is enabled in underestimation mode.

To **dynamically set** the **conservativeRasterizationMode**, call:

```c
// Provided by VK_EXT_conservative_rasterization with VK_EXT_extended_dynamic_state3,
// VK_EXT_conservative_rasterization with VK_EXT_shader_object
void vkCmdSetConservativeRasterizationModeEXT(
    VkCommandBuffer commandBuffer,
    VkConservativeRasterizationModeEXT conservativeRasterizationMode);
```

• *commandBuffer* is the command buffer into which the command will be recorded.

• *conservativeRasterizationMode* specifies the **conservativeRasterizationMode** state.

This command sets the **conservativeRasterizationMode** state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT** set in *VkPipelineDynamicStateCreateInfo::*pDynamicStates. Otherwise, this state is specified by the *VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode* value used to create the currently active pipeline.

**Valid Usage**

• VUID-vkCmdSetConservativeRasterizationModeEXT-None-09423
  At least one of the following **must** be true:
  - The **extendedDynamicState3ConservativeRasterizationMode** feature is enabled
  - The **shaderObject** feature is enabled

**Valid Usage (Implicit)**

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-parameter
  *commandBuffer* **must** be a valid *VkCommandBuffer* handle

• VUID-vkCmdSetConservativeRasterizationModeEXT-conservativeRasterizationMode-parameter
  *conservativeRasterizationMode** must** be a valid *VkConservativeRasterizationModeEXT* value

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-recording
  *commandBuffer** must** be in the **recording state**

• VUID-vkCmdSetConservativeRasterizationModeEXT-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from **must** support graphics operations

• VUID-vkCmdSetConservativeRasterizationModeEXT-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To dynamically set the `extraPrimitiveOverestimationSize`, call:

```c
void vkCmdSetExtraPrimitiveOverestimationSizeEXT(
    VkCommandBuffer commandBuffer,
    float extraPrimitiveOverestimationSize);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `extraPrimitiveOverestimationSize` specifies the `extraPrimitiveOverestimationSize`.

This command sets the `extraPrimitiveOverestimationSize` for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationConservativeStateCreateInfoEXT::extraPrimitiveOverestimationSize` value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is enabled
  - The `shaderObject` feature is enabled

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-extraPrimitiveOverestimationSize-07428
  `extraPrimitiveOverestimationSize` must be in the range of 0.0 to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive
Valid Usage (Implicit)

- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-recording
  `commandBuffer` must be in the `recording` state
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetExtraPrimitiveOverestimationSizeEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize` pixels at each of the primitive edges. This may increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above `0.0` in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This may further increase the number of fragments generated by this primitive.
The actual precision of the overestimation size used for conservative rasterization may vary between implementations and produce results that only approximate the primitiveOverestimationSize and extraPrimitiveOverestimationSizeGranularity properties. Implementations may especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized is VK_FALSE or will generate fragments if degenerateTrianglesRasterized is VK_TRUE. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application can enable backface culling if desired. Triangles that are zero area before rasterization may be culled regardless.

For lines if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized is VK_FALSE or will generate fragments if degenerateLinesRasterized is VK_TRUE. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization may be culled regardless.

For points if VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT is enabled, and the implementation sets VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization to VK_TRUE, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the fragment is discarded even if some pixels are considered covered.

For triangles, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.
For points, if `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive must set `FullyCoveredEXT` to `VK_TRUE` if the implementation enables the `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::fullyCoveredFragmentShaderInputVariable` feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with `FullyCoveredEXT`, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 29. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Certain Fragment shading operations:
   - Sample Mask Accesses
   - Tile Image Reads
   - Depth Replacement
   - Stencil Reference Replacement
   - Interlocked Operations
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programatically discarded in a fragment shader by executing one of

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.
If there is a fragment shader and it declares the PostDepthCoverage execution mode, the sample mask test is instead performed after the depth test.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations must be performed after sample counting.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentMultisampleCoverageAfterSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting, but may be performed before sample counting.

If VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_TRUE and there is a fragment shader which declares the EarlyFragmentTests execution mode sample mask test operations must follow the order of fragment operations from above.

Otherwise, if VkPhysicalDeviceMaintenance5PropertiesKHR::earlyFragmentSampleMaskTestBeforeSampleCounting is set to VK_FALSE and there is a fragment shader which declares the EarlyFragmentTests execution mode, sample mask test operations should follow the order of fragment operations from above but may instead be performed after sample counting.

If there is a fragment shader which declares the EarlyAndLateFragmentTestsAMD execution mode, and it does not declare the DepthReplacing or StencilRefReplacingEXT execution mode, fragment shading and multisample coverage operations are instead be performed after sample counting.

For a pipeline with the following properties:

- a fragment shader is specified
- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the StencilRefReplacingEXT execution mode;
- either
  - the fragment shader specifies the StencilRefUnchangedFrontAMD execution mode;
  - the fragment shader specifies the StencilRefLessFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefGreaterFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL; and
- either
  - the fragment shader specifies the StencilRefUnchangedBackAMD execution mode;
  - the fragment shader specifies the StencilRefLessBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
the fragment shader specifies the StencilRefGreaterBackAMD execution mode and the pipeline
uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_LESS or
VK_COMPARE_OP_LESS_OR_EQUAL

an additional stencil test may be performed before fragment shading, using the stencil reference
value specified by VkPipelineDepthStencilStateCreateInfo::front.reference or
VkPipelineDepthStencilStateCreateInfo::back.reference.

For a pipeline with the following properties:

• a fragment shader is specified
• the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage
resources;
• the fragment shader specifies the DepthReplacing execution mode; and
• either
  ◦ the fragment shader specifies the DepthUnchanged execution mode;
  ◦ the fragment shader specifies the DepthLess execution mode and the pipeline uses a
    VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_GREATER or
    VK_COMPARE_OP_GREATER_OR_EQUAL; or
  ◦ the fragment shader specifies the DepthGreater execution mode and the pipeline uses a
    VkPipelineDepthStencilStateCreateInfo::depthCompareOp of VK_COMPARE_OP_LESS or
    VK_COMPARE_OP_LESS_OR_EQUAL

the implementation may perform depth bounds test before fragment shading and perform an
additional depth test immediately after that using the interpolated depth value generated by
rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color
attachment samples pass through framebuffer operations.

29.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a
fragment against a set of discard rectangles.

Each discard rectangle is defined by a VkRect2D. These values are either set by the
VkPipelineDiscardRectangleStateCreateInfoEXT structure during pipeline creation, or dynamically
by the vkCmdSetDiscardRectangleEXT command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\). If the test is set to be inclusive, samples that are not inside any of
the discard rectangles will have their coverage set to 0. If the test is set to be exclusive, samples that
are inside any of the discard rectangles will have their coverage set to 0.

If no discard rectangles are specified, the coverage mask is unmodified by this operation.
The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_discard_rectangles
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;
    VkDiscardRectangleModeEXT discardRectangleMode;
    uint32_t discardRectangleCount;
    const VkRect2D* pDiscardRectangles;
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
- `discardRectangleCount` is the number of discard rectangles to use.
- `pDiscardRectangles` is a pointer to an array of `VkRect2D` structures defining discard rectangles.

If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is enabled for a pipeline, the `pDiscardRectangles` member is ignored. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state is not enabled for the pipeline, the presence of this structure in the `VkGraphicsPipelineCreateInfo` chain, and a `discardRectangleCount` greater than zero, implicitly enables discard rectangles in the pipeline, otherwise discard rectangles must enabled or disabled by `vkCmdSetDiscardRectangleEnableEXT`. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state is enabled for the pipeline, the `discardRectangleMode` member is ignored, and the discard rectangle mode must be set by `vkCmdSetDiscardRectangleModeEXT`.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the discard rectangle test. If the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state is not enabled, and this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `discardRectangleCount` of 0.

### Valid Usage

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discordRectangleCount-00582
discardRectangleCount must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

### Valid Usage (Implicit)

- VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType
tsType must be `VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT`
flags must be 0

• VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter
discardRectangleMode must be a valid VkDiscardRectangleModeEXT value

// Provided by VK_EXT_discard_rectangles
typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

VkPipelineDiscardRectangleStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

VkDiscardRectangleModeEXT values are:

// Provided by VK_EXT_discard_rectangles
typedef enum VkDiscardRectangleModeEXT {
    VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT = 0,
    VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT = 1,
} VkDiscardRectangleModeEXT;

• VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT specifies that the discard rectangle test is inclusive.
• VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:

// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);

• commandBuffer is the command buffer into which the command will be recorded.
• firstDiscardRectangle is the index of the first discard rectangle whose state is updated by the command.
• discardRectangleCount is the number of discard rectangles whose state are updated by the command.
• pDiscardRectangles is a pointer to an array of VkRect2D structures specifying discard rectangles.

The discard rectangle taken from element i of pDiscardRectangles replace the current state for the discard rectangle at index firstDiscardRectangle + i, for i in [0, discardRectangleCount).

This command sets the discard rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT set in VkPipelineDynamicStateCreateInfo::pDynamicStates.
Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::pDiscardRectangles` values used to create the currently active pipeline.

## Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of `firstDiscardRectangle` and `discardRectangleCount` must be less than or equal to `VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles`

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The `x` and `y` member of `offset` in each `VkRect2D` element of `pDiscardRectangles` must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of `(offset.x + extent.width)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of `(offset.y + extent.height)` in each `VkRect2D` element of `pDiscardRectangles` must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled, then this function must not be called

## Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDiscardRectangleEXT-pDiscardRectangles-parameter**
  `pDiscardRectangles` must be a valid pointer to an array of `discardRectangleCount` `VkRect2D` structures

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDiscardRectangleEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetDiscardRectangleEXT-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetDiscardRectangleEXT-discardRectangleCount-arraylength**
  `discardRectangleCount` must be greater than 0

## Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set whether discard rectangles are enabled, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEnableEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    VkBool32 discardRectangleEnable  // discardRectangleEnable specifies whether discard rectangles are enabled or not.
);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `discardRectangleEnable` specifies whether discard rectangles are enabled or not.

This command sets the discard rectangle enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is implied by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount` value used to create the currently active pipeline, where a non-zero `discardRectangleCount` implicitly enables discard rectangles, otherwise they are disabled.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEnableEXT-specVersion-07851**
  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension

### Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetDiscardRectangleEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics
To dynamically set the discard rectangle mode, call:

```c
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleModeEXT(
    VkCommandBuffer commandBuffer,
    VkDiscardRectangleModeEXT discardRectangleMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `discardRectangleMode` specifies the discard rectangle mode for all discard rectangles, either inclusive or exclusive.

This command sets the discard rectangle mode for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleMode` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDiscardRectangleModeEXT-specVersion-07852

  The `VK_EXT_discard_rectangles` extension must be enabled, and the implementation must support at least `specVersion 2` of this extension
### Valid Usage (Implicit)

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetDiscardRectangleModeEXT-discardRectangleMode-parameter**
  
  `discardRectangleMode` **must** be a valid `VkDiscardRectangleModeEXT` value

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-recording**
  
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdSetDiscardRectangleModeEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetDiscardRectangleModeEXT-videocoding**
  
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### 29.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a **scissor rectangle** at the index equal to the fragment's `ViewportIndex`.

Each scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportStateCreateInfo` structure during pipeline creation, or dynamically by the `vkCmdSetScissor` command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D}::\text{offset.x}, \text{VkRect2D}::\text{offset.x} + \text{VkRect2D}::\text{extent.x}]\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset.y}, \text{VkRect2D}::\text{offset.y} + \text{VkRect2D}::\text{extent.y}]\). Samples with coordinates outside the scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

If a render pass transform is enabled, the \((\text{offset.x} \text{ and } \text{offset.y})\) and \((\text{extent.width} \text{ and } \)
extent.height) values are transformed as described in render pass transform before participating in the scissor test.

To **dynamically set** the scissor rectangles, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer,
    uint32_t firstScissor,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining scissor rectangles.

The scissor rectangles taken from element `i` of `pScissors` replace the current state for the scissor index `firstScissor + i`, for `i` in `[0, scissorCount)`.

This command sets the scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissor-firstScissor-00592**
  The sum of `firstScissor` and `scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- **VUID-vkCmdSetScissor-firstScissor-00593**
  If the `multiViewport` feature is not enabled, `firstScissor` **must** be 0

- **VUID-vkCmdSetScissor-scissorCount-00594**
  If the `multiViewport` feature is not enabled, `scissorCount` **must** be 1

- **VUID-vkCmdSetScissor-x-00595**
  The `x` and `y` members of `offset` member of any element of `pScissors` **must** be greater than or equal to 0

- **VUID-vkCmdSetScissor-offset-00596**
  Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- **VUID-vkCmdSetScissor-offset-00597**
  Evaluation of `(offset.y + extent.height)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- **VUID-vkCmdSetScissor-viewportScissor2D-04789**

2722
If this command is recorded in a secondary command buffer with
VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled, then
this function must not be called

Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetScissor-pScissors-parameter
  pScissors must be a valid pointer to an array of scissorCount VkRect2D structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics
  operations

- VUID-vkCmdSetScissor-vidoeencoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissor-scissorCount-arraylength
  scissorCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally
  synchronized

</tbody>
</table>

29.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a
fragment against an exclusive scissor rectangle at the index equal to the fragment's ViewportIndex.

Each exclusive scissor rectangle is defined by a VkRect2D. These values are either set by the
VkPipelineViewportExclusiveScissorStateCreateInfoNV structure during pipeline creation, or
dynamically by the `vkCmdSetExclusiveScissorNV` command.

A given sample is considered inside an exclusive scissor rectangle if \( x_f \) is in the range \([\text{VkRect2D}::\text{offset.x}, \text{VkRect2D}::\text{offset.x} + \text{VkRect2D}::\text{extent.x})\), and \( y_f \) is in the range \([\text{VkRect2D}::\text{offset.y}, \text{VkRect2D}::\text{offset.y} + \text{VkRect2D}::\text{extent.y})\). Samples with coordinates inside the exclusive scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t exclusiveScissorCount;
    const VkRect2D* pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the `pExclusiveScissors` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with an `exclusiveScissorCount` of 0.

### Valid Usage

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027**
  If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 0 or 1

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028**
  `exclusiveScissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- **VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029**
  `exclusiveScissorCount` must be 0 or greater than or equal to the `viewportCount` member of `VkPipelineViewportStateCreateInfo`
To **dynamically set** the exclusive scissor rectangles, call:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstExclusiveScissor** is the index of the first exclusive scissor rectangle whose state is updated by the command.
- **exclusiveScissorCount** is the number of exclusive scissor rectangles updated by the command.
- **pExclusiveScissors** is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element `i` of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`.

This command sets the exclusive scissor rectangles for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV::pExclusiveScissors` values used to create the currently active pipeline.

---

**Valid Usage**

- VUID-vkCmdSetExclusiveScissorNV-None-02031
  The `exclusiveScissor` feature must be enabled.

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034
  The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive.

- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035
  If the `multiViewport` feature is not enabled, `firstExclusiveScissor` must be 0.

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036
  If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 1.

- VUID-vkCmdSetExclusiveScissorNV-x-02037
The $x$ and $y$ members of $\text{offset}$ in each member of $p\text{ExclusiveScissors}$ must be greater than or equal to 0

- VUID-vkCmdSetExclusiveScissorNV-offset-02038
  Evaluation of $(\text{offset.x} + \text{extent.width})$ for each member of $p\text{ExclusiveScissors}$ must not cause a signed integer addition overflow

- VUID-vkCmdSetExclusiveScissorNV-offset-02039
  Evaluation of $(\text{offset.y} + \text{extent.height})$ for each member of $p\text{ExclusiveScissors}$ must not cause a signed integer addition overflow

### Valid Usage (Implicit)

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter
  $\text{commandBuffer}$ must be a valid $\text{VkCommandBuffer}$ handle

- VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter
  $p\text{ExclusiveScissors}$ must be a valid pointer to an array of $\text{exclusiveScissorCount}$ $\text{VkRect2D}$ structures

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording
  $\text{commandBuffer}$ must be in the recording state

- VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool
  The $\text{VkCommandPool}$ that $\text{commandBuffer}$ was allocated from must support graphics operations

- VUID-vkCmdSetExclusiveScissorNV-videoencoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength
  $\text{exclusiveScissorCount}$ must be greater than 0

### Host Synchronization

- Host access to $\text{commandBuffer}$ must be externally synchronized

- Host access to the $\text{VkCommandPool}$ that $\text{commandBuffer}$ was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>

<td>State</td>
</tr>
</tbody>
</table>

To dynamically set whether an exclusive scissor is enabled or not, call:
void vkCmdSetExclusiveScissorEnableNV(
    VkCommandBuffer commandBuffer,  
    uint32_t firstExclusiveScissor,  
    uint32_t exclusiveScissorCount,  
    const VkBool32* pExclusiveScissorEnables);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissorEnables` is a pointer to an array of `VkBool32` values defining whether the exclusive scissor is enabled.

The exclusive scissor enables taken from element `i` of `pExclusiveScissorEnables` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`.

This command sets the exclusive scissor enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo`::`pDynamicStates`. Otherwise, this state is implied by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV`::`exclusiveScissorCount` value used to create the currently active pipeline, where all `exclusiveScissorCount` exclusive scissors are implicitly enabled and the remainder up to `VkPhysicalDeviceLimits::maxViewports` are implicitly disabled.

**Valid Usage**

- VUID-vkCmdSetExclusiveScissorEnableNV-exclusiveScissor-07853
  The `exclusiveScissor` feature must be enabled, and the implementation must support at least `specVersion` 2 of the `VK_NV_scissor_exclusive` extension

**Valid Usage (Implicit)**

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetExclusiveScissorEnableNV-pExclusiveScissorEnables-parameter
  `pExclusiveScissorEnables` must be a valid pointer to an array of `exclusiveScissorCount` `VkBool32` values

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetExclusiveScissorEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
29.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by `VkPipelineMultisampleStateCreateInfo::pSampleMask`.

To dynamically set the sample mask, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
define void vkCmdSetSampleMaskEXT(
    VkCommandBuffer commandBuffer,
    VkSampleCountFlagBits samples,
    const VkSampleMask* pSampleMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `samples` specifies the number of sample bits in the `pSampleMask`.
- `pSampleMask` is a pointer to an array of `VkSampleMask` values, where the array size is based on the `samples` parameter.

This command sets the sample mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::pSampleMask` value used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetSampleMaskEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3SampleMask` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetSampleMaskEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetSampleMaskEXT-samples-parameter
  `samples` **must** be a valid `VkSampleCountFlagBits` value
- VUID-vkCmdSetSampleMaskEXT-pSampleMask-parameter
  `pSampleMask` **must** be a valid pointer to an array of \( \frac{\text{samples}}{32} \) `VkSampleMask` values
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetSampleMaskEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetSampleMaskEXT-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

Each bit of the coverage mask is associated with a sample index as described in the **rasterization chapter**. If the bit in `VkPipelineMultisampleStateCreateInfo::pSampleMask` which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.
29.5. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
  - If a fragment shader statically computes the same values for different framebuffer locations, and does not write to any storage resources, multiple fragments may be shaded by one fragment shader invocation. This may affect VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT results, but must otherwise not be visible behavior to applications.
- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - If a shading rate image is used and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - Each covered sample must be included in at least one fragment shader invocation.

If no fragment shader is included in the pipeline, no fragment shader is executed, and undefined values may be written to all color attachment outputs during this fragment operation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations is
VK_TRUE. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

29.5.1. Sample Mask

Reading from the SampleMask built-in in the Input storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in SampleMask which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the SampleMask built-in in the Output storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

29.5.2. Fragment Shader Tile Image Reads

If the VK_EXT_shader_tile_image extension is enabled, implementations divide the framebuffer into a grid of tiles. A tile image is a view of a framebuffer attachment tile for fragments with locations within the tile.

Within a render pass instance initiated by vkCmdBeginRenderingKHR, fragment shader invocations can read the framebuffer color, depth, and stencil values at the fragment location via tile images.

Note

Even though fragment shader invocation can only read from the corresponding fragment location, the abstraction of a tile image is introduced for the following reasons:

• Tile dimensions will be exposed in a future extension
• Future functionality such as executing compute dispatches within render passes via tile shaders can leverage tile images.

Enabling shaderTileImageColorReadAccess, shaderTileImageDepthReadAccess, shaderTileImageStencilReadAccess enables fragment shader invocations to read from color, depth, and stencil, respectively.

Color values are read from tile image variables with OpColorAttachmentReadEXT. Tile image variables are linked to specific color attachments using Location decoration. See Fragment Tile Image Interface for more details.

Depth values are read with OpDepthAttachmentReadEXT.

Stencil values are read with OpStencilAttachmentReadEXT.
The sample to read is specified by a sample index value specified as the Sample operand to OpColorAttachmentReadEXT, OpDepthAttachmentReadEXT, or OpStencilAttachmentReadEXT.

If sample shading is disabled, a fragment invocation can read from all sample locations associated with the fragment regardless of the fragment’s coverage. This functionality is supported for VkPipelineMultisampleStateCreateInfo::rasterizationSamples > 1 when VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadSampleFromPixelRateInvocation is VK_TRUE.

If sample shading is enabled, and minSampleShading is 1.0, a fragment invocation must only read from the coverage index sample. Tile image access must not be used if the value of minSampleShading is not 1.0.

If the fragment shader declares the EarlyFragmentTests execution mode, depth reads are allowed only if depth writes are disabled and stencil reads are allowed only if stencil writes are disabled.

If VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageReadFromHelperInvocation is VK_FALSE, values read from helper invocations are undefined otherwise the values read are subject to the coherency guarantees described below.

OpDepthAttachmentReadEXT returns an undefined value if no depth attachment is present. OpStencilAttachmentReadEXT returns an undefined value if no stencil attachment is present.

Tile image reads from color, depth and stencil attachments are said to be coherent when the accesses happen in raster order and without data race with respect to accesses to the attachments from framebuffer-space pipeline stages. The samples which qualify for coherent access and the enabling conditions are described below.

- Let Rc be the set of components being read from an attachment A in a draw call
- Let Wc be the set of components being written to A by the draw call

The samples which qualify for coherent tile image reads from an attachment A are:

- All samples in a pixel when Rc is disjoint with Wc.
- The samples with coverage in a fragment when Rc is not disjoint with Wc. The samples with coverage are determined by the coverage mask for the fragment as calculated by fragment operations that executed prior to fragment shading, including early fragment tests if enabled for the draw call.

A fragment shader can declare NonCoherentColorAttachmentReadEXT, NonCoherentDepthAttachmentReadEXT, or NonCoherentStencilAttachmentReadEXT execution modes to enable non-coherent tile image reads which require an explicit vkCmdPipelineBarrier2 call for the writes to an attachment to be made visible via tile image reads.

When VkPhysicalDeviceShaderTileImagePropertiesEXT::shaderTileImageCoherentReadAccelerated is VK_TRUE, the implementation prefers that coherent tile image reads are used, otherwise the implementation prefers that non-coherent tile image reads are used.
In practice, the most common tile image reads usage patterns fall under one of the following:

- **Programmable blending** - each fragment reads from a single sample (SampleID) at its location. Per-sample shading is typically enabled when multisampled rendertargets are used.

- **G-buffer generation and shading in one render pass** - in the shading phase a fragment reads from a single sample at its location.

- **Programmable resolve** - a fragment reads from all samples at its location (per-sample shading is disabled). This requires the use of a "full-screen triangle" instead of a rectangle composed of two triangles in order to avoid data races along the shared edge of the triangles.

- **1:1 texturing with LOD** - in use cases such a deferred screen space decals a fragment reads a single sample (SampleID) from depth buffer, but requires being able to read from helper threads to derive the texture LOD. This use case is supported as long as the attachment components being read are not overwritten by color, depth, or stencil attachment writes.

All of the above use cases are supported by coherent tile image reads, but only the latter three are supported when non-coherent reads are used as there is no mechanism to synchronize non-coherent reads with writes within a draw call.

### 29.5.3. Depth Replacement

Writing to the `FragDepth` built-in will replace the fragment’s calculated depth values for each sample in the input `SampleMask`. Depth testing performed after the fragment shader for this fragment will use this new value as $z_f$.

### 29.5.4. Stencil Reference Replacement

Writing to the `FragStencilRefEXT` built-in will replace the fragment’s stencil reference value for each sample in the input `SampleMask`. Stencil testing performed after the fragment shader for this fragment will use this new value as $s_r$.

### 29.5.5. Interlocked Operations

`OpBeginInvocationInterlockEXT` and `OpEndInvocationInterlockEXT` define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as *interlocked operations*. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the `ShadingRateInterlockOrderedEXT` execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same fragment area, and **must** happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same fragment area.

If the `ShadingRateInterlockUnorderedEXT` execution mode is specified, any interlocked operations in a
fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in **rasterization order** and cover at least one sample in the same fragment area.

If the **PixelInterlockOrderedEXT** execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in **rasterization order** and cover at least one sample in the same pixel, and **must** happen after interlocked operations in a fragment shader that executes earlier in **rasterization order** and cover at least one sample in the same pixel.

If the **PixelInterlockUnorderedEXT** execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in **rasterization order** and cover at least one sample in the same pixel.

If the **SampleInterlockOrderedEXT** execution mode is specified, any interlocked operations in a fragment shader **must** happen before interlocked operations in fragment shader invocations that execute later in **rasterization order** and cover at least one of the same samples, and **must** happen after interlocked operations in a fragment shader that executes earlier in **rasterization order** and cover at least one of the same samples.

If the **SampleInterlockUnorderedEXT** execution mode is specified, any interlocked operations in a fragment shader **must** happen before or after interlocked operations in fragment shader invocations that execute earlier or later in **rasterization order** and cover at least one of the same samples.

### 29.6. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with **SampleMask**, but not **OverrideCoverageNV**, the coverage mask is **ANDed** with the bits of the **SampleMask** built-in to generate a new coverage mask. If the **SampleMask** built-in is also decorated with **OverrideCoverageNV**, the coverage mask is replaced with the mask bits set in the shader. If **sample shading** is enabled, bits written to **SampleMask** corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include **SampleMask** in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the **lineRasterizationMode** member of the **VkPipelineRasterizationStateCreateInfo** structure is **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR**, and the **alphaToCoverageEnable** and **alphaToOneEnable** members of the **VkPipelineMultisampleStateCreateInfo** structure.

To **dynamically set** the **alphaToCoverageEnable** state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToCoverageEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToCoverageEnable);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **alphaToCoverageEnable** specifies the **alphaToCoverageEnable** state.

This command sets the **alphaToCoverageEnable** state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with **VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT** set in **VkPipelineDynamicStateCreateInfo**::pDynamicStates. Otherwise, this state is specified by the **VkPipelineMultisampleStateCreateInfo**::alphaToCoverageEnable value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetAlphaToCoverageEnableEXT-None-09423
  At least one of the following **must** be true:
  - The extendedDynamicState3AlphaToCoverageEnable feature is enabled
  - The shaderObject feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-parameter
  **commandBuffer** **must** be a valid **VkCommandBuffer** handle
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-recording
  **commandBuffer** **must** be in the recording state
- VUID-vkCmdSetAlphaToCoverageEnableEXT-commandBuffer-cmdpool
  The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics operations
- VUID-vkCmdSetAlphaToCoverageEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To **dynamically set** the *alphaToOneEnable* state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetAlphaToOneEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 alphaToOneEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `alphaToOneEnable` specifies the *alphaToOneEnable* state.

This command sets the *alphaToOneEnable* state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with *VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT* set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineMultisampleStateCreateInfo::alphaToOneEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetAlphaToOneEnableEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3AlphaToOneEnable` feature is enabled
  - The `shaderObject` feature is enabled
- VUID-vkCmdSetAlphaToOneEnableEXT-alphaToOne-07607
  If the *alphaToOne* feature is not enabled, *alphaToOneEnable must be VK_FALSE*

### Valid Usage (Implicit)

- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-recording
  `commandBuffer` **must** be in the **recording state**
- VUID-vkCmdSetAlphaToOneEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetAlphaToOneEnableEXT-videocoding
  This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

All alpha values in this section refer only to the alpha component of the fragment shader output that has a Location and Index decoration of zero (see the Fragment Output Interface section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the `lineRasterizationMode` member of the `VkPipelineRasterizationStateCreateInfo` structure is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during smooth line rasterization.

If `alphaToCoverageEnable` is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is ANDed with the fragment coverage mask.

No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1's in this value be proportional to the alpha value (clamped to [0,1]), with all 1's corresponding to a value of 1.0 and all 0's corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

**Note**

Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

## 29.7. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the `VkPipelineDepthStencilStateCreateInfo` structure.

The `VkPipelineDepthStencilStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType              sType;          
    const void*                  pNext;          
    VkPipelineDepthStencilStateCreateFlags flags; 
    VkBool32                      depthTestEnable; 
    VkBool32                      depthWriteEnable; 
};  
```
VkCompareOp
VkBool32
VkBool32
VkStencilOpState
VkStencilOpState
float
float

VkPipelineDepthStencilStateCreateInfo;

sType is a VkStructureType value identifying this structure.
pNext is NULL or a pointer to a structure extending this structure.
flags is a bitmask of VkPipelineDepthStencilStateCreateFlagBits specifying additional
depth/stencil state information.
depthTestEnable controls whether depth testing is enabled.
depthWriteEnable controls whether depth writes are enabled when depthTestEnable is VK_TRUE. Depth writes are always disabled when depthTestEnable is VK_FALSE.
depthCompareOp is a VkCompareOp value specifying the comparison operator to use in the Depth
Comparison step of the depth test.
depthBoundsTestEnable controls whether depth bounds testing is enabled.
stencilTestEnable controls whether stencil testing is enabled.
front and back are VkStencilOpState values controlling the corresponding parameters of the
stencil test.
minDepthBounds is the minimum depth bound used in the depth bounds test.
maxDepthBounds is the maximum depth bound used in the depth bounds test.

Valid Usage

• VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598
  If the depthBounds feature is not enabled, depthBoundsTestEnable must be VK_FALSE

• VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef is VK_FALSE, and
  the value of VkPipelineDepthStencilStateCreateInfo::stencilTestEnable is VK_TRUE, and
  the value of VkPipelineRasterizationStateCreateInfo::cullMode is VK_CULL_MODE_NONE, the value
  of reference in each of the VkStencilOpState structs in front and back must be the same

• VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderDepthAttachmentAccess-06463
  If the rasterizationOrderDepthAttachmentAccess feature is not enabled, flags must not include
  VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT

• VUID-VkPipelineDepthStencilStateCreateInfo-rasterizationOrderStencilAttachmentAccess-
If the `rasterizationOrderStencilAttachmentAccess` feature is not enabled, `flags` must not include `VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT`.

### Valid Usage (Implicit)

- **VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`

- **VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter**
  - `flags` must be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter**
  - `depthCompareOp` must be a valid `VkCompareOp` value

- **VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter**
  - `front` must be a valid `VkStencilOpState` structure

- **VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter**
  - `back` must be a valid `VkStencilOpState` structure

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineDepthStencilStateCreateFlags;
```

`VkPipelineDepthStencilStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineDepthStencilStateCreateFlagBits`.

Bits which can be set in the `VkPipelineDepthStencilStateCreateInfo::flags` parameter are:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineDepthStencilStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT = 0x00000002,
    // Provided by VK_ARM_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT
}
```
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM =
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT,
} VkPipelineDepthStencilStateCreateInfo;

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
  indicates that access to the depth aspects of depth/stencil and input attachments will have
  implicit framebuffer-local memory dependencies.

• VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
  indicates that access to the stencil aspects of depth/stencil and input attachments will have
  implicit framebuffer-local memory dependencies.

When
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_EXT
is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment
generated by draw commands for that pipeline with the following scopes:

• The first synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT and
  VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages executed by all previous fragments
  (as defined by primitive order) in the corresponding framebuffer regions including those
  generated by the same draw command.

• The second synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
  stage executed by the generated fragment.

• The first access scope includes all writes to the depth aspect of depth/stencil attachments.

• The second access scope includes all reads from the depth aspect of input attachments.

When
VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_EXT
is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment
generated by draw commands for that pipeline with the following scopes:

• The first synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT
  VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages executed by all previous fragments
  (as defined by primitive order) in the corresponding framebuffer regions including those
  generated by the same draw command.

• The second synchronization scope includes VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT and
  VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT pipeline stages executed by the generated fragment.

• The first access scope includes all writes to the stencil aspect of depth/stencil attachments.

• The second access scope includes all reads from the stencil aspect of input attachments.
29.8. Depth Bounds Test

The depth bounds test compares the depth value \( z_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \(i\) against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum (\( \text{minDepthBounds} \)) and maximum (\( \text{maxDepthBounds} \)) depth value. These values are either set by the \text{VkPipelineDepthStencilStateCreateInfo} structure during pipeline creation, or dynamically by \text{vkCmdSetDepthBoundsTestEnable} and \text{vkCmdSetDepthBounds}.

A given sample is considered within the depth bounds if \( z_a \) is in the range \([\text{minDepthBounds}, \text{maxDepthBounds}]\). Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:

```
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

or the equivalent command

```
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- \text{commandBuffer} is the command buffer into which the command will be recorded.
- \text{depthBoundsTestEnable} specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with \text{VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE} set in \text{VkPipelineDynamicStateCreateInfo}::pDynamicStates. Otherwise, this state is specified by the \text{VkPipelineDepthStencilStateCreateInfo}::depthBoundsTestEnable value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetDepthBoundsTestEnable-None-08971
  At least one of the following \textbf{must} be true:
  - the \text{extendedDynamicState} feature is enabled
  - the \text{shaderObject} feature is enabled
• the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBoundsTestEnable-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tr>
</tbody>
</table>

To dynamically set the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.
This command sets the depth bounds range for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

**Valid Usage**

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, `minDepthBounds` must be between 0.0 and 1.0, inclusive.

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  If the `VK_EXT_depth_range_unrestricted` extension is not enabled, `maxDepthBounds` must be between 0.0 and 1.0, inclusive.

**Valid Usage (Implicit)**

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetDepthBounds-videocoding**
  This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

29.9. Stencil Test

The stencil test compares the stencil attachment value $s_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y)$ and sample index $i$ against a stencil reference value.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by back-facing polygons, and the front stencil state when processing fragments generated by front-facing polygons or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOp::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask $s_c$ and stencil reference value $s_r$ of the front or the back stencil state set determine arguments of the comparison operation. $s_c$ is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. $s_r$ is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`.

$s_r$ and $s_a$ are each independently combined with $s_c$ using a bitwise AND operation to create masked reference and attachment values $s'_r$ and $s'_a$. $s'_r$ and $s'_a$ are used as the reference and test values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value $s_g$ is generated according to a stencil operation defined by `VkStencilOp` parameters set by `vkCmdSetStencilOp` or `VkPipelineDepthStencilStateCreateInfo`. If the stencil test fails, `failOp` defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, `VkPipelineDepthStencilStateCreateInfo::passOp` is used, otherwise `VkPipelineDepthStencilStateCreateInfo::depthFailOp` is used.

The stencil attachment value $s_a$ is then updated with the generated stencil value $s_g$ according to the write mask $s_w$ defined by `writeMask` in `VkPipelineDepthStencilStateCreateInfo::front` and `VkPipelineDepthStencilStateCreateInfo::back` as:

$$ s_a = (s_g \& \neg s_w) \mid (s_g \& s_w) $$

To dynamically enable or disable the stencil test, call:
// Provided by VK_VERSION_1_3
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer, 
    VkBool32 stencilTestEnable);

or the equivalent command

// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer, 
    VkBool32 stencilTestEnable);

• `commandBuffer` is the command buffer into which the command will be recorded.
• `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetStencilTestEnable-None-08971
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetStencilTestEnable-videoencoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
   VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

or the equivalent command:

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
• depthFailOp is a VkStencilOp value specifying the action performed on samples that pass the stencil test and fail the depth test.

• compareOp is a VkCompareOp value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_OP set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the corresponding VkPipelineDepthStencilStateCreateInfo::failOp, passOp, depthFailOp, and compareOp values used to create the currently active pipeline, for both front and back faces.

**Valid Usage**

- VUID-vkCmdSetStencilOp-None-08971
  At least one of the following must be true:
  
  ◦ the extendedDynamicState feature is enabled
  ◦ the shaderObject feature is enabled
  ◦ the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilOp-faceMask-parameter
  faceMask must be a valid combination of VkStencilFaceFlagBits values

- VUID-vkCmdSetStencilOp-faceMask-requiredbitmap
  faceMask must not be 0

- VUID-vkCmdSetStencilOp-failOp-parameter
  failOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-passOp-parameter
  passOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-depthFailOp-parameter
  depthFailOp must be a valid VkStencilOp value

- VUID-vkCmdSetStencilOp-compareOp-parameter
  compareOp must be a valid VkCompareOp value

- VUID-vkCmdSetStencilOp-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilOp-videocoding
This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>

The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- **failOp** is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- **passOp** is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- **depthFailOp** is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- **compareOp** is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- **compareMask** selects the bits of the unsigned integer stencil values participating in the stencil test.
- **writeMask** selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- **reference** is an integer stencil reference value that is used in the unsigned stencil comparison.
Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
  *failOp* must be a valid *VkStencilOp* value

- VUID-VkStencilOpState-passOp-parameter
  *passOp* must be a valid *VkStencilOp* value

- VUID-VkStencilOpState-depthFailOp-parameter
  *depthFailOp* must be a valid *VkStencilOp* value

- VUID-VkStencilOpState-compareOp-parameter
  *compareOp* must be a valid *VkCompareOp* value

To dynamically set the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- *commandBuffer* is the command buffer into which the command will be recorded.
- *faceMask* is a bitmask of *VkStencilFaceFlagBits* specifying the set of stencil state for which to update the compare mask.
- *compareMask* is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkStencilOpState::compareMask` value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  *commandBuffer* must be a valid *VkCommandBuffer* handle

- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  *faceMask* must be a valid combination of *VkStencilFaceFlagBits* values

- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitmask
  *faceMask* must not be 0

- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  *commandBuffer* must be in the recording state

- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from must support graphics
• VUID-vkCmdSetStencilCompareMask-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

• Host access to `commandBuffer` **must** be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

• `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
• `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
• `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To **dynamically set** the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
```
VkCommandBuffer commandBuffer,
VkStencilFaceFlags faceMask,
uint32_t writeMask);

• commandBuffer is the command buffer into which the command will be recorded.
• faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the write mask, as described above for vkCmdSetStencilCompareMask.
• writeMask is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the writeMask value used to create the currently active pipeline, for both VkPipelineDepthStencilStateCreateInfo::front and VkPipelineDepthStencilStateCreateInfo::back faces.

Valid Usage (Implicit)

• VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
• VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  faceMask must be a valid combination of VkStencilFaceFlagBits values
• VUID-vkCmdSetStencilWriteMask-faceMask-required bitmask
  faceMask must not be 0
• VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  commandBuffer must be in the recording state
• VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
• VUID-vkCmdSetStencilWriteMask-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To **dynamically set** the stencil reference value, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo`::`pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo`::`reference` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- `VUID-vkCmdSetStencilReference-commandBuffer-parameter`  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- `VUID-vkCmdSetStencilReference-faceMask-parameter`  
  `faceMask` must be a valid combination of `VkStencilFaceFlagBits` values

- `VUID-vkCmdSetStencilReference-faceMask-requiredbitmask`  
  `faceMask` must not be 0

- `VUID-vkCmdSetStencilReference-commandBuffer-recording`  
  `commandBuffer` must be in the recording state

- `VUID-vkCmdSetStencilReference-commandBuffer-cmdpool`  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- `VUID-vkCmdSetStencilReference-videoencoding`  
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {    
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- `VK_STENCIL_OP_KEEP` keeps the current value.
- `VK_STENCIL_OP_ZERO` sets the value to 0.
- `VK_STENCIL_OP_REPLACE` sets the value to `reference`.
- `VK_STENCIL_OP_INCREMENT_AND_CLAMP` increments the current value and clamps to the maximum representable unsigned value.
- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.
29.10. Depth Test

The depth test compares the depth value $z_a$ in the depth/stencil attachment at each sample's framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against the sample's depth value $z_f$. If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

29.10.1. Depth Clamping and Range Adjustment

If $VkPipelineRasterizationStateCreateInfo::depthClampEnable$ is enabled, $z_t$ is clamped to $[z_{\text{min}}, z_{\text{max}}]$, where $z_{\text{min}} = \min(n, f)$, $z_{\text{max}} = \max(n, f)$, and $n$ and $f$ are the $\text{minDepth}$ and $\text{maxDepth}$ depth range values of the viewport used by this fragment, respectively.

If $VkPhysicalDeviceDepthClampZeroOneFeaturesEXT::depthClampZeroOne$ is enabled:

- If the depth attachment has a floating-point format and $VK_EXT_depth_range_unrestricted$ is enabled then $z_t$ is unchanged.
- Otherwise, $z_t$ is clamped to the range $[0, 1]$.

Otherwise:

- If $z_t$ is not in the range $[z_{\text{min}}, z_{\text{max}}]$, then $z_t$ is undefined following this step.
- If the depth attachment has a fixed-point format and $z_t$ is not in the range $[0, 1]$, then $z_t$ is undefined following this step.

29.10.2. Depth Comparison

If the depth test is not enabled, as specified by $vkCmdSetDepthTestEnable$ or $VkPipelineDepthStencilStateCreateInfo::depthTestEnable$, then this step is skipped.

The comparison operation performed is determined by the $VkCompareOp$ value set by $vkCmdSetDepthCompareOp$, or by $VkPipelineDepthStencilStateCreateInfo::depthCompareOp$ during pipeline creation. $z_t$ and $z_a$ are used as the reference and test values, respectively, in the operation specified by the $VkCompareOp$.

If the comparison evaluates to false, the coverage for the sample is set to 0.

29.10.3. Depth Attachment Writes

If depth writes are enabled, as specified by $vkCmdSetDepthWriteEnable$ or $VkPipelineDepthStencilStateCreateInfo::depthWriteEnable$, and the comparison evaluated to true, the depth attachment value $z_a$ is set to the sample's depth value $z_f$. If there is no depth attachment, no value is written.
To **dynamically enable or disable** the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthTestEnable` specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthTestEnable-None-08971
  At least one of the following **must** be true:
    - the `extendedDynamicState` feature is enabled
    - the `shaderObject` feature is enabled
    - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetDepthTestEnable-videocoding
This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthCompareOp-None-08971
At least one of the following must be true:

- the extendedDynamicState feature is enabled
- the shaderObject feature is enabled
- the value of VkApplicationInfo::apiVersion used to create the VkInstance parent of commandBuffer is greater than or equal to Version 1.3

Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter depthCompareOp must be a valid VkCompareOp value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetDepthCompareOp-videoencoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>

</tbody>
</table>

To dynamically set the depth write enable, call:

```c
// Provided by VK_VERSION_1_3
define void vkCmdSetDepthWriteEnable( VkCommandBuffer commandBuffer, VkBool32 depthWriteEnable);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state, VK_EXT_shader_object
void vkCmdSetDepthWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthWriteEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthWriteEnable` specifies if depth writes are enabled.

This command sets the depth write enable for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetDepthWriteEnable-None-08971
  At least one of the following must be true:
  - the `extendedDynamicState` feature is enabled
  - the `shaderObject` feature is enabled
  - the value of `VkApplicationInfo::apiVersion` used to create the `VkInstance` parent of `commandBuffer` is greater than or equal to Version 1.3

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthWriteEnable-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthWriteEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthWriteEnable-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
29.11. Representative Fragment Test

The representative fragment test allows implementations to reduce the amount of rasterization and fragment processing work performed for each point, line, or triangle primitive. For any primitive that produces one or more fragments that pass all prior early fragment tests, the implementation **may** choose one or more “representative” fragments for processing and discard all other fragments. For draw calls rendering multiple points, lines, or triangles arranged in lists, strips, or fans, the representative fragment test is performed independently for each of those primitives. The set of fragments discarded by the representative fragment test is implementation-dependent. In some cases, the representative fragment test may not discard any fragments for a given primitive.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure, then that structure includes parameters controlling the representative fragment test.

The `VkPipelineRepresentativeFragmentTestStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPipelineRepresentativeFragmentTestStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 representativeFragmentTestEnable;
} VkPipelineRepresentativeFragmentTestStateCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `representativeFragmentTestEnable` controls whether the representative fragment test is enabled.

If this structure is not included in the `pNext` chain, `representativeFragmentTestEnable` is considered to be `VK_FALSE`, and the representative fragment test is disabled.

If the active fragment shader does not specify the `EarlyFragmentTests` execution mode, the representative fragment shader test has no effect, even if enabled.

---

**Valid Usage (Implicit)**

- `VUID-VkPipelineRepresentativeFragmentTestStateCreateInfoNV-sType-sType` must be 2759
To dynamically set the `representativeFragmentTestEnable` state, call:

```c
void vkCmdSetRepresentativeFragmentTestEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 representativeFragmentTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `representativeFragmentTestEnable` specifies the `representativeFragmentTestEnable` state.

This command sets the `representativeFragmentTestEnable` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRepresentativeFragmentTestStateCreateInfoNV::representativeFragmentTestEnable` value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3RepresentativeFragmentTestEnable` feature is enabled
  - The `shaderObject` feature is enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetRepresentativeFragmentTestEnableNV-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

## Command Properties

### 29.12. Sample Counting

Occlusion queries use query pool entries to track the number of samples that pass all the per-fragment tests. The mechanism of collecting an occlusion query value is described in Occlusion Queries.

The occlusion query sample counter increments by one for each sample with a coverage value of 1 in each fragment that survives all the per-fragment tests, including scissor, exclusive scissor, sample mask, alpha to coverage, stencil, and depth tests.

### 29.13. Fragment Coverage to Color

The VkPipelineCoverageToColorStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef struct VkPipelineCoverageToColorStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageToColorStateCreateFlagsNV flags;
    VkBool32 coverageToColorEnable;
    uint32_t coverageToColorLocation;
} VkPipelineCoverageToColorStateCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageToColorEnable` controls whether the fragment coverage value replaces a fragment color output.
- `coverageToColorLocation` controls which fragment shader color output value is replaced.

If the `pNext` chain of VkPipelineMultisampleStateCreateInfo includes a VkPipelineCoverageToColorStateCreateInfoNV structure, then that structure controls whether the fragment coverage is substituted for a fragment color output and, if so, which output is replaced.
If `coverageToColorEnable` is `VK_TRUE`, the coverage mask replaces the first component of the color value corresponding to the fragment shader output location with `Location` equal to `coverageToColorLocation` and `Index` equal to zero. If the color attachment format has fewer bits than the coverage mask, the low bits of the sample coverage mask are taken without any clamping. If the color attachment format has more bits than the coverage mask, the high bits of the sample coverage mask are filled with zeros.

If `coverageToColorEnable` is `VK_FALSE`, these operations are skipped. If this structure is not included in the `pNext` chain, it is as if `coverageToColorEnable` is `VK_FALSE`.

### Valid Usage

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-coverageToColorEnable-01404**
  If `coverageToColorEnable` is `VK_TRUE`, then the render pass subpass indicated by `VkGraphicsPipelineCreateInfo::renderPass` and `VkGraphicsPipelineCreateInfo::subpass` must have a color attachment at the location selected by `coverageToColorLocation`, with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

### Valid Usage (Implicit)

- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_TO_COLOR_STATE_CREATE_INFO_NV`
- **VUID-VkPipelineCoverageToColorStateCreateInfoNV-flags-zerobitmask**
  `flags` must be `0`

```c
// Provided by VK_NV_fragment_coverage_to_color
typedef VkFlags VkPipelineCoverageToColorStateCreateInfoNV;

VkPipelineCoverageToColorStateCreateInfoNV is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically set the `coverageToColorEnable` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_fragment_coverage_to_color, VK_EXT_shader_object with VK_NV_fragment_coverage_to_color
void vkCmdSetCoverageToColorEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageToColorEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorEnable` specifies the `coverageToColorEnable` state.

This command sets the `coverageToColorEnable` state for subsequent drawing commands when
drawing using shader objects, or when the graphics pipeline is created with
\texttt{VK_DYNAMIC\_STATE\_COVERAGE\_TO\_COLOR\_ENABLE\_NV} set in \texttt{VkPipelineDynamicStateCreateInfo}:
pDynamicStates. Otherwise, this state is specified by the
\texttt{VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorEnable} value used to create the
currently active pipeline.

### Valid Usage

- \textbf{VUID-vkCmdSetCoverageToColorEnableNV-None-09423}
  At least one of the following \textbf{must} be true:
  - The \texttt{extendedDynamicState3CoverageToColorEnable} feature is enabled
  - The \texttt{shaderObject} feature is enabled

### Valid Usage (Implicit)

- \textbf{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-parameter}
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle
- \textbf{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-recording}
  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording state}
- \textbf{VUID-vkCmdSetCoverageToColorEnableNV-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics
  operations
- \textbf{VUID-vkCmdSetCoverageToColorEnableNV-videocoding}
  This command \textbf{must} only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally
  synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To \textbf{dynamically set} the \texttt{coverageToColorLocation} state, call:
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_fragment_coverage_to_color, VK_EXT_shader_object with VK_NV_fragment_coverage_to_color

```c
void vkCmdSetCoverageToColorLocationNV(
    VkCommandBuffer commandBuffer,
    uint32_t coverageToColorLocation);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageToColorLocation` specifies the `coverageToColorLocation` state.

This command sets the `coverageToColorLocation` state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageToColorStateCreateInfoNV::coverageToColorLocation` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCoverageToColorLocationNV-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3CoverageToColorLocation` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetCoverageToColorLocationNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetCoverageToColorLocationNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

29.14. **Coverage Reduction**

Coverage reduction takes the coverage information for a fragment and converts that to a boolean coverage value for each color sample in each pixel covered by the fragment.

29.14.1. **Pixel Coverage**

Coverage for each pixel is first extracted from the total fragment coverage mask. This consists of `rasterizationSamples` unique coverage samples for each pixel in the fragment area, each with a unique sample index. If the fragment only contains a single pixel, coverage for the pixel is equivalent to the fragment coverage.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, pixel coverage is generated in an implementation-dependent manner. If all samples in the fragment are covered, all samples will be covered in each pixel coverage.

If a shading rate image is used, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples corresponding to that pixel, and each sample retains its unique sample index `i`.

If the fragment shading rate is set, and the fragment covers multiple pixels, each pixel's coverage consists of the coverage samples with a pixel index matching that pixel, and each sample retains its unique sample index `i`.

29.14.2. **Color Sample Coverage**

Once pixel coverage is determined, coverage for each individual color sample corresponding to that pixel is determined.

If the number of `rasterizationSamples` is identical to the number of samples in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index `i` is covered.

Otherwise, the coverage for each color sample is computed from the pixel coverage as follows.

If the `VK_AMD_mixed_attachment_samples` extension is enabled, for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index `i` is covered; additional pixel coverage samples are discarded.

If the `pNext` chain of `VkSubpassDescription2` or `VkRenderingInfo` includes a
VkMultisampledRenderToSingleSampledInfoEXT structure with the multisampledRenderToSingleSampledEnable field equal to VK_TRUE, sample coverage is calculated as if the attachment has VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples samples.

When the VK_NV_coverage_reduction_mode extension is enabled, the pipeline state controlling coverage reduction is specified through the members of the VkPipelineCoverageReductionStateCreateInfoNV structure.

The VkPipelineCoverageReductionStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkPipelineCoverageReductionStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageReductionStateCreateFlagsNV flags;
    VkCoverageReductionModeNV coverageReductionMode;
} VkPipelineCoverageReductionStateCreateInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `coverageReductionMode` is a VkCoverageReductionModeNV value controlling how color sample coverage is generated from pixel coverage.

If this structure is not included in the `pNext` chain, or if the extension is not enabled, the default coverage reduction mode is inferred as follows:

- If the VK_NV_framebuffer_mixed_samples extension is enabled, then it is as if the `coverageReductionMode` is VK_COVERAGE_REDUCTION_MODE_MERGE_NV.
- If the VK_AMD_mixed_attachment_samples extension is enabled, then it is as if the `coverageReductionMode` is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV.
- If both VK_NV_framebuffer_mixed_samples and VK_AMD_mixed_attachment_samples are enabled, then the default coverage reduction mode is implementation-dependent.

**Valid Usage (Implicit)**

- VUID-VkPipelineCoverageReductionStateCreateInfoNV-sType-sType `sType` must be VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_REDUCTION_STATE_CREATE_INFO_NV
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-flags-zerobitmask `flags` must be 0
- VUID-VkPipelineCoverageReductionStateCreateInfoNV-coverageReductionMode-parameter `coverageReductionMode` must be a valid VkCoverageReductionModeNV value
VkPipelineCoverageReductionStateCreateFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode, specifying how color sample coverage is generated from pixel coverage, are:

- VK_COVERAGE_REDUCTION_MODE_MERGE_NV specifies that each color sample will be associated with an implementation-dependent subset of samples in the pixel coverage. If any of those associated samples are covered, the color sample is covered.
- VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV specifies that for color samples present in the color attachments, a color sample is covered if the pixel coverage sample with the same sample index \( i \) is covered; other pixel coverage samples are discarded.

To dynamically set the coverageReductionMode state, call:

```c
void vkCmdSetCoverageReductionModeNV(
    VkCommandBuffer commandBuffer,
    VkCoverageReductionModeNV coverageReductionMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageReductionMode` specifies the coverageReductionMode state.

This command sets the coverageReductionMode state for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageReductionStateCreateInfoNV::coverageReductionMode value used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoverageReductionModeNV-None-09423
  At least one of the following must be true:
  - The extendedDynamicState3CoverageReductionMode feature is enabled
The shaderObject feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageReductionModeNV-coverageReductionMode-parameter
  `coverageReductionMode` must be a valid `VkCoverageReductionModeNV` value
- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetCoverageReductionModeNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetCoverageReductionModeNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

To query the set of mixed sample combinations of coverage reduction mode, rasterization samples and color, depth, stencil attachment sample counts that are supported by a physical device, call:

```c
// Provided by VK_NV_coverage_reduction_mode
VkResult vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV(
    VkPhysicalDevice physicalDevice,
    uint32_t* pCombinationCount,
    VkFramebufferMixedSamplesCombinationNV* pCombinations);
```

- `physicalDevice` is the physical device from which to query the set of combinations.
- `pCombinationCount` is a pointer to an integer related to the number of combinations available or
queried, as described below.

- **pCombinations** is either NULL or a pointer to an array of `VkFramebufferMixedSamplesCombinationNV` values, indicating the supported combinations of coverage reduction mode, rasterization samples, and color, depth, stencil attachment sample counts.

If **pCombinations** is NULL, then the number of supported combinations for the given **physicalDevice** is returned in **pCombinationCount**. Otherwise, **pCombinationCount** must point to a variable set by the user to the number of elements in the **pCombinations** array, and on return the variable is overwritten with the number of values actually written to **pCombinations**. If the value of **pCombinationCount** is less than the number of combinations supported for the given **physicalDevice**, at most **pCombinationCount** values will be written to **pCombinations**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the supported values were returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-physicalDevice-parameter **physicalDevice** must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinationCount-parameter **pCombinationCount** must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV-pCombinations-parameter If the value referenced by **pCombinationCount** is not 0, and **pCombinations** is not NULL, **pCombinations** must be a valid pointer to an array of **pCombinationCount** `VkFramebufferMixedSamplesCombinationNV` structures

### Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkFramebufferMixedSamplesCombinationNV` structure is defined as:

```c
// Provided by VK_NV_coverage_reduction_mode
typedef struct VkFramebufferMixedSamplesCombinationNV {
    VkStructureType sType;
    void* pNext;
} VkFramebufferMixedSamplesCombinationNV;
```
• **sType** is a [VkStructureType](#) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **coverageReductionMode** is a [VkCoverageReductionModeNV](#) value specifying the coverage reduction mode.

• **rasterizationSamples** is a [VkSampleCountFlagBits](#) specifying the number of rasterization samples in the supported combination.

• **depthStencilSamples** specifies the number of samples in the depth stencil attachment in the supported combination. A value of 0 indicates the combination does not have a depth stencil attachment.

• **colorSamples** specifies the number of color samples in a color attachment in the supported combination. A value of 0 indicates the combination does not have a color attachment.

---

### Valid Usage (Implicit)

- **VUID-VkFramebufferMixedSamplesCombinationNV-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_FRAMEBUFFER_MIXED_SAMPLES_COMBINATION_NV`

- **VUID-VkFramebufferMixedSamplesCombinationNV-pNext-pNext**
  
  *pNext* must be **NULL**

---

### 29.14.3. Coverage Modulation

As part of coverage reduction, fragment color values **can** also be modulated (multiplied) by a value that is a function of fraction of covered rasterization samples associated with that color sample.

Pipeline state controlling coverage modulation is specified through the members of the [VkPipelineCoverageModulationStateCreateInfoNV](#) structure.

The [VkPipelineCoverageModulationStateCreateInfoNV](#) structure is defined as:

```c
// Provided by VK_NV_framebuffer_mixed_samples
typedef struct VkPipelineCoverageModulationStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCoverageModulationStateCreateFlagsNV flags;
    VkCoverageModulationModeNV coverageModulationMode;
    VkBool32 coverageModulationTableEnable;
    uint32_t coverageModulationTableCount;
    const float* coverageModulationTable;
} VkPipelineCoverageModulationStateCreateInfoNV;
```
• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• coverageModulationMode is a VkCoverageModulationModeNV value controlling which color components are modulated.
• coverageModulationTableEnable controls whether the modulation factor is looked up from a table in pCoverageModulationTable.
• coverageModulationTableCount is the number of elements in pCoverageModulationTable.
• pCoverageModulationTable is a table of modulation factors containing a value for each number of covered samples.

If coverageModulationTableEnable is VK_FALSE, then for each color sample the associated bits of the pixel coverage are counted and divided by the number of associated bits to produce a modulation factor R in the range (0,1] (a value of zero would have been killed due to a color coverage of 0). Specifically:

• N = value of rasterizationSamples
• M = value of VkAttachmentDescription::samples for any color attachments
• R = popcount(associated coverage bits) / (N / M)

If coverageModulationTableEnable is VK_TRUE, the value R is computed using a programmable lookup table. The lookup table has N / M elements, and the element of the table is selected by:

• R = pCoverageModulationTable[popcount(associated coverage bits)-1]

Note that the table does not have an entry for popcount(associated coverage bits) = 0, because such samples would have been killed.

The values of pCoverageModulationTable may be rounded to an implementation-dependent precision, which is at least as fine as 1 / N, and clamped to [0,1].

For each color attachment with a floating point or normalized color format, each fragment output color value is replicated to M values which can each be modulated (multiplied) by that color sample’s associated value of R. Which components are modulated is controlled by coverageModulationMode.

If this structure is not included in the pNext chain, it is as if coverageModulationMode is VK_COVERAGE_MODULATION_MODE_NONE_NV.

If the coverage reduction mode is VK_COVERAGE_REDUCTION_MODE_TRUNCATE_NV, each color sample is associated with only a single coverage sample. In this case, it is as if coverageModulationMode is VK_COVERAGE_MODULATION_MODE_NONE_NV.
Valid Usage

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationTableEnable-01405
  If `coverageModulationTableEnable` is `VK_TRUE`, `coverageModulationTableCount` must be equal to the number of rasterization samples divided by the number of color samples in the subpass.

Valid Usage (Implicit)

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COVERAGE_MODULATION_STATE_CREATE_INFO_NV`.

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-flags-zerobitmask
  `flags` must be `0`.

- VUID-VkPipelineCoverageModulationStateCreateInfoNV-coverageModulationMode-parameter
  `coverageModulationMode` must be a valid `VkCoverageModulationModeNV` value.

// Provided by VK_NV_framebuffer_mixed_samples
typedef VkFlags VkPipelineCoverageModulationStateCreateInfoFlagsNV;

`VkPipelineCoverageModulationStateCreateInfoFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of `VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationMode`, specifying which color components are modulated, are:

// Provided by VK_NV_framebuffer_mixed_samples
typedef enum VkCoverageModulationModeNV {
  VK_COVERAGE_MODULATION_MODE_NONE_NV = 0,
  VK_COVERAGE_MODULATION_MODE_RGB_NV = 1,
  VK_COVERAGE_MODULATION_MODE_ALPHA_NV = 2,
  VK_COVERAGE_MODULATION_MODE_RGBA_NV = 3,
} VkCoverageModulationModeNV;

- `VK_COVERAGE_MODULATION_MODE_NONE_NV` specifies that no components are multiplied by the modulation factor.
- `VK_COVERAGE_MODULATION_MODE_RGB_NV` specifies that the red, green, and blue components are multiplied by the modulation factor.
- `VK_COVERAGE_MODULATION_MODE_ALPHA_NV` specifies that the alpha component is multiplied by the modulation factor.
- `VK_COVERAGE_MODULATION_MODE_RGBA_NV` specifies that all components are multiplied by the modulation factor.
To **dynamically set** the `coverageModulationMode` state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
// VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationModeNV(
    VkCommandBuffer            commandBuffer,
    VkCoverageModulationModeNV coverageModulationMode);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `coverageModulationMode` specifies the `coverageModulationMode` state.

This command sets the `coverageModulationMode` state for subsequent drawing commands when drawing using **shader objects**, or the graphics pipeline is created with `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` set in `VkPipelineDynamicStateCreateInfo ::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineCoverageModulationStateCreateInfoNV ::coverageModulationMode` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetCoverageModulationModeNV-None-09423
  At least one of the following **must** be true:
    - The `extendedDynamicState3CoverageModulationMode` feature is enabled
    - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetCoverageModulationModeNV-coverageModulationMode-parameter
  `coverageModulationMode` **must** be a valid `VkCoverageModulationModeNV` value
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetCoverageModulationModeNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetCoverageModulationModeNV-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

To dynamically set the \texttt{coverageModulationTableEnable} state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
// VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationTableEnableNV(
    VkCommandBuffer commandBuffer,
    VkBool32 coverageModulationTableEnable);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{coverageModulationTableEnable} specifies the \texttt{coverageModulationTableEnable} state.

This command sets the \texttt{coverageModulationTableEnable} state for subsequent drawing commands when drawing using \texttt{shader objects}, or when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableEnable} value used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetCoverageModulationTableEnableNV-None-09423
  At least one of the following must be true:
  - The \texttt{extendedDynamicState3CoverageModulationTableEnable} feature is enabled
  - The \texttt{shaderObject} feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetCoverageModulationTableEnableNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetCoverageModulationTableEnableNV-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the pCoverageModulationTable state, call:

```c
// Provided by VK_EXT_extended_dynamic_state3 with VK_NV_framebuffer_mixed_samples,
// VK_EXT_shader_object with VK_NV_framebuffer_mixed_samples
void vkCmdSetCoverageModulationTableNV(VkCommandBuffer commandBuffer, 
                                       uint32_t coverageModulationTableCount, 
                                       const float* pCoverageModulationTable);
```

- commandBuffer is the command buffer into which the command will be recorded.
- coverageModulationTableCount specifies the number of elements in pCoverageModulationTable.
- pCoverageModulationTable specifies the table of modulation factors containing a value for each number of covered samples.

This command sets the table of modulation factors for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineCoverageModulationStateCreateInfoNV::coverageModulationTableCount, and VkPipelineCoverageModulationStateCreateInfoNV::pCoverageModulationTable values used to create
the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetCoverageModulationTableNV-None-09423**
  At least one of the following must be true:
  - The `extendedDynamicState3CoverageModulationTable` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetCoverageModulationTableNV-pCoverageModulationTable-parameter**
  `pCoverageModulationTable` must be a valid pointer to an array of `coverageModulationTableCount float` values

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdSetCoverageModulationTableNV-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdSetCoverageModulationTableNV-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetCoverageModulationTableNV-coverageModulationTableCount-arraylength**
  `coverageModulationTableCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

30.1. Blending

Blending combines the incoming source fragment's R, G, B, and A values with the destination R, G, B, and A values of each sample stored in the framebuffer at the fragment's (x_f,y_f) location. Blending is performed for each color sample covered by the fragment, rather than just once for each fragment.

Source and destination values are combined according to the blend operation, quadruplets of source and destination weighting factors determined by the blend factors, and a blend constant, to obtain a new set of R, G, B, and A values, as described below.

Blending is computed and applied separately to each color attachment used by the subpass, with separate controls for each attachment.

Prior to performing the blend operation, signed and unsigned normalized fixed-point color components undergo an implied conversion to floating-point as specified by Conversion from Normalized Fixed-Point to Floating-Point. Blending computations are treated as if carried out in floating-point, and basic blend operations are performed with a precision and dynamic range no lower than that used to represent destination components. Advanced blending operations are performed with a precision and dynamic range no lower than the smaller of that used to represent destination components or that used to represent 16-bit floating-point values.

Note

Blending is only defined for floating-point, UNORM, SNORM, and sRGB formats. Within those formats, the implementation may only support blending on some subset of them. Which formats support blending is indicated by VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT.

The pipeline blend state is included in the VkPipelineColorBlendStateCreateInfo structure during graphics pipeline creation:

The VkPipelineColorBlendStateCreateInfo structure is defined as:

```c
typedef struct VkPipelineColorBlendStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineColorBlendStateCreateFlags flags;
    VkBool32 logicOpEnable;
    VkLogicOp logicOp;
    uint32_t attachmentCount;
    const VkPipelineColorBlendAttachmentState* pAttachments;
    float blendConstants[4];
} VkPipelineColorBlendStateCreateInfo;
```

- `sType` is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of **VkPipelineColorBlendStateCreateFlagBits** specifying additional color blending information.

• **logicOpEnable** controls whether to apply Logical Operations.

• **logicOp** selects which logical operation to apply.

• **attachmentCount** is the number of **VkPipelineColorBlendAttachmentState** elements in **pAttachments**. It is ignored if the pipeline is created with **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set, and either **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** set or **advancedBlendCoherentOperations** is not enabled on the device.

• **pAttachments** is a pointer to an array of **VkPipelineColorBlendAttachmentState** structures defining blend state for each color attachment. It is ignored if the pipeline is created with **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, and **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** dynamic states set, and either **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** set or **advancedBlendCoherentOperations** is not enabled on the device.

• **blendConstants** is a pointer to an array of four values used as the R, G, B, and A components of the blend constant that are used in blending, depending on the **blend factor**. 

### Valid Usage

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-00605**
  If the independentBlend feature is not enabled, all elements of **pAttachments** must be identical

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00606**
  If the logicOp feature is not enabled, **logicOpEnable** must be **VK_FALSE**

- **VUID-VkPipelineColorBlendStateCreateInfo-logicOpEnable-00607**
  If **logicOpEnable** is **VK_TRUE**, **logicOp** must be a valid **VkLogicOp** value

- **VUID-VkPipelineColorBlendStateCreateInfo-rasterizationOrderColorAttachmentAccess-06465**
  If the rasterizationOrderColorAttachmentAccess feature is not enabled, **flags** must not include **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT**

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-07353**
  If attachmentCount is not 0, and any of **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT**, **VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT**, or **VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT** are not set, **pAttachments** must be a valid pointer to an array of attachmentCount valid **VkPipelineColorBlendAttachmentState** structures
Valid Usage (Implicit)

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_STATE_CREATE_INFO`.

- **VUID-VkPipelineColorBlendStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkPipelineColorBlendAdvancedStateCreateInfoEXT` or `VkPipelineColorWriteCreateInfoEXT`.

- **VUID-VkPipelineColorBlendStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain **must** be unique.

- **VUID-VkPipelineColorBlendStateCreateInfo-flags-parameter**
  
  `flags` **must** be a valid combination of `VkPipelineColorBlendStateCreateFlagBits` values.

- **VUID-VkPipelineColorBlendStateCreateInfo-pAttachments-parameter**
  
  If `attachmentCount` is not 0, and `pAttachments` is not `NULL`, `pAttachments` **must** be a valid pointer to an array of `attachmentCount` valid `VkPipelineColorBlendAttachmentState` structures.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineColorBlendStateCreateFlags;
```

`VkPipelineColorBlendStateCreateFlags` is a bitmask type for setting a mask of zero or more `VkPipelineColorBlendStateCreateFlagBits`.

Bits which **can** be set in the `VkPipelineColorBlendStateCreateInfo::flags` parameter are:

```c
// Provided by VK_EXT_rasterization_order_attachment_access
typedef enum VkPipelineColorBlendStateCreateFlagBits {
    // Provided by VK_EXT_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT = 0x00000001,
    // Provided by VK_ARM_rasterization_order_attachment_access
    VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_ARM = VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT,
} VkPipelineColorBlendStateCreateFlagBits;
```

- **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** indicates that access to color and input attachments will have implicit framebuffer-local memory dependencies, allowing applications to express custom blending operations in a fragment shader.

When **VK_PIPELINE_COLOR_BLEND_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_BIT_EXT** is included in a pipeline, it forms a framebuffer-local memory dependency for each fragment generated by draw commands for that pipeline with the following scopes:
The first synchronization scope includes the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT pipeline stage executed by all previous fragments (as defined by primitive order) in the corresponding framebuffer regions including those generated by the same draw command.

The second synchronization scope includes the VK_PIPELINE_STAGE_FRAGMENT_SHADER_BIT pipeline stage executed by the generated fragment.

The first access scope includes all writes to color attachments.

The second access scope includes all reads from input attachments.

The VkPipelineColorBlendAttachmentState structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineColorBlendAttachmentState {

    VkBool32 blendEnable;
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
    VkColorComponentFlags colorWriteMask;
} VkPipelineColorBlendAttachmentState;
```

- **blendEnable** controls whether blending is enabled for the corresponding color attachment. If blending is not enabled, the source fragment’s color for that attachment is passed through unmodified.

- **srcColorBlendFactor** selects which blend factor is used to determine the source factors \((S, S_g, S_b)\).

- **dstColorBlendFactor** selects which blend factor is used to determine the destination factors \((D_r, D_g, D_b)\).

- **colorBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.

- **srcAlphaBlendFactor** selects which blend factor is used to determine the source factor \(S_a\).

- **dstAlphaBlendFactor** selects which blend factor is used to determine the destination factor \(D_a\).

- **alphaBlendOp** selects which blend operation is used to calculate the alpha values to write to the color attachment.

- **colorWriteMask** is a bitmask of VkColorComponentFlagBits specifying which of the R, G, B, and/or A components are enabled for writing, as described for the Color Write Mask.

**Valid Usage**

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-00608
  
  If the dualSrcBlend feature is not enabled, **srcColorBlendFactor** must not be
  VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA
If the dualSrcBlend feature is not enabled, dstColorBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

If the dualSrcBlend feature is not enabled, srcAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

If the dualSrcBlend feature is not enabled, dstAlphaBlendFactor must not be VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA.

If either of colorBlendOp or alphaBlendOp is an advanced blend operation, then colorBlendOp must equal alphaBlendOp.

If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and colorBlendOp is an advanced blend operation, then colorBlendOp must be the same for all attachments.

If VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendIndependentBlend is VK_FALSE and alphaBlendOp is an advanced blend operation, then alphaBlendOp must be the same for all attachments.

If colorBlendOp or alphaBlendOp is an advanced blend operation, then colorAttachmentCount of the subpass this pipeline is compiled against must be less than or equal to VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT::advancedBlendMaxColorAttachments.

If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is VK_FALSE, srcColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or 2781.
VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

- VUID-VkPipelineColorBlendAttachmentState-constantAlphaColorBlendFactors-04455
  If the VK_KHR_portability_subset extension is enabled, and
  VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors is
  VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or
  VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

Valid Usage (Implicit)

- VUID-VkPipelineColorBlendAttachmentState-srcColorBlendFactor-parameter
  srcColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-dstColorBlendFactor-parameter
  dstColorBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-colorBlendOp-parameter
  colorBlendOp must be a valid VkBlendOp value

- VUID-VkPipelineColorBlendAttachmentState-srcAlphaBlendFactor-parameter
  srcAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-dstAlphaBlendFactor-parameter
  dstAlphaBlendFactor must be a valid VkBlendFactor value

- VUID-VkPipelineColorBlendAttachmentState-alphaBlendOp-parameter
  alphaBlendOp must be a valid VkBlendOp value

- VUID-VkPipelineColorBlendAttachmentState-colorWriteMask-parameter
  colorWriteMask must be a valid combination of VkColorComponentColorBits values

To dynamically set blendEnable, call:

// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEnableEXT(
    VkCommandBuffer commandBuffer,        // Command buffer into which the command will be recorded.
    uint32_t firstAttachment,             // First color attachment the color blending enable applies.
    uint32_t attachmentCount,             // Number of color blending enables in the pColorBlendEnables array.
    const VkBool32* pColorBlendEnables);  // Array of booleans to indicate whether color blending is enabled for the corresponding attachment.

This command sets the color blending enable of the specified color attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT set in VkPipelineDynamicStateCreateInfo.
::pDynamicStates. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::blendEnable` values used to create the currently active pipeline.

## Valid Usage

- **VUID-vkCmdSetColorBlendEnableEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEnable` feature is enabled
  - The `shaderObject` feature is enabled

## Valid Usage (Implicit)

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetColorBlendEnableEXT-pColorBlendEnables-parameter**
  `pColorBlendEnables` **must** be a valid pointer to an array of `attachmentCount` `VkBool32` values

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the `recording` state

- **VUID-vkCmdSetColorBlendEnableEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdSetColorBlendEnableEXT-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdSetColorBlendEnableEXT-attachmentCount-arraylength**
  `attachmentCount` **must** be greater than 0

## Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>
To **dynamically set** color blend factors and operations, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorBlendEquationEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendEquationEXT* pColorBlendEquations);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color blend factors and operations apply to.
- `attachmentCount` the number of `VkColorBlendEquationEXT` elements in the `pColorBlendEquations` array.
- `pColorBlendEquations` an array of `VkColorBlendEquationEXT` structs that specify the color blend factors and operations for the corresponding attachments.

This command sets the color blending factors and operations of the specified attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::srcColorBlendFactor`, `VkPipelineColorBlendAttachmentState::dstColorBlendFactor`, `VkPipelineColorBlendAttachmentState::colorBlendOp`, `VkPipelineColorBlendAttachmentState::srcAlphaBlendFactor`, `VkPipelineColorBlendAttachmentState::dstAlphaBlendFactor`, and `VkPipelineColorBlendAttachmentState::alphaBlendOp` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetColorBlendEquationEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendEquation` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- **VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetColorBlendEquationEXT-pColorBlendEquations-parameter**
  `pColorBlendEquations` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendEquationEXT` structures

- **VUID-vkCmdSetColorBlendEquationEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the `recording state`
The VkCommandPool that commandBuffer was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

attachmentCount must be greater than 0.

Host Synchronization

- Host access to commandBuffer must be externally synchronized.
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

The VkColorBlendEquationEXT structure is defined as:

```c
typedef struct VkColorBlendEquationEXT {
    VkBlendFactor srcColorBlendFactor;
    VkBlendFactor dstColorBlendFactor;
    VkBlendOp colorBlendOp;
    VkBlendFactor srcAlphaBlendFactor;
    VkBlendFactor dstAlphaBlendFactor;
    VkBlendOp alphaBlendOp;
} VkColorBlendEquationEXT;
```

- `srcColorBlendFactor` selects which blend factor is used to determine the source factors $(S_r, S_g, S_b)$.
- `dstColorBlendFactor` selects which blend factor is used to determine the destination factors $(D_r, D_g, D_b)$.
- `colorBlendOp` selects which blend operation is used to calculate the RGB values to write to the color attachment.
- `srcAlphaBlendFactor` selects which blend factor is used to determine the source factor $S_a$.
- `dstAlphaBlendFactor` selects which blend factor is used to determine the destination factor $D_a$.
- `alphaBlendOp` selects which blend operation is used to calculate the alpha values to write to the attachment.
Valid Usage

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07357**
  If the dualSrcBlend feature is not enabled, \( \text{srcColorBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_SRC1_ALPHA} \), or \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA} \).

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07358**
  If the dualSrcBlend feature is not enabled, \( \text{dstColorBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_SRC1_ALPHA} \), or \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA} \).

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07359**
  If the dualSrcBlend feature is not enabled, \( \text{srcAlphaBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_SRC1_ALPHA} \), or \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA} \).

- **VUID-VkColorBlendEquationEXT-dualSrcBlend-07360**
  If the dualSrcBlend feature is not enabled, \( \text{dstAlphaBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR} \), \( \text{VK_BLEND_FACTOR_SRC1_ALPHA} \), or \( \text{VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA} \).

- **VUID-VkColorBlendEquationEXT-colorBlendOp-07361**
  \( \text{colorBlendOp} \) and \( \text{alphaBlendOp} \) must not be \( \text{VK_BLEND_OP_ZERO_EXT} \), \( \text{VK_BLEND_OP_SRC_EXT} \), \( \text{VK_BLEND_OP_DST_EXT} \), \( \text{VK_BLEND_OP_SRC_OVER_EXT} \), \( \text{VK_BLEND_OP_DST_OVER_EXT} \), \( \text{VK_BLEND_OP_SRC_IN_EXT} \), \( \text{VK_BLEND_OP_DST_IN_EXT} \), \( \text{VK_BLEND_OP_SRC_OUT_EXT} \), \( \text{VK_BLEND_OP_DST_OUT_EXT} \), \( \text{VK_BLEND_OP_SRC_ATOP_EXT} \), \( \text{VK_BLEND_OP_DST_ATOP_EXT} \), \( \text{VK_BLEND_OP_XOR_EXT} \), \( \text{VK_BLEND_OP_MULTIPLY_EXT} \), \( \text{VK_BLEND_OP_SCREEN_EXT} \), \( \text{VK_BLEND_OP_OVERLAY_EXT} \), \( \text{VK_BLEND_OP_DARKEN_EXT} \), \( \text{VK_BLEND_OP_LIGHTEN_EXT} \), \( \text{VK_BLEND_OP_COLORBURN_EXT} \), \( \text{VK_BLEND_OP_HARDLIGHT_EXT} \), \( \text{VK_BLEND_OP_COLORDOGE_EXT} \), \( \text{VK_BLEND_OP_HARDMIX_EXT} \), \( \text{VK_BLEND_OP_LINEARDODGE_EXT} \), \( \text{VK_BLEND_OP_LINEARLIGHT_EXT} \), \( \text{VK_BLEND_OP_VIVIDLIGHT_EXT} \), \( \text{VK_BLEND_OP_PINLIGHT_EXT} \), \( \text{VK_BLEND_OP_HSL_HUE_EXT} \), \( \text{VK_BLEND_OP_HSL_SATURATION_EXT} \), \( \text{VK_BLEND_OP_HSL_LUMINOSITY_EXT} \), \( \text{VK_BLEND_OP_PLUS_EXT} \), \( \text{VK_BLEND_OP_PLUS_CLAMPED_EXT} \), \( \text{VK_BLEND_OP_PLUS_DARKER_EXT} \), \( \text{VK_BLEND_OP_MINUS_EXT} \), \( \text{VK_BLEND_OP_MINUS_CLAMPED_EXT} \), \( \text{VK_BLEND_OP_CONTRAST_EXT} \), \( \text{VK_BLEND_OP_INVERT_OVG_EXT} \), \( \text{VK_BLEND_OP_RED_EXT} \), \( \text{VK_BLEND_OP_GREEN_EXT} \), or \( \text{VK_BLEND_OP_BLUE_EXT} \).

- **VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07362**
  If the VK_KHR_portability_subset extension is enabled, and \( \text{VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors} \) is \( \text{VK_FALSE} \), \( \text{srcColorBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_CONSTANT_ALPHA} \) or \( \text{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA} \).

- **VUID-VkColorBlendEquationEXT-constantAlphaColorBlendFactors-07363**
  If the VK_KHR_portability_subset extension is enabled, and \( \text{VkPhysicalDevicePortabilitySubsetFeaturesKHR::constantAlphaColorBlendFactors} \) is \( \text{VK_FALSE} \), \( \text{dstColorBlendFactor} \) must not be \( \text{VK_BLEND_FACTOR_CONSTANT_ALPHA} \) or \( \text{VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA} \).
VK_FALSE, dstColorBlendFactor must not be VK_BLEND_FACTOR_CONSTANT_ALPHA or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA

Valid Usage (Implicit)

- VUID-VkColorBlendEquationEXT-srcColorBlendFactor-parameter srcColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstColorBlendFactor-parameter dstColorBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-colorBlendOp-parameter colorBlendOp must be a valid VkBlendOp value
- VUID-VkColorBlendEquationEXT-srcAlphaBlendFactor-parameter srcAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-dstAlphaBlendFactor-parameter dstAlphaBlendFactor must be a valid VkBlendFactor value
- VUID-VkColorBlendEquationEXT-alphaBlendOp-parameter alphaBlendOp must be a valid VkBlendOp value

To **dynamically set** the color write masks, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetColorWriteMaskEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorComponentFlags* pColorWriteMasks);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` the first color attachment the color write masks apply to.
- `attachmentCount` the number of VkColorComponentFlags values in the `pColorWriteMasks` array.
- `pColorWriteMasks` an array of VkColorComponentFlags values that specify the color write masks of the corresponding attachments.

This command sets the color write masks of the specified attachments for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAttachmentState::colorWriteMask` values used to create the currently active pipeline.

**Note**

Formats with bits that are shared between components specified by `VkColorComponentFlagBits`, such as `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`, cannot
have their channels individually masked by this functionality; either all components that share bits have to be enabled, or none of them.

Valid Usage

- **VUID-vkCmdSetColorWriteMaskEXT-None-09423**
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorWriteMask` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetColorWriteMaskEXT-pColorWriteMasks-parameter**
  `pColorWriteMasks` **must** be a valid pointer to an array of `attachmentCount` valid combinations of `VkColorComponentFlagBits` values
- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording state**
- **VUID-vkCmdSetColorWriteMaskEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- **VUID-vkCmdSetColorWriteMaskEXT-videocoding**
  This command **must** only be called outside of a video coding scope
- **VUID-vkCmdSetColorWriteMaskEXT-attachmentCount-arraylength**
  `attachmentCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

30.1.1. Blend Factors

The source and destination color and alpha blending factors are selected from the enum:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBlendFactor {
    VK_BLEND_FACTOR_ZERO = 0,
    VK_BLEND_FACTOR_ONE = 1,
    VK_BLEND_FACTOR_SRC_COLOR = 2,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_COLOR = 3,
    VK_BLEND_FACTOR_DST_COLOR = 4,
    VK_BLEND_FACTOR_ONE_MINUS_DST_COLOR = 5,
    VK_BLEND_FACTOR_SRC_ALPHA = 6,
    VK_BLEND_FACTOR_ONE_MINUS_SRC_ALPHA = 7,
    VK_BLEND_FACTOR_DST_ALPHA = 8,
    VK_BLEND_FACTOR_ONE_MINUS_DST_ALPHA = 9,
    VK_BLEND_FACTOR_CONSTANT_COLOR = 10,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR = 11,
    VK_BLEND_FACTOR_CONSTANT_ALPHA = 12,
    VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA = 13,
    VK_BLEND_FACTOR_SRC_ALPHA_SATURATE = 14,
    VK_BLEND_FACTOR_SRC1_COLOR = 15,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR = 16,
    VK_BLEND_FACTOR_SRC1_ALPHA = 17,
    VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA = 18,
} VkBlendFactor;
```

The semantics of the enum values are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendFactor</th>
<th>RGB Blend Factors (S_r,S_g,S_b) or (D_r,D_g,D_b)</th>
<th>Alpha Blend Factor (S_a or D_a)</th>

</tr>
<tr>
<td>---------------------------------------------------</td>
<td>--------------------------------------------------</td>
<td>---------------------------------</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_COLOR</td>
<td>(R_c,G_c,B_c)</td>
<td>A_c</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR</td>
<td>(1-R_c,1-G_c,1-B_c)</td>
<td>1-A_c</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_CONSTANT_ALPHA</td>
<td>(A_c,A_c,A_c)</td>
<td>A_c</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA</td>
<td>(1-A_c,1-A_c,1-A_c)</td>
<td>1-A_c</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC_ALPHA_SATURATE</td>
<td>(f,f,f); f = min(A_s0,1-A_d)</td>
<td>1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_COLOR</td>
<td>(R_s1,G_s1,B_s1)</td>
<td>A_s1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR</td>
<td>(1-R_s1,1-G_s1,1-B_s1)</td>
<td>1-A_s1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_SRC1_ALPHA</td>
<td>(A_s1,A_s1,A_s1)</td>
<td>A_s1</td>
</tr>
<tr>
<td>VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA</td>
<td>(1-A_s1,1-A_s1,1-A_s1)</td>
<td>1-A_s1</td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \(R_{s0},G_{s0},B_{s0}\) and \(A_{s0}\) represent the first source color R, G, B, and A components, respectively, for the fragment output location corresponding to the color attachment being blended.
- \(R_{s1},G_{s1},B_{s1}\) and \(A_{s1}\) represent the second source color R, G, B, and A components, respectively, used in dual source blending modes, for the fragment output location corresponding to the color attachment being blended.
- \(R_d,G_d,B_d\) and \(A_d\) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \(R_c,G_c,B_c\) and \(A_c\) represent the blend constant R, G, B, and A components, respectively.

To dynamically set and change the blend constants, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetBlendConstants(
    VkCommandBuffer commandBuffer,
    const float blendConstants[4]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `blendConstants` is a pointer to an array of four values specifying the \(R_c, G_c, B_c\), and \(A_c\) components of the blend constant color used in blending, depending on the blend factor.

This command sets blend constants for subsequent drawing commands when drawing using shader objects, or the graphics pipeline is created with `VK_DYNAMIC_STATE_BLEND_CONSTANTS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::blendConstants` values used to create the currently active pipeline.
Valid Usage (Implicit)

- VUID-vkCmdSetBlendConstants-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetBlendConstants-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetBlendConstants-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetBlendConstants-videcoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

30.1.2. Dual-Source Blending

Blend factors that use the secondary color input \((R_{s1}, G_{s1}, B_{s1}, A_{s1})\) (VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA) may consume implementation resources that could otherwise be used for rendering to multiple color attachments. Therefore, the number of color attachments that can be used in a framebuffer may be lower when using dual-source blending.

Dual-source blending is only supported if the dualSrcBlend feature is enabled.

The maximum number of color attachments that can be used in a subpass when using dual-source blending functions is implementation-dependent and is reported as the maxFragmentDualSrcAttachments member of `VkPhysicalDeviceLimits`.

Color outputs can be bound to the first and second inputs of the blender using the Index decoration, as described in Fragment Output Interface. If the second color input to the blender is not written in the shader, or if no output is bound to the second input of a blender, the value of the second input is undefined.
30.1.3. Blend Operations

Once the source and destination blend factors have been selected, they along with the source and
destination components are passed to the blending operations. RGB and alpha components can use
different operations. Possible values of VkBlendOp, specifying the operations, are:

```c
typedef enum VkBlendOp {
    VK_BLEND_OP_ADD = 0,
    VK_BLEND_OP_SUBTRACT = 1,
    VK_BLEND_OP_REVERSE_SUBTRACT = 2,
    VK_BLEND_OP_MIN = 3,
    VK_BLEND_OP_MAX = 4,

    // Provided by VK_EXT_blend_operation_advanced
    VK_BLEND_OP_ZERO_EXT = 1000148000,
    VK_BLEND_OP_SRC_EXT = 1000148001,
    VK_BLEND_OP_DST_EXT = 1000148002,
    VK_BLEND_OP_SRC_OVER_EXT = 1000148003,
    VK_BLEND_OP_DST_OVER_EXT = 1000148004,
    VK_BLEND_OP_SRC_IN_EXT = 1000148005,
    VK_BLEND_OP_DST_IN_EXT = 1000148006,
    VK_BLEND_OP_SRC_ATOP_EXT = 1000148009,
    VK_BLEND_OP_DST_ATOP_EXT = 1000148010,
    VK_BLEND_OP_XOR_EXT = 1000148011,
    VK_BLEND_OP_MULTIPLY_EXT = 1000148012,
    VK_BLEND_OP_SCREEN_EXT = 1000148013,
    VK_BLEND_OP_OVERLAY_EXT = 1000148014,
    VK_BLEND_OP_DARKEN_EXT = 1000148015,
    VK_BLEND_OP_LIGHTEN_EXT = 1000148016,
    VK_BLEND_OP_COLORDODGE_EXT = 1000148017,
} VkBlendOp;
```
VK_BLEND_OP_COLORBURN_EXT = 1000148018,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HARDLIGHT_EXT = 1000148019,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_SOFTLIGHT_EXT = 1000148020,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_DIFFERENCE_EXT = 1000148021,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_EXCLUSION_EXT = 1000148022,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_EXT = 1000148023,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_RGB_EXT = 1000148024,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARDODGE_EXT = 1000148025,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARBURN_EXT = 1000148026,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_VIVIDLIGHT_EXT = 1000148027,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_LINEARLIGHT_EXT = 1000148028,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PINLIGHT_EXT = 1000148029,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_HUE_EXT = 1000148030,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_SATURATION_EXT = 1000148031,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_COLOR_EXT = 1000148032,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_HSL_LUMINOSITY_EXT = 1000148033,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_EXT = 1000148035,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_EXT = 1000148036,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_CLAMPED_ALPHA_EXT = 1000148037,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_PLUS_DARKER_EXT = 1000148038,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_EXT = 1000148039,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_MINUS_CLAMPED_EXT = 1000148040,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_CONTRAST_EXT = 1000148041,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_INVERT_OVG_EXT = 1000148042,
    // Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_RED_EXT = 1000148043,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_GREEN_EXT = 1000148044,
// Provided by VK_EXT_blend_operation_advanced
VK_BLEND_OP_BLUE_EXT = 1000148045,
} VkBlendOp;
The semantics of the basic blend operations are described in the table below:

<table>
<thead>
<tr>
<th>VkBlendOp</th>
<th>RGB Components</th>
<th>Alpha Component</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BLEND_OP_ADD</td>
<td>( R = R_s \times S_r + R_d \times D_r )</td>
<td>( A = A_s \times S_a + A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_s \times S_g + G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_s \times S_b + B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_SUBTRACT</td>
<td>( R = R_s \times S_r - R_d \times D_r )</td>
<td>( A = A_s \times S_a - A_d \times D_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_s \times S_g - G_d \times D_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_s \times S_b - B_d \times D_b )</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_REVERSE_SUBTRACT</td>
<td>( R = R_d \times D_r - R_s \times S_r )</td>
<td>( A = A_d \times D_a - A_s \times S_a )</td>
</tr>
<tr>
<td></td>
<td>( G = G_d \times D_g - G_s \times S_g )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = B_d \times D_b - B_s \times S_b )</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MIN</td>
<td>( R = \min(R_s, R_d) )</td>
<td>( A = \min(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \min(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \min(B_s, B_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>VK_BLEND_OP_MAX</td>
<td>( R = \max(R_s, R_d) )</td>
<td>( A = \max(A_s, A_d) )</td>
</tr>
<tr>
<td></td>
<td>( G = \max(G_s, G_d) )</td>
<td></td>
</tr>
<tr>
<td></td>
<td>( B = \max(B_s, B_d) )</td>
<td></td>
</tr>
</tbody>
</table>

In this table, the following conventions are used:

- \( R_s, G_s, B_s \) and \( A_s \) represent the first source color R, G, B, and A components, respectively.
- \( R_d, G_d, B_d \) and \( A_d \) represent the R, G, B, and A components of the destination color. That is, the color currently in the corresponding color attachment for this fragment/sample.
- \( S_r, S_g, S_b \) and \( S_a \) represent the source blend factor R, G, B, and A components, respectively.
- \( D_r, D_g, D_b \) and \( D_a \) represent the destination blend factor R, G, B, and A components, respectively.

The blending operation produces a new set of values R, G, B, and A, which are written to the framebuffer attachment. If blending is not enabled for this attachment, then R, G, B and A are assigned \( R_s, G_s, B_s \) and \( A_s \), respectively.

If the color attachment is fixed-point, the components of the source and destination values and blend factors are each clamped to \([0,1]\) or \([-1,1]\) respectively for an unsigned normalized or signed normalized color attachment prior to evaluating the blend operations. If the color attachment is floating-point, no clamping occurs.

If the numeric format of a framebuffer attachment uses sRGB encoding, the R, G, and B destination color values (after conversion from fixed-point to floating-point) are considered to be encoded for the sRGB color space and hence are linearized prior to their use in blending. Each R, G, and B component is converted from nonlinear to linear as described in the “sRGB EOTF” section of the Khronos Data Format Specification. If the format is not sRGB, no linearization is performed.

If the numeric format of a framebuffer attachment uses sRGB encoding, then the final R, G and B values are converted into the nonlinear sRGB representation before being written to the framebuffer attachment as described in the “sRGB EOTF\(^{-1}\)” section of the Khronos Data Format
If the numeric format of a framebuffer color attachment is not sRGB encoded then the resulting $c_s$ values for R, G and B are unmodified. The value of A is never sRGB encoded. That is, the alpha component is always stored in memory as linear.

If the framebuffer color attachment is \texttt{VK_ATTACHMENT_UNUSED}, no writes are performed through that attachment. Writes are not performed to framebuffer color attachments greater than or equal to the $\texttt{VkSubpassDescription::colorAttachmentCount}$ or $\texttt{VkSubpassDescription2::colorAttachmentCount}$ value.

### 30.1.4. Advanced Blend Operations

The \textit{advanced blend operations} are those listed in tables f/X/Y/Z Advanced Blend Operations, Hue-Saturation-Luminosity Advanced Blend Operations, and Additional RGB Blend Operations.

If the $\texttt{pNext}$ chain of $\texttt{VkPipelineColorBlendStateCreateInfo}$ includes a $\texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT}$ structure, then that structure includes parameters that affect advanced blend operations.

The $\texttt{VkPipelineColorBlendAdvancedStateCreateInfoEXT}$ structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPipelineColorBlendAdvancedStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
} VkPipelineColorBlendAdvancedStateCreateInfoEXT;
```

- $\texttt{sType}$ is a $\texttt{VkStructureType}$ value identifying this structure.
- $\texttt{pNext}$ is NULL or a pointer to a structure extending this structure.
- $\texttt{srcPremultiplied}$ specifies whether the source color of the blend operation is treated as premultiplied.
- $\texttt{dstPremultiplied}$ specifies whether the destination color of the blend operation is treated as premultiplied.
- $\texttt{blendOverlap}$ is a $\texttt{VkBlendOverlapEXT}$ value specifying how the source and destination sample’s coverage is correlated.

If this structure is not present, $\texttt{srcPremultiplied}$ and $\texttt{dstPremultiplied}$ are both considered to be $\texttt{VK_TRUE}$, and $\texttt{blendOverlap}$ is considered to be $\texttt{VK_BLEND_OVERLAP_UNCORRELATED_EXT}$.

### Valid Usage

- VUID-VkPipelineColorBlendAdvancedStateCreateInfoEXT-srcPremultiplied-01424

If the \textit{non-premultiplied source color} property is not supported, $\texttt{srcPremultiplied}$ must be
If the non-premultiplied destination color property is not supported, `dstPremultiplied` must be `VK_TRUE`.

If the correlated overlap property is not supported, `blendOverlap` must be `VK_BLEND_OVERLAP_UNCORRELATED_EXT`.

### Valid Usage (Implicit)

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_BLEND_ADVANCED_STATE_CREATE_INFO_EXT`.
- `blendOverlap` must be a valid `VkBlendOverlapEXT` value.

To dynamically set the advanced blend state, call:

```c
void vkCmdSetColorBlendAdvancedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstAttachment,
    uint32_t attachmentCount,
    const VkColorBlendAdvancedEXT* pColorBlendAdvanced);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstAttachment` is the first color attachment the advanced blend parameters apply to.
- `attachmentCount` is the number of `VkColorBlendAdvancedEXT` elements in the `pColorBlendAdvanced` array.
- `pColorBlendAdvanced` is an array of `VkColorBlendAdvancedEXT` structs that specify the advanced color blend parameters for the corresponding attachments.

This command sets the advanced blend operation parameters of the specified attachments for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied`, `VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied`, and `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap` values used to create the currently active pipeline.
Valid Usage

- VUID-vkCmdSetColorBlendAdvancedEXT-None-09423
  At least one of the following **must** be true:
  - The `extendedDynamicState3ColorBlendAdvanced` feature is enabled
  - The `shaderObject` feature is enabled

Valid Usage (Implicit)

- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetColorBlendAdvancedEXT-pColorBlendAdvanced-parameter
  `pColorBlendAdvanced` **must** be a valid pointer to an array of `attachmentCount` valid `VkColorBlendAdvancedEXT` structures
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-recording
  `commandBuffer` **must** be in the `recording state`
- VUID-vkCmdSetColorBlendAdvancedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetColorBlendAdvancedEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdSetColorBlendAdvancedEXT-attachmentCount-arraylength
  `attachmentCount` **must** be greater than 0

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

The `VkColorBlendAdvancedEXT` structure is defined as:
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object

typedef struct VkColorBlendAdvancedEXT {
    VkBlendOp advancedBlendOp;
    VkBool32 srcPremultiplied;
    VkBool32 dstPremultiplied;
    VkBlendOverlapEXT blendOverlap;
    VkBool32 clampResults;
} VkColorBlendAdvancedEXT;

- **advancedBlendOp** selects which blend operation is used to calculate the RGB values to write to the color attachment.
- **srcPremultiplied** specifies whether the source color of the blend operation is treated as premultiplied.
- **dstPremultiplied** specifies whether the destination color of the blend operation is treated as premultiplied.
- **blendOverlap** is a `VkBlendOverlapEXT` value specifying how the source and destination sample’s coverage is correlated.
- **clampResults** specifies the results must be clamped to the [0,1] range before writing to the attachment, which is useful when the attachment format is not normalized fixed-point.

### Valid Usage

- VUID-VkColorBlendAdvancedEXT-srcPremultiplied-07505
  If the non-premultiplied source color property is not supported, **srcPremultiplied** must be **VK_TRUE**

- VUID-VkColorBlendAdvancedEXT-dstPremultiplied-07506
  If the non-premultiplied destination color property is not supported, **dstPremultiplied** must be **VK_TRUE**

- VUID-VkColorBlendAdvancedEXT-blendOverlap-07507
  If the correlated overlap property is not supported, **blendOverlap** must be **VK_BLEND_OVERLAP_UNCORRELATED_EXT**

### Valid Usage (Implicit)

- VUID-VkColorBlendAdvancedEXT-advancedBlendOp-parameter
  **advancedBlendOp** must be a valid `VkBlendOp` value

- VUID-VkColorBlendAdvancedEXT-blendOverlap-parameter
  **blendOverlap** must be a valid `VkBlendOverlapEXT` value

When using one of the operations in table [f/X/Y/Z Advanced Blend Operations](#) or [Hue-Saturation-Luminosity Advanced Blend Operations](#), blending is performed according to the following equations:
where the function $f$ and terms $X$, $Y$, and $Z$ are specified in the table. The $R$, $G$, and $B$ components of the source color used for blending are derived according to $\text{srcPremultiplied}$. If $\text{srcPremultiplied}$ is set to $\text{VK_TRUE}$, the fragment color components are considered to have been premultiplied by the $A$ component prior to blending. The base source color $(R_s', G_s', B_s')$ is obtained by dividing through by the $A$ component:

$$
(R_s', G_s', B_s') = \begin{cases} 
(0, 0, 0) & A_s = 0 \\
\left(\frac{R_s}{A_s}, \frac{G_s}{A_s}, \frac{B_s}{A_s}\right) & \text{otherwise}
\end{cases}
$$

If $\text{srcPremultiplied}$ is $\text{VK_FALSE}$, the fragment color components are used as the base color:

$$(R_s', G_s', B_s') = (R_s, G_s, B_s)$$

The $R$, $G$, and $B$ components of the destination color used for blending are derived according to $\text{dstPremultiplied}$. If $\text{dstPremultiplied}$ is set to $\text{VK_TRUE}$, the destination components are considered to have been premultiplied by the $A$ component prior to blending. The base destination color $(R_d', G_d', B_d')$ is obtained by dividing through by the $A$ component:

$$
(R_d', G_d', B_d') = \begin{cases} 
(0, 0, 0) & A_d = 0 \\
\left(\frac{R_d}{A_d}, \frac{G_d}{A_d}, \frac{B_d}{A_d}\right) & \text{otherwise}
\end{cases}
$$

If $\text{dstPremultiplied}$ is $\text{VK_FALSE}$, the destination color components are used as the base color:

$$(R_d', G_d', B_d') = (R_d, G_d, B_d)$$

When blending using advanced blend operations, we expect that the $R$, $G$, and $B$ components of premultiplied source and destination color inputs be stored as the product of non-premultiplied $R$, $G$, and $B$ component values and the $A$ component of the color. If any $R$, $G$, or $B$ component of a premultiplied input color is non-zero and the $A$ component is zero, the color is considered ill-formed, and the corresponding component of the blend result is undefined.

All of the advanced blend operation formulas in this chapter compute the result as a premultiplied color. If $\text{dstPremultiplied}$ is $\text{VK_FALSE}$, that result color’s $R$, $G$, and $B$ components are divided by the $A$ component before being written to the framebuffer. If any $R$, $G$, or $B$ component of the color is non-zero and the $A$ component is zero, the result is considered ill-formed, and the corresponding component of the blend result is undefined. If all components are zero, that value is unchanged.

If the $A$ component of any input or result color is less than zero, the color is considered ill-formed, and all components of the blend result are undefined.

The weighting functions $p_0$, $p_1$, and $p_2$ are defined in table Advanced Blend Overlap Modes. In these
functions, the A components of the source and destination colors are taken to indicate the portion of
the pixel covered by the fragment (source) and the fragments previously accumulated in the
pixel (destination). The functions $p_0$, $p_1$, and $p_2$ approximate the relative portion of the pixel covered
by the intersection of the source and destination, covered only by the source, and covered only by
the destination, respectively.

Possible values of `VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap`, specifying the
blend overlap functions, are:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef enum VkBlendOverlapEXT {
    VK_BLEND_OVERLAP_UNCORRELATED_EXT = 0,
    VK_BLEND_OVERLAP_DISJOINT_EXT = 1,
    VK_BLEND_OVERLAP_CONJOINT_EXT = 2,
} VkBlendOverlapEXT;
```

- **VK_BLEND_OVERLAP_UNCORRELATED_EXT** specifies that there is no correlation between the source and
destination coverage.

- **VK_BLEND_OVERLAP_CONJOINT_EXT** specifies that the source and destination coverage are considered
to have maximal overlap.

- **VK_BLEND_OVERLAP_DISJOINT_EXT** specifies that the source and destination coverage are considered
to have minimal overlap.

When using one of the HSL blend operations in table Hue-Saturation-Luminosity Advanced Blend.
Operations as the blend operation, the RGB color components produced by the function \( f \) are effectively obtained by converting both the non-premultiplied source and destination colors to the HSL (hue, saturation, luminosity) color space, generating a new HSL color by selecting H, S, and L components from the source or destination according to the blend operation, and then converting the result back to RGB. In the equations below, a blended RGB color is produced according to the following pseudocode:

```cpp
float minv3(vec3 c) {
    return min(min(c.r, c.g), c.b);
}
float maxv3(vec3 c) {
    return max(max(c.r, c.g), c.b);
}
float lumv3(vec3 c) {
    return dot(c, vec3(0.30, 0.59, 0.11));
}
float satv3(vec3 c) {
    return maxv3(c) - minv3(c);
}

// If any color components are outside [0,1], adjust the color to
// get the components in range.
vec3 ClipColor(vec3 color) {
    float lum = lumv3(color);
    float mincol = minv3(color);
    float maxcol = maxv3(color);
    if (mincol < 0.0) {
        color = lum + ((color-lum)*lum) / (lum-mincol);
    }
    if (maxcol > 1.0) {
        color = lum + ((color-lum)*(1-lum)) / (maxcol-lum);
    }
    return color;
}

// Take the base RGB color <cbase> and override its luminosity
// with that of the RGB color <clum>.
vec3 SetLum(vec3 cbase, vec3 clum) {
    float lbase = lumv3(cbase);
    float llum = lumv3(clum);
    float ldiff = llum - lbase;
    vec3 color = cbase + vec3(ldiff);
    return ClipColor(color);
}

// Take the base RGB color <cbase> and override its saturation with
// that of the RGB color <csat>.  The override the luminosity of the
// result with that of the RGB color <clum>.
vec3 SetLumSat(vec3 cbase, vec3 csat, vec3 clum) {
}
```
float minbase = minv3(cbase);
float sbase = satv3(cbase);
float ssat = satv3(csat);
vec3 color;
if (sbase > 0) {
    // Equivalent (modulo rounding errors) to setting the
    // smallest (R,G,B) component to 0, the largest to <ssat>,
    // and interpolating the "middle" component based on its
    // original value relative to the smallest/largest.
    color = (cbase - minbase) * ssat / sbase;
} else {
    color = vec3(0.0);
}
return SetLum(color, clum);

</tbody>
</table>

### 30.2. Logical Operations

The application can enable a logical operation between the fragment’s color values and the existing value in the framebuffer attachment. This logical operation is applied prior to updating the framebuffer attachment. Logical operations are applied only for signed and unsigned integer and normalized integer framebuffers. Logical operations are not applied to floating-point or sRGB format color attachments.
Logical operations are controlled by the `logicOpEnable` and `logicOp` members of `VkPipelineColorBlendStateCreateInfo`. The `logicOpEnable` state can also be controlled by `vkCmdSetLogicOpEnableEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. The `logicOp` state can also be controlled by `vkCmdSetLogicOpEXT` if graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. If `logicOpEnable` is `VK_TRUE`, then a logical operation selected by `logicOp` is applied between each color attachment and the fragment's corresponding output value, and blending of all attachments is treated as if it were disabled. Any attachments using color formats for which logical operations are not supported simply pass through the color values unmodified. The logical operation is applied independently for each of the red, green, blue, and alpha components. The `logicOp` is selected from the following operations:

```c
// Provided by VK_VERSION_1_0
typedef enum VkLogicOp {
    VK_LOGIC_OP_CLEAR = 0,
    VK_LOGIC_OP_AND = 1,
    VK_LOGIC_OP_AND_REVERSE = 2,
    VK_LOGIC_OP_COPY = 3,
    VK_LOGIC_OP_AND_INVERTED = 4,
    VK_LOGIC_OP_NO_OP = 5,
    VK_LOGIC_OP_XOR = 6,
    VK_LOGIC_OP_OR = 7,
    VK_LOGIC_OP_NOR = 8,
    VK_LOGIC_OP_EQUIVALENT = 9,
    VK_LOGIC_OP_INVERT = 10,
    VK_LOGIC_OP_REVERSE = 11,
    VK_LOGIC_OP_COPY_INVERTED = 12,
    VK_LOGIC_OP_OR_INVERTED = 13,
    VK_LOGIC_OP_NAND = 14,
    VK_LOGIC_OP_SET = 15,
} VkLogicOp;
```
The logical operations supported by Vulkan are summarized in the following table in which

- $\neg$ is bitwise invert,
- $\&$ is bitwise and,
- $\lor$ is bitwise or,
- $\oplus$ is bitwise exclusive or,
- $s$ is the fragment’s $R_{s0}$, $G_{s0}$, $B_{s0}$ or $A_{s0}$ component value for the fragment output corresponding to the color attachment being updated, and
- $d$ is the color attachment’s $R$, $G$, $B$ or $A$ component value:

<table>
<thead>
<tr>

</tr>
<tr>
<td>VK_LOGIC_OP_SET</td>
<td>all 1s</td>
</tr>
</tbody>
</table>

The result of the logical operation is then written to the color attachment as controlled by the component write mask, described in Blend Operations.

To dynamically set whether logical operations are enabled, call:

```c
// Provided by VK_EXT_extended_dynamic_state3, VK_EXT_shader_object
void vkCmdSetLogicOpEnableEXT(
  VkCommandBuffer commandBuffer,
  VkBool32 logicOpEnable);
```
- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOpEnable` specifies whether logical operations are enabled.

This command sets whether logical operations are enabled for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOpEnable` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEnableEXT-None-09423
  At least one of the following must be true:
  - The `extendedDynamicState3LogicOpEnable` feature is enabled
  - The `shaderObject` feature is enabled
- VUID-vkCmdSetLogicOpEnableEXT-logicOp-07366
  If the `logicOp` feature is not enabled, `logicOpEnable` must be `VK_FALSE`

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetLogicOpEnableEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLogicOpEnableEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To **dynamically set** the logical operation to apply for blend state, call:

```c
// Provided by VK_EXT_extended_dynamic_state2, VK_EXT_shader_object
void vkCmdSetLogicOpEXT(
    VkCommandBuffer commandBuffer,
    VkLogicOp logicOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `logicOp` specifies the logical operation to apply for blend state.

This command sets the logical operation for blend state for subsequent drawing commands when drawing using **shader objects**, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_LOGIC_OP_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorBlendStateCreateInfo::logicOp` value used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetLogicOpEXT-None-09422
  At least one of the following **must** be true:
  - The `extendedDynamicState2LogicOp` feature is enabled
  - The `shaderObject` feature is enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetLogicOpEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetLogicOpEXT-logicOp-parameter
  `logicOp` **must** be a valid `VkLogicOp` value

- VUID-vkCmdSetLogicOpEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdSetLogicOpEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

30.3. Color Write Mask

Bits which **can** be set in `VkPipelineColorBlendAttachmentState::colorWriteMask`, determining whether the final color values R, G, B and A are written to the framebuffer attachment, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkColorComponentFlagBits {
    VK_COLOR_COMPONENT_R_BIT    = 0x00000001,
    VK_COLOR_COMPONENT_G_BIT    = 0x00000002,
    VK_COLOR_COMPONENT_B_BIT    = 0x00000004,
    VK_COLOR_COMPONENT_A_BIT    = 0x00000008,
} VkColorComponentFlagBits;
```

- **VK_COLOR_COMPONENT_R_BIT** specifies that the R value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_G_BIT** specifies that the G value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_B_BIT** specifies that the B value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.
- **VK_COLOR_COMPONENT_A_BIT** specifies that the A value is written to the color attachment for the appropriate sample. Otherwise, the value in memory is unmodified.

The color write mask operation is applied regardless of whether blending is enabled.

The color write mask operation is applied only if **Color Write Enable** is enabled for the respective attachment. Otherwise the color write mask is ignored and writes to all components of the
VkColorComponentFlags is a bitmask type for setting a mask of zero or more VkColorComponentFlagBits.

30.4. Color Write Enable

The VkPipelineColorWriteCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPipelineColorWriteCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t attachmentCount;
    const VkBool32* pColorWriteEnables;
} VkPipelineColorWriteCreateInfoEXT;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `attachmentCount` is the number of VkBool32 elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

When this structure is included in the `pNext` chain of VkPipelineColorBlendStateCreateInfo, it defines per-attachment color write state. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with `attachmentCount` equal to the `attachmentCount` member of VkPipelineColorBlendStateCreateInfo, and `pColorWriteEnables` pointing to an array of as many VK_TRUE values.

If the `colorWriteEnable` feature is not enabled on the device, all VkBool32 elements in the `pColorWriteEnables` array must be VK_TRUE.

Color Write Enable interacts with the Color Write Mask as follows:

- If `colorWriteEnable` is VK_TRUE, writes to the attachment are determined by the `colorWriteMask`.
- If `colorWriteEnable` is VK_FALSE, the `colorWriteMask` is ignored and writes to all components of the attachment are disabled. This is equivalent to specifying a `colorWriteMask` of 0.

Valid Usage

- VUID-VkPipelineColorWriteCreateInfoEXT-pAttachments-04801
  If the `colorWriteEnable` feature is not enabled, all elements of `pColorWriteEnables` must be
If the pipeline is being created with `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT`, `VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT`, or `VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT` dynamic states not set, `attachmentCount` must be equal to the `attachmentCount` member of the `VkPipelineColorBlendStateCreateInfo` structure specified during pipeline creation.

`attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

**Valid Usage (Implicit)**

- `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_COLOR_WRITE_CREATE_INFO_EXT`
- If `attachmentCount` is not 0, `pColorWriteEnables` must be a valid pointer to an array of `attachmentCount` `VkBool32` values.

To dynamically enable or disable writes to a color attachment, call:

```c
// Provided by VK_EXT_color_write_enable
void vkCmdSetColorWriteEnableEXT(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkBool32* pColorWriteEnables);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of `VkBool32` elements in `pColorWriteEnables`.
- `pColorWriteEnables` is a pointer to an array of per target attachment boolean values specifying whether color writes are enabled for the given attachment.

This command sets the color write enables for subsequent drawing commands when drawing using shader objects, or when the graphics pipeline is created with `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineColorWriteCreateInfoEXT::pColorWriteEnables` values used to create the currently active pipeline.

**Valid Usage**

- The `colorWriteEnable` feature must be enabled.
- `attachmentCount` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.
attachmentCount must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

Valid Usage (Implicit)

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetColorWriteEnableEXT-pColorWriteEnables-parameter pColorWriteEnables must be a valid pointer to an array of attachmentCount VkBool32 values

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-recording commandBuffer must be in the recording state

• VUID-vkCmdSetColorWriteEnableEXT-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdSetColorWriteEnableEXT-videocoding This command must only be called outside of a video coding scope

• VUID-vkCmdSetColorWriteEnableEXT-attachmentCount-arraylength attachmentCount must be greater than 0

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
</tbody>
</table>

30.5. Framebuffer Query Instructions

To query the tile properties from the attachments in framebuffer, call:

```
// Provided by VK_QCOM_tile_properties
VkResult vkGetFramebufferTilePropertiesQCOM(VkDevice device,  
```
VkFramebuffer framebuffer,
uint32_t* pPropertiesCount,
VkTilePropertiesQCOM* pProperties);

• **device** is a logical device associated with the framebuffer.
• **framebuffer** is a handle of the framebuffer to query.
• **pPropertiesCount** is a pointer to an integer related to the number of tile properties available or queried, as described below.
• **pProperties** is either NULL or a pointer to an array of VkTilePropertiesQCOM structures.

If **pProperties** is NULL, then the number of tile properties available is returned in **pPropertiesCount**. Otherwise, **pPropertiesCount must** point to a variable set by the user to the number of elements in the **pProperties** array, and on return the variable is overwritten with the number of properties actually written to **pProperties**. If **pPropertiesCount** is less than the number of tile properties available, at most **pPropertiesCount** structures will be written, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available properties were returned.

The number of tile properties available is determined by the number of merged subpasses, and each tile property is associated with a merged subpass. There will be at most as many properties as there are subpasses within the render pass. To obtain the tile properties for a given merged subpass, the **pProperties** array can be indexed using the postMergeIndex value provided in VkRenderPassSubpassFeedbackInfoEXT.

### Valid Usage (Implicit)

- **VUID-vkGetFramebufferTilePropertiesQCOM-device-parameter**
  device must be a valid VkDevice handle
- **VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parameter**
  framebuffer must be a valid VkFramebuffer handle
- **VUID-vkGetFramebufferTilePropertiesQCOM-pPropertiesCount-parameter**
  pPropertiesCount must be a valid pointer to a uint32_t value
- **VUID-vkGetFramebufferTilePropertiesQCOM-pProperties-parameter**
  If the value referenced by **pPropertiesCount** is not 0, and **pProperties** is not NULL, pProperties must be a valid pointer to an array of pPropertiesCount VkTilePropertiesQCOM structures
- **VUID-vkGetFramebufferTilePropertiesQCOM-framebuffer-parent**
  framebuffer must have been created, allocated, or retrieved from device

### Return Codes

**Success**
- **VK_SUCCESS**
- **VK_INCOMPLETE**
Chapter 31. Dispatching Commands

Dispatching commands (commands with Dispatch in the name) provoke work in a compute pipeline. Dispatching commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound compute pipeline. A compute pipeline must be bound to a command buffer before any dispatching commands are recorded in that command buffer.

To record a dispatch, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatch(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of \( \text{groupCountX} \times \text{groupCountY} \times \text{groupCountZ} \) local workgroups is assembled.

**Valid Usage**

- **VUID-vkCmdDispatch-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDispatch-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDispatch-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of
the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDispatch-None-08600
For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-None-08601
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-maintenance4-08602
If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatch-None-08114
Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08115
If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatch-None-08116
Descriptors in bound descriptor buffers, specified via
vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by the 
**VkPipeline** bound to the pipeline bind point used by this command and the bound 
**VkPipeline** was created with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmdDispatch-None-08604**
  Descriptors in bound descriptor buffers, specified via 
vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by any 
**VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this 
command

- **VUID-vkCmdDispatch-None-08117**
  If the descriptors used by the **VkPipeline** bound to the pipeline bind point were specified 
via vkCmdSetDescriptorBufferOffsetsEXT, the bound **VkPipeline** **must** have been created 
with **VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**

- **VUID-vkCmd Dispatch-None-08119**
  If a descriptor is dynamically used with a **VkPipeline** created with 
**VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDispatch-None-08605**
  If a descriptor is dynamically used with a **VkShaderEXT** created with a 
**VkDescriptorSetLayout** that was created with 
**VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT**, the descriptor memory **must** be resident

- **VUID-vkCmdDispatch-None-08606**
  If the **shaderObject** feature is not enabled, a valid pipeline **must** be bound to the pipeline 
bind point used by this command

- **VUID-vkCmdDispatch-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not 
have been any calls to dynamic state setting commands for any state not specified as 
dynamic in the **VkPipeline** object bound to the pipeline bind point used by this command, 
since that pipeline was bound

- **VUID-vkCmdDispatch-None-08609**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any 
**VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this 
command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler 
**must** not be used to sample from any **VkImage** with a **VkImageView** of the type 
**VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, **VK_IMAGE_VIEW_TYPE_1D_ARRAY**, 
**VK_IMAGE_VIEW_TYPE_2D_ARRAY** or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**, in any shader stage

- **VUID-vkCmdDispatch-None-08610**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any 
**VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this 
command accesses a **VkSampler** object that uses unnormalized coordinates, that sampler 
**must** not be used with any of the SPIR-V **OpImageSample* or OpImageSparseSample* 
instructions with **ImplicitLod**, **Dref** or **Proj** in their name, in any shader stage

- **VUID-vkCmdDispatch-None-08611**
  If the **VkPipeline** object bound to the pipeline bind point used by this command or any 
**VkShaderEXT** bound to a stage corresponding to the pipeline bind point used by this
command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage

- \textbf{VUID-vkCmdDispatch-None-08607}
  If the \texttt{shaderObject} is enabled, either a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command, or a valid combination of valid and \texttt{VK_NULL_HANDLE} shader objects \textbf{must} be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- \textbf{VUID-vkCmdDispatch-uniformBuffers-06935}
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdDispatch-None-08612}
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdDispatch-storageBuffers-06936}
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{storageBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdDispatch-None-08613}
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdDispatch-commandBuffer-02707}
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, any resource accessed by bound shaders \textbf{must} not be a protected resource

- \textbf{VUID-vkCmdDispatch-None-06550}
  If a bound shader accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables sampler YC₃a conversion, that object \textbf{must} only be used with \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions

- \textbf{VUID-vkCmdDispatch-ConstOffset-06551}
  If a bound shader accesses a \texttt{VkSampler} or \texttt{VkImageView} object that enables sampler YC₃a conversion, that object \textbf{must} not use the \texttt{ConstOffset} and \texttt{Offset} operands
If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` must match.

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.
• VUID-vkCmdDispatch-OpImageWeightedSampleQCOM-06971
If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

• VUID-vkCmdDispatch-OpImageWeightedSampleSampleQCOM-06972
If OpImageWeightedSampleSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBoxFilterQCOM-06973
If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindowSSDQCOM-06974
If OpImageBlockMatchWindowSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindowSADQCOM-06975
If OpImageBlockMatchWindowSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindowSSDQCOM-06976
If OpImageBlockMatchWindowSSDQCOM or OpImageBlockMatchWindowSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatch-OpImageBoxFilterQCOM-06973
If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindow-09215
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindow-09216
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatch-OpImageBlockMatchWindow-09216
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
must be a single-component format.

- VUID-vkCmdDispatch-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatch-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdDispatch-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDispatch-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDispatch-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

- VUID-vkCmdDispatch-groupCountX-00386
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdDispatch-groupCountY-00387
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdDispatch-groupCountZ-00388
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdDispatch-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDispatch-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDispatch-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdDispatch-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDispatch-videocoding
This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

To record an indirect dispatching command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDispatchIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `buffer` is the buffer containing dispatch parameters.
- `offset` is the byte offset into `buffer` where parameters begin.

`vkCmdDispatchIndirect` behaves similarly to `vkCmdDispatch` except that the parameters are read by the device from a buffer during execution. The parameters of the dispatch are encoded in a `VkDispatchIndirectCommand` structure taken from `buffer` starting at `offset`.

### Valid Usage

- **VUID-vkCmdDispatchIndirect-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchIndirect-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain...
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDispatchIndirect-None-06479
  If a \texttt{VkImageView} is sampled with depth comparison, the image view's format features must contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}

- VUID-vkCmdDispatchIndirect-None-02691
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- VUID-vkCmdDispatchIndirect-None-07888
  If a \texttt{VkDescriptorTypeSTORAGE_TEXEL_BUFFER} descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain \texttt{VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT}

- VUID-vkCmdDispatchIndirect-None-02692
  If a \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- VUID-vkCmdDispatchIndirect-filterCubic-02693
  If the \texttt{VK_EXT_filter_cubic} extension is not enabled and any \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, it must not have a \texttt{VkImageViewType} of \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}

- VUID-vkCmdDispatchIndirect-filterCubic-02694
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- VUID-vkCmdDispatchIndirect-filterCubicMinmax-02695
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} with a reduction mode of either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} as a result of this command must have a \texttt{VkImageViewType} and format that supports cubic filtering together with minmax filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- VUID-vkCmdDispatchIndirect-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must not have a \texttt{VkSamplerReductionModeCreateInfo::reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM}

- VUID-vkCmdDispatchIndirect-reductionMode-09213
  Any \texttt{VkImageView} being sampled with a \texttt{VkSamplerReductionModeCreateInfo::reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM} as a result of this command must sample with \texttt{VK_FILTER_CUBIC_EXT}

- VUID-vkCmdDispatchIndirect-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command must have
 VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

- **VUID-vkCmdDispatchIndirect-flags-02696**
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07027**
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07028**
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07029**
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchIndirect-OpTypeImage-07030**
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- **VUID-vkCmdDispatchIndirect-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchIndirect-None-08114**
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline
bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchIndirect-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchIndirect-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchIndirect-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchIndirect-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchIndirect-None-08119**
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident

- **VUID-vkCmdDispatchIndirect-None-08605**
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident

- **VUID-vkCmdDispatchIndirect-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatchIndirect-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatchIndirect-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDispatchIndirect-None-08610**
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchIndirect-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchIndirect-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-uniformBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchIndirect-None-08612**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` must not be a protected resource.
If a bound shader accesses a VkSampler or VkImageView object that enables Y’C’C’R conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

If a bound shader accesses a VkSampler or VkImageView object that enables Y’C’C’R conversion, that object must not use the ConstOffset and Offset operands

If a VkImageView is accessed as a result of this command, then the image view’s viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage must match

If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- VUID-vkCmdDispatchIndirect-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_IMAGE_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdDispatchIndirect-OpImageWeightedSampleQCOM-06977
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`. If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.
• VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's `format must` be a single-component format.

• VUID-vkCmdDispatchIndirect-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdDispatchIndirect-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdDispatchIndirect-buffer-02708
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

• VUID-vkCmdDispatchIndirect-buffer-02709
  `buffer must` have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

• VUID-vkCmdDispatchIndirect-offset-02710
  `offset must` be a multiple of 4.

• VUID-vkCmdDispatchIndirect-commandBuffer-02711
  `commandBuffer must` not be a protected command buffer.

• VUID-vkCmdDispatchIndirect-offset-00407
  The sum of `offset` and the size of `VkDispatchIndirectCommand` must be less than or equal to the size of `buffer`.

---

**Valid Usage (Implicit)**

• VUID-vkCmdDispatchIndirect-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle.

• VUID-vkCmdDispatchIndirect-buffer-parameter
  `buffer must` be a valid `VkBuffer` handle.

• VUID-vkCmdDispatchIndirect-commandBuffer-recording
  `commandBuffer must` be in the `recording state`.

• VUID-vkCmdDispatchIndirect-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations.

• VUID-vkCmdDispatchIndirect-renderpass
  This command must only be called outside of a render pass instance.

• VUID-vkCmdDispatchIndirect-videocoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdDispatchIndirect-commonparent
  
  Both of `buffer`, and `commandBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The `VkDispatchIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDispatchIndirectCommand {
    uint32_t x;
    uint32_t y;
    uint32_t z;
} VkDispatchIndirectCommand;
```

- `x` is the number of local workgroups to dispatch in the X dimension.
- `y` is the number of local workgroups to dispatch in the Y dimension.
- `z` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDispatchIndirectCommand` have the same meaning as the corresponding parameters of `vkCmdDispatch`.

### Valid Usage

- VUID-VkDispatchIndirectCommand-x-00417
  
  `x` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- VUID-VkDispatchIndirectCommand-y-00418
  
  `y` **must** be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- VUID-VkDispatchIndirectCommand-z-00419

2832
must be less than or equal to VkPhysicalDeviceLimits:maxComputeWorkGroupCount[2]

To record a dispatch using non-zero base values for the components of WorkgroupId, call:

```c
// Provided by VK_VERSION_1_1
void vkCmdDispatchBase(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

or the equivalent command

```c
// Provided by VK_KHR_device_group
void vkCmdDispatchBaseKHR(
    VkCommandBuffer commandBuffer,
    uint32_t baseGroupX,
    uint32_t baseGroupY,
    uint32_t baseGroupZ,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `baseGroupX` is the start value for the X component of WorkgroupId.
- `baseGroupY` is the start value for the Y component of WorkgroupId.
- `baseGroupZ` is the start value for the Z component of WorkgroupId.
- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of `groupCountX × groupCountY × groupCountZ` local workgroups is assembled, with WorkgroupId values ranging from \([baseGroup*, baseGroup* + groupCount*]) in each component. `vkCmdDispatch` is equivalent to `vkCmdDispatchBase(0,0,0,groupCountX,groupCountY,groupCountZ)`. 

**Valid Usage**

- VUID-vkCmdDispatchBase-magFilter-04553
  If a VkSampler created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a VkImageView as a result of this
command, then the image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDispatchBase-mipmapMode-04770**
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDispatchBase-None-06479**
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- **VUID-vkCmdDispatchBase-None-02691**
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- **VUID-vkCmdDispatchBase-None-07888**
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- **VUID-vkCmdDispatchBase-None-02692**
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- **VUID-vkCmdDispatchBase-filterCubic-02694**
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- **VUID-vkCmdDispatchBase-cubicRangeClamp-09212**
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

- **VUID-vkCmdDispatchBase-reductionMode-09213**

2834
Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo`::reductionMode equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM` as a result of this command **must** sample with `VK_FILTER_CUBIC_EXT`

- **VUID-vkCmdDispatchBase-selectableCubicWeights-09214**
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have `VkSamplerCubicWeightsCreateInfoQCOM`::cubicWeights equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`

- **VUID-vkCmdDispatchBase-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo`::flags containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDispatchBase-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDispatchBase-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the
VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchBase-None-08114**
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchBase-None-08115**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchBase-None-08116**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchBase-None-08604**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-None-08117**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline **must** have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchBase-None-08119**
  If a descriptor is dynamically used with a VkPipeline created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- **VUID-vkCmdDispatchBase-None-08605**
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- **VUID-vkCmdDispatchBase-None-08606**
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatchBase-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDispatchBase-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any
VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDispatchBase-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDispatchBase-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDispatchBase-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchBase-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchBase-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage
corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchBase-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by **bound shaders must** not be a protected resource

- **VUID-vkCmdDispatchBase-None-06550**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDispatchBase-ConstOffset-06551**
  If a **bound shader** accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object **must** not use the **ConstOffset** and **Offset** operands

- **VUID-vkCmdDispatchBase-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s **viewType** **must** match the **Dim** operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatchBase-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the **numeric type** of the image view’s **format** and the **Sampled Type** operand of the `OpTypeImage` **must** match

- **VUID-vkCmdDispatchBase-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDispatchBase-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have four components

- **VUID-vkCmdDispatchBase-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the **Type** of the **Texel** operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDispatchBase-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDispatchBase-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDispatchBase-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the `OpTypeImage` operand of that instruction
must have a Width of 64

- VUID-vkCmdDispatchBase-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchBase-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchBase-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
• VUID-vkCmdDispatchBase-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format must be a single-component format.

• VUID-vkCmdDispatchBase-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdDispatchBase-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdDispatchBase-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource.

• VUID-vkCmdDispatchBase-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource.

• VUID-vkCmdDispatchBase-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer.

• VUID-vkCmdDispatchBase-baseGroupX-00421
  baseGroupX must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0].

• VUID-vkCmdDispatchBase-baseGroupX-00422
  baseGroupY must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1].

• VUID-vkCmdDispatchBase-baseGroupX-00423
  baseGroupZ must be less than VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2].

• VUID-vkCmdDispatchBase-groupCountX-00424
  groupCountX must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] minus baseGroupX.
• VUID-vkCmdDispatchBase-groupCountY-00425
  groupCountY must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] minus baseGroupY

• VUID-vkCmdDispatchBase-groupCountZ-00426
  groupCountZ must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] minus baseGroupZ

• VUID-vkCmdDispatchBase-baseGroupX-00427
  If any of baseGroupX, baseGroupY, or baseGroupZ are not zero, then the bound compute pipeline must have been created with the VK_PIPELINE_CREATE_DISPATCH_BASE flag

Valid Usage (Implicit)

• VUID-vkCmdDispatchBase-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDispatchBase-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDispatchBase-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdDispatchBase-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdDispatchBase-vidoeencoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

A subpass shading dispatches a compute pipeline work with the work dimension of render area of the calling subpass and work groups are partitioned by specified work group size. Subpass operations like subpassLoad are allowed to be used.
To record a subpass shading, call:

```cpp
// Provided by VK_HUAWEI_subpass_shading
void vkCmdSubpassShadingHUAWEI(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which the command will be recorded.

When the command is executed, a global workgroup consisting of ceil (render area size / local workgroup size) local workgroups is assembled.

**Valid Usage**

- VUID-vkCmdSubpassShadingHUAWEI-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdSubpassShadingHUAWEI-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdSubpassShadingHUAWEI-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdSubpassShadingHUAWEI-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdSubpassShadingHUAWEI-None-07888
  If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- VUID-vkCmdSubpassShadingHUAWEI-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdSubpassShadingHUAWEI-None-02693
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- VUID-vkCmdSubpassShadingHUAWEI-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command...
must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdSubpassShadingHUAWEI-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdSubpassShadingHUAWEI-cubicRangeClamp-09212
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

- VUID-vkCmdSubpassShadingHUAWEI-reductionMode-09213
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- VUID-vkCmdSubpassShadingHUAWEI-selectableCubicWeights-09214
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- VUID-vkCmdSubpassShadingHUAWEI-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is Unknown, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is Unknown, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdSubpassShadingHUAWEI-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`. 
For each set \( n \) that is statically used by a bound shader, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for set \( n \), with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) array used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for push constants, with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) array used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility.

If the \( \text{maintenance4} \) feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for push constants, with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \) or the \( \text{VkDescriptorSetLayout} \) and \( \text{VkPushConstantRange} \) arrays used to create the current \( \text{VkShaderEXT} \), as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via \( \text{vkCmdBindDescriptorSets} \), must be valid as described by descriptor validity if they are statically used by the \( \text{VkPipeline} \) bound to the pipeline bind point used by this command and the bound \( \text{VkPipeline} \) was not created with \text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

If the descriptors used by the \( \text{VkPipeline} \) bound to the pipeline bind point were specified via \( \text{vkCmdBindDescriptorSets} \), the bound \( \text{VkPipeline} \) must have been created without \text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

Descriptors in bound descriptor buffers, specified via \( \text{vkCmdSetDescriptorBufferOffsetsEXT} \), must be valid if they are dynamically used by the \( \text{VkPipeline} \) bound to the pipeline bind point used by this command and the bound \( \text{VkPipeline} \) was created with \text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

Descriptors in bound descriptor buffers, specified via \( \text{vkCmdSetDescriptorBufferOffsetsEXT} \), must be valid if they are dynamically used by any \( \text{VkShaderEXT} \) bound to a stage corresponding to the pipeline bind point used by this command.

If the descriptors used by the \( \text{VkPipeline} \) bound to the pipeline bind point were specified via \( \text{vkCmdSetDescriptorBufferOffsetsEXT} \), the bound \( \text{VkPipeline} \) must have been created with \text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}.

If a descriptor is dynamically used with a \( \text{VkPipeline} \) created with \text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory must be resident.
If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorsetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource.

If a `VkSampler` or `VkImageView` object that enables `sampler Y′C_aC_b conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

If a `VkImageView` is accessed as a result of this command, then the `numeric type` of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

If a `VkImageView` is accessed as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.
If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdSubpassShadingHUAWEI-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`
• VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchSADQCOM-06976
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06977
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageWeightedSampleQCOM-06978
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

• VUID-vkCmdSubpassShadingHUAWEI-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdSubpassShadingHUAWEI-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdSubpassShadingHUAWEI-None-04931
  This command must be called in a subpass with bind point `VK_PIPELINE_BIND_POINT_SUBPASS_SHADING_HUAWEI`. No draw commands can be called in the same subpass. Only one `vkCmdSubpassShadingHUAWEI` command can be called in a subpass.
31.1. Dispatch Command for CUDA PTX Kernels

Compute kernels can be provided in SPIR-V or PTX code. When using PTX kernels the dispatch mechanism is different than with regular compute pipelines.

The way to create a PTX assembly file is beyond the scope of this documentation. For more information, please refer to the CUDA toolkit documentation at https://docs.nvidia.com/cuda/.

Prior to using this command, you must initialize a CUDA module, and create a function handle that will serve as the entry point of the kernel to dispatch. See CUDA Modules.

The dispatching of a CUDA kernel is recorded into a command buffer, and when executed by a queue submit, will produce work which executes according to the bound compute pipeline.

To record a CUDA kernel launch, call:
void vkCmdCudaLaunchKernel_NV(
    VkCommandBuffer commandBuffer,
    const VkCudaLaunchInfoNV* pLaunchInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pLaunchInfo` is a pointer to a `VkCudaLaunchInfoNV` structure in which the grid (similar to workgroup) dimension, function handle and related arguments are defined.

When the command is executed, a global workgroup consisting of \( \text{gridDimX} \times \text{gridDimY} \times \text{gridDimZ} \) local workgroups is assembled.

**Valid Usage (Implicit)**

- VUID-vkCmdCudaLaunchKernelNV-commandBuffer-parameter 
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdCudaLaunchKernelNV-pLaunchInfo-parameter 
  `pLaunchInfo` must be a valid pointer to a valid `VkCudaLaunchInfoNV` structure.
- VUID-vkCmdCudaLaunchKernelNV-commandBuffer-recording 
  `commandBuffer` must be in the recording state.
- VUID-vkCmdCudaLaunchKernelNV-commandBuffer-cmdpool 
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.
- VUID-vkCmdCudaLaunchKernelNV-videocoding 
  This command must only be called outside of a video coding scope.

**Host Synchronization**

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

**31.1.1. Passing Dispatch Parameters and Arguments**

The `VkCudaLaunchInfoNV` structure is very close to the parameters of the CUDA-Driver function.
The structure is defined as:

```c
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkCudaLaunchInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkCudaFunctionNV function;
    uint32_t gridDimX;
    uint32_t gridDimY;
    uint32_t gridDimZ;
    uint32_t blockDimX;
    uint32_t blockDimY;
    uint32_t blockDimZ;
    uint32_t sharedMemBytes;
    size_t paramCount;
    const void* const * pParams;
    size_t extraCount;
    const void* const * pExtras;
} VkCudaLaunchInfoNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **function** is the CUDA-Driver handle to the function being launched.
- **gridDimX** is the number of local workgroups to dispatch in the X dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`
- **gridDimY** is the number of local workgroups to dispatch in the Y dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`
- **gridDimZ** is the number of local workgroups to dispatch in the Z dimension. It must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`
- **blockDimX** is block size in the X dimension.
- **blockDimY** is block size in the Y dimension.
- **blockDimZ** is block size in the Z dimension.
- **sharedMemBytes** is the dynamic shared-memory size per thread block in bytes.
- **paramCount** is the length of the `pParams` table.
- **pParams** is a pointer to an array of `paramCount` pointers, corresponding to the arguments of `function`.
- **extraCount** is reserved for future use.
- **pExtras** is reserved for future use.

Kernel parameters of `function` are specified via `pParams`, very much the same way as described in `cuLaunchKernel`
If `function` has N parameters, then `pParams` must be an array of N pointers and `paramCount` must be set to N. Each of `kernelParams[0]` through `kernelParams[N-1]` must point to a region of memory from which the actual kernel parameter will be copied. The number of kernel parameters and their offsets and sizes are not specified here as that information is stored in the `VkCudaFunctionNV` object.

The application-owned memory pointed to by `pParams` and `kernelParams[0]` through `kernelParams[N-1]` are consumed immediately, and may be altered or freed after `vkCmdCudaLaunchKernelNV` has returned.

### Valid Usage

- **VUID-VkCudaLaunchInfoNV-gridDimX-09406**
  
  `gridDimX` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]`

- **VUID-VkCudaLaunchInfoNV-gridDimY-09407**
  
  `gridDimY` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]`

- **VUID-VkCudaLaunchInfoNV-gridDimZ-09408**
  
  `gridDimZ` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]`

- **VUID-VkCudaLaunchInfoNV-paramCount-09409**
  
  `paramCount` must be the total amount of parameters listed in the `pParams` table.

- **VUID-VkCudaLaunchInfoNV-pParams-09410**
  
  `pParams` must be a pointer to a table of `paramCount` parameters, corresponding to the arguments of `function`.

- **VUID-VkCudaLaunchInfoNV-extraCount-09411**
  
  `extraCount` must be 0

- **VUID-VkCudaLaunchInfoNV-pExtras-09412**
  
  `pExtras` must be NULL

### Valid Usage (Implicit)

- **VUID-VkCudaLaunchInfoNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV`

- **VUID-VkCudaLaunchInfoNV-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkCudaLaunchInfoNV-function-parameter**
  
  `function` must be a valid `VkCudaFunctionNV` handle

### 31.1.2. Resource Sharing from Vulkan to the CUDA Kernel

Given that one key limitation of this extension is that Vulkan cannot access, nor bind any global
resource of CUDA modules, the only way to exchange data with the kernel must be to pass resources via the arguments of the function.

You can use `VK_KHR_buffer_device_address` to write/read to/from a `VkBuffer` object. `VK_KHR_buffer_device_address` allows you to get the device address of the buffer to pass it as an argument into `pParams`. Application-side pointer arithmetic on the device address is legal, but will not be bounds-checked on the device.

The corresponding argument of the CUDA function should be declared as a pointer of the same type as the referenced buffer. CUDA code may simply read or write to this buffer in the typical C way.

You may also use `VK_NVX_image_view_handle` as another convenient way to read/write from/to a `VkImage`.

The corresponding argument of the CUDA function must be typed as `cudaSurfaceObject_t`.

- You may read from it by using CUDA surface-read functions such as `surf3Dread`, `surf2Dread`, and `surf1Dread`
- You may write to it by using CUDA surface-write functions such as `surf3Dwrite`, `surf2Dwrite`, and `surf1Dwrite`

Please refer to CUDA surface object documentation for more details.

On Vulkan side, here is an example on how to setup `VkImageViewHandleInfoNVX` to query the handle for `cudaSurfaceObject_t`:

```cpp
VkImageViewHandleInfoNVX imageViewHandleInfo = 
{VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX};
imageViewHandleInfo.sampler = VK_NULL_HANDLE;
imageViewHandleInfo.descriptorType = VK_DESCRIPTOR_TYPE_STORAGE_IMAGE;
imageViewHandleInfo.imageView = imageViewIn; // the VkImageView we want to access
uint32_t myViewHandleIn = vkGetImageViewHandleNVX(m_device, &imageViewHandleInfo);
imageViewHandleInfo.imageView = imageViewOut; // the VkImageView we want to access
uint32_t myViewHandleOut = vkGetImageViewHandleNVX(m_device, &imageViewHandleInfo);
```

Here is an example of how to declare parameters for `pParams`:

```cpp
VkCudaLaunchInfoNV launchInfo = { VK_STRUCTURE_TYPE_CUDA_LAUNCH_INFO_NV };

int block_size = 8;
float dt = 1.0f / 60.0f;

const void* params[] =
{
    &dt,
    &uint32_t myViewHandleIn,
    &uint32_t myViewHandleOut
};
```
launchInfo.function = cudaFunction;  // CUDA function previously created
launchInfo.gridDimX = (volumeTexDimensionNonBoundary / block_size);
launchInfo.gridDimY = (volumeTexDimensionNonBoundary / block_size);
launchInfo.gridDimZ = (volumeTexDimensionNonBoundary / block_size);
launchInfo.blockDimX = block_size;
launchInfo.blockDimY = block_size;
launchInfo.blockDimZ = block_size;
launchInfo.sharedMemBytes = 0;
launchInfo.paramCount = 3;
launchInfo.pParams = &params[0];
launchInfo.extraCount = 0;
launchInfo.pExtras = nullptr;

vkCmdCudaLaunchKernelNV(commandBuffer, &launchInfo);

In the CUDA kernel source code, here is an example on how arguments match pParams and how we can use Surface object:

```c
extern "C" __global__ void cudaFunction(  
    float dt,  
    cudaSurfaceObject_t volumeTexIn,  
    cudaSurfaceObject_t volumeTexOut  
)  
{
    int i = 1 + blockIdx.x * blockDim.x + threadIdx.x;
    int j = 1 + blockIdx.y * blockDim.y + threadIdx.y;
    int k = 1 + blockIdx.z * blockDim.z + threadIdx.z;

    float val;  
surf3Dread(&val, volumeTexIn, i * sizeof(float), j, k);
    ...

    float result = ...;
    // write result
    surf3Dwrite(result, volumeTexOut, i * sizeof(float), j, k);
}
```
Chapter 32. Device-Generated Commands

This chapter discusses the generation of command buffer content on the device, for which these principle steps are to be taken:

- Define via `VkIndirectCommandsLayoutNV` the sequence of commands which should be generated.
- Optionally make use of device-bindable Shader Groups for graphics pipelines.
- Retrieve device addresses by `vkGetBufferDeviceAddressEXT` for setting buffers on the device.
- Retrieve device addresses of compute pipelines by `vkGetPipelineIndirectDeviceAddressNV` to be able to bind it in device generated rendering.
- Fill one or more `VkBuffer` with the appropriate content that gets interpreted by `VkIndirectCommandsLayoutNV`.
- Create a preprocess `VkBuffer` using the allocation information from `vkGetGeneratedCommandsMemoryRequirementsNV`.
- Optionally preprocess the input data using `vkCmdPreprocessGeneratedCommandsNV` in a separate action.
- Generate and execute the actual commands via `vkCmdExecuteGeneratedCommandsNV` passing all required data.

`vkCmdPreprocessGeneratedCommandsNV` executes in a separate logical pipeline from either graphics or compute. When preprocessing commands in a separate step they **must** be explicitly synchronized against the command execution. When not preprocessing, the preprocessing is automatically synchronized against the command execution.

### 32.1. Indirect Commands Layout

The device-side command generation happens through an iterative processing of an atomic sequence comprised of command tokens, which are represented by:

```
// Provided by VK_NV_device_generated_commands
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkIndirectCommandsLayoutNV)
```

Each indirect command layout **must** have exactly one action command token and it **must** be the last token in the sequence.

#### 32.1.1. Creation and Deletion

Indirect command layouts are created by:

```
// Provided by VK_NV_device_generated_commands
VkResult vkCreateIndirectCommandsLayoutNV(VkDevice device, const VkIndirectCommandsLayoutCreateInfoNV* pCreateInfo, const VkAllocationCallbacks* pAllocator)
```
device is the logical device that creates the indirect command layout.

- pCreateInfo is a pointer to a VkIndirectCommandsLayoutCreateInfoNV structure containing parameters affecting creation of the indirect command layout.

- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

- pIndirectCommandsLayout is a pointer to a VkIndirectCommandsLayoutNV handle in which the resulting indirect command layout is returned.

Valid Usage

- VUID-vkCreateIndirectCommandsLayoutNV-deviceGeneratedCommands-02929
  The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateIndirectCommandsLayoutNV-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateIndirectCommandsLayoutNV-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkIndirectCommandsLayoutCreateInfoNV structure

- VUID-vkCreateIndirectCommandsLayoutNV-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateIndirectCommandsLayoutNV-pIndirectCommandsLayout-parameter
  pIndirectCommandsLayout must be a valid pointer to a VkIndirectCommandsLayoutNV handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkIndirectCommandsLayoutCreateInfoNV structure is defined as:

```cpp
// Provided by VK_NV_device_generated_commands
```
typedef struct VkIndirectCommandsLayoutCreateInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkIndirectCommandsLayoutUsageFlagsNV flags;
  VkPipelineBindPoint pipelineBindPoint;
  uint32_t tokenCount;
  const VkIndirectCommandsLayoutTokenNV* pTokens;
  uint32_t streamCount;
  const uint32_t* pStreamStrides;
} VkIndirectCommandsLayoutCreateInfoNV;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` that this layout targets.
- `flags` is a bitmask of `VkIndirectCommandsLayoutUsageFlagBitsNV` specifying usage hints of this layout.
- `tokenCount` is the length of the individual command sequence.
- `pTokens` is an array describing each command token in detail. See `VkIndirectCommandsTokenTypeNV` and `VkIndirectCommandsLayoutTokenNV` below for details.
- `streamCount` is the number of streams used to provide the token inputs.
- `pStreamStrides` is an array defining the byte stride for each input stream.

The following code illustrates some of the flags:

```c
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sequencesCount, indexbuffer, indexbufferOffset)
{
  for (s = 0; s < sequencesCount; s++)
  {
    sUsed = s;

    if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV) {
      sUsed = indexbuffer.load_uint32( sUsed * sizeof(uint32_t) + indexbufferOffset);
    }

    if (indirectCommandsLayout.flags & VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV) {
      sUsed = incoherent_implementation_dependent_permutation[ sUsed ];
    }

    cmdProcessSequence( cmd, pipeline, indirectCommandsLayout, pIndirectCommandsTokens, sUsed );
  }
}
```
When tokens are consumed, an offset is computed based on token offset and stream stride. The resulting offset is required to be aligned. The alignment for a specific token is equal to the scalar alignment of the data type as defined in Alignment Requirements, or VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment, whichever is lower.

**Note**
A minIndirectCommandsBufferOffsetAlignment of 4 allows VkDeviceAddress to be packed as uvec2 with scalar layout instead of uint64_t with 8 byte alignment. This enables direct compatibility with D3D12 command signature layouts.

### Valid Usage

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-02930**
  The pipelineBindPoint must be VK_PIPELINE_BIND_POINT_GRAPHICS or VK_PIPELINE_BIND_POINT_COMPUTE

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-02931**
  tokenCount must be greater than 0 and less than or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenCount

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02932**
  If pTokens contains an entry of VK间接命令令牌类型SHADER_GROUP_NV it must be the first element of the array and there must be only a single element of such token type

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-09585**
  If pTokens contains an entry of VK间接命令令牌类型PIPELINE_NV it must be the first element of the array and there must be only a single element of such token type

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02933**
  If pTokens contains an entry of VK间接命令令牌类型STATE_FLAGS_NV there must be only a single element of such token type

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02934**
  All state tokens in pTokens must occur before any action command tokens (VK间接命令令牌类型DRAW_NV, VK间接命令令牌类型DRAW_INDEXED_NV, VK间接命令令牌类型DRAW_TASKS_NV, VK间接命令令牌类型DRAW_MESH_TASKS_NV, VK间接命令令牌类型DISPATCH_NV)

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-02935**
  The content of pTokens must include one single action command token that is compatible with the pipelineBindPoint

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-02936**
  streamCount must be greater than 0 and less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamCount

- **VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-02937**
  each element of pStreamStrides must be greater than 0 and less than or equal to
VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsStreamStride. Furthermore the alignment of each token input must be ensured

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09088
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE then the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute feature must be enabled

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09089
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE then the state tokens in pTokens must only include VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV, VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV, or VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-09090
  If pipelineBindPoint is VK_PIPELINE_BIND_POINT_COMPUTE and pTokens includes VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV, then the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines feature must be enabled

Valid Usage (Implicit)

- VUID-VkIndirectCommandsLayoutCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_CREATE_INFO_NV

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pNext-pNext
  pNext must be NULL

- VUID-VkIndirectCommandsLayoutCreateInfoNV-flags-parameter
  flags must be a valid combination of VkIndirectCommandsLayoutUsageFlagBitsNV values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pTokens-parameter
  pTokens must be a valid pointer to an array of tokenCount valid VkIndirectCommandsLayoutTokenNV structures

- VUID-VkIndirectCommandsLayoutCreateInfoNV-pStreamStrides-parameter
  pStreamStrides must be a valid pointer to an array of streamCount uint32_t values

- VUID-VkIndirectCommandsLayoutCreateInfoNV-tokenCount-arraylength
  tokenCount must be greater than 0

- VUID-VkIndirectCommandsLayoutCreateInfoNV-streamCount-arraylength
  streamCount must be greater than 0

Bits which can be set in VkIndirectCommandsLayoutCreateInfoNV::flags, specifying usage hints of an indirect command layout, are:

// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsLayoutUsageFlagBitsNV {
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV = 0x00000001,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV = 0x00000002,
    VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV = 0x00000004,
} VkIndirectCommandsLayoutUsageFlagBitsNV;

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV** specifies that the layout is always used with the manual preprocessing step through calling `vkCmdPreprocessGeneratedCommandsNV` and executed by `vkCmdExecuteGeneratedCommandsNV` with `isPreprocessed` set to `VK_TRUE`.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV** specifies that the input data for the sequences is not implicitly indexed from 0..sequencesUsed but a user provided `VkBuffer` encoding the index is provided.

- **VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV** specifies that the processing of sequences can happen at an implementation-dependent order, which is not guaranteed to be coherent using the same input data. This flag is ignored when the `pipelineBindPoint` is `VK_PIPELINE_BIND_POINT_COMPUTE` as it is implied that the dispatch sequence is always unordered.

typedef VkFlags VkIndirectCommandsLayoutUsageFlagsNV;

VkIndirectCommandsLayoutUsageFlagsNV is a bitmask type for setting a mask of zero or more `VkIndirectCommandsLayoutUsageFlagBitsNV`.

Indirect command layouts are destroyed by:

```c
void vkDestroyIndirectCommandsLayoutNV(
    VkDevice device, 
    VkIndirectCommandsLayoutNV indirectCommandsLayout, 
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the layout.
- **indirectCommandsLayout** is the layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02938**
  All submitted commands that refer to `indirectCommandsLayout` must have completed execution

- **VUID-vkDestroyIndirectCommandsLayoutNV-indirectCommandsLayout-02939**
  If `VkAllocationCallbacks` were provided when `indirectCommandsLayout` was created, a compatible set of callbacks must be provided here
If no \texttt{VkAllocationCallbacks} were provided when \textit{indirectCommandsLayout} was created, \texttt{pAllocator} must be NULL.

The \texttt{VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands} feature must be enabled.

**Valid Usage (Implicit)**

- \texttt{VkAllocationCallbacks} must be provided when \textit{indirectCommandsLayout} was created.
- If \textit{indirectCommandsLayout} is not \texttt{VK_NULL_HANDLE}, \textit{indirectCommandsLayout} must be a valid \texttt{VkIndirectCommandsLayoutNV} handle.
- \texttt{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure.
- If \textit{indirectCommandsLayout} is a valid handle, it must have been created, allocated, or retrieved from \texttt{device}.

**Host Synchronization**

- Host access to \textit{indirectCommandsLayout} must be externally synchronized.

### 32.1.2. Token Input Streams

The \texttt{VkIndirectCommandsStreamNV} structure specifies the input data for one or more tokens at processing time.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsStreamNV {
    VkBuffer buffer;
    VkDeviceSize offset;
} VkIndirectCommandsStreamNV;
```

- \texttt{buffer} specifies the \texttt{VkBuffer} storing the functional arguments for each sequence. These arguments can be written by the device.
- \texttt{offset} specifies an offset into \texttt{buffer} where the arguments start.
Valid Usage

- VUID-VkIndirectCommandsStreamNV-buffer-02942
  The buffer’s usage flag **must** have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- VUID-VkIndirectCommandsStreamNV-offset-02943
  The offset **must** be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`

- VUID-VkIndirectCommandsStreamNV-buffer-02975
  If buffer is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

Valid Usage (Implicit)

- VUID-VkIndirectCommandsStreamNV-buffer-parameter
  buffer **must** be a valid `VkBuffer` handle

The input streams **can** contain raw `uint32_t` values, existing indirect commands such as:

- `VkDrawIndirectCommand`
- `VkDrawIndexedIndirectCommand`
- `VkDrawMeshTasksIndirectCommandNV`
- `VkDrawMeshTasksIndirectCommandEXT`
- `VkDispatchIndirectCommand`

or additional commands as listed below. How the data is used is described in the next section.

The `VkBindShaderGroupIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindShaderGroupIndirectCommandNV {
    uint32_t groupIndex;
} VkBindShaderGroupIndirectCommandNV;
```

- `groupIndex` specifies which shader group of the current bound graphics pipeline is used.

Valid Usage

- VUID-VkBindShaderGroupIndirectCommandNV-None-02944
  The current bound graphics pipeline, as well as the pipelines it may reference, **must** have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

- VUID-VkBindShaderGroupIndirectCommandNV-index-02945
The index must be within range of the accessible shader groups of the current bound graphics pipeline. See `vkCmdBindPipelineShaderGroupNV` for further details.

The `VkBindIndexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindIndexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
    VkIndexType indexType;
} VkBindIndexBufferIndirectCommandNV;
```

- `bufferAddress` specifies a physical address of the `VkBuffer` used as index buffer.
- `size` is the byte size range which is available for this operation from the provided address.
- `indexType` is a `VkIndexType` value specifying how indices are treated. Instead of the Vulkan enum values, a custom `uint32_t` value can be mapped to an `VkIndexType` by specifying the `VkIndirectCommandsLayoutTokenNV::pIndexTypes` and `VkIndirectCommandsLayoutTokenNV::pIndexTypeValues` arrays.

### Valid Usage

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02946**
  The buffer's usage flag from which the address was acquired must have the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` bit set.

- **VUID-VkBindIndexBufferIndirectCommandNV-bufferAddress-02947**
  The `bufferAddress` must be aligned to the `indexType` used.

- **VUID-VkBindIndexBufferIndirectCommandNV-None-02948**
  Each element of the buffer from which the address was acquired and that is non-sparse must be bound completely and contiguously to a single `VkDeviceMemory` object.

### Valid Usage (Implicit)

- **VUID-VkBindIndexBufferIndirectCommandNV-indexType-parameter**
  `indexType` must be a valid `VkIndexType` value.

The `VkBindVertexBufferIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV` token.

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkBindVertexBufferIndirectCommandNV {
    VkDeviceAddress bufferAddress;
    uint32_t size;
} VkBindVertexBufferIndirectCommandNV;
```
uint32_t stride;
} VkBindVertexBufferIndirectCommandNV;

- `bufferAddress` specifies a physical address of the `VkBuffer` used as vertex input binding.
- `size` is the byte size range which is available for this operation from the provided address.
- `stride` is the byte size stride for this vertex input binding as in `VkVertexInputBindingDescription::stride`. It is only used if `VkIndirectCommandsLayoutTokenNV::vertexDynamicStride` was set, otherwise the stride is inherited from the current bound graphics pipeline.

### Valid Usage

- **VUID-VkBindVertexBufferIndirectCommandNV-None-02949**
  The buffer's usage flag from which the address was acquired **must** have the `VK_BUFFER_USAGE_VERTEX_BUFFER_BIT` bit set.

- **VUID-VkBindVertexBufferIndirectCommandNV-None-02950**
  Each element of the buffer from which the address was acquired and that is non-sparse **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

The `VkSetStateFlagsIndirectCommandNV` structure specifies the input data for the `VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV` token. Which state is changed depends on the `VkIndirectStateFlagBitsNV` specified at `VkIndirectCommandsLayoutNV` creation time.

```c
// Provided byVK_NV_device_generated_commands
typedef struct VkSetStateFlagsIndirectCommandNV {
    uint32_t data;
} VkSetStateFlagsIndirectCommandNV;
```

- `data` encodes packed state that this command alters.
  - Bit 0: If set represents `VK_FRONT_FACE_CLOCKWISE`, otherwise `VK_FRONT_FACE_COUNTER_CLOCKWISE`

A subset of the graphics pipeline state **can** be altered using indirect state flags:

```c
// Provided byVK_NV_device_generated_commands
typedef enum VkIndirectStateFlagBitsNV {
    VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV = 0x00000001,
} VkIndirectStateFlagBitsNV;
```

- `VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV` allows to toggle the `VkFrontFace` rasterization state for subsequent drawing commands.

```c
// Provided byVK_NV_device_generated_commands
typedef VkFlags VkIndirectStateFlagsNV;
```
VkIndirectStateFlagsNV is a bitmask type for setting a mask of zero or more
VkIndirectStateFlagBitsNV.

The VkBindPipelineIndirectCommandNV structure specifies the input data for
the VK INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token.

```c
typedef struct VkBindPipelineIndirectCommandNV {
    VkDeviceAddress pipelineAddress;
} VkBindPipelineIndirectCommandNV;
```

- `pipelineAddress` specifies the pipeline address of the compute pipeline that
  will be used in device generated rendering.

**Valid Usage**

- VUID-VkBindPipelineIndirectCommandNV-deviceGeneratedComputePipelines-09091
  The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::
deviceGeneratedComputePipelines feature must be enabled

- VUID-VkBindPipelineIndirectCommandNV-None-09092
  The referenced pipeline must have been created with
  VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV

- VUID-VkBindPipelineIndirectCommandNV-None-09093
  The referenced pipeline must have been updated with
  vkCmdUpdatePipelineIndirectBufferNV

- VUID-VkBindPipelineIndirectCommandNV-None-09094
  The referenced pipeline’s address must have been queried with
  vkGetPipelineIndirectDeviceAddressNV

### 32.1.3. Tokenized Command Processing

The processing is in principle illustrated below:

```c
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        uint32_t stream = indirectCommandsLayout.pTokens[t].stream;
        uint32_t offset = indirectCommandsLayout.pTokens[t].offset;
        uint32_t stride = indirectCommandsLayout.pStreamStrides[stream];
        stream = pIndirectCommandsStreams[stream];
        const void* input = stream.buffer.pointer( stream.offset + stride * s + offset )

// further details later
```
void cmdProcessAllSequences(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, sequencesCount)
{
    for (s = 0; s < sequencesCount; s++)
    {
        cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s);
    }
}

The processing of each sequence is considered stateless, therefore all state changes must occur before any action command tokens within the sequence. A single sequence is strictly targeting the VkPipelineBindPoint it was created with.

The primary input data for each token is provided through VkBuffer content at preprocessing using vkCmdPreprocessGeneratedCommandsNV or execution time using vkCmdExecuteGeneratedCommandsNV, however some functional arguments, for example binding sets, are specified at layout creation time. The input size is different for each token.

Possible values of those elements of the VkIndirectCommandsLayoutCreateInfoNV::pTokens array specifying command tokens (other elements of the array specify command parameters) are:

```c
// Provided by VK_NV_device_generated_commands
typedef enum VkIndirectCommandsTokenTypeNV {
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV = 0,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV = 1,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV = 2,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV = 3,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV = 4,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV = 5,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV = 6,
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV = 7,
    // Provided by VK_EXT_mesh_shader with VK_NV_device_generated_commands
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV = 1000328000,
    // Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV = 1000428003,
    // Provided by VK_NV_device_generated_commands_compute
    VK_INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV = 1000428004,
} VkIndirectCommandsTokenTypeNV;
```

Table 46. Supported indirect command tokens

<table>

The `VkIndirectCommandsLayoutTokenNV` structure specifies details to the function arguments that need to be known at layout creation time:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkIndirectCommandsLayoutTokenNV {
    VkStructureType            sType;
    const void*                pNext;
    VkIndirectCommandsTokenTypeNV tokenType;
    uint32_t                    stream;
    uint32_t                    offset;
    uint32_t                    vertexBindingUnit;
    VkBool32                    vertexDynamicStride;
    VkPipelineLayout           pushconstantPipelineLayout;
    VkShaderStageFlags         pushconstantShaderStageFlags;
    uint32_t                    pushconstantOffset;
    uint32_t                    pushconstantSize;
    VkIndirectStateFlagsNV     indirectStateFlags;
    uint32_t                    indexTypeCount;
    const VkIndexType*          pIndexTypes;
    const uint32_t*             pIndexTypeValues;
} VkIndirectCommandsLayoutTokenNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **tokenType** is a `VkIndirectCommandsTokenTypeNV` specifying the token command type.
- **stream** is the index of the input stream containing the token argument data.
• **offset** is a relative starting offset within the input stream memory for the token argument data.
• **vertexBindingUnit** is used for the vertex buffer binding command.
• **vertexDynamicStride** sets if the vertex buffer stride is provided by the binding command rather than the current bound graphics pipeline state.
• **pushconstantPipelineLayout** is the **VkPipelineLayout** used for the push constant command.
• **pushconstantShaderStageFlags** are the shader stage flags used for the push constant command.
• **pushconstantOffset** is the offset used for the push constant command.
• **pushconstantSize** is the size used for the push constant command.
• **indirectStateFlags** is a **VkIndirectStateFlagsNV** bitfield indicating the active states for the state flag command.
• **indexTypeCount** is the optional size of the **pIndexTypes** and **pIndexTypeValues** array pairings. If not zero, it allows to register a custom **uint32_t** value to be treated as specific **VkIndexType**.
• **pIndexTypes** is the used **VkIndexType** for the corresponding **uint32_t** value entry in **pIndexTypeValues**.

### Valid Usage

- **VUID-VkIndirectCommandsLayoutTokenNV-stream-02951**
  stream must be smaller than **VkIndirectCommandsLayoutCreateInfoNV::streamCount**

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-02952**
  offset must be less than or equal to **VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectCommandsTokenOffset**

- **VUID-VkIndirectCommandsLayoutTokenNV-offset-06888**
  offset must be aligned to the scalar alignment of **tokenType** or 
  **minIndirectCommandsBufferOffsetAlignment**, whichever is lower

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02976**
  If **tokenType** is **VK_INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV**, **vertexBindingUnit** must 
  stay within device supported limits for the appropriate commands

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02977**
  If **tokenType** is **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, **pushconstantPipelineLayout** must be valid

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02978**
  If **tokenType** is **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, **pushconstantOffset** must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02979**
  If **tokenType** is **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, **pushconstantSize** must be a multiple of 4

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02980**
  If **tokenType** is **VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV**, **pushconstantOffset** must be less than **VkPhysicalDeviceLimits::maxPushConstantsSize**
If `tokenType` is `VK间接命令令牌类型.PUSH_CONSTANT_NV`, `pushconstantSize` must be less than or equal to `VkPhysicalDeviceLimits.maxPushConstantsSize` minus `pushconstantOffset`.

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02982**
  If `tokenType` is `VK间接命令令牌类型.PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each shader stage in `pushconstantShaderStageFlags`, there must be a push constant range in `pushconstantPipelineLayout` that includes that byte and that stage.

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02983**
  If `tokenType` is `VK间接命令令牌类型.PUSH_CONSTANT_NV`, for each byte in the range specified by `pushconstantOffset` and `pushconstantSize` and for each push constant range that overlaps that byte, `pushconstantShaderStageFlags` must include all stages in that push constant range's `VkPushConstantRange.stageFlags`.

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-02984**
  If `tokenType` is `VK间接命令令牌类型.STATE_FLAGS_NV`, `indirectStateFlags` must not be 0.

**Valid Usage (Implicit)**

- **VUID-VkIndirectCommandsLayoutTokenNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_INDIRECT_COMMANDS_LAYOUT_TOKEN_NV`.

- **VUID-VkIndirectCommandsLayoutTokenNV-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkIndirectCommandsLayoutTokenNV-tokenType-parameter**
  `tokenType` must be a valid `VkIndirectCommandsTokenTypeNV` value.

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantPipelineLayout-parameter**
  If `pushconstantPipelineLayout` is not `VK_NULL_HANDLE`, `pushconstantPipelineLayout` must be a valid `VkPipelineLayout` handle.

- **VUID-VkIndirectCommandsLayoutTokenNV-pushconstantShaderStageFlags-parameter**
  `pushconstantShaderStageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-VkIndirectCommandsLayoutTokenNV-indirectStateFlags-parameter**
  `indirectStateFlags` must be a valid combination of `VkIndirectStateFlagBitsNV` values.

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypes-parameter**
  If `indexTypeCount` is not 0, `pIndexTypes` must be a valid pointer to an array of `indexTypeCount` valid `VkIndexType` values.

- **VUID-VkIndirectCommandsLayoutTokenNV-pIndexTypeValues-parameter**
  If `indexTypeCount` is not 0, `pIndexTypeValues` must be a valid pointer to an array of `indexTypeCount` `uint32_t` values.

The following code provides detailed information on how an individual sequence is processed. For valid usage, all restrictions from the regular commands apply.
void cmdProcessSequence(cmd, pipeline, indirectCommandsLayout, pIndirectCommandsStreams, s)
{
    for (uint32_t t = 0; t < indirectCommandsLayout.tokenCount; t++)
    {
        token = indirectCommandsLayout.pTokens[t];

        uint32_t stride = indirectCommandsLayout.pStreamStrides[token.stream];
        stream = pIndirectCommandsStreams[token.stream];
        uint32_t offset = stream.offset + stride * s + token.offset;
        const void* input = stream.buffer.pointer(offset);

        switch(input.type){
        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV:
            VkBindShaderGroupIndirectCommandNV* bind = input;

            vkCmdBindPipelineShaderGroupNV(cmd, indirectCommandsLayout.pipelineBindPoint, pipeline, bind->groupIndex);
            break;

        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_STATE_FLAGS_NV:
            VkSetStateFlagsIndirectCommandNV* state = input;

            if (token.indirectStateFlags & VK_INDIRECT_STATE_FLAG_FRONTFACE_BIT_NV){
                if (state.data & (1 << 0)){
                    set VK_FRONT_FACE_CLOCKWISE;
                } else {
                    set VK_FRONT_FACE_COUNTER_CLOCKWISE;
                }
            }
            break;

        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV:
            uint32_t* data = input;

            vkCmdPushConstants(cmd, token.pushconstantPipelineLayout, token.pushconstantStageFlags, token.pushconstantOffset, token.pushconstantSize, data);
            break;

        case VK_INDIRECT_COMMANDS_TOKEN_TYPE_INDEX_BUFFER_NV:
            VkBindIndexBufferIndirectCommandNV* data = input;

            // the indexType may optionally be remapped
            // from a custom uint32_t value, via
            // VkIndirectCommandsLayoutTokenNV::pIndexTypeValues

            vkCmdBindIndexBuffer(cmd, deriveBuffer(data->bufferAddress),

deriveOffset(data->bufferAddress),
data->indexType);
break;

case VK INDIRECT_COMMANDS_TOKEN_TYPE_VERTEX_BUFFER_NV:
    VkBindVertexBufferIndirectCommandNV* data = input;
    // if token.vertexDynamicStride is VK_TRUE
    // then the stride for this binding is set
    // using data->stride as well
    vkCmdBindVertexBuffers(cmd,
        token.vertexBindingUnit, 1,
        deriveBuffer(data->bufferAddress),
        deriveOffset(data->bufferAddress));
break;

case VK INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_INDEXED_NV:
    vkCmdDrawIndexedIndirect(cmd,
        stream.buffer, offset, 1, 0);
break;

case VK INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_NV:
    vkCmdDrawIndirect(cmd,
        stream.buffer, offset, 1, 0);
break;

    // only available if VK_NV_mesh_shader is supported
    case VK INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV:
        vkCmdDrawMeshTasksIndirectNV(cmd,
            stream.buffer, offset, 1, 0);
    break;

    // only available if VK_EXT_mesh_shader is supported
    case VK INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV:
        vkCmdDrawMeshTasksIndirectEXT(cmd,
            stream.buffer, offset, 1, 0);
    break;

case VK INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV:
    VkBindPipelineIndirectCommandNV *data = input;
    VkPipeline computePipeline = deriveFromDeviceAddress(data->pipelineAddress);
    vkCmdBindPipeline(cmd, VK_PIPELINE_BIND_POINT_COMPUTE, computePipeline);
break;

case VK INDIRECT_COMMANDS_TOKEN_TYPE_DISPATCH_NV:
    vkCmdDispatchIndirect(cmd, stream.buffer, offset);
break;
32.2. Indirect Commands Generation and Execution

The generation of commands on the device requires a preprocess buffer. To retrieve the memory size and alignment requirements of a particular execution state call:

```c
// Provided by VK_NV_device_generated_commands
void vkGetGeneratedCommandsMemoryRequirementsNV(
    VkDevice device,
    const VkGeneratedCommandsMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkGeneratedCommandsMemoryRequirementsInfoNV` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-deviceGeneratedCommands-02906
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-09074
  If `pInfo->pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedCompute` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkGeneratedCommandsMemoryRequirementsInfoNV` structure

- VUID-vkGetGeneratedCommandsMemoryRequirementsNV-pMemoryRequirements-parameter
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

// Provided by VK_NV_device_generated_commands

2872
typedef struct VkGeneratedCommandsMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t maxSequencesCount;
} VkGeneratedCommandsMemoryRequirementsInfoNV;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pipelineBindPoint is the VkPipelineBindPoint of the pipeline that this buffer memory is intended to be used with during the execution.
- pipeline is the VkPipeline that this buffer memory is intended to be used with during the execution.
- indirectCommandsLayout is the VkIndirectCommandsLayoutNV that this buffer memory is intended to be used with.
- maxSequencesCount is the maximum number of sequences that this buffer memory in combination with the other state provided can be used with.

Valid Usage

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-maxSequencesCount-02907 maxSequencesCount must be less or equal to VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09075 If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_GRAPHICS, then pipeline must be a valid VkPipeline handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09076 If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout was not created with a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be a valid VkPipeline handle
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-09077 If pipelineBindPoint is of type VK_PIPELINE_BIND_POINT_COMPUTE, and the indirectCommandsLayout contains a VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV token, then the pipeline must be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-sType-sType sType must be VK_STRUCTURE_TYPE_GENERATED_COMMANDS_MEMORY_REQUIREMENTS_INFO_NV
- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pNext-pNext
pNext must be NULL

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-pipeline-parameter
  If pipeline is not VK_NULL_HANDLE, pipeline must be a valid VkPipeline handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-indirectCommandsLayout-parameter
  indirectCommandsLayout must be a valid VkIndirectCommandsLayoutNV handle

- VUID-VkGeneratedCommandsMemoryRequirementsInfoNV-commonparent
  Both of indirectCommandsLayout, and pipeline that are valid handles of non-ignored
  parameters must have been created, allocated, or retrieved from the same VkDevice

To bind a compute pipeline inDevice-Generated Commands, an application must query the
pipeline’s device address.

To query a compute pipeline’s 64-bit device address, call:

```
// Provided by VK_NV_device_generated_commands_compute
VkDeviceAddress vkGetPipelineIndirectDeviceAddressNV(
    VkDevice device,
    const VkPipelineIndirectDeviceAddressInfoNV* pInfo);
```

- deviceis the logical device on which the pipeline was created.
- pInfois a pointer to a VkPipelineIndirectDeviceAddressInfoNV structure specifying the pipeline
to retrieve the address for.

### Valid Usage

- VUID-vkGetPipelineIndirectDeviceAddressNV-deviceGeneratedComputePipelines-09078
  The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV
  ::deviceGeneratedComputePipelines feature must be enabled

### Valid Usage (Implicit)

- VUID-vkGetPipelineIndirectDeviceAddressNV-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetPipelineIndirectDeviceAddressNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkPipelineIndirectDeviceAddressInfoNV structure

The VkPipelineIndirectDeviceAddressInfoNV structure is defined as:

```
// Provided by VK_NV_device_generated_commands_compute
```
typedef struct VkPipelineIndirectDeviceAddressInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
} VkPipelineIndirectDeviceAddressInfoNV;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineBindPoint** is a VkPipelineBindPoint value specifying the type of pipeline whose device address is being queried.
- **pipeline** specifies the pipeline whose device address is being queried.

**Valid Usage**

- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-09079
  The provided pipelineBindPoint must be of type VK_PIPELINE_BIND_POINT_COMPUTE
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09080
  pipeline must have been created with flag VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV set
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-09081
  pipeline must have been created with a VkComputePipelineIndirectBufferInfoNV structure specifying a valid address where its metadata will be saved

**Valid Usage (Implicit)**

- VUID-VkPipelineIndirectDeviceAddressInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_INDIRECT_DEVICE_ADDRESS_INFO_NV
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pNext-pNext
  pNext must be NULL
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value
- VUID-VkPipelineIndirectDeviceAddressInfoNV-pipeline-parameter
  pipeline must be a valid VkPipeline handle

To determine the memory requirements for a compute pipeline's metadata, call:

```c
// Provided by VK_NV_device_generated_commands_compute
void vkGetPipelineIndirectMemoryRequirementsNV(
    VkDevice device,
    const VkComputePipelineCreateInfo* pCreateInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```
• **device** is the logical device that owns the buffer.

• **pCreateInfo** is a [VkComputePipelineCreateInfo](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkComputePipelineCreateInfo.html) structure specifying the creation parameters of the compute pipeline whose memory requirements are being queried.

• **pMemoryRequirements** is a pointer to a [VkMemoryRequirements2](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkMemoryRequirements2.html) structure in which the requested pipeline’s memory requirements are returned.

If `pCreateInfo->pNext` chain includes a pointer to a [VkComputePipelineIndirectBufferInfoNV](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkComputePipelineIndirectBufferInfoNV.html) structure, then the contents of that structure are ignored.

### Valid Usage

- **VUID-vkGetPipelineIndirectMemoryRequirementsNV-deviceGeneratedComputePipelines-09082**
  - The `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` feature **must** be enabled

- **VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-09083**
  - `pCreateInfo->flags` **must** include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

### Valid Usage (Implicit)

- **VUID-vkGetPipelineIndirectMemoryRequirementsNV-device-parameter**
  - `device` **must** be a valid `VkDevice` handle

- **VUID-vkGetPipelineIndirectMemoryRequirementsNV-pCreateInfo-parameter**
  - `pCreateInfo` **must** be a valid pointer to a valid `VkComputePipelineCreateInfo` structure

- **VUID-vkGetPipelineIndirectMemoryRequirementsNV-pMemoryRequirements-parameter**
  - `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2` structure

The actual generation of commands as well as their execution on the device is handled as single action with:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdExecuteGeneratedCommandsNV(
    VkCommandBuffer commandBuffer,              // commandBuffer
    VkBool32 isPreprocessed,                    // isPreprocessed
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo); // pGeneratedCommandsInfo
```

- **commandBuffer** is the command buffer into which the command is recorded.

- **isPreprocessed** represents whether the input data has already been preprocessed on the device. If it is `VK_FALSE` this command will implicitly trigger the preprocessing step, otherwise not.

- **pGeneratedCommandsInfo** is a pointer to a [VkGeneratedCommandsInfoNV](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkGeneratedCommandsInfoNV.html) structure containing parameters affecting the generation of commands.

If the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_UNORDERED_SEQUENCES_BIT_NV` flag was used to create the
VkGeneratedCommandsInfoNV::indirectCommandsLayout then the order of execution of individual draws through this command may execute in any order, and may not necessarily be in the same order as specified in VkGeneratedCommandsInfoNV::pStreams.

The order of execution of individual dispatches through this command may execute in any order and may not necessarily be in the same order as specified in VkGeneratedCommandsInfoNV::pStreams.

Valid Usage

- VUID-vkCmdExecuteGeneratedCommandsNV-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-mipmapMode-04770
  If a VkSampler created with.mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2
• VUID-vkCmdExecuteGeneratedCommandsNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

• VUID-vkCmdExecuteGeneratedCommandsNV-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM.

• VUID-vkCmdExecuteGeneratedCommandsNV-reductionMode-09213
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT.

• VUID-vkCmdExecuteGeneratedCommandsNV-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

• VUID-vkCmdExecuteGeneratedCommandsNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

• VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

• VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

• VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

• VUID-vkCmdExecuteGeneratedCommandsNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08600
  For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for...
set $n$, with the $\text{VkPipelineLayout}$ used to create the current $\text{VkPipeline}$ or the $\text{VkDescriptorSetLayout}$ array used to create the current $\text{VkShaderEXT}$, as described in Pipeline Layout Compatibility

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a $\text{VkPipelineLayout}$ that is compatible for push constants, with the $\text{VkPipelineLayout}$ used to create the current $\text{VkPipeline}$ or the $\text{VkDescriptorSetLayout}$ array used to create the current $\text{VkShaderEXT}$, as described in Pipeline Layout Compatibility

- **VUID-vkCmdExecuteGeneratedCommandsNV-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a $\text{VkPipelineLayout}$ that is compatible for push constants, with the $\text{VkPipelineLayout}$ used to create the current $\text{VkPipeline}$ or the $\text{VkDescriptorSetLayout}$ and $\text{VkPushConstantRange}$ arrays used to create the current $\text{VkShaderEXT}$, as described in Pipeline Layout Compatibility

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08114**
  Descriptors in each bound descriptor set, specified via $\text{vkCmdBindDescriptorSets}$, must be valid as described by descriptor validity if they are statically used by the $\text{VkPipeline}$ bound to the pipeline bind point used by this command and the bound $\text{VkPipeline}$ was not created with $\text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}$

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08115**
  If the descriptors used by the $\text{VkPipeline}$ bound to the pipeline bind point were specified via $\text{vkCmdBindDescriptorSets}$, the bound $\text{VkPipeline}$ must have been created without $\text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}$

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08116**
  Descriptors in bound descriptor buffers, specified via $\text{vkCmdSetDescriptorBufferOffsetsEXT}$, must be valid if they are dynamically used by the $\text{VkPipeline}$ bound to the pipeline bind point used by this command and the bound $\text{VkPipeline}$ was created with $\text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}$

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08604**
  Descriptors in bound descriptor buffers, specified via $\text{vkCmdSetDescriptorBufferOffsetsEXT}$, must be valid if they are dynamically used by any $\text{VkShaderEXT}$ bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08117**
  If the descriptors used by the $\text{VkPipeline}$ bound to the pipeline bind point were specified via $\text{vkCmdSetDescriptorBufferOffsetsEXT}$, the bound $\text{VkPipeline}$ must have been created with $\text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}$

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08119**
  If a descriptor is dynamically used with a $\text{VkPipeline}$ created with $\text{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}$, the descriptor memory must be resident

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08605**
  If a descriptor is dynamically used with a $\text{VkShaderEXT}$ created with a
VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- VUID-vkCmdExecuteGeneratedCommandsNV-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage
corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdExecuteGeneratedCommandsNV-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdExecuteGeneratedCommandsNV-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr conversion`, that object must not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` must match.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as
the buffer view's format

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdExecuteGeneratedCommandsNV-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdExecuteGeneratedCommandsNV-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- **VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this
command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from a VkImageView as result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view’s format must be a single-component format.

- VUID-vkCmdExecuteGeneratedCommandsNV-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07288
  Any shader invocation executed by this command must terminate.

- VUID-vkCmdExecuteGeneratedCommandsNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdExecuteGeneratedCommandsNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07748
  If any shader statically accesses an input attachment, a valid descriptor must be bound to the pipeline via a descriptor set.
If any shader executed by this pipeline accesses an `OpTypeImage` variable with a `Dim` operand of `SubpassData`, it **must** be decorated with an `InputAttachmentIndex` that corresponds to a valid input attachment in the current subpass.

Input attachment views accessed in a subpass **must** be created with the same `VkFormat` as the corresponding subpass definition, and be created with a `VkImageView` that is compatible with the attachment referenced by the subpass' `pInputAttachments[InputAttachmentIndex]` in the currently bound `VkFramebuffer` as specified by Fragment Input Attachment Compatibility.

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

If a color attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_COLOR_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_COLOR_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command.

If a depth attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_DEPTH_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command.

If a stencil attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it is not in the `VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT` image layout, and either:

- the `VK_PIPELINE_CREATE_DEPTH_STENCIL_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT` is set on the currently bound pipeline or
- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  - there is no currently bound graphics pipeline or
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it **must** not be accessed in any way other than as an attachment by this command.
currently bound pipeline or

- the last call to `vkCmdSetAttachmentFeedbackLoopEnableEXT` included `VK_IMAGE_ASPECT_STENCIL_BIT` and
  
  - there is no currently bound graphics pipeline or
  
  - the currently bound graphics pipeline was created with `VK_DYNAMIC_STATE_ATTACHMENT_FEEDBACK_LOOP_ENABLE_EXT` it must not be accessed in any way other than as an attachment by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-09003
  If an attachment is written by any prior command in this subpass or by the load, store, or resolve operations for this subpass, it must not be accessed in any way other than as an attachment, storage image, or sampled image by this command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06539
  If any previously recorded command in the current subpass accessed an image subresource used as an attachment in this subpass in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdExecuteGeneratedCommandsNV-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect, both front and back writeMask are not zero, and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07831
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT` dynamic state enabled then `vkCmdSetViewport` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07832
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR` dynamic state enabled then `vkCmdSetScissor` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07833
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state enabled then `vkCmdSetLineWidth` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08617
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetPolygonModeEXT` in the current command buffer set `polygonMode` to `VK_POLYGON_MODE_LINE`, `vkCmdSetLineWidth` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08618
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08619
  If a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, vkCmdSetLineWidth must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07834
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS dynamic state enabled then vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08620
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBiasEnable in the current command buffer set depthBiasEnable to VK_TRUE, vkCmdSetDepthBias or vkCmdSetDepthBias2EXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07835
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_BLEND_CONSTANTS dynamic state enabled then vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08621
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT in the current command buffer set any element of pColorBlendEnables to VK_TRUE, and the most recent call to vkCmdSetColorBlendEquationEXT in the current command buffer set the same element of pColorBlendEquations to a VkColorBlendEquationEXT structure with any VkBlendFactor member with a value of VK_BLEND_FACTOR_CONSTANT_COLOR, VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_COLOR, VK_BLEND_FACTOR_CONSTANT_ALPHA, or VK_BLEND_FACTOR_ONE_MINUS_CONSTANT_ALPHA, vkCmdSetBlendConstants must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07836
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BOUNDS dynamic state enabled, and if the current depthBoundsTestEnable state is VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08622
  If a shader object is bound to any graphics stage, and the most recent call to
vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetDepthBoundsTestEnable in the current command buffer set depthBoundsTestEnable to VK_TRUE, then vkCmdSetDepthBounds must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07837**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08623**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilCompareMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08623**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_WRITE_MASK dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08624**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilWriteMask must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08625**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_STENCIL_REFERENCE dynamic state enabled, and if the current stencilTestEnable state is VK_TRUE, then vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08625**
  If a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetStencilTestEnable in the current command buffer set stencilTestEnable to VK_TRUE, vkCmdSetStencilReference must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex
If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetSampleLocationsEnableEXT` in the current command buffer set `sampleLocationsEnable` to `VK_TRUE`, then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_CULL_MODE` dynamic state enabled then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCullMode` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_FRONT_FACE` dynamic state enabled then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFrontFace` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE` dynamic state enabled then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.

If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthTestEnable` must have been called in the current command buffer prior to this drawing command.
• VUID-vkCmdExecuteGeneratedCommandsNV-None-07844
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE` dynamic state enabled then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08630
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthWriteEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07845
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` dynamic state enabled then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08631
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDepthTestEnable` in the current command buffer set `depthTestEnable` to `VK_TRUE`, then `vkCmdSetDepthCompareOp` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07846
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST.Enable` dynamic state enabled then `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08632
  If a shader object is bound to any graphics stage, and the `depthBounds` feature is enabled, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `vkCmdSetDepthBoundsTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07847
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE` dynamic state enabled then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08633
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetStencilTestEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07848
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_STENCIL_OP` dynamic state enabled then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command.
command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08634
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetStencilTestEnable` in the current command buffer set `stencilTestEnable` to `VK_TRUE`, then `vkCmdSetStencilOp` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03417
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the ` VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-scissorCount-03418
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the ` VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08635
  If a shader object is bound to any graphics stage, then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04137
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE/viewport with/Count` and `VK_DYNAMIC_STATE/viewport with/Count` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04138
  If the bound graphics pipeline state was created with the `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-None-09232
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in the current command buffer set viewportWScalingEnable to VK_TRUE, then vkCmdSetViewportWScalingNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08636
  If the VK_NV_clip_space_w_scaling extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetViewportWScalingEnableNV in the current command buffer set viewportWScalingEnable to VK_TRUE, then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09233
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetCoarseSampleOrderNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-shadingRateImage-09234
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetShadingRateImageEnableNV in the current command buffer set shadingRateImageEnable to VK_TRUE, then vkCmdSetViewportShadingRatePaletteNV must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08637
  If the shadingRateImage feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetShadingRateImageEnableNV in the current command buffer set shadingRateImageEnable to VK_TRUE, then vkCmdSetViewportShadingRatePaletteNV must have been called in the current command buffer prior to this drawing command
stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetShadingRateImageEnable` in the current command buffer set `shadingRateImageEnable` to `VK_TRUE`, then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdExecuteGeneratedCommandsNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV:: exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_ENABLE_NV` dynamic state enabled then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state enabled then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-exclusiveScissor-09235**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetExclusiveScissorEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08638**
  If the `exclusiveScissor` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetExclusiveScissorEnableNV` in the current command buffer set any element of `pExclusiveScissorEnables` to `VK_TRUE`, then `vkCmdSetExclusiveScissorNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer
prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08639**
  If a shader object is bound to any graphics stage, then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08640**
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08641**
  If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLogicOpEnableEXT` set `logicOpEnable` to `VK_TRUE`, then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitiveFragmentShadingRateWithMultipleViewports-08642**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, and any shader object bound to a graphics stage writes to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1

- **VUID-vkCmdExecuteGeneratedCommandsNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of
the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK_FALSE}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08643}
  If a shader object is bound to the \texttt{VK_SHADER_STAGE_FRAGMENT_BIT} stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, then for each color attachment in the render pass, if the corresponding image view’s format features do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the corresponding member of \texttt{pColorBlendEnables} in the most recent call to \texttt{vkCmdSetColorBlendEnableEXT} in the current command buffer that affected that attachment index must have been \texttt{VK_FALSE}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-multisampledRenderToSingleSampled-07284}
  If rasterization is not disabled in the bound graphics pipeline, and none of the following is enabled:

  - the \texttt{VK_AMD_mixed_attachment_samples} extension
  - the \texttt{VK_NV_framebuffer_mixed_samples} extension
  - the \texttt{multisampledRenderToSingleSampled} feature

  then \texttt{rasterizationSamples} for the currently bound graphics pipeline must be the same as the current subpass color and/or depth/stencil attachments

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08644}
  If a shader object is bound to any graphics stage, and the most recent call to \texttt{vkCmdSetRasterizerDiscardEnable} in the current command buffer set \texttt{rasterizerDiscardEnable} to \texttt{VK_FALSE}, and none of the following is enabled:

  - the \texttt{VK_AMD_mixed_attachment_samples} extension
  - the \texttt{VK_NV_framebuffer_mixed_samples} extension
  - the \texttt{multisampledRenderToSingleSampled} feature

  then the most recent call to \texttt{vkCmdSetRasterizationSamplesEXT} in the current command buffer must have set \texttt{rasterizationSamples} to be the same as the number of samples for the current render pass color and/or depth/stencil attachments

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08876}
  If a shader object is bound to any graphics stage, the current render pass instance must have been begun with \texttt{vkCmdBeginRendering}

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06172}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command must not write any values to the depth attachment

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06173}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command
must not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

- VUID-vkCmdExecuteGeneratedCommandsNV-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06179
  If the `dynamicRenderingUnusedAttachments` feature is not enabled and the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08910
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08912
  If the `dynamicRenderingUnusedAttachments` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an `imageView` equal to `VK_NULL_HANDLE` must have the
corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats} used to create the currently bound pipeline equal to \texttt{VK_FORMAT_UNDEFINED}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08911}
  
  If the \texttt{dynamicRenderingUnusedAttachments} feature is enabled, and the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingInfo::colorAttachmentCount} greater than 0, then each element of the \texttt{VkRenderingInfo::pColorAttachments} array with an \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} must have been created with a \texttt{VkFormat} equal to the corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats} used to create the currently bound graphics pipeline, or the corresponding element of \texttt{VkPipelineRenderingCreateInfo::pColorAttachmentFormats}, if it exists, must be \texttt{VK_FORMAT_UNDEFINED}

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-09362}
  
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, with a \texttt{VkRenderingInfo::colorAttachmentCount} equal to 1, there is no shader object bound to any graphics stage, and a color attachment with a resolve mode of \texttt{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID}, each element of the \texttt{VkRenderingInfo::pColorAttachments} array with a \texttt{resolveImageView} not equal to \texttt{VK_NULL_HANDLE} must have been created with an image created with a \texttt{VkExternalFormatANDROID::externalFormat} value equal to the \texttt{VkExternalFormatANDROID::externalFormat} value used to create the currently bound graphics pipeline

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09363}
  
  If there is no shader object bound to any graphics stage, the current render pass instance was begun with \texttt{vkCmdBeginRendering} and a \texttt{VkRenderingInfo::colorAttachmentCount} equal to 1, and a color attachment with a resolve mode of \texttt{VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID}, each element of the \texttt{VkRenderingInfo::pColorAttachments} array with an \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} must have been created with an image created with a \texttt{VkExternalFormatANDROID::externalFormat} value equal to the \texttt{VkExternalFormatANDROID::externalFormat} value used to create the currently bound graphics pipeline

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09364}
  
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero \texttt{VkExternalFormatANDROID::externalFormat} value and with the \texttt{VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT} dynamic state enabled, then \texttt{vkCmdSetColorBlendEnableEXT} must have set the blend enable to \texttt{VK_FALSE} prior to this drawing command

- \texttt{VUID-vkCmdExecuteGeneratedCommandsNV-None-09365}
  
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero \texttt{VkExternalFormatANDROID::externalFormat} value and with the \texttt{VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT} dynamic state enabled, then \texttt{vkCmdSetRasterizationSamplesEXT} must have set \texttt{rasterizationSamples} to
VK_SAMPLE_COUNT_1_BIT prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09366**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetColorBlendEnableEXT must have set blend enable to VK_FALSE prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-09367**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetRasterizationSamplesEXT must have set rasterizationSamples to VK_SAMPLE_COUNT_1_BIT prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09368**
  If the current render pass instance was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero VkExternalFormatANDROID::externalFormat value and with the VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR dynamic state enabled, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->width to 1 prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09369**
  If the current render pass instance was begun with vkCmdBeginRendering, there is no shader object bound to any graphics stage, and the currently bound graphics pipeline was created with a non-zero VkExternalFormatANDROID::externalFormat value and with the VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR dynamic state enabled, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->height to 1 prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pFragmentSize-09370**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->width to 1 prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pFragmentSize-09371**
  If there is a shader object bound to any graphics stage, and the current render pass includes a color attachment that uses the VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID resolve mode, then vkCmdSetFragmentShadingRateKHR must have set pFragmentSize->height to 1 prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07749**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08646**
If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentCount-07750**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08647**
  If the `colorWriteEnable` feature is enabled on the device, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then the `attachmentCount` parameter of most recent call to `vkCmdSetColorWriteEnableEXT` in the current command buffer must be greater than or equal to the number of color attachments in the current render pass instance.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07751**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command for each discard rectangle in `VkPipelineDiscardRectangleStateCreateInfoEXT::discardRectangleCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07880**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT` dynamic state enabled then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09236**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetDiscardRectangleEnableEXT` in the current command buffer set `discardRectangleEnable` to `VK_TRUE`, then `vkCmdSetDiscardRectangleEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08648**
  If the `VK_EXT_discard_rectangles` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDiscardRectangleEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07881**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT` dynamic state enabled then...
**vkCmdSetDiscardRectangleModeEXT** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08649
  If the **VK_EXT_discard_rectangles** extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to **vkCmdSetRasterizerDiscardEnable** in the current command buffer set **rasterizerDiscardEnable** to **VK_FALSE**, and the most recent call to **vkCmdSetDiscardRectangleEnableEXT** in the current command buffer set **discardRectangleEnable** to **VK_TRUE**, then **vkCmdSetDiscardRectangleModeEXT** must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08913
  If the current render pass instance was begun with **vkCmdBeginRendering**, the dynamicRenderingUnusedAttachments feature is not enabled, and **VkRenderingInfo::pDepthAttachment->imageView** was **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline must be equal to **VK_FORMAT_UNDEFINED**

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08914
  If current render pass instance was begun with **vkCmdBeginRendering**, the dynamicRenderingUnusedAttachments feature is not enabled, and **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, the value of ** VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline must be equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08915
  If the current render pass instance was begun with **vkCmdBeginRendering**, the dynamicRenderingUnusedAttachments feature is enabled, **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, and the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline was not equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**, the value of the format must be **VK_FORMAT_UNDEFINED**

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08916
  If the current render pass instance was begun with **vkCmdBeginRendering**, the dynamicRenderingUnusedAttachments feature is not enabled, and **VkRenderingInfo::pStencilAttachment->imageView** was **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** used to create the currently bound graphics pipeline must be equal to **VK_FORMAT_UNDEFINED**

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08917
  If current render pass instance was begun with **vkCmdBeginRendering**, the dynamicRenderingUnusedAttachments feature is not enabled, and **VkRenderingInfo::pStencilAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** used to create the currently bound
bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdExecuteGeneratedCommandsNV-dynamicRenderingUnusedAttachments-08918
  If the current render pass instance was begun with vkCmdBeginRendering, the dynamicRenderingUnusedAttachments feature is enabled, VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, and the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline was not equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView, the value of the format must be VK_FORMAT_UNDEFINED

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdExecuteGeneratedCommandsNV-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

- VUID-vkCmdExecuteGeneratedCommandsNV-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `rasterizationSamples` for the currently bound graphics pipeline.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If this command has been called inside a render pass instance started with `vkCmdBeginRendering`, and the `pNext` chain of `VkRenderingInfo` includes a `VkMultisampledRenderToSingleSampledInfoEXT` structure with `multisampledRenderToSingleSampledEnable` equal to `VK_TRUE`, then the value of `rasterizationSamples` for the currently bound graphics pipeline must be equal to `VkMultisampledRenderToSingleSampledInfoEXT::rasterizationSamples`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound with a fragment shader that statically writes to a color attachment, the color write mask is not zero, color writes are enabled, and the corresponding element of the `VkRenderingInfo::colorAttachments->imageView` was not `VK_NULL_HANDLE`, then the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.
If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, depth test is enabled, depth write is enabled, and the `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-pStencilAttachment-08965**
  If the current render pass instance was begun with `vkCmdBeginRendering`, there is a graphics pipeline bound, stencil test is enabled and the `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, then the `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the pipeline must not be `VK_FORMAT_UNDEFINED`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07619**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT` dynamic state enabled then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07620**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09237**
  If a shader object is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` stage, then `vkCmdSetTessellationDomainOriginEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08650**
  If the `depthClamp` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetDepthClampEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07621**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_POLYGON_MODE_EXT` dynamic state enabled then `vkCmdSetPolygonModeEXT` must have been called in the current command buffer prior to this drawing command.
to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08651
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdPolygonModeEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07622
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` dynamic state enabled then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08652
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRasterizationSamplesEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07623
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` dynamic state enabled then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08653
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleMaskEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07624
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08919
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT` dynamic state enabled, and `alphaToCoverageEnable` was `VK_TRUE` in the last call to `vkCmdSetAlphaToCoverageEnableEXT`, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08654
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetAlphaToCoverageEnableEXT` must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-alphaToCoverageEnable-08920
  If a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetAlphaToCoverageEnableEXT` in the current command buffer set
alphaToCoverageEnable to VK_TRUE, then the Fragment Output Interface must contain a variable for the alpha Component word in Location 0 at Index 0

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07625
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT dynamic state enabled then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08655
  If the alphaToOne feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAlphaToOneEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07626
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT dynamic state enabled then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08656
  If the logicOp feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLogicOpEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07627
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08657
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07628
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08658
  If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetColorBlendEnableEXT for any attachment set that attachment's value in pColorBlendEnables to VK_TRUE, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command
• VUID-vkCmdExecuteGeneratedCommandsNV-None-07629
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then
vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08659
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07630
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT dynamic state enabled then
vkCmdSetRasterizationStreamEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08660
If the geometryStreams feature is enabled, and a shader object is bound to the VK_SHADER_STAGE_GEOMETRY_BIT stage, then vkCmdSetRasterizationStreamEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07631
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT dynamic state enabled then
vkCmdSetConservativeRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08661
If the VK_EXT_conservative_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetConservativeRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07632
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT dynamic state enabled then
vkCmdSetExtraPrimitiveOverestimationSizeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08662
If the VK_EXT_conservative_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetConservativeRasterizationModeEXT in the current command buffer set conservativeRasterizationMode to VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT, then vkCmdSetExtraPrimitiveOverestimationSizeEXT must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07633
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT` dynamic state enabled then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08663
  If the `depthClipEnable` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07634
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08664
  If the `VK_EXT_sample_locations` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetSampleLocationsEnableEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07635
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT` dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09416
  If the `VK_EXT_blend_operation_advanced` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then at least one of `vkCmdSetColorBlendEquationEXT` and `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07636
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT` dynamic state enabled then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08665
  If the `VK_EXT_provoking_vertex` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetProvokingVertexModeEXT` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07637
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic state enabled then
vkCmdSetLineRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08666
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08667
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08668
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object that outputs line primitives is bound to the VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetLineRasterizationModeEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07638
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT dynamic state enabled then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08669
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPolygonModeEXT in the current command buffer set polygonMode to VK_POLYGON_MODE_LINE, then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08670
  If the VK_KHR_line_rasterization or VK_EXT_line_rasterization extension is enabled, and a shader object is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, and the most recent call to vkCmdSetPrimitiveTopology in the current command buffer set primitiveTopology to any line topology, then vkCmdSetLineStippleEnableEXT must have been called in the current command buffer prior to this drawing command
command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08671**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object that outputs line primitives is bound to the `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetLineStippleEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07849**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_KHR` dynamic state enabled then `vkCmdSetLineStippleKHR` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08672**
  If the `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetLineStippleEnableEXT` in the current command buffer set `stippledLineEnable` to `VK_TRUE`, then `vkCmdSetLineStippleEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07639**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT` dynamic state enabled then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08673**
  If the `depthClipControl` feature is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetDepthClipNegativeOneToOneEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07640**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV` dynamic state enabled then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08674**
  If the `VK_NV_clip_space_w_scaling` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportWScalingEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07641**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08675**
If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then `vkCmdSetViewportSwizzleNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07642
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08676
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageToColorEnableNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07643
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV` dynamic state enabled then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08677
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageToColorEnableNV` in the current command buffer set `coverageToColorEnable` to `VK_TRUE`, then `vkCmdSetCoverageToColorLocationNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07644
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08678
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageModulationModeNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-07645
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08679
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound
to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationModeNV` in the current command buffer set `coverageModulationMode` to any value other than `VK_COVERAGE_MODULATION_MODE_NONE_NV`, then `vkCmdSetCoverageModulationTableEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07646**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV` dynamic state enabled then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08680**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the most recent call to `vkCmdSetCoverageModulationTableEnableNV` in the current command buffer set `coverageModulationTableEnable` to `VK_TRUE`, then `vkCmdSetCoverageModulationTableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07647**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV` dynamic state enabled then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pipelineFragmentShadingRate-09238**
  If the `pipelineFragmentShadingRate` feature is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetFragmentShadingRateKHR` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08681**
  If the `shadingRateImage` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetShadingRateImageEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-07648**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV` dynamic state enabled then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08682**
  If the `representativeFragmentTest` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetRepresentativeFragmentTestEnableNV` must have been called in the current command buffer prior to this drawing command
command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-07649
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV` dynamic state enabled then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-None-08683
  If the `coverageReductionMode` feature is enabled, and a shader object is bound to any graphics stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, then `vkCmdSetCoverageReductionModeNV` must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdExecuteGeneratedCommandsNV-pColorBlendEnables-07470
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT` state enabled and the last call to `vkCmdSetColorBlendEnableEXT` set `pColorBlendEnables` for any attachment to `VK_TRUE`, then for those attachments in the subpass the corresponding image view's format features must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07471
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the current subpass does not use any color and/or depth/stencil attachments, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must follow the rules for a zero-attachment subpass

• VUID-vkCmdExecuteGeneratedCommandsNV-samples-07472
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state enabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state disabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` parameter used to create the bound graphics pipeline

• VUID-vkCmdExecuteGeneratedCommandsNV-samples-07473
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_MASK_EXT` state and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, then the `samples` parameter in the last call to `vkCmdSetSampleMaskEXT` must be greater or equal to the `rasterizationSamples` parameter in the last call to `vkCmdSetRasterizationSamplesEXT`

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07474
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then the `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT` must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdExecuteGeneratedCommandsNV-None-09211
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT state enabled, or a shader object is bound to any graphics stage, and the current render pass instance includes a VkMultisampledRenderToSingleSampledInfoEXT structure with multisampledRenderToSingleSampledEnable equal to VK_TRUE, then the rasterizationSamples in the last call to vkCmdSetRasterizationSamplesEXT must be the same as the rasterizationSamples member of that structure.

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07476
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT dynamic state enabled then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass.

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09417
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEnableEXT calls must specify an enable for all active color attachments in the current subpass.

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07477
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT dynamic state enabled then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

• VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09418
If a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetColorBlendEquationEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorBlendEquationEXT calls must specify the blend equations for all active color attachments in the current subpass where blending is enabled.

• VUID-vkCmdExecuteGeneratedCommandsNV-firstAttachment-07478
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT dynamic state enabled then vkCmdSetColorWriteMaskEXT must have been called in the current command buffer prior to this drawing command, and the attachments specified by the firstAttachment and attachmentCount parameters of vkCmdSetColorWriteMaskEXT calls must specify the color write mask for all active color attachments in the current subpass.
If a shader object is bound to the **VK_SHADER_STAGE_FRAGMENT_BIT** stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to **VK_FALSE**, then `vkCmdSetColorWriteMaskEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorWriteMaskEXT` calls must specify the color write mask for all active color attachments in the current subpass.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT** dynamic state enabled then `vkCmdSetColorBlendAdvancedEXT` must have been called in the current command buffer prior to this drawing command, and the attachments specified by the `firstAttachment` and `attachmentCount` parameters of `vkCmdSetColorBlendAdvancedEXT` calls must specify the advanced blend equations for all active color attachments in the current subpass where blending is enabled.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_BLEND_MAX_COLOR_ATTACHMENTS_EXT** and **VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT** dynamic states enabled and the last calls to `vkCmdSetColorBlendEnableEXT` and `vkCmdSetColorBlendAdvancedEXT` have enabled advanced blending, then the number of active color attachments in the current subpass must not exceed `advancedBlendMaxColorAttachments`.

If the bound graphics pipeline state was created with the **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT** query is active, and the bound graphics pipeline was created with **VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT** state enabled, the last call to `vkCmdSetRasterizationStreamEXT` must have set the `rasterizationStream` to zero.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state disabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** state enabled and the **VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT** state enabled, then the `sampleLocationsPerPixel` member of `pSampleLocationsInfo` in the last call to `vkCmdSetSampleLocationsEXT` must equal the `rasterizationSamples` parameter of the last call to `vkCmdSetRasterizationSamplesEXT`.
If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, then the `sampleLocationsInfo.sampleLocationGridSize.width` in the last call to `vkCmdSetSampleLocationsEXT` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling `rasterizationSamples`.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state enabled and the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and if `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, the fragment shader code must not statically use the extended instruction `InterpolateAtSample`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.width` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.width` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

If a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, or the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, and `sampleLocationsEnable` was `VK_TRUE` in the last call to `vkCmdSetSampleLocationsEnableEXT`, and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationGridSize.height` must evenly divide `VkMultisamplePropertiesEXT::sampleLocationGridSize.height` as returned by `vkGetPhysicalDeviceMultisamplePropertiesEXT` with a `samples` parameter equaling the value of `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-sampleLocationsEnable-07938**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` state disabled and the `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` state enabled, and the `sampleLocationsEnable` member of a `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` in the bound graphics pipeline is `VK_TRUE` or `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT` state enabled, then, `sampleLocationsInfo.sampleLocationsPerPixel` must equal `rasterizationSamples` in the last call to `vkCmdSetRasterizationSamplesEXT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageModulationTableEnable-07488**
  If a shader object is bound to any graphics stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV` state enabled, and the last call to `vkCmdSetCoverageModulationTableEnableNV` set `coverageModulationTableEnable` to `VK_TRUE`, then the `coverageModulationTableCount` parameter in the last call to `vkCmdSetCoverageModulationTableNV` must equal the current `rasterizationSamples` divided by the number of color samples in the current subpass.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07489**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if current subpass has a depth/stencil attachment and depth test, stencil test, or depth bounds test are enabled in the currently bound pipeline state, then the current `rasterizationSamples` must be the same as the sample count of the depth/stencil attachment.

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageToColorEnable-07490**
  If the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` state enabled and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` with a `VkFormat` of `VK_FORMAT_R8_UINT`, `VK_FORMAT_R8_SINT`, `VK_FORMAT_R16_UINT`, `VK_FORMAT_R16_SINT`, `VK_FORMAT_R32_UINT`, or `VK_FORMAT_R32_SINT`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizerDiscardEnable-09420**
  If the `VK_NV_fragment_coverage_to_color` extension is enabled, and a shader object is bound to the `VK_SHADER_STAGE_FRAGMENT_BIT` stage, and the most recent call to `vkCmdSetRasterizerDiscardEnable` in the current command buffer set `rasterizerDiscardEnable` to `VK_FALSE`, and the last call to `vkCmdSetCoverageToColorEnableNV` set the `coverageToColorEnable` to `VK_TRUE`, then the current subpass must have a color attachment at the location selected by the last call to `vkCmdSetCoverageToColorLocationNV` with a `VkFormat` of...
VK_FORMAT_R8_UINT, VK_FORMAT_R8_SINT, VK_FORMAT_R16_UINT, VK_FORMAT_R16_SINT, VK_FORMAT_R32_UINT, or VK_FORMAT_R32_SINT

- **VUID-vkCmdExecuteGeneratedCommandsNV-coverageReductionMode-07491**
  If this `VK_NV_coverage_reduction_mode` extension is enabled, the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV` and `VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT` states enabled, the current coverage reduction mode `coverageReductionMode_EXT` states enabled, then the current `rasterizationSamples_EXT` and the sample counts for the color and depth/stencil attachments (if the subpass has them) **must** be a valid combination returned by `vkGetPhysicalDeviceSupportedFramebufferMixedSamplesCombinationsNV`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07492**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-07493**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-viewportCount-09421**
  If the `VK_NV_viewport_swizzle` extension is enabled, and a shader object is bound to any graphics stage, then the `viewportCount` parameter in the last call to `vkCmdSetViewportSwizzleNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-rasterizationSamples-07494**
  If the `VK_NV_framebuffer_mixed_samples` extension is enabled, and if the current subpass has any color attachments and `rasterizationSamples` of the last call to `vkCmdSetRasterizationSamplesEXT` is greater than the number of color samples, then the pipeline `sampleShadingEnable_EXT` **must** be `VK_FALSE`.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07495**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR`, then the `stippledRectangularLines` feature **must** be enabled.

- **VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07496**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT` or `VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT` dynamic states enabled, and if the current `stippledLineEnable` state is `VK_TRUE` and the current `lineRasterizationMode` state is
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_LINE\_STIPPLE\_ENABLE\_EXT} or
\texttt{VK\_DYNAMIC\_STATE\_LINE\_RASTERIZATION\_MODE\_EXT} dynamic states enabled, and if the current
\texttt{stippledLineEnable} state is \texttt{VK\_TRUE} and the current \texttt{lineRasterizationMode} state is
\texttt{VK\_LINE\_RASTERIZATION\_MODE\_RECTANGULAR\_SMOOTH\_KHR}, then the \texttt{stippledSmoothLines} feature \textbf{must} be enabled

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07497}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-stippledLineEnable-07498}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-conservativePointAndLineRasterization-07499}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-stage-07073}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08877}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-07850}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08684}
- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-08685}
vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08686
  If there is no bound graphics pipeline, and the tessellationShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08687
  If there is no bound graphics pipeline, and the geometryShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_GEOMETRY_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08688
  If there is no bound graphics pipeline, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_FRAGMENT_BIT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08689
  If there is no bound graphics pipeline, and the taskShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_TASK_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08690
  If there is no bound graphics pipeline, and the meshShader feature is enabled, vkCmdBindShadersEXT must have been called in the current command buffer with pStages with an element of VK_SHADER_STAGE_MESH_BIT_EXT

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08693
  If there is no bound graphics pipeline, and at least one of the taskShader and meshShader features is enabled, one of the VK_SHADER_STAGE_VERTEX_BIT or VK_SHADER_STAGE_MESH_BIT_EXT stages must have a valid VkShaderEXT bound, and the other must have no VkShaderEXT bound

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08694
  If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created without the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, a valid VkShaderEXT must be bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08695
  If there is no bound graphics pipeline, and both the taskShader and meshShader features are enabled, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_MESH_BIT_EXT stage, and that VkShaderEXT was created with the VK_SHADER_CREATE_NO_TASK_SHADER_BIT_EXT flag, there must be no VkShaderEXT bound to the VK_SHADER_STAGE_TASK_BIT_EXT stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08696
  If there is no bound graphics pipeline, and a valid VkShaderEXT is bound to the VK_SHADER_STAGE_VERTEX_BIT stage, there must be no VkShaderEXT bound to either the VK_SHADER_STAGE_TASK_BIT_EXT stage or the VK_SHADER_STAGE_MESH_BIT_EXT stage

- VUID-vkCmdExecuteGeneratedCommandsNV-None-08698
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, then all shaders created with the
VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag in the same vkCreateShadersEXT call must also be bound

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08699**
  If any graphics shader is bound which was created with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag, any stages in between stages whose shaders which did not create a shader with the VK_SHADER_CREATE_LINK_STAGE_BIT_EXT flag as part of the same vkCreateShadersEXT call must not have any VkShaderEXT bound

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08878**
  All bound graphics shader objects must have been created with identical or identically defined push constant ranges

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08879**
  All bound graphics shader objects must have been created with identical or identically defined arrays of descriptor set layouts

- **VUID-vkCmdExecuteGeneratedCommandsNV-colorAttachmentCount-09372**
  If the current render pass instance was begun with vkCmdBeginRendering and a VkRenderingInfo::colorAttachmentCount equal to 1, a color attachment with a resolve mode of VK_RESOLVE_MODE_EXTERNAL_FORMAT_DOWNSAMPLE_ANDROID, and a fragment shader is bound, it must not declare the DepthReplacing or StencilRefReplacingEXT execution modes

- **VUID-vkCmdExecuteGeneratedCommandsNV-attachmentFeedbackLoopDynamicState-08715**
  If the attachmentFeedbackLoopDynamicState feature is enabled on the device, and a shader object is bound to the VK_SHADER_STAGE_FRAGMENT_BIT stage, and the most recent call to vkCmdSetRasterizerDiscardEnable in the current command buffer set rasterizerDiscardEnable to VK_FALSE, then vkCmdSetAttachmentFeedbackLoopEnableEXT must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpDepthAttachmentReadEXT, the depthWriteEnable parameter in the last call to vkCmdSetDepthWriteEnable must be VK_FALSE

- **VUID-vkCmdExecuteGeneratedCommandsNV-pDynamicStates-08716**
  If the bound graphics pipeline state includes a fragment shader stage, was created with VK_DYNAMIC_STATE_STENCIL_WRITE_MASK set in VkPipelineDynamicStateCreateInfo ::pDynamicStates, and the fragment shader declares the EarlyFragmentTests execution mode and uses OpStencilAttachmentReadEXT, the writeMask parameter in the last call to vkCmdSetStencilWriteMask must be 0

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09116**
  If a shader object is bound to any graphics stage or the currently bound graphics pipeline was created with VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT, and the format of any color attachment is VK_FORMAT_E5B9G9R9_UFLOAT_PACK32, the corresponding element of the pColorWriteMasks parameter of vkCmdSetColorWriteMaskEXT must either include all of VK_COLOR_COMPONENT_R_BIT, VK_COLOR_COMPONENT_G_BIT, and VK_COLOR_COMPONENT_B_BIT, or none of them

- **VUID-vkCmdExecuteGeneratedCommandsNV-maxFragmentDualSrcAttachments-09239**
If \textbf{blending} is enabled for any attachment where either the source or destination blend factors for that attachment use the secondary color input, the maximum value of \texttt{Location} for any output attachment \texttt{statically used} in the Fragment Execution Model executed by this command \textbf{must} be less than \texttt{maxFragmentDualSrcAttachments}.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-09548}
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, the value of each element of \texttt{VkRenderingAttachmentLocationInfoKHR::pColorAttachmentLocations} set by \texttt{vkCmdSetRenderingAttachmentLocationsKHR} \textbf{must} match the value set for the corresponding element in the currently bound pipeline.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-09549}
  If the current render pass was begun with \texttt{vkCmdBeginRendering}, and there is no shader object bound to any graphics stage, input attachment index mappings in the currently bound pipeline \textbf{must} match those set for the current render pass instance via \texttt{VkRenderingInputAttachmentIndexInfoKHR}.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-04007}
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface \textbf{must} have either valid or \texttt{VK_NULL_HANDLE} buffers bound.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-04008}
  If the \texttt{nullDescriptor} feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface \textbf{must} not be \texttt{VK_NULL_HANDLE}.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-02721}
  For a given vertex buffer binding, any attribute data fetched \textbf{must} be entirely contained within the corresponding vertex buffer binding, as described in \textit{Vertex Input Description}.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-07842}
  If there is a shader object bound to the \texttt{VK_SHADER_STAGE_VERTEX_BIT} stage or the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY} dynamic state enabled then \texttt{vkCmdSetPrimitiveTopology} \textbf{must} have been called in the current command buffer prior to this drawing command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-dynamicPrimitiveTopologyUnrestricted-07500}
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY} dynamic state enabled and the \texttt{dynamicPrimitiveTopologyUnrestricted} is \texttt{VK_FALSE}, then the primitiveTopology parameter of \texttt{vkCmdSetPrimitiveTopology} \textbf{must} be of the same \textit{topology class} as the pipeline \texttt{VkPipelineInputAssemblyStateCreateInfo::topology} state.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-None-04913}
  If the bound graphics pipeline was created with both the \texttt{VK_DYNAMIC_STATE_VERTEX_INPUT_EXT} and \texttt{VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT} dynamic states enabled, then \texttt{vkCmdSetVertexInputEXT} \textbf{must} have been called in the current command buffer prior to this draw command.

- \textbf{VUID-vkCmdExecuteGeneratedCommandsNV-pStrides-04913}
If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but without the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04914**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-07939**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then all variables with the `Input` storage class decorated with `Location` in the Vertex Execution Model `OpEntryPoint` must contain a location in `VkVertexInputAttributeDescription2EXT::location`

- **VUID-vkCmdExecuteGeneratedCommandsNV-Input-08734**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled then the numeric type associated with all `Input` variables of the corresponding Location in the Vertex Execution Model `OpEntryPoint` must be the same as `VkVertexInputAttributeDescription2EXT::format`

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08936**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and `VkVertexInputAttributeDescription2EXT::format` has a 64-bit component, then the scalar width associated with all `Input` variables of the corresponding Location in the Vertex Execution Model `OpEntryPoint` must be 64-bit

- **VUID-vkCmdExecuteGeneratedCommandsNV-format-08937**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled and the scalar width associated with a `Location` decorated `Input` variable in the Vertex Execution Model `OpEntryPoint` is 64-bit, then the corresponding `VkVertexInputAttributeDescription2EXT::format` must have a 64-bit component

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-09203**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage and the most recent call to `vkCmdSetPrimitiveTopology` in the current command buffer set `primitiveTopology` to `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, or the bound graphics pipeline
state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-04879**
  If there is a shader object bound to the `VK_SHADER_STAGE_VERTEX_BIT` stage or the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` dynamic state enabled then `vkCmdSetPrimitiveRestartEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdExecuteGeneratedCommandsNV-stage-06481**
The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-08885**
  There must be no shader object bound to either of the `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT` stages

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-02970**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdExecuteGeneratedCommandsNV-isPreprocessed-02908**
  If `isPreprocessed` is `VK_TRUE` then `vkCmdPreprocessGeneratedCommandsNV` must have already been executed on the device, using the same `pGeneratedCommandsInfo` content as well as the content of the input buffers it references (all except `VkGeneratedCommandsInfoNV::preprocessBuffer`). Furthermore `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- **VUID-vkCmdExecuteGeneratedCommandsNV-pipeline-02909**
  `VkGeneratedCommandsInfoNV::pipeline` must match the current bound pipeline at `VkGeneratedCommandsInfoNV::pipelineBindPoint`

- **VUID-vkCmdExecuteGeneratedCommandsNV-None-02910**
  Transform feedback must not be active

- **VUID-vkCmdExecuteGeneratedCommandsNV-deviceGeneratedCommands-02911**
The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

---

**Valid Usage (Implicit)**

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdExecuteGeneratedCommandsNV-pGeneratedCommandsInfo-parameter**
  `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- **VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-recording**
  `commandBuffer` must be in the recording state
• VUID-vkCmdExecuteGeneratedCommandsNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdExecuteGeneratedCommandsNV-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdExecuteGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>

The VkGeneratedCommandsInfoNV is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkGeneratedCommandsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipeline pipeline;
    VkIndirectCommandsLayoutNV indirectCommandsLayout;
    uint32_t streamCount;
    const VkIndirectCommandsStreamNV* pStreams;
    uint32_t sequencesCount;
    VkBuffer preprocessBuffer;
    VkDeviceSize preprocessOffset;
    VkDeviceSize preprocessSize;
    VkBuffer sequencesCountBuffer;
    VkDeviceSize sequencesCountOffset;
    VkBuffer sequencesIndexBuffer;
    VkDeviceSize sequencesIndexOffset;
} VkGeneratedCommandsInfoNV;
```

• `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineBindPoint` is the `VkPipelineBindPoint` used for the `pipeline`.
- `pipeline` is the `VkPipeline` used in the generation and execution process.
- `indirectCommandsLayout` is the `VkIndirectCommandsLayoutNV` that provides the command sequence to generate.
- `streamCount` defines the number of input streams
- `pStreams` is a pointer to an array of `streamCount` `VkIndirectCommandsStreamNV` structures providing the input data for the tokens used in `indirectCommandsLayout`.
- `sequencesCount` is the maximum number of sequences to reserve. If `sequencesCountBuffer` is `VK_NULL_HANDLE`, this is also the actual number of sequences generated.
- `preprocessBuffer` is the `VkBuffer` that is used for preprocessing the input data for execution. If this structure is used with `vkCmdExecuteGeneratedCommandsNV` with its `isPreprocessed` set to `VK_TRUE`, then the preprocessing step is skipped and data in this buffer will not be modified. The contents and the layout of this buffer are opaque to applications and must not be modified outside functions related to device-generated commands or copied to another buffer for reuse.
- `preprocessOffset` is the byte offset into `preprocessBuffer` where the preprocessed data is stored.
- `preprocessSize` is the maximum byte size within the `preprocessBuffer` after the `preprocessOffset` that is available for preprocessing.
- `sequencesCountBuffer` is a `VkBuffer` in which the actual number of sequences is provided as single `uint32_t` value.
- `sequencesCountOffset` is the byte offset into `sequencesCountBuffer` where the count value is stored.
- `sequencesIndexBuffer` is a `VkBuffer` that encodes the used sequence indices as `uint32_t` array.
- `sequencesIndexOffset` is the byte offset into `sequencesIndexBuffer` where the index values start.

**Valid Usage**

- VUID-VkGeneratedCommandsInfoNV-pipeline-02912
  The provided `pipeline` must match the pipeline bound at execution time
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02913
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV`, then the `pipeline` must have been created with multiple shader groups
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02914
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_SHADER_GROUP_NV`, then the `pipeline` must have been created with `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV` set in `VkGraphicsPipelineCreateInfo::flags`
- VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-02915
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV`, then the pipeline's `VkPipelineLayout`
must match the `VkIndirectCommandsLayoutTokenNV::pushconstantPipelineLayout`

- **VUID-VkGeneratedCommandsInfoNV-streamCount-02916**
  
  `streamCount` must match the indirectCommandsLayout's `streamCount`

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09084**
  
  If `pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then the pipeline must have been created with the flag `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09085**
  
  If `pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then the pipeline must have been created with a `VkComputePipelineIndirectBufferInfoNV` structure specifying a valid address where its metadata will be saved

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09086**
  
  If `pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, then `vkCmdUpdatePipelineIndirectBufferNV` must have been called on that pipeline to save its metadata to a device address

- **VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-09087**
  
  If `pipelineBindPoint` is of type `VK_PIPELINE_BIND_POINT_COMPUTE`, and if `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PIPELINE_NV` is used, then pipeline must be `VK_NULL_HANDLE`

- **VUID-VkGeneratedCommandsInfoNV-sequencesCount-02917**
  
  `sequencesCount` must be less or equal to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::maxIndirectSequenceCount` and `VkGeneratedCommandsMemoryRequirementsInfoNV::maxSequencesCount` that was used to determine the `preprocessSize`

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02918**
  
  `preprocessBuffer` must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set in its usage flag

- **VUID-VkGeneratedCommandsInfoNV-preprocessOffset-02919**
  
  `preprocessOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minIndirectCommandsBufferOffsetAlignment`

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-02971**
  
  If `preprocessBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkGeneratedCommandsInfoNV-preprocessSize-02920**
  
  `preprocessSize` must be at least equal to the memory requirement's size returned by `vkGetGeneratedCommandsMemoryRequirementsNV` using the matching inputs (indirectCommandsLayout, ...) as within this structure

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02921**
  
  `sequencesCountBuffer` can be set if the actual used count of sequences is sourced from the provided buffer. In that case the `sequencesCount` serves as upper bound

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02922**
  
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, its usage flag must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
• VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02923
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, `sequencesCountOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesCountBufferOffsetAlignment`

• VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-02972
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

• VUID-VkGeneratedCommandsInfoNV-sequencesCountIndexBuffer-02924
  If `indirectCommandsLayout`'s `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_INDEXED_SEQUENCES_BIT_NV` is set, `sequencesIndexBuffer` must be set otherwise it must be `VK_NULL_HANDLE`

• VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02925
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, its usage flag must have the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

• VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02926
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, `sequencesIndexOffset` must be aligned to `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV::minSequencesIndexBufferOffsetAlignment`

• VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-02973
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE` and is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07078
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_TASKS_NV`, then the pipeline must contain a shader stage using the MeshNV Execution Model

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-07079
  If the `indirectCommandsLayout` uses a token of `VK_INDIRECT_COMMANDS_TOKEN_TYPE_DRAW_MESH_TASKS_NV`, then the pipeline must contain a shader stage using the MeshEXT Execution Model

Valid Usage (Implicit)

• VUID-VkGeneratedCommandsInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_GENERATED_COMMANDS_INFO_NV`

• VUID-VkGeneratedCommandsInfoNV-pNext-pNext
  `pNext` must be `NULL`

• VUID-VkGeneratedCommandsInfoNV-pipelineBindPoint-parameter
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value

• VUID-VkGeneratedCommandsInfoNV-pipeline-parameter
  If `pipeline` is not `VK_NULL_HANDLE`, `pipeline` must be a valid `VkPipeline` handle

• VUID-VkGeneratedCommandsInfoNV-indirectCommandsLayout-parameter
  `indirectCommandsLayout` must be a valid `VkIndirectCommandsLayoutNV` handle

• VUID-VkGeneratedCommandsInfoNV-pStreams-parameter
The `pStreams` must be a valid pointer to an array of `streamCount` valid `VkIndirectCommandsStreamNV` structures.

- **VUID-VkGeneratedCommandsInfoNV-preprocessBuffer-parameter preprocessBuffer** must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-sequencesCountBuffer-parameter**
  If `sequencesCountBuffer` is not `VK_NULL_HANDLE`, `sequencesCountBuffer` must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-sequencesIndexBuffer-parameter**
  If `sequencesIndexBuffer` is not `VK_NULL_HANDLE`, `sequencesIndexBuffer` must be a valid `VkBuffer` handle

- **VUID-VkGeneratedCommandsInfoNV-streamCount-arraylength streamCount** must be greater than 0

- **VUID-VkGeneratedCommandsInfoNV-commonparent**
  Each of `indirectCommandsLayout`, `pipeline`, `preprocessBuffer`, `sequencesCountBuffer`, and `sequencesIndexBuffer` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Referencing the functions defined in *Indirect Commands Layout*, `vkCmdExecuteGeneratedCommandsNV` behaves as:

```c
uint32_t sequencesCount = sequencesCountBuffer ?
    min(maxSequencesCount, sequencesCountBuffer.load_uint32(sequencesCountOffset)) :
    maxSequencesCount;

cmdProcessAllSequences(commandBuffer, pipeline,
    indirectCommandsLayout, pIndirectCommandsStreams,
    sequencesCount,
    sequencesIndexBuffer, sequencesIndexOffset);
```

// The stateful commands within indirectCommandsLayout will not
// affect the state of subsequent commands in the target
// command buffer (cmd)

**Note**

It is important to note that the values of all state related to the `pipelineBindPoint` used are undefined after this command.

Commands can be preprocessed prior execution using the following command:

```c
// Provided by VK_NV_device_generated_commands
void vkCmdPreprocessGeneratedCommandsNV(
    VkCommandBuffer commandBuffer, 
    const VkGeneratedCommandsInfoNV* pGeneratedCommandsInfo);
```
• `commandBuffer` is the command buffer which does the preprocessing.

• `pGeneratedCommandsInfo` is a pointer to a `VkGeneratedCommandsInfoNV` structure containing parameters affecting the preprocessing step.

---

**Valid Usage**

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-02974
  `commandBuffer` must not be a protected command buffer

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-02927
  `pGeneratedCommandsInfo`'s `indirectCommandsLayout` must have been created with the `VK_INDIRECT_COMMANDS_LAYOUT_USAGE_EXPLICIT_PREPROCESS_BIT_NV` bit set

- VUID-vkCmdPreprocessGeneratedCommandsNV-deviceGeneratedCommands-02928
  The `VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV::deviceGeneratedCommands` feature must be enabled

---

**Valid Usage (Implicit)**

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdPreprocessGeneratedCommandsNV-pGeneratedCommandsInfo-parameter
  `pGeneratedCommandsInfo` must be a valid pointer to a valid `VkGeneratedCommandsInfoNV` structure

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdPreprocessGeneratedCommandsNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdPreprocessGeneratedCommandsNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdPreprocessGeneratedCommandsNV-videocoding
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The bound descriptor sets and push constants that will be used with indirect command generation for the compute pipelines **must** already be specified at the time of preprocessing commands with `vkCmdPreprocessGeneratedCommandsNV`. They **must** not change until the execution of indirect commands is submitted with `vkCmdExecuteGeneratedCommandsNV`.

If push constants for the compute pipeline are also specified in the `VkGeneratedCommandsInfoNV::indirectCommandsLayout` with `VK_INDIRECT_COMMANDS_TOKEN_TYPE_PUSH_CONSTANT_NV` token, then those values override the push constants that were previously pushed for the compute pipeline.

Chapter 33. Sparse Resources

As documented in Resource Memory Association, 
VkBuffer and 
VkImage resources in Vulkan must be bound completely and contiguously to a single 
VkDeviceMemory object. This binding must be done before the resource is used, and the binding is immutable for the lifetime of the resource.

Sparse resources relax these restrictions and provide these additional features:

• Sparse resources can be bound non-contiguously to one or more 
VkDeviceMemory allocations.
• Sparse resources can be re-bound to different memory allocations over the lifetime of the resource.
• Sparse resources can have descriptors generated and used orthogonally with memory binding commands.

33.1. Sparse Resource Features

Sparse resources have several features that must be enabled explicitly at resource creation time. The features are enabled by including bits in the flags parameter of 
VkImageCreateInfo or 
VkBufferCreateInfo. Each feature also has one or more corresponding feature enables specified in 
VkPhysicalDeviceFeatures.

• The sparseBinding feature is the base, and provides the following capabilities:
  ◦ Resources can be bound at some defined (sparse block) granularity.
  ◦ The entire resource must be bound to memory before use regardless of regions actually accessed.
  ◦ No specific mapping of image region to memory offset is defined, i.e. the location that each texel corresponds to in memory is implementation-dependent.
  ◦ Sparse buffers have a well-defined mapping of buffer range to memory range, where an offset into a range of the buffer that is bound to a single contiguous range of memory corresponds to an identical offset within that range of memory.
  ◦ Requested via the VK_IMAGE_CREATE_SPARSE_BINDING_BIT and 
VK_BUFFER_CREATE_SPARSE_BINDING_BIT bits.
  ◦ A sparse image created using VK_IMAGE_CREATE_SPARSE_BINDING_BIT (but not 
VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT) supports all formats that non-sparse usage supports, and supports both 
VK_IMAGE_TILING_OPTIMAL and 
VK_IMAGE_TILING_LINEAR tiling.

• Sparse Residency builds on (and requires) the sparseBinding feature. It includes the following capabilities:
  ◦ Resources do not have to be completely bound to memory before use on the device.
  ◦ Images have a prescribed sparse image block layout, allowing specific rectangular regions of the image to be bound to specific offsets in memory allocations.
  ◦ Consistency of access to unbound regions of the resource is defined by the absence or presence of 
VkPhysicalDeviceSparseProperties::residencyNonResidentStrict. If this property is present, accesses to unbound regions of the resource are well defined and behave as if the
data bound is populated with all zeros; writes are discarded. When this property is absent, accesses are considered safe, but reads will return undefined values.

- Requested via the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` and `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bits.

- Sparse residency support is advertised on a finer grain via the following features:

  - The `sparseResidencyBuffer` feature provides support for creating `VkBuffer` objects with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidencyImage2D` feature provides support for creating 2D single-sampled `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidencyImage3D` feature provides support for creating 3D `VkImage` objects with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidency2Samples` feature provides support for creating 2D `VkImage` objects with 2 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidency4Samples` feature provides support for creating 2D `VkImage` objects with 4 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidency8Samples` feature provides support for creating 2D `VkImage` objects with 8 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

  - The `sparseResidency16Samples` feature provides support for creating 2D `VkImage` objects with 16 samples and `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`.

Implementations supporting `sparseResidencyImage2D` are only required to support sparse 2D, single-sampled images. Support for sparse 3D and MSAA images is optional and can be enabled via `sparseResidencyImage3D`, `sparseResidency2Samples`, `sparseResidency4Samples`, `sparseResidency8Samples`, and `sparseResidency16Samples`.

- A sparse image created using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` supports all non-compressed color formats with power-of-two element size that non-sparse usage supports. Additional formats may also be supported and can be queried via `vkGetPhysicalDeviceSparseImageFormatProperties`. `VK_IMAGE_TILING_LINEAR` tiling is not supported.

  - The `sparseResidencyAliased` feature provides the following capability that can be enabled per resource:

    Allows physical memory ranges to be shared between multiple locations in the same sparse resource or between multiple sparse resources, with each binding of a memory location observing a consistent interpretation of the memory contents.

    See Sparse Memory Aliasing for more information.

### 33.2. Sparse Buffers and Fully-Resident Images

Both `VkBuffer` and `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` or `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bits can be thought of as a linear region of address space. In the `VkImage` case if `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` is not used, this linear region is entirely
opaque, meaning that there is no application-visible mapping between texel location and memory offset.

Unless `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` or `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` are also used, the entire resource must be bound to one or more `VkDeviceMemory` objects before use.

### 33.2.1. Sparse Buffer and Fully-Resident Image Block Size

The sparse block size in bytes for sparse buffers and fully-resident images is reported as `VkMemoryRequirements::alignment`, which represents both the memory alignment requirement and the binding granularity (in bytes) for sparse resources.

### 33.3. Sparse Partially-Resident Buffers

`VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` bit allow the buffer to be made only partially resident. Partially resident `VkBuffer` objects are allocated and bound identically to `VkBuffer` objects using only the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` feature. The only difference is the ability for some regions of the buffer to be unbound during device use.

### 33.4. Sparse Partially-Resident Images

`VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` bit allow specific rectangular regions of the image called sparse image blocks to be bound to specific ranges of memory. This allows the application to manage residency at either image subresource or sparse image block granularity. Each image subresource (outside of the mip tail) starts on a sparse block boundary and has dimensions that are integer multiples of the corresponding dimensions of the sparse image block.

**Note**

Applications can use these types of images to control LOD based on total memory consumption. If memory pressure becomes an issue the application can unbind and disable specific mipmap levels of images without having to recreate resources or modify texel data of unaffected levels.

The application can also use this functionality to access subregions of the image in a “megatexture” fashion. The application can create a large image and only populate the region of the image that is currently being used in the scene.

### 33.4.1. Accessing Unbound Regions

The following member of `VkPhysicalDeviceSparseProperties` affects how data in unbound regions of sparse resources are handled by the implementation:

- `residencyNonResidentStrict`

If this property is not present, reads of unbound regions of the image will return undefined values. Both reads and writes are still considered safe and will not affect other resources or populated regions of the image.
If this property is present, all reads of unbound regions of the image will behave as if the region was bound to memory populated with all zeros; writes will be discarded.

**Image operations** performed on unbound memory may still alter some component values in the natural way for those accesses, e.g. substituting a value of one for alpha in formats that do not have an alpha component.

Example: Reading the alpha component of an unbacked `VK_FORMAT_R8_UNORM` image will return a value of 1.0f.

See [Physical Device Enumeration](#) for instructions for retrieving physical device properties.

**Implementor’s Note**

For implementations that cannot natively handle access to unbound regions of a resource, the implementation may allocate and bind memory to the unbound regions. Reads and writes to unbound regions will access the implementation-managed memory instead.

Given that the values resulting from reads of unbound regions are undefined in this scenario, implementations may use the same physical memory for all unbound regions of multiple resources within the same process.

### 33.4.2. Mip Tail Regions

Sparse images created using `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` (without also using `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`) have no specific mapping of image region or image subresource to memory offset defined, so the entire image can be thought of as a linear opaque address region. However, images created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` do have a prescribed sparse image block layout, and hence each image subresource must start on a sparse block boundary. Within each array layer, the set of mip levels that have a smaller size than the sparse block size in bytes are grouped together into a **mip tail region**.

If the `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` flag is present in the flags member of `VkSparseImageFormatProperties`, for the image's format, then any mip level which has dimensions that are not integer multiples of the corresponding dimensions of the sparse image block, and all subsequent mip levels, are also included in the mip tail region.

The following member of `VkPhysicalDeviceSparseProperties` may affect how the implementation places mip levels in the mip tail region:

- `residencyAlignedMipSize`

Each mip tail region is bound to memory as an opaque region (i.e. must be bound using a `VkSparseImageOpaqueMemoryBindInfo` structure) and may be of a size greater than or equal to the sparse block size in bytes. This size is guaranteed to be an integer multiple of the sparse block size in bytes.
An implementation may choose to allow each array-layer's mip tail region to be bound to memory independently or require that all array-layer's mip tail regions be treated as one. This is dictated by VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT in VkSparseImageMemoryRequirements::flags.

The following diagrams depict how VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT and VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT alter memory usage and requirements.

![Figure 22. Sparse Image](image)

In the absence of VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT and VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT, each array layer contains a mip tail region containing texel data for all mip levels smaller than the sparse image block in any dimension.

Mip levels that are as large or larger than a sparse image block in all dimensions can be bound individually. Right-edges and bottom-edges of each level are allowed to have partially used sparse blocks. Any bound partially-used-sparse-blocks must still have their full sparse block size in bytes allocated in memory.
When `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` is present all array layers will share a single mip tail region.

Figure 23. Sparse Image with Single Mip Tail

Figure 24. Sparse Image with Aligned Mip Size

Note
The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` is present the first mip level that would contain partially used sparse blocks begins the mip tail region. This level and all subsequent levels are placed in the mip tail. Only the first N mip levels whose dimensions are an exact multiple of the sparse image block dimensions can be bound and unbound on a sparse block basis.

![Figure 25. Sparse Image with Aligned Mip Size and Single Mip Tail](image)

### Note

The mip tail region is presented here in a 2D array simply for figure size reasons. It is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

When both `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` and `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` are present the constraints from each of these flags are in effect.

#### 33.4.3. Standard Sparse Image Block Shapes

Standard sparse image block shapes define a standard set of dimensions for sparse image blocks that depend on the format of the image. Layout of texels or compressed texel blocks within a sparse image block is implementation-dependent. All currently defined standard sparse image block shapes are 64 KB in size.

For block-compressed formats (e.g. `VK_FORMAT_BC5_UNORM_BLOCK`), the texel size is the size of the compressed texel block (e.g. 128-bit for `BC5`) thus the dimensions of the standard sparse image block...
shapes apply in terms of compressed texel blocks.

**Note**

For block-compressed formats, the dimensions of a sparse image block in terms of texels can be calculated by multiplying the sparse image block dimensions by the compressed texel block dimensions.
Table 47. Standard Sparse Image Block Shapes (Single Sample)

</tbody>
</table>

Implementations that support the standard sparse image block shape for all formats listed in the Standard Sparse Image Block Shapes (Single Sample) and Standard Sparse Image Block Shapes (MSAA) tables may advertise the following VkPhysicalDeviceSparseProperties:

- residencyStandard2DBlockShape
- residencyStandard2DMultisampleBlockShape
- residencyStandard3DBlockShape

Reporting each of these features does not imply that all possible image types are supported as sparse. Instead, this indicates that no supported sparse image of the corresponding type will use custom sparse image block dimensions for any formats that have a corresponding standard sparse image block shape.

33.4.4. Custom Sparse Image Block Shapes

An implementation that does not support a standard image block shape for a particular sparse partially-resident image may choose to support a custom sparse image block shape for it instead. The dimensions of such a custom sparse image block shape are reported in VkSparseImageFormatProperties::imageGranularity. As with standard sparse image block shapes, the size in bytes of the custom sparse image block shape will be reported in VkMemoryRequirements::alignment.

Custom sparse image block dimensions are reported through vkGetPhysicalDeviceSparseImageFormatProperties and vkGetImageSparseMemoryRequirements.

An implementation must not support both the standard sparse image block shape and a custom
sparse image block shape for the same image. The standard sparse image block shape must be used if it is supported.

### 33.4.5. Multiple Aspects

Partially resident images are allowed to report separate sparse properties for different aspects of the image. One example is for depth/stencil images where the implementation separates the depth and stencil data into separate planes. Another reason for multiple aspects is to allow the application to manage memory allocation for implementation-private metadata associated with the image. See the figure below:

![Multiple Aspect Sparse Image](image)

*Figure 26. Multiple Aspect Sparse Image*

**Note**

The mip tail regions are presented here in 2D arrays simply for figure size reasons. Each mip tail is logically a single array of sparse blocks with an implementation-dependent mapping of texels or compressed texel blocks to sparse blocks.

In the figure above the depth, stencil, and metadata aspects all have unique sparse properties. The
per-texel stencil data is \( \frac{1}{4} \) the size of the depth data, hence the stencil sparse blocks include \( 4 \times \) the number of texels. The sparse block size in bytes for all of the aspects is identical and defined by `VkMemoryRequirements::alignment`.

**Metadata**

The metadata aspect of an image has the following constraints:

- All metadata is reported in the mip tail region of the metadata aspect.
- All metadata **must** be bound prior to device use of the sparse image.

### 33.5. Sparse Memory Aliasing

By default sparse resources have the same aliasing rules as non-sparse resources. See [Memory Aliasing](#) for more information.

`VkDevice` objects that have the `sparseResidencyAliased` feature enabled are able to use the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flags for resource creation. These flags allow resources to access physical memory bound into multiple locations within one or more sparse resources in a *data consistent* fashion. This means that reading physical memory from multiple aliased locations will return the same value.

Care **must** be taken when performing a write operation to aliased physical memory. Memory dependencies **must** be used to separate writes to one alias from reads or writes to another alias. Writes to aliased memory that are not properly guarded against accesses to different aliases will have undefined results for all accesses to the aliased memory.

Applications that wish to make use of data consistent sparse memory aliasing **must** abide by the following guidelines:

- All sparse resources that are bound to aliased physical memory **must** be created with the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT / VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` flag.
- All resources that access aliased physical memory **must** interpret the memory in the same way. This implies the following:
  - Buffers and images **cannot** alias the same physical memory in a data consistent fashion. The physical memory ranges **must** be used exclusively by buffers or used exclusively by images for data consistency to be guaranteed.
  - Memory in sparse image mip tail regions **cannot** access aliased memory in a data consistent fashion.
  - Sparse images that alias the same physical memory **must** have compatible formats and be using the same sparse image block shape in order to access aliased memory in a data consistent fashion.

Failure to follow any of the above guidelines will require the application to abide by the normal, non-sparse resource aliasing rules. In this case memory **cannot** be accessed in a data consistent fashion.
Note

Enabling sparse resource memory aliasing can be a way to lower physical memory use, but it may reduce performance on some implementations. An application developer can test on their target HW and balance the memory / performance trade-offs measured.

33.6. Sparse Resource Implementation Guidelines (Informative)

This section is Informative. It is included to aid in implementors’ understanding of sparse resources.

Device Virtual Address

The basic sparseBinding feature allows the resource to reserve its own device virtual address range at resource creation time rather than relying on a bind operation to set this. Without any other creation flags, no other constraints are relaxed compared to normal resources. All pages must be bound to physical memory before the device accesses the resource.

The sparseResidency features allow sparse resources to be used even when not all pages are bound to memory. Implementations that support access to unbound pages without causing a fault may support residencyNonResidentStrict.

Not faulting on access to unbound pages is not enough to support residencyNonResidentStrict. An implementation must also guarantee that reads after writes to unbound regions of the resource always return data for the read as if the memory contains zeros. Depending on any caching hierarchy of the implementation this may not always be possible.

Any implementation that does not fault, but does not guarantee correct read values must not support residencyNonResidentStrict.

Any implementation that cannot access unbound pages without causing a fault will require the implementation to bind the entire device virtual address range to physical memory. Any pages that the application does not bind to memory may be bound to one (or more) "placeholder" physical page(s) allocated by the implementation. Given the following properties:

- A process must not access memory from another process
- Reads return undefined values

It is sufficient for each host process to allocate these placeholder pages and use them for all resources in that process. Implementations may allocate more often (per instance, per device, or per resource).

Binding Memory

The byte size reported in VkMemoryRequirements::size must be greater than or equal to the amount of physical memory required to fully populate the resource. Some implementations
require “holes” in the device virtual address range that are never accessed. These holes may be included in the size reported for the resource.

Including or not including the device virtual address holes in the resource size will alter how the implementation provides support for VkSparseImageOpaqueMemoryBindInfo. This operation must be supported for all sparse images, even ones created with VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT.

- If the holes are included in the size, this bind function becomes very easy. In most cases the resourceOffset is simply a device virtual address offset and the implementation can easily determine what device virtual address to bind. The cost is that the application may allocate more physical memory for the resource than it needs.

- If the holes are not included in the size, the application can allocate less physical memory than otherwise for the resource. However, in this case the implementation must account for the holes when mapping resourceOffset to the actual device virtual address intended to be mapped.

**Note**

If the application always uses VkSparseImageMemoryBindInfo to bind memory for the non-tail mip levels, any holes that are present in the resource size may never be bound.

Since VkSparseImageMemoryBindInfo uses texel locations to determine which device virtual addresses to bind, it is impossible to bind device virtual address holes with this operation.

**Binding Metadata Memory**

All metadata for sparse images have their own sparse properties and are embedded in the mip tail region for said properties. See the Multiaspect section for details.

Given that metadata is in a mip tail region, and the mip tail region must be reported as contiguous (either globally or per-array-layer), some implementations will have to resort to complicated offset → device virtual address mapping for handling VkSparseImageOpaqueMemoryBindInfo.

To make this easier on the implementation, the VK_SPARSE_MEMORY_BIND_METADATA_BIT explicitly specifies when metadata is bound with VkSparseImageOpaqueMemoryBindInfo. When this flag is not present, the resourceOffset may be treated as a strict device virtual address offset.

When VK_SPARSE_MEMORY_BIND_METADATA_BIT is present, the resourceOffset must have been derived explicitly from the imageMipTailOffset in the sparse resource properties returned for the metadata aspect. By manipulating the value returned for imageMipTailOffset, the resourceOffset does not have to correlate directly to a device virtual address offset, and may instead be whatever value makes it easiest for the implementation to derive the correct device virtual address.
33.7. Sparse Resource API

The APIs related to sparse resources are grouped into the following categories:

- Physical Device Features
- Physical Device Sparse Properties
- Sparse Image Format Properties
- Sparse Resource Creation
- Sparse Resource Memory Requirements
- Binding Resource Memory

33.7.1. Physical Device Features

Some sparse-resource related features are reported and enabled in \texttt{VkPhysicalDeviceFeatures}. These features \textbf{must} be supported and enabled on the \texttt{VkDevice} object before applications \textbf{can} use them. See Physical Device Features for information on how to get and set enabled device features, and for more detailed explanations of these features.

\textbf{Sparse Physical Device Features}

- \texttt{sparseBinding}: Support for creating \texttt{VkBuffer} and \texttt{VkImage} objects with the \texttt{VK_BUFFER_CREATE_SPARSE_BINDING_BIT} and \texttt{VK_IMAGE_CREATE_SPARSE_BINDING_BIT} flags, respectively.
- \texttt{sparseResidencyBuffer}: Support for creating \texttt{VkBuffer} objects with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag.
- \texttt{sparseResidencyImage2D}: Support for creating 2D single-sampled \texttt{VkImage} objects with \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidencyImage3D}: Support for creating 3D \texttt{VkImage} objects with \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidency2Samples}: Support for creating 2D \texttt{VkImage} objects with 2 samples and \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidency4Samples}: Support for creating 2D \texttt{VkImage} objects with 4 samples and \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidency8Samples}: Support for creating 2D \texttt{VkImage} objects with 8 samples and \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidency16Samples}: Support for creating 2D \texttt{VkImage} objects with 16 samples and \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}.
- \texttt{sparseResidencyAliased}: Support for creating \texttt{VkBuffer} and \texttt{VkImage} objects with the \texttt{VK_BUFFER_CREATE_SPARSE_ALIASED_BIT} and \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT} flags, respectively.

33.7.2. Physical Device Sparse Properties

Some features of the implementation are not possible to disable, and are reported to allow applications to alter their sparse resource usage accordingly. These read-only capabilities are
reported in the `VkPhysicalDeviceProperties::sparseProperties` member, which is a `VkPhysicalDeviceSparseProperties` structure.

The `VkPhysicalDeviceSparseProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceSparseProperties {
    VkBool32 residencyStandard2DBlockShape;
    VkBool32 residencyStandard2DMultisampleBlockShape;
    VkBool32 residencyStandard3DBlockShape;
    VkBool32 residencyAlignedMipSize;
    VkBool32 residencyNonResidentStrict;
} VkPhysicalDeviceSparseProperties;
```

- `residencyStandard2DBlockShape` is `VK_TRUE` if the physical device will access all single-sample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for single-sample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyStandard2DMultisampleBlockShape` is `VK_TRUE` if the physical device will access all multisample 2D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (MSAA) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for multisample 2D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyStandard3DBlockShape` is `VK_TRUE` if the physical device will access all 3D sparse resources using the standard sparse image block shapes (based on image format), as described in the Standard Sparse Image Block Shapes (Single Sample) table. If this property is not supported, the value returned in the `imageGranularity` member of the `VkSparseImageFormatProperties` structure for 3D images is not required to match the standard sparse image block dimensions listed in the table.

- `residencyAlignedMipSize` is `VK_TRUE` if images with mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block may be placed in the mip tail. If this property is not reported, only mip levels with dimensions smaller than the `imageGranularity` member of the `VkSparseImageFormatProperties` structure will be placed in the mip tail. If this property is reported the implementation is allowed to return `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` in the flags member of `VkSparseImageFormatProperties`, indicating that mip level dimensions that are not integer multiples of the corresponding dimensions of the sparse image block will be placed in the mip tail.

- `residencyNonResidentStrict` specifies whether the physical device can consistently access non-resident regions of a resource. If this property is `VK_TRUE`, access to non-resident regions of resources will be guaranteed to return values as if the resource was populated with 0; writes to non-resident regions will be discarded.
33.7.3. Sparse Image Format Properties

Given that certain aspects of sparse image support, including the sparse image block dimensions, may be implementation-dependent, `vkGetPhysicalDeviceSparseImageFormatProperties` can be used to query for sparse image format properties prior to resource creation. This command is used to check whether a given set of sparse image parameters is supported and what the sparse image block shape will be.

Sparse Image Format Properties API

The `VkSparseImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageFormatProperties {
    VkImageAspectFlags aspectMask;
    VkExtent3D imageGranularity;
    VkSparseImageFormatFlags flags;
} VkSparseImageFormatProperties;
```

- `aspectMask` is a bitmask `VkImageAspectFlagBits` specifying which aspects of the image the properties apply to.
- `imageGranularity` is the width, height, and depth of the sparse image block in texels or compressed texel blocks.
- `flags` is a bitmask of `VkSparseImageFormatFlagBits` specifying additional information about the sparse resource.

Bits which may be set in `VkSparseImageFormatProperties::flags`, specifying additional information about the sparse resource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSparseImageFormatFlagBits {
    VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT = 0x00000001,
    VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT = 0x00000002,
    VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT = 0x00000004,
} VkSparseImageFormatFlagBits;
```

- `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` specifies that the image uses a single mip tail region for all array layers.
- `VK_SPARSE_IMAGE_FORMAT_ALIGNED_MIP_SIZE_BIT` specifies that the first mip level whose dimensions are not integer multiples of the corresponding dimensions of the sparse image block begins the mip tail region.
- `VK_SPARSE_IMAGE_FORMAT_NONSTANDARD_BLOCK_SIZE_BIT` specifies that the image uses non-standard sparse image block dimensions, and the `imageGranularity` values do not match the standard sparse image block dimensions for the given format.
typedef VkFlags VkSparseImageFormatFlags;

VkSparseImageFormatFlags is a bitmask type for setting a mask of zero or more VkSparseImageFormatFlagBits.

vkGetPhysicalDeviceSparseImageFormatProperties returns an array of VkSparseImageFormatProperties. Each element describes properties for one set of image aspects that are bound simultaneously for a VkImage created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.

void vkGetPhysicalDeviceSparseImageFormatProperties(
    VkPhysicalDevice physicalDevice, 
    VkFormat format, 
    VkImageType type, 
    VkSampleCountFlagBits samples, 
    VkImageUsageFlags usage, 
    VkImageTiling tiling, 
    uint32_t* pPropertyCount, 
    VkSparseImageFormatProperties* pProperties);

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **format** is the image format.
- **type** is the dimensionality of the image.
- **samples** is a VkSampleCountFlagBits value specifying the number of samples per texel.
- **usage** is a bitmask describing the intended usage of the image.
- **tiling** is the tiling arrangement of the texel blocks in memory.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either NULL or a pointer to an array of VkSparseImageFormatProperties structures.

If pProperties is NULL, then the number of sparse format properties available is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If pPropertyCount is less than the number of sparse format properties available, at most pPropertyCount structures will be written.

If VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT is not supported for the given arguments, pPropertyCount will be set to zero upon return, and no data will be written to pProperties.

Multiple aspects are returned for depth/stencil images that are implemented as separate planes by the implementation. The depth and stencil data planes each have unique
VkSparseImageFormatProperties data.

Depth/stencil images with depth and stencil data interleaved into a single plane will return a single VkSparseImageFormatProperties structure with the aspectMask set to VK_IMAGE_ASPECT_DEPTH_BIT | VK_IMAGE_ASPECT_STENCIL_BIT.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-01094**
  - `samples` must be a valid VkSampleCountFlagBits value that is set in VkImageFormatProperties::sampleCounts returned by vkGetPhysicalDeviceImageFormatProperties with format, type, tiling, and usage equal to those in this command

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-physicalDevice-parameter**
  - `physicalDevice` must be a valid VkPhysicalDevice handle
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-format-parameter**
  - `format` must be a valid VkFormat value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-type-parameter**
  - `type` must be a valid VkImageType value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-samples-parameter**
  - `samples` must be a valid VkSampleCountFlagBits value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-parameter**
  - `usage` must be a valid combination of VkImageUsageFlagBits values
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-usage-requiredbitsetmask**
  - `usage` must not be 0
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-tiling-parameter**
  - `tiling` must be a valid VkImageTiling value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pPropertyCount-parameter**
  - `pPropertyCount` must be a valid pointer to a uint32_t value
- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties-pProperties-parameter**
  - If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of pPropertyCount VkSparseImageFormatProperties structures

vkGetPhysicalDeviceSparseImageFormatProperties2 returns an array of VkSparseImageFormatProperties2. Each element describes properties for one set of image aspects that are bound simultaneously for a VkImage created with the provided image creation parameters. This is usually one element for each aspect in the image, but for interleaved depth/stencil images there is only one element describing the combined aspects.
**void vkGetPhysicalDeviceSparseImageFormatProperties2**

```c
VkPhysicalDevice physicalDevice,
const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
uint32_t* pPropertyCount,
VkSparseImageFormatProperties2* pProperties);
```

or the equivalent command

**void vkGetPhysicalDeviceSparseImageFormatProperties2KHR**

```c
VkPhysicalDevice physicalDevice,
const VkPhysicalDeviceSparseImageFormatInfo2* pFormatInfo,
uint32_t* pPropertyCount,
VkSparseImageFormatProperties2* pProperties);
```

- **physicalDevice** is the physical device from which to query the sparse image format properties.
- **pFormatInfo** is a pointer to a `VkPhysicalDeviceSparseImageFormatInfo2` structure containing input parameters to the command.
- **pPropertyCount** is a pointer to an integer related to the number of sparse format properties available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of `VkSparseImageFormatProperties2` structures.

`vkGetPhysicalDeviceSparseImageFormatProperties2` behaves identically to `vkGetPhysicalDeviceSparseImageFormatProperties`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pProperties` parameter.

---

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-physicalDevice-parameter**
  `physicalDevice` *must* be a valid `VkPhysicalDevice` handle

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pFormatInfo-parameter**
  `pFormatInfo` *must* be a valid pointer to a valid `VkPhysicalDeviceSparseImageFormatInfo2` structure

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pPropertyCount-parameter**
  `pPropertyCount` *must* be a valid pointer to a `uint32_t` value

- **VUID-vkGetPhysicalDeviceSparseImageFormatProperties2-pProperties-parameter**
  If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not **NULL**, `pProperties` *must* be a valid pointer to an array of `pPropertyCount` `VkSparseImageFormatProperties2` structures

The `VkPhysicalDeviceSparseImageFormatInfo2` structure is defined as:
typedef struct VkPhysicalDeviceSparseImageFormatInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkImageType type;
    VkSampleCountFlagBits samples;
    VkImageUsageFlags usage;
    VkImageTiling tiling;
} VkPhysicalDeviceSparseImageFormatInfo2;

or the equivalent

typedef VkPhysicalDeviceSparseImageFormatInfo2 VkPhysicalDeviceSparseImageFormatInfo2KHR;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **format** is the image format.

• **type** is the dimensionality of the image.

• **samples** is a `VkSampleCountFlagBits` value specifying the number of samples per texel.

• **usage** is a bitmask describing the intended usage of the image.

• **tiling** is the tiling arrangement of the texel blocks in memory.

### Valid Usage

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-01095**

  samples **must** be a valid `VkSampleCountFlagBits` value that is set in `VkImageFormatProperties::sampleCounts` returned by `vkGetPhysicalDeviceImageFormatProperties` with **format**, **type**, **tiling**, and **usage** equal to those in this command

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-sType-sType**

  **sType** **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SPARSE_IMAGE_FORMAT_INFO_2`

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-pNext-pNext**

  **pNext** **must** be **NULL**

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-format-parameter**

  **format** **must** be a valid `VkFormat` value

- **VUID-VkPhysicalDeviceSparseImageFormatInfo2-type-parameter**

  **type** **must** be a valid `VkImageType` value
type must be a valid VkImageType value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-samples-parameter
  samples must be a valid VkSampleCountFlagBits value

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-usage-requiredbitmask
  usage must not be 0

- VUID-VkPhysicalDeviceSparseImageFormatInfo2-tiling-parameter
  tiling must be a valid VkImageTiling value

The VkSparseImageFormatProperties2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageFormatProperties properties;
} VkSparseImageFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkSparseImageFormatProperties2 VkSparseImageFormatProperties2KHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- properties is a VkSparseImageFormatProperties structure which is populated with the same values as in vkGetPhysicalDeviceSparseImageFormatProperties.

### Valid Usage (Implicit)

- VUID-VkSparseImageFormatProperties2-sType-sType
  sType must be VK_STRUCTURE_TYPE_SPARSE_IMAGE_FORMAT_PROPERTIES_2

- VUID-VkSparseImageFormatProperties2-pNext-pNext
  pNext must be NULL

### 33.7.4. Sparse Resource Creation

Sparse resources require that one or more sparse feature flags be specified (as part of the VkPhysicalDeviceFeatures structure described previously in the Physical Device Features section) when calling vkCreateDevice. When the appropriate device features are enabled, the VK_BUFFER_CREATE_SPARSE_* and VK_IMAGE_CREATE_SPARSE_* flags can be used. See vkCreateBuffer and

2950
vkCreateImage for details of the resource creation APIs.

Note

Specifying VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT or VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT requires specifying VK_BUFFER_CREATE_SPARSE_BINDING_BIT or VK_IMAGE_CREATE_SPARSE_BINDING_BIT, respectively, as well. This means that resources must be created with the appropriate *_SPARSE_BINDING_BIT to be used with the sparse binding command (vkQueueBindSparse).

33.7.5. Sparse Resource Memory Requirements

Sparse resources have specific memory requirements related to binding sparse memory. These memory requirements are reported differently for VkBuffer objects and VkImage objects.

Buffer and Fully-Resident Images

Buffers (both fully and partially resident) and fully-resident images can be bound to memory using only the data from VkMemoryRequirements. For all sparse resources the VkMemoryRequirements::alignment member specifies both the bindable sparse block size in bytes and required alignment of VkDeviceMemory.

Partially Resident Images

Partially resident images have a different method for binding memory. As with buffers and fully resident images, the VkMemoryRequirements::alignment field specifies the bindable sparse block size in bytes for the image.

Requesting sparse memory requirements for VkImage objects using vkGetImageSparseMemoryRequirements will return an array of one or more VkSparseImageMemoryRequirements structures. Each structure describes the sparse memory requirements for a group of aspects of the image.

The sparse image must have been created using the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag to retrieve valid sparse image memory requirements.

Sparse Image Memory Requirements

The VkSparseImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryRequirements {
    VkSparseImageFormatProperties formatProperties;
    uint32_t imageMipTailFirstLod;
    VkDeviceSize imageMipTailSize;
    VkDeviceSize imageMipTailOffset;
    VkDeviceSize imageMipTailStride;
} VkSparseImageMemoryRequirements;
```
• **formatProperties** is a `VkSparseImageFormatProperties` structure specifying properties of the image format.

• **imageMipTailFirstLod** is the first mip level at which image subresources are included in the mip tail region.

• **imageMipTailSize** is the memory size (in bytes) of the mip tail region. If `formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`, this is the size of the whole mip tail, otherwise this is the size of the mip tail of a single array layer. This value is guaranteed to be a multiple of the sparse block size in bytes.

• **imageMipTailOffset** is the opaque memory offset used with `VkSparseImageOpaqueMemoryBindInfo` to bind the mip tail region(s).

• **imageMipTailStride** is the offset stride between each array-layer’s mip tail, if `formatProperties.flags` does not contain `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT` (otherwise the value is undefined).

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSparseMemoryRequirements(
    VkDevice device,
    VkImage image,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements* pSparseMemoryRequirements);
```

• **device** is the logical device that owns the image.

• **image** is the `VkImage` object to get the memory requirements for.

• **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.

• **pSparseMemoryRequirements** is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements` structures.

If `pSparseMemoryRequirements` is `NULL`, then the number of sparse memory requirements available is returned in `pSparseMemoryRequirementCount`. Otherwise, `pSparseMemoryRequirementCount` must point to a variable set by the user to the number of elements in the `pSparseMemoryRequirements` array, and on return the variable is overwritten with the number of structures actually written to `pSparseMemoryRequirements`. If `pSparseMemoryRequirementCount` is less than the number of sparse memory requirements available, at most `pSparseMemoryRequirementCount` structures will be written.

If the image was not created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` then `pSparseMemoryRequirementCount` will be set to zero and `pSparseMemoryRequirements` will not be written to.

**Note**

It is legal for an implementation to report a larger value in `VkMemoryRequirements::size` than would be obtained by adding together memory sizes for all `VkSparseImageMemoryRequirements` returned by `vkGetImageSparseMemoryRequirements`. 

2952
This may occur when the implementation requires unused padding in the address range describing the resource.

Valid Usage (Implicit)

- VUID-vkGetImageSparseMemoryRequirements-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetImageSparseMemoryRequirements-image-parameter
image must be a valid VkImage handle

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter
pSparseMemoryRequirementCount must be a valid pointer to a uint32_t value

- VUID-vkGetImageSparseMemoryRequirements-pSparseMemoryRequirements-parameter
If the value referenced by pSparseMemoryRequirementCount is not 0, and pSparseMemoryRequirements is not NULL, pSparseMemoryRequirements must be a valid pointer to an array of pSparseMemoryRequirementCount VkSparseImageMemoryRequirements structures

- VUID-vkGetImageSparseMemoryRequirements-image-parent
image must have been created, allocated, or retrieved from device

To query sparse memory requirements for an image, call:

```c
// Provided by VK_VERSION_1_1
def void vkGetImageSparseMemoryRequirements2(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
def void vkGetImageSparseMemoryRequirements2KHR(
    VkDevice device,
    const VkImageSparseMemoryRequirementsInfo2* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- device is the logical device that owns the image.
- pInfo is a pointer to a VkImageSparseMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- pSparseMemoryRequirementCount is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
*pSparseMemoryRequirements* is either **NULL** or a pointer to an array of **VkSparseImageMemoryRequirements2** structures.

### Valid Usage (Implicit)

- **VUID-vkGetImageSparseMemoryRequirements2-device-parameter**
  *device* **must** be a valid **VkDevice** handle.

- **VUID-vkGetImageSparseMemoryRequirements2-pInfo-parameter**
  *pInfo* **must** be a valid pointer to a valid **VkImageSparseMemoryRequirementsInfo2** structure.

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirementCount-parameter**
  *pSparseMemoryRequirementCount** must** be a valid pointer to a uint32_t value.

- **VUID-vkGetImageSparseMemoryRequirements2-pSparseMemoryRequirements-parameter**
  If the value referenced by *pSparseMemoryRequirementCount* is not 0, and *pSparseMemoryRequirements* is not NULL, *pSparseMemoryRequirements** must** be a valid pointer to an array of **VkSparseImageMemoryRequirements2** structures.

To determine the sparse memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageSparseMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageSparseMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    uint32_t* pSparseMemoryRequirementCount,
    VkSparseImageMemoryRequirements2* pSparseMemoryRequirements);
```

- **device** is the logical device intended to own the image.

- **pInfo** is a pointer to a **VkDeviceImageMemoryRequirements** structure containing parameters required for the memory requirements query.

- **pSparseMemoryRequirementCount** is a pointer to an integer related to the number of sparse memory requirements available or queried, as described below.
• `pSparseMemoryRequirements` is either `NULL` or a pointer to an array of `VkSparseImageMemoryRequirements2` structures.

---

### Valid Usage (Implicit)

- **VUID-vkGetDeviceImageSparseMemoryRequirements-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkGetDeviceImageSparseMemoryRequirements-pInfo-parameter**
  
  `pInfo` **must** be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure.

- **VUID-vkGetDeviceImageSparseMemoryRequirements-pSparseMemoryRequirementCount-parameter**
  
  If the value referenced by `pSparseMemoryRequirementCount` is not 0, and `pSparseMemoryRequirements` is not `NULL`, `pSparseMemoryRequirements` **must** be a valid pointer to an array of `pSparseMemoryRequirementCount` `VkSparseImageMemoryRequirements2` structures.

---

The `VkImageSparseMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageSparseMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageSparseMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageSparseMemoryRequirementsInfo2 VkImageSparseMemoryRequirementsInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

---

### Valid Usage (Implicit)

- **VUID-VkImageSparseMemoryRequirementsInfo2-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_SPARSE_MEMORY_REQUIREMENTS_INFO_2`.

- **VUID-VkImageSparseMemoryRequirementsInfo2-pNext-pNext**
  
  `pNext` **must** be `NULL`.

---

The `VkSparseImageMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSparseImageMemoryRequirements2 {
    VkStructureType sType;
    void* pNext;
    VkSparseImageMemoryRequirements memoryRequirements;
} VkSparseImageMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkSparseImageMemoryRequirements2 VkSparseImageMemoryRequirements2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkSparseImageMemoryRequirements` structure describing the memory requirements of the sparse image.

**Valid Usage (Implicit)**

- VUID-VkSparseImageMemoryRequirements2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SPARSE_IMAGE_MEMORY_REQUIREMENTS_2`
- VUID-VkSparseImageMemoryRequirements2-pNext-pNext
  `pNext` must be NULL

### 33.7.6. Binding Resource Memory

Non-sparse resources are backed by a single physical allocation prior to device use (via `vkBindImageMemory` or `vkBindBufferMemory`), and their backing must not be changed. On the other hand, sparse resources *can* be bound to memory non-contiguously and these bindings *can* be altered during the lifetime of the resource.

**Note**

It is important to note that freeing a `VkDeviceMemory` object with `vkFreeMemory` will not cause resources (or resource regions) bound to the memory object to become unbound. Applications must not access resources bound to memory that has been freed.

Sparse memory bindings execute on a queue that includes the `VK_QUEUE_SPARSE_BINDING_BIT` bit.
Applications **must** use **synchronization primitives** to guarantee that other queues do not access ranges of memory concurrently with a binding change. Applications **can** access other ranges of the same resource while a bind operation is executing.

**Note**

Implementations **must** provide a guarantee that simultaneously binding sparse blocks while another queue accesses those same sparse blocks via a sparse resource **must** not access memory owned by another process or otherwise corrupt the system.

While some implementations **may** include **VK_QUEUE_SPARSE_BINDING_BIT** support in queue families that also include graphics and compute support, other implementations **may** only expose a **VK_QUEUE_SPARSE_BINDING_BIT**-only queue family. In either case, applications **must** use **synchronization primitives** to explicitly request any ordering dependencies between sparse memory binding operations and other graphics/compute/transfer operations, as sparse binding operations are not automatically ordered against command buffer execution, even within a single queue.

When binding memory explicitly for the **VK_IMAGE_ASPECT_METADATA_BIT** the application **must** use the **VK_SPARSE_MEMORY_BIND_METADATA_BIT** in the VkSparseMemoryBind::flags field when binding memory. Binding memory for metadata is done the same way as binding memory for the mip tail, with the addition of the **VK_SPARSE_MEMORY_BIND_METADATA_BIT** flag.

Binding the mip tail for any aspect **must** only be performed using VkSparseImageOpaqueMemoryBindInfo. If **formatProperties.flags** contains **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT**, then it **can** be bound with a single VkSparseMemoryBind structure, with **resourceOffset** = **imageMipTailOffset** and **size** = **imageMipTailSize**.

If **formatProperties.flags** does not contain **VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT** then the offset for the mip tail in each array layer is given as:

```
arrayMipTailOffset = imageMipTailOffset + arrayLayer * imageMipTailStride;
```

and the mip tail **can** be bound with **layerCount** VkSparseMemoryBind structures, each using **size** = **imageMipTailSize** and **resourceOffset** = **arrayMipTailOffset** as defined above.

Sparse memory binding is handled by the following APIs and related data structures.

**Sparse Memory Binding Functions**

The **VkSparseMemoryBind** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseMemoryBind {
    VkDeviceSize resourceOffset;
    VkDeviceSize size;
    VkDeviceMemory memory;
};
```
• `resourceOffset` is the offset into the resource.
• `size` is the size of the memory region to be bound.
• `memory` is the `VkDeviceMemory` object that the range of the resource is bound to. If `memory` is `VK_NULL_HANDLE`, the range is unbound.
• `memoryOffset` is the offset into the `VkDeviceMemory` object to bind the resource range to. If `memory` is `VK_NULL_HANDLE`, this value is ignored.
• `flags` is a bitmask of `VkSparseMemoryBindFlagBits` specifying usage of the binding operation.

The binding range `[resourceOffset, resourceOffset + size)` has different constraints based on `flags`. If `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the mip tail region of the metadata aspect. This metadata region is defined by:

```
metadataRegion = [base, base + imageSizeMipTailSize]
```

```
base = imageSizeMipTailOffset + imageSizeMipTailStride × n
```

and `imageMipTailOffset`, `imageSizeMipTailSize`, and `imageMipTailStride` values are from the `VkSparseImageMemoryRequirements` corresponding to the metadata aspect of the image, and `n` is a valid array layer index for the image.

`imageMipTailStride` is considered to be zero for aspects where `VkSparseImageMemoryRequirements::formatProperties.flags` contains `VK_SPARSE_IMAGE_FORMAT_SINGLE_MIPTAIL_BIT`.

If `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range must be within the range `[0, VkMemoryRequirements::size)`.

**Valid Usage**

- **VUID-VkSparseMemoryBind-memory-01096**
  If `memory` is not `VK_NULL_HANDLE`, `memory` and `memoryOffset` must match the memory requirements of the resource, as described in section Resource Memory Association.

- **VUID-VkSparseMemoryBind-resourceOffset-09491**
  If the resource being bound is a `VkBuffer`, `resourceOffset` and `memoryOffset` must be an integer multiple of the alignment of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with the buffer resource.

- **VUID-VkSparseMemoryBind-resourceOffset-09492**
  If the resource being bound is a `VkImage`, `resourceOffset` and `memoryOffset` must be an integer multiple of the alignment of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the image resource.
• **VUID-VkSparseMemoryBind-memory-01097**
If `memory` is not `VK_NULL_HANDLE`, `memory` must not have been created with a memory type that reports `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

• **VUID-VkSparseMemoryBind-size-01098**
  
  `size` must be greater than 0

• **VUID-VkSparseMemoryBind-resourceOffset-01099**
  
  `resourceOffset` must be less than the size of the resource

• **VUID-VkSparseMemoryBind-size-01100**
  
  `size` must be less than or equal to the size of the resource minus `resourceOffset`

• **VUID-VkSparseMemoryBind-memoryOffset-01101**
  
  `memoryOffset` must be less than the size of `memory`

• **VUID-VkSparseMemoryBind-size-01102**
  
  `size` must be less than or equal to the size of `memory` minus `memoryOffset`

• **VUID-VkSparseMemoryBind-memory-02730**
If `memory` was created with `VkExportMemoryAllocateInfo::handleTypes` not equal to 0, at least one handle type it contained must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

• **VUID-VkSparseMemoryBind-memory-02731**
If `memory` was created by a memory import operation, the external handle type of the imported memory must also have been set in `VkExternalMemoryBufferCreateInfo::handleTypes` or `VkExternalMemoryImageCreateInfo::handleTypes` when the resource was created.

---

**Valid Usage (Implicit)**

• **VUID-VkSparseMemoryBind-memory-parameter**
If `memory` is not `VK_NULL_HANDLE`, `memory` must be a valid `VkDeviceMemory` handle

• **VUID-VkSparseMemoryBind-flags-parameter**
  
  `flags` must be a valid combination of `VkSparseMemoryBindFlagBits` values

Bits which can be set in `VkSparseMemoryBind::flags`, specifying usage of a sparse memory binding operation, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkSparseMemoryBindFlagBits {
    VK_SPARSE_MEMORY_BIND_METADATA_BIT = 0x00000001,
} VkSparseMemoryBindFlagBits;
```

• `VK_SPARSE_MEMORY_BIND_METADATA_BIT` specifies that the memory being bound is only for the metadata aspect.
typedef VkFlags VkSparseMemoryBindFlags;

VkSparseMemoryBindFlags is a bitmask type for setting a mask of zero or more VkSparseMemoryBindFlagBits.

Memory is bound to VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT flag using the following structure:

```c
typedef struct VkSparseBufferMemoryBindInfo {
    VkBuffer buffer;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseBufferMemoryBindInfo;
```

- **buffer** is the VkBuffer object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.

Valid Usage (Implicit)

- VUID-VkSparseBufferMemoryBindInfo-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-VkSparseBufferMemoryBindInfo-pBinds-parameter
  pBinds must be a valid pointer to an array of bindCount valid VkSparseMemoryBind structures
- VUID-VkSparseBufferMemoryBindInfo-bindCount-arraylength
  bindCount must be greater than 0

Memory is bound to opaque regions of VkImage objects created with the VK_IMAGE_CREATE_SPARSE_BINDING_BIT flag using the following structure:

```c
typedef struct VkSparseImageOpaqueMemoryBindInfo {
    VkImage image;
    uint32_t bindCount;
    const VkSparseMemoryBind* pBinds;
} VkSparseImageOpaqueMemoryBindInfo;
```

- **image** is the VkImage object to be bound.
- **bindCount** is the number of VkSparseMemoryBind structures in the pBinds array.
- **pBinds** is a pointer to an array of VkSparseMemoryBind structures.
Valid Usage

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-01103
  If the `flags` member of any element of `pBinds` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range defined must be within the mip tail region of the metadata aspect of `image`.

Valid Usage (Implicit)

- VUID-VkSparseImageOpaqueMemoryBindInfo-image-parameter
  `image` must be a valid `VkImage` handle.

- VUID-VkSparseImageOpaqueMemoryBindInfo-pBinds-parameter
  `pBinds` must be a valid pointer to an array of `bindCount` valid `VkSparseMemoryBind` structures.

- VUID-VkSparseImageOpaqueMemoryBindInfo-bindCount-arraylength
  `bindCount` must be greater than 0.

Note

This operation is normally used to bind memory to fully-resident sparse images or for mip tail regions of partially resident images. However, it can also be used to bind memory for the entire binding range of partially resident images.

In case `flags` does not contain `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the `resourceOffset` is in the range `[0, VkMemoryRequirements::size)`. This range includes data from all aspects of the image, including metadata. For most implementations this will probably mean that the `resourceOffset` is a simple device address offset within the resource. It is possible for an application to bind a range of memory that includes both resource data and metadata. However, the application would not know what part of the image the memory is used for, or if any range is being used for metadata.

When `flags` contains `VK_SPARSE_MEMORY_BIND_METADATA_BIT`, the binding range specified must be within the mip tail region of the metadata aspect. In this case the `resourceOffset` is not required to be a simple device address offset within the resource. However, it is defined to be within `[imageMipTailOffset, imageMipTailOffset + imageMipTailSize)` for the metadata aspect. See `VkSparseMemoryBind` for the full constraints on binding region with this flag present.

Memory can be bound to sparse image blocks of `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag using the following structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBindInfo {
```
VkImage
uint32_t bindCount;
const VkSparseImageMemoryBind* pBinds;
} VkSparseImageMemoryBindInfo;

- **image** is the **VkImage** object to be bound
- **bindCount** is the number of **VkSparseImageMemoryBind** structures in **pBinds** array
- **pBinds** is a pointer to an array of **VkSparseImageMemoryBind** structures

### Valid Usage

- **VUID-VkSparseImageMemoryBindInfo-subresource-01722**
  The `subresource.mipLevel` member of each element of **pBinds** must be less than the `mipLevels` specified in **VkImageCreateInfo** when **image** was created

- **VUID-VkSparseImageMemoryBindInfo-subresource-01723**
  The `subresource.arrayLayer` member of each element of **pBinds** must be less than the `arrayLayers` specified in **VkImageCreateInfo** when **image** was created

- **VUID-VkSparseImageMemoryBindInfo-image-02901**
  **image** must have been created with **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** set

### Valid Usage (Implicit)

- **VUID-VkSparseImageMemoryBindInfo-image-parameter**
  **image** must be a valid **VkImage** handle

- **VUID-VkSparseImageMemoryBindInfo-pBinds-parameter**
  **pBinds** must be a valid pointer to an array of **bindCount** valid **VkSparseImageMemoryBind** structures

- **VUID-VkSparseImageMemoryBindInfo-bindCount-arraylength**
  **bindCount** must be greater than 0

The **VkSparseImageMemoryBind** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSparseImageMemoryBind {
    VkImageSubresource subresource;
    VkOffset3D offset;
    VkExtent3D extent;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkSparseMemoryBindFlags flags;
} VkSparseImageMemoryBind;
```

- **subresource** is the image **aspect** and region of interest in the image.
• **offset** are the coordinates of the first texel within the image subresource to bind.

• **extent** is the size in texels of the region within the image subresource to bind. The extent **must** be a multiple of the sparse image block dimensions, except when binding sparse image blocks along the edge of an image subresource it **can** instead be such that any coordinate of **offset + extent** equals the corresponding dimensions of the image subresource.

• **memory** is the VkDeviceMemory object that the sparse image blocks of the image are bound to. If **memory** is VK_NULL_HANDLE, the sparse image blocks are unbound.

• **memoryOffset** is an offset into VkDeviceMemory object. If **memory** is VK_NULL_HANDLE, this value is ignored.

• **flags** are sparse memory binding flags.

---

**Valid Usage**

• VUID-VkSparseImageMemoryBind-memory-01104
  If the sparseResidencyAliased feature is not enabled, and if any other resources are bound to ranges of **memory**, the range of **memory** being bound **must** not overlap with those bound ranges

• VUID-VkSparseImageMemoryBind-memory-01105
  **memory** and **memoryOffset** **must** match the memory requirements of the calling command’s image, as described in section Resource Memory Association

• VUID-VkSparseImageMemoryBind-subresource-01106
  **subresource** **must** be a valid image subresource for image (see Image Views)

• VUID-VkSparseImageMemoryBind-offset-01107
  **offset.x** **must** be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of the image

• VUID-VkSparseImageMemoryBind-extent-09388
  **extent.width** **must** be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01108
  **extent.width** **must** either be a multiple of the sparse image block width of the image, or else (**extent.width + offset.x**) **must** equal the width of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01109
  **offset.y** **must** be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of the image

• VUID-VkSparseImageMemoryBind-extent-09389
  **extent.height** **must** be greater than 0

• VUID-VkSparseImageMemoryBind-extent-01110
  **extent.height** **must** either be a multiple of the sparse image block height of the image, or else (**extent.height + offset.y**) **must** equal the height of the image subresource

• VUID-VkSparseImageMemoryBind-offset-01111
  **offset.z** **must** be a multiple of the sparse image block depth (VkSparseImageFormatProperties::imageGranularity.depth) of the image

• VUID-VkSparseImageMemoryBind-extent-09390
**Valid Usage (Implicit)**

- VUID-VkSparseImageMemoryBind-subresource-parameter
  subresource must be a valid VkImageSubresource structure

- VUID-VkSparseImageMemoryBind-memory-parameter
  If memory is not VK_NULL_HANDLE, memory must be a valid VkDeviceMemory handle

- VUID-VkSparseImageMemoryBind-flags-parameter
  flags must be a valid combination of VkSparseMemoryBindFlagBits values

To submit sparse binding operations to a queue, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkQueueBindSparse(
    VkQueue queue,
    uint32_t bindInfoCount,
    const VkBindSparseInfo* pBindInfo,
    VkFence fence);
```

- queue is the queue that the sparse binding operations will be submitted to.
- bindInfoCount is the number of elements in the pBindInfo array.
- pBindInfo is a pointer to an array of VkBindSparseInfo structures, each specifying a sparse binding submission batch.
- fence is an optional handle to a fence to be signaled. If fence is not VK_NULL_HANDLE, it defines a fence signal operation.

vkQueueBindSparse is a queue submission command, with each batch defined by an element of pBindInfo as a VkBindSparseInfo structure. Batches begin execution in the order they appear in pBindInfo, but may complete out of order.

Within a batch, a given range of a resource must not be bound more than once. Across batches, if a
range is to be bound to one allocation and offset and then to another allocation and offset, then the
application must guarantee (usually using semaphores) that the binding operations are executed in
the correct order, as well as to order binding operations against the execution of command buffer
submissions.

As no operation to vkQueueBindSparse causes any pipeline stage to access memory,
synchronization primitives used in this command effectively only define execution dependencies.

Additional information about fence and semaphore operation is described in the synchronization
chapter.

Valid Usage

- VUID-vkQueueBindSparse-fence-01113
  If fence is not VK_NULL_HANDLE, fence must be unsignaled

- VUID-vkQueueBindSparse-fence-01114
  If fence is not VK_NULL_HANDLE, fence must not be associated with any other queue
  command that has not yet completed execution on that queue

- VUID-vkQueueBindSparse-pSignalSemaphores-01115
  Each element of the pSignalSemaphores member of each element of pBindInfo must be
  unsignaled when the semaphore signal operation it defines is executed on the device

- VUID-vkQueueBindSparse-pWaitSemaphores-01116
  When a semaphore wait operation referring to a binary semaphore defined by any
  element of the pWaitSemaphores member of any element of pBindInfo executes on queue,
  there must be no other queues waiting on the same semaphore

- VUID-vkQueueBindSparse-pWaitSemaphores-03245
  All elements of the pWaitSemaphores member of all elements of pBindInfo referring to a
  semaphore created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY must reference
  a semaphore signal operation that has been submitted for execution and any semaphore
  signal operations on which it depends must have also been submitted for execution

Valid Usage (Implicit)

- VUID-vkQueueBindSparse-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueBindSparse-pBindInfo-parameter
  If bindInfoCount is not 0, pBindInfo must be a valid pointer to an array of bindInfoCount
  valid VkBindSparseInfo structures

- VUID-vkQueueBindSparse-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkQueueBindSparse-queuetype
  The queue must support sparse binding operations

- VUID-vkQueueBindSparse-commonparent
  Both of fence, and queue that are valid handles of non-ignored parameters must have
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to fence must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

The VkBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t bufferBindCount;
    const VkSparseBufferMemoryBindInfo* pBufferBinds;
    uint32_t signalSemaphoreCount;
    const VkSemaphore* pSignalSemaphores;
    uint32_t imageOpaqueBindCount;
    const VkSparseImageOpaqueMemoryBindInfo* pImageOpaqueBinds;
    uint32_t imageBindCount;
    const VkSparseImageMemoryBindInfo* pImageBinds;
    uint32_t imageBindCount;
} VkBindSparseInfo;
```

- `sType` is a VkStructureType value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `waitSemaphoreCount` is the number of semaphores upon which to wait before executing the sparse binding operations for the batch.
• `pWaitSemaphores` is a pointer to an array of semaphores upon which to wait on before the sparse binding operations for this batch begin execution. If semaphores to wait on are provided, they define a semaphore wait operation.
• `bufferBindCount` is the number of sparse buffer bindings to perform in the batch.
• ` pBufferBinds` is a pointer to an array of `VkSparseBufferMemoryBindInfo` structures.
• `imageOpaqueBindCount` is the number of opaque sparse image bindings to perform.
• `pImageOpaqueBinds` is a pointer to an array of `VkSparseImageOpaqueMemoryBindInfo` structures, indicating opaque sparse image bindings to perform.
• `imageBindCount` is the number of sparse image bindings to perform.
• `pImageBinds` is a pointer to an array of `VkSparseImageMemoryBindInfo` structures, indicating sparse image bindings to perform.
• `signalSemaphoreCount` is the number of semaphores to be signaled once the sparse binding operations specified by the structure have completed execution.
• `pSignalSemaphores` is a pointer to an array of semaphores which will be signaled when the sparse binding operations for this batch have completed execution. If semaphores to be signaled are provided, they define a semaphore signal operation.

**Valid Usage**

- `VUID-VkBindSparseInfo-pWaitSemaphores-03246`
  If any element of `pWaitSemaphores` or `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then the `pNext` chain must include a `VkTimelineSemaphoreSubmitInfo` structure

- `VUID-VkBindSparseInfo-pNext-03247`
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pWaitSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `waitSemaphoreValueCount` member must equal `waitSemaphoreCount`

- `VUID-VkBindSparseInfo-pNext-03248`
  If the `pNext` chain of this structure includes a `VkTimelineSemaphoreSubmitInfo` structure and any element of `pSignalSemaphores` was created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` then its `signalSemaphoreValueCount` member must equal `signalSemaphoreCount`

- `VUID-VkBindSparseInfo-pSignalSemaphores-03249`
  For each element of `pSignalSemaphores` created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` the corresponding element of `VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues` must have a value greater than the current value of the semaphore when the semaphore signal operation is executed
• VUID-VkBindSparseInfo-pWaitSemaphores-03250
For each element of \( \text{pWaitSemaphores} \) created with a \( \text{VkSemaphoreType} \) of \( \text{VK_SEMAPHORE_TYPE_TIMELINE} \) the corresponding element of \( \text{VkTimelineSemaphoreSubmitInfo::pWaitSemaphoreValues} \) must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than \( \text{maxTimelineSemaphoreValueDifference} \)

• VUID-VkBindSparseInfo-pSignalSemaphores-03251
For each element of \( \text{pSignalSemaphores} \) created with a \( \text{VkSemaphoreType} \) of \( \text{VK_SEMAPHORE_TYPE_TIMELINE} \) the corresponding element of \( \text{VkTimelineSemaphoreSubmitInfo::pSignalSemaphoreValues} \) must have a value which does not differ from the current value of the semaphore or from the value of any outstanding semaphore wait or signal operation on that semaphore by more than \( \text{maxTimelineSemaphoreValueDifference} \)

Valid Usage (Implicit)

• VUID-VkBindSparseInfo-sType-sType
\( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_BIND_SPARSE_INFO} \)

• VUID-VkBindSparseInfo-pNext-pNext
Each \( \text{pNext} \) member of any structure (including this one) in the \( \text{pNext} \) chain must be either \( \text{NULL} \) or a pointer to a valid instance of \( \text{VkDeviceGroupBindSparseInfo} \), \( \text{VkFrameBoundaryEXT} \), or \( \text{VkTimelineSemaphoreSubmitInfo} \)

• VUID-VkBindSparseInfo-sType-unique
The \( \text{sType} \) value of each struct in the \( \text{pNext} \) chain must be unique

• VUID-VkBindSparseInfo-pWaitSemaphores-parameter
If \( \text{waitSemaphoreCount} \) is not \( 0 \), \( \text{pWaitSemaphores} \) must be a valid pointer to an array of \( \text{waitSemaphoreCount} \) valid \( \text{VkSemaphore} \) handles

• VUID-VkBindSparseInfo-pBufferBinds-parameter
If \( \text{bufferBindCount} \) is not \( 0 \), \( \text{pBufferBinds} \) must be a valid pointer to an array of \( \text{bufferBindCount} \) valid \( \text{VkSparseBufferMemoryBindInfo} \) structures

• VUID-VkBindSparseInfo-pImageOpaqueBinds-parameter
If \( \text{imageOpaqueBindCount} \) is not \( 0 \), \( \text{pImageOpaqueBinds} \) must be a valid pointer to an array of \( \text{imageOpaqueBindCount} \) valid \( \text{VkSparseImageOpaqueMemoryBindInfo} \) structures

• VUID-VkBindSparseInfo-pImageBinds-parameter
If \( \text{imageBindCount} \) is not \( 0 \), \( \text{pImageBinds} \) must be a valid pointer to an array of \( \text{imageBindCount} \) valid \( \text{VkSparseImageMemoryBindInfo} \) structures

• VUID-VkBindSparseInfo-pSignalSemaphores-parameter
If \( \text{signalSemaphoreCount} \) is not \( 0 \), \( \text{pSignalSemaphores} \) must be a valid pointer to an array of \( \text{signalSemaphoreCount} \) valid \( \text{VkSemaphore} \) handles

• VUID-VkBindSparseInfo-commonparent
Both of the elements of \( \text{pSignalSemaphores} \), and the elements of \( \text{pWaitSemaphores} \) that are valid handles of non-ignored parameters must have been created, allocated, or retrieved
To specify the values to use when waiting for and signaling semaphores created with a 
VkSemaphoreType of VK_SEMAPHORE_TYPE_TIMELINE, add a VkTimelineSemaphoreSubmitInfo structure to the pNext chain of the VkBindSparseInfo structure.

If the pNext chain of VkBindSparseInfo includes a VkDeviceGroupBindSparseInfo structure, then that structure includes device indices specifying which instance of the resources and memory are bound.

The VkDeviceGroupBindSparseInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDeviceGroupBindSparseInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t resourceDeviceIndex;
    uint32_t memoryDeviceIndex;
} VkDeviceGroupBindSparseInfo;
```

or the equivalent

```c
// Provided by VK_KHR_device_group
typedef VkDeviceGroupBindSparseInfo VkDeviceGroupBindSparseInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- resourceDeviceIndex is a device index indicating which instance of the resource is bound.
- memoryDeviceIndex is a device index indicating which instance of the memory the resource instance is bound to.

These device indices apply to all buffer and image memory binds included in the batch pointing to this structure. The semaphore waits and signals for the batch are executed only by the physical device specified by the resourceDeviceIndex.

If this structure is not present, resourceDeviceIndex and memoryDeviceIndex are assumed to be zero.

**Valid Usage**

- VUID-VkDeviceGroupBindSparseInfo-resourceDeviceIndex-01118
  resourceDeviceIndex and memoryDeviceIndex must be valid device indices

- VUID-VkDeviceGroupBindSparseInfo-memoryDeviceIndex-01119
  Each memory allocation bound in this batch must have allocated an instance for memoryDeviceIndex
Valid Usage (Implicit)

- VUID-VkDeviceGroupBindSparseInfo-sType-sType
  
sType must be VK_STRUCTURE_TYPEDEVICE_GROUP_BIND_SPARSE_INFO
Chapter 34. Window System Integration (WSI)

This chapter discusses the window system integration (WSI) between the Vulkan API and the various forms of displaying the results of rendering to a user. Since the Vulkan API can be used without displaying results, WSI is provided through the use of optional Vulkan extensions. This chapter provides an overview of WSI. See the appendix for additional details of each WSI extension, including which extensions must be enabled in order to use each of the functions described in this chapter.

34.1. WSI Platform

A platform is an abstraction for a window system, OS, etc. Some examples include MS Windows, Android, and Wayland. The Vulkan API may be integrated in a unique manner for each platform.

The Vulkan API does not define any type of platform object. Platform-specific WSI extensions are defined, each containing platform-specific functions for using WSI. Use of these extensions is guarded by preprocessor symbols as defined in the Window System-Specific Header Control appendix.

In order for an application to be compiled to use WSI with a given platform, it must either:

- define the appropriate preprocessor symbol prior to including the vulkan.h header file, or
- include vulkan_core.h and any native platform headers, followed by the appropriate platform-specific header.

The preprocessor symbols and platform-specific headers are defined in the Window System Extensions and Headers table.

Each platform-specific extension is an instance extension. The application must enable instance extensions with vkCreateInstance before using them.

34.2. WSI Surface

Native platform surface or window objects are abstracted by surface objects, which are represented by VkSurfaceKHR handles:

```c
// Provided by VK_KHR_surface
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSurfaceKHR)
```

The VK_KHR_surface extension declares the VkSurfaceKHR object, and provides a function for destroying VkSurfaceKHR objects. Separate platform-specific extensions each provide a function for creating a VkSurfaceKHR object for the respective platform. From the application's perspective this is an opaque handle, just like the handles of other Vulkan objects.
On certain platforms, the Vulkan loader and ICDs may have conventions that treat the handle as a pointer to a structure containing the platform-specific information about the surface. This will be described in the documentation for the loader-ICD interface, and in the `vk_icd.h` header file of the LoaderAndTools source-code repository. This does not affect the loader-layer interface; layers may wrap `VkSurfaceKHR` objects.

### 34.2.1. Android Platform

To create a `VkSurfaceKHR` object for an Android native window, call:

```c
// Provided by VK_KHR_android_surface
VkResult vkCreateAndroidSurfaceKHR(
    VkInstance instance,
    const VkAndroidSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkAndroidSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

During the lifetime of a surface created using a particular `ANativeWindow` handle any attempts to create another surface for the same `ANativeWindow` and any attempts to connect to the same `ANativeWindow` through other platform mechanisms will fail.

**Note**

In particular, only one `VkSurfaceKHR` can exist at a time for a given window. Similarly, a native window cannot be used by both a `VkSurfaceKHR` and `EGLSurface` simultaneously.

If successful, `vkCreateAndroidSurfaceKHR` increments the `ANativeWindow`’s reference count, and `vkDestroySurfaceKHR` will decrement it.

On Android, when a swapchain’s `imageExtent` does not match the surface’s `currentExtent`, the presentable images will be scaled to the surface’s dimensions during presentation. `minImageExtent` is (1,1), and `maxImageExtent` is the maximum image size supported by the consumer. For the system compositor, `currentExtent` is the window size (i.e. the consumer’s preferred size).

**Valid Usage (Implicit)**

- VUID-vkCreateAndroidSurfaceKHR-instance-parameter
  instance must be a valid `VkInstance` handle
The `VkAndroidSurfaceCreateInfoKHR` structure is defined as:

```c
typedef struct VkAndroidSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void*pNext;
    VkAndroidSurfaceCreateFlagsKHR flags;
    struct ANativeWindow* window;
} VkAndroidSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `window` is a pointer to the `ANativeWindow` to associate the surface with.

**Valid Usage**

- VUID-VkAndroidSurfaceCreateInfoKHR-window-01248
  `window` must point to a valid Android `ANativeWindow`
To remove an unnecessary compile time dependency, an incomplete type definition of ANativeWindow is provided in the Vulkan headers:

```c
// Provided by VK_KHR_android_surface
struct ANativeWindow;
```

The actual ANativeWindow type is defined in Android NDK headers.

```c
// Provided by VK_KHR_android_surface
typedef VkFlags VkAndroidSurfaceCreateFlagsKHR;
```

VkAndroidSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.2. Wayland Platform

To create a VkSurfaceKHR object for a Wayland surface, call:

```c
// Provided by VK_KHR_wayland_surface
VkResult vkCreateWaylandSurfaceKHR(
    VkInstance instance,           // instance is the instance to associate the surface with.
    const VkWaylandSurfaceCreateInfoKHR* pCreateInfo,  // pCreateInfo is a pointer to a VkWaylandSurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
    const VkAllocationCallbacks* pAllocator,  // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
    VkSurfaceKHR* pSurface);  // pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.
```

**Valid Usage (Implicit)**

- VUID-vkCreateWaylandSurfaceKHR-instance-parameter
  - `instance` must be a valid VkInstance handle
- VUID-vkCreateWaylandSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid VkWaylandSurfaceCreateInfoKHR structure
• VUID-vkCreateWaylandSurfaceKHR-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
  `VkAllocationCallbacks` structure

• VUID-vkCreateWaylandSurfaceKHR-pSurface-parameter
  `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkWaylandSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_wayland_surface
typedef struct VkWaylandSurfaceCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkWaylandSurfaceCreateFlagsKHR flags;
  struct wl_display* display;
  struct wl_surface* surface;
} VkWaylandSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `display` and `surface` are pointers to the Wayland `wl_display` and `wl_surface` to associate the
  surface with.

### Valid Usage

- VUID-VkWaylandSurfaceCreateInfoKHR-display-01304
  `display` must point to a valid Wayland `wl_display`

- VUID-VkWaylandSurfaceCreateInfoKHR-surface-01305
  `surface` must point to a valid Wayland `wl_surface`

### Valid Usage (Implicit)

- VUID-VkWaylandSurfaceCreateInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_WAYLAND_SURFACE_CREATE_INFO_KHR

- VUID-VkWaylandSurfaceCreateInfoKHR-pNext-pNext
pNext must be NULL

- VUID-VkWaylandSurfaceCreateInfoKHR-flags-zerobitmask
flags must be 0

On Wayland, currentExtent is the special value (0xFFFFFFFF, 0xFFFFFFFF), indicating that the surface size will be determined by the extent of a swapchain targeting the surface. Whatever the application sets a swapchain’s imageExtent to will be the size of the window, after the first image is presented. minImageExtent is (1,1), and maxImageExtent is the maximum supported surface size. Any calls to vkGetPhysicalDeviceSurfacePresentModesKHR on a surface created with vkCreateWaylandSurfaceKHR are required to return VK_PRESENT_MODE_MAILBOX_KHR as one of the valid present modes.

Some Vulkan functions may send protocol over the specified wl_display connection when using a swapchain or presentable images created from a VkSurfaceKHR referring to a wl_surface. Applications must therefore ensure that both the wl_display and the wl_surface remain valid for the lifetime of any VkSwapchainKHR objects created from a particular wl_display and wl_surface. Also, calling vkQueuePresentKHR will result in Vulkan sending wl_surface.commit requests to the underlying wl_surface of each. The wl_surface.attach, wl_surface.damage, and wl_surface.commit requests must be issued by the implementation during the call to vkQueuePresentKHR and must not be issued by the implementation outside of vkQueuePresentKHR. This ensures that any Wayland requests sent by the client after the call to vkQueuePresentKHR returns will be received by the compositor after the wl_surface.commit. Regardless of the mode of swapchain creation, a new wl_event_queue must be created for each successful vkCreateWaylandSurfaceKHR call, and every Wayland object created by the implementation must be assigned to this event queue. If the platform provides Wayland 1.11 or greater, this must be implemented by the use of Wayland proxy object wrappers, to avoid race conditions.

If the application wishes to synchronize any window changes with a particular frame, such requests must be sent to the Wayland display server prior to calling vkQueuePresentKHR.

```cpp
// Provided by VK_KHR_wayland_surface
typedef VkFlags VkWaylandSurfaceCreateFlagsKHR;

VkWaylandSurfaceCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.3. Win32 Platform

To create a VkSurfaceKHR object for a Win32 window, call:

```cpp
// Provided by VK_KHR_win32_surface
VkResult vkCreateWin32SurfaceKHR(
    VkInstance instance,
    const VkWin32SurfaceCreateInfoKHR* pCreateInfo,
```
const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);

- instance is the instance to associate the surface with.
- pCreateInfo is a pointer to a VkWin32SurfaceCreateInfoKHR structure containing parameters affecting the creation of the surface object.
- pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- pSurface is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateWin32SurfaceKHR-instance-parameter instance must be a valid VkInstance handle
- VUID-vkCreateWin32SurfaceKHR-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkWin32SurfaceCreateInfoKHR structure
- VUID-vkCreateWin32SurfaceKHR-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateWin32SurfaceKHR-pSurface-parameter pSurface must be a valid pointer to a VkSurfaceKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Some Vulkan functions may call the SendMessage system API when interacting with a VkSurfaceKHR through a VkSwapchainKHR. In a multithreaded environment, calling SendMessage from a thread that is not the thread associated with pCreateInfo::hwnd will block until the application has processed the window message. Thus, applications should either call these Vulkan functions on the message pump thread, or make sure their message pump is actively running. Failing to do so may result in deadlocks.

The functions subject to this requirement are:

- vkCreateSwapchainKHR
- vkDestroySwapchainKHR
- vkAcquireNextImageKHR and vkAcquireNextImage2KHR
The VkWin32SurfaceCreateInfoKHR structure is defined as:

```c
typedef struct VkWin32SurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkWin32SurfaceCreateFlagsKHR flags;
    HINSTANCE hinstance;
    HWND hwnd;
} VkWin32SurfaceCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **hinstance** is the Win32 `HINSTANCE` for the window to associate the surface with.
- **hwnd** is the Win32 `HWND` for the window to associate the surface with.

### Valid Usage

- VUID-VkWin32SurfaceCreateInfoKHR-hinstance-01307
  
  `hinstance` must be a valid Win32 `HINSTANCE`

- VUID-VkWin32SurfaceCreateInfoKHR hwnd-01308
  
  `hwnd` must be a valid Win32 `HWND`

### Valid Usage (Implicit)

- VUID-VkWin32SurfaceCreateInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_WIN32_SURFACE_CREATE_INFO_KHR`

- VUID-VkWin32SurfaceCreateInfoKHR-pNext pNext
  
  `pNext` must be NULL

- VUID-VkWin32SurfaceCreateInfoKHR-flags-zerobitmask
  
  `flags` must be 0

With Win32, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of a Win32 surface must have both `width` and `height` greater than 0, or both of
Note

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size **may** become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain **cannot** be created until the size changes.

```c
// Provided by VK_KHR_win32_surface
typedef VkFlags VkWin32SurfaceCreateFlagsKHR;
```

`VkWin32SurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.4. XCB Platform

To create a `VkSurfaceKHR` object for an X11 window, using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkResult vkCreateXcbSurfaceKHR(
    VkInstance instance,
    const VkXcbSurfaceCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkXcbSurfaceCreateInfoKHR` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateXcbSurfaceKHR-instance-parameter
  - `instance` must be a valid `VkInstance` handle
- VUID-vkCreateXcbSurfaceKHR-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkXcbSurfaceCreateInfoKHR` structure
- VUID-vkCreateXcbSurfaceKHR-pAllocator-parameter
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
The `VkXcbSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xcb_surface
typedef struct VkXcbSurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkXcbSurfaceCreateFlagsKHR flags;
    xcb_connection_t* connection;
    xcb_window_t window;
} VkXcbSurfaceCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `window` is the `xcb_window_t` for the X11 window to associate the surface with.

**Valid Usage**

- VUID-VkXcbSurfaceCreateInfoKHR-connection-01310
  connection **must** point to a valid X11 `xcb_connection_t`
- VUID-VkXcbSurfaceCreateInfoKHR-window-01311
  window **must** be a valid X11 `xcb_window_t`

**Valid Usage (Implicit)**

- VUID-VkXcbSurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_XCB_SURFACE_CREATE_INFO_KHR`
VUID-VkXcbSurfaceCreateInfoKHR-pNext-pNext

pNext must be NULL

VUID-VkXcbSurfaceCreateInfoKHR-flags-zerobitmask

flags must be 0

With Xcb, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xcb surface must have both *width* and *height* greater than 0, or both of them 0.

**Note**

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified xcb connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an xcb window. Applications must therefore ensure the xcb connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with xcb-based swapchains must

- Avoid holding a server grab on an xcb connection while waiting for Vulkan operations to complete using a swapchain derived from a different xcb connection referring to the same X server instance. Failing to do so may result in deadlock.

```
// Provided by VK_KHR_xcb_surface
typedef VkFlags VkXcbSurfaceCreateFlagsKHR;
```

`VkXcbSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.5. Xlib Platform

To create a `VkSurfaceKHR` object for an X11 window, using the Xlib client-side library, call:

```
// Provided by VK_KHR_xlib_surface
VkResult vkCreateXlibSurfaceKHR(  
    VkInstance instance,  
    const VkXlibSurfaceCreateInfoKHR* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,
```
• **instance** is the instance to associate the surface with.

• **pCreateInfo** is a pointer to a `VkXlibSurfaceCreateInfoKHR` structure containing the parameters affecting the creation of the surface object.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreateXlibSurfaceKHR-instance-parameter**
  - `instance` must be a valid `VkInstance` handle

- **VUID-vkCreateXlibSurfaceKHR-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkXlibSurfaceCreateInfoKHR` structure

- **VUID-vkCreateXlibSurfaceKHR-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateXlibSurfaceKHR-pSurface-parameter**
  - `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkXlibSurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_xlib_surface
typedef struct VkXlibSurfaceCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkXlibSurfaceCreateFlagsKHR flags;
    Display*                 dpy;
    Window                   window;
} VkXlibSurfaceCreateInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `dpy` is a pointer to an Xlib `Display` connection to the X server.
• `window` is an Xlib `Window` to associate the surface with.

### Valid Usage

- VUID-VkXlibSurfaceCreateInfoKHR-dpy-01313
  dpy must point to a valid Xlib `Display`
- VUID-VkXlibSurfaceCreateInfoKHR-window-01314
  window must be a valid Xlib `Window`

### Valid Usage (Implicit)

- VUID-VkXlibSurfaceCreateInfoKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_XLIB_SURFACE_CREATE_INFO_KHR`
- VUID-VkXlibSurfaceCreateInfoKHR-pNext-pNext
  pNext must be `NULL`
- VUID-VkXlibSurfaceCreateInfoKHR-flags-zerobitmask
  flags must be `0`

With Xlib, `minImageExtent`, `maxImageExtent`, and `currentExtent` must always equal the window size.

The `currentExtent` of an Xlib surface must have both `width` and `height` greater than 0, or both of them 0.

#### Note

Due to above restrictions, unless `VkSwapchainPresentScalingCreateInfoEXT` is used to specify handling of disparities between surface and swapchain dimensions, it is only possible to create a new swapchain on this platform with `imageExtent` being equal to the current size of the window, as reported in `VkSurfaceCapabilitiesKHR::currentExtent`.

The window size may become (0, 0) on this platform (e.g. when the window is minimized), and so a swapchain cannot be created until the size changes.

Some Vulkan functions may send protocol over the specified Xlib `Display` connection when using a swapchain or presentable images created from a `VkSurfaceKHR` referring to an Xlib window. Applications must therefore ensure the display connection is available to Vulkan for the duration of any functions that manipulate such swapchains or their presentable images, and any functions that build or queue command buffers that operate on such presentable images. Specifically, applications using Vulkan with Xlib-based swapchains must

- Avoid holding a server grab on a display connection while waiting for Vulkan operations to
complete using a swapchain derived from a different display connection referring to the same X server instance. Failing to do so may result in deadlock.

Some implementations may require threads to implement some presentation modes so applications must call XInitThreads() before calling any other Xlib functions.

```c
// Provided by VK_KHR_xlib_surface
typedef VkFlags VkXlibSurfaceCreateFlagsKHR;
```

`VkXlibSurfaceCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.6. DirectFB Platform

To create a `VkSurfaceKHR` object for a DirectFB surface, call:

```c
// Provided by VK_EXT_directfb_surface
VkResult vkCreateDirectFBSurfaceEXT(
    VkInstance instance, const VkDirectFBSurfaceCreateInfoEXT* pCreateInfo, const VkAllocationCallbacks* pAllocator, VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkDirectFBSurfaceCreateInfoEXT` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

**Valid Usage (Implicit)**

- `VUID-vkCreateDirectFBSurfaceEXT-instance-parameter` instance must be a valid `VkInstance` handle
- `VUID-vkCreateDirectFBSurfaceEXT-pCreateInfo-parameter` `pCreateInfo` must be a valid pointer to a valid `VkDirectFBSurfaceCreateInfoEXT` structure
- `VUID-vkCreateDirectFBSurfaceEXT-pAllocator-parameter` If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- `VUID-vkCreateDirectFBSurfaceEXT-pSurface-parameter` `pSurface` must be a valid pointer to a `VkSurfaceKHR` handle
Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDirectFBSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_directfb_surface
typedef struct VkDirectFBSurfaceCreateInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkDirectFBSurfaceCreateFlagsEXT flags;
  IDirectFB* dfb;
  IDirectFBSurface* surface;
} VkDirectFBSurfaceCreateInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.
• `surface` is a pointer to a `IDirectFBSurface` surface interface.

Valid Usage

• VUID-VkDirectFBSurfaceCreateInfoEXT-dfb-04117
dfb must point to a valid DirectFB `IDirectFB`

• VUID-VkDirectFBSurfaceCreateInfoEXT-surface-04118
  surface must point to a valid DirectFB `IDirectFBSurface`

Valid Usage (Implicit)

• VUID-VkDirectFBSurfaceCreateInfoEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_DIRECTFB_SURFACE_CREATE_INFO_EXT`

• VUID-VkDirectFBSurfaceCreateInfoEXT-pNext-pNext
  pNext must be NULL

• VUID-VkDirectFBSurfaceCreateInfoEXT-flags-zero bitmask
  flags must be 0
With DirectFB, \texttt{minImageExtent}, \texttt{maxImageExtent}, and \texttt{currentExtent} must always equal the surface size.

\begin{verbatim}
// Provided by VK_EXT_directfb_surface
typedef VkFlags VkDirectFBSurfaceCreateFlagsEXT;
\end{verbatim}

\texttt{VkDirectFBSurfaceCreateFlagsEXT} is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.7. Fuchsia Platform

To create a \texttt{VkSurfaceKHR} object for a Fuchsia ImagePipe, call:

\begin{verbatim}
// Provided by VK_FUCHSIA_imagepipe_surface
VkResult \texttt{vkCreateImagePipeSurfaceFUCHSIA}(
    VkInstance instance,
    const VkImagePipeSurfaceCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
\end{verbatim}

- \textit{instance} is the instance to associate with the surface.
- \textit{pCreateInfo} is a pointer to a \texttt{VkImagePipeSurfaceCreateInfoFUCHSIA} structure containing parameters affecting the creation of the surface object.
- \textit{pAllocator} is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- \textit{pSurface} is a pointer to a \texttt{VkSurfaceKHR} handle in which the created surface object is returned.

\begin{center}
\textbf{Valid Usage (Implicit)}
\end{center}

- VUID-vkCreateImagePipeSurfaceFUCHSIA-instance-parameter \textit{instance} must be a valid \texttt{VkInstance} handle
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pCreateInfo-parameter \textit{pCreateInfo} must be a valid pointer to a valid \texttt{VkImagePipeSurfaceCreateInfoFUCHSIA} structure
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pAllocator-parameter If \textit{pAllocator} is not NULL, \textit{pAllocator} must be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure
- VUID-vkCreateImagePipeSurfaceFUCHSIA-pSurface-parameter \textit{pSurface} must be a valid pointer to a \texttt{VkSurfaceKHR} handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkImagePipeSurfaceCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_imagepipe_surface
typedef struct VkImagePipeSurfaceCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImagePipeSurfaceCreateFlagsFUCHSIA flags;
    zx_handle_t imagePipeHandle;
} VkImagePipeSurfaceCreateInfoFUCHSIA;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `imagePipeHandle` is a `zx_handle_t` referring to the ImagePipe to associate with the surface.

Valid Usage

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-imagePipeHandle-04863
  `imagePipeHandle` must be a valid `zx_handle_t`

Valid Usage (Implicit)

• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGEPIPE_SURFACE_CREATE_INFO_FUCHSIA`
• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`
• VUID-VkImagePipeSurfaceCreateInfoFUCHSIA-flags-zerobitmask
  `flags` must be `0`

On Fuchsia, the surface `currentExtent` is the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
typedef VkFlags VkImagePipeSurfaceCreateFlagsFUCHSIA;

VkImagePipeSurfaceCreateFlagsFUCHSIA is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.8. Google Games Platform

To create a VkSurfaceKHR object for a Google Games Platform stream descriptor, call:

```c
// Provided by VK_GGP_stream_descriptor_surface
VkResult vkCreateStreamDescriptorSurfaceGGP(
    VkInstance instance,
    const VkStreamDescriptorSurfaceCreateInfoGGP* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate with the surface.
- `pCreateInfo` is a pointer to a VkStreamDescriptorSurfaceCreateInfoGGP structure containing parameters that affect the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateStreamDescriptorSurfaceGGP-instance-parameter *instance* must be a valid VkInstance handle
- VUID-vkCreateStreamDescriptorSurfaceGGP-pCreateInfo-parameter *pCreateInfo* must be a valid pointer to a valid VkStreamDescriptorSurfaceCreateInfoGGP structure
- VUID-vkCreateStreamDescriptorSurfaceGGP-pAllocator-parameter If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateStreamDescriptorSurfaceGGP-pSurface-parameter *pSurface* must be a valid pointer to a VkSurfaceKHR handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
The VkStreamDescriptorSurfaceCreateInfoGGP structure is defined as:

```c
// Provided by VK_GGP_stream_descriptor_surface
typedef struct VkStreamDescriptorSurfaceCreateInfoGGP {
    VkStructureType sType;
    const void* pNext;
    VkStreamDescriptorSurfaceCreateFlagsGGP flags;
    GgpStreamDescriptor streamDescriptor;
} VkStreamDescriptorSurfaceCreateInfoGGP;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **streamDescriptor** is a GgpStreamDescriptor referring to the GGP stream descriptor to associate with the surface.

### Valid Usage

- **VUID-VkStreamDescriptorSurfaceCreateInfoGGP-streamDescriptor-02681**
  
  streamDescriptor must be a valid GgpStreamDescriptor

### Valid Usage (Implicit)

- **VUID-VkStreamDescriptorSurfaceCreateInfoGGP-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_STREAM_DESCRIPTOR_SURFACE_CREATE_INFO_GGP

- **VUID-VkStreamDescriptorSurfaceCreateInfoGGP-pNext-pNext**
  
  pNext must be NULL

- **VUID-VkStreamDescriptorSurfaceCreateInfoGGP-flags-zerobitmask**
  
  flags must be 0

On Google Games Platform, the surface extents are dynamic. The minImageExtent will never be greater than 1080p and the maxImageExtent will never be less than 1080p. The currentExtent will reflect the current optimal resolution.

Applications are expected to choose an appropriate size for the swapchain's imageExtent, within the bounds of the surface. Using the surface's currentExtent will offer the best performance and quality. When a swapchain's imageExtent does not match the surface's currentExtent, the presentable images are scaled to the surface's dimensions during presentation if possible and VK_SUBOPTIMAL_KHR is returned, otherwise presentation fails with VK_ERROR_OUT_OF_DATE_KHR.
typedef VkFlags VkStreamDescriptorSurfaceCreateFlagsGGP;

VkStreamDescriptorSurfaceCreateFlagsGGP is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.9. iOS Platform

To create a VkSurfaceKHR object for an iOS UIView or CAMetalLayer, call:

```c
VkResult vkCreateIOSSurfaceMVK(
    VkInstance instance,
    const VkIOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface
);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkIOSSurfaceCreateInfoMVK structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Note**
The `vkCreateIOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the VK_EXT_metal_surface extension.

### Valid Usage (Implicit)

- VUID-vkCreateIOSSurfaceMVK-instance-parameter
  * `instance` must be a valid VkInstance handle
- VUID-vkCreateIOSSurfaceMVK-pCreateInfo-parameter
  * `pCreateInfo` must be a valid pointer to a valid VkIOSSurfaceCreateInfoMVK structure
- VUID-vkCreateIOSSurfaceMVK-pAllocator-parameter
  * If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateIOSSurfaceMVK-pSurface-parameter
  * `pSurface` must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkIOSSurfaceCreateInfoMVK` structure is defined as:

```c
// Provided by VK_MVK_ios_surface
typedef struct VkIOSSurfaceCreateInfoMVK {
  VkStructureType sType;
  const void* pNext;
  VkIOSSurfaceCreateFlagsMVK flags;
  const void* pView;
} VkIOSSurfaceCreateInfoMVK;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pView` is a reference to either a `CAMetalLayer` object or a `UIView` object.

Valid Usage

- VUID-VkIOSSurfaceCreateInfoMVK-pView-04143
  If `pView` is a `CAMetalLayer` object, it must be a valid `CAMetalLayer`

- VUID-VkIOSSurfaceCreateInfoMVK-pView-01316
  If `pView` is a `UIView` object, it must be a valid `UIView`, must be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateIOSSurfaceMVK` must be called on the main thread

Valid Usage (Implicit)

- VUID-VkIOSSurfaceCreateInfoMVK-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IOS_SURFACE_CREATE_INFO_MVK`

- VUID-VkIOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkIOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` must be 0
typedef VkFlags VkIOSurfaceCreateFlagsMVK;

VkIOSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.10. macOS Platform

To create a VkSurfaceKHR object for a macOS NSView or CAMetalLayer, call:

```c
VkResult vkCreateMacOSSurfaceMVK(
    VkInstance instance,
    const VkMacOSSurfaceCreateInfoMVK* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkMacOSSurfaceCreateInfoMVK structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

**Note**
The `vkCreateMacOSSurfaceMVK` function is considered deprecated and has been superseded by `vkCreateMetalSurfaceEXT` from the VK_EXT_metal_surface extension.

**Valid Usage (Implicit)**

- VUID-vkCreateMacOSSurfaceMVK-instance-parameter
  `instance` must be a valid VkInstance handle

- VUID-vkCreateMacOSSurfaceMVK-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid VkMacOSSurfaceCreateInfoMVK structure

- VUID-vkCreateMacOSSurfaceMVK-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateMacOSSurfaceMVK-pSurface-parameter
  `pSurface` must be a valid pointer to a VkSurfaceKHR handle
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

The `VkMacOSSurfaceCreateInfoMVK` structure is defined as:

```c
// Provided by VK_MVK_macos_surface
typedef struct VkMacOSSurfaceCreateInfoMVK {
    VkStructureType sType;
    const void* pNext;
    VkMacOSSurfaceCreateFlagsMVK flags;
    const void* pView;
} VkMacOSSurfaceCreateInfoMVK;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `pView` is a reference to either a `CAMetalLayer` object or an `NSView` object.

Valid Usage

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-04144
  If `pView` is a `CAMetalLayer` object, it **must** be a valid `CAMetalLayer`

• VUID-VkMacOSSurfaceCreateInfoMVK-pView-01317
  If `pView` is an `NSView` object, it **must** be a valid `NSView`, **must** be backed by a `CALayer` object of type `CAMetalLayer`, and `vkCreateMacOSSurfaceMVK` **must** be called on the main thread

Valid Usage (Implicit)

• VUID-VkMacOSSurfaceCreateInfoMVK-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_MACOS_SURFACE_CREATE_INFO_MVK`

• VUID-VkMacOSSurfaceCreateInfoMVK-pNext-pNext
  `pNext` **must** be `NULL`

• VUID-VkMacOSSurfaceCreateInfoMVK-flags-zerobitmask
  `flags` **must** be `0`
typedef VkFlags VkMacOSSurfaceCreateFlagsMVK;

VkMacOSSurfaceCreateFlagsMVK is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.11. VI Platform

To create a VkSurfaceKHR object for an nn::vi::Layer, query the layer's native handle using nn::vi::GetNativeWindow, and then call:

```c
// Provided by VK_NN_vi_surface
VkResult vkCreateViSurfaceNN(
    VkInstance instance, 
    const VkViSurfaceCreateInfoNN* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkViSurfaceCreateInfoNN structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

During the lifetime of a surface created using a particular nn::vi::NativeWindowHandle, applications must not attempt to create another surface for the same nn::vi::Layer or attempt to connect to the same nn::vi::Layer through other platform mechanisms.

If the native window is created with a specified size, `currentExtent` will reflect that size. In this case, applications should use the same size for the swapchain's `imageExtent`. Otherwise, the `currentExtent` will have the special value `(0xFFFFFFFF, 0xFFFFFFFF)`, indicating that applications are expected to choose an appropriate size for the swapchain's `imageExtent` (e.g., by matching the result of a call to nn::vi::GetDisplayResolution).

Valid Usage (Implicit)

- VUID-vkCreateViSurfaceNN-instance-parameter instance must be a valid VkInstance handle
- VUID-vkCreateViSurfaceNN-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid VkViSurfaceCreateInfoNN structure
- VUID-vkCreateViSurfaceNN-pAllocator-parameter If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
• VUID-vkCreateViSurfaceNN-pSurface-parameter
  
  pSurface **must** be a valid pointer to a VkSurfaceKHR handle

---

Return Codes

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_NATIVE_WINDOW_IN_USE_KHR

---

The VkViSurfaceCreateInfoNN structure is defined as:

```c
// Provided by VK_NN_vi_surface
typedef struct VkViSurfaceCreateInfoNN {
  VkStructureType sType;
  const void* pNext;
  VkViSurfaceCreateFlagsNN flags;
  void* window;
} VkViSurfaceCreateInfoNN;
```

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **window** is the nn::vi::NativeWindowHandle for the nn::vi::Layer with which to associate the surface.

---

Valid Usage

• VUID-VkViSurfaceCreateInfoNN-window-01318
  
  window **must** be a valid nn::vi::NativeWindowHandle

---

Valid Usage (Implicit)

• VUID-VkViSurfaceCreateInfoNN-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_VI_SURFACE_CREATE_INFO_NN

• VUID-VkViSurfaceCreateInfoNN-pNext-pNext
  
  pNext **must** be NULL

• VUID-VkViSurfaceCreateInfoNN-flags-zerobitmask
  
  flags **must** be 0
typedef VkFlags VkViSurfaceCreateFlagsNN;

VkViSurfaceCreateFlagsNN is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.12. Metal Platform

To create a VkSurfaceKHR object for a CAMetalLayer, call:

```c
// Provided by VK_EXT_metal_surface
VkResult vkCreateMetalSurfaceEXT(
    VkInstance instance,
    const VkMetalSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance with which to associate the surface.
- `pCreateInfo` is a pointer to a VkMetalSurfaceCreateInfoEXT structure specifying parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a VkSurfaceKHR handle in which the created surface object is returned.

#### Valid Usage (Implicit)

- VUID-vkCreateMetalSurfaceEXT-instance-parameter
  instance must be a valid VkInstance handle
- VUID-vkCreateMetalSurfaceEXT-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkMetalSurfaceCreateInfoEXT structure
- VUID-vkCreateMetalSurfaceEXT-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateMetalSurfaceEXT-pSurface-parameter
  pSurface must be a valid pointer to a VkSurfaceKHR handle

#### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkMetalSurfaceCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_metal_surface
typedef struct VkMetalSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMetalSurfaceCreateFlagsEXT flags;
    const CAMetalLayer* pLayer;
} VkMetalSurfaceCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `pLayer` is a reference to a `CAMetalLayer` object representing a renderable surface.

### Valid Usage (Implicit)

- `VUID-VkMetalSurfaceCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_METAL_SURFACE_CREATE_INFO_EXT`
- `VUID-VkMetalSurfaceCreateInfoEXT-pNext-pNext`  
  `pNext` must be `NULL`
- `VUID-VkMetalSurfaceCreateInfoEXT-flags-zerobitmask`  
  `flags` must be `0`

To remove an unnecessary compile time dependency, an incomplete type definition of `CAMetalLayer` is provided in the Vulkan headers:

```c
// Provided by VK_EXT_metal_surface
#ifdef __OBJC__
@class CAMetalLayer;
#else
typedef void CAMetalLayer;
#endif
```

The actual `CAMetalLayer` type is defined in the QuartzCore framework.

```c
// Provided by VK_EXT_metal_surface
typedef VkFlags VkMetalSurfaceCreateFlagsEXT;
```
VkMetalSurfaceCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

34.2.13. QNX Screen Platform

To create a VkSurfaceKHR object for a QNX Screen surface, call:

```c
// Provided by VK_QNX_screen_surface
VkResult vkCreateScreenSurfaceQNX(
    VkInstance instance,
    const VkScreenSurfaceCreateInfoQNX* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- `instance` is the instance to associate the surface with.
- `pCreateInfo` is a pointer to a `VkScreenSurfaceCreateInfoQNX` structure containing parameters affecting the creation of the surface object.
- `pAllocator` is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
- `pSurface` is a pointer to a `VkSurfaceKHR` handle in which the created surface object is returned.

Valid Usage (Implicit)

- VUID-vkCreateScreenSurfaceQNX-instance-parameter instance must be a valid `VkInstance` handle
- VUID-vkCreateScreenSurfaceQNX-pCreateInfo-parameter pCreateInfo must be a valid pointer to a valid `VkScreenSurfaceCreateInfoQNX` structure
- VUID-vkCreateScreenSurfaceQNX-pAllocator-parameter If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateScreenSurfaceQNX-pSurface-parameter pSurface must be a valid pointer to a `VkSurfaceKHR` handle

Return Codes

Success

- `VK_SUCCESS`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkScreenSurfaceCreateInfoQNX` structure is defined as:
typedef struct VkScreenSurfaceCreateInfoQNX {
    VkStructureType sType;
    const void* pNext;
    VkScreenSurfaceCreateFlagsQNX flags;
    struct _screen_context* context;
    struct _screen_window* window;
} VkScreenSurfaceCreateInfoQNX;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `context` and `window` are QNX Screen context and window to associate the surface with.

### Valid Usage

- VUID-VkScreenSurfaceCreateInfoQNX-context-04741
  `context` must point to a valid QNX Screen struct _screen_context
- VUID-VkScreenSurfaceCreateInfoQNX-window-04742
  `window` must point to a valid QNX Screen struct _screen_window

### Valid Usage (Implicit)

- VUID-VkScreenSurfaceCreateInfoQNX-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_SCREEN_SURFACE_CREATE_INFO_QNX
- VUID-VkScreenSurfaceCreateInfoQNX-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkScreenSurfaceCreateInfoQNX-flags-zerobitmask
  `flags` must be 0

// Provided by VK_QNX_screen_surface
typedef VkFlags VkScreenSurfaceCreateFlagsQNX;

VkScreenSurfaceCreateFlagsQNX is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.2.14. Platform-Independent Information

Once created, `VkSurfaceKHR` objects can be used in this and other extensions, in particular the `VK_KHR_swapchain` extension.

Several WSI functions return `VK_ERROR_SURFACE_LOST_KHR` if the surface becomes no longer available.
After such an error, the surface (and any child swapchain, if one exists) should be destroyed, as there is no way to restore them to a not-lost state. Applications may attempt to create a new VkSurfaceKHR using the same native platform window object, but whether such re-creation will succeed is platform-dependent and may depend on the reason the surface became unavailable. A lost surface does not otherwise cause devices to be lost.

To destroy a VkSurfaceKHR object, call:

```c
// Provided by VK_KHR_surface
void vkDestroySurfaceKHR(
    VkInstance instance,           // instance is the instance used to create the surface.
    VkSurfaceKHR surface,         // surface is the surface to destroy.
    const VkAllocationCallbacks* pAllocator); // pAllocator is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).
```

Destroying a VkSurfaceKHR merely severs the connection between Vulkan and the native surface, and does not imply destroying the native surface, closing a window, or similar behavior.

### Valid Usage

- **VUID-vkDestroySurfaceKHR-surface-01266**
  All VkSwapchainKHR objects created for surface must have been destroyed prior to destroying surface.

- **VUID-vkDestroySurfaceKHR-surface-01267**
  If VkAllocationCallbacks were provided when surface was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroySurfaceKHR-surface-01268**
  If no VkAllocationCallbacks were provided when surface was created, pAllocator must be NULL.

### Valid Usage (Implicit)

- **VUID-vkDestroySurfaceKHR-instance-parameter**
  instance must be a valid VkInstance handle.

- **VUID-vkDestroySurfaceKHR-surface-parameter**
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle.

- **VUID-vkDestroySurfaceKHR-pAllocator-parameter**
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure.
34.3. Presenting Directly to Display Devices

In some environments applications can also present Vulkan rendering directly to display devices without using an intermediate windowing system. This can be useful for embedded applications, or implementing the rendering/presentation backend of a windowing system using Vulkan. The VK_KHR_display extension provides the functionality necessary to enumerate display devices and create VkSurfaceKHR objects that target displays.

34.3.1. Display Enumeration

Displays are represented by VkDisplayKHR handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayKHR)
```

Various functions are provided for enumerating the available display devices present on a Vulkan physical device. To query information about the available displays, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pPropertyCount,
    VkDisplayPropertiesKHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display devices available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of VkDisplayPropertiesKHR structures.

If `pProperties` is NULL, then the number of display devices available for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display devices for `physicalDevice`, at most `pPropertyCount` structures will be written, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to indicate that not all the available properties were returned.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPropertiesKHR structures

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPropertiesKHR {
    VkDisplayKHR display;
    const char* displayName;
    VkExtent2D physicalDimensions;
    VkExtent2D physicalResolution;
    VkSurfaceTransformFlagsKHR supportedTransforms;
    VkBool32 planeReorderPossible;
    VkBool32 persistentContent;
} VkDisplayPropertiesKHR;
```

- display is a handle that is used to refer to the display described here. This handle will be valid for the lifetime of the Vulkan instance.

- displayName is NULL or a pointer to a null-terminated UTF-8 string containing the name of the display. Generally, this will be the name provided by the display's EDID. If NULL, no suitable name is available. If not NULL, the string pointed to must remain accessible and unmodified as long as display is valid.

- physicalDimensions describes the physical width and height of the visible portion of the display, in millimeters.

- physicalResolution describes the physical, native, or preferred resolution of the display.
**Note**
For devices which have no natural value to return here, implementations **should** return the maximum resolution supported.

- **supportedTransforms** is a bitmask of *VkSurfaceTransformFlagBitsKHR* describing which transforms are supported by this display.
- **planeReorderPossible** tells whether the planes on this display **can** have their z order changed. If this is *VK_TRUE*, the application **can** re-arrange the planes on this display in any order relative to each other.
- **persistentContent** tells whether the display supports self-refresh/internal buffering. If this is true, the application **can** submit persistent present operations on swapchains created against this display.

**Note**
Persistent presents **may** have higher latency, and **may** use less power when the screen content is updated infrequently, or when only a portion of the screen needs to be updated in most frames.

To query information about the available displays, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pPropertyCount, 
    VkDisplayProperties2KHR* pProperties);
```

- **physicalDevice** is a physical device.
- **pPropertyCount** is a pointer to an integer related to the number of display devices available or queried, as described below.
- **pProperties** is either **NULL** or a pointer to an array of *VkDisplayProperties2KHR* structures.

vkGetPhysicalDeviceDisplayProperties2KHR behaves similarly to vkGetPhysicalDeviceDisplayPropertiesKHR, with the ability to return extended information via chained output structures.

**Valid Usage (Implicit)**

- **VUID-vkGetPhysicalDeviceDisplayProperties2KHR-physicalDevice-parameter**
  **physicalDevice** **must** be a valid *VkPhysicalDevice* handle

- **VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pPropertyCount-parameter**
  **pPropertyCount** **must** be a valid pointer to a *uint32_t* value

- **VUID-vkGetPhysicalDeviceDisplayProperties2KHR-pProperties-parameter**
  If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** **must** be a valid pointer to an array of **pPropertyCount** *VkDisplayProperties2KHR* structures
Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPropertiesKHR displayProperties;
} VkDisplayProperties2KHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `displayProperties` is a VkDisplayPropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayProperties2KHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_DISPLAY_PROPERTIES_2_KHR
- VUID-VkDisplayProperties2KHR-pNext-pNext
  `pNext` must be NULL

Acquiring and Releasing Displays

On some platforms, access to displays is limited to a single process or native driver instance. On such platforms, some or all of the displays may not be available to Vulkan if they are already in use by a native windowing system or other application.

To acquire permission to directly access a display in Vulkan from an X11 server, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkAcquireXlibDisplayEXT(
    VkPhysicalDevice physicalDevice,
    Display* dpy,
    VkDisplayKHR display);
```
- **physicalDevice** The physical device the display is on.
- **dpy** A connection to the X11 server that currently owns **display**.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the X11 connection specified by **dpy** is terminated. Permission to access the display **may** be temporarily revoked during periods when the X11 server from which control was acquired itself loses access to **display**. During such periods, operations which require access to the display **must** fail with an appropriate error code. If the X11 server associated with **dpy** does not own **display**, or if permission to access it has already been acquired by another entity, the call **must** return the error code **VK_ERROR_INITIALIZATION_FAILED**.

**Note**
One example of when an X11 server loses access to a display is when it loses ownership of its virtual terminal.

**Valid Usage (Implicit)**
- VUID-vkAcquireXlibDisplayEXT-physicalDevice-parameter
  **physicalDevice** **must** be a valid **VkPhysicalDevice** handle
- VUID-vkAcquireXlibDisplayEXT-dpy-parameter
  **dpy** **must** be a valid pointer to a **Display** value
- VUID-vkAcquireXlibDisplayEXT-display-parameter
  **display** **must** be a valid **VkDisplayKHR** handle
- VUID-vkAcquireXlibDisplayEXT-display-parent
  **display** **must** have been created, allocated, or retrieved from **physicalDevice**

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_INITIALIZATION_FAILED**

When acquiring displays from an X11 server, an application may also wish to enumerate and identify them using a native handle rather than a **VkDisplayKHR** handle. To determine the **VkDisplayKHR** handle corresponding to an X11 RandR Output, call:

```c
// Provided by VK_EXT_acquire_xlib_display
VkResult vkGetRandROutputDisplayEXT(
    VkPhysicalDevice physicalDevice,
```
• **physicalDevice** The physical device to query the display handle on.
• **dpy** A connection to the X11 server from which **rrOutput** was queried.
• **rrOutput** An X11 RandR output ID.
• **pDisplay** The corresponding **VkDisplayKHR** handle will be returned here.

If there is no **VkDisplayKHR** corresponding to **rrOutput** on **physicalDevice**, **VK_NULL_HANDLE** must be returned in **pDisplay**.

### Valid Usage (Implicit)

- `VUID-vkGetRandROutputDisplayEXT-physicalDevice-parameter` **physicalDevice** must be a valid **VkPhysicalDevice** handle
- `VUID-vkGetRandROutputDisplayEXT-dpy-parameter` **dpy** must be a valid pointer to a **Display** value
- `VUID-vkGetRandROutputDisplayEXT-pDisplay-parameter` **pDisplay** must be a valid pointer to a **VkDisplayKHR** handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

To acquire permission to directly access a display in Vulkan on Windows 10, call:

```cpp
// Provided by VK_NV_acquire_winrt_display
VkResult vkAcquireWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- **physicalDevice** The physical device the display is on.
- **display** The display the caller wishes to control in Vulkan.

All permissions necessary to control the display are granted to the Vulkan instance associated with **physicalDevice** until the display is released or the application is terminated. Permission to access the display **may** be revoked by events that cause Windows 10 itself to lose access to **display**. If this has happened, operations which require access to the display **must** fail with an appropriate error.
code. If permission to access \textit{display} has already been acquired by another entity, the call \textbf{must} return the error code \texttt{VK_ERROR_INITIALIZATION_FAILED}.

\begin{quote}
\textbf{Note}

The Vulkan instance acquires control of a “\texttt{winrt::Windows::Devices::Display::Core::DisplayTarget}” by performing an operation equivalent to “\texttt{winrt::Windows::Devices::Display::Core::DisplayManager.TryAcquireTarget()}” on the “DisplayTarget”.
\end{quote}

\begin{quote}
\textbf{Note}

One example of when Windows 10 loses access to a display is when the display is hot-unplugged.
\end{quote}

\begin{quote}
\textbf{Note}

One example of when a display has already been acquired by another entity is when the Windows desktop compositor (DWM) is in control of the display. Beginning with Windows 10 version 2004 it is possible to cause DWM to release a display by using the “Advanced display settings” sub-page of the “Display settings” control panel. \texttt{vkAcquireWinrtDisplayNV} does not itself cause DWM to release a display; this action must be performed outside of Vulkan.
\end{quote}

\begin{quote}
\textbf{Valid Usage (Implicit)}

- \texttt{VUID-vkAcquireWinrtDisplayNV-physicalDevice-parameter} \texttt{physicalDevice} \textbf{must} be a valid \texttt{VkPhysicalDevice} handle
- \texttt{VUID-vkAcquireWinrtDisplayNV-display-parameter} \texttt{display} \textbf{must} be a valid \texttt{VkDisplayKHR} handle
- \texttt{VUID-vkAcquireWinrtDisplayNV-display-parent} \texttt{display} \textbf{must} have been created, allocated, or retrieved from \texttt{physicalDevice}
\end{quote}

\begin{quote}
\textbf{Return Codes}

\textbf{Success}

- \texttt{VK_SUCCESS}

\textbf{Failure}

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_DEVICE_LOST}
- \texttt{VK_ERROR_INITIALIZATION_FAILED}
\end{quote}

When acquiring displays on Windows 10, an application may also wish to enumerate and identify them using a native handle rather than a \texttt{VkDisplayKHR} handle.
To determine the VkDisplayKHR handle corresponding to a "winrt::Windows::Devices::Display::Core::DisplayTarget", call:

```c
// Provided by VK_NV_acquire_winrt_display
VkResult vkGetWinrtDisplayNV(
    VkPhysicalDevice physicalDevice,
    uint32_t deviceRelativeId,
    VkDisplayKHR* pDisplay);
```

- **physicalDevice** The physical device on which to query the display handle.
- **deviceRelativeId** The value of the "AdapterRelativeId" property of a "DisplayTarget" that is enumerated by a "DisplayAdapter" with an "Id" property matching the deviceUID property of a VkPhysicalDeviceIDProperties for `physicalDevice`.
- **pDisplay** The corresponding VkDisplayKHR handle will be returned here.

If there is no VkDisplayKHR corresponding to `deviceRelativeId` on `physicalDevice`, `VK_NULL_HANDLE` must be returned in `pDisplay`.

### Valid Usage (Implicit)

- VUID-vkGetWinrtDisplayNV-physicalDevice-parameter `physicalDevice` must be a valid VkPhysicalDevice handle
- VUID-vkGetWinrtDisplayNV-pDisplay-parameter `pDisplay` must be a valid pointer to a VkDisplayKHR handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_INITIALIZATION_FAILED

To acquire permission to directly a display in Vulkan from the Direct Rendering Manager (DRM) interface, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkAcquireDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    VkDisplayKHR display);
```
• **physicalDevice** The physical device the display is on.
• **drmFd** DRM primary file descriptor.
• **display** The display the caller wishes Vulkan to control.

All permissions necessary to control the display are granted to the Vulkan instance associated with the provided `physicalDevice` until the display is either released or the connector is unplugged. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. The DRM FD must have DRM master permissions. If any error is encountered during the acquisition of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

The provided DRM fd should not be closed before the display is released, attempting to do it may result in undefined behaviour.

### Valid Usage (Implicit)

- VUID-vkAcquireDrmDisplayEXT-physicalDevice-parameter
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- VUID-vkAcquireDrmDisplayEXT-display-parameter
  `display` **must** be a valid `VkDisplayKHR` handle
- VUID-vkAcquireDrmDisplayEXT-display-parent
  `display` **must** have been created, allocated, or retrieved from `physicalDevice`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INITIALIZATION_FAILED`

Before acquiring a display from the DRM interface, the caller may want to select a specific `VkDisplayKHR` handle by identifying it using a `connectorId`. To do so, call:

```c
// Provided by VK_EXT_acquire_drm_display
VkResult vkGetDrmDisplayEXT(
    VkPhysicalDevice physicalDevice,
    int32_t drmFd,
    uint32_t connectorId,
    VkDisplayKHR* display);
```

• **physicalDevice** The physical device to query the display from.
• **drmFd** DRM primary file descriptor.
• **connectorId** Identifier of the specified DRM connector.
The corresponding `VkDisplayKHR` handle will be returned here.

If there is no `VkDisplayKHR` corresponding to the `connectorId` on the `physicalDevice`, the returning `display` must be set to `VK_NULL_HANDLE`. The provided `drmFd` must correspond to the one owned by the `physicalDevice`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. Master permissions are not required, because the file descriptor is just used for information gathering purposes. The given `connectorId` must be a resource owned by the provided `drmFd`. If not, the error code `VK_ERROR_UNKNOWN` must be returned. If any error is encountered during the identification of the display, the call must return the error code `VK_ERROR_INITIALIZATION_FAILED`.

**Valid Usage (Implicit)**

- VUID-vkGetDrmDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDrmDisplayEXT-display-parameter
  `display` must be a valid pointer to a `VkDisplayKHR` handle

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To release a previously acquired display, call:

```c
// Provided by VK_EXT_direct_mode_display
VkResult vkReleaseDisplayEXT(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display);
```

- `physicalDevice` The physical device the display is on.
- `display` The display to release control of.

**Valid Usage (Implicit)**

- VUID-vkReleaseDisplayEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkReleaseDisplayEXT-display-parameter
  `display` must be a valid `VkDisplayKHR` handle
- VUID-vkReleaseDisplayEXT-display-parent
Display Planes

Images are presented to individual planes on a display. Devices must support at least one plane on each display. Planes can be stacked and blended to composite multiple images on one display. Devices may support only a fixed stacking order and fixed mapping between planes and displays, or they may allow arbitrary application specified stacking orders and mappings between planes and displays. To query the properties of device display planes, call:

```c
// Provided by VK_KHR_display
VkResult vkGetPhysicalDeviceDisplayPlanePropertiesKHR(
    VkPhysicalDevice physicalDevice,  // physicalDevice is a physical device.
    uint32_t* pPropertyCount,  // pPropertyCount is a pointer to an integer related to the number of display planes available or queried, as described below.
    VkDisplayPlanePropertiesKHR* pProperties  // pProperties is either NULL or a pointer to an array of VkDisplayPlanePropertiesKHR structures.
);
```

If pProperties is NULL, then the number of display planes available for physicalDevice is returned in pPropertyCount. Otherwise, pPropertyCount must point to a variable set by the user to the number of elements in the pProperties array, and on return the variable is overwritten with the number of structures actually written to pProperties. If the value of pPropertyCount is less than the number of display planes for physicalDevice, at most pPropertyCount structures will be written.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pPropertyCount-parameter pPropertyCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceDisplayPlanePropertiesKHR-pProperties-parameter If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlanePropertiesKHR structures

Return Codes

Success
- VK_SUCCESS
Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlanePropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlanePropertiesKHR {
    VkDisplayKHR currentDisplay;
    uint32_t currentStackIndex;
} VkDisplayPlanePropertiesKHR;
```

- `currentDisplay` is the handle of the display the plane is currently associated with. If the plane is not currently attached to any displays, this will be VK_NULL_HANDLE.
- `currentStackIndex` is the current z-order of the plane. This will be between 0 and the value returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` in `pPropertyCount`.

To query the properties of a device's display planes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetPhysicalDeviceDisplayPlaneProperties2KHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pPropertyCount, 
    VkDisplayPlaneProperties2KHR* pProperties);
```

- `physicalDevice` is a physical device.
- `pPropertyCount` is a pointer to an integer related to the number of display planes available or queried, as described below.
- `pProperties` is either NULL or a pointer to an array of VkDisplayPlaneProperties2KHR structures.

`vkGetPhysicalDeviceDisplayPlaneProperties2KHR` behaves similarly to `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`, with the ability to return extended information via chained output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pPropertyCount-parameter
pPropertyCount must be a valid pointer to a uint32_t value

VUID-vkGetPhysicalDeviceDisplayPlaneProperties2KHR-pProperties-parameter
If the value referenced by pPropertyCount is not 0, and pProperties is not NULL, pProperties must be a valid pointer to an array of pPropertyCount VkDisplayPlaneProperties2KHR structures

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneProperties2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlanePropertiesKHR displayPlaneProperties;
} VkDisplayPlaneProperties2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• displayPlaneProperties is a VkDisplayPlanePropertiesKHR structure.

Valid Usage (Implicit)

• VUID-VkDisplayPlaneProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PLANE_PROPERTIES_2_KHR

• VUID-VkDisplayPlaneProperties2KHR-pNext-pNext
  pNext must be NULL

To determine which displays a plane is usable with, call

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneSupportedDisplaysKHR(
    VkPhysicalDevice physicalDevice,
```
uint32_t planeIndex,
uint32_t* pDisplayCount,
VkDisplayKHR* pDisplays);

• `physicalDevice` is a physical device.
• `planeIndex` is the plane which the application wishes to use, and must be in the range [0, physical device plane count - 1].
• `pDisplayCount` is a pointer to an integer related to the number of displays available or queried, as described below.
• `pDisplays` is either `NULL` or a pointer to an array of `VkDisplayKHR` handles.

If `pDisplays` is `NULL`, then the number of displays usable with the specified `planeIndex` for `physicalDevice` is returned in `pDisplayCount`. Otherwise, `pDisplayCount` must point to a variable set by the user to the number of elements in the `pDisplays` array, and on return the variable is overwritten with the number of handles actually written to `pDisplays`. If the value of `pDisplayCount` is less than the number of usable display-plane pairs for `physicalDevice`, at most `pDisplayCount` handles will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available pairs were returned.

Valid Usage

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-planeIndex-01249
  `planeIndex` must be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`

Valid Usage (Implicit)

- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplayCount-parameter
  `pDisplayCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayPlaneSupportedDisplaysKHR-pDisplays-parameter
  If the value referenced by `pDisplayCount` is not 0, and `pDisplays` is not `NULL`, `pDisplays` must be a valid pointer to an array of `pDisplayCount` `VkDisplayKHR` handles

Return Codes

Success

- `VK_SUCCESS`
- `VK_INCOMPLETE`

Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
Additional properties of displays are queried using specialized query functions.

**Display Modes**

Display modes are represented by `VkDisplayModeKHR` handles:

```c
// Provided by VK_KHR_display
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDisplayModeKHR)
```

Each display has one or more supported modes associated with it by default. These built-in modes are queried by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayModePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModePropertiesKHR* pProperties);
```

- `physicalDevice` is the physical device associated with `display`.
- `display` is the display to query.
- `pPropertyCount` is a pointer to an integer related to the number of display modes available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkDisplayModePropertiesKHR` structures.

If `pProperties` is `NULL`, then the number of display modes available on the specified `display` for `physicalDevice` is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the user to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If the value of `pPropertyCount` is less than the number of display modes for `physicalDevice`, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available display modes were returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetDisplayModePropertiesKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetDisplayModePropertiesKHR-display-parameter `display` must be a valid `VkDisplayKHR` handle
- VUID-vkGetDisplayModePropertiesKHR-pPropertyCount-parameter `pPropertyCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetDisplayModePropertiesKHR-pProperties-parameter
If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkDisplayModePropertiesKHR` structures.

• VUID-vkGetDisplayModePropertiesKHR-display-parent `display` must have been created, allocated, or retrieved from `physicalDevice`.

**Return Codes**

**Success**

• `VK_SUCCEESS`
• `VK_INCOMPLETE`

**Failure**

• `VK_ERROR_OUT_OF_HOST_MEMORY`
• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayModePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModePropertiesKHR {
    VkDisplayModeKHR displayMode;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModePropertiesKHR;
```

• `displayMode` is a handle to the display mode described in this structure. This handle will be valid for the lifetime of the Vulkan instance.
• `parameters` is a `VkDisplayModeParametersKHR` structure describing the display parameters associated with `displayMode`.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayModeCreateFlagsKHR;
```

`VkDisplayModeCreateFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To query the properties of a device’s built-in display modes, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayModeProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    uint32_t* pPropertyCount,
    VkDisplayModeProperties2KHR* pProperties);
```
• **physicalDevice** is the physical device associated with **display**.

• **display** is the display to query.

• **pPropertyCount** is a pointer to an integer related to the number of display modes available or queried, as described below.

• **pProperties** is either **NULL** or a pointer to an array of **VkDisplayModeProperties2KHR** structures.

**vkGetDisplayModeProperties2KHR** behaves similarly to **vkGetDisplayModePropertiesKHR**, with the ability to return extended information via chained output structures.

### Valid Usage (Implicit)

- VUID-vkGetDisplayModeProperties2KHR-physicalDevice-parameter
  - **physicalDevice** must be a valid **VkPhysicalDevice** handle

- VUID-vkGetDisplayModeProperties2KHR-display-parameter
  - **display** must be a valid **VkDisplayKHR** handle

- VUID-vkGetDisplayModeProperties2KHR-pPropertyCount-parameter
  - **pPropertyCount** must be a valid pointer to a **uint32_t** value

- VUID-vkGetDisplayModeProperties2KHR-pProperties-parameter
  - If the value referenced by **pPropertyCount** is not 0, and **pProperties** is not **NULL**, **pProperties** must be a valid pointer to an array of **pPropertyCount** **VkDisplayModeProperties2KHR** structures

- VUID-vkGetDisplayModeProperties2KHR-display-parent
  - **display** must have been created, allocated, or retrieved from **physicalDevice**

### Return Codes

**Success**

- **VK_SUCCESS**
- **VK_INCOMPLETE**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The **VkDisplayModeProperties2KHR** structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayModeProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayModePropertiesKHR displayModeProperties;
} VkDisplayModeProperties2KHR;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

displayModeProperties is a VkDisplayModePropertiesKHR structure.

Valid Usage (Implicit)

- VUID-VkDisplayModeProperties2KHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_MODE_PROPERTIES_2_KHR

- VUID-VkDisplayModeProperties2KHR-pNext-pNext
  pNext must be NULL

The VkDisplayModeParametersKHR structure is defined as:

```
// Provided by VK_KHR_display
typedef struct VkDisplayModeParametersKHR {
    VkExtent2D visibleRegion;
    uint32_t refreshRate;
} VkDisplayModeParametersKHR;
```

• visibleRegion is the 2D extents of the visible region.

• refreshRate is a uint32_t that is the number of times the display is refreshed each second multiplied by 1000.

  Note
  For example, a 60Hz display mode would report a refreshRate of 60,000.

Valid Usage

- VUID-VkDisplayModeParametersKHR-width-01990
  The width member of visibleRegion must be greater than 0

- VUID-VkDisplayModeParametersKHR-height-01991
  The height member of visibleRegion must be greater than 0

- VUID-VkDisplayModeParametersKHR-refreshRate-01992
  refreshRate must be greater than 0

Additional modes may also be created by calling:

```
// Provided by VK_KHR_display
VkResult vkCreateDisplayModeKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayKHR display,
    const VkDisplayModeCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
);```
• `physicalDevice` is the physical device associated with `display`.
• `display` is the display to create an additional mode for.
• `pCreateInfo` is a pointer to a `VkDisplayModeCreateInfoKHR` structure describing the new mode to create.
• `pAllocator` is the allocator used for host memory allocated for the display mode object when there is no more specific allocator available (see Memory Allocation).
• `pMode` is a pointer to a `VkDisplayModeKHR` handle in which the mode created is returned.

Valid Usage (Implicit)

• VUID-vkCreateDisplayModeKHR-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
• VUID-vkCreateDisplayModeKHR-display-parameter `display` must be a valid `VkDisplayKHR` handle
• VUID-vkCreateDisplayModeKHR-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkDisplayModeCreateInfoKHR` structure
• VUID-vkCreateDisplayModeKHR-pAllocator-parameter If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
• VUID-vkCreateDisplayModeKHR-pMode-parameter `pMode` must be a valid pointer to a `VkDisplayModeKHR` handle
• VUID-vkCreateDisplayModeKHR-display-parent `display` must have been created, allocated, or retrieved from `physicalDevice`

Host Synchronization

• Host access to `display` must be externally synchronized

Return Codes

Success

• `VK_SUCCESS`

Failure

• `VK_ERROR_OUT_OF_HOST_MEMORY`
• `VK_ERROR_OUT_OF_DEVICE_MEMORY`
• `VK_ERROR_INITIALIZATION_FAILED`
The VkDisplayModeCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayModeCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeCreateFlagsKHR flags;
    VkDisplayModeParametersKHR parameters;
} VkDisplayModeCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use, and must be zero.
- `parameters` is a VkDisplayModeParametersKHR structure describing the display parameters to use in creating the new mode. If the parameters are not compatible with the specified display, the implementation must return VK_ERROR_INITIALIZATION_FAILED.

**Valid Usage (Implicit)**

- `VUID-VkDisplayModeCreateInfoKHR-sType-sType`  
  `sType` must be VK_STRUCTURE_TYPE_DISPLAY_MODE_CREATE_INFO_KHR
- `VUID-VkDisplayModeCreateInfoKHR-pNext-pNext`  
  `pNext` must be NULL
- `VUID-VkDisplayModeCreateInfoKHR-flags-zerobitmask`  
  `flags` must be 0
- `VUID-VkDisplayModeCreateInfoKHR-parameters-parameter`  
  `parameters` must be a valid VkDisplayModeParametersKHR structure

Applications that wish to present directly to a display must select which layer, or “plane” of the display they wish to target, and a mode to use with the display. Each display supports at least one plane. The capabilities of a given mode and plane combination are determined by calling:

```c
// Provided by VK_KHR_display
VkResult vkGetDisplayPlaneCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkDisplayModeKHR mode,
    uint32_t planeIndex,
    VkDisplayPlaneCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device associated with the display specified by `mode`.
- `mode` is the display mode the application intends to program when using the specified plane. Note this parameter also implicitly specifies a display.
- `planeIndex` is the plane which the application intends to use with the display, and is less than the
number of display planes supported by the device.

- `pCapabilities` is a pointer to a `VkDisplayPlaneCapabilitiesKHR` structure in which the capabilities are returned.

**Valid Usage (Implicit)**

- `VUID-vkGetDisplayPlaneCapabilitiesKHR-physicalDevice-parameter`  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- `VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parameter`  
  `mode` must be a valid `VkDisplayModeKHR` handle

- `VUID-vkGetDisplayPlaneCapabilitiesKHR-pCapabilities-parameter`  
  `pCapabilities` must be a valid pointer to a `VkDisplayPlaneCapabilitiesKHR` structure

- `VUID-vkGetDisplayPlaneCapabilitiesKHR-mode-parent`  
  `mode` must have been created, allocated, or retrieved from `physicalDevice`

**Host Synchronization**

- Host access to `mode` must be externally synchronized

**Return Codes**

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDisplayPlaneCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplayPlaneCapabilitiesKHR {
    VkDisplayPlaneAlphaFlagsKHR supportedAlpha;
    VkOffset2D minSrcPosition;
    VkOffset2D maxSrcPosition;
    VkExtent2D minSrcExtent;
    VkExtent2D maxSrcExtent;
    VkOffset2D minDstPosition;
    VkOffset2D maxDstPosition;
    VkExtent2D minDstExtent;
    VkExtent2D maxDstExtent;
} VkDisplayPlaneCapabilitiesKHR;
```
• **supportedAlpha** is a bitmask of *VkDisplayPlaneAlphaFlagBitsKHR* describing the supported alpha blending modes.

• **minSrcPosition** is the minimum source rectangle offset supported by this plane using the specified mode.

• **maxSrcPosition** is the maximum source rectangle offset supported by this plane using the specified mode. The *x* and *y* components of **maxSrcPosition** must each be greater than or equal to the *x* and *y* components of **minSrcPosition**, respectively.

• **minSrcExtent** is the minimum source rectangle size supported by this plane using the specified mode.

• **maxSrcExtent** is the maximum source rectangle size supported by this plane using the specified mode.

• **minDstPosition**, **maxDstPosition**, **minDstExtent**, **maxDstExtent** all have similar semantics to their corresponding **Src** equivalents, but apply to the output region within the mode rather than the input region within the source image. Unlike the **Src** offsets, **minDstPosition** and **maxDstPosition** may contain negative values.

The minimum and maximum position and extent fields describe the implementation limits, if any, as they apply to the specified display mode and plane. Vendors may support displaying a subset of a swapchain's presentable images on the specified display plane. This is expressed by returning **minSrcPosition**, **maxSrcPosition**, **minSrcExtent**, and **maxSrcExtent** values that indicate a range of possible positions and sizes which may be used to specify the region within the presentable images that source pixels will be read from when creating a swapchain on the specified display mode and plane.

Vendors may also support mapping the presentable images' content to a subset or superset of the visible region in the specified display mode. This is expressed by returning **minDstPosition**, **maxDstPosition**, **minDstExtent** and **maxDstExtent** values that indicate a range of possible positions and sizes which may be used to describe the region within the display mode that the source pixels will be mapped to.

Other vendors may support only a 1-1 mapping between pixels in the presentable images and the display mode. This may be indicated by returning (0,0) for **minSrcPosition**, **maxSrcPosition**, **minDstPosition**, and **maxDstPosition**, and (display mode width, display mode height) for **minSrcExtent**, **maxSrcExtent**, **minDstExtent**, and **maxDstExtent**.

The value **supportedAlpha** must contain at least one valid *VkDisplayPlaneAlphaFlagBitsKHR* bit.

These values indicate the limits of the implementation's individual fields. Not all combinations of values within the offset and extent ranges returned in *VkDisplayPlaneCapabilitiesKHR* are guaranteed to be supported. Presentation requests specifying unsupported combinations may fail.

To query the capabilities of a given mode and plane combination, call:

```c
// Provided by VK_KHR_get_display_properties2
VkResult vkGetDisplayPlaneCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkDisplayPlaneInfo2KHR* pDisplayPlaneInfo,
)
```
• physicalDevice is the physical device associated with pDisplayPlaneInfo.
• pDisplayPlaneInfo is a pointer to a VkDisplayPlaneInfo2KHR structure describing the plane and mode.
• pCapabilities is a pointer to a VkDisplayPlaneCapabilities2KHR structure in which the capabilities are returned.

vkGetDisplayPlaneCapabilities2KHR behaves similarly to vkGetDisplayPlaneCapabilitiesKHR, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

Valid Usage (Implicit)

• VUID-vkGetDisplayPlaneCapabilities2KHR-physicalDevice-parameter
physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetDisplayPlaneCapabilities2KHR-pDisplayPlaneInfo-parameter
pDisplayPlaneInfo must be a valid pointer to a valid VkDisplayPlaneInfo2KHR structure
• VUID-vkGetDisplayPlaneCapabilities2KHR-pCapabilities-parameter
pCapabilities must be a valid pointer to a VkDisplayPlaneCapabilities2KHR structure

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkDisplayPlaneInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplayModeKHR mode;
    uint32_t planeIndex;
} VkDisplayPlaneInfo2KHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• mode is the display mode the application intends to program when using the specified plane.
This parameter also implicitly specifies a display.

- **planeIndex** is the plane which the application intends to use with the display.

The members of **VkDisplayPlaneInfo2KHR** correspond to the arguments to **vkGetDisplayPlaneCapabilitiesKHR**, with **sType** and **pNext** added for extensibility.

### Valid Usage (Implicit)

- **VUID-VkDisplayPlaneInfo2KHR-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_DISPLAY_PLANE_INFO_2_KHR**
- **VUID-VkDisplayPlaneInfo2KHR-pNext-pNext**  
  **pNext** must be **NULL**
- **VUID-VkDisplayPlaneInfo2KHR-mode-parameter**  
  **mode** must be a valid **VkDisplayModeKHR** handle

### Host Synchronization

- Host access to **mode** must be externally synchronized

The **VkDisplayPlaneCapabilities2KHR** structure is defined as:

```c
// Provided by VK_KHR_get_display_properties2
typedef struct VkDisplayPlaneCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkDisplayPlaneCapabilitiesKHR capabilities;
} VkDisplayPlaneCapabilities2KHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **capabilities** is a **VkDisplayPlaneCapabilitiesKHR** structure.

### Valid Usage (Implicit)

- **VUID-VkDisplayPlaneCapabilities2KHR-sType-sType**  
  **sType** must be **VK_STRUCTURE_TYPE_DISPLAY_PLANE_CAPABILITIES_2_KHR**
- **VUID-VkDisplayPlaneCapabilities2KHR-pNext-pNext**  
  **pNext** must be **NULL**
### 34.3.2. Display Control

To set the power state of a display, call:

```c
// Provided by VK_EXT_display_control
VkResult vkDisplayPowerControlEXT(
    VkDevice device, 
    VkDisplayKHR display, 
    const VkDisplayPowerInfoEXT* pDisplayPowerInfo);
```

- **device** is a logical device associated with **display**.
- **display** is the display whose power state is modified.
- **pDisplayPowerInfo** is a pointer to a `VkDisplayPowerInfoEXT` structure specifying the new power state of **display**.

#### Valid Usage (Implicit)

- VUID-vkDisplayPowerControlEXT-device-parameter
  - **device** must be a valid `VkDevice` handle
- VUID-vkDisplayPowerControlEXT-display-parameter
  - **display** must be a valid `VkDisplayKHR` handle
- VUID-vkDisplayPowerControlEXT-pDisplayPowerInfo-parameter
  - **pDisplayPowerInfo** must be a valid pointer to a valid `VkDisplayPowerInfoEXT` structure
- VUID-vkDisplayPowerControlEXT-commonparent
  - Both of **device**, and **display** must have been created, allocated, or retrieved from the same `VkPhysicalDevice`

#### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkDisplayPowerInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkDisplayPowerInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDisplayPowerStateEXT powerState;
} VkDisplayPowerInfoEXT;
```
• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `powerState` is a `VkDisplayPowerStateEXT` value specifying the new power state of the display.

### Valid Usage (Implicit)

- `VUID-VkDisplayPowerInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DISPLAY_POWER_INFO_EXT`
- `VUID-VkDisplayPowerInfoEXT-pNext-pNext`  
  `pNext` must be `NULL`
- `VUID-VkDisplayPowerInfoEXT-powerState-parameter`  
  `powerState` must be a valid `VkDisplayPowerStateEXT` value

Possible values of `VkDisplayPowerInfoEXT::powerState`, specifying the new power state of a display, are:

```c
// Provided by VK_EXT_display_control
typedef enum VkDisplayPowerStateEXT {
    VK_DISPLAY_POWER_STATE_OFF_EXT = 0,
    VK_DISPLAY_POWER_STATE_SUSPEND_EXT = 1,
    VK_DISPLAY_POWER_STATE_ON_EXT = 2,
} VkDisplayPowerStateEXT;
```

- `VK_DISPLAY_POWER_STATE_OFF_EXT` specifies that the display is powered down.
- `VK_DISPLAY_POWER_STATE_SUSPEND_EXT` specifies that the display is put into a low power mode, from which it may be able to transition back to `VK_DISPLAY_POWER_STATE_ON_EXT` more quickly than if it were in `VK_DISPLAY_POWER_STATE_OFF_EXT`. This state may be the same as `VK_DISPLAY_POWER_STATE_OFF_EXT`.
- `VK_DISPLAY_POWER_STATE_ON_EXT` specifies that the display is powered on.

### 34.3.3. Display Surfaces

A complete display configuration includes a mode, one or more display planes and any parameters describing their behavior, and parameters describing some aspects of the images associated with those planes. Display surfaces describe the configuration of a single plane within a complete display configuration. To create a `VkSurfaceKHR` object for a display plane, call:

```c
// Provided by VK_KHR_display
VkResult vkCreateDisplayPlaneSurfaceKHR(VkInstance instance,  
const VkDisplaySurfaceCreateInfoKHR* pCreateInfo,  
const VkAllocationCallbacks* pAllocator,  
VkSurfaceKHR* pSurface);
```
• **instance** is the instance corresponding to the physical device the targeted display is on.

• **pCreateInfo** is a pointer to a `VkDisplaySurfaceCreateInfoKHR` structure specifying which mode, plane, and other parameters to use, as described below.

• **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see Memory Allocation).

• **pSurface** is a pointer to a `VkSurfaceKHR` handle in which the created surface is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDisplayPlaneSurfaceKHR-instance-parameter
  
  **instance** must be a valid `VkInstance` handle

- VUID-vkCreateDisplayPlaneSurfaceKHR-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid `VkDisplaySurfaceCreateInfoKHR` structure

- VUID-vkCreateDisplayPlaneSurfaceKHR-pAllocator-parameter
  
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDisplayPlaneSurfaceKHR-pSurface-parameter
  
  **pSurface** must be a valid pointer to a `VkSurfaceKHR` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkDisplaySurfaceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_display
typedef struct VkDisplaySurfaceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDisplaySurfaceCreateFlagsKHR flags;
    VkDisplayModeKHR displayMode;
    uint32_t planeIndex;
    uint32_t planeStackIndex;
    VkSurfaceTransformFlagBitsKHR transform;
    float globalAlpha;
    VkDisplayPlaneAlphaFlagBitsKHR alphaMode;
    VkExtent2D imageExtent;
} VkDisplaySurfaceCreateInfoKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **flags** is reserved for future use, and **must** be zero.
• **displayMode** is a `VkDisplayModeKHR` handle specifying the mode to use when displaying this surface.
• **planeIndex** is the plane on which this surface appears.
• **planeStackIndex** is the z-order of the plane.
• **transform** is a `VkSurfaceTransformFlagBitsKHR` value specifying the transformation to apply to images as part of the scanout operation.
• **globalAlpha** is the global alpha value. This value is ignored if **alphaMode** is not `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR`.
• **alphaMode** is a `VkDisplayPlaneAlphaFlagBitsKHR` value specifying the type of alpha blending to use.
• **imageExtent** is the size of the presentable images to use with the surface.

**Note**
Creating a display surface **must** not modify the state of the displays, planes, or other resources it names. For example, it **must** not apply the specified mode to be set on the associated display. Application of display configuration occurs as a side effect of presenting to a display surface.

---

### Valid Usage

• **VUID-VkDisplaySurfaceCreateInfoKHR-planeIndex-01252**
  - **planeIndex** **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`.

• **VUID-VkDisplaySurfaceCreateInfoKHR-planeReorderPossible-01253**
  - If the **planeReorderPossible** member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display corresponding to **displayMode** is `VK_TRUE` then **planeStackIndex** **must** be less than the number of display planes supported by the device as determined by calling `vkGetPhysicalDeviceDisplayPlanePropertiesKHR`; otherwise **planeStackIndex** **must** equal the **currentStackIndex** member of `VkDisplayPlanePropertiesKHR` returned by `vkGetPhysicalDeviceDisplayPlanePropertiesKHR` for the display plane corresponding to **displayMode**.

• **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01254**
  - If **alphaMode** is `VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR` then **globalAlpha** **must** be between 0 and 1, inclusive.

• **VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-01255**
  - **alphaMode** **must** be one of the bits present in the **supportedAlpha** member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to **displayMode**.

• **VUID-VkDisplaySurfaceCreateInfoKHR-transform-06740**
  - **transform** **must** be one of the bits present in the **supportedTransforms** member of `VkDisplayPlaneCapabilitiesKHR` for the display plane corresponding to **displayMode**.
VkDisplayPropertiesKHR for the display corresponding to `displayMode`

- VUID-VkDisplaySurfaceCreateInfoKHR-width-01256
  The width and height members of `imageExtent` **must** be less than or equal to `VkPhysicalDeviceLimits::maxImageDimension2D`

### Valid Usage (Implicit)

- VUID-VkDisplaySurfaceCreateInfoKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_DISPLAY_SURFACE_CREATE_INFO_KHR`

- VUID-VkDisplaySurfaceCreateInfoKHR-pNext-pNext
  `pNext` **must** be `NULL`

- VUID-VkDisplaySurfaceCreateInfoKHR-flags-zerobitmask
  `flags` **must** be `0`

- VUID-VkDisplaySurfaceCreateInfoKHR-displayMode-parameter
  `displayMode` **must** be a valid `VkDisplayModeKHR` handle

- VUID-VkDisplaySurfaceCreateInfoKHR-transform-parameter
  `transform` **must** be a valid `VkSurfaceTransformFlagBitsKHR` value

- VUID-VkDisplaySurfaceCreateInfoKHR-alphaMode-parameter
  `alphaMode` **must** be a valid `VkDisplayPlaneAlphaFlagBitsKHR` value

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplaySurfaceCreateFlagsKHR;
```

*VkDisplaySurfaceCreateFlagsKHR* is a bitmask type for setting a mask, but is currently reserved for future use.

Bits which **can** be set in `VkDisplaySurfaceCreateInfoKHR::alphaMode`, specifying the type of alpha blending to use on a display, are:

```c
// Provided by VK_KHR_display
typedef enum VkDisplayPlaneAlphaFlagBitsKHR {
    VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR = 0x00000001,
    VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR = 0x00000002,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR = 0x00000004,
    VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR = 0x00000008,
} VkDisplayPlaneAlphaFlagBitsKHR;
```

- **VK_DISPLAY_PLANE_ALPHA_OPAQUE_BIT_KHR** specifies that the source image will be treated as opaque.
- **VK_DISPLAY_PLANE_ALPHA_GLOBAL_BIT_KHR** specifies that a global alpha value **must** be specified that will be applied to all pixels in the source image.
- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR** specifies that the alpha value will be determined by
the alpha component of the source image's pixels. If the source format contains no alpha values, no blending will be applied. The source alpha values are not premultiplied into the source image's other color components.

- **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_PREMULTIPLIED_BIT_KHR** is equivalent to **VK_DISPLAY_PLANE_ALPHA_PER_PIXEL_BIT_KHR**, except the source alpha values are assumed to be premultiplied into the source image's other color components.

```c
// Provided by VK_KHR_display
typedef VkFlags VkDisplayPlaneAlphaFlagsKHR;
```

**VkDisplayPlaneAlphaFlagsKHR** is a bitmask type for setting a mask of zero or more **VkDisplayPlaneAlphaFlagBitsKHR**.

### 34.3.4. Presenting to Headless Surfaces

Vulkan rendering can be presented to a headless surface, where the presentation operation is a no-op producing no externally-visible result.

**Note**

Because there is no real presentation target, the headless presentation engine may be extended to impose an arbitrary or customisable set of restrictions and features. This makes it a useful portable test target for applications targeting a wide range of presentation engines where the actual target presentation engines might be scarce, unavailable or otherwise undesirable or inconvenient to use for general Vulkan application development.

The usual surface query mechanisms must be used to determine the actual restrictions and features of the implementation.

To create a headless **VkSurfaceKHR** object, call:

```c
// Provided by VK_EXT_headless_surface
VkResult vkCreateHeadlessSurfaceEXT(
    VkInstance instance,
    const VkHeadlessSurfaceCreateInfoEXT* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSurfaceKHR* pSurface);
```

- **instance** is the instance to associate the surface with.
- **pCreateInfo** is a pointer to a **VkHeadlessSurfaceCreateInfoEXT** structure containing parameters affecting the creation of the surface object.
- **pAllocator** is the allocator used for host memory allocated for the surface object when there is no more specific allocator available (see **Memory Allocation**).
- **pSurface** is a pointer to a **VkSurfaceKHR** handle in which the created surface object is returned.
Valid Usage (Implicit)

- VUID-vkCreateHeadlessSurfaceEXT-instance-parameter
  
  instance **must** be a valid VkInstance handle

- VUID-vkCreateHeadlessSurfaceEXT-pCreateInfo-parameter
  
  pCreateInfo **must** be a valid pointer to a valid VkHeadlessSurfaceCreateInfoEXT structure

- VUID-vkCreateHeadlessSurfaceEXT-pAllocator-parameter
  
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateHeadlessSurfaceEXT-pSurface-parameter
  
  pSurface **must** be a valid pointer to a VkSurfaceKHR handle

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkHeadlessSurfaceCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_headless_surface
typedef struct VkHeadlessSurfaceCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkHeadlessSurfaceCreateFlagsEXT flags;
} VkHeadlessSurfaceCreateInfoEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

Valid Usage (Implicit)

- VUID-VkHeadlessSurfaceCreateInfoEXT-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_HEADLESS_SURFACE_CREATE_INFO_EXT

- VUID-VkHeadlessSurfaceCreateInfoEXT-pNext-pNext
  
  pNext **must** be NULL

- VUID-VkHeadlessSurfaceCreateInfoEXT-flags-zero bitmask
  
  flags **must** be 0
For headless surfaces, `currentExtent` is the reserved value (0xFFFFFFFF, 0xFFFFFFFF). Whatever the application sets a swapchain’s `imageExtent` to will be the size of the surface, after the first image is presented.

```c
// Provided by VK_EXT_headless_surface
typedef VkFlags VkHeadlessSurfaceCreateFlagsEXT;
```

`VkHeadlessSurfaceCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 34.4. Querying for WSI Support

Not all physical devices will include WSI support. Within a physical device, not all queue families will support presentation. WSI support and compatibility can be determined in a platform-neutral manner (which determines support for presentation to a particular surface object) and additionally may be determined in platform-specific manners (which determine support for presentation on the specified physical device but do not guarantee support for presentation to a particular surface object).

To determine whether a queue family of a physical device supports presentation to a given surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    VkSurfaceKHR surface,
    VkBool32* pSupported);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family.
- `surface` is the surface.
- `pSupported` is a pointer to a `VkBool32`, which is set to `VK_TRUE` to indicate support, and `VK_FALSE` otherwise.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-queueFamilyIndex-01269
  queueFamilyIndex **must** be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-physicalDevice-parameter
**Physical Device** must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-surface-parameter
  - **surface** must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-pSupported-parameter
  - **pSupported** must be a valid pointer to a `VkBool32` value

- VUID-vkGetPhysicalDeviceSurfaceSupportKHR-commonparent
  - Both of **physicalDevice**, and **surface** must have been created, allocated, or retrieved from the same `VkInstance`

## Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

### 34.4.1. Android Platform

On Android, all physical devices and queue families **must** be capable of presentation with any native window. As a result there is no Android-specific query for these capabilities.

### 34.4.2. Wayland Platform

To determine whether a queue family of a physical device supports presentation to a Wayland compositor, call:

```c
// Provided by VK_KHR_wayland_surface
VkBool32 vkGetPhysicalDeviceWaylandPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct wl_display* display);
```

- **physicalDevice** is the physical device.
- **queueFamilyIndex** is the queue family index.
- **display** is a pointer to the `wl_display` associated with a Wayland compositor.

This platform-specific function **can** be called prior to creating a surface.
Valid Usage

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-queueFamilyIndex-01306

  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-physicalDevice-parameter

  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceWaylandPresentationSupportKHR-display-parameter

  display must be a valid pointer to a wl_display value

34.4.3. Win32 Platform

To determine whether a queue family of a physical device supports presentation to the Microsoft Windows desktop, call:

```c
// Provided by VK_KHR_win32_surface
VkBool32  vkGetPhysicalDeviceWin32PresentationSupportKHR(  
                         VkPhysicalDevice  physicalDevice,  
                         uint32_t  queueFamilyIndex);  
```

- physicalDevice is the physical device.
- queueFamilyIndex is the queue family index.

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-queueFamilyIndex-01309

  queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
  vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceWin32PresentationSupportKHR-physicalDevice-parameter

  physicalDevice must be a valid VkPhysicalDevice handle

34.4.4. XCB Platform

To determine whether a queue family of a physical device supports presentation to an X11 server,
using the XCB client-side library, call:

```c
// Provided by VK_KHR_xcb_surface
VkBool32 vkGetPhysicalDeviceXcbPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    xcb_connection_t* connection,
    xcb_visualid_t visual_id);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
- `connection` is a pointer to an `xcb_connection_t` to the X server.
- `visual_id` is an X11 visual (`xcb_visualid_t`).

This platform-specific function can be called prior to creating a surface.

Valid Usage

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-queueFamilyIndex-01312
  queueFamilyIndex must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceXcbPresentationSupportKHR-connection-parameter
  `connection` must be a valid pointer to an `xcb_connection_t` value.

### 34.4.5. Xlib Platform

To determine whether a queue family of a physical device supports presentation to an X11 server, using the Xlib client-side library, call:

```c
// Provided by VK_KHR_xlib_surface
VkBool32 vkGetPhysicalDeviceXlibPresentationSupportKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    Display* dpy,
    VisualID visualID);
```

- `physicalDevice` is the physical device.
- `queueFamilyIndex` is the queue family index.
• `dpy` is a pointer to an Xlib `Display` connection to the server.

• `visualId` is an X11 visual (VisualID).

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-queueFamilyIndex-01315
  
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-physicalDevice-parameter
  
  `physicalDevice` must be a valid `VkPhysicalDevice` handle.

- VUID-vkGetPhysicalDeviceXlibPresentationSupportKHR-dpy-parameter
  
  `dpy` must be a valid pointer to a `Display` value.

### 34.4.6. DirectFB Platform

To determine whether a queue family of a physical device supports presentation with DirectFB library, call:

```c
// Provided by VK_EXT_directfb_surface
VkBool32 vkGetPhysicalDeviceDirectFBPresentationSupportEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    IDirectFB* dfb);
```

- `physicalDevice` is the physical device.

- `queueFamilyIndex` is the queue family index.

- `dfb` is a pointer to the `IDirectFB` main interface of DirectFB.

This platform-specific function can be called prior to creating a surface.

### Valid Usage

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-queueFamilyIndex-04119
  
  `queueFamilyIndex` must be less than `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties` for the given `physicalDevice`.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceDirectFBPresentationSupportEXT-dfb-parameter
  dfb must be a valid pointer to an IDirectFB value

34.4.7. Fuchsia Platform

On Fuchsia, all physical devices and queue families **must** be capable of presentation with any ImagePipe. As a result there is no Fuchsia-specific query for these capabilities.

34.4.8. Google Games Platform

On Google Games Platform, all physical devices and queue families with the VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT capabilities **must** be capable of presentation with any Google Games Platform stream descriptor. As a result, there is no query specific to Google Games Platform for these capabilities.

34.4.9. iOS Platform

On iOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no iOS-specific query for these capabilities.

34.4.10. macOS Platform

On macOS, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no macOS-specific query for these capabilities.

34.4.11. VI Platform

On VI, all physical devices and queue families **must** be capable of presentation with any layer. As a result there is no VI-specific query for these capabilities.

34.4.12. QNX Screen Platform

To determine whether a queue family of a physical device supports presentation to a QNX Screen compositor, call:

```c
// Provided by VK_QNX_screen_surface
VkBool32 vkGetPhysicalDeviceScreenPresentationSupportQNX(
    VkPhysicalDevice physicalDevice,
    uint32_t queueFamilyIndex,
    struct _screen_window* window);
```

- physicalDevice is the physical device.
• queueFamilyIndex is the queue family index.
• window is the QNX Screen window object.

This platform-specific function can be called prior to creating a surface.

Valid Usage

• VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-queueFamilyIndex-04743
queueFamilyIndex must be less than pQueueFamilyPropertyCount returned by
vkGetPhysicalDeviceQueueFamilyProperties for the given physicalDevice

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-physicalDevice-parameter
physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceScreenPresentationSupportQNX-window-parameter
window must be a valid pointer to a _screen_window value

34.5. Surface Queries

The capabilities of a swapchain targeting a surface are the intersection of the capabilities of the WSI platform, the native window or display, and the physical device. The resulting capabilities can be obtained with the queries listed below in this section.

Note
In addition to the surface capabilities as obtained by surface queries below, swapchain images are also subject to ordinary image creation limits as reported by vkGetPhysicalDeviceImageFormatProperties. As an application is instructed by the appropriate Valid Usage sections, both the surface capabilities and the image creation limits have to be satisfied whenever swapchain images are created.

34.5.1. Surface Capabilities

To query the basic capabilities of a surface, needed in order to create a swapchain, call:

// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfaceCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilitiesKHR*pSurfaceCapabilities);

• physicalDevice is the physical device that will be associated with the swapchain to be created, as described for vkCreateSwapchainKHR.
• `surface` is the surface that will be associated with the swapchain.

• `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilitiesKHR` structure in which the capabilities are returned.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06523
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-06211
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-surface-parameter
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-pSurfaceCapabilities-parameter
  - `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilitiesKHR` structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilitiesKHR-commonparent
  - Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceCapabilitiesKHR {
    uint32_t  minImageCount;
    uint32_t  maxImageCount;
    VkExtent2D currentExtent;
    VkExtent2D minImageExtent;
} VkSurfaceCapabilitiesKHR;
```
VkExtent2D maxImageExtent;
uint32_t maxImageArrayLayers;
VkSurfaceTransformFlagBitsKHR supportedTransforms;
VkSurfaceTransformFlagBitsKHR currentTransform;
VkCompositeAlphaFlagBitsKHR supportedCompositeAlpha;
VkImageUsageFlags supportedUsageFlags;

VkSurfaceCapabilitiesKHR

- \textit{minImageCount} is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.

- \textit{maxImageCount} is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to \textit{minImageCount}. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.

- \textit{currentExtent} is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.

- \textit{minImageExtent} contains the smallest valid swapchain extent for the surface on the specified device. The \textit{width} and \textit{height} of the extent will each be less than or equal to the corresponding \textit{width} and \textit{height} of \textit{currentExtent}, unless \textit{currentExtent} has the special value described above.

- \textit{maxImageExtent} contains the largest valid swapchain extent for the surface on the specified device. The \textit{width} and \textit{height} of the extent will each be greater than or equal to the corresponding \textit{width} and \textit{height} of \textit{minImageExtent}. The \textit{width} and \textit{height} of the extent will each be greater than or equal to the corresponding \textit{width} and \textit{height} of \textit{currentExtent}, unless \textit{currentExtent} has the special value described above.

- \textit{maxImageArrayLayers} is the maximum number of layers presentable images can have for a swapchain created for this device and surface, and will be at least one.

- \textit{supportedTransforms} is a bitmask of \textit{VkSurfaceTransformFlagBitsKHR} indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- \textit{currentTransform} is \textit{VkSurfaceTransformFlagBitsKHR} value indicating the surface’s current transform relative to the presentation engine’s natural orientation.

- \textit{supportedCompositeAlpha} is a bitmask of \textit{VkCompositeAlphaFlagBitsKHR}, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- \textit{supportedUsageFlags} is a bitmask of \textit{VkImageUsageFlagBits} representing the ways the application can use the presentable images of a swapchain created with \textit{VkPresentModeKHR} set to \textit{VK_PRESENT_MODE_IMMEDIATE_KHR}, \textit{VK_PRESENT_MODE_MAILBOX_KHR}, \textit{VK_PRESENT_MODE_FIFO_KHR} or \textit{VK_PRESENT_MODE_FIFO_RELAXED_KHR} for the surface on the specified device. \textit{VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT} must be included in the set. Implementations may support additional usages.
Note

Supported usage flags of a presentable image when using `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` presentation mode are provided by `VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags`.

Note

Formulas such as \( \text{min}(N, \maxImageCount) \) are not correct, since \( \maxImageCount \) may be zero.

To query the basic capabilities of a surface defined by the core or extensions, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceCapabilities2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkSurfaceCapabilities2KHR* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2KHR` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06521**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-06522**
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-02671**
  If a `VkSurfaceCapabilitiesFullScreenExclusiveEXT` structure is included in the `pNext` chain of `pSurfaceCapabilities`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure must be included in the `pNext` chain of `pSurfaceInfo`

- **VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07776**
  If a `VkSurfacePresentModeCompatibilityEXT` structure is included in the `pNext` chain of
pSurfaceCapabilities, a VkSurfacePresentModeEXT structure must be included in the pNext chain of pSurfaceInfo

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07777
  If a VkSurfacePresentScalingCapabilitiesEXT structure is included in the pNext chain of pSurfaceCapabilities, a VkSurfacePresentModeEXT structure must be included in the pNext chain of pSurfaceInfo

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07778
  If a VkSurfacePresentModeCompatibilityEXT structure is included in the pNext chain of pSurfaceCapabilities, pSurfaceInfo->surface must be a valid VkSurfaceKHR handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pNext-07779
  If a VkSurfacePresentScalingCapabilitiesEXT structure is included in the pNext chain of pSurfaceCapabilities, pSurfaceInfo->surface must be a valid VkSurfaceKHR handle

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-physicalDevice-parameter physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceInfo-parameter pSurfaceInfo must be a valid pointer to a valid VkPhysicalDeviceSurfaceInfo2KHR structure

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2KHR-pSurfaceCapabilities-parameter pSurfaceCapabilities must be a valid pointer to a VkSurfaceCapabilities2KHR structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkPhysicalDeviceSurfaceInfo2KHR structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkPhysicalDeviceSurfaceInfo2KHR {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceKHR surface;
} VkPhysicalDeviceSurfaceInfo2KHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **surface** is the surface that will be associated with the swapchain.

The members of `VkPhysicalDeviceSurfaceInfo2KHR` correspond to the arguments to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with **sType** and **pNext** added for extensibility.

Additional capabilities of a surface **may** be available to swapchains created with different full-screen exclusive settings - particularly if exclusive full-screen access is application controlled. These additional capabilities **can** be queried by adding a `VkSurfaceFullScreenExclusiveInfoEXT` structure to the **pNext** chain of this structure when used to query surface properties. Additionally, for Win32 surfaces with application controlled exclusive full-screen access, chaining a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **may** also report additional surface capabilities. These additional capabilities only apply to swapchains created with the same parameters included in the **pNext** chain of `VkSwapchainCreateInfoKHR`.

### Valid Usage

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-02672**
  If the **pNext** chain includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure with its `fullScreenExclusive` member set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, and **surface** was created using `vkCreateWin32SurfaceKHR`, a `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure **must** be included in the **pNext** chain.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-surface-07919**
  If surface is not `VK_NULL_HANDLE`, and the `VK_GOOGLE_surfaceless_query` extension is not enabled, **surface** **must** be a valid `VkSurfaceKHR` handle.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-sType**
  **sType** **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SURFACE_INFO_2_KHR`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-pNext-pNext**
  Each **pNext** member of any structure (including this one) in the **pNext** chain **must** be either **NULL** or a pointer to a valid instance of `VkSurfaceFullScreenExclusiveInfoEXT`, `VkSurfaceFullScreenExclusiveWin32InfoEXT`, or `VkSurfacePresentModeEXT`.

- **VUID-VkPhysicalDeviceSurfaceInfo2KHR-sType-unique**
  The **sType** value of each struct in the **pNext** chain **must** be unique.

If the **pNext** chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen transition behavior.

The `VkSurfaceFullScreenExclusiveInfoEXT` structure is defined as:
typedef struct VkSurfaceFullScreenExclusiveInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkFullScreenExclusiveEXT fullscreenExclusive;
} VkSurfaceFullScreenExclusiveInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fullscreenExclusive** is a `VkFullScreenExclusiveEXT` value specifying the preferred full-screen transition behavior.

If this structure is not present, `fullscreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

### Valid Usage (Implicit)

- VUID-VkSurfaceFullScreenExclusiveInfoEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_INFO_EXT`
- VUID-VkSurfaceFullScreenExclusiveInfoEXT-fullscreenExclusive-parameter
  - `fullscreenExclusive` must be a valid `VkFullScreenExclusiveEXT` value

Possible values of `VkSurfaceFullScreenExclusiveInfoEXT::fullscreenExclusive` are:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef enum VkFullScreenExclusiveEXT {
    VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT = 0,
    VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT = 1,
    VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT = 2,
    VK_FULL_SCREEN_EXCLUSIVE_APPLICATIONCONTROLLED_EXT = 3,
} VkFullScreenExclusiveEXT;
```

- **VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT** indicates the implementation should determine the appropriate full-screen method by whatever means it deems appropriate.
- **VK_FULL_SCREEN_EXCLUSIVE_ALLOWED_EXT** indicates the implementation may use full-screen exclusive mechanisms when available. Such mechanisms may result in better performance and/or the availability of different presentation capabilities, but may require a more disruptive transition during swapchain initialization, first presentation and/or destruction.
- **VK_FULL_SCREEN_EXCLUSIVE_DISALLOWED_EXT** indicates the implementation should avoid using full-screen mechanisms which rely on disruptive transitions.
- **VK_FULL_SCREEN_EXCLUSIVE_APPLICATIONCONTROLLED_EXT** indicates the application will manage full-screen exclusive mode by using the `vkAcquireFullScreenExclusiveModeEXT` and `vkReleaseFullScreenExclusiveModeEXT` commands.
The `VkSurfaceFullScreenExclusiveWin32InfoEXT` structure is defined as:

```c
// Provided by VK_KHR_win32_surface with VK_EXT_full_screen_exclusive
typedef struct VkSurfaceFullScreenExclusiveWin32InfoEXT {
    VkStructureType sType;
    const void* pNext;
    HMONITOR hmonitor;
} VkSurfaceFullScreenExclusiveWin32InfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hmonitor` is the Win32 `HMONITOR` handle identifying the display to create the surface with.

**Note**
If `hmonitor` is invalidated (e.g. the monitor is unplugged) during the lifetime of a swapchain created with this structure, operations on that swapchain will return `VK_ERROR_OUT_OF_DATE_KHR`.

**Note**
It is the responsibility of the application to change the display settings of the targeted Win32 display using the appropriate platform APIs. Such changes may alter the surface capabilities reported for the created surface.

### Valid Usage

- `VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-hmonitor-02673`
  
  `hmonitor` must be a valid `HMONITOR`

### Valid Usage (Implicit)

- `VUID-VkSurfaceFullScreenExclusiveWin32InfoEXT-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FULL_SCREEN_EXCLUSIVE_WIN32_INFO_EXT`

The `VkSurfaceCapabilities2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceCapabilities2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceCapabilitiesKHR surfaceCapabilities;
} VkSurfaceCapabilities2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `surfaceCapabilities` is a `VkSurfaceCapabilitiesKHR` structure describing the capabilities of the specified surface.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `VkPhysicalDeviceSurfaceInfo2KHR::surface` in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call is `VK_NULL_HANDLE`, the values returned in `minImageCount`, `maxImageCount`, `currentExtent`, and `currentTransform` will not reflect that of any surface and will instead be as such:

- `minImageCount` and `maxImageCount` will be `0xFFFFFFFF`
- `currentExtent` will be `(0xFFFFFFFF, 0xFFFFFFFF)`
- `currentTransform` will be `VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR`

### Valid Usage (Implicit)

- VUID-VkSurfaceCapabilities2KHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_KHR`

- VUID-VkSurfaceCapabilities2KHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of `VkDisplayNativeHdrSurfaceCapabilitiesAMD`, `VkLatencySurfaceCapabilitiesNV`, `VkSharedPresentSurfaceCapabilitiesKHR`, `VkSurfaceCapabilitiesFullScreenExclusiveEXT`, `VkSurfaceCapabilitiesPresentBarrierNV`, `VkSurfacePresentModeCompatibilityEXT`, `VkSurfacePresentScalingCapabilitiesEXT`, or `VkSurfaceProtectedCapabilitiesKHR`

- VUID-VkSurfaceCapabilities2KHR-sType-unique
  The sType value of each struct in the `pNext` chain must be unique

An application queries if a protected `VkSurfaceKHR` is displayable on a specific windowing system using `VkSurfaceProtectedCapabilitiesKHR`, which can be passed in `pNext` parameter of `VkSurfaceCapabilities2KHR`.

The `VkSurfaceProtectedCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_surface_protected_capabilities
typedef struct VkSurfaceProtectedCapabilitiesKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 supportsProtected;
} VkSurfaceProtectedCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `supportsProtected` specifies whether a protected swapchain created from `VkPhysicalDeviceSurfaceInfo2KHR::surface` for a particular windowing system can be displayed
on screen or not. If `supportsProtected` is `VK_TRUE`, then creation of swapchains with the `VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR` flag set must be supported for `surface`.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the value returned in `supportsProtected` will be identical for every valid surface created on this physical device, and so in the `vkGetPhysicalDeviceSurfaceCapabilities2KHR` call, `VkPhysicalDeviceSurfaceInfo2KHR:surface` can be `VK_NULL_HANDLE`. In that case, the contents of `VkSurfaceCapabilities2KHR::surfaceCapabilities` as well as any other struct chained to it will be undefined.

**Valid Usage (Implicit)**

- VUID-VkSurfaceProtectedCapabilitiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PROTECTED_CAPABILITIES_KHR`

The `VkSurfacePresentScalingCapabilitiesEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentScalingCapabilitiesEXT {
    VkStructureType sType;
    void* pNext;
    VkPresentScalingFlagsEXT supportedPresentScaling;
    VkPresentGravityFlagsEXT supportedPresentGravityX;
    VkPresentGravityFlagsEXT supportedPresentGravityY;
    VkExtent2D minScaledImageExtent;
    VkExtent2D maxScaledImageExtent;
} VkSurfacePresentScalingCapabilitiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supportedPresentScaling` is a bitmask of `VkPresentScalingFlagBitsEXT` representing the scaling methods supported by the surface, or `0` if application-defined scaling is not supported.
- `supportedPresentGravityX` is a bitmask of `VkPresentGravityFlagBitsEXT` representing the X-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the X axis.
- `supportedPresentGravityY` is a bitmask of `VkPresentGravityFlagBitsEXT` representing the Y-axis pixel gravity supported by the surface, or `0` if Vulkan-defined pixel gravity is not supported for the Y axis.
- `minScaledImageExtent` contains the smallest valid swapchain extent for the surface on the specified device when one of the scaling methods specified in `supportedPresentScaling` is used, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface. The `width` and `height` of the extent will each be smaller than or equal to the corresponding `width` and `height` of `VkSurfaceCapabilitiesKHR::minImageExtent`.
- `maxScaledImageExtent` contains the largest valid swapchain extent for the surface on the
specified device when one of the scaling methods specified in supportedPresentScaling is used, or the special value described above for minScaledImageExtent. The width and height of the extent will each be greater than or equal to the corresponding width and height of VkSurfaceCapabilitiesKHR::maxImageExtent.

Before creating a swapchain whose scaling mode can be specified through the use of VkSwapchainPresentScalingCreateInfoEXT, obtain the set of supported scaling modes by including a VkSurfacePresentModeEXT structure in the pNext chain of VkPhysicalDeviceSurfaceInfo2KHR when calling vkGetPhysicalDeviceSurfaceCapabilities2KHR. The implementation must return the same values in VkSurfacePresentScalingCapabilitiesEXT for any of the compatible present modes as obtained through VkSurfacePresentModeCompatibilityEXT.

**Valid Usage (Implicit)**

- VUID-VkSurfacePresentScalingCapabilitiesEXT-sType-sType must be VK_STRUCTURE_TYPE_SURFACE_PRESENT_SCALING_CAPABILITIES_EXT
- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentScaling-parameter supportedPresentScaling must be a valid combination of VkPresentScalingFlagBitsEXT values
- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityX-parameter supportedPresentGravityX must be a valid combination of VkPresentGravityFlagBitsEXT values
- VUID-VkSurfacePresentScalingCapabilitiesEXT-supportedPresentGravityY-parameter supportedPresentGravityY must be a valid combination of VkPresentGravityFlagBitsEXT values

Bits which may be set in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling, specifying scaling modes supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentScalingFlagBitsEXT {
    VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT = 0x00000001,
    VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT = 0x00000002,
    VK_PRESENT_SCALING_STRETCH_BIT_EXT = 0x00000004,
} VkPresentScalingFlagBitsEXT;
```

- **VK_PRESENT_SCALING_ONE_TO_ONE_BIT_EXT** specifies that no scaling occurs, and pixels in the swapchain image are mapped to one and only one pixel in the surface. The mapping between pixels is defined by the chosen presentation gravity.
- **VK_PRESENT_SCALING_ASPECT_RATIO_STRETCH_BIT_EXT** specifies that the swapchain image will be minified or magnified such that at least one of the resulting width or height is equal to the corresponding surface dimension, and the other resulting dimension is less than or equal to the corresponding surface dimension, with the aspect ratio of the resulting image being identical to that of the original swapchain image.
- **VK_PRESENT_SCALING_STRETCH_BIT_EXT** specifies that the swapchain image will be minified or
magnified such that the resulting image dimensions are equal to those of the surface.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentScalingFlagsEXT;
```

`VkPresentScalingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentScalingFlagBitsEXT`.

Bits which may be set in the `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX` or `supportedPresentGravityY` fields, specifying the gravity of presented pixels supported by the surface, are:

```c
// Provided by VK_EXT_surface_maintenance1
typedef enum VkPresentGravityFlagBitsEXT {    VK_PRESENT_GRAVITY_MIN_BIT_EXT = 0x00000001,    VK_PRESENT_GRAVITY_MAX_BIT_EXT = 0x00000002,    VK_PRESENT_GRAVITY_CENTERED_BIT_EXT = 0x00000004,} VkPresentGravityFlagBitsEXT;
```

- `VK_PRESENT_GRAVITY_MIN_BIT_EXT` means that the pixels will gravitate towards the top or left side of the surface.
- `VK_PRESENT_GRAVITY_MAX_BIT_EXT` means that the pixels will gravitate towards the bottom or right side of the surface.
- `VK_PRESENT_GRAVITY_CENTERED_BIT_EXT` means that the pixels will be centered in the surface.

If the value in `VkSurfaceCapabilitiesKHR::currentTransform` is not `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, it is implementation-defined whether the gravity configuration applies to the presented image before or after transformation.

```c
// Provided by VK_EXT_surface_maintenance1
typedef VkFlags VkPresentGravityFlagsEXT;
```

`VkPresentGravityFlagsEXT` is a bitmask type for setting a mask of zero or more `VkPresentGravityFlagBitsEXT`.

The `VkSurfacePresentModeEXT` structure is defined as:

```c
// Provided by VK_EXT_surface_maintenance1
typedef struct VkSurfacePresentModeEXT {    VkStructureType sType;    void* pNext;    VkPresentModeKHR presenteMode;} VkSurfacePresentModeEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `presentMode` is the presentation mode the swapchain will use.

If the `VkSurfacePresentModeEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceSurfaceInfo2KHR`, the values returned in `VkSurfaceCapabilitiesKHR::minImageCount`, `VkSurfaceCapabilitiesKHR::maxImageCount`, `VkSurfacePresentScalingCapabilitiesEXT::minScaledImageExtent`, and `VkSurfacePresentScalingCapabilitiesEXT::maxScaledImageExtent` are valid only for the specified `presentMode`. If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, the per-present mode image counts must both be one. The per-present mode image counts may be less-than or greater-than the image counts returned when `VkSurfacePresentModeEXT` is not provided.

**Note**

If `VkSwapchainPresentModesCreateInfoEXT` is provided to swapchain creation, the requirements for forward progress may be less strict. For example, a FIFO swapchain might only require 2 images to guarantee forward progress, but a MAILBOX one might require 4. Without the per-present image counts, such an implementation would have to return 4 in `VkSurfaceCapabilitiesKHR::minImageCount`, which pessimizes FIFO. Conversely, an implementation may return a low number for `minImageCount`, but internally bump the image count when application queries `vkGetSwapchainImagesKHR`, which can surprise applications, and is not discoverable until swapchain creation. Using `VkSurfacePresentModeEXT` and `VkSwapchainPresentModesCreateInfoEXT` together effectively removes this problem.

`VkSwapchainPresentModesCreateInfoEXT` is required for the specification to be backwards compatible with applications that do not know about, or make use of this feature.

**Valid Usage**

• VUID-VkSurfacePresentModeEXT-presentMode-07780
  `presentMode` must be a value reported by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the specified surface.

**Valid Usage (Implicit)**

• VUID-VkSurfacePresentModeEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_EXT`

• VUID-VkSurfacePresentModeEXT-presentMode-parameter
  `presentMode` must be a valid `VkPresentModeKHR` value

The `VkSurfacePresentModeCompatibilityEXT` structure is defined as:
typedef struct VkSurfacePresentModeCompatibilityEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t presentModeCount;
    VkPresentModeKHR* pPresentModes;
} VkSurfacePresentModeCompatibilityEXT;

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **presentModeCount** is an integer related to the number of present modes available or queried, as described below.
- **pPresentModes** is a pointer to an array of **VkPresentModeKHR** in which present modes compatible with a given present mode are returned.

If **pPresentModes** is **NULL**, then the number of present modes that are compatible with the one specified in **VkSurfacePresentModeEXT** is returned in **presentModeCount**. Otherwise, **presentModeCount** must be set by the user to the number of elements in the **pPresentModes** array, and on return the variable is overwritten with the number of values actually written to **pPresentModes**. If the value of **presentModeCount** is less than the number of compatible present modes that are supported, at most **presentModeCount** values will be written to **pPresentModes**. The implementation **must** include the present mode passed to **VkSurfacePresentModeEXT** in **pPresentModes**, unless **presentModeCount** is zero.

Before creating a swapchain whose present modes can be modified through the use of **VkSwapchainPresentModesCreateInfoEXT**, obtain the set of present modes compatible with a given initial present mode by including a **VkSurfacePresentModeEXT** structure in the **pNext** chain of **VkPhysicalDeviceSurfaceInfo2KHR** when calling **vkGetPhysicalDeviceSurfaceCapabilities2KHR**.

### Valid Usage (Implicit)

- **VUID-VkSurfacePresentModeCompatibilityEXT-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_SURFACE_PRESENT_MODE_COMPATIBILITY_EXT**

- **VUID-VkSurfacePresentModeCompatibilityEXT-pPresentModes-parameter**
  - If **presentModeCount** is not 0, and **pPresentModes** is not **NULL**, **pPresentModes** must be a valid pointer to an array of **presentModeCount** **VkPresentModeKHR** values

The **VkSharedPresentSurfaceCapabilitiesKHR** structure is defined as:

```c
// Provided by VK_KHR_shared_presentable_image
typedef struct VkSharedPresentSurfaceCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkImageUsageFlags sharedPresentSupportedUsageFlags;
} VkSharedPresentSurfaceCapabilitiesKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **sharedPresentSupportedUsageFlags** is a bitmask of *VkImageUsageFlagBits* representing the ways the application can use the shared presentable image from a swapchain created with *VkPresentModeKHR* set to `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR` for the surface on the specified device. *VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT* must be included in the set but implementations may support additional usages.

### Valid Usage (Implicit)

- VUID-VkSharedPresentSurfaceCapabilitiesKHR-sType-sType
  sType must be `VK_STRUCTURE_TYPE_SHARED_PRESENT_SURFACE_CAPABILITIES_KHR`

The *VkDisplayNativeHdrSurfaceCapabilitiesAMD* structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkDisplayNativeHdrSurfaceCapabilitiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 localDimmingSupport;
} VkDisplayNativeHdrSurfaceCapabilitiesAMD;
```

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **localDimmingSupport** specifies whether the surface supports local dimming. If this is `VK_TRUE`, *VkSwapchainDisplayNativeHdrCreateInfoAMD* can be used to explicitly enable or disable local dimming for the surface. Local dimming may also be overridden by *vkSetLocalDimmingAMD* during the lifetime of the swapchain.

### Valid Usage (Implicit)

- VUID-VkDisplayNativeHdrSurfaceCapabilitiesAMD-sType-sType
  sType must be `VK_STRUCTURE_TYPE_DISPLAY_NATIVE_HDR_SURFACE_CAPABILITIES_AMD`

The *VkSurfaceCapabilitiesFullScreenExclusiveEXT* structure is defined as:

```c
// Provided by VK_EXT_full_screen_exclusive
typedef struct VkSurfaceCapabilitiesFullScreenExclusiveEXT {
    VkStructureType sType;
    void* pNext;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;
```
VkBool32 fullScreenExclusiveSupported;
} VkSurfaceCapabilitiesFullScreenExclusiveEXT;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fullScreenExclusiveControlSupported** is a boolean describing whether the surface is able to make use of exclusive full-screen access.

This structure can be included in the **pNext** chain of *VkSurfaceCapabilities2KHR* to determine support for exclusive full-screen access. If **fullScreenExclusiveSupported** is **VK_FALSE**, it indicates that exclusive full-screen access is not obtainable for this surface.

Applications must not attempt to create swapchains with **VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT** set if **fullScreenExclusiveSupported** is **VK_FALSE**.

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilitiesFullScreenExclusiveEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_FULLSCREEN_EXCLUSIVE_EXT**

The *VkSurfaceCapabilitiesPresentBarrierNV* structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkSurfaceCapabilitiesPresentBarrierNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrierSupported;
} VkSurfaceCapabilitiesPresentBarrierNV;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentBarrierSupported** is a boolean describing whether the surface is able to make use of the present barrier feature.

This structure can be included in the **pNext** chain of *VkSurfaceCapabilities2KHR* to determine support for present barrier access. If **presentBarrierSupported** is **VK_FALSE**, it indicates that the present barrier feature is not obtainable for this surface.

**Valid Usage (Implicit)**

- VUID-VkSurfaceCapabilitiesPresentBarrierNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_PRESENT_BARRIER_NV**
To query the basic capabilities of a surface, needed in order to create a swapchain, call:

```c
// Provided by VK_EXT_display_surface_counter
VkResult vkGetPhysicalDeviceSurfaceCapabilities2EXT(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    VkSurfaceCapabilities2EXT* pSurfaceCapabilities);
```

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- `surface` is the surface that will be associated with the swapchain.
- `pSurfaceCapabilities` is a pointer to a `VkSurfaceCapabilities2EXT` structure in which the capabilities are returned.

`vkGetPhysicalDeviceSurfaceCapabilities2EXT` behaves similarly to `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, with the ability to return extended information by adding extending structures to the `pNext` chain of its `pSurfaceCapabilities` parameter.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06523 `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-06211 `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-surface-parameter `surface` must be a valid `VkSurfaceKHR` handle
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-pSurfaceCapabilities-parameter `pSurfaceCapabilities` must be a valid pointer to a `VkSurfaceCapabilities2EXT` structure
- VUID-vkGetPhysicalDeviceSurfaceCapabilities2EXT-commonparent Both of `physicalDevice`, and `surface` must have been created, allocated, or retrieved from the same `VkInstance`

### Return Codes

**Success**
- `VK_SUCCESS`
The `VkSurfaceCapabilities2EXT` structure is defined as:

```c
// Provided by VK_EXT_display_surface_counter
typedef struct VkSurfaceCapabilities2EXT {
  VkStructureType sType;
  void* pNext;
  uint32_t minImageCount;
  uint32_t maxImageCount;
  VkExtent2D currentExtent;
  VkExtent2D minImageExtent;
  VkExtent2D maxImageExtent;
  uint32_t maxImageArrayLayers;
  VkSurfaceTransformFlagsKHR supportedTransforms;
  VkSurfaceTransformFlagBitsKHR currentTransform;
  VkCompositeAlphaFlagsKHR supportedCompositeAlpha;
  VkImageUsageFlags supportedUsageFlags;
  VkSurfaceCounterFlagsEXT supportedSurfaceCounters;
} VkSurfaceCapabilities2EXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minImageCount` is the minimum number of images the specified device supports for a swapchain created for the surface, and will be at least one.
- `maxImageCount` is the maximum number of images the specified device supports for a swapchain created for the surface, and will be either 0, or greater than or equal to `minImageCount`. A value of 0 means that there is no limit on the number of images, though there may be limits related to the total amount of memory used by presentable images.
- `currentExtent` is the current width and height of the surface, or the special value (0xFFFFFFFF, 0xFFFFFFFF) indicating that the surface size will be determined by the extent of a swapchain targeting the surface.
- `minImageExtent` contains the smallest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be less than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageExtent` contains the largest valid swapchain extent for the surface on the specified device. The width and height of the extent will each be greater than or equal to the corresponding width and height of `minImageExtent`. The width and height of the extent will each be greater than or equal to the corresponding width and height of `currentExtent`, unless `currentExtent` has the special value described above.
- `maxImageArrayLayers` is the maximum number of layers presentable images can have for a
A swapchain created for this device and surface, and will be at least one.

- **supportedTransforms** is a bitmask of `VkSurfaceTransformFlagBitsKHR` indicating the presentation transforms supported for the surface on the specified device. At least one bit will be set.

- **currentTransform** is `VkSurfaceTransformFlagBitsKHR` value indicating the surface’s current transform relative to the presentation engine’s natural orientation.

- **supportedCompositeAlpha** is a bitmask of `VkCompositeAlphaFlagBitsKHR`, representing the alpha compositing modes supported by the presentation engine for the surface on the specified device, and at least one bit will be set. Opaque composition can be achieved in any alpha compositing mode by either using an image format that has no alpha component, or by ensuring that all pixels in the presentable images have an alpha value of 1.0.

- **supportedUsageFlags** is a bitmask of `VkImageUsageFlagBits` representing the ways the application can use the presentable images of a swapchain created with `VkPresentModeKHR` set to `VK_PRESENT_MODE_IMMEDIATE_KHR`, `VK_PRESENT_MODE_MAILBOX_KHR`, `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` for the surface on the specified device. `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT` must be included in the set. Implementations may support additional usages.

- **supportedSurfaceCounters** is a bitmask of `VkSurfaceCounterFlagBitsEXT` indicating the supported surface counter types.

### Valid Usage

- **VUID-VkSurfaceCapabilities2EXT-supportedSurfaceCounters-01246**

  `supportedSurfaceCounters` must not include `VK_SURFACE_COUNTER_VBLANK_BIT_EXT` unless the surface queried is a display surface.

### Valid Usage (Implicit)

- **VUID-VkSurfaceCapabilities2EXT-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_CAPABILITIES_2_EXT`

- **VUID-VkSurfaceCapabilities2EXT-pNext-pNext**

  `pNext` must be `NULL`

Bits which can be set in `VkSurfaceCapabilities2EXT::supportedSurfaceCounters`, indicating supported surface counter types, are:

```c
// Provided by VK_EXT_display_surface_counter
typedef enum VkSurfaceCounterFlagBitsEXT {
  VK_SURFACE_COUNTER_VBLANK_BIT_EXT = 0x00000001,
} VkSurfaceCounterFlagBitsEXT;
```

- **VK_SURFACE_COUNTER_VBLANK_BIT_EXT** specifies a counter incrementing once every time a vertical
blanking period occurs on the display associated with the surface.

\[
\begin{verbatim}
// Provided by VK_EXT_display_surface_counter
typedef VkFlags VkSurfaceCounterFlagsEXT;
\end{verbatim}
\]

\textbf{VkSurfaceCounterFlagsEXT} is a bitmask type for setting a mask of zero or more \textbf{VkSurfaceCounterFlagBitsEXT}.

Bits which \textbf{may} be set in \textbf{VkSurfaceCapabilitiesKHR::supportedTransforms} indicating the presentation transforms supported for the surface on the specified device, and possible values of \textbf{VkSurfaceCapabilitiesKHR::currentTransform} indicating the surface’s current transform relative to the presentation engine’s natural orientation, are:

\[
\begin{verbatim}
// Provided by VK_KHR_surface
typedef enum VkSurfaceTransformFlagBitsKHR {
    VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR = 0x00000001,
    VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR = 0x00000002,
    VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR = 0x00000004,
    VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR = 0x00000008,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR = 0x00000010,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR = 0x00000020,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR = 0x00000040,
    VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR = 0x00000080,
    VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR = 0x00000100,
} VkSurfaceTransformFlagBitsKHR;
\end{verbatim}
\]

- \textbf{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR} specifies that image content is presented without being transformed.
- \textbf{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR} specifies that image content is rotated 90 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR} specifies that image content is rotated 180 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR} specifies that image content is rotated 270 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_BIT_KHR} specifies that image content is mirrored horizontally.
- \textbf{VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_90_BIT_KHR} specifies that image content is mirrored horizontally, then rotated 90 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_180_BIT_KHR} specifies that image content is mirrored horizontally, then rotated 180 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_HORIZONTAL_MIRROR_ROTATE_270_BIT_KHR} specifies that image content is mirrored horizontally, then rotated 270 degrees clockwise.
- \textbf{VK_SURFACE_TRANSFORM_INHERIT_BIT_KHR} specifies that the presentation transform is not specified, and is instead determined by platform-specific considerations and mechanisms outside Vulkan.
VkSurfaceTransformFlagsKHR is a bitmask type for setting a mask of zero or more VkSurfaceTransformFlagBitsKHR.

The supportedCompositeAlpha member is of type VkCompositeAlphaFlagBitsKHR, containing the following values:

These values are described as follows:

- **VK_COMPOSITE_ALPHA_OPAQUE_BIT_KHR**: The alpha component, if it exists, of the images is ignored in the compositing process. Instead, the image is treated as if it has a constant alpha of 1.0.

- **VK_COMPOSITE_ALPHA_PRE_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are expected to already be multiplied by the alpha component by the application.

- **VK_COMPOSITE_ALPHA_POST_MULTIPLIED_BIT_KHR**: The alpha component, if it exists, of the images is respected in the compositing process. The non-alpha components of the image are not expected to already be multiplied by the alpha component by the application; instead, the compositor will multiply the non-alpha components of the image by the alpha component during compositing.

- **VK_COMPOSITE_ALPHA_INHERIT_BIT_KHR**: The way in which the presentation engine treats the alpha component in the images is unknown to the Vulkan API. Instead, the application is responsible for setting the composite alpha blending mode using native window system commands. If the application does not set the blending mode using native window system commands, then a platform-specific default will be used.

**34.5.2. Surface Format Support**

To query the supported swapchain format-color space pairs for a surface, call:
## Provided by VK_KHR_surface

```c
VkResult vkGetPhysicalDeviceSurfaceFormatsKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pSurfaceFormatCount,
    VkSurfaceFormatKHR* pSurfaceFormats);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- **surface** is the surface that will be associated with the swapchain.

- **pSurfaceFormatCount** is a pointer to an integer related to the number of format pairs available or queried, as described below.

- **pSurfaceFormats** is either `NULL` or a pointer to an array of `VkSurfaceFormatKHR` structures.

If `pSurfaceFormats` is `NULL`, then the number of format pairs supported for the given `surface` is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format pairs supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available format pairs were returned.

The number of format pairs supported must be greater than or equal to 1. `pSurfaceFormats` must not contain an entry whose value for `format` is `VK_FORMAT_UNDEFINED`.

If `pSurfaceFormats` includes an entry whose value for `colorSpace` is `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` and whose value for `format` is a UNORM (or SRGB) format and the corresponding SRGB (or UNORM) format is a color renderable format for `VK_IMAGE_TILING_OPTIMAL`, then `pSurfaceFormats` must also contain an entry with the same value for `colorSpace` and `format` equal to the corresponding SRGB (or UNORM) format.

If the `VK_GOOGLE_surfaceless_query` extension is enabled, the values returned in `pSurfaceFormats` will be identical for every valid surface created on this physical device, and so `surface` can be `VK_NULL_HANDLE`.

### Valid Usage

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06524**
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `surface` must be a valid `VkSurfaceKHR` handle.

- **VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-06525**
  If `surface` is not `VK_NULL_HANDLE`, `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormatCount-parameter
  pSurfaceFormatCount must be a valid pointer to a uint32_t value
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-pSurfaceFormats-parameter
  If the value referenced by pSurfaceFormatCount is not 0, and pSurfaceFormats is not NULL, pSurfaceFormats must be a valid pointer to an array of pSurfaceFormatCount VkSurfaceFormatKHR structures
- VUID-vkGetPhysicalDeviceSurfaceFormatsKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

The VkSurfaceFormatKHR structure is defined as:

```c
// Provided by VK_KHR_surface
typedef struct VkSurfaceFormatKHR {
    VkFormat format;
    VkColorSpaceKHR colorSpace;
} VkSurfaceFormatKHR;
```

- format is a VkFormat that is compatible with the specified surface.
- colorSpace is a presentation VkColorSpaceKHR that is compatible with the surface.

To query the supported swapchain format tuples for a surface, call:

```c
// Provided by VK_KHR_get_surface_capabilities2
VkResult vkGetPhysicalDeviceSurfaceFormats2KHR(...)
```
• `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

• `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• `pSurfaceFormatCount` is a pointer to an integer related to the number of format tuples available or queried, as described below.

• `pSurfaceFormats` is either `NULL` or a pointer to an array of `VkSurfaceFormat2KHR` structures.

`vkGetPhysicalDeviceSurfaceFormats2KHR` behaves similarly to `vkGetPhysicalDeviceSurfaceFormatsKHR`, with the ability to be extended via `pNext` chains.

If `pSurfaceFormats` is `NULL`, then the number of format tuples supported for the given surface is returned in `pSurfaceFormatCount`. Otherwise, `pSurfaceFormatCount` must point to a variable set by the user to the number of elements in the `pSurfaceFormats` array, and on return the variable is overwritten with the number of structures actually written to `pSurfaceFormats`. If the value of `pSurfaceFormatCount` is less than the number of format tuples supported, at most `pSurfaceFormatCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

**Valid Usage**

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06521
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-06522
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormatCount-parameter
  `pSurfaceFormatCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfaceFormats2KHR-pSurfaceFormats-parameter
If the value referenced by `pSurfaceFormatCount` is not 0, and `pSurfaceFormats` is not NULL, `pSurfaceFormats` must be a valid pointer to an array of `pSurfaceFormatCount` `VkSurfaceFormat2KHR` structures.

### Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`

The `VkSurfaceFormat2KHR` structure is defined as:

```c
// Provided by VK_KHR_get_surface_capabilities2
typedef struct VkSurfaceFormat2KHR {
    VkStructureType sType;
    void* pNext;
    VkSurfaceFormatKHR surfaceFormat;
} VkSurfaceFormat2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceFormat` is a `VkSurfaceFormatKHR` structure describing a format-color space pair that is compatible with the specified surface.

If the `imageCompressionControlSwapchain` feature is supported and a `VkImageCompressionPropertiesEXT` structure is included in the `pNext` chain of this structure, then it will be filled with the compression properties that are supported for the `surfaceFormat`.

### Valid Usage

- VUID-VkSurfaceFormat2KHR-pNext-06750
  If the `imageCompressionControlSwapchain` feature is not enabled, the `pNext` chain must not include an `VkImageCompressionPropertiesEXT` structure.

### Valid Usage (Implicit)

- VUID-VkSurfaceFormat2KHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SURFACE_FORMAT_2_KHR`
While the `format` of a presentable image refers to the encoding of each pixel, the `colorSpace` determines how the presentation engine interprets the pixel values. A color space in this document refers to a specific color space (defined by the chromaticities of its primaries and a white point in CIE Lab), and a transfer function that is applied before storing or transmitting color data in the given color space.

Possible values of `VkSurfaceFormatKHR::colorSpace`, specifying supported color spaces of a presentation engine, are:

```c
// Provided by VK_KHR_surface
typedef enum VkColorSpaceKHR {
    VK_COLOR_SPACE_SRGB_NONLINEAR_KHR = 0,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT = 1000104001,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT = 1000104002,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT = 1000104003,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT = 1000104004,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_LINEAR_EXT = 1000104005,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT709_NONLINEAR_EXT = 1000104006,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_BT2020_LINEAR_EXT = 1000104007,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_ST2084_EXT = 1000104008,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_DOLBYVISION_EXT = 1000104009,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_HDR10_HLG_EXT = 1000104010,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT = 1000104011,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT = 1000104012,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_PASS_THROUGH_EXT = 1000104013,
    // Provided by VK_EXT_swapchain_colorspace
    VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT = 1000104014,
    // Provided by VK_AMD_display_native_hdr
    VK_COLOR_SPACE_DISPLAY_NATIVE_AMD = 1000213000,
    VK_COLORSPACE_SRGB_NONLINEAR_KHR = VK_COLOR_SPACE_SRGB_NONLINEAR_KHR,
};
```
VK_COLOR_SPACE_DCI_P3_LINEAR_EXT = VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT,
} VkColorSpaceKHR;

- **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** specifies support for the sRGB color space.
- **VK_COLOR_SPACE_DISPLAY_P3_NONLINEAR_EXT** specifies support for the Display-P3 color space to be displayed using an sRGB-like EOTF (defined below).
- **VK_COLOR_SPACE_EXTENDED_SRGB_LINEAR_EXT** specifies support for the extended sRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_EXTENDED_SRGB_NONLINEAR_EXT** specifies support for the extended sRGB color space to be displayed using an sRGB EOTF.
- **VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT** specifies support for the Display-P3 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_DCI_P3_NONLINEAR_EXT** specifies support for the DCI-P3 color space to be displayed using the DCI-P3 EOTF. Note that values in such an image are interpreted as XYZ encoded color data by the presentation engine.
- **VK_COLOR_SPACE_BT709_LINEAR_EXT** specifies support for the BT709 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_BT709_NONLINEAR_EXT** specifies support for the BT709 color space to be displayed using the SMPTE 170M EOTF.
- **VK_COLOR_SPACE_BT2020_LINEAR_EXT** specifies support for the BT2020 color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_HDR10_ST2084_EXT** specifies support for the HDR10 (BT2020 color) space to be displayed using the SMPTE ST2084 Perceptual Quantizer (PQ) EOTF.
- **VK_COLOR_SPACE_DOLBYVISION_EXT** specifies support for the Dolby Vision (BT2020 color space), proprietary encoding, to be displayed using the SMPTE ST2084 EOTF.
- **VK_COLOR_SPACE_HDR10_HLG_EXT** specifies support for the HDR10 (BT2020 color space) to be displayed using the Hybrid Log Gamma (HLG) EOTF.
- **VK_COLOR_SPACE_ADOBERGB_LINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using a linear EOTF.
- **VK_COLOR_SPACE_ADOBERGB_NONLINEAR_EXT** specifies support for the AdobeRGB color space to be displayed using the Gamma 2.2 EOTF.
- **VK_COLOR_SPACE_PASS_THROUGH_EXT** specifies that color components are used “as is”. This is intended to allow applications to supply data for color spaces not described here.
- **VK_COLOR_SPACE_DISPLAY_NATIVE_AMD** specifies support for the display’s native color space. This matches the color space expectations of AMD’s FreeSync2 standard, for displays supporting it.

**Note**

In the initial release of the **VK_KHR_surface** and **VK_KHR_swapchain** extensions, the token **VK_COLORSPACE_SRGB_NONLINEAR_KHR** was used. Starting in the 2016-05-13 updates to the extension branches, matching release 1.0.13 of the core API specification, **VK_COLOR_SPACE_SRGB_NONLINEAR_KHR** is used instead for consistency.
with Vulkan naming rules. The older enum is still available for backwards compatibility.

**Note**

In older versions of this extension `VK_COLOR_SPACE_DISPLAY_P3_LINEAR_EXT` was misnamed `VK_COLOR_SPACE_DCI_P3_LINEAR_EXT`. This has been updated to indicate that it uses RGB color encoding, not XYZ. The old name is deprecated but is maintained for backwards compatibility.

**Note**

For a traditional “Linear” or non-gamma transfer function color space use `VK_COLOR_SPACE_PASS_THROUGH_EXT`.

The color components of non-linear color space swapchain images **must** have had the appropriate transfer function applied. The color space selected for the swapchain image will not affect the processing of data written into the image by the implementation. Vulkan requires that all implementations support the sRGB transfer function by use of an SRGB pixel format. Other transfer functions, such as SMPTE 170M or SMPTE2084, can be performed by the application shader. This extension defines enums for `VkColorSpaceKHR` that correspond to the following color spaces:

**Table 49. Color Spaces and Attributes**

</tbody>
</table>

The transfer functions are described in the “Transfer Functions” chapter of the **Khronos Data Format Specification**.
Except Display-P3 OETF, which is:

\[
E = \begin{cases} 
1.055 \times L^{2.4} - 0.055 & \text{for } 0.0030186 \leq L \leq 1 \\
12.92 \times L & \text{for } 0 \leq L < 0.0030186 
\end{cases}
\]

where \( L \) is the linear value of a color component and \( E \) is the encoded value (as stored in the image in memory).

\[\text{Note}\]
For most uses, the sRGB OETF is equivalent.

### 34.5.3. Surface Presentation Mode Support

To query the supported presentation modes for a surface, call:

```c
// Provided by VK_KHR_surface
VkResult vkGetPhysicalDeviceSurfacePresentModesKHR(
    VkPhysicalDevice physicalDevice, 
    VkSurfaceKHR surface, 
    uint32_t* pPresentModeCount, 
    VkPresentModeKHR* pPresentModes);
```

- **physicalDevice** is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.
- **surface** is the surface that will be associated with the swapchain.
- **pPresentModeCount** is a pointer to an integer related to the number of presentation modes available or queried, as described below.
- **pPresentModes** is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

If `pPresentModes` is `NULL`, then the number of presentation modes supported for the given `surface` is returned in `pPresentModeCount`. Otherwise, `pPresentModeCount` must point to a variable set by the user to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `pPresentModeCount` is less than the number of presentation modes supported, at most `pPresentModeCount` values will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available modes were returned.

If the `VK_GOOGLE_surfaceless_query` extension is enabled and `surface` is `VK_NULL_HANDLE`, the values returned in `pPresentModes` will only indicate support for `VK_PRESENT_MODE_FIFO_KHR`, `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR`, and `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`. To query support for any other present mode, a valid handle must be provided in `surface`. 
Valid Usage

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06524
  If the VK_GOOGLE_surfaceless_query extension is not enabled, surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-06525
  If surface is not VK_NULL_HANDLE, surface must be supported by physicalDevice, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-surface-parameter
  If surface is not VK_NULL_HANDLE, surface must be a valid VkSurfaceKHR handle

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModeCount-parameter
  pPresentModeCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-pPresentModes-parameter
  If the value referenced by pPresentModeCount is not 0, and pPresentModes is not NULL, pPresentModes must be a valid pointer to an array of pPresentModeCount VkPresentModeKHR values

• VUID-vkGetPhysicalDeviceSurfacePresentModesKHR-commonparent
  Both of physicalDevice, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Return Codes

Success
  • VK_SUCCESS
  • VK_INCOMPLETE

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported presentation modes for a surface combined with select other fixed swapchain creation parameters, call:

```cpp
// Provided by VK_EXT_full_screen_exclusive
```
VkResult vkGetPhysicalDeviceSurfacePresentModes2EXT(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    uint32_t* pPresentModeCount,
    VkPresentModeKHR* pPresentModes);

- `physicalDevice` is the physical device that will be associated with the swapchain to be created, as described for `vkCreateSwapchainKHR`.

- `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

- `pPresentModeCount` is a pointer to an integer related to the number of presentation modes available or queried, as described below.

- `pPresentModes` is either `NULL` or a pointer to an array of `VkPresentModeKHR` values, indicating the supported presentation modes.

`vkGetPhysicalDeviceSurfacePresentModes2EXT` behaves similarly to `vkGetPhysicalDeviceSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

### Valid Usage

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06521
  If the `VK_GOOGLE_surfaceless_query` extension is not enabled, `pSurfaceInfo->surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-06522
  If `pSurfaceInfo->surface` is not `VK_NULL_HANDLE`, `pSurfaceInfo->surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pSurfaceInfo-parameter
  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModeCount-parameter
  `pPresentModeCount` must be a valid pointer to a `uint32_t` value

- VUID-vkGetPhysicalDeviceSurfacePresentModes2EXT-pPresentModes-parameter
  If the value referenced by `pPresentModeCount` is not 0, and `pPresentModes` is not `NULL`, `pPresentModes` must be a valid pointer to an array of `pPresentModeCount` `VkPresentModeKHR` values
Return Codes

Success

• VK_SUCCESS
• VK_INCOMPLETE

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_SURFACE_LOST_KHR

Possible values of elements of the `vkGetPhysicalDeviceSurfacePresentModesKHR::pPresentModes` array, indicating the supported presentation modes for a surface, are:

```
// Provided by VK_KHR_surface
typedef enum VkPresentModeKHR {
    VK_PRESENT_MODE_IMMEDIATE_KHR = 0,
    VK_PRESENT_MODE_MAILBOX_KHR = 1,
    VK_PRESENT_MODE_FIFO_KHR = 2,
    VK_PRESENT_MODE_FIFO_RELAXED_KHR = 3,

    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR = 1000111000,
    // Provided by VK_KHR_shared_presentable_image
    VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR = 1000111001,
} VkPresentModeKHR;
```

- **VK_PRESENT_MODE_IMMEDIATE_KHR** specifies that the presentation engine does not wait for a vertical blanking period to update the current image, meaning this mode may result in visible tearing. No internal queuing of presentation requests is needed, as the requests are applied immediately.

- **VK_PRESENT_MODE_MAILBOX_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal single-entry queue is used to hold pending presentation requests. If the queue is full when a new presentation request is received, the new request replaces the existing entry, and any images associated with the prior entry become available for reuse by the application. One request is removed from the queue and processed during each vertical blanking period in which the queue is non-empty.

- **VK_PRESENT_MODE_FIFO_KHR** specifies that the presentation engine waits for the next vertical blanking period to update the current image. Tearing cannot be observed. An internal queue is used to hold pending presentation requests. New requests are appended to the end of the queue, and one request is removed from the beginning of the queue and processed during each vertical blanking period in which the queue is non-empty. This is the only value of `presentMode` that is required to be supported.

- **VK_PRESENT_MODE_FIFO_RELAXED_KHR** specifies that the presentation engine generally waits for the
The supported `VkImageUsageFlagBits` of the presentable images of a swapchain created for a surface may differ depending on the presentation mode, and can be determined as per the table below:

**Table 50. Presentable image usage queries**

<table>
<thead>
<tr>
<th>Presentation mode</th>
<th>Image usage flags</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_PRESENT_MODE_IMMEDIATE_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_MAILBOX_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_FIFO_RELAXED_KHR</td>
<td>VkSurfaceCapabilitiesKHR::supportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
<tr>
<td>VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR</td>
<td>VkSharedPresentSurfaceCapabilitiesKHR::sharedPresentSupportedUsageFlags</td>
</tr>
</tbody>
</table>

**Note**

For reference, the mode indicated by `VK_PRESENT_MODE_FIFO_KHR` is equivalent to the behavior of `{wgl|glX|egl}SwapBuffers with a swap interval of 1, while the mode indicated by `VK_PRESENT_MODE_FIFO_RELAXED_KHR` is equivalent to the behavior of `{wgl|glX}SwapBuffers with a swap interval of -1 (from the
34.6. Full Screen Exclusive Control

Swapchains created with `fullscreenexclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT` must acquire and release exclusive full-screen access explicitly, using the following commands.

To acquire exclusive full-screen access for a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkAcquireFullScreenExclusiveModeEXT(
    VkDevice        device,
    VkSwapchainKHR  swapchain);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to acquire exclusive full-screen access for.

**Valid Usage**

- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02674 `swapchain` must not be in the retired state
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02675 `swapchain` must be a swapchain created with a `VkSurfaceFullScreenExclusiveInfoEXT` structure, with `fullscreenexclusive` set to `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`
- VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-02676 `swapchain` must not currently have exclusive full-screen access

A return value of `VK_SUCCESS` indicates that the `swapchain` successfully acquired exclusive full-screen access. The swapchain will retain this exclusivity until either the application releases exclusive full-screen access with `vkReleaseFullScreenExclusiveModeEXT`, destroys the swapchain, or if any of the swapchain commands return `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` indicating that the mode was lost because of platform-specific changes.

If the swapchain was unable to acquire exclusive full-screen access to the display then `VK_ERROR_INITIALIZATION_FAILED` is returned. An application can attempt to acquire exclusive full-screen access again for the same swapchain even if this command fails, or if `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` has been returned by a swapchain command.

**Valid Usage (Implicit)**

- VUID-vkAcquireFullScreenExclusiveModeEXT-device-parameter `device` must be a valid `VkDevice` handle
• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkAcquireFullScreenExclusiveModeEXT-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_INITIALIZATION_FAILED
  • VK_ERROR_SURFACE_LOST_KHR

To release exclusive full-screen access from a swapchain, call:

```c
// Provided by VK_EXT_full_screen_exclusive
VkResult vkReleaseFullScreenExclusiveModeEXT(
  VkDevice device,
  VkSwapchainKHR swapchain);
```

• device is the device associated with swapchain.
• swapchain is the swapchain to release exclusive full-screen access from.

Note
Applications will not be able to present to swapchain after this call until exclusive full-screen access is reacquired. This is usually useful to handle when an application is minimised or otherwise intends to stop presenting for a time.

Valid Usage

• VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02677
  swapchain must not be in the retired state

• VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-02678
  swapchain must be a swapchain created with a VkSurfaceFullScreenExclusiveInfoEXT structure, with fullScreenExclusive set to VK_FULLSCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT
Valid Usage (Implicit)

- VUID-vkReleaseFullScreenExclusiveModeEXT-device-parameter
  device must be a valid VkDevice handle

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkReleaseFullScreenExclusiveModeEXT-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_SURFACE_LOST_KHR

34.7. Device Group Queries

A logical device that represents multiple physical devices may support presenting from images on more than one physical device, or combining images from multiple physical devices.

To query these capabilities, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
VkResult vkGetDeviceGroupPresentCapabilitiesKHR(
    VkDevice device,
    VkDeviceGroupPresentCapabilitiesKHR* pDeviceGroupPresentCapabilities);
```

- device is the logical device.

- pDeviceGroupPresentCapabilities is a pointer to a VkDeviceGroupPresentCapabilitiesKHR structure in which the device's capabilities are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetDeviceGroupPresentCapabilitiesKHR-pDeviceGroupPresentCapabilities-parameter
**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDeviceGroupPresentCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_surface
typedef struct VkDeviceGroupPresentCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t presentMask[VK_MAX_DEVICE_GROUP_SIZE];
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupPresentCapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `presentMask` is an array of `VK_MAX_DEVICE_GROUP_SIZE` `uint32_t` masks, where the mask at element `i` is non-zero if physical device `i` has a presentation engine, and where bit `j` is set in element `i` if physical device `i` can present swapchain images from physical device `j`. If element `i` is non-zero, then bit `i` must be set.
- `modes` is a bitmask of `VkDeviceGroupPresentModeFlagBitsKHR` indicating which device group presentation modes are supported.

`modes` always has `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR` set.

The present mode flags are also used when presenting an image, in `VkDeviceGroupPresentInfoKHR::mode`.

If a device group only includes a single physical device, then `modes` must equal `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

**Valid Usage (Implicit)**

- VUID-VkDeviceGroupPresentCapabilitiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_CAPABILITIES_KHR`
Bits which \textbf{may} be set in \texttt{VkDeviceGroupPresentCapabilitiesKHR:}:\texttt{modes}, indicating which device group presentation modes are supported, are:

\begin{verbatim}
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef enum VkDeviceGroupPresentModeFlagBitsKHR {
  VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR = 0x00000001,
  VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR = 0x00000002,
  VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR = 0x00000004,
  VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR = 0x00000008,
} VkDeviceGroupPresentModeFlagBitsKHR;
\end{verbatim}

- \texttt{VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR} specifies that any physical device with a presentation engine \textbf{can} present its own swapchain images.
- \texttt{VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR} specifies that any physical device with a presentation engine \textbf{can} present swapchain images from any physical device in its \texttt{presentMask}.
- \texttt{VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR} specifies that any physical device with a presentation engine \textbf{can} present the sum of swapchain images from any physical devices in its \texttt{presentMask}.
- \texttt{VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI DEVICE BIT_KHR} specifies that multiple physical devices with a presentation engine \textbf{can} each present their own swapchain images.

\begin{verbatim}
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
typedef VkFlags VkDeviceGroupPresentModeFlagsKHR;
\end{verbatim}

\texttt{VkDeviceGroupPresentModeFlagsKHR} is a bitmask type for setting a mask of zero or more \texttt{VkDeviceGroupPresentModeFlagBitsKHR}.

Some surfaces \textbf{may} not be capable of using all the device group present modes.

To query the supported device group present modes for a particular surface, call:

\begin{verbatim}
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
VK_KHR_surface
VkResult vkGetDeviceGroupSurfacePresentModesKHR(
  VkDevice device,
  VkSurfaceKHR surface,
  VkDeviceGroupPresentModeFlagsKHR* pModes);
\end{verbatim}

- \texttt{device} is the logical device.
- \texttt{surface} is the surface.
• pModes is a pointer to a VkDeviceGroupPresentModeFlagsKHR in which the supported device group present modes for the surface are returned.

The modes returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded. These modes must be a subset of the modes returned by vkGetDeviceGroupPresentCapabilitiesKHR.

Valid Usage

• VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-06212
  surface must be supported by all physical devices associated with device, as reported by vkGetPhysicalDeviceSurfaceSupportKHR or an equivalent platform-specific mechanism

Valid Usage (Implicit)

• VUID-vkGetDeviceGroupSurfacePresentModesKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetDeviceGroupSurfacePresentModesKHR-surface-parameter
  surface must be a valid VkSurfaceKHR handle

• VUID-vkGetDeviceGroupSurfacePresentModesKHR-pModes-parameter
  pModes must be a valid pointer to a VkDeviceGroupPresentModeFlagsKHR value

• VUID-vkGetDeviceGroupSurfacePresentModesKHR-commonparent
  Both of device, and surface must have been created, allocated, or retrieved from the same VkInstance

Host Synchronization

• Host access to surface must be externally synchronized

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY
  • VK_ERROR_SURFACE_LOST_KHR

Alternatively, to query the supported device group presentation modes for a surface combined with select other fixed swapchain creation parameters, call:
VkResult vkGetDeviceGroupSurfacePresentModes2EXT(
    VkDevice device,
    const VkPhysicalDeviceSurfaceInfo2KHR* pSurfaceInfo,
    VkDeviceGroupPresentModeFlagsKHR* pModes);

• `device` is the logical device.

• `pSurfaceInfo` is a pointer to a `VkPhysicalDeviceSurfaceInfo2KHR` structure describing the surface and other fixed parameters that would be consumed by `vkCreateSwapchainKHR`.

• `pModes` is a pointer to a `VkDeviceGroupPresentModeFlagsKHR` in which the supported device group present modes for the surface are returned.

`vkGetDeviceGroupSurfacePresentModes2EXT` behaves similarly to `vkGetDeviceGroupSurfacePresentModesKHR`, with the ability to specify extended inputs via chained input structures.

### Valid Usage

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-06213**

  `pSurfaceInfo->surface` must be supported by all physical devices associated with `device`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-device-parameter**

  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pSurfaceInfo-parameter**

  `pSurfaceInfo` must be a valid pointer to a valid `VkPhysicalDeviceSurfaceInfo2KHR` structure.

- **VUID-vkGetDeviceGroupSurfacePresentModes2EXT-pModes-parameter**

  `pModes` must be a valid pointer to a `VkDeviceGroupPresentModeFlagsKHR` value.

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_SURFACE_LOST_KHR`
When using `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, the application may need to know which regions of the surface are used when presenting locally on each physical device. Presentation of swapchain images to this surface need only have valid contents in the regions returned by this command.

To query a set of rectangles used in presentation on the physical device, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_surface
VkResult vkGetPhysicalDevicePresentRectanglesKHR(
    VkPhysicalDevice physicalDevice,
    VkSurfaceKHR surface,
    uint32_t* pRectCount,
    VkRect2D* pRects);
```

- `physicalDevice` is the physical device.
- `surface` is the surface.
- `pRectCount` is a pointer to an integer related to the number of rectangles available or queried, as described below.
- `pRects` is either `NULL` or a pointer to an array of `VkRect2D` structures.

If `pRects` is `NULL`, then the number of rectangles used when presenting the given `surface` is returned in `pRectCount`. Otherwise, `pRectCount` must point to a variable set by the user to the number of elements in the `pRects` array, and on return the variable is overwritten with the number of structures actually written to `pRects`. If the value of `pRectCount` is less than the number of rectangles, at most `pRectCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available rectangles were returned.

The values returned by this command are not invariant, and may change in response to the surface being moved, resized, or occluded.

The rectangles returned by this command must not overlap.

**Valid Usage**

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06523
  - `surface` must be a valid `VkSurfaceKHR` handle

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-surface-06211
  - `surface` must be supported by `physicalDevice`, as reported by `vkGetPhysicalDeviceSurfaceSupportKHR` or an equivalent platform-specific mechanism

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDevicePresentRectanglesKHR-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
34.8. Display Timing Queries

Traditional game and real-time-animation applications frequently use VK_PRESENT_MODE_FIFO_KHR so that presentable images are updated during the vertical blanking period of a given refresh cycle (RC) of the presentation engine’s display. This avoids the visual anomaly known as tearing.

However, synchronizing the presentation of images with the RC does not prevent all forms of visual anomalies. Stuttering occurs when the geometry for each presentable image is not accurately positioned for when that image will be displayed. The geometry may appear to move too little some RCs, and too much for others. Sometimes the animation appears to freeze, when the same image is used for more than one RC.

In order to minimize stuttering, an application needs to correctly position their geometry for when the presentable image will be displayed to the user. To accomplish this, applications need various timing information about the presentation engine’s display. They need to know when presentable images were actually presented, and when they could have been presented. Applications also need to tell the presentation engine to display an image no sooner than a given time. This can allow the application’s animation to look smooth to the user, with no stuttering. The VK_GOOGLE_display_timing
extension allows an application to satisfy these needs.

The presentation engine’s display typically refreshes the pixels that are displayed to the user on a periodic basis. The period may be fixed or variable. In many cases, the presentation engine is associated with fixed refresh rate (FRR) display technology, with a fixed refresh rate (RR, e.g. 60Hz). In some cases, the presentation engine is associated with variable refresh rate (VRR) display technology, where each refresh cycle (RC) can vary in length. This extension treats VRR displays as if they are FRR.

To query the duration of a refresh cycle (RC) for the presentation engine’s display, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetRefreshCycleDurationGOOGLE(
  VkDevice device,
  VkSwapchainKHR swapchain,
  VkRefreshCycleDurationGOOGLE* pDisplayTimingProperties);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to obtain the refresh duration for.
- **pDisplayTimingProperties** is a pointer to a `VkRefreshCycleDurationGOOGLE` structure.

### Valid Usage (Implicit)

- **VUID-vkGetRefreshCycleDurationGOOGLE-device-parameter**
  - `device` **must** be a valid `VkDevice` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parameter**
  - `swapchain` **must** be a valid `VkSwapchainKHR` handle
- **VUID-vkGetRefreshCycleDurationGOOGLE-pDisplayTimingProperties-parameter**
  - `pDisplayTimingProperties` **must** be a valid pointer to a `VkRefreshCycleDurationGOOGLE` structure
- **VUID-vkGetRefreshCycleDurationGOOGLE-swapchain-parent**
  - `swapchain` **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to **swapchain** **must** be externally synchronized

### Return Codes

**Success**
- `VK_SUCCESS`
The VkRefreshCycleDurationGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkRefreshCycleDurationGOOGLE {
    uint64_t refreshDuration;
} VkRefreshCycleDurationGOOGLE;
```

- **refreshDuration** is the number of nanoseconds from the start of one refresh cycle to the next.

**Note**

The rate at which an application renders and presents new images is known as the image present rate (IPR, aka frame rate). The inverse of IPR, or the duration between each image present, is the image present duration (IPD). In order to provide a smooth, stutter-free animation, an application will want its IPD to be a multiple of **refreshDuration**. For example, if a display has a 60Hz refresh rate, **refreshDuration** will be a value in nanoseconds that is approximately equal to 16.67ms. In such a case, an application will want an IPD of 16.67ms (1X multiplier of **refreshDuration**), or 33.33ms (2X multiplier of **refreshDuration**), or 50.00ms (3X multiplier of **refreshDuration**), etc.

In order to determine a target IPD for a display (i.e. a multiple of **refreshDuration**), an application needs to determine when its images are actually displayed. Suppose an application has an initial target IPD of 16.67ms (1X multiplier of **refreshDuration**). It will therefore position the geometry of a new image 16.67ms later than the previous image. But suppose this application is running on slower hardware, so that it actually takes 20ms to render each new image. This will create visual anomalies, because the images will not be displayed to the user every 16.67ms, nor every 20ms. In this case, it is better for the application to adjust its target IPD to 33.33ms (i.e. a 2X multiplier of **refreshDuration**), and tell the presentation engine to not present images any sooner than every 33.33ms. This will allow the geometry to be correctly positioned for each presentable image.

Adjustments to an application's IPD may be needed because different views of an application's geometry can take different amounts of time to render. For example, looking at the sky may take less time to render than looking at multiple, complex items in a room. In general, it is good to not frequently change IPD, as that can cause visual anomalies. Adjustments to a larger IPD because of late images should happen quickly, but adjustments to a smaller IPD should only happen if the actualPresentTime and earliestPresentTime members of the VkPastPresentationTimingGOOGLE structure are consistently different, and if
presentMargin is consistently large, over multiple images.

The implementation will maintain a limited amount of history of timing information about previous presents. Because of the asynchronous nature of the presentation engine, the timing information for a given `vkQueuePresentKHR` command will become available some time later. These time values can be asynchronously queried, and will be returned if available. All time values are in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux).

To asynchronously query the presentation engine, for newly-available timing information about one or more previous presents to a given swapchain, call:

```c
// Provided by VK_GOOGLE_display_timing
VkResult vkGetPastPresentationTimingGOOGLE(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pPresentationTimingCount,
    VkPastPresentationTimingGOOGLE* pPresentationTimings);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to obtain presentation timing information duration for.
- `pPresentationTimingCount` is a pointer to an integer related to the number of `VkPastPresentationTimingGOOGLE` structures to query, as described below.
- `pPresentationTimings` is either `NULL` or a pointer to an array of `VkPastPresentationTimingGOOGLE` structures.

If `pPresentationTimings` is `NULL`, then the number of newly-available timing records for the given swapchain is returned in `pPresentationTimingCount`. Otherwise, `pPresentationTimingCount` must point to a variable set by the user to the number of elements in the `pPresentationTimings` array, and on return the variable is overwritten with the number of structures actually written to `pPresentationTimings`. If the value of `pPresentationTimingCount` is less than the number of newly-available timing records, at most `pPresentationTimingCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available timing records were returned.

---

**Valid Usage (Implicit)**

- VUID-vkGetPastPresentationTimingGOOGLE-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parameter `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimingCount-parameter `pPresentationTimingCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPastPresentationTimingGOOGLE-pPresentationTimings-parameter If the value referenced by `pPresentationTimingCount` is not 0, and `pPresentationTimings` is
not NULL, `pPresentationTimings` **must** be a valid pointer to an array of `pPresentationTimingCount` `VkPastPresentationTimingGOOGLE` structures

- VUID-vkGetPastPresentationTimingGOOGLE-swapchain-parent
  
  swapchain **must** have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to swapchain **must** be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR

The `VkPastPresentationTimingGOOGLE` structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPastPresentationTimingGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
    uint64_t actualPresentTime;
    uint64_t earliestPresentTime;
    uint64_t presentMargin;
} VkPastPresentationTimingGOOGLE;
```

- **presentID** is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::presentID` (see below). It can be used to uniquely identify a previous present with the `vkQueuePresentKHR` command.

- **desiredPresentTime** is an application-provided value that was given to a previous `vkQueuePresentKHR` command via `VkPresentTimeGOOGLE::desiredPresentTime`. If non-zero, it was used by the application to indicate that an image not be presented any sooner than `desiredPresentTime`.

- **actualPresentTime** is the time when the image of the swapchain was actually displayed.

- **earliestPresentTime** is the time when the image of the swapchain could have been displayed. This may differ from `actualPresentTime` if the application requested that the image be presented no
sooner than \texttt{VkPresentTimeGOOGLE::desiredPresentTime}.

- \texttt{presentMargin} is an indication of how early the \texttt{vkQueuePresentKHR} command was processed compared to how soon it needed to be processed, and still be presented at \texttt{earliestPresentTime}.

The results for a given swapchain and presentID are only returned once from \texttt{vkGetPastPresentationTimingGOOGLE}.

The application can use the \texttt{VkPastPresentationTimingGOOGLE} values to occasionally adjust its timing. For example, if \texttt{actualPresentTime} is later than expected (e.g. one \texttt{refreshDuration} late), the application may increase its target IPD to a higher multiple of \texttt{refreshDuration} (e.g. decrease its frame rate from 60Hz to 30Hz). If \texttt{actualPresentTime} and \texttt{earliestPresentTime} are consistently different, and if \texttt{presentMargin} is consistently large enough, the application may decrease its target IPD to a smaller multiple of \texttt{refreshDuration} (e.g. increase its frame rate from 30Hz to 60Hz). If \texttt{actualPresentTime} and \texttt{earliestPresentTime} are same, and if \texttt{presentMargin} is consistently high, the application may delay the start of its input-render-present loop in order to decrease the latency between user input and the corresponding present (always leaving some margin in case a new image takes longer to render than the previous image). An application that desires its target IPD to always be the same as \texttt{refreshDuration}, can also adjust features until \texttt{actualPresentTime} is never late and \texttt{presentMargin} is satisfactory.

The full \texttt{VK_GOOGLE_display_timing} extension semantics are described for swapchains created with \texttt{VK_PRESENT_MODE_FIFO_KHR}. For example, non-zero values of \texttt{VkPresentTimeGOOGLE::desiredPresentTime} must be honored, and \texttt{vkGetPastPresentationTimingGOOGLE} should return a \texttt{VkPastPresentationTimingGOOGLE} structure with valid values for all images presented with \texttt{vkQueuePresentKHR}. The semantics for other present modes are as follows:

- **\texttt{VK_PRESENT_MODE_IMMEDIATE_KHR}**. The presentation engine may ignore non-zero values of \texttt{VkPresentTimeGOOGLE::desiredPresentTime} in favor of presenting immediately. The value of \texttt{VkPastPresentationTimingGOOGLE::earliestPresentTime} must be the same as \texttt{VkPastPresentationTimingGOOGLE::actualPresentTime}, which should be when the presentation engine displayed the image.

- **\texttt{VK_PRESENT_MODE_MAILBOX_KHR}**. The intention of using this present mode with this extension is to handle cases where an image is presented late, and the next image is presented soon enough to replace it at the next vertical blanking period. For images that are displayed to the user, the value of \texttt{VkPastPresentationTimingGOOGLE::actualPresentTime} must be when the image was displayed. For images that are not displayed to the user, \texttt{vkGetPastPresentationTimingGOOGLE} may not return a \texttt{VkPastPresentationTimingGOOGLE} structure, or it may return a \texttt{VkPastPresentationTimingGOOGLE} structure with the value of zero for both \texttt{VkPastPresentationTimingGOOGLE::actualPresentTime} and \texttt{VkPastPresentationTimingGOOGLE::earliestPresentTime}. It is possible that an application can submit images with \texttt{VkPresentTimeGOOGLE::desiredPresentTime} values such that new images may not be displayed. For example, if \texttt{VkPresentTimeGOOGLE::desiredPresentTime} is far enough in the future that an image is not presented before \texttt{vkQueuePresentKHR} is called to present another image, the first image will not be displayed to the user. If the application continues to do that, the presentation may not display new images.

- **\texttt{VK_PRESENT_MODE_FIFO_RELAXED_KHR}**. For images that are presented in time to be displayed at the next vertical blanking period, the semantics are identical as for
34.9. Present Wait

Applications wanting to control the pacing of the application by monitoring when presentation processes have completed to limit the number of outstanding images queued for presentation, need to have a method of being signaled during the presentation process.

Using the VK_GOOGLE_display_timing extension applications can discover when images were presented, but only asynchronously.

Providing a mechanism which allows applications to block, waiting for a specific step of the presentation process to complete allows them to control the amount of outstanding work (and hence the potential lag in responding to user input or changes in the rendering environment).

The VK_KHR_present_wait extension allows applications to tell the presentation engine at the vkQueuePresentKHR call that it plans on waiting for presentation by passing a VkPresentIdKHR structure. The presentId passed in that structure may then be passed to a future vkWaitForPresentKHR call to cause the application to block until that presentation is finished.

34.10. WSI Swapchain

A swapchain object (a.k.a. swapchain) provides the ability to present rendering results to a surface. Swapchain objects are represented by VkSwapchainKHR handles:

```
// Provided by VK_KHR_swapchain
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSwapchainKHR)
```

A swapchain is an abstraction for an array of presentable images that are associated with a surface. The presentable images are represented by VkImage objects created by the platform. One image (which can be an array image for multiview/stereoscopic-3D surfaces) is displayed at a time, but multiple images can be queued for presentation. An application renders to the image, and then queues the image for presentation to the surface.

A native window cannot be associated with more than one non-retired swapchain at a time. Further, swapchains cannot be created for native windows that have a non-Vulkan graphics API surface associated with them.

Note

The presentation engine is an abstraction for the platform's compositor or display engine.

The presentation engine may be synchronous or asynchronous with respect to the application and/or logical device.
Some implementations may use the device’s graphics queue or dedicated presentation hardware to perform presentation.

The presentable images of a swapchain are owned by the presentation engine. An application can acquire use of a presentable image from the presentation engine. Use of a presentable image must occur only after the image is returned by vkAcquireNextImageKHR, and before it is released by vkQueuePresentKHR. This includes transitioning the image layout and rendering commands.

An application can acquire use of a presentable image with vkAcquireNextImageKHR. After acquiring a presentable image and before modifying it, the application must use a synchronization primitive to ensure that the presentation engine has finished reading from the image. The application can then transition the image's layout, queue rendering commands to it, etc. Finally, the application presents the image with vkQueuePresentKHR, which releases the acquisition of the image. The application can also release the acquisition of the image through vkReleaseSwapchainImagesEXT, if the image is not in use by the device, and skip the present operation.

The presentation engine controls the order in which presentable images are acquired for use by the application.

Note
This allows the platform to handle situations which require out-of-order return of images after presentation. At the same time, it allows the application to generate command buffers referencing all of the images in the swapchain at initialization time, rather than in its main loop.

How this all works is described below.

If a swapchain is created with presentMode set to either VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, a single presentable image can be acquired, referred to as a shared presentable image. A shared presentable image may be concurrently accessed by the application and the presentation engine, without transitioning the image's layout after it is initially presented.

- With VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR, the presentation engine is only required to update to the latest contents of a shared presentable image after a present. The application must call vkQueuePresentKHR to guarantee an update. However, the presentation engine may update from it at any time.

- With VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, the presentation engine will automatically present the latest contents of a shared presentable image during every refresh cycle. The application is only required to make one initial call to vkQueuePresentKHR, after which the presentation engine will update from it without any need for further present calls. The application can indicate the image contents have been updated by calling vkQueuePresentKHR, but this does not guarantee the timing of when updates will occur.

The presentation engine may access a shared presentable image at any time after it is first presented. To avoid tearing, an application should coordinate access with the presentation engine. This requires presentation engine timing information through platform-specific mechanisms and
ensuring that color attachment writes are made available during the portion of the presentation engine's refresh cycle they are intended for.

**Note**
The VK_KHR_shared_presentable_image extension does not provide functionality for determining the timing of the presentation engine's refresh cycles.

In order to query a swapchain's status when rendering to a shared presentable image, call:

```c
// Provided by VK_KHR_shared_presentable_image
VkResult vkGetSwapchainStatusKHR(
    VkDevice device,
    VkSwapchainKHR swapchain);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to query.

**Valid Usage (Implicit)**

- VUID-vkGetSwapchainStatusKHR-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle
- VUID-vkGetSwapchainStatusKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to **swapchain** must be externally synchronized

**Return Codes**

**Success**

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
• VK_ERROR_SURFACE_LOST_KHR
• VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The possible return values for `vkGetSwapchainStatusKHR` should be interpreted as follows:

• VK_SUCCESS specifies the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
• VK_SUBOPTIMAL_KHR the swapchain no longer matches the surface properties exactly, but the presentation engine is presenting the contents of the shared presentable image, as per the swapchain's `VkPresentModeKHR`.
• VK_ERROR_OUT_OF_DATE_KHR the surface has changed in such a way that it is no longer compatible with the swapchain.
• VK_ERROR_SURFACE_LOST_KHR the surface is no longer available.

Note
The swapchain state may be cached by implementations, so applications should regularly call `vkGetSwapchainStatusKHR` when using a swapchain with `VkPresentModeKHR` set to `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`.

To create a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkCreateSwapchainKHR(    VkDevice device,    const VkSwapchainCreateInfoKHR* pCreateInfo,    const VkAllocationCallbacks* pAllocator,    VkSwapchainKHR* pSwapchain);
```

• `device` is the device to create the swapchain for.
• `pCreateInfo` is a pointer to a `VkSwapchainCreateInfoKHR` structure specifying the parameters of the created swapchain.
• `pAllocator` is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
• `pSwapchain` is a pointer to a `VkSwapchainKHR` handle in which the created swapchain object will be returned.

As mentioned above, if `vkCreateSwapchainKHR` succeeds, it will return a handle to a swapchain containing an array of at least `pCreateInfo->minImageCount` presentable images.

While acquired by the application, presentable images can be used in any way that equivalent non-presentable images can be used. A presentable image is equivalent to a non-presentable image created with the following `VkImageCreateInfo` parameters:
<table>
<thead>
<tr>
<th>VkImageCreateInfo Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>flags</td>
<td>VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT is set if VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR is set. VK_IMAGE_CREATE_PROTECTED_BIT is set if VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR is set. VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR are both set if VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR is set. all other bits are unset.</td>
</tr>
<tr>

</tbody>
</table>

The pCreateInfo->surface must not be destroyed until after the swapchain is destroyed.

If oldSwapchain is VK_NULL_HANDLE, and the native window referred to by pCreateInfo->surface is already associated with a Vulkan swapchain, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

If the native window referred to by pCreateInfo->surface is already associated with a non-Vulkan graphics API surface, VK_ERROR_NATIVE_WINDOW_IN_USE_KHR must be returned.

The native window referred to by pCreateInfo->surface must not become associated with a non-Vulkan graphics API surface before all associated Vulkan swapchains have been destroyed.

vkCreateSwapchainKHR will return VK_ERROR_DEVICE_LOST if the logical device was lost. The VkSwapchainKHR is a child of the device, and must be destroyed before the device. However, VkSurfaceKHR is not a child of any VkDevice and is not affected by the lost device. After successfully recreating a VkDevice, the same VkSurfaceKHR can be used to create a new VkSwapchainKHR, provided the previous one was destroyed.
If the `oldSwapchain` parameter of `pCreateInfo` is a valid swapchain, which has exclusive full-screen access, that access is released from `pCreateInfo->oldSwapchain`. If the command succeeds in this case, the newly created swapchain will automatically acquire exclusive full-screen access from `pCreateInfo->oldSwapchain`.

**Note**
This implicit transfer is intended to avoid exiting and entering full-screen exclusive mode, which may otherwise cause unwanted visual updates to the display.

In some cases, swapchain creation may fail if exclusive full-screen mode is requested for application control, but for some implementation-specific reason exclusive full-screen access is unavailable for the particular combination of parameters provided. If this occurs, `VK_ERROR_INITIALIZATION_FAILED` will be returned.

**Note**
In particular, it will fail if the `imageExtent` member of `pCreateInfo` does not match the extents of the monitor. Other reasons for failure may include the app not being set as high-dpi aware, or if the physical device and monitor are not compatible in this mode.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainPresentBarrierCreateInfoNV` structure, then that structure includes additional swapchain creation parameters specific to the present barrier. Swapchain creation may fail if the state of the current system restricts the usage of the present barrier feature `VkSurfaceCapabilitiesPresentBarrierNV`, or a swapchain itself does not satisfy all the required conditions. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

When the `VkSurfaceKHR` in `VkSwapchainCreateInfoKHR` is a display surface, then the `VkDisplayModeKHR` in display surface’s `VkDisplaySurfaceCreateInfoKHR` is associated with a particular `VkDisplayKHR`. Swapchain creation may fail if that `VkDisplayKHR` is not acquired by the application. In this scenario `VK_ERROR_INITIALIZATION_FAILED` is returned.

---

**Valid Usage (Implicit)**

- VUID-vkCreateSwapchainKHR-device-parameter
devicemust be a valid `VkDevice` handle

- VUID-vkCreateSwapchainKHR-pCreateInfo-parameter
`pCreateInfo` must be a valid pointer to a valid `VkSwapchainCreateInfoKHR` structure

- VUID-vkCreateSwapchainKHR-pAllocationCallbacksparameter
If `pAllocation` is not `NULL`, `pAllocation` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSwapchainKHR-pSwapchain-parameter
`pSwapchain` must be a valid pointer to a `VkSwapchainKHR` handle
Host Synchronization

- Host access to `pCreateInfo->surface` must be externally synchronized
- Host access to `pCreateInfo->oldSwapchain` must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_NATIVE_WINDOW_IN_USE_KHR
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_COMPRESSION_EXHAUSTED_EXT

The `VkSwapchainCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainCreateFlagsKHR flags;
    VkSurfaceKHR surface;
    uint32_t minImageCount;
    VkExtent2D imageExtent;
    uint32_t imageArrayLayers;
    VkImageUsageFlags imageUsage;
    VkSharingMode imageSharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
    VkSurfaceTransformFlagBitsKHR preTransform;
    VkCompositeAlphaFlagBitsKHR compositeAlpha;
    VkPresentModeKHR presentMode;
    VkBool32 clipped;
    VkSwapchainKHR oldSwapchain;
} VkSwapchainCreateInfoKHR;
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkSwapchainCreateFlagBitsKHR` indicating parameters of the swapchain creation.
- **surface** is the surface onto which the swapchain will present images. If the creation succeeds, the swapchain becomes associated with `surface`.
- **minImageCount** is the minimum number of presentable images that the application needs. The implementation will either create the swapchain with at least that many images, or it will fail to create the swapchain.
- **imageFormat** is a `VkFormat` value specifying the format the swapchain image(s) will be created with.
- **imageColorSpace** is a `VkColorSpaceKHR` value specifying the way the swapchain interprets image data.
- **imageExtent** is the size (in pixels) of the swapchain image(s). The behavior is platform-dependent if the image extent does not match the surface's `currentExtent` as returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`.

  **Note**
  
  On some platforms, it is normal that `maxImageExtent` may become `(0, 0)`, for example when the window is minimized. In such a case, it is not possible to create a swapchain due to the Valid Usage requirements, unless scaling is selected through `VkSwapchainPresentScalingCreateInfoEXT`, if supported.

- **imageArrayLayers** is the number of views in a multiview/stereo surface. For non-stereoscopic-3D applications, this value is 1.
- **imageUsage** is a bitmask of `VkImageUsageFlagBits` describing the intended usage of the (acquired) swapchain images.
- **imageSharingMode** is the sharing mode used for the image(s) of the swapchain.
- **queueFamilyIndexCount** is the number of queue families having access to the image(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- **pQueueFamilyIndices** is a pointer to an array of queue family indices having access to the images(s) of the swapchain when `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`.
- **preTransform** is a `VkSurfaceTransformFlagBitsKHR` value describing the transform, relative to the presentation engine's natural orientation, applied to the image content prior to presentation. If it does not match the `currentTransform` value returned by `vkGetPhysicalDeviceSurfaceCapabilitiesKHR`, the presentation engine will transform the image content as part of the presentation operation.
- **compositeAlpha** is a `VkCompositeAlphaFlagBitsKHR` value indicating the alpha compositing mode to use when this surface is composited together with other surfaces on certain window systems.
- **presentMode** is the presentation mode the swapchain will use. A swapchain's present mode determines how incoming present requests will be processed and queued internally.
- **clipped** specifies whether the Vulkan implementation is allowed to discard rendering
operations that affect regions of the surface that are not visible.

- If set to \texttt{VK_TRUE}, the presentable images associated with the swapchain \textbf{may} not own all of their pixels. Pixels in the presentable images that correspond to regions of the target surface obscured by another window on the desktop, or subject to some other clipping mechanism will have undefined content when read back. Fragment shaders \textbf{may} not execute for these pixels, and thus any side effects they would have had will not occur. Setting \texttt{VK_TRUE} does not guarantee any clipping will occur, but allows more efficient presentation methods to be used on some platforms.

- If set to \texttt{VK_FALSE}, presentable images associated with the swapchain will own all of the pixels they contain.

  \textit{Note} Applications \textbf{should} set this value to \texttt{VK_TRUE} if they do not expect to read back the content of presentable images before presenting them or after reacquiring them, and if their fragment shaders do not have any side effects that require them to run for all pixels in the presentable image.

- \texttt{oldSwapchain} is \texttt{VK_NULL_HANDLE}, or the existing non-retired swapchain currently associated with \texttt{surface}. Providing a valid \texttt{oldSwapchain} \textbf{may} aid in the resource reuse, and also allows the application to still present any images that are already acquired from it.

Upon calling \texttt{vkCreateSwapchainKHR} with an \texttt{oldSwapchain} that is not \texttt{VK_NULL_HANDLE}, \texttt{oldSwapchain} is retired — even if creation of the new swapchain fails. The new swapchain is created in the non-retired state whether or not \texttt{oldSwapchain} is \texttt{VK_NULL_HANDLE}.

Upon calling \texttt{vkCreateSwapchainKHR} with an \texttt{oldSwapchain} that is not \texttt{VK_NULL_HANDLE}, any images from \texttt{oldSwapchain} that are not acquired by the application \textbf{may} be freed by the implementation, which \textbf{may} occur even if creation of the new swapchain fails. The application \textbf{can} destroy \texttt{oldSwapchain} to free all memory associated with \texttt{oldSwapchain}.

  \textit{Note} Multiple retired swapchains \textbf{can} be associated with the same \texttt{VkSurfaceKHR} through multiple uses of \texttt{oldSwapchain} that outnumber calls to \texttt{vkDestroySwapchainKHR}.

After \texttt{oldSwapchain} is retired, the application \textbf{can} pass to \texttt{vkQueuePresentKHR} any images it had already acquired from \texttt{oldSwapchain}. E.g., an application may present an image from the old swapchain before an image from the new swapchain is ready to be presented. As usual, \texttt{vkQueuePresentKHR} \textbf{may} fail if \texttt{oldSwapchain} has entered a state that causes \texttt{VK_ERROR_OUT_OF_DATE_KHR} to be returned.

The application \textbf{can} continue to use a shared presentable image obtained from \texttt{oldSwapchain} until a presentable image is acquired from the new swapchain, as long as it has not entered a state that causes it to return \texttt{VK_ERROR_OUT_OF_DATE_KHR}.

\textbf{Valid Usage}

- VUID-VkSwapchainCreateInfoKHR-surface-01270
surface must be a surface that is supported by the device as determined using 
vkGetPhysicalDeviceSurfaceSupportKHR

• VUID-VkSwapchainCreateInfoKHR-minImageCount-01272
  minImageCount must be less than or equal to the value returned in the maxImageCount
  member of the VkSurfaceCapabilitiesKHR structure returned by 
vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface if the returned maxImageCount is not zero

• VUID-VkSwapchainCreateInfoKHR-presentMode-02839
  If presentMode is not VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR nor 
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR, then minImageCount must be greater than 
or equal to the value returned in the minImageCount member of the 
VkSurfaceCapabilitiesKHR structure returned by 
vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-minImageCount-01383
  minImageCount must be 1 if presentMode is either 
  VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR or  
  VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR

• VUID-VkSwapchainCreateInfoKHR-imageFormat-01273
  imageFormat and imageColorSpace must match the format and colorSpace members, 
  respectively, of one of the VkSurfaceFormatKHR structures returned by 
vkGetPhysicalDeviceSurfaceFormatsKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-pNext-07781
  If a VkSwapchainPresentScalingCreateInfoEXT structure was not included in the pNext 
  chain, or it is included and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is 
  zero then imageExtent must be between minImageExtent and maxImageExtent, inclusive, 
where minImageExtent and maxImageExtent are members of the VkSurfaceCapabilitiesKHR 
structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-pNext-07782
  If a VkSwapchainPresentScalingCreateInfoEXT structure was included in the pNext chain 
and VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior is not zero then imageExtent must be between minScaledImageExtent and maxScaledImageExtent, inclusive, 
where minScaledImageExtent and maxScaledImageExtent are members of the 
VkSurfacePresentScalingCapabilitiesEXT structure returned by 
vkGetPhysicalDeviceSurfaceCapabilities2KHR for the surface and presentMode

• VUID-VkSwapchainCreateInfoKHR-imageExtent-01689
  imageExtent members width and height must both be non-zero

• VUID-VkSwapchainCreateInfoKHR-imageArrayLayers-01275
  imageArrayLayers must be greater than 0 and less than or equal to the maxImageArrayLayers 
  member of the VkSurfaceCapabilitiesKHR structure returned by 
vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

• VUID-VkSwapchainCreateInfoKHR-presentMode-01427
  If presentMode is VK_PRESENT_MODE_IMMEDIATE_KHR, VK_PRESENT_MODE_MAILBOX_KHR, 
  VK_PRESENT_MODE_FIFO_KHR or VK_PRESENT_MODE_FIFO_RELAXED_KHR, imageUsage must be a 
subset of the supported usage flags present in the supportedUsageFlags member of the
VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for surface

- **VUID-VkSwapchainCreateInfoKHR-imageUsage-01384**
  If `presentMode` is `VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR` or `VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR`, imageUsage must be a subset of the supported usage flags present in the sharedPresentSupportedUsageFlags member of the VkSharedPresentSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01277**
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01278**
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, `queueFamilyIndexCount` must be greater than 1

- **VUID-VkSwapchainCreateInfoKHR-imageSharingMode-01428**
  If `imageSharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than `pQueueFamilyPropertyCount` returned by either vkGetPhysicalDeviceQueueFamilyProperties or vkGetPhysicalDeviceQueueFamilyProperties2 for the physicalDevice that was used to create device

- **VUID-VkSwapchainCreateInfoKHR-preTransform-01279**
  `preTransform` must be one of the bits present in the `supportedTransforms` member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- **VUID-VkSwapchainCreateInfoKHR-compositeAlpha-01280**
  `compositeAlpha` must be one of the bits present in the `supportedCompositeAlpha` member of the VkSurfaceCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilitiesKHR for the surface

- **VUID-VkSwapchainCreateInfoKHR-presentMode-01281**
  `presentMode` must be one of the VkPresentModeKHR values returned by vkGetPhysicalDeviceSurfacePresentModesKHR for the surface

- **VUID-VkSwapchainCreateInfoKHR-physicalDeviceCount-01429**
  If the logical device was created with VkDeviceGroupDeviceCreateInfo::physicalDeviceCount equal to 1, flags must not contain `VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR`

- **VUID-VkSwapchainCreateInfoKHR-oldSwapchain-01933**
  If `oldSwapchain` is not `VK_NULL_HANDLE`, `oldSwapchain` must be a non-retired swapchain associated with native window referred to by `surface`

- **VUID-VkSwapchainCreateInfoKHR-imageFormat-01778**
  The implied image creation parameters of the swapchain must be supported as reported by vkGetPhysicalDeviceImageFormatProperties

- **VUID-VkSwapchainCreateInfoKHR-flags-03168**
  If `flags` contains `VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR` then the `pNext` chain must
include a VkImageFormatListCreateInfo structure with a viewFormatCount greater than zero and pViewFormats must have an element equal to imageFormat

• VUID-VkSwapchainCreateInfoKHR-pNext-04099
  If a VkImageFormatListCreateInfo structure was included in the pNext chain and VkImageFormatListCreateInfo::viewFormatCount is not zero then all of the formats in VkImageFormatListCreateInfo::pViewFormats must be compatible with the format as described in the compatibility table

• VUID-VkSwapchainCreateInfoKHR-flags-04100
  If flags does not contain VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR and the pNext chain include a VkImageFormatListCreateInfo structure then VkImageFormatListCreateInfo::viewFormatCount must be 0 or 1

• VUID-VkSwapchainCreateInfoKHR-flags-03187
  If flags contains VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR, then VkSurfaceProtectedCapabilitiesKHR::supportsProtected must be VK_TRUE in the VkSurfaceProtectedCapabilitiesKHR structure returned by vkGetPhysicalDeviceSurfaceCapabilities2KHR for surface

• VUID-VkSwapchainCreateInfoKHR-pNext-02679
  If the pNext chain includes a VkSurfaceFullScreenExclusiveInfoEXT structure with its fullScreenExclusive member set to VKFULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT, and surface was created using vkCreateWin32SurfaceKHR, a VkSurfaceFullScreenExclusiveWin32InfoEXT structure must be included in the pNext chain

• VUID-VkSwapchainCreateInfoKHR-pNext-06752
  If the imageCompressionControlSwapchain feature is not enabled, the pNext chain must not include an VkImageCompressionControlEXT structure

Valid Usage (Implicit)

• VUID-VkSwapchainCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_CREATE_INFO_KHR

• VUID-VkSwapchainCreateInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupSwapchainCreateInfoKHR, VkImageCompressionControlEXT, VkImageFormatListCreateInfo, VkSurfaceFullScreenExclusiveInfoEXT, VkSurfaceFullScreenExclusiveWin32InfoEXT, VkSwapchainCounterCreateInfoEXT, VkSwapchainDisplayNativeHdrCreateInfoAMD, VkSwapchainLatencyCreateInfoNV, VkSwapchainPresentBarrierCreateInfoNV, VkSwapchainPresentModesCreateInfoEXT, or VkSwapchainPresentScalingCreateInfoEXT

• VUID-VkSwapchainCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkSwapchainCreateInfoKHR-flags-parameter
  flags must be a valid combination of VkSwapchainCreateFlagBitsKHR values

• VUID-VkSwapchainCreateInfoKHR-surface-parameter
surface must be a valid VkSurfaceKHR handle

- VUID-VkSwapchainCreateInfoKHR-imageFormat-parameter
  imageFormat must be a valid VkFormat value

- VUID-VkSwapchainCreateInfoKHR-imageColorSpace-parameter
  imageColorSpace must be a valid VkColorSpaceKHR value

- VUID-VkSwapchainCreateInfoKHR-imageUsage-parameter
  imageUsage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkSwapchainCreateInfoKHR-imageUsage-requiredbitmask
  imageUsage must not be 0

- VUID-VkSwapchainCreateInfoKHR-imageSharingMode-parameter
  imageSharingMode must be a valid VkSharingMode value

- VUID-VkSwapchainCreateInfoKHR-preTransform-parameter
  preTransform must be a valid VkSurfaceTransformFlagBitsKHR value

- VUID-VkSwapchainCreateInfoKHR-compositeAlpha-parameter
  compositeAlpha must be a valid VkCompositeAlphaFlagBitsKHR value

- VUID-VkSwapchainCreateInfoKHR-presentMode-parameter
  presentMode must be a valid VkPresentModeKHR value

- VUID-VkSwapchainCreateInfoKHR-oldSwapchain-parameter
  If oldSwapchain is not VK_NULL_HANDLE, oldSwapchain must be a valid VkSwapchainKHR handle

- VUID-VkSwapchainCreateInfoKHR-commonparent
  Both of oldSwapchain, and surface that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkInstance

Bits which can be set in VkSwapchainCreateInfoKHR::flags, specifying parameters of swapchain creation, are:

```cpp
// Provided by VK_KHR_swapchain
typedef enum VkSwapchainCreateFlagBitsKHR {
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
    // VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = 0x00000001,
    // Provided by VK_VERSION_1_1 with VK_KHR_swapchain
    VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_swapchain_mutable_format
    VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR = 0x00000004,
    // Provided by VK_EXT_swapchain_maintenance1
    VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT = 0x00000008,
} VkSwapchainCreateFlagBitsKHR;
```

- VK_SWAPCHAIN_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR specifies that images created from the swapchain (i.e. with the swapchain member of VkImageSwapchainCreateInfoKHR set to this swapchain’s handle) must use VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT.
• **VK_SWAPCHAIN_CREATE_PROTECTED_BIT_KHR** specifies that images created from the swapchain are protected images.

• **VK_SWAPCHAIN_CREATE_MUTABLE_FORMAT_BIT_KHR** specifies that the images of the swapchain can be used to create a VkImageView with a different format than what the swapchain was created with. The list of allowed image view formats is specified by adding a VkImageFormatListCreateInfo structure to the pNext chain of VkSwapchainCreateInfoKHR. In addition, this flag also specifies that the swapchain can be created with usage flags that are not supported for the format the swapchain is created with but are supported for at least one of the allowed image view formats.

• **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT** specifies that the implementation may defer allocation of memory associated with each swapchain image until its index is to be returned from vkAcquireNextImageKHR or vkAcquireNextImage2KHR for the first time.

```c
// Provided by VK_KHR_swapchain
typedef VkFlags VkSwapchainCreateFlagsKHR;
```

**VkSwapchainCreateFlagsKHR** is a bitmask type for setting a mask of zero or more VkSwapchainCreateFlagBitsKHR.

If the pNext chain of VkSwapchainCreateInfoKHR includes a VkDeviceGroupSwapchainCreateInfoKHR structure, then that structure includes a set of device group present modes that the swapchain can be used with.

The **VkDeviceGroupSwapchainCreateInfoKHR** structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkDeviceGroupSwapchainCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceGroupPresentModeFlagsKHR modes;
} VkDeviceGroupSwapchainCreateInfoKHR;
```

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **modes** is a bitfield of modes that the swapchain can be used with.

If this structure is not present, **modes** is considered to be **VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR**.

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_DEVICE_GROUP_SWAPCHAIN_CREATE_INFO_KHR**

- **VUID-VkDeviceGroupSwapchainCreateInfoKHR-modes-parameter**
  
  **modes** must be a valid combination of **VkDeviceGroupPresentModeFlagBitsKHR** values
If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure, then that structure includes additional swapchain creation parameters specific to display native HDR support.

The `VkSwapchainDisplayNativeHdrCreateInfoAMD` structure is defined as:

```c
// Provided by VK_AMD_display_native_hdr
typedef struct VkSwapchainDisplayNativeHdrCreateInfoAMD {
    VkStructureType sType;
    const void* pNext;
    VkBool32 localDimmingEnable;
} VkSwapchainDisplayNativeHdrCreateInfoAMD;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

If the `pNext` chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for `localDimmingEnable` is `VK_TRUE`, meaning local dimming is initially enabled for the swapchain.

**Valid Usage (Implicit)**

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_DISPLAY_NATIVE_HDR_CREATE_INFO_AMD`

**Valid Usage**

- VUID-VkSwapchainDisplayNativeHdrCreateInfoAMD-localDimmingEnable-04449
  It is only valid to set `localDimmingEnable` to `VK_TRUE` if `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` is supported

The local dimming HDR setting may also be changed over the life of a swapchain by calling:

```c
// Provided by VK_AMD_display_native_hdr
void vkSetLocalDimmingAMD(
    VkDevice device,
    VkSwapchainKHR swapChain,
    VkBool32 localDimmingEnable);
```

- `device` is the device associated with `swapChain`. 
• `swapChain` handle to enable local dimming.

• `localDimmingEnable` specifies whether local dimming is enabled for the swapchain.

### Valid Usage (Implicit)

- VUID-vkSetLocalDimmingAMD-device-parameter
  - `device` must be a valid `VkDevice` handle

- VUID-vkSetLocalDimmingAMD-swapChain-parameter
  - `swapChain` must be a valid `VkSwapchainKHR` handle

- VUID-vkSetLocalDimmingAMD-swapChain-parent
  - `swapChain` must have been created, allocated, or retrieved from `device`

### Valid Usage

- VUID-vkSetLocalDimmingAMD-localDimmingSupport-04618
  - `VkDisplayNativeHdrSurfaceCapabilitiesAMD::localDimmingSupport` must be supported

If the `pNext` chain of `VkSwapchainCreateInfoKHR` includes a `VkSurfaceFullScreenExclusiveInfoEXT` structure, then that structure specifies the application’s preferred full-screen presentation behavior. If this structure is not present, `fullScreenExclusive` is considered to be `VK_FULL_SCREEN_EXCLUSIVE_DEFAULT_EXT`.

To enable surface counters when creating a swapchain, add a `VkSwapchainCounterCreateInfoEXT` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`. `VkSwapchainCounterCreateInfoEXT` is defined as:

```c
// Provided by VK_EXT_display_control
typedef struct VkSwapchainCounterCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceCounterFlagsEXT surfaceCounters;
} VkSwapchainCounterCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `surfaceCounters` is a bitmask of `VkSurfaceCounterFlagBitsEXT` specifying surface counters to enable for the swapchain.

### Valid Usage

- VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-01244
  - The bits in `surfaceCounters` must be supported by `VkSwapchainCreateInfoKHR::surface`, as reported by `vkGetPhysicalDeviceSurfaceCapabilities2EXT`
Valid Usage (Implicit)

• VUID-VkSwapchainCounterCreateInfoEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_COUNTER_CREATE_INFO_EXT

• VUID-VkSwapchainCounterCreateInfoEXT-surfaceCounters-parameter
  surfaceCounters must be a valid combination of VkSurfaceCounterFlagBitsEXT values

The requested counters become active when the first presentation command for the associated swapchain is processed by the presentation engine. To query the value of an active counter, use:

```cpp
// Provided by VK_EXT_display_control
VkResult vkGetSwapchainCounterEXT(
    VkDevice device,                     // device is the VkDevice associated with swapchain.
    VkSwapchainKHR swapchain,           // swapchain is the swapchain from which to query the counter value.
    VkSurfaceCounterFlagBitsEXT counter,  // counter is a VkSurfaceCounterFlagBitsEXT value specifying the counter to query.
    uint64_t* pCounterValue);           // pCounterValue will return the current value of the counter.
```

If a counter is not available because the swapchain is out of date, the implementation may return VK_ERROR_OUT_OF_DATE_KHR.

Valid Usage

• VUID-vkGetSwapchainCounterEXT-swapchain-01245
  One or more present commands on swapchain must have been processed by the presentation engine

Valid Usage (Implicit)

• VUID-vkGetSwapchainCounterEXT-device-parameter
  device must be a valid VkDevice handle

• VUID-vkGetSwapchainCounterEXT-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

• VUID-vkGetSwapchainCounterEXT-counter-parameter
  counter must be a valid VkSurfaceCounterFlagBitsEXT value

• VUID-vkGetSwapchainCounterEXT-pCounterValue-parameter
  pCounterValue must be a valid pointer to a uint64_t value

• VUID-vkGetSwapchainCounterEXT-swapchain-parent

3101
swapchain must have been created, allocated, or retrieved from device

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR

To specify compression properties for the swapchain images in this swapchain, add a `VkImageCompressionControlEXT` structure to the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

Applications can modify the presentation mode used by the swapchain on a per-presentation basis. However, all presentation modes the application intends to use with the swapchain must be specified at swapchain creation time. To specify more than one presentation mode when creating a swapchain, include the `VkSwapchainPresentModesCreateInfoEXT` structure in the `pNext` chain of the `VkSwapchainCreateInfoKHR` structure.

The `VkSwapchainPresentModesCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModesCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t presentModeCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModesCreateInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentModeCount` is the number of presentation modes provided.
- `pPresentModes` is a list of presentation modes with `presentModeCount` entries

### Valid Usage

- VUID-VkSwapchainPresentModesCreateInfoEXT-None-07762
  Each entry in `pPresentModes` must be one of the `VkPresentModeKHR` values returned by `vkGetPhysicalDeviceSurfacePresentModesKHR` for the surface

- VUID-VkSwapchainPresentModesCreateInfoEXT-pPresentModes-07763
  The entries in `pPresentModes` must be a subset of the present modes returned in
When an application presents a swapchain image with dimensions different than those of the target surface, different behavior is possible on different platforms per their respective specifications:

- Presentation fails and \( \text{VK\_ERROR\_OUT\_OF\_DATE\_KHR} \) is returned
- Scaling is done and \( \text{VK\_SUCCESS} \) or \( \text{VK\_SUBOPTIMAL\_KHR} \) is returned
- Unspecified scaling using an arbitrary combination of stretching, centering and/or clipping.

Applications \textit{can} define specific behavior when creating a swapchain by including the \texttt{VkSwapchainPresentScalingCreateInfoEXT} structure in the \texttt{pNext} chain of the \texttt{VkSwapchainCreateInfoKHR} structure.

The \texttt{VkSwapchainPresentScalingCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentScalingCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPresentScalingFlagsEXT scalingBehavior;
    VkPresentGravityFlagsEXT presentGravityX;
    VkPresentGravityFlagsEXT presentGravityY;
} VkSwapchainPresentScalingCreateInfoEXT;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{scalingBehavior} is 0 or the scaling method to use when the dimensions of the surface and swapchain images differ.
- \texttt{presentGravityX} is 0 or the x-axis direction in which swapchain image pixels gravitate relative to
the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

- `presentGravityY` is 0 or the y-axis direction in which swapchain image pixels gravitate relative to the surface when `scalingBehavior` does not result in a one-to-one pixel mapping between the scaled swapchain image and the surface.

If `scalingBehavior` is 0, the result of presenting a swapchain image with dimensions that do not match the surface dimensions is implementation and platform-dependent. If `presentGravityX` or `presentGravityY` are 0, the presentation gravity must match that defined by the native platform surface on platforms which define surface gravity.

### Valid Usage

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07765**
  If `presentGravityX` is 0, `presentGravityY` must be 0.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07766**
  If `presentGravityX` is not 0, `presentGravityY` must not be 0.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07767**
  `scalingBehavior` must not have more than one bit set.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07768**
  `presentGravityX` must not have more than one bit set.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07769**
  `presentGravityY` must not have more than one bit set.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07770**
  `scalingBehavior` must be a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-07771**
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `scalingBehavior` must be a valid scaling method for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentScaling`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-07772**
  `presentGravityX` must be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX`, given `VkSwapchainCreateInfoKHR::presentMode` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07773**
  If the swapchain is created with `VkSwapchainPresentModesCreateInfoEXT`, `presentGravityX` must be a valid x-axis present gravity for the surface as returned in `VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityX`, given each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurfacePresentModeEXT`.

- **VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07774**
presentGravityY must be a valid y-axis present gravity for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY, given VkSwapchainCreateInfoKHR::presentMode in VkSurfacePresentModeEXT

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-07775
  If the swapchain is created with VkSwapchainPresentModesCreateInfoEXT, presentGravityY must be a valid y-axis present gravity for the surface as returned in VkSurfacePresentScalingCapabilitiesEXT::supportedPresentGravityY, given each present mode in VkSwapchainPresentModesCreateInfoEXT::pPresentModes in VkSurfacePresentModeEXT

Valid Usage (Implicit)

- VUID-VkSwapchainPresentScalingCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_SCALING_CREATE_INFO_EXT

- VUID-VkSwapchainPresentScalingCreateInfoEXT-scalingBehavior-parameter
  scalingBehavior must be a valid combination of VkPresentScalingFlagBitsEXT values

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityX-parameter
  presentGravityX must be a valid combination of VkPresentGravityFlagBitsEXT values

- VUID-VkSwapchainPresentScalingCreateInfoEXT-presentGravityY-parameter
  presentGravityY must be a valid combination of VkPresentGravityFlagBitsEXT values

To destroy a swapchain object call:

```c
// Provided by VK_KHR_swapchain
void vkDestroySwapchainKHR(
    VkDevice device,           // device is the VkDevice associated with swapchain.
    VkSwapchainKHR swapchain,  // swapchain is the swapchain to destroy.
    const VkAllocationCallbacks* pAllocator); // pAllocator is the allocator used for host memory allocated for the swapchain object when there is no more specific allocator available (see Memory Allocation).
```

The application must not destroy a swapchain until after completion of all outstanding operations on images that were acquired from the swapchain. swapchain and all associated VkImage handles are destroyed, and must not be acquired or used any more by the application. The memory of each VkImage will only be freed after that image is no longer used by the presentation engine. For example, if one image of the swapchain is being displayed in a window, the memory for that image may not be freed until the window is destroyed, or another swapchain is created for the window. Destroying the swapchain does not invalidate the parent VkSurfaceKHR, and a new swapchain can be created with it.

When a swapchain associated with a display surface is destroyed, if the image most recently
presented to the display surface is from the swapchain being destroyed, then either any display resources modified by presenting images from any swapchain associated with the display surface must be reverted by the implementation to their state prior to the first present performed on one of these swapchains, or such resources must be left in their current state.

If swapchain has exclusive full-screen access, it is released before the swapchain is destroyed.

**Valid Usage**

- VUID-vkDestroySwapchainKHR-swapchain-01282
  All uses of presentable images acquired from swapchain must have completed execution

- VUID-vkDestroySwapchainKHR-swapchain-01283
  If VkAllocationCallbacks were provided when swapchain was created, a compatible set of callbacks must be provided here

- VUID-vkDestroySwapchainKHR-swapchain-01284
  If no VkAllocationCallbacks were provided when swapchain was created, pAllocator must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroySwapchainKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroySwapchainKHR-swapchain-parameter
  If swapchain is not VK_NULL_HANDLE, swapchain must be a valid VkSwapchainKHR handle

- VUID-vkDestroySwapchainKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySwapchainKHR-swapchain-parent
  If swapchain is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to swapchain must be externally synchronized

When the VK_KHR_display_swapchain extension is enabled, multiple swapchains that share presentable images are created by calling:

```c
// Provided by VK_KHR_display_swapchain
VkResult vkCreateSharedSwapchainsKHR(
    VkDevice device,
    uint32_t swapchainCount,
```

3106
const VkSwapchainCreateInfoKHR* pCreateInfos,
const VkAllocationCallbacks* pAllocator,
VkSwapchainKHR* pSwapchains);

- **device** is the device to create the swapchains for.
- **swapchainCount** is the number of swapchains to create.
- **pCreateInfos** is a pointer to an array of VkSwapchainCreateInfoKHR structures specifying the parameters of the created swapchains.
- **pAllocator** is the allocator used for host memory allocated for the swapchain objects when there is no more specific allocator available (see Memory Allocation).
- **pSwapchains** is a pointer to an array of VkSwapchainKHR handles in which the created swapchain objects will be returned.

vkCreateSharedSwapchainsKHR is similar to vkCreateSwapchainKHR, except that it takes an array of VkSwapchainCreateInfoKHR structures, and returns an array of swapchain objects.

The swapchain creation parameters that affect the properties and number of presentable images must match between all the swapchains. If the displays used by any of the swapchains do not use the same presentable image layout or are incompatible in a way that prevents sharing images, swapchain creation will fail with the result code VK_ERROR_INCOMPATIBLE_DISPLAY_KHR. If any error occurs, no swapchains will be created. Images presented to multiple swapchains must be re-acquired from all of them before being modified. After destroying one or more of the swapchains, the remaining swapchains and the presentable images can continue to be used.

**Valid Usage (Implicit)**

- VUID-vkCreateSharedSwapchainsKHR-device-parameter
  *device* must be a valid VkDevice handle

- VUID-vkCreateSharedSwapchainsKHR-pCreateInfos-parameter
  *pCreateInfos* must be a valid pointer to an array of *swapchainCount* valid VkSwapchainCreateInfoKHR structures

- VUID-vkCreateSharedSwapchainsKHR-pAllocator-parameter
  If *pAllocator* is not NULL, *pAllocator* must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateSharedSwapchainsKHR-pSwapchains-parameter
  *pSwapchains* must be a valid pointer to an array of *swapchainCount* VkSwapchainKHR handles

- VUID-vkCreateSharedSwapchainsKHR-swapchainCount-arraylength
  *swapchainCount* must be greater than 0

**Host Synchronization**

- Host access to *pCreateInfos[].surface* must be externally synchronized
Host access to `pCreateInfos[].oldSwapchain` must be externally synchronized

## Return Codes

### Success
- `VK_SUCCESS`

### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_INCOMPATIBLE_DISPLAY_KHR`
- `VK_ERROR_DEVICE_LOST`
- `VK_ERROR_SURFACE_LOST_KHR`

To obtain the array of presentable images associated with a swapchain, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkGetSwapchainImagesKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,
    uint32_t* pSwapchainImageCount,
    VkImage* pSwapchainImages);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to query.
- `pSwapchainImageCount` is a pointer to an integer related to the number of presentable images available or queried, as described below.
- `pSwapchainImages` is either `NULL` or a pointer to an array of `VkImage` handles.

If `pSwapchainImages` is `NULL`, then the number of presentable images for `swapchain` is returned in `pSwapchainImageCount`. Otherwise, `pSwapchainImageCount` must point to a variable set by the user to the number of elements in the `pSwapchainImages` array, and on return the variable is overwritten with the number of structures actually written to `pSwapchainImages`. If the value of `pSwapchainImageCount` is less than the number of presentable images for `swapchain`, at most `pSwapchainImageCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available presentable images were returned.

## Valid Usage (Implicit)

- VUID-vkGetSwapchainImagesKHR-device-parameter: `device` must be a valid `VkDevice` handle
- VUID-vkGetSwapchainImagesKHR-swapchain-parameter: `swapchain` must be a valid `VkSwapchainKHR` handle
• VUID-vkGetSwapchainImagesKHR-pSwapchainImageCount-parameter
  pSwapchainImageCount must be a valid pointer to a uint32_t value

• VUID-vkGetSwapchainImagesKHR-pSwapchainImages-parameter
  If the value referenced by pSwapchainImageCount is not 0, and pSwapchainImages is not NULL, pSwapchainImages must be a valid pointer to an array of pSwapchainImageCount VkImage handles

• VUID-vkGetSwapchainImagesKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

---

## Return Codes

### Success

- VK_SUCCESS
- VK_INCOMPLETE

### Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

---

**Note**

By knowing all presentable images used in the swapchain, the application can create command buffers that reference these images prior to entering its main rendering loop. However, command buffers are not allowed to reference presentable images created with VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT until their indices have been returned from vkAcquireNextImageKHR at least once.

Images returned by vkGetSwapchainImagesKHR are fully backed by memory before they are passed to the application, as if they are each bound completely and contiguously to a single VkDeviceMemory object, unless the swapchain is created with the VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT flag. All presentable images are initially in the VK_IMAGE_LAYOUT_UNDEFINED layout, thus before using presentable images, the application must transition them to a valid layout for the intended use.

Further, the lifetime of presentable images is controlled by the implementation, so applications must not destroy a presentable image. See vkDestroySwapchainKHR for further details on the lifetime of presentable images.

Images can also be created by using vkCreateImage with VkImageSwapchainCreateInfoKHR and bound to swapchain memory using vkBindImageMemory2 with VkBindImageMemorySwapchainInfoKHR. These images can be used anywhere swapchain images are used, and are useful in logical devices with multiple physical devices to create peer memory bindings of swapchain memory. These images and bindings have no effect on what memory is presented. Unlike images retrieved from vkGetSwapchainImagesKHR, these images must be destroyed with vkDestroyImage.
To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkAcquireNextImageKHR(
    VkDevice device,
    VkSwapchainKHR swapchain,  // Provided by VK_KHR_swapchain
    uint64_t timeout,           // Provided by VK_KHR_swapchain
    VkSemaphore semaphore,      // Provided by VK_KHR_swapchain
    VkFence fence,             // Provided by VK_KHR_swapchain
    uint32_t* pImageIndex)      // Provided by VK_KHR_swapchain
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the non-retired swapchain from which an image is being acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is **VK_NULL_HANDLE** or a semaphore to signal.
- **fence** is **VK_NULL_HANDLE** or a fence to signal.
- **pImageIndex** is a pointer to a **uint32_t** in which the index of the next image to use (i.e. an index into the array of images returned by **vkGetSwapchainImagesKHR**) is returned.

If the **swapchain** has been created with the **VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT** flag, the image whose index is returned in **pImageIndex** will be fully backed by memory before this call returns to the application, as if it is bound completely and contiguously to a single **VkDeviceMemory** object.

### Valid Usage

- **VUID-vkAcquireNextImageKHR-swapchain-01285**
  - **swapchain** must not be in the retired state

- **VUID-vkAcquireNextImageKHR-semaphore-01286**
  - **semaphore** must not be **VK_NULL_HANDLE** if **semaphore** is not **VK_NULL_HANDLE**

- **VUID-vkAcquireNextImageKHR-semaphore-01779**
  - **semaphore** must not have any uncompleted signal or wait operations pending if **semaphore** is not **VK_NULL_HANDLE**

- **VUID-vkAcquireNextImageKHR-fence-01287**
  - **fence** must not be **VK_NULL_HANDLE** if **fence** is not **VK_NULL_HANDLE**

- **VUID-vkAcquireNextImageKHR-semaphore-03265**
  - **semaphore** must not be equal to **VK_NULL_HANDLE** if **semaphore** is not **VK_NULL_HANDLE**

- **VUID-vkAcquireNextImageKHR-surface-07783**
  - forward progress cannot be guaranteed for the **surface** used to create the **swapchain** member of **pAcquireInfo** if **timeout** member of **pAcquireInfo** is **UINT64_MAX**

- **semaphore** must have a **VkSemaphoreType** of **VK_SEMAPHORE_TYPE_BINARY**
Valid Usage (Implicit)

- VUID-vkAcquireNextImageKHR-device-parameter
  
  device must be a valid VkDevice handle

- VUID-vkAcquireNextImageKHR-swapchain-parameter

  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkAcquireNextImageKHR-semaphore-parameter
  
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-vkAcquireNextImageKHR-fence-parameter

  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-vkAcquireNextImageKHR-pImageIndex-parameter

  pImageIndex must be a valid pointer to a uint32_t value

- VUID-vkAcquireNextImageKHR-swapchain-parent

  swapchain must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-semaphore-parent

  If semaphore is a valid handle, it must have been created, allocated, or retrieved from device

- VUID-vkAcquireNextImageKHR-fence-parent

  If fence is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to swapchain must be externally synchronized

- Host access to semaphore must be externally synchronized

- Host access to fence must be externally synchronized

Return Codes

**Success**

- VK_SUCCESS

- VK_TIMEOUT

- VK_NOT_READY

- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY

- VK_ERROR_OUT_OF_DEVICE_MEMORY

- VK_ERROR_DEVICE_LOST

- VK_ERROR_OUT_OF_DATE_KHR
If an image is acquired successfully, `vkAcquireNextImageKHR` **must** either return `VK_SUCCESS` or `VK_SUBOPTIMAL_KHR`. The implementation **may** return `VK_SUBOPTIMAL_KHR` if the swapchain no longer matches the surface properties exactly, but **can** still be used for presentation.

When successful, `vkAcquireNextImageKHR` acquires a presentable image from `swapchain` that an application **can** use, and sets `pImageIndex` to the index of that image within the swapchain. The presentation engine **may** not have finished reading from the image at the time it is acquired, so the application **must** use `semaphore` and/or `fence` to ensure that the image layout and contents are not modified until the presentation engine reads have completed. Once `vkAcquireNextImageKHR` successfully acquires an image, the semaphore signal operation referenced by `semaphore`, if not `VK_NULL_HANDLE`, and the fence signal operation referenced by `fence`, if not `VK_NULL_HANDLE`, are submitted for execution. If `vkAcquireNextImageKHR` does not successfully acquire an image, `semaphore` and `fence` are unaffected. The order in which images are acquired is implementation-dependent, and **may** be different than the order the images were presented.

If `timeout` is zero, then `vkAcquireNextImageKHR` does not wait, and will either successfully acquire an image, or fail and return `VK_NOT_READY` if no image is available.

If the specified timeout period expires before an image is acquired, `vkAcquireNextImageKHR` returns `VK_TIMEOUT`. If `timeout` is `UINT64_MAX`, the timeout period is treated as infinite, and `vkAcquireNextImageKHR` will block until an image is acquired or an error occurs.

Let \( S \) be the number of images in `swapchain`. If `swapchain` is created with `VkSwapchainPresent ModesCreateInfoEXT`, let \( M \) be the maximum of the values in `VkSurfaceCapabilitiesKHR::minImageCount` when queried with each present mode in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` in `VkSurface Present Mode EXT`. Otherwise, let \( M \) be the value of `VkSurfaceCapabilitiesKHR::minImageCount` without a `VkSurfacePresentModeEXT` as part of the query input.

`vkAcquireNextImageKHR` **should** not be called if the number of images that the application has currently acquired is greater than \( S-M \). If `vkAcquireNextImageKHR` is called when the number of images that the application has currently acquired is less than or equal to \( S-M \), `vkAcquireNextImageKHR` **must** return in finite time with an allowed `VkResult` code.

**Note**

Returning a result in finite time guarantees that the implementation cannot deadlock an application, or suspend its execution indefinitely with correct API usage. Acquiring too many images at once may block indefinitely, which is covered by valid usage when attempting to use `UINT64_MAX`. For example, a scenario here is when a compositor holds on to images which are currently being presented, and there are not any vacant images left to be acquired.

**Note**

`VK_SUBOPTIMAL_KHR` **may** happen, for example, if the platform surface has been
If the swapchain images no longer match native surface properties, either `VK_SUBOPTIMAL_KHR` or `VK_ERROR_OUT_OF_DATE_KHR` must be returned. If `VK_ERROR_OUT_OF_DATE_KHR` is returned, no image is acquired and attempts to present previously acquired images to the swapchain will also fail with `VK_ERROR_OUT_OF_DATE_KHR`. Applications need to create a new swapchain for the surface to continue presenting if `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If device loss occurs (see Lost Device) before the timeout has expired, `vkAcquireNextImageKHR` must return in finite time with either one of the allowed success codes, or `VK_ERROR_DEVICE_LOST`.

If `semaphore` is not `VK_NULL_HANDLE`, the semaphore must be unsignaled, with no signal or wait operations pending. It will become signaled when the application can use the image.

**Note**
Use of `semaphore` allows rendering operations to be recorded and submitted before the presentation engine has completed its use of the image.

If `fence` is not equal to `VK_NULL_HANDLE`, the fence must be unsignaled, with no signal operations pending. It will become signaled when the application can use the image.

**Note**
Applications should not rely on `vkAcquireNextImageKHR` blocking in order to meter their rendering speed. The implementation may return from this function immediately regardless of how many presentation requests are queued, and regardless of when queued presentation requests will complete relative to the call. Instead, applications can use `fence` to meter their frame generation work to match the presentation rate.

An application must wait until either the `semaphore` or `fence` is signaled before accessing the image’s data.

**Note**
When the presentable image will be accessed by some stage S, the recommended idiom for ensuring correct synchronization is:

- The `VkSubmitInfo` used to submit the image layout transition for execution includes `vkAcquireNextImageKHR::semaphore` in its `pWaitSemaphores` member, with the corresponding element of `pWaitDstStageMask` including S.
- The synchronization command that performs any necessary image layout transition includes S in both the `srcStageMask` and `dstStageMask`.

After a successful return, the image indicated by `pImageIndex` and its data will be unmodified compared to when it was presented.
Exclusive ownership of presentable images corresponding to a swapchain created with \texttt{VK\_SHARING\_MODE\_EXCLUSIVE} as defined in \textit{Resource Sharing} is not altered by a call to \texttt{vkAcquireNextImageKHR}. That means upon the first acquisition from such a swapchain presentable images are not owned by any queue family, while at subsequent acquisitions the presentable images remain owned by the queue family the image was previously presented on.

The possible return values for \texttt{vkAcquireNextImageKHR} depend on the \texttt{timeout} provided:

- \texttt{VK\_SUCCESS} is returned if an image became available.
- \texttt{VK\_ERROR\_SURFACE\_LOST\_KHR} is returned if the surface becomes no longer available.
- \texttt{VK\_NOT\_READY} is returned if \texttt{timeout} is zero and no image was available.
- \texttt{VK\_TIMEOUT} is returned if \texttt{timeout} is greater than zero and less than \texttt{UINT64\_MAX}, and no image became available within the time allowed.
- \texttt{VK\_SUBOPTIMAL\_KHR} is returned if an image became available, and the swapchain no longer matches the surface properties exactly, but \texttt{can} still be used to present to the surface successfully.

This \textit{may} happen, for example, if the platform surface has been resized but the platform is able to scale the presented images to the new size to produce valid surface updates. It is up to the application to decide whether it prefers to continue using the current swapchain indefinitely or temporarily in this state, or to re-create the swapchain to better match the platform surface properties.

\texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} is returned if the surface has changed in such a way that it is no longer compatible with the swapchain, and further presentation requests using the swapchain will fail. Applications \textbf{must} query the new surface properties and recreate their swapchain if they wish to continue presenting to the surface.

If the native surface and presented image sizes no longer match, presentation \textbf{may} fail unless the swapchain is created with a non-zero value in \texttt{VkSwapchainPresentScalingCreateInfoEXT::scalingBehavior}. If presentation does succeed, the mapping from the presented image to the native surface is defined by the \texttt{VkSwapchainPresentScalingCreateInfoEXT} structure if provided. Otherwise it is implementation-defined. It is the application's responsibility to detect surface size changes and react appropriately. If presentation fails because of a mismatch in the surface and presented image sizes, a \texttt{VK\_ERROR\_OUT\_OF\_DATE\_KHR} error will be returned.

For example, consider a 4x3 window/surface that gets resized to be 3x4 (taller than wider). On some window systems, the portion of the window/surface that was previously and still is visible (the 3x3 part) will contain the same contents as before, while the remaining parts of the window will have undefined contents. Other window systems \textbf{may} squash/stretch the image to fill the new window size...
without any undefined contents, or apply some other mapping.

To acquire an available presentable image to use, and retrieve the index of that image, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_swapchain
VkResult vkAcquireNextImage2KHR(
    VkDevice device,
    const VkAcquireNextImageInfoKHR* pAcquireInfo,
    uint32_t* pImageIndex);
```

- `device` is the device associated with `swapchain`.
- `pAcquireInfo` is a pointer to a `VkAcquireNextImageInfoKHR` structure containing parameters of the acquire.
- `pImageIndex` is a pointer to a `uint32_t` that is set to the index of the next image to use.

If the `swapchain` has been created with the `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, the image whose index is returned in `pImageIndex` will be fully backed by memory before this call returns to the application.

### Valid Usage

- **VUID-vkAcquireNextImage2KHR-surface-07784**
  
  If forward progress cannot be guaranteed for the `surface` used to create `swapchain`, the `timeout` member of `pAcquireInfo` must not be `UINT64_MAX`

### Valid Usage (Implicit)

- **VUID-vkAcquireNextImage2KHR-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkAcquireNextImage2KHR-pAcquireInfo-parameter**
  
  `pAcquireInfo` must be a valid pointer to a valid `VkAcquireNextImageInfoKHR` structure

- **VUID-vkAcquireNextImage2KHR-pImageIndex-parameter**
  
  `pImageIndex` must be a valid pointer to a `uint32_t` value

### Return Codes

**Success**

- `VK_SUCCESS`
- `VK_TIMEOUT`
- `VK_NOT_READY`
- `VK_SUBOPTIMAL_KHR`
**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The **VkAcquireNextImageInfoKHR** structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkAcquireNextImageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint64_t timeout;
    VkSemaphore semaphore;
    VkFence fence;
    uint32_t deviceMask;
} VkAcquireNextImageInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchain** is a non-retired swapchain from which an image is acquired.
- **timeout** specifies how long the function waits, in nanoseconds, if no image is available.
- **semaphore** is `VK_NULL_HANDLE` or a semaphore to signal.
- **fence** is `VK_NULL_HANDLE` or a fence to signal.
- **deviceMask** is a mask of physical devices for which the swapchain image will be ready to use when the semaphore or fence is signaled.

If **vkAcquireNextImageKHR** is used, the device mask is considered to include all physical devices in the logical device.

**Note**

**vkAcquireNextImage2KHR** signals at most one semaphore, even if the application requests waiting for multiple physical devices to be ready via the **deviceMask**. However, only a single physical device can wait on that semaphore, since the semaphore becomes unsignaled when the wait succeeds. For other physical devices to wait for the image to be ready, it is necessary for the application to submit semaphore signal operation(s) to that first physical device to signal additional semaphore(s) after the wait succeeds, which the other physical device(s)
Valid Usage

- VUID-VkAcquireNextImageInfoKHR-swapchain-01675
  
  swapchain must not be in the retired state

- VUID-VkAcquireNextImageInfoKHR-semaphore-01288
  If semaphore is not VK_NULL_HANDLE it must be unsignaled

- VUID-VkAcquireNextImageInfoKHR-semaphore-01781
  If semaphore is not VK_NULL_HANDLE it must not have any uncompleted signal or wait operations pending

- VUID-VkAcquireNextImageInfoKHR-fence-01289
  If fence is not VK_NULL_HANDLE it must be unsignaled and must not be associated with any other queue command that has not yet completed execution on that queue

- VUID-VkAcquireNextImageInfoKHR-semaphore-01782
  semaphore and fence must not both be equal to VK_NULL_HANDLE

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01290
  deviceMask must be a valid device mask

- VUID-VkAcquireNextImageInfoKHR-deviceMask-01291
  deviceMask must not be zero

- VUID-VkAcquireNextImageInfoKHR-semaphore-03266
  semaphore must have a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

Valid Usage (Implicit)

- VUID-VkAcquireNextImageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_NEXT_IMAGE_INFO_KHR

- VUID-VkAcquireNextImageInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAcquireNextImageInfoKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

- VUID-VkAcquireNextImageInfoKHR-semaphore-parameter
  If semaphore is not VK_NULL_HANDLE, semaphore must be a valid VkSemaphore handle

- VUID-VkAcquireNextImageInfoKHR-fence-parameter
  If fence is not VK_NULL_HANDLE, fence must be a valid VkFence handle

- VUID-VkAcquireNextImageInfoKHR-commonparent
  Each of fence, semaphore, and swapchain that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to swapchain must be externally synchronized
- Host access to semaphore must be externally synchronized
- Host access to fence must be externally synchronized

After queueing all rendering commands and transitioning the image to the correct layout, to queue an image for presentation, call:

```c
// Provided by VK_KHR_swapchain
VkResult vkQueuePresentKHR(
    VkQueue queue,
    const VkPresentInfoKHR* pPresentInfo);
```

- `queue` is a queue that is capable of presentation to the target surface's platform on the same device as the image's swapchain.
- `pPresentInfo` is a pointer to a `VkPresentInfoKHR` structure specifying parameters of the presentation.

**Note**
There is no requirement for an application to present images in the same order that they were acquired - applications can arbitrarily present any image that is currently acquired.

**Note**
The origin of the native orientation of the surface coordinate system is not specified in the Vulkan specification; it depends on the platform. For most platforms the origin is by default upper-left, meaning the pixel of the presented `VkImage` at coordinates (0,0) would appear at the upper left pixel of the platform surface (assuming `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, and the display standing the right way up).

The result codes `VK_ERROR_OUT_OF_DATE_KHR` and `VK_SUBOPTIMAL_KHR` have the same meaning when returned by `vkQueuePresentKHR` as they do when returned by `vkAcquireNextImageKHR`. If any swapchain member of `pPresentInfo` was created with `VK_FULL_SCREEN_EXCLUSIVE_APPLICATION_CONTROLLED_EXT`, `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` will be returned if that swapchain does not have exclusive full-screen access, possibly for implementation-specific reasons outside of the application's control. If multiple swapchains are presented, the result code is determined by applying the following rules in order:

- If the device is lost, `VK_ERROR_DEVICE_LOST` is returned.
- If any of the target surfaces are no longer available the error `VK_ERROR_SURFACE_LOST_KHR` is returned.
If any of the presents would have a result of `VK_ERROR_OUT_OF_DATE_KHR` if issued separately then `VK_ERROR_OUT_OF_DATE_KHR` is returned.

If any of the presents would have a result of `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` if issued separately then `VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT` is returned.

If any of the presents would have a result of `VK_SUBOPTIMAL_KHR` if issued separately then `VK_SUBOPTIMAL_KHR` is returned.

Otherwise `VK_SUCCESS` is returned.

Any writes to memory backing the images referenced by the `pImageIndices` and `pSwapchains` members of `pPresentInfo`, that are available before `vkQueuePresentKHR` is executed, are automatically made visible to the read access performed by the presentation engine. This automatic visibility operation for an image happens-after the semaphore signal operation, and happens-before the presentation engine accesses the image.

Presentation is a read-only operation that will not affect the content of the presentable images. Upon reacquiring the image and transitioning it away from the `VK_IMAGE_LAYOUT_PRESENT_SRC_KHR` layout, the contents will be the same as they were prior to transitioning the image to the present source layout and presenting it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

Calls to `vkQueuePresentKHR` may block, but must return in finite time. The processing of the presentation happens in issue order with other queue operations, but semaphores must be used to ensure that prior rendering and other commands in the specified queue complete before the presentation begins. The presentation command itself does not delay processing of subsequent commands on the queue. However, presentation requests sent to a particular queue are always performed in order. Exact presentation timing is controlled by the semantics of the presentation engine and native platform in use.

If an image is presented to a swapchain created from a display surface, the mode of the associated display will be updated, if necessary, to match the mode specified when creating the display surface. The mode switch and presentation of the specified image will be performed as one atomic operation.

Queueing an image for presentation defines a set of queue operations, including waiting on the semaphores and submitting a presentation request to the presentation engine. However, the scope of this set of queue operations does not include the actual processing of the image by the presentation engine.

If `vkQueuePresentKHR` fails to enqueue the corresponding set of queue operations, it may return `VK_ERROR_OUT_OF_HOST_MEMORY` or `VK_ERROR_OUT_OF_DEVICE_MEMORY`. If it does, the implementation must ensure that the state and contents of any resources or synchronization primitives referenced is unaffected by the call or its failure.

If `vkQueuePresentKHR` fails in such a way that the implementation is unable to make that guarantee, the implementation must return `VK_ERROR_DEVICE_LOST`.

However, if the presentation request is rejected by the presentation engine with an error
VK_ERROR_OUT_OF_DATE_KHR, VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT, or VK_ERROR_SURFACE_LOST_KHR, the set of queue operations are still considered to be enqueued and thus any semaphore wait operation specified in VkPresentInfoKHR will execute when the corresponding queue operation is complete.

vkQueuePresentKHR releases the acquisition of the images referenced by imageIndices. The queue family corresponding to the queue vkQueuePresentKHR is executed on must have ownership of the presented images as defined in Resource Sharing. vkQueuePresentKHR does not alter the queue family ownership, but the presented images must not be used again before they have been reacquired using vkAcquireNextImageKHR.

**Note**
The application can continue to present any acquired images from a retired swapchain as long as the swapchain has not entered a state that causes vkQueuePresentKHR to return VK_ERROR_OUT_OF_DATE_KHR.

### Valid Usage

- **VUID-vkQueuePresentKHR-pSwapchains-01292**
  
  Each element of pSwapchains member of pPresentInfo must be a swapchain that is created for a surface for which presentation is supported from queue as determined using a call to vkGetPhysicalDeviceSurfaceSupportKHR

- **VUID-vkQueuePresentKHR-pSwapchains-01293**
  
  If more than one member of pSwapchains was created from a display surface, all display surfaces referenced that refer to the same display must use the same display mode

- **VUID-vkQueuePresentKHR-pWaitSemaphores-01294**
  
  When a semaphore wait operation referring to a binary semaphore defined by the elements of the pWaitSemaphores member of pPresentInfo executes on queue, there must be no other queues waiting on the same semaphore

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03267**
  
  All elements of the pWaitSemaphores member of pPresentInfo must be created with a VkSemaphoreType of VK_SEMAPHORE_TYPE_BINARY

- **VUID-vkQueuePresentKHR-pWaitSemaphores-03268**
  
  All elements of the pWaitSemaphores member of pPresentInfo must reference a semaphore signal operation that has been submitted for execution and any semaphore signal operations on which it depends must have also been submitted for execution

### Valid Usage (Implicit)

- **VUID-vkQueuePresentKHR-queue-parameter**

  queue must be a valid VkQueue handle

- **VUID-vkQueuePresentKHR-pPresentInfo-parameter**

  pPresentInfo must be a valid pointer to a valid VkPresentInfoKHR structure
Host Synchronization

- Host access to queue must be externally synchronized
- Host access to pPresentInfo->pWaitSemaphores[] must be externally synchronized
- Host access to pPresentInfo->pSwapchains[] must be externally synchronized

Command Properties

<table>

<td>-</td>
</tr>
</tbody>
</table>

Return Codes

**Success**

- VK_SUCCESS
- VK_SUBOPTIMAL_KHR

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

The VkPresentInfoKHR structure is defined as:

```c
// Provided by VK_KHR_swapchain
typedef struct VkPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t waitSemaphoreCount;
    const VkSemaphore* pWaitSemaphores;
    uint32_t swapchainCount;
    const VkSwapchainKHR* pSwapchains;
    const uint32_t* pImageIndices;
    VkResult* pResults;
} VkPresentInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **waitSemaphoreCount** is the number of semaphores to wait for before issuing the present request. The number **may** be zero.

• **pWaitSemaphores** is NULL or a pointer to an array of VkSemaphore objects with **waitSemaphoreCount** entries, and specifies the semaphores to wait for before issuing the present request.

• **swapchainCount** is the number of swapchains being presented to by this command.

• **pSwapchains** is a pointer to an array of VkSwapchainKHR objects with **swapchainCount** entries.

• **pImageIndices** is a pointer to an array of indices into the array of each swapchain's presentable images, with **swapchainCount** entries. Each entry in this array identifies the image to present on the corresponding entry in the **pSwapchains** array.

• **pResults** is a pointer to an array of VkResult typed elements with **swapchainCount** entries. Applications that do not need per-swapchain results can use NULL for **pResults**. If non-NULL, each entry in **pResults** will be set to the VkResult for presenting the swapchain corresponding to the same index in **pSwapchains**.

Before an application can present an image, the image's layout must be transitioned to the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR layout, or for a shared presentable image the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout.

**Note**

When transitioning the image to VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_PRESENT_SRC_KHR, there is no need to delay subsequent processing, or perform any visibility operations (as vkQueuePresentKHR performs automatic visibility operations). To achieve this, the **dstAccessMask** member of the VkImageMemoryBarrier should be set to 0, and the **dstStageMask** parameter should be set to VK_PIPELINE_STAGE_BOTTOM_OF_PIPE_BIT.

---

### Valid Usage

• VUID-VkPresentInfoKHR-pSwapchain-09231
  Elements of **pSwapchain** must be unique

• VUID-VkPresentInfoKHR-pImageIndices-01430
  Each element of **pImageIndices** must be the index of a presentable image acquired from the swapchain specified by the corresponding element of the **pSwapchains** array, and the presented image subresource must be in the VK_IMAGE_LAYOUT_PRESENT_SRC_KHR or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR layout at the time the operation is executed on a VkDevice

• VUID-VkPresentInfoKHR-pNext-06235
  If a VkPresentIdKHR structure is included in the **pNext** chain, and the **presentId** feature is not enabled, each **presentIds** entry in that structure must be NULL

• VUID-VkPresentInfoKHR-pSwapchains-09199
  If any element of the **pSwapchains** array has been created with VkSwapchainPresentModesCreateInfoEXT, all of the elements of this array must be created with VkSwapchainPresentModesCreateInfoEXT
Valid Usage (Implicit)

- **VUID-VkPresentInfoKHR-sType-sType**
  - sType must be VK_STRUCTURE_TYPE_PRESENT_INFO_KHR

- **VUID-VkPresentInfoKHR-pNext-pNext**
  - Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDeviceGroupPresentInfoKHR, VkDisplayPresentInfoKHR, VkFrameBoundaryEXT, VkPresentFrameTokenGGP, VkPresentIdKHR, VkPresentRegionsKHR, VkPresentTimesInfoGOOGLE, VkSwapchainPresentFenceInfoEXT, or VkSwapchainPresentModeInfoEXT

- **VUID-VkPresentInfoKHR-sType-unique**
  - The sType value of each struct in the pNext chain must be unique

- **VUID-VkPresentInfoKHR-pWaitSemaphores-parameter**
  - If waitSemaphoreCount is not 0, pWaitSemaphores must be a valid pointer to an array of waitSemaphoreCount valid VkSemaphore handles

- **VUID-VkPresentInfoKHR-pSwapchains-parameter**
  - pSwapchains must be a valid pointer to an array of swapchainCount valid VkSwapchainKHR handles

- **VUID-VkPresentInfoKHR-pImageIndices-parameter**
  - pImageIndices must be a valid pointer to an array of swapchainCount uint32_t values

- **VUID-VkPresentInfoKHR-pResults-parameter**
  - If pResults is not NULL, pResults must be a valid pointer to an array of swapchainCount VkResult values

- **VUID-VkPresentInfoKHR-swapchainCount-arraylength**
  - swapchainCount must be greater than 0

- **VUID-VkPresentInfoKHR-commonparent**
  - Both of the elements of pSwapchains, and the elements of pWaitSemaphores that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

When the VK_KHR_incremental_present extension is enabled, additional fields can be specified that allow an application to specify that only certain rectangular regions of the presentable images of a swapchain are changed. This is an optimization hint that a presentation engine may use to only update the region of a surface that is actually changing. The application still must ensure that all pixels of a presented image contain the desired values, in case the presentation engine ignores this hint. An application can provide this hint by adding a VkPresentRegionsKHR structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentRegionsKHR structure is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionsKHR {
    VkStructureType sType;
    const void* pNext;
} VkPresentRegionsKHR;
```
uint32_t swapchainCount;
const VkPresentRegionKHR* pRegions;
} VkPresentRegionsKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pRegions** is NULL or a pointer to an array of `VkPresentRegionKHR` elements with `swapchainCount` entries. If not NULL, each element of `pRegions` contains the region that has changed since the last present to the swapchain in the corresponding entry in the `VkPresentInfoKHR::pSwapchains` array.

### Valid Usage

- VUID-VkPresentRegionsKHR-swapchainCount-01260
  
  swapchainCount must be the same value as `VkPresentInfoKHR::swapchainCount`, where `VkPresentInfoKHR` is included in the `pNext` chain of this `VkPresentRegionsKHR` structure

### Valid Usage (Implicit)

- VUID-VkPresentRegionsKHR-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_PRESENT_REGIONS_KHR`

- VUID-VkPresentRegionsKHR-pRegions-parameter
  
  If `pRegions` is not NULL, `pRegions` must be a valid pointer to an array of `swapchainCount` valid `VkPresentRegionKHR` structures

- VUID-VkPresentRegionsKHR-swapchainCount-arraylength
  
  swapchainCount must be greater than 0

For a given image and swapchain, the region to present is specified by the `VkPresentRegionKHR` structure, which is defined as:

```c
// Provided by VK_KHR_incremental_present
typedef struct VkPresentRegionKHR {
  uint32_t rectangleCount;
  const VkRectLayerKHR* pRectangles;
} VkPresentRegionKHR;
```

- **rectangleCount** is the number of rectangles in `pRectangles`, or zero if the entire image has changed and should be presented.

- **pRectangles** is either NULL or a pointer to an array of `VkRectLayerKHR` structures. The `VkRectLayerKHR` structure is the framebuffer coordinates, plus layer, of a portion of a presentable image that has changed and must be presented. If non-NULL, each entry in `pRectangles` is a rectangle of the given image that has changed since the last image was presented to the given swapchain. The rectangles must be specified relative to `VkSurfaceCapabilitiesKHR`
currentTransform, regardless of the swapchain’s preTransform. The presentation engine will apply the preTransform transformation to the rectangles, along with any further transformation it applies to the image content.

Valid Usage (Implicit)

- VUID-VkPresentRegionKHR-pRectangles-parameter
  If rectangleCount is not 0, and pRectangles is not NULL, pRectangles must be a valid pointer to an array of rectangleCount valid VkRectLayerKHR structures

The VkRectLayerKHR structure is defined as:

```c
typedef struct VkRectLayerKHR {
    VkOffset2D offset;
    VkExtent2D extent;
    uint32_t layer;
} VkRectLayerKHR;
```

- offset is the origin of the rectangle, in pixels.
- extent is the size of the rectangle, in pixels.
- layer is the layer of the image. For images with only one layer, the value of layer must be 0.

Some platforms allow the size of a surface to change, and then scale the pixels of the image to fit the surface. VkRectLayerKHR specifies pixels of the swapchain’s image(s), which will be constant for the life of the swapchain.

Valid Usage

- VUID-VkRectLayerKHR-offset-04864
  The sum of offset and extent, after being transformed according to the preTransform member of the VkSwapchainCreateInfoKHR structure, must be no greater than the imageExtent member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

- VUID-VkRectLayerKHR-layer-01262
  layer must be less than the imageArrayLayers member of the VkSwapchainCreateInfoKHR structure passed to vkCreateSwapchainKHR

When the VK_KHR_display_swapchain extension is enabled, additional fields can be specified when presenting an image to a swapchain by setting VkPresentInfoKHR::pNext to point to a VkDisplayPresentInfoKHR structure.

The VkDisplayPresentInfoKHR structure is defined as:
Provided by VK_KHR_display_swapchain

```c
typedef struct VkDisplayPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkRect2D srcRect;
    VkRect2D dstRect;
    VkBool32 persistent;
} VkDisplayPresentInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcRect` is a rectangular region of pixels to present. It **must** be a subset of the image being presented. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire presentable image.
- `dstRect` is a rectangular region within the visible region of the swapchain's display mode. If `VkDisplayPresentInfoKHR` is not specified, this region will be assumed to be the entire visible region of the swapchain's mode. If the specified rectangle is a subset of the display mode's visible region, content from display planes below the swapchain's plane will be visible outside the rectangle. If there are no planes below the swapchain's, the area outside the specified rectangle will be black. If portions of the specified rectangle are outside of the display's visible region, pixels mapping only to those portions of the rectangle will be discarded.
- `persistent`: If this is `VK_TRUE`, the display engine will enable buffered mode on displays that support it. This allows the display engine to stop sending content to the display until a new image is presented. The display will instead maintain a copy of the last presented image. This allows less power to be used, but **may** increase presentation latency. If `VkDisplayPresentInfoKHR` is not specified, persistent mode will not be used.

If the extent of the `srcRect` and `dstRect` are not equal, the presented pixels will be scaled accordingly.

### Valid Usage

- **VUID-VkDisplayPresentInfoKHR-srcRect-01257**
  - `srcRect` **must** specify a rectangular region that is a subset of the image being presented

- **VUID-VkDisplayPresentInfoKHR-dstRect-01258**
  - `dstRect` **must** specify a rectangular region that is a subset of the `visibleRegion` parameter of the display mode the swapchain being presented uses

- **VUID-VkDisplayPresentInfoKHR-persistentContent-01259**
  - If the `persistentContent` member of the `VkDisplayPropertiesKHR` structure returned by `vkGetPhysicalDeviceDisplayPropertiesKHR` for the display the present operation targets is `VK_FALSE`, then `persistent` **must** be `VK_FALSE`
Valid Usage (Implicit)

- VUID-VkDisplayPresentInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_DISPLAY_PRESENT_INFO_KHR

If thepNext chain of VkPresentInfoKHR includes a VkDeviceGroupPresentInfoKHR structure, then that structure includes an array of device masks and a device group present mode.

The VkDeviceGroupPresentInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with
// VK_KHR_swapchain
typedef struct VkDeviceGroupPresentInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint32_t* pDeviceMasks;
    VkDeviceGroupPresentModeFlagBitsKHR mode;
} VkDeviceGroupPresentInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchainCount is zero or the number of elements in pDeviceMasks.
- pDeviceMasks is a pointer to an array of device masks, one for each element of VkPresentInfoKHR:swapchains.
- mode is a VkDeviceGroupPresentModeFlagBitsKHR value specifying the device group present mode that will be used for this present.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks must have exactly one bit set, and the corresponding physical device must have a presentation engine as reported by VkDeviceGroupPresentCapabilitiesKHR.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR, then each element of pDeviceMasks selects which instance of the swapchain image is presented. Each element of pDeviceMasks must have exactly one bit set, and some physical device in the logical device must include that bit in its VkDeviceGroupPresentCapabilitiesKHR:presentMask.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR, then each element of pDeviceMasks selects which instances of the swapchain image are component-wise summed and the sum of those images is presented. If the sum in any component is outside the representable range, the value of that component is undefined. Each element of pDeviceMasks must have a value for which all set bits are set in one of the elements of VkDeviceGroupPresentCapabilitiesKHR:presentMask.

If mode is VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR, then each element of pDeviceMasks selects which instance(s) of the swapchain images are presented. For each bit set in
each element of `pDeviceMasks`, the corresponding physical device must have a presentation engine as reported by `VkDeviceGroupPresentCapabilitiesKHR`.

If `VkDeviceGroupPresentInfoKHR` is not provided or `swapchainCount` is zero then the masks are considered to be 1. If `VkDeviceGroupPresentInfoKHR` is not provided, `mode` is considered to be `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`.

### Valid Usage

- **VUID-VkDeviceGroupPresentInfoKHR-swapchainCount-01297**
  - `swapchainCount` must equal 0 or `VkPresentInfoKHR::swapchainCount`

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01298**
  - If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_LOCAL_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01299**
  - If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_REMOTE_BIT_KHR`, then each element of `pDeviceMasks` must have exactly one bit set, and some physical device in the logical device must include that bit in its `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01300**
  - If `mode` is `VK_DEVICE_GROUP_PRESENT_MODE_SUM_BIT_KHR`, then each element of `pDeviceMasks` must have a value for which all set bits are set in one of the elements of `VkDeviceGroupPresentCapabilitiesKHR::presentMask`

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01301**
  - If `mode` is `VK DEVICE_GROUP_PRESENT_MODE_LOCAL_MULTI_DEVICE_BIT_KHR`, then for each bit set in each element of `pDeviceMasks`, the corresponding element of `VkDeviceGroupPresentCapabilitiesKHR::presentMask` must be non-zero

- **VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-01302**
  - The value of each element of `pDeviceMasks` must be equal to the device mask passed in `VkAcquireNextImageInfoKHR::deviceMask` when the image index was last acquired

- **VUID-VkDeviceGroupPresentInfoKHR-mode-01303**
  - `mode` must have exactly one bit set, and that bit must have been included in `VkDeviceGroupSwapchainCreateInfoKHR::modes`

### Valid Usage (Implicit)

- **VUID-VkDeviceGroupPresentInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_DEVICE_GROUP_PRESENT_INFO_KHR`

- **VUID-VkDeviceGroupPresentInfoKHR-pDeviceMasks-parameter**
  - If `swapchainCount` is not 0, `pDeviceMasks` must be a valid pointer to an array of `swapchainCount` `uint32_t` values

- **VUID-VkDeviceGroupPresentInfoKHR-mode-parameter**
  - `mode` must be a valid `VkDeviceGroupPresentModeFlagBitsKHR` value
When the VK_GOOGLE_display_timing extension is enabled, additional fields can be specified that allow an application to specify the earliest time that an image should be displayed. This allows an application to avoid stutter that is caused by an image being displayed earlier than planned. Such stuttering can occur with both fixed and variable-refresh-rate displays, because stuttering occurs when the geometry is not correctly positioned for when the image is displayed. An application can instruct the presentation engine that an image should not be displayed earlier than a specified time by adding a VkPresentTimesInfoGOOGLE structure to the pNext chain of the VkPresentInfoKHR structure.

The VkPresentTimesInfoGOOGLE structure is defined as:

```c
// Provided by VK_GOOGLE_display_timing
typedef struct VkPresentTimesInfoGOOGLE {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentTimeGOOGLE* pTimes;
} VkPresentTimesInfoGOOGLE;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to by this command.
- `pTimes` is NULL or a pointer to an array of VkPresentTimeGOOGLE elements with swapchainCount entries. If not NULL, each element of `pTimes` contains the earliest time to present the image corresponding to the entry in the VkPresentInfoKHR::pImageIndices array.

Valid Usage

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-01247
  ```
  swapchainCount must be the same value as VkPresentInfoKHR::swapchainCount, where VkPresentInfoKHR is included in the pNext chain of this VkPresentTimesInfoGOOGLE structure
  ```

Valid Usage (Implicit)

- VUID-VkPresentTimesInfoGOOGLE-sType-sType
  ```
  sType must be VK_STRUCTURE_TYPE_PRESENT_TIMES_INFO_GOOGLE
  ```

- VUID-VkPresentTimesInfoGOOGLE-pTimes-parameter
  ```
  If pTimes is not NULL, pTimes must be a valid pointer to an array of swapchainCount VkPresentTimeGOOGLE structures
  ```

- VUID-VkPresentTimesInfoGOOGLE-swapchainCount-arraylength
  ```
  swapchainCount must be greater than 0
  ```

The VkPresentTimeGOOGLE structure is defined as:
typedef struct VkPresentTimeGOOGLE {
    uint32_t presentID;
    uint64_t desiredPresentTime;
} VkPresentTimeGOOGLE;

- `presentID` is an application-provided identification value, that **can** be used with the results of `vkGetPastPresentationTimingGOOGLE`, in order to uniquely identify this present. In order to be useful to the application, it **should** be unique within some period of time that is meaningful to the application.

- `desiredPresentTime` specifies that the image given **should** not be displayed to the user any earlier than this time. `desiredPresentTime` is a time in nanoseconds, relative to a monotonically-increasing clock (e.g. `CLOCK_MONOTONIC` (see `clock_gettime(2)`) on Android and Linux). A value of zero specifies that the presentation engine **may** display the image at any time. This is useful when the application desires to provide `presentID`, but does not need a specific `desiredPresentTime`.

The `VkPresentIdKHR` structure is defined as:

```c
typedef struct VkPresentIdKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const uint64_t* pPresentIds;
} VkPresentIdKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `swapchainCount` is the number of swapchains being presented to the `vkQueuePresentKHR` command.
- `pPresentIds` is NULL or a pointer to an array of `uint64_t` with `swapchainCount` entries. If not NULL, each non-zero value in `pPresentIds` specifies the present id to be associated with the presentation of the swapchain with the same index in the `vkQueuePresentKHR` call.

For applications to be able to reference specific presentation events queued by a call to `vkQueuePresentKHR`, an identifier needs to be associated with them. When the `presentId` feature is enabled, applications **can** include the `VkPresentIdKHR` structure in the `pNext` chain of the `VkPresentInfoKHR` structure to supply identifiers.

Each `VkSwapchainKHR` has a presentId associated with it. This value is initially set to zero when the `VkSwapchainKHR` is created.

When a `VkPresentIdKHR` structure with a non-NULL `pPresentIds` is included in the `pNext` chain of a `VkPresentInfoKHR` structure, each `pSwapchains` entry has a presentId associated in the `pPresentIds` array at the same index as the swapchain in the `pSwapchains` array. If this presentId is non-zero,
then the application can later use this value to refer to that image presentation. A value of zero indicates that this presentation has no associated presentId. A non-zero presentId must be greater than any non-zero presentId passed previously by the application for the same swapchain.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the new image to the user.

### Valid Usage

- **VUID-VkPresentIdKHR-swapchainCount-04998**
  
  `swapchainCount` must be the same value as `VkPresentInfoKHR::swapchainCount`, where this `VkPresentIdKHR` is in the `pNext` chain of the `VkPresentInfoKHR` structure.

- **VUID-VkPresentIdKHR-presentIds-04999**
  
  Each `presentIds` entry must be greater than any previous `presentIds` entry passed for the associated `pSwapchains` entry.

### Valid Usage (Implicit)

- **VUID-VkPresentIdKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PRESENT_ID_KHR`.

- **VUID-VkPresentIdKHR-pPresentIds-parameter**
  
  If `pPresentIds` is not NULL, `pPresentIds` must be a valid pointer to an array of `swapchainCount` uint64_t values.

- **VUID-VkPresentIdKHR-swapchainCount-arraylength**
  
  `swapchainCount` must be greater than 0.

When the `presentWait` feature is enabled, an application can wait for an image to be presented to the user by first specifying a presentId for the target presentation by adding a `VkPresentIdKHR` structure to the `pNext` chain of the `VkPresentInfoKHR` structure and then waiting for that presentation to complete by calling:

```c
// Provided by VK_KHR_present_wait
VkResult vkWaitForPresentKHR(
    VkDevice device,  // device associated with swapchain.
    VkSwapchainKHR swapchain,  // non-retired swapchain on which an image was queued for presentation.
    uint64_t presentId,  // presentation presentId to wait for.
    uint64_t timeout);  // timeout is the timeout period in units of nanoseconds. timeout is adjusted to the closest value
```
allowed by the implementation-dependent timeout accuracy, which may be substantially longer than one nanosecond, and may be longer than the requested period.

vkWaitForPresentKHR waits for the presentId associated with swapchain to be increased in value so that it is at least equal to presentId.

For VK_PRESENT_MODE_MAILBOX_KHR (or other present mode where images may be replaced in the presentation queue) any wait of this type associated with such an image must be signaled no later than a wait associated with the replacing image would be signaled.

When the presentation has completed, the presentId associated with the related pSwapchains entry will be increased in value so that it is at least equal to the value provided in the VkPresentIdKHR structure.

There is no requirement for any precise timing relationship between the presentation of the image to the user and the update of the presentId value, but implementations should make this as close as possible to the presentation of the first pixel in the next image being presented to the user.

The call to vkWaitForPresentKHR will block until either the presentId associated with swapchain is greater than or equal to presentId, or timeout nanoseconds passes. When the swapchain becomes OUT_OF_DATE, the call will either return VK_SUCCESS (if the image was delivered to the presentation engine and may have been presented to the user) or will return early with status VK_ERROR_OUT_OF_DATE_KHR (if the image was not presented to the user).

As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to vkWaitForPresentKHR may be simultaneously used by other threads in calls to functions other than vkDestroySwapchainKHR. Access to the swapchain data associated with this extension must be atomic within the implementation.

Valid Usage

- VUID-vkWaitForPresentKHR-swapchain-04997
  swapchain must not be in the retired state

- VUID-vkWaitForPresentKHR-presentWait-06234
  The presentWait feature must be enabled

Valid Usage (Implicit)

- VUID-vkWaitForPresentKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkWaitForPresentKHR-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle

- VUID-vkWaitForPresentKHR-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device
Host Synchronization

- Host access to swapchain must be externally synchronized

Return Codes

**Success**
- VK_SUCCESS
- VK_TIMEOUT
- VK_SUBOPTIMAL_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST
- VK_ERROR_OUT_OF_DATE_KHR
- VK_ERROR_SURFACE_LOST_KHR
- VK_ERROR_FULL_SCREEN_EXCLUSIVE_MODE_LOST_EXT

When the VK_GGP_frame_token extension is enabled, a Google Games Platform frame token can be specified when presenting an image to a swapchain by adding a VkPresentFrameTokenGGP structure to thepNext chain of the VkPresentInfoKHR structure.

The VkPresentFrameTokenGGP structure is defined as:

```c
// Provided by VK_GGP_frame_token
typedef struct VkPresentFrameTokenGGP {
    VkStructureType sType;
    const void* pNext;
    GgpFrameToken frameToken;
} VkPresentFrameTokenGGP;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **frameToken** is the Google Games Platform frame token.

**Valid Usage**

- VUID-VkPresentFrameTokenGGP-frameToken-02680
  frameToken must be a valid GgpFrameToken
Valid Usage (Implicit)

- **sType** must be **VK_STRUCTURE_TYPE_PRESENT_FRAME_TOKEN_GGP**

The **VkSwapchainPresentModeInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentModeInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkPresentModeKHR* pPresentModes;
} VkSwapchainPresentModeInfoEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchainCount** is the number of swapchains being presented to by this command.
- **pPresentModes** is a list of presentation modes with **swapchainCount** entries.

If the **pNext** chain of **VkPresentInfoKHR** includes a **VkSwapchainPresentModeInfoEXT** structure, then that structure defines the presentation modes used for the current and subsequent presentation operations.

When the application changes present modes with **VkSwapchainPresentModeInfoEXT**, images that have already been queued for presentation will continue to be presented according to the previous present mode. The current image being queued for presentation and subsequent images will be presented according to the new present mode. The behavior during the transition between the two modes is defined as follows.

- **Transition from** **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR** to **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR**: the presentation engine updates the shared presentable image according to the behavior of **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR**.
- **Transition from** **VK_PRESENT_MODE_SHARED_DEMAND_REFRESH_KHR** to **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**: the presentation engine may update the shared presentable image or defer that to its regular refresh cycle, according to the behavior of **VK_PRESENT_MODE_SHARED_CONTINUOUS_REFRESH_KHR**.
- **Transition between** **VK_PRESENT_MODE_FIFO_KHR** and **VK_PRESENT_MODE_FIFO_RELAXED_KHR**: Images continue to be appended to the same FIFO queue, and the behavior with respect to waiting for vertical blanking period will follow the new mode for current and subsequent images.
- **Transition from** **VK_PRESENT_MODE_IMMEDIATE_KHR** to **VK_PRESENT_MODE_FIFO_KHR** or **VK_PRESENT_MODE_FIFO_RELAXED_KHR**: As all prior present requests in the **VK_PRESENT_MODE_IMMEDIATE_KHR** mode are applied immediately, there are no outstanding present operations in this mode, and current and subsequent images are appended to the FIFO queue.
and presented according to the new mode.

• Transition from `VK_PRESENT_MODE_MAILBOX_KHR` to `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR`: Presentation in both modes require waiting for the next vertical blanking period, with `VK_PRESENT_MODE_MAILBOX_KHR` allowing the pending present operation to be replaced by a new one. In this case, the current present operation will replace the pending present operation and is applied according to the new mode.

• Transition from `VK_PRESENT_MODE_FIFO_KHR` or `VK_PRESENT_MODE_FIFO_RELAXED_KHR` to `VK_PRESENT_MODE_IMMEDIATE_KHR` or `VK_PRESENT_MODE_MAILBOX_KHR`: If the FIFO queue is empty, presentation is done according to the behavior of the new mode. If there are present operations in the FIFO queue, once the last present operation is performed based on the respective vertical blanking period, the current and subsequent updates are applied according to the new mode.

• The behavior during transition between any other present modes, if possible, is implementation defined.

Valid Usage

• VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-07760
  `swapchainCount` must be equal to `VkPresentInfoKHR::swapchainCount`

• VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-07761
  Each entry in `pPresentModes` must be a presentation mode specified in `VkSwapchainPresentModesCreateInfoEXT::pPresentModes` when creating the entry’s corresponding swapchain

Valid Usage (Implicit)

• VUID-VkSwapchainPresentModeInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_MODE_INFO_EXT`

• VUID-VkSwapchainPresentModeInfoEXT-pPresentModes-parameter
  `pPresentModes` must be a valid pointer to an array of `swapchainCount` valid `VkPresentModeKHR` values

• VUID-VkSwapchainPresentModeInfoEXT-swapchainCount-arraylength
  `swapchainCount` must be greater than 0

The `VkSwapchainPresentFenceInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkSwapchainPresentFenceInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t swapchainCount;
    const VkFence* pFences;
} VkSwapchainPresentFenceInfoEXT;
```
• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **swapchainCount** is the number of swapchains being presented to by this command.

• **pFences** is a list of fences with **swapchainCount** entries. Each entry **must** be **VK_NULL_HANDLE** or the handle of a fence to signal when the relevant operations on the associated swapchain have completed.

The set of **queue operations** defined by queuing an image for presentation, as well as operations performed by the presentation engine access the payloads of objects associated with the presentation operation. The associated objects include:

• The swapchain image, its implicitly bound memory, and any other resources bound to that memory.

• The wait semaphores specified when queuing the image for presentation.

The application **can** provide a fence that the implementation will signal when all such queue operations have completed and the presentation engine has taken a reference to the payload of any objects it accesses as part of the present operation. For all binary wait semaphores imported by the presentation engine using the equivalent of reference transference, as described in **Importing Semaphore Payloads**, this fence **must** not signal until all such semaphore payloads have been reset by the presentation engine.

The application **can** destroy the wait semaphores associated with a given presentation operation when at least one of the associated fences is signaled, and **can** destroy the swapchain when the fences associated with all past presentation requests referring to that swapchain have signaled.

Fences associated with presentations to the same swapchain on the same **VkQueue** **must** be signaled in the same order as the present operations.

To specify a fence for each swapchain in a present operation, include the **VkSwapchainPresentFenceInfoEXT** structure in the **pNext** chain of the **VkPresentInfoKHR** structure.

---

### Valid Usage

- **VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-07757**
  
  **swapchainCount** **must** be equal to **VkPresentInfoKHR::swapchainCount**

- **VUID-VkSwapchainPresentFenceInfoEXT-pFences-07758**
  
  Each element of **pFences** **must** be unsignaled

- **VUID-VkSwapchainPresentFenceInfoEXT-pFences-07759**
  
  Each element of **pFences** **must** not be associated with any other queue command that has not yet completed execution on that queue

---

### Valid Usage (Implicit)

- **VUID-VkSwapchainPresentFenceInfoEXT-sType-sType**
sType must be VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_FENCE_INFO_EXT

- VUID-VkSwapchainPresentFenceInfoEXT-pFences-parameter
  pFences must be a valid pointer to an array of swapchainCount valid VkFence handles
- VUID-VkSwapchainPresentFenceInfoEXT-swapchainCount-arraylength
  swapchainCount must be greater than 0

To release images previously acquired through vkAcquireNextImage2KHR or vkAcquireNextImageKHR, call:

```c
// Provided by VK_EXT_swapchain_maintenance1
VkResult vkReleaseSwapchainImagesEXT(
    VkDevice device,
    const VkReleaseSwapchainImagesInfoEXT* pReleaseInfo);
```

- device is the device associated with VkReleaseSwapchainImagesInfoEXT::swapchain.
- pReleaseInfo is a pointer to a VkReleaseSwapchainImagesInfoEXT structure containing parameters of the release.

Only images that are not in use by the device can be released.

Releasing images is a read-only operation that will not affect the content of the released images. Upon reacquiring the image, the image contents and its layout will be the same as they were prior to releasing it. However, if a mechanism other than Vulkan is used to modify the platform window associated with the swapchain, the content of all presentable images in the swapchain becomes undefined.

**Note**

This functionality is useful during swapchain recreation, where acquired images from the old swapchain can be released instead of presented.

### Valid Usage (Implicit)

- VUID-vkReleaseSwapchainImagesEXT-device-parameter
  device must be a valid VkDevice handle
- VUID-vkReleaseSwapchainImagesEXT-pReleaseInfo-parameter
  pReleaseInfo must be a valid pointer to a valid VkReleaseSwapchainImagesInfoEXT structure

### Return Codes

**Success**

- VK_SUCCESS
The `VkReleaseSwapchainImagesInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_swapchain_maintenance1
typedef struct VkReleaseSwapchainImagesInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndexCount;
    const uint32_t* pImageIndices;
} VkReleaseSwapchainImagesInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `swapchain` is a swapchain to which images are being released.
- `imageIndexCount` is the number of image indices to be released.
- `pImageIndices` is a pointer to an array of indices into the array of `swapchain`’s presentable images, with `imageIndexCount` entries.

### Valid Usage

- **VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07785**  
  Each element of `pImageIndices` must be the index of a presentable image acquired from the swapchain specified by `swapchain`

- **VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-07786**  
  All uses of presentable images identified by elements of `pImageIndices` must have completed execution

### Valid Usage (Implicit)

- **VUID-VkReleaseSwapchainImagesInfoEXT-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_RELEASE_SWAPCHAIN_IMAGES_INFO_EXT`

- **VUID-VkReleaseSwapchainImagesInfoEXT-pNext-pNext**  
  `pNext` must be `NULL`

- **VUID-VkReleaseSwapchainImagesInfoEXT-swapchain-parameter**  
  `swapchain` must be a valid `VkSwapchainKHR` handle

- **VUID-VkReleaseSwapchainImagesInfoEXT-pImageIndices-parameter**  
  `pImageIndices` must be a valid pointer to an array of `imageIndexCount uint32_t` values

- **VUID-VkReleaseSwapchainImagesInfoEXT-imageIndexCount-arraylength**  
  `imageIndexCount` must be greater than 0
34.11. Hdr Metadata

This section describes how to improve color reproduction of content to better reproduce colors as seen on the reference monitor. Definitions below are from the associated SMPTE 2086, CTA 861.3 and CIE 15:2004 specifications.

To provide Hdr metadata to an implementation, call:

```c
// Provided by VK_EXT_hdr_metadata
void vkSetHdrMetadataEXT(
    VkDevice            device,            
    uint32_t            swapchainCount,    
    const VkSwapchainKHR* pSwapchains,     
    const VkHdrMetadataEXT* pMetadata);
```

- `device` is the logical device where the swapchain(s) were created.
- `swapchainCount` is the number of swapchains included in `pSwapchains`.
- `pSwapchains` is a pointer to an array of `swapchainCount` `VkSwapchainKHR` handles.
- `pMetadata` is a pointer to an array of `swapchainCount` `VkHdrMetadataEXT` structures.

The metadata will be applied to the specified `VkSwapchainKHR` objects at the next `vkQueuePresentKHR` call using that `VkSwapchainKHR` object. The metadata will persist until a subsequent `vkSetHdrMetadataEXT` changes it.

### Valid Usage (Implicit)

- `VUID-vkSetHdrMetadataEXT-device-parameter` 
  `device` must be a valid `VkDevice` handle
- `VUID-vkSetHdrMetadataEXT-pSwapchains-parameter` 
  `pSwapchains` must be a valid pointer to an array of `swapchainCount` valid `VkSwapchainKHR` handles
- `VUID-vkSetHdrMetadataEXT-pMetadata-parameter` 
  `pMetadata` must be a valid pointer to an array of `swapchainCount` valid `VkHdrMetadataEXT` structures
- `VUID-vkSetHdrMetadataEXT-swapchainCount-arraylength` 
  `swapchainCount` must be greater than 0
- `VUID-vkSetHdrMetadataEXT-pSwapchains-parent` 
  Each element of `pSwapchains` must have been created, allocated, or retrieved from `device`
The `VkHdrMetadataEXT` structure is defined as:

```c
// Provided by VK_EXT_hdr_metadata
typedef struct VkHdrMetadataEXT {
    VkStructureType sType;
    const void* pNext;
    VkXYColorEXT displayPrimaryRed;
    VkXYColorEXT displayPrimaryGreen;
    VkXYColorEXT displayPrimaryBlue;
    VkXYColorEXT whitePoint;
    float maxLuminance;
    float minLuminance;
    float maxContentLightLevel;
    float maxFrameAverageLightLevel;
} VkHdrMetadataEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `displayPrimaryRed` is a `VkXYColorEXT` structure specifying the reference monitor’s red primary in chromaticity coordinates
- `displayPrimaryGreen` is a `VkXYColorEXT` structure specifying the reference monitor’s green primary in chromaticity coordinates
- `displayPrimaryBlue` is a `VkXYColorEXT` structure specifying the reference monitor’s blue primary in chromaticity coordinates
- `whitePoint` is a `VkXYColorEXT` structure specifying the reference monitor's white-point in chromaticity coordinates
- `maxLuminance` is the maximum luminance of the reference monitor in nits
- `minLuminance` is the minimum luminance of the reference monitor in nits
- `maxContentLightLevel` is content’s maximum luminance in nits
- `maxFrameAverageLightLevel` is the maximum frame average light level in nits

**Valid Usage (Implicit)**

- VUID-VkHdrMetadataEXT-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_HDR_METADATA_EXT`

- VUID-VkHdrMetadataEXT-pNext-pNext
  
  `pNext` **must** be `NULL`

---

**Note**

The validity and use of this data is outside the scope of Vulkan.

The `VkXYColorEXT` structure is defined as:
• x is the x chromaticity coordinate.
• y is the y chromaticity coordinate.

Chromaticity coordinates are as specified in CIE 15:2004 “Calculation of chromaticity coordinates” (Section 7.3) and are limited to between 0 and 1 for real colors for the reference monitor.

34.12. Present Barrier

The VK_NV_present_barrier extension allows applications to synchronize corresponding presentation requests across multiple swapchains using the present barrier. A swapchain is said to be using the present barrier if the swapchain is created by adding a VkSwapchainPresentBarrierCreateInfoNV structure to the pNext chain of the VkSwapchainCreateInfoKHR structure, and setting VkSwapchainPresentBarrierCreateInfoNV::presentBarrierEnable to true.

A set of corresponding presentation requests is defined as exactly one queued presentation request associated with each swapchain using the present barrier, whether or not that queued request has executed. A given presentation request is added, when created by calling vkQueuePresentKHR and specifying a swapchain using the present barrier, either to the oldest existing set of corresponding requests for which there is no existing member associated with the request’s swapchain, or to a new set of corresponding requests if no such set exists.

A set of corresponding requests is said to be full when it contains one request from each swapchain using the present barrier. Queued presentation of an image to a swapchain using the present barrier is deferred by the implementation until the set of corresponding requests is full, and the visibility operations associated with all requests in that set, as described by vkQueuePresentKHR, have completed.

Additionally, the set of swapchains using the present barrier can be in the same process, or different processes running under the same operating system. And if the required synchronization hardware is connected and correctly configured, this extension also supports applications to synchronize corresponding presentation requests using the present barrier across distributed systems. However, the configuration mechanism of the required hardware is outside the scope of the Vulkan specification and this extension.

The VkSwapchainPresentBarrierCreateInfoNV structure is defined as:

```c
typedef struct VkSwapchainPresentBarrierCreateInfoNV {
    VkStructureType sType;
    void* pNext;
} VkSwapchainPresentBarrierCreateInfoNV;
```
VkBool32 presentBarrierEnable;
} VkSwapchainPresentBarrierCreateInfoNV;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **presentBarrierEnable** is a boolean value indicating a request for using the *present barrier*.

If the **pNext** chain of `VkSwapchainCreateInfoKHR` does not include this structure, the default value for **presentBarrierEnable** is **VK_FALSE**, meaning the swapchain does not request to use the present barrier. Additionally, when recreating a swapchain that was using the present barrier, and the **pNext** chain of `VkSwapchainCreateInfoKHR` does not include this structure, it means the swapchain will stop using the present barrier.

**Valid Usage (Implicit)**

- VUID-VkSwapchainPresentBarrierCreateInfoNV-sType-sType
  
  `sType` **must** be **VK_STRUCTURE_TYPE_SWAPCHAIN_PRESENT_BARRIER_CREATE_INFO_NV**
Chapter 35. Deferred Host Operations

Certain Vulkan commands are inherently expensive for the host CPU to execute. It is often desirable to offload such work onto background threads, and to parallelize the work across multiple CPUs. The concept of deferred operations allows applications and drivers to coordinate the execution of expensive host commands using an application-managed thread pool.

The VK_KHR_deferred_host_operations extension defines the infrastructure and usage patterns for deferrable commands, but does not specify any commands as deferrable. This is left to additional dependent extensions. Commands must not be deferred unless the deferral is specifically allowed by another extension which depends on VK_KHR_deferred_host_operations. This specification will refer to such extensions as deferral extensions.

35.1. Requesting Deferral

When an application requests an operation deferral, the implementation may defer the operation. When deferral is requested and the implementation defers any operation, the implementation must return VK_OPERATION_DEFERRED_KHR as the success code if no errors occurred. When deferral is requested, the implementation should defer the operation when the workload is significant, however if the implementation chooses not to defer any of the requested operations and instead executes all of them immediately, the implementation must return VK_OPERATION_NOT_DEFERRED_KHR as the success code if no errors occurred.

A deferred operation is created complete with an initial result value of VK_SUCCESS. The deferred operation becomes pending when an operation has been successfully deferred with that deferred operation object.

A deferred operation is considered pending until the deferred operation completes. A pending deferred operation becomes complete when it has been fully executed by one or more threads. Pending deferred operations will never complete until they are joined by an application thread, using vkDeferredOperationJoinKHR. Applications can join multiple threads to the same deferred operation, enabling concurrent execution of subtasks within that operation.

The application can query the status of a VkDeferredOperationKHR using the vkGetDeferredOperationMaxConcurrencyKHR or vkGetDeferredOperationResultKHR commands.

Parameters to the command requesting a deferred operation may be accessed by the implementation at any time until the deferred operation enters the complete state. The application must obey the following rules while a deferred operation is pending:

- Externally synchronized parameters must not be accessed.
- Pointer parameters must not be modified (e.g. reallocated/freed).
- The contents of pointer parameters which may be read by the command must not be modified.
- The contents of pointer parameters which may be written by the command must not be read.
- Vulkan object parameters must not be passed as externally synchronized parameters to any other command.
When the deferred operation is complete, the application should call `vkGetDeferredOperationResultKHR` to obtain the `VkResult` indicating success or failure of the operation. The `VkResult` value returned will be one of the values that the command requesting the deferred operation is able to return. Writes to output parameters of the requesting command will happen-before the deferred operation is complete.

When a deferral is requested for a command, the implementation may perform memory management operations on the allocator supplied to `vkCreateDeferredOperationKHR` for the deferred operation object, as described in the Memory Allocation chapter. Such allocations must occur on the thread which requests deferral.

If an allocator was supplied for the deferred command at the time of the deferral request, then the implementation may perform memory management operations on this allocator during the execution of `vkDeferredOperationJoinKHR`. These operations may occur concurrently and may be performed by any joined thread. The application must ensure that the supplied allocator is able to operate correctly under these conditions.

### 35.2. Deferred Host Operations API

The `VkDeferredOperationKHR` handle is defined as:

```
// Provided by VK_KHR_deferred_host_operations
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDeferredOperationKHR)
```

This handle refers to a tracking structure which manages the execution state for a deferred command.

To construct the tracking object for a deferred command, call:

```
// Provided by VK_KHR_deferred_host_operations
VkResult vkCreateDeferredOperationKHR(
    VkDevice device,
    const VkAllocationCallbacks* pAllocator,
    VkDeferredOperationKHR* pDeferredOperation);
```

- `device` is the device which owns operation.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDeferredOperation` is a pointer to a handle in which the created `VkDeferredOperationKHR` is returned.

### Valid Usage (Implicit)

- `VUID-vkCreateDeferredOperationKHR-device-parameter`  
  * `device` must be a valid `VkDevice` handle
- `VUID-vkCreateDeferredOperationKHR-pAllocator-parameter`
If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDeferredOperationKHR-pDeferredOperation-parameter
  `pDeferredOperation` **must** be a valid pointer to a `VkDeferredOperationKHR` handle

---

## Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

To assign a thread to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkDeferredOperationJoinKHR(
    VkDevice device,  // device is the device which owns operation.
    VkDeferredOperationKHR operation);  // operation is the deferred operation that the calling thread should work on.
```

The `vkDeferredOperationJoinKHR` command will execute a portion of the deferred operation on the calling thread.

The return value will be one of the following:

- A return value of `VK_SUCCESS` indicates that `operation` is complete. The application **should** use `vkGetDeferredOperationResultKHR` to retrieve the result of `operation`.

- A return value of `VK_THREAD_DONE_KHR` indicates that the deferred operation is not complete, but there is no work remaining to assign to threads. Future calls to `vkDeferredOperationJoinKHR` are not necessary and will simply harm performance. This situation **may** occur when other threads executing `vkDeferredOperationJoinKHR` are about to complete `operation`, and the implementation is unable to partition the workload any further.

- A return value of `VK_THREAD_IDLE_KHR` indicates that the deferred operation is not complete, and there is no work for the thread to do at the time of the call. This situation **may** occur if the operation encounters a temporary reduction in parallelism. By returning `VK_THREAD_IDLE_KHR`, the implementation is signaling that it expects that more opportunities for parallelism will emerge as execution progresses, and that future calls to `vkDeferredOperationJoinKHR` **can** be beneficial. In the meantime, the application **can** perform other work on the calling thread.

Implementations **must** guarantee forward progress by enforcing the following invariants:

1. If only one thread has invoked `vkDeferredOperationJoinKHR` on a given operation, that thread
must execute the operation to completion and return VK_SUCCESS.

2. If multiple threads have concurrently invoked vkDeferredOperationJoinKHR on the same operation, then at least one of them must complete the operation and return VK_SUCCESS.

Valid Usage (Implicit)

• VUID-vkDeferredOperationJoinKHR-device-parameter
device must be a valid VkDevice handle

• VUID-vkDeferredOperationJoinKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle

• VUID-vkDeferredOperationJoinKHR-operation-parent
operation must have been created, allocated, or retrieved from device

Return Codes

Success

• VK_SUCCESS
• VK_THREAD_DONE_KHR
• VK_THREAD_IDLE_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

When a deferred operation is completed, the application can destroy the tracking object by calling:

// Provided by VK_KHR_deferred_host_operations
void vkDestroyDeferredOperationKHR(
    VkDevice device,
    VkDeferredOperationKHR operation,
    const VkAllocationCallbacks* pAllocator);

• device is the device which owns operation.

• operation is the completed operation to be destroyed.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

• VUID-vkDestroyDeferredOperationKHR-operation-03434
If VkAllocationCallbacks were provided when operation was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyDeferredOperationKHR-operation-03435
If no `VkAllocationCallbacks` were provided when `operation` was created, `pAllocator` must be `NULL`.

- **VUID-vkDestroyDeferredOperationKHR-operation-03436**
  `operation` must be completed.

### Valid Usage (Implicit)

- **VUID-vkDestroyDeferredOperationKHR-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkDestroyDeferredOperationKHR-operation-parameter**
  If `operation` is not `VK_NULL_HANDLE`, `operation` must be a valid `VkDeferredOperationKHR` handle.

- **VUID-vkDestroyDeferredOperationKHR-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyDeferredOperationKHR-operation-parent**
  If `operation` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `operation` must be externally synchronized.

To query the number of additional threads that can usefully be joined to a deferred operation, call:

```c
// Provided by VK_KHR_deferred_host_operations
uint32_t vkGetDeferredOperationMaxConcurrencyKHR(
    VkDevice device,  // device is the device which owns operation.
    VkDeferredOperationKHR operation);  // operation is the deferred operation to be queried.
```

The returned value is the maximum number of threads that can usefully execute a deferred operation concurrently, reported for the state of the deferred operation at the point this command is called. This value is intended to be used to better schedule work onto available threads. Applications can join any number of threads to the deferred operation and expect it to eventually complete, though excessive joins may return `VK_THREAD_DONE_KHR` immediately, performing no useful work.

If `operation` is complete, `vkGetDeferredOperationMaxConcurrencyKHR` returns zero.

If `operation` is currently joined to any threads, the value returned by this command may
immediately be out of date.

If operation is pending, implementations must not return zero unless at least one thread is currently executing `vkDeferredOperationJoinKHR` on operation. If there are such threads, the implementation should return an estimate of the number of additional threads which it could profitably use.

Implementations may return $2^{32} - 1$ to indicate that the maximum concurrency is unknown and cannot be easily derived. Implementations may return values larger than the maximum concurrency available on the host CPU. In these situations, an application should clamp the return value rather than oversubscribing the machine.

Note
The recommended usage pattern for applications is to query this value once, after deferral, and schedule no more than the specified number of threads to join the operation. Each time a joined thread receives `VK_THREAD_IDLE_KHR`, the application should schedule an additional join at some point in the future, but is not required to do so.

Valid Usage (Implicit)

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-device-parameter
  device must be a valid `VkDevice` handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parameter
  operation must be a valid `VkDeferredOperationKHR` handle

- VUID-vkGetDeferredOperationMaxConcurrencyKHR-operation-parent
  operation must have been created, allocated, or retrieved from device

The `vkGetDeferredOperationResultKHR` function is defined as:

```c
// Provided by VK_KHR_deferred_host_operations
VkResult vkGetDeferredOperationResultKHR(
    VkDevice device, 
    VkDeferredOperationKHR operation);
```

- device is the device which owns operation.
- operation is the operation whose deferred result is being queried.

If no command has been deferred on operation, `vkGetDeferredOperationResultKHR` returns `VK_SUCCESS`.

If the deferred operation is pending, `vkGetDeferredOperationResultKHR` returns `VK_NOT_READY`.

If the deferred operation is complete, it returns the appropriate return value from the original command. This value must be one of the `VkResult` values which could have been returned by the original command if the operation had not been deferred.
Valid Usage (Implicit)

- VUID-vkGetDeferredOperationResultKHR-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetDeferredOperationResultKHR-operation-parameter
operation must be a valid VkDeferredOperationKHR handle
- VUID-vkGetDeferredOperationResultKHR-operation-parent
operation must have been created, allocated, or retrieved from device

Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY
Chapter 36. Private Data

The private data extension provides a way for users to associate arbitrary user defined data with Vulkan objects. This association is accomplished by storing 64-bit unsigned integers of user defined data in private data slots. A private data slot represents a storage allocation for one data item for each child object of the device.

An application can reserve private data slots at device creation. To reserve private data slots, insert a VkDevicePrivateCreateInfo in the pNext chain in VkDeviceCreateInfo before device creation. Multiple VkDevicePrivateCreateInfo structures can be chained together, and the sum of the requested slots will be reserved. This is an exception to the specified valid usage for structure pointer chains. Reserving slots in this manner is not strictly necessary but it may improve performance.

Private data slots are represented by VkPrivateDataSlot handles:

```c
// Provided by VK_VERSION_1_3
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPrivateDataSlot)
```

or the equivalent

```c
// Provided by VK_EXT_private_data
typedef VkPrivateDataSlot VkPrivateDataSlotEXT;
```

To create a private data slot, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkCreatePrivateDataSlot(  
    VkDevice device,  
    const VkPrivateCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkPrivateDataSlot* pPrivateDataSlot);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkCreatePrivateDataSlotEXT(  
    VkDevice device,  
    const VkPrivateCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkPrivateDataSlot* pPrivateDataSlot);
```

- `device` is the logical device associated with the creation of the object(s) holding the private data slot.
• `pCreateInfo` is a pointer to a `VkPrivateDataSlotCreateInfo`
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
• `pPrivateDataSlot` is a pointer to a `VkPrivateDataSlot` handle in which the resulting private data slot is returned

### Valid Usage

- **VUID-vkCreatePrivateDataSlot-privateData-04564**
  The `privateData` feature **must** be enabled

### Valid Usage (Implicit)

- **VUID-vkCreatePrivateDataSlot-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkCreatePrivateDataSlot-pCreateInfo-parameter**
  `pCreateInfo` **must** be a valid pointer to a valid `VkPrivateDataSlotCreateInfo` structure

- **VUID-vkCreatePrivateDataSlot-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreatePrivateDataSlot-pPrivateDataSlot-parameter**
  `pPrivateDataSlot` **must** be a valid pointer to a `VkPrivateDataSlot` handle

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPrivateDataSlotCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPrivateDataSlotCreateInfo {
    VkStructureType sType;
    const void*pNext;
    VkPrivateDataSlotCreateFlags flags;
} VkPrivateDataSlotCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_private_data
```
typedef VkPrivateDataSlotCreateInfo VkPrivateDataSlotCreateInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

### Valid Usage (Implicit)

- VUID-VkPrivateDataSlotCreateInfo-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PRIVATE_DATA_SLOT_CREATE_INFO`

- VUID-VkPrivateDataSlotCreateInfo-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkPrivateDataSlotCreateInfo-flags-zerobitmask
  
  `flags` must be `0`

// Provided by VK_VERSION_1_3
typedef VkFlags VkPrivateDataSlotCreateFlags;

or the equivalent

// Provided by VK_EXT_private_data
typedef VkPrivateDataSlotCreateFlags VkPrivateDataSlotCreateFlagsEXT;

`VkPrivateDataSlotCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To destroy a private data slot, call:

// Provided by VK_VERSION_1_3
void vkDestroyPrivateDataSlot(
  VkDevice device,
  VkPrivateDataSlot privateDataSlot,
  const VkAllocationCallbacks* pAllocator);

or the equivalent command

// Provided by VK_EXT_private_data
void vkDestroyPrivateDataSlotEXT(
  VkDevice device,
  VkPrivateDataSlot privateDataSlot,
  const VkAllocationCallbacks* pAllocator);
- **device** is the logical device associated with the creation of the object(s) holding the private data slot.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **privateDataSlot** is the private data slot to destroy.

### Valid Usage

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04062**
  If `VkAllocationCallbacks` were provided when `privateDataSlot` was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-04063**
  If no `VkAllocationCallbacks` were provided when `privateDataSlot` was created, `pAllocator` **must** be `NULL`.

### Valid Usage (Implicit)

- **VUID-vkDestroyPrivateDataSlot-device-parameter**
  `device` **must** be a valid `VkDevice` handle.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parameter**
  If `privateDataSlot` is not `VK_NULL_HANDLE`, `privateDataSlot` **must** be a valid `VkPrivateDataSlot` handle.

- **VUID-vkDestroyPrivateDataSlot-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure.

- **VUID-vkDestroyPrivateDataSlot-privateDataSlot-parent**
  If `privateDataSlot` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `privateDataSlot` **must** be externally synchronized.

To store user defined data in a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
VkResult vkSetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```
or the equivalent command

```c
// Provided by VK_EXT_private_data
VkResult vkSetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t data);
```

- `device` is the device that created the object.
- `objectType` is a `VkObjectType` specifying the type of object to associate data with.
- `objectHandle` is a handle to the object to associate data with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data storage.
- `data` is user defined data to associate the object with. This data will be stored at `privateDataSlot`.

### Valid Usage

- VUID-vkSetPrivateData-objectHandle-04016
  - `objectHandle` must be `device` or a child of `device`.

- VUID-vkSetPrivateData-objectHandle-04017
  - `objectHandle` must be a valid handle to an object of type `objectType`.

### Valid Usage (Implicit)

- VUID-vkSetPrivateData-device-parameter
  - `device` must be a valid `VkDevice` handle.

- VUID-vkSetPrivateData-objectType-parameter
  - `objectType` must be a valid `VkObjectType` value.

- VUID-vkSetPrivateData-privateDataSlot-parameter
  - `privateDataSlot` must be a valid `VkPrivateDataSlot` handle.

- VUID-vkSetPrivateData-privateDataSlot-parent
  - `privateDataSlot` must have been created, allocated, or retrieved from `device`.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
To retrieve user defined data from a slot associated with a Vulkan object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetPrivateData(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

or the equivalent command

```c
// Provided by VK_EXT_private_data
void vkGetPrivateDataEXT(
    VkDevice device,
    VkObjectType objectType,
    uint64_t objectHandle,
    VkPrivateDataSlot privateDataSlot,
    uint64_t* pData);
```

- `device` is the device that created the object
- `objectType` is a `VkObjectType` specifying the type of object data is associated with.
- `objectHandle` is a handle to the object data is associated with.
- `privateDataSlot` is a handle to a `VkPrivateDataSlot` specifying location of private data pointer storage.
- `pData` is a pointer to specify where user data is returned. 0 will be written in the absence of a previous call to `vkSetPrivateData` using the object specified by `objectHandle`.

**Note**

Due to platform details on Android, implementations might not be able to reliably return 0 from calls to `vkGetPrivateData` for `VkSwapchainKHR` objects on which `vkSetPrivateData` has not previously been called. This erratum is exclusive to the Android platform and objects of type `VkSwapchainKHR`.

**Valid Usage**

- VUID-vkGetPrivateData-objectType-04018
  `objectHandle` must be `device` or a child of `device`
- VUID-vkGetPrivateData-objectHandle-09498
  `objectHandle` must be a valid handle to an object of type `objectType`
Valid Usage (Implicit)

- **VUID-vkGetPrivateData-device-parameter**
  
  *device must* be a valid *VkDevice* handle

- **VUID-vkGetPrivateData-objectType-parameter**
  
  *objectType must* be a valid *VkObjectType* value

- **VUID-vkGetPrivateData-privateDataSlot-parameter**
  
  *privateDataSlot must* be a valid *VkPrivateDataSlot* handle

- **VUID-vkGetPrivateData-pData-parameter**
  
  *pData must* be a valid pointer to a *uint64_t* value

- **VUID-vkGetPrivateData-privateDataSlot-parent**
  
  *privateDataSlot must* have been created, allocated, or retrieved from *device*
Chapter 37. Acceleration Structures

37.1. Acceleration Structures

Acceleration structures are data structures used by the implementation to efficiently manage scene geometry as it is traversed during a ray tracing query. The application is responsible for managing acceleration structure objects (see Acceleration Structures), including allocation, destruction, executing builds or updates, and synchronizing resources used during ray tracing queries.

There are two types of acceleration structures, top level acceleration structures and bottom level acceleration structures.

An acceleration structure is considered to be constructed if an acceleration structure build command or copy command has been executed with the given acceleration structure as the destination.

![Diagram showing the relationship between top and bottom level acceleration structures](image)

**Figure 27. Acceleration Structure**

The diagram shows the relationship between top and bottom level acceleration structures.

37.1.1. Geometry

*Geometries* refer to a triangle or axis-aligned bounding box.
37.1.2. Top Level Acceleration Structures

Opaque acceleration structure for an array of instances. The descriptor or device address referencing this is the starting point for traversal.

The top level acceleration structure takes a reference to any bottom level acceleration structure referenced by its instances. Those bottom level acceleration structure objects must be valid when the top level acceleration structure is accessed.

37.1.3. Bottom Level Acceleration Structures

Opaque acceleration structure for an array of geometries.

37.1.4. Acceleration Structure Update Rules

The API defines two types of operations to produce acceleration structures from geometry:

- A build operation is used to construct an acceleration structure.
- An update operation is used to modify an existing acceleration structure.

An update operation imposes certain constraints on the input, in exchange for considerably faster execution. When performing an update, the application is required to provide a full description of the acceleration structure, but is prohibited from changing anything other than instance definitions, transform matrices, and vertex or AABB positions. All other aspects of the description must exactly match the one from the original build.

More precisely, the application must not use an update operation to do any of the following:

- Change primitives or instances from active to inactive, or vice versa (as defined in Inactive Primitives and Instances).
- Change the index or vertex formats of triangle geometry.
- Change triangle geometry transform pointers from null to non-null or vice versa.
- Change the number of geometries or instances in the structure.
- Change the geometry flags for any geometry in the structure.
- Change the number of vertices or primitives for any geometry in the structure.

If the original acceleration structure was built using opacity micromaps and VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_DATA_UPDATE_EXT was set in flags, the application must provide the corresponding micromap information to the update operation. The application is prohibited from changing anything other than the specific opacity values assigned to the triangles.

More precisely, the application must not use an update operation to do any of the following:

- Remove micromaps or VkOpacityMicromapSpecialIndexEXT values from a geometry which previously had them, or vice versa.
- Change between use of VkOpacityMicromapSpecialIndexEXT values and explicit micro-map
triangles.

• Change the subdivision level or format of the micromap triangle associated with any acceleration-structure triangle.

If the original acceleration structure was built using opacity micromaps and 
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_OPACITY_MICROMAP_UPDATE_EXT was set in flags, the application must provide a micromap to the update operation.

If the original acceleration structure was built using opacity micromaps and neither opacity micromap update flag is set the application must provide the original micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and 
VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_DISPLACEMENT_MICROMAP_UPDATE_NV was set in flags, the application must provide a displacement micromap to the update operation.

If the original acceleration structure was built using displacement micromaps and the displacement micromap update flag is not set the application must provide the original micromap to the update operation.

### 37.1.5. Inactive Primitives and Instances

Acceleration structures allow the use of particular input values to signal inactive primitives or instances.

An inactive triangle is one for which the first (X) component of any vertex is NaN. If any other vertex component is NaN, and the first is not, the behavior is undefined. If the vertex format does not have a NaN representation, then all triangles are considered active.

An inactive instance is one whose acceleration structure reference is 0.

An inactive AABB is one for which the minimum X coordinate is NaN. If any other component is NaN, and the first is not, the behavior is undefined.

In the above definitions, “NaN” refers to any type of NaN. Signaling, non-signaling, quiet, loud, or otherwise.

An inactive object is considered invisible to all rays, and should not be represented in the acceleration structure. Implementations should ensure that the presence of inactive objects does not seriously degrade traversal performance.

Inactive objects are counted in the auto-generated index sequences which are provided to shaders via InstanceId and PrimitiveId SPIR-V decorations. This allows objects in the scene to change freely between the active and inactive states, without affecting the layout of any arrays which are being indexed using the ID values.

Any transition between the active and inactive states requires a full acceleration structure rebuild. Applications must not perform an acceleration structure update where an object is active in the source acceleration structure but would be inactive in the destination, or vice versa.
37.1.6. Building Acceleration Structures

To build an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdBuildAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    const VkAccelerationStructureInfoNV* pInfo,
    VkBuffer instanceData,
    VkDeviceSize instanceOffset,
    VkBool32 update,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkBuffer scratch,
    VkDeviceSize scratchOffset);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` contains the shared information for the acceleration structure’s structure.
- `instanceData` is the buffer containing an array of `VkAccelerationStructureInstanceKHR` structures defining acceleration structures. This parameter must be `NULL` for bottom level acceleration structures.
- `instanceOffset` is the offset in bytes (relative to the start of `instanceData`) at which the instance data is located.
- `update` specifies whether to update the `dst` acceleration structure with the data in `src`.
- `dst` is a pointer to the target acceleration structure for the build.
- `src` is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure.
- `scratch` is the `VkBuffer` that will be used as scratch memory for the build.
- `scratchOffset` is the offset in bytes relative to the start of `scratch` that will be used as a scratch memory.

Accesses to `dst`, `src`, and `scratch` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`.

### Valid Usage

- VUID-vkCmdBuildAccelerationStructureNV-geometryCount-02241
  `geometryCount` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- VUID-vkCmdBuildAccelerationStructureNV-dst-02488
  `dst` must have been created with compatible `VkAccelerationStructureInfoNV` where `VkAccelerationStructureInfoNV::type` and `VkAccelerationStructureInfoNV::flags` are identical, and `VkAccelerationStructureInfoNV::instanceCount`
VkAccelerationStructureInfoNV::geometryCount for dst are greater than or equal to the build size and each geometry in VkAccelerationStructureInfoNV::pGeometries for dst has greater than or equal to the number of vertices, indices, and AABBs

- VUID-vkCmdBuildAccelerationStructureNV-update-02489
  If update is VK_TRUE, src must not be VK_NULL_HANDLE

- VUID-vkCmdBuildAccelerationStructureNV-update-02490
  If update is VK_TRUE, src must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV set in VkAccelerationStructureInfoNV::flags in the original build

- VUID-vkCmdBuildAccelerationStructureNV-update-02491
  If update is VK_FALSE, the size member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure set to dst and VkAccelerationStructureMemoryRequirementsInfoNV::type set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset

- VUID-vkCmdBuildAccelerationStructureNV-update-02492
  If update is VK_TRUE, the size member of the VkMemoryRequirements structure returned from a call to vkGetAccelerationStructureMemoryRequirementsNV with VkAccelerationStructureMemoryRequirementsInfoNV::accelerationStructure set to dst and VkAccelerationStructureMemoryRequirementsInfoNV::type set to VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV must be less than or equal to the size of scratch minus scratchOffset

- VUID-vkCmdBuildAccelerationStructureNV-scratch-03522
  scratch must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag

- VUID-vkCmdBuildAccelerationStructureNV-instanceData-03523
  If instanceData is not VK_NULL_HANDLE, instanceData must have been created with VK_BUFFER_USAGE_RAY_TRACING_BIT_NV usage flag

- VUID-vkCmdBuildAccelerationStructureNV-accelerationStructureReference-03786
  Each VkAccelerationStructureInstanceKHR::accelerationStructureReference value in instanceData must be a valid device address containing a value obtained from vkGetAccelerationStructureHandleNV

- VUID-vkCmdBuildAccelerationStructureNV-update-03524
  If update is VK_TRUE, then objects that were previously active must not be made inactive as per Inactive Primitives and Instances

- VUID-vkCmdBuildAccelerationStructureNV-update-03525
  If update is VK_TRUE, then objects that were previously inactive must not be made active as per Inactive Primitives and Instances

- VUID-vkCmdBuildAccelerationStructureNV-update-03526
  If update is VK_TRUE, the src and dst objects must either be the same object or not have any memory aliasing

- VUID-vkCmdBuildAccelerationStructureNV-dst-07787
  dst must be bound completely and contiguously to a single VkDeviceMemory object via
vkBindAccelerationStructureMemoryNV

Valid Usage (Implicit)

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-pInfo-parameter
  pInfo must be a valid pointer to a valid VkAccelerationStructureInfoNV structure

- VUID-vkCmdBuildAccelerationStructureNV-instanceData-parameter
  If instanceData is not VK_NULL_HANDLE, instanceData must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-dst-parameter
  dst must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-src-parameter
  If src is not VK_NULL_HANDLE, src must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdBuildAccelerationStructureNV-scratch-parameter
  scratch must be a valid VkBuffer handle

- VUID-vkCmdBuildAccelerationStructureNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructureNV-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructureNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructureNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructureNV-commonparent
  Each of commandBuffer, dst, instanceData, scratch, and src that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
To build acceleration structures call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdBuildAccelerationStructuresKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i].` 

The `vkCmdBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application **cannot** build a top-level acceleration structure in the same `vkCmdBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also **cannot** be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

Accesses to the acceleration structure scratch buffers as identified by the `VkAccelerationStructureBuildGeometryInfoKHR::scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `(VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR | VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR)`. Accesses to each `VkAccelerationStructureBuildGeometryInfoKHR::srcAccelerationStructure` and `VkAccelerationStructureBuildGeometryInfoKHR::dstAccelerationStructure` must be synchronized.
with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR`, as appropriate.

Accesses to other input buffers as identified by any used values of `VkAccelerationStructureGeometryMotionTrianglesDataNV::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::vertexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::indexData`, `VkAccelerationStructureGeometryTrianglesDataKHR::transformData`, `VkAccelerationStructureGeometryAabbsDataKHR::data`, and `VkAccelerationStructureGeometryInstancesDataKHR::data` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_SHADER_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresKHR-accelerationStructure-08923**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value.

- **VUID-vkCmdBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid `VkAccelerationStructureKHR` handle.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member
must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03700
  For each element of \texttt{pInfos}, if its \texttt{type} member is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR}, its \texttt{dstAccelerationStructure} member must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03663
  For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, inactive primitives in its \texttt{srcAccelerationStructure} member must not be made active

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03664
  For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, active primitives in its \texttt{srcAccelerationStructure} member must not be made inactive

- VUID-vkCmdBuildAccelerationStructuresKHR-None-03407
  The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must not be referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR} in any other element of \texttt{pInfos}

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03701
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03702
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03703
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} (including the same element), which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03704
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{scratchData} member of any other element of \texttt{pInfos}, which is accessed by this command

- VUID-vkCmdBuildAccelerationStructuresKHR-scratchData-03705
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure} member of any element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command
VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR (including the same element), which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresKHR-dstAccelerationStructure-03706**
  The range of memory backing the dstAccelerationStructure member of any element of pInfos that is accessed by this command must not overlap the memory backing any acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfos, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03667**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03668**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03758**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03759**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03760**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03761**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03762**
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03763**
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.vertexFormat` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03764**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03765**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03766**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03767**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must** not be `NULL`

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03768**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built

- **VUID-vkCmdBuildAccelerationStructuresKHR-primitiveCount-03769**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each
VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, the primitiveCount member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-firstVertex-03770
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if the geometry uses indices, the firstVertex member of its corresponding VkAccelerationStructureBuildRangeInfoKHR structure must have the same value which was specified when srcAccelerationStructure was last built

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03801
For each element of pInfo[i].pGeometries or pInfo[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, the corresponding ppBuildRangeInfos[i][j].primitiveCount must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03707
For each element of pInfo, the buffer used to create its dstAccelerationStructure member must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03708
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03709
For each element of pInfo, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to device memory

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03671
If pInfo[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03672
If pInfo[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in the buffer device address range of the same buffer, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

- VUID-vkCmdBuildAccelerationStructuresKHR-geometry-03673
The buffers from which the buffer device addresses for all of the
• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03710
  For each element of pInfos, its scratchData.deviceAddress member must be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.vertexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03712
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and with `geometry.triangles.indexType` not equal to `VK_INDEX_TYPE_NONE_KHR`, `geometry.triangles.indexData.deviceAddress` must be aligned to the size in bytes of the type in `indexType`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03808**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03809**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be a valid device address obtained from `vkGetBufferDeviceAddress`.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03810**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is not 0, it must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03811**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03812**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03813**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03815**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03816**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03817**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03818**
  For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if `geometry.triangles.transformData.deviceAddress` is the address of a non-sparse buffer then it must be bound completely and contiguously to a single `VkDeviceMemory` object.
device address obtained from \texttt{vkGetBufferDeviceAddress}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03814}

  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, if \texttt{geometry.instances.data.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-06707}

  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, each \texttt{VkAccelerationStructureInstanceKHR::accelerationStructureReference} value in \texttt{geometry.instances.data.deviceAddress} \textbf{must} be a valid device address containing a value obtained from \texttt{vkGetAccelerationStructureDeviceAddressKHR} or \texttt{0}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-09547}

  \texttt{commandBuffer} \textbf{must} not be a protected command buffer.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-03675}

  For each \texttt{pInfos[i]}, \texttt{dstAccelerationStructure} \textbf{must} have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::size} greater than or equal to the memory size required by the build operation, as returned by \texttt{vkGetAccelerationStructureBuildSizesKHR} with \texttt{pBuildInfo = pInfos[i]} and with each element of the \texttt{pMaxPrimitiveCounts} array greater than or equal to the equivalent \texttt{ppBuildRangeInfos[i][j].primitiveCount} values for \texttt{j} in \texttt{[0, pInfos[i].geometryCount)}

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676}

  Each element of \texttt{ppBuildRangeInfos[i]} \textbf{must} be a valid pointer to an array of \texttt{pInfos[i].geometryCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures.

### Valid Usage (Implicit)

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-parameter}

  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-pInfos-parameter}

  \texttt{pInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkAccelerationStructureBuildGeometryInfoKHR} structures.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-ppBuildRangeInfos-parameter}

  \texttt{ppBuildRangeInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} \texttt{VkAccelerationStructureBuildRangeInfoKHR} structures.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-recording}

  \texttt{commandBuffer} \textbf{must} be in the \texttt{recording} state.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-commandBuffer-cmdpool}

  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support compute operations.

- \textbf{VUID-vkCmdBuildAccelerationStructuresKHR-renderpass}

  This command \textbf{must} only be called outside of a render pass instance.
This command must only be called outside of a video coding scope.

infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To build acceleration structures with some parameters sourced on the device call:

```c
void vkCmdBuildAccelerationStructuresIndirectKHR(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
    const VkDeviceAddress* pIndirectDeviceAddresses,
    const uint32_t* pIndirectStrides,
    const uint32_t* const* ppMaxPrimitiveCounts);
```

- commandBuffer is the command buffer into which the command will be recorded.
- infoCount is the number of acceleration structures to build.
- pInfos is a pointer to an array of infoCount VkAccelerationStructureBuildGeometryInfoKHR structures defining the geometry used to build each acceleration structure.
- pIndirectDeviceAddresses is a pointer to an array of infoCount buffer device addresses which point to pInfos[i].geometryCount VkAccelerationStructureBuildRangeInfoKHR structures defining dynamic offsets to the addresses where geometry data is stored, as defined by pInfos[i].
- pIndirectStrides is a pointer to an array of infoCount byte strides between elements of pIndirectDeviceAddresses.
- ppMaxPrimitiveCounts is a pointer to an array of infoCount pointers to arrays of pInfos[i].geometryCount values indicating the maximum number of primitives that will be built by this command for each geometry.
Accesses to acceleration structures, scratch buffers, vertex buffers, index buffers, and instance buffers must be synchronized as with `vkCmdBuildAccelerationStructuresKHR`.

Accesses to any element of `pIndirectDeviceAddresses` must be synchronized with the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage and an access type of `VK_ACCESS_INDIRECT_COMMAND_READ_BIT`.

### Valid Usage

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-accelerationStructureIndirectBuild-03650**
  The [VkPhysicalDeviceAccelerationStructureFeaturesKHR](https://www.khronos.org/registry/vk/specs/1.3-extensions/man-html/vkPhysicalDeviceAccelerationStructureFeaturesKHR.html)::accelerationStructureIndirectBuild feature must be enabled.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid [VkBuildAccelerationStructureModeKHR](https://www.khronos.org/registry/vk/specs/1.3-extensions/man-html/vkBuildAccelerationStructureModeKHR.html) value.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid [VkAccelerationStructureKHR](https://www.khronos.org/registry/vk/specs/1.3-extensions/man-html/vkAccelerationStructureKHR.html) handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-04630**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03403**
  The `srcAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03698**
  The `dstAccelerationStructure` member of any element of `pInfos` must not be the same acceleration structure as the `dstAccelerationStructure` member of any other element of `pInfos`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03800**
  The `dstAccelerationStructure` member of any element of `pInfos` must be a valid [VkAccelerationStructureKHR](https://www.khronos.org/registry/vk/specs/1.3-extensions/man-html/vkAccelerationStructureKHR.html) handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03699**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, its `dstAccelerationStructure` member must have been created with a value of [VkAccelerationStructureCreateInfoKHR](https://www.khronos.org/registry/vk/specs/1.3-extensions/man-html/vkAccelerationStructureCreateInfoKHR.html)::type equal to either `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` or `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03700**
  For each element of `pInfos`, if its `type` member is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, its `dstAccelerationStructure` member
must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type}
equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} or
\texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03663**
  For each element of \texttt{pInfos}, if its \texttt{mode} member is
  \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, inactive primitives in its
  \texttt{srcAccelerationStructure} member must not be made active

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03664**
  For each element of \texttt{pInfos}, if its \texttt{mode} member is
  \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, active primitives in its
  \texttt{srcAccelerationStructure} member must not be made inactive

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-None-03407**
  The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must not be referenced
  by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries}
  with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR} in any other element of \texttt{pInfos}

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03701**
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of
  \texttt{pInfos} that is accessed by this command must not overlap the memory backing the
  \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos} with a \texttt{mode} equal to
  \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03702**
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of
  \texttt{pInfos} that is accessed by this command must not overlap the memory backing the
  \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}, which is accessed by
  this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03703**
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of
  \texttt{pInfos} that is accessed by this command must not overlap the memory backing the
  \texttt{scratchData} member of any other element of \texttt{pInfos} (including the same element), which is
  accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03704**
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is
  accessed by this command must not overlap the memory backing the \texttt{scratchData}
  member of any other element of \texttt{pInfos}, which is accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-scratchData-03705**
  The range of memory backing the \texttt{scratchData} member of any element of \texttt{pInfos} that is
  accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure}
  member of any element of \texttt{pInfos} with a \texttt{mode} equal to
  \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR} (including the same element), which is
  accessed by this command

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-dstAccelerationStructure-03706**
  The range of memory backing the \texttt{dstAccelerationStructure} member of any element of
  \texttt{pInfos} that is accessed by this command must not overlap the memory backing any
  acceleration structure referenced by the \texttt{geometry.instances.data} member of any element
of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR in any other element of pInfo, which is accessed by this command

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03667
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure member must have previously been constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR set in VkAccelerationStructureBuildGeometryInfoKHR::flags in the build

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03668
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its srcAccelerationStructure and dstAccelerationStructure members must either be the same VkAccelerationStructureKHR, or not have any memory aliasing

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03758
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its geometryCount member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03759
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its flags member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03760
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03761
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03762
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built

• VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03763
For each element of pInfo, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.maxVertex` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, its `geometry.triangles.indexType` member **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was `NULL` when `srcAccelerationStructure` was last built, then it **must** be `NULL`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not `NULL` when `srcAccelerationStructure` was last built, then it **must** not be `NULL`.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced **must** be the same as the corresponding index value when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, the `primitiveCount` member of its corresponding `VkAccelerationStructureBuildRangeInfoKHR` structure **must** have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is...
For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `pMaxPrimitiveCounts[i][j]` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`.

For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member must be bound to device memory.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` must be bound to device memory.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `buildScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

If `pInfos[i].mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, all addresses between `pInfos[i].scratchData.deviceAddress` and `pInfos[i].scratchData.deviceAddress + N - 1` must be in the buffer device address range of the same buffer, where `N` is given by the `updateScratchSize` member of the `VkAccelerationStructureBuildSizesInfoKHR` structure returned from a call to `vkGetAccelerationStructureBuildSizesKHR` with an identical `VkAccelerationStructureBuildGeometryInfoKHR` structure and primitive count.

The buffers from which the buffer device addresses for all of the `geometry.triangles.vertexData`, `geometry.triangles.indexData`, `geometry.triangles.transformData`, `geometry.aabbs.data`, and `geometry.instances.data` members of all `pInfos[i].pGeometries` and `pInfos[i].ppGeometries` are queried must have been created with the `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_BUILD_INPUT_READ_ONLY_BIT_KHR` usage flag.

The buffer from which the buffer device address `pInfos[i].scratchData.deviceAddress` is
queried must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT usage flag

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03802
  For each element of pInfos, its scratchData.deviceAddress member must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03803
  For each element of pInfos, if scratchData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03710
  For each element of pInfos, its scratchData.deviceAddress member must be a multiple of VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03804
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03805
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexData.deviceAddress is the address of a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03711
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.deviceAddress must be aligned to the size in bytes of the smallest component of the format in vertexFormat

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03806
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be a valid device address obtained from vkGetBufferDeviceAddress

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03807
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to the size in bytes of the type in indexType

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03712
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, and with geometry.triangles.indexType not equal to VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.deviceAddress must be aligned to the size in bytes of the type in indexType

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03808
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.deviceAddress is not
0, it must be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03809**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is the address of a non-sparse buffer then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03810**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR}, if \texttt{geometry.triangles.transformData.deviceAddress} is not 0, it must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03811**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, \texttt{geometry.aabbs.data.deviceAddress} must be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03812**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, if \texttt{geometry.aabbs.data.deviceAddress} is the address of a non-sparse buffer then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03714**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, \texttt{geometry.aabbs.data.deviceAddress} must be aligned to 8 bytes.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03715**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, if \texttt{geometry.instances.arrayOfPointers} is \texttt{VK\_FALSE}, \texttt{geometry.instances.data.deviceAddress} must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03716**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, if \texttt{geometry.instances.arrayOfPointers} is \texttt{VK\_TRUE}, \texttt{geometry.instances.data.deviceAddress} must be aligned to 8 bytes.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03717**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, if \texttt{geometry.instances.arrayOfPointers} is \texttt{VK\_TRUE}, each element of \texttt{geometry.instances.data.deviceAddress} in device memory must be aligned to 16 bytes.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03813**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, \texttt{geometry.instances.data.deviceAddress} must be a valid device address obtained from \texttt{vkGetBufferDeviceAddress}.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03814**
  For any element of \texttt{pInfos[i].pGeometries} or \texttt{pInfos[i].ppGeometries} with a \texttt{geometryType} of \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR}, if \texttt{geometry.instances.data.deviceAddress} is the address of a non-sparse buffer then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.
For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.deviceAddress` must be a valid device address containing a value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or 0.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-03645**
  For any element of `pIndirectDeviceAddresses`, if the buffer from which it was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-03652**
  `pInfos[i].dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and `pMaxPrimitiveCounts = ppMaxPrimitiveCounts[i]`.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-03653**
  Each `ppMaxPrimitiveCounts[i][j]` must be greater than or equal to the primitiveCount value specified by the `VkAccelerationStructureBuildRangeInfoKHR` structure located at `pIndirectDeviceAddresses[i] + (j × pIndirectStrides[i])`.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pInfos-parameter**
  `3180`
pInfos must be a valid pointer to an array of infoCount valid VkAccelerationStructureBuildGeometryInfoKHR structures

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectDeviceAddresses-parameter
  pIndirectDeviceAddresses must be a valid pointer to an array of infoCount VkDeviceAddress values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-pIndirectStrides-parameter
  pIndirectStrides must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-ppMaxPrimitiveCounts-parameter
  ppMaxPrimitiveCounts must be a valid pointer to an array of infoCount uint32_t values

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBuildAccelerationStructuresIndirectKHR-infoCount-arraylength
  infoCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkAccelerationStructureBuildGeometryInfoKHR structure is defined as:

```
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildGeometryInfoKHR {
    VkStructureType sType;
    const void* pNext;
}
```
VkAccelerationStructureTypeKHR type;
VkBuildAccelerationStructureFlagsKHR flags;
VkBuildAccelerationStructureModeKHR mode;
VkAccelerationStructureKHR srcAccelerationStructure;
VkAccelerationStructureKHR dstAccelerationStructure;
uint32_t geometryCount;
const VkAccelerationStructureGeometryKHR* pGeometries;
const VkAccelerationStructureGeometryKHR* const* ppGeometries;
VkDeviceOrHostAddressKHR scratchData;
}

VkAccelerationStructureBuildGeometryInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure being built.
- **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsKHR` specifying additional parameters of the acceleration structure.
- **mode** is a `VkBuildAccelerationStructureModeKHR` value specifying the type of operation to perform.
- **srcAccelerationStructure** is a pointer to an existing acceleration structure that is to be used to update the `dst` acceleration structure when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`.
- **dstAccelerationStructure** is a pointer to the target acceleration structure for the build.
- **geometryCount** specifies the number of geometries that will be built into `dstAccelerationStructure`.
- **pGeometries** is a pointer to an array of `VkAccelerationStructureGeometryKHR` structures.
- **ppGeometries** is a pointer to an array of pointers to `VkAccelerationStructureGeometryKHR` structures.
- **scratchData** is the device or host address to memory that will be used as scratch memory for the build.

Only one of `pGeometries` or `ppGeometries` can be a valid pointer, the other must be NULL. Each element of the non-NULL array describes the data used to build each acceleration structure geometry.

The index of each element of the `pGeometries` or `ppGeometries` members of `VkAccelerationStructureBuildGeometryInfoKHR` is used as the geometry index during ray traversal. The geometry index is available in ray shaders via the `RayGeometryIndexKHR` built-in, and is used to determine hit and intersection shaders executed during traversal. The geometry index is available to ray queries via the `OpRayQueryGetIntersectionGeometryIndexKHR` instruction.

Setting `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags` indicates that this build is a motion top level acceleration structure. A motion top level uses instances of format `VkAccelerationStructureMotionInstance_NV::arrayOfPointers` if `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_FALSE`. 3182
If `VkAccelerationStructureGeometryInstancesDataKHR::arrayOfPointers` is `VK_TRUE`, the pointer for each element of the array of instance pointers consists of 4 bits of `VkAccelerationStructureMotionInstanceTypeNV` in the low 4 bits of the pointer identifying the type of structure at the pointer. The device address accessed is the value in the array with the low 4 bits set to zero. The structure at the pointer is one of `VkAccelerationStructureInstanceKHR`, `VkAccelerationStructureMatrixMotionInstanceNV` or `VkAccelerationStructureSRTMotionInstanceNV`, depending on the type value encoded in the low 4 bits.

A top level acceleration structure with either motion instances or vertex motion in its instances must set `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` in `flags`.

Members `srcAccelerationStructure` and `dstAccelerationStructure` may be the same or different for an update operation (when `mode` is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`). If they are the same, the update happens in-place. Otherwise, the target acceleration structure is updated and the source is not modified.

**Valid Usage**

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03654**
  - `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-03788**
  - If `geometryCount` is not 0, exactly one of `pGeometries` or `ppGeometries` must be a valid pointer, the other must be `NULL`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03789**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03790**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, `geometryCount` must be 1

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03791**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR`, the `geometryType` member of elements of either `pGeometries` or `ppGeometries` must not be `VK_GEOMETRY_TYPE_INSTANCES_KHR`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03792**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then the `geometryType` member of each geometry in either `pGeometries` or `ppGeometries` must be the same

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03793**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` then `geometryCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxGeometryCount`

- **VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-03794**
  - If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` and the `geometryType` member of either `pGeometries` or `ppGeometries` is `VK_GEOMETRY_TYPE_AABBs_KHR`, the total number of AABBs in all geometries must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount`
If \texttt{type} is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} and the \texttt{geometryType} member of either \texttt{pGeometries} or \texttt{ppGeometries} is \texttt{VK_GEOMETRY_TYPE_TRIANGLES_KHR}, the total number of triangles in all geometries \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPrimitiveCount}.

If \texttt{flags} has the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR} bit set, then it \textbf{must} not have the \texttt{VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR} bit set.

\textbf{Valid Usage (Implicit)}

\begin{itemize}
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-sType-sType} \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_GEOMETRY_INFO_KHR}
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-pNext-pNext} \texttt{pNext} \textbf{must} be \texttt{NULL}
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-type-parameter} \texttt{type} \textbf{must} be a valid \texttt{VkAccelerationStructureTypeKHR} value
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-flags-parameter} \texttt{flags} \textbf{must} be a valid combination of \texttt{VkBuildAccelerationStructureFlagBitsKHR} values
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-pGeometries-parameter} If \texttt{geometryCount} is not 0, and \texttt{pGeometries} is not \texttt{NULL}, \texttt{pGeometries} \textbf{must} be a valid pointer to an array of \texttt{geometryCount} valid \texttt{VkAccelerationStructureGeometryKHR} structures
\item \texttt{VUID-VkAccelerationStructureBuildGeometryInfoKHR-ppGeometries-parameter} If \texttt{geometryCount} is not 0, and \texttt{ppGeometries} is not \texttt{NULL}, \texttt{ppGeometries} \textbf{must} be a valid pointer to an array of \texttt{geometryCount} valid pointers to valid \texttt{VkAccelerationStructureGeometryKHR} structures
\end{itemize}
Both of \textit{dstAccelerationStructure}, and \textit{srcAccelerationStructure} that are valid handles of non-ignored parameters \textbf{must} have been created, allocated, or retrieved from the same \textbf{VkDevice}.

The \textbf{VkBuildAccelerationStructureModeKHR} enumeration is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureModeKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR = 0,
    VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR = 1,
} VkBuildAccelerationStructureModeKHR;
```

- \textbf{VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR} specifies that the destination acceleration structure will be built using the specified geometries.
- \textbf{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR} specifies that the destination acceleration structure will be built using data in a source acceleration structure, updated by the specified geometries.

The \textbf{VkDeviceOrHostAddressKHR} union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressKHR {
    VkDeviceAddress deviceAddress;
    void* hostAddress;
} VkDeviceOrHostAddressKHR;
```

- \textbf{deviceAddress} is a buffer device address as returned by the \textbf{vkGetBufferDeviceAddressKHR} command.
- \textbf{hostAddress} is a host memory address.

The \textbf{VkDeviceOrHostAddressConstKHR} union is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef union VkDeviceOrHostAddressConstKHR {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstKHR;
```

- \textbf{deviceAddress} is a buffer device address as returned by the \textbf{vkGetBufferDeviceAddressKHR} command.
- \textbf{hostAddress} is a const host memory address.

The \textbf{VkAccelerationStructureGeometryKHR} structure is defined as:
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryKHR {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkAccelerationStructureGeometryDataKHR geometry;
    VkGeometryFlagsKHR flags;
} VkAccelerationStructureGeometryKHR;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **geometryType** describes which type of geometry this **VkAccelerationStructureGeometryKHR** refers to.
• **geometry** is a **VkAccelerationStructureGeometryDataKHR** union describing the geometry data for the relevant geometry type.
• **flags** is a bitmask of **VkGeometryFlagBitsKHR** values describing additional properties of how the geometry should be built.

---

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureGeometryKHR-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_KHR**

- **VUID-VkAccelerationStructureGeometryKHR-pNext-pNext**
  
  *pNext* must be **NULL**

- **VUID-VkAccelerationStructureGeometryKHR-geometryType-parameter**
  
  *geometryType* must be a valid **VkGeometryTypeKHR** value

- **VUID-VkAccelerationStructureGeometryKHR-triangles-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_TRIANGLES_KHR**, the *triangles* member of *geometry* must be a valid **VkAccelerationStructureGeometryTrianglesDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-aabbs-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_AABBS_KHR**, the *aabbs* member of *geometry* must be a valid **VkAccelerationStructureGeometryAabbsDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-instances-parameter**
  
  If *geometryType* is **VK_GEOMETRY_TYPE_INSTANCES_KHR**, the *instances* member of *geometry* must be a valid **VkAccelerationStructureGeometryInstancesDataKHR** structure

- **VUID-VkAccelerationStructureGeometryKHR-flags-parameter**
  
  *flags* must be a valid combination of **VkGeometryFlagBitsKHR** values

---

The **VkAccelerationStructureGeometryDataKHR** union is defined as:

// Provided by VK_KHR_acceleration_structure
typedef union VkAccelerationStructureGeometryDataKHR {
• **triangles** is a `VkAccelerationStructureGeometryTrianglesDataKHR` structure.
• **aabbs** is a `VkAccelerationStructureGeometryAabbsDataKHR` structure.
• **instances** is a `VkAccelerationStructureGeometryInstancesDataKHR` structure.

The `VkAccelerationStructureGeometryTrianglesDataKHR` structure is defined as:

```c
typedef struct VkAccelerationStructureGeometryTrianglesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkFormat vertexFormat;
    VkDeviceOrHostAddressConstKHR vertexData;
    VkDeviceSize vertexStride;
    uint32_t maxVertex;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexData;
    VkDeviceOrHostAddressConstKHR transformData;
} VkAccelerationStructureGeometryTrianglesDataKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **vertexFormat** is the `VkFormat` of each vertex element.
- **vertexData** is a device or host address to memory containing vertex data for this geometry.
- **maxVertex** is the highest index of a vertex that will be addressed by a build command using this structure.
- **vertexStride** is the stride in bytes between each vertex.
- **indexType** is the `VkIndexType` of each index element.
- **indexData** is a device or host address to memory containing index data for this geometry.
- **transformData** is a device or host address to memory containing an optional reference to a `VkTransformMatrixKHR` structure describing a transformation from the space in which the vertices in this geometry are described to the space in which the acceleration structure is defined.

**Note**

Unlike the stride for vertex buffers in `VkVertexInputBindingDescription` for graphics pipelines which must not exceed `maxVertexInputBindingStride`, `vertexStride` for acceleration structure geometry is instead restricted to being a 32-bit value.
Valid Usage

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03735
  vertexStride must be a multiple of the size in bytes of the smallest component of vertexFormat.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexStride-03819
  vertexStride must be less than or equal to \(2^{32}-1\).

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-03797
  The format features of vertexFormat must contain VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-03798
  indexType must be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_KHR.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_TRIANGLES_DATA_KHR.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of
  VkAccelerationStructureGeometryMotionTrianglesDataNV, VkAccelerationStructureTrianglesDisplacementMicromapNV, or
  VkAccelerationStructureTrianglesOpacityMicromapEXT.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value.

• VUID-VkAccelerationStructureGeometryTrianglesDataKHR-indexType-parameter
  indexType must be a valid VkIndexType value.

The VkAccelerationStructureGeometryMotionTrianglesDataNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureGeometryMotionTrianglesDataNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR vertexData;
} VkAccelerationStructureGeometryMotionTrianglesDataNV;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.
• vertexData is a pointer to vertex data for this geometry at time 1.0

If VkAccelerationStructureGeometryMotionTrianglesDataNV is included in the pNext chain of a VkAccelerationStructureGeometryTrianglesDataKHR structure, the basic vertex positions are used for the position of the triangles in the geometry at time 0.0 and the vertexData in VkAccelerationStructureGeometryMotionTrianglesDataNV is used for the vertex positions at time 1.0, with positions linearly interpolated at intermediate times.

Indexing for VkAccelerationStructureGeometryMotionTrianglesDataNV vertexData is equivalent to the basic vertex position data.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureGeometryMotionTrianglesDataNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_MOTION_TRIANGLES_DATA_NV

The VkAccelerationStructureTrianglesOpacityMicromapEXT structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkAccelerationStructureTrianglesOpacityMicromapEXT {
    VkStructureType sType;
    void* pNext;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesOpacityMicromapEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• indexType is the type of triangle indices used when indexing this micromap
• indexBuffer is the address containing the triangle indices
• indexStride is the byte stride between triangle indices
• baseTriangle is the base value added to the non-negative triangle indices
• usageCountsCount specifies the number of usage counts structures that will be used to determine the size of this micromap.
• pUsageCounts is a pointer to an array of VkMicromapUsageEXT structures.
• ppUsageCounts is a pointer to an array of pointers to VkMicromapUsageEXT structures.
• micromap is the handle to the micromap object to include in this geometry
If `VkAccelerationStructureTrianglesOpacityMicromapEXT` is included in the `pNext` chain of a `VkAccelerationStructureGeometryTrianglesDataKHR` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. If that value is the unsigned cast of one of the values from `VkOpacityMicromapSpecialIndexEXT` then that triangle behaves as described for that special value in Ray Opacity Micromap. Otherwise that triangle uses the opacity micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`. The elements of the non-NULL array describe the total count used to build this geometry. For a given format and subdivisionLevel the number of triangles in this geometry matching those values after indirection and special index handling must be equal to the sum of matching count provided.

If `micromap` is `VK_NULL_HANDLE`, then every value read from `indexBuffer` must be one of the values in `VkOpacityMicromapSpecialIndexEXT`.

### Valid Usage

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-07335
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be `NULL`.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_OPACITY_MICROMAP_EXT`.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-indexType-parameter
  `indexType` must be a valid `VkIndexType` value.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-pUsageCounts-parameter
  If `usageCountsCount` is not 0, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-ppUsageCounts-parameter
  If `usageCountsCount` is not 0, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.

- VUID-VkAccelerationStructureTrianglesOpacityMicromapEXT-micromap-parameter
  If `micromap` is not `VK_NULL_HANDLE`, `micromap` must be a valid `VkMicromapEXT` handle.

The `VkOpacityMicromapSpecialIndexEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapSpecialIndexEXT {
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT = -1,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT = -2,
    VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT = -3,
};
```
• **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_TRANSPARENT_EXT** specifies that the entire triangle is fully transparent.

• **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_OPAQUE_EXT** specifies that the entire triangle is fully opaque.

• **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_TRANSPARENT_EXT** specifies that the entire triangle is unknown-transparent.

• **VK_OPACITY_MICROMAP_SPECIAL_INDEX_FULLY_UNKNOWN_OPAQUE_EXT** specifies that the entire triangle is unknown-opaque.

The **VkAccelerationStructureTrianglesDisplacementMicromapNV** structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
typedef struct VkAccelerationStructureTrianglesDisplacementMicromapNV {
    VkStructureType sType;
    void* pNext;
    VkFormat displacementBiasAndScaleFormat;
    VkFormat displacementVectorFormat;
    VkDeviceOrHostAddressConstKHR displacementBiasAndScaleBuffer;
    VkDeviceSize displacementBiasAndScaleStride;
    VkDeviceOrHostAddressConstKHR displacementVectorBuffer;
    VkDeviceSize displacementVectorStride;
    VkDeviceOrHostAddressConstKHR displacedMicromapPrimitiveFlags;
    VkDeviceSize displacedMicromapPrimitiveFlagsStride;
    VkIndexType indexType;
    VkDeviceOrHostAddressConstKHR indexBuffer;
    VkDeviceSize indexStride;
    uint32_t baseTriangle;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkMicromapEXT micromap;
} VkAccelerationStructureTrianglesDisplacementMicromapNV;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **displacementBiasAndScaleFormat** is the format of displacement bias and scale used in this displacement micromap reference.

• **displacementVectorFormat** is the format of displacement vector used in this displacement micromap reference.

• **displacementBiasAndScaleBuffer** is the address containing the bias and scale.

• **displacementBiasAndScaleStride** is the byte stride between bias and scale values.

• **displacementVectorBuffer** is the address containing the displacement vector values.
• `displacementVectorStride` is the byte stride between displacement vector values.
• `displacedMicromapPrimitiveFlags` is the address containing the primitive flags.
• `displacedMicromapPrimitiveFlagsStride` is the byte stride between primitive flag values.
• `indexType` is the type of triangle indices used when indexing this micromap.
• `indexBuffer` is the address containing the triangle indices.
• `indexStride` is the byte stride between triangle indices.
• `baseTriangle` is the base value added to the non-negative triangle indices.
• `usageCountsCount` specifies the number of usage counts structures that will be used to determine the size of this micromap.
• `pUsageCounts` is a pointer to an array of `VkMicromapUsageEXT` structures.
• `ppUsageCounts` is a pointer to an array of pointers to `VkMicromapUsageEXT` structures.
• `micromap` is the handle to the micromap object to include in this geometry.

If ` VkAccelerationStructureTrianglesDisplacementMicromapNV ` is included in the `pNext` chain of a ` VkAccelerationStructureGeometryTrianglesDataKHR ` structure, that geometry will reference that micromap.

For each triangle in the geometry, the acceleration structure build fetches an index from `indexBuffer` using `indexType` and `indexStride`. That triangle uses the displacement micromap information from `micromap` at that index plus `baseTriangle`.

Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be NULL. The elements of the non-NULL array describe the total count used to build this geometry. For a given format and subdivisionLevel the number of triangles in this geometry matching those values after indirection must be equal to the sum of matching count provided.

### Valid Usage

- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementBiasAndScaleFormat-09501**
  `displacementBiasAndScaleFormat` must not be `VK_FORMAT_UNDEFINED`

- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-displacementVectorFormat-09502**
  `displacementVectorFormat` must not be `VK_FORMAT_UNDEFINED`

- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-07992**
  Only one of `pUsageCounts` or `ppUsageCounts` can be a valid pointer, the other must be NULL

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_TRIANGLES_DISPLACEMENT_MICROMAP_NV`
• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-
displacementBiasAndScaleFormat-parameter
displacementBiasAndScaleFormat must be a valid VkFormat value

• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-
displacementVectorFormat-parameter
displacementVectorFormat must be a valid VkFormat value

• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-indexType-parameter
indexType must be a valid VkIndexType value

• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-pUsageCounts-
parameter
If usageCountsCount is not 0, and pUsageCounts is not NULL, pUsageCounts must be a valid
pointer to an array of usageCountsCount VkMicromapUsageEXT structures

• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-ppUsageCounts-
parameter
If usageCountsCount is not 0, and ppUsageCounts is not NULL, ppUsageCounts must be a valid
pointer to an array of usageCountsCount valid pointers to VkMicromapUsageEXT structures

• VUID-VkAccelerationStructureTrianglesDisplacementMicromapNV-micromap-parameter
If micromap is not VK_NULL_HANDLE, micromap must be a valid VkMicromapEXT handle

The VkTransformMatrixKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkTransformMatrixKHR {
    float matrix[3][4];
} VkTransformMatrixKHR;
```
or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkTransformMatrixKHR VkTransformMatrixNV;
```

• matrix is a 3x4 row-major affine transformation matrix.

Valid Usage

• VUID-VkTransformMatrixKHR-matrix-03799
The first three columns of matrix must define an invertible 3x3 matrix

The VkAccelerationStructureGeometryAabbsDataKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryAabbsDataKHR {
    VkStructureType sType;
```
```c
const void* pNext;
VkDeviceOrHostAddressConstKHR data;
VkDeviceSize stride;
} VkAccelerationStructureGeometryAabbsDataKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **data** is a device or host address to memory containing `VkAabbPositionsKHR` structures containing position data for each axis-aligned bounding box in the geometry.
- **stride** is the stride in bytes between each entry in `data`. The stride must be a multiple of 8.

### Valid Usage

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03545
  
  **stride** must be a multiple of 8

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-stride-03820
  
  **stride** must be less than or equal to \(2^{32}-1\)

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_AABB_DATA_KHR`

- VUID-VkAccelerationStructureGeometryAabbsDataKHR-pNext-pNext
  
  **pNext** must be `NULL`.

The `VkAabbPositionsKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAabbPositionsKHR {
    float minX;
    float minY;
    float minZ;
    float maxX;
    float maxY;
    float maxZ;
} VkAabbPositionsKHR;
```

or the equivalent,

```c
// Provided by VK_NV_ray_tracing
typedef VkAabbPositionsKHR VKAabbPositionsNV;
```
- \textit{minX} is the x position of one opposing corner of a bounding box.
- \textit{minY} is the y position of one opposing corner of a bounding box.
- \textit{minZ} is the z position of one opposing corner of a bounding box.
- \textit{maxX} is the x position of the other opposing corner of a bounding box.
- \textit{maxY} is the y position of the other opposing corner of a bounding box.
- \textit{maxZ} is the z position of the other opposing corner of a bounding box.

### Valid Usage

- VUID-VkAabbPositionsKHR-minX-03546
  \textit{minX} must be less than or equal to \textit{maxX}
- VUID-VkAabbPositionsKHR-minY-03547
  \textit{minY} must be less than or equal to \textit{maxY}
- VUID-VkAabbPositionsKHR-minZ-03548
  \textit{minZ} must be less than or equal to \textit{maxZ}

The \texttt{VkAccelerationStructureGeometryInstancesDataKHR} structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureGeometryInstancesDataKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 arrayOfPointers;
    VkDeviceOrHostAddressConstKHR data;
} VkAccelerationStructureGeometryInstancesDataKHR;
```

- \textit{sType} is a \texttt{VkStructureType} value identifying this structure.
- \textit{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \textit{arrayOfPointers} specifies whether \textit{data} is used as an array of addresses or just an array.
- \textit{data} is either the address of an array of device or host addresses referencing individual \texttt{VkAccelerationStructureInstanceKHR} structures or packed motion instance information as described in motion instances if \textit{arrayOfPointers} is \texttt{VK_TRUE}, or the address of an array of \texttt{VkAccelerationStructureInstanceKHR} or \texttt{VkAccelerationStructureMotionInstanceNV} structures. Addresses and \texttt{VkAccelerationStructureInstanceKHR} structures are tightly packed. \texttt{VkAccelerationStructureMotionInstanceNV} structures have a stride of 160 bytes.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureGeometryInstancesDataKHR-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_GEOMETRY_INSTANCES_DATA_KHR}
- VUID-VkAccelerationStructureGeometryInstancesDataKHR-pNext-pNext
  \textit{pNext} must be \texttt{NULL}
Acceleration structure instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location. Multiple instances can point to the same bottom level acceleration structure.

An acceleration structure instance is defined by the structure:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureInstanceKHR {
    VkTransformMatrixKHR transform;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureInstanceKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureInstanceKHR VkAccelerationStructureInstanceNV;
```

- **transform** is a `VkTransformMatrixKHR` structure describing a transformation to be applied to the acceleration structure.

- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the `InstanceCustomIndexKHR` built-in.

- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if `Cull Mask & instance.mask != 0`

- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.

- **flags** is an 8-bit mask of `VkGeometryInstanceFlagBitsKHR` values to apply to this instance.

- **accelerationStructureReference** is either:
  - a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
  - a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- **instanceCustomIndex** and **mask** occupy the same memory as if a single `uint32_t` was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
• mask occupies the 8 most significant bits of that memory
• instanceShaderBindingTableRecordOffset and flags occupy the same memory as if a single
  uint32_t was specified in their place
• instanceShaderBindingTableRecordOffset occupies the 24 least significant bits of that memory
• flags occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another
method to set values according to the correct bit pattern.

## Valid Usage (Implicit)

- VUID-VkAccelerationStructureInstanceKHR-flags-parameter
  - flags must be a valid combination of VkGeometryInstanceFlagBitsKHR values

Possible values of flags in the instance modifying the behavior of that instance are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryInstanceFlagBitsKHR {
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR = 0x00000002,
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR = 0x00000004,
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR = 0x00000008,
    // Provided by VK_EXT_opaque_micromap
    VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT = 0x00000010,
    // Provided by VK_EXT_opaque_micromap
    VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT = 0x00000020,
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR =
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_CULL_DISABLE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_NV =
    VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_NV =
    VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR,
} VkGeometryInstanceFlagBitsKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagBitsKHR VkGeometryInstanceFlagBitsNV;
```
• VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR disables face culling for this instance.

• VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR indicates that the facing determination for geometry in this instance is inverted. Because the facing is determined in object space, an instance transform does not change the winding, but a geometry transform does.

• VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V NoOpaqueKHR ray flag.

• VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR causes this instance to act as though VK_GEOMETRY_OPAQUE_BIT_KHR were not specified on all geometries referenced by this instance. This behavior can be overridden by the SPIR-V OpaqueKHR ray flag.

VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR and VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR must not be used in the same flag.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryInstanceFlagsKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkGeometryInstanceFlagsKHR VkGeometryInstanceFlagsNV;
```

VkGeometryInstanceFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryInstanceFlagBitsKHR.

Acceleration structure motion instances can be built into top-level acceleration structures. Each acceleration structure instance is a separate entry in the top-level acceleration structure which includes all the geometry of a bottom-level acceleration structure at a transformed location including a type of motion and parameters to determine the motion of the instance over time.

An acceleration structure motion instance is defined by the structure:

```
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInstanceNV {
    VkAccelerationStructureMotionInstanceTypeNV type;
    VkAccelerationStructureMotionInstanceFlagsNV flags;
    VkAccelerationStructureMotionInstanceDataNV data;
} VkAccelerationStructureMotionInstanceNV;
```

• type is a VkAccelerationStructureMotionInstanceTypeNV enumerant identifying which type of motion instance this is and which type of the union is valid.

• flags is currently unused, but is required to keep natural alignment of data.

• data is a VkAccelerationStructureMotionInstanceDataNV containing motion instance data for
this instance.

Note
If writing this other than with a standard C compiler, note that the final structure should be 152 bytes in size.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureMotionInstanceNV-type-parameter
type must be a valid VkAccelerationStructureMotionInstanceTypeNV value

• VUID-VkAccelerationStructureMotionInstanceNV-flags-zerobitmask
flags must be 0

• VUID-VkAccelerationStructureMotionInstanceNV-staticInstance-parameter
If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV, the staticInstance member of data must be a valid VkAccelerationStructureInstanceKHR structure

• VUID-VkAccelerationStructureMotionInstanceNV-matrixMotionInstance-parameter
If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV, the matrixMotionInstance member of data must be a valid VkAccelerationStructureMatrixMotionInstanceNV structure

• VUID-VkAccelerationStructureMotionInstanceNV-srtMotionInstance-parameter
If type is VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV, the srtMotionInstance member of data must be a valid VkAccelerationStructureSRTMotionInstanceNV structure

Acceleration structure motion instance is defined by the union:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef union VkAccelerationStructureMotionInstanceDataNV {
    VkAccelerationStructureInstanceKHR staticInstance;
    VkAccelerationStructureMatrixMotionInstanceNV matrixMotionInstance;
    VkAccelerationStructureSRTMotionInstanceNV srtMotionInstance;
} VkAccelerationStructureMotionInstanceDataNV;
```

• staticInstance is a VkAccelerationStructureInstanceKHR structure containing data for a static instance.

• matrixMotionInstance is a VkAccelerationStructureMatrixMotionInstanceNV structure containing data for a matrix motion instance.

• srtMotionInstance is a VkAccelerationStructureSRTMotionInstanceNV structure containing data for an SRT motion instance.

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInstanceFlagsNV;
```
VkAccelerationStructureMotionInstanceFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

The VkAccelerationStructureMotionInstanceTypeNV enumeration is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef enum VkAccelerationStructureMotionInstanceTypeNV {
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV = 0,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV = 1,
    VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV = 2,
} VkAccelerationStructureMotionInstanceTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_STATIC_NV** specifies that the instance is a static instance with no instance motion.
- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_MATRIX_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation between two matrices.
- **VK_ACCELERATION_STRUCTURE_MOTION_INSTANCE_TYPE_SRT_MOTION_NV** specifies that the instance is a motion instance with motion specified by interpolation in the SRT decomposition.

An acceleration structure matrix motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMatrixMotionInstanceNV {
    VkTransformMatrixKHR transformT0;
    VkTransformMatrixKHR transformT1;
    uint32_t instanceCustomIndex:24;
    uint32_t mask:8;
    uint32_t instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR flags:8;
    uint64_t accelerationStructureReference;
} VkAccelerationStructureMatrixMotionInstanceNV;
```

- **transformT0** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 0.
- **transformT1** is a VkTransformMatrixKHR structure describing a transformation to be applied to the acceleration structure at time 1.
- **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.
- **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask & instance.mask != 0
- **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.
- **flags** is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.
- **accelerationStructureReference** is either:
- a device address containing the value obtained from `vkGetAccelerationStructureDeviceAddressKHR` or `vkGetAccelerationStructureHandleNV` (used by device operations which reference acceleration structures) or,
- a `VkAccelerationStructureKHR` object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

- `instanceCustomIndex` and `mask` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceCustomIndex` occupies the 24 least significant bits of that memory
  - `mask` occupies the 8 most significant bits of that memory
- `instanceShaderBindingTableRecordOffset` and `flags` occupy the same memory as if a single `uint32_t` was specified in their place
  - `instanceShaderBindingTableRecordOffset` occupies the 24 least significant bits of that memory
  - `flags` occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications **must** employ another method to set values according to the correct bit pattern.

The transform for a matrix motion instance at a point in time is derived by component-wise linear interpolation of the two transforms. That is, for a `time` in [0,1] the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

### Valid Usage (Implicit)

- `VUID-VkAccelerationStructureMatrixMotionInstanceNV-flags-parameter`
  - `flags` **must** be a valid combination of `VkGeometryInstanceFlagBitsKHR` values

An acceleration structure SRT motion instance is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureSRTMotionInstanceNV {
    VKSRTDataNV                 transformT0;
    VKSRTDataNV                 transformT1;
    uint32_t                    instanceCustomIndex:24;
    uint32_t                    mask:8;
    uint32_t                    instanceShaderBindingTableRecordOffset:24;
    VkGeometryInstanceFlagsKHR  flags:8;
    uint64_t                    accelerationStructureReference;
} VkAccelerationStructureSRTMotionInstanceNV;
```
• **transformT0** is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 0.

• **transformT1** is a VkSRTDataNV structure describing a transformation to be applied to the acceleration structure at time 1.

• **instanceCustomIndex** is a 24-bit user-specified index value accessible to ray shaders in the InstanceCustomIndexKHR built-in.

• **mask** is an 8-bit visibility mask for the geometry. The instance may only be hit if Cull Mask \& instance.mask \(!= 0\)

• **instanceShaderBindingTableRecordOffset** is a 24-bit offset used in calculating the hit shader binding table index.

• **flags** is an 8-bit mask of VkGeometryInstanceFlagBitsKHR values to apply to this instance.

• **accelerationStructureReference** is either:
  - a device address containing the value obtained from vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV (used by device operations which reference acceleration structures) or,
  - a VkAccelerationStructureKHR object (used by host operations which reference acceleration structures).

The C language specification does not define the ordering of bit-fields, but in practice, this struct produces the correct layout with existing compilers. The intended bit pattern is for the following:

• **instanceCustomIndex** and **mask** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceCustomIndex** occupies the 24 least significant bits of that memory
  - **mask** occupies the 8 most significant bits of that memory

• **instanceShaderBindingTableRecordOffset** and **flags** occupy the same memory as if a single uint32_t was specified in their place
  - **instanceShaderBindingTableRecordOffset** occupies the 24 least significant bits of that memory
  - **flags** occupies the 8 most significant bits of that memory

If a compiler produces code that diverges from that pattern, applications must employ another method to set values according to the correct bit pattern.

The transform for a SRT motion instance at a point in time is derived from component-wise linear interpolation of the two SRT transforms. That is, for a time in \([0, 1]\) the resulting transform is

\[
\text{transformT0} \times (1 - \text{time}) + \text{transformT1} \times \text{time}
\]

---

**Valid Usage (Implicit)**

- VUID-VkAccelerationStructureSRTMotionInstanceNV-flags-parameter
  - **flags** must be a valid combination of VkGeometryInstanceFlagBitsKHR values
An acceleration structure SRT transform is defined by the structure:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkSRTDataNV {
    float    sx;
    float    a;
    float    b;
    float    pvx;
    float    sy;
    float    c;
    float    pvy;
    float    sz;
    float    pvz;
    float    qx;
    float    qy;
    float    qz;
    float    qw;
    float    tx;
    float    ty;
    float    tz;
} VkSRTDataNV;
```

- `sx` is the x component of the scale of the transform
- `a` is one component of the shear for the transform
- `b` is one component of the shear for the transform
- `pvx` is the x component of the pivot point of the transform
- `sy` is the y component of the scale of the transform
- `c` is one component of the shear for the transform
- `pvy` is the y component of the pivot point of the transform
- `sz` is the z component of the scale of the transform
- `pvz` is the z component of the pivot point of the transform
- `qx` is the x component of the rotation quaternion
- `qy` is the y component of the rotation quaternion
- `qz` is the z component of the rotation quaternion
- `qw` is the w component of the rotation quaternion
- `tx` is the x component of the post-rotation translation
- `ty` is the y component of the post-rotation translation
- `tz` is the z component of the post-rotation translation

This transform decomposition consists of three elements. The first is a matrix $S$, consisting of a scale, shear, and translation, usually used to define the pivot point of the following rotation. This matrix is constructed from the parameters above by:
The rotation quaternion is defined as:

\[
R = [qx, qy, qz, qw]
\]

This is a rotation around a conceptual normalized axis \([ax, ay, az]\) of amount \(\theta\) such that:

\[
[qx, qy, qz] = \sin(\theta/2) \times [ax, ay, az]
\]

and

\[
qw = \cos(\theta/2)
\]

Finally, the transform has a translation \(T\) constructed from the parameters above by:

\[
T = \begin{pmatrix}
1 & 0 & 0 & tx \\
0 & 1 & 0 & ty \\
0 & 0 & 1 & tz
\end{pmatrix}
\]

The effective derived transform is then given by

\[T \times R \times S\]

\texttt{VkAccelerationStructureBuildRangeInfoKHR} is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildRangeInfoKHR {
    uint32_t primitiveCount;
    uint32_t primitiveOffset;
    uint32_t firstVertex;
    uint32_t transformOffset;
} VkAccelerationStructureBuildRangeInfoKHR;
```

- \texttt{primitiveCount} defines the number of primitives for a corresponding acceleration structure geometry.
- \texttt{primitiveOffset} defines an offset in bytes into the memory where primitive data is defined.
- \texttt{firstVertex} is the index of the first vertex to build from for triangle geometry.
- \texttt{transformOffset} defines an offset in bytes into the memory where a transform matrix is defined.

The primitive count and primitive offset are interpreted differently depending on the \texttt{VkGeometryTypeKHR} used.
For geometries of type \texttt{VK\_GEOMETRY\_TYPE\__TRIANGLES\_KHR}, \texttt{primitiveCount} is the number of triangles to be built, where each triangle is treated as 3 vertices.

- If the geometry uses indices, \texttt{primitiveCount} \times 3 indices are consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::indexData}, starting at an offset of \texttt{primitiveOffset}. The value of \texttt{firstVertex} is added to the index values before fetching vertices.

- If the geometry does not use indices, \texttt{primitiveCount} \times 3 vertices are consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexData}, starting at an offset of \texttt{primitiveOffset} + \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexStride} \times \texttt{firstVertex}.

- If \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::transformData} is not \texttt{NULL}, a single \texttt{VkTransformMatrixKHR} structure is consumed from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::transformData}, at an offset of \texttt{transformOffset}. This matrix describes a transformation from the space in which the vertices for all triangles in this geometry are described to the space in which the acceleration structure is defined.

For geometries of type \texttt{VK\_GEOMETRY\_TYPE\_AABB\_KHR}, \texttt{primitiveCount} is the number of axis-aligned bounding boxes. \texttt{primitiveCount} \texttt{VkAabbPositionsKHR} structures are consumed from \texttt{VkAccelerationStructureGeometryAabbsDataKHR::data}, starting at an offset of \texttt{primitiveOffset}.

For geometries of type \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR}, \texttt{primitiveCount} is the number of acceleration structures. \texttt{primitiveCount} \texttt{VkAccelerationStructureInstanceKHR} or \texttt{VkAccelerationStructureMotionInstanceNV} structures are consumed from \texttt{VkAccelerationStructureGeometryInstancesDataKHR::data}, starting at an offset of \texttt{primitiveOffset}.

### Valid Usage

- \texttt{VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03656}
  For geometries of type \texttt{VK\_GEOMETRY\_TYPE\__TRIANGLES\_KHR}, if the geometry uses indices, the offset \texttt{primitiveOffset} from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::indexData} must be a multiple of the element size of \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::indexType}

- \texttt{VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03657}
  For geometries of type \texttt{VK\_GEOMETRY\_TYPE\__TRIANGLES\_KHR}, if the geometry does not use indices, the offset \texttt{primitiveOffset} from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexData} must be a multiple of the component size of \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat}

- \texttt{VUID-VkAccelerationStructureBuildRangeInfoKHR-transformOffset-03658}
  For geometries of type \texttt{VK\_GEOMETRY\_TYPE\__TRIANGLES\_KHR}, the offset \texttt{transformOffset} from \texttt{VkAccelerationStructureGeometryTrianglesDataKHR::transformData} must be a multiple of 16

- \texttt{VUID-VkAccelerationStructureBuildRangeInfoKHR-primitiveOffset-03659}
  For geometries of type \texttt{VK\_GEOMETRY\_TYPE\_AABB\_KHR}, the offset \texttt{primitiveOffset} from \texttt{VkAccelerationStructureGeometryAabbsDataKHR::data} must be a multiple of 8
37.1.7. Copying Acceleration Structures

An additional command exists for copying acceleration structures without updating their contents. The acceleration structure object can be compacted in order to improve performance. Before copying, an application must query the size of the resulting acceleration structure.

To query acceleration structure size parameters call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdWriteAccelerationStructuresPropertiesKHR(
    VkCommandBuffer commandBuffer,  // The command buffer into which the command will be recorded.
    uint32_t accelerationStructureCount,  // The count of acceleration structures for which to query the property.
    const VkAccelerationStructureKHR* pAccelerationStructures,  // A pointer to an array of existing previously built acceleration structures.
    VkQueryType queryType,  // A VkQueryType value specifying the type of queries managed by the pool.
   VkQueryPool queryPool,  // The query pool that will manage the results of the query.
    uint32_t firstQuery);  // The first query index within the query pool that will contain the accelerationStructureCount number of results.
```

Accesses to any of the acceleration structures listed in pAccelerationStructures must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR.

- If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, then the value written out is the number of bytes required by a compacted acceleration structure.
- If queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR, then the value written out is the number of bytes required by a serialized acceleration structure.

Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructure-08924
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature
must be enabled

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02493
  queryPool must have been created with a queryType matching queryType

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-02494
  The queries identified by queryPool and firstQuery must be unavailable

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-buffer-03736
  The buffer used to create each acceleration structure in pAccelerationStructures must be bound to device memory

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-query-04880
  The sum of firstQuery plus accelerationStructureCount must be less than or equal to the number of queries in queryPool

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964
  All acceleration structures in pAccelerationStructures must have been built prior to the execution of this command

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431
  All acceleration structures in pAccelerationStructures must have been built with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR if queryType is VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-06742
  queryType must be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR, VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR, VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR, or VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR

Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid VkAccelerationStructureKHR handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryType-parameter
  queryType must be a valid VkQueryType value

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

• VUID-vkCmdWriteAccelerationStructuresPropertiesKHR-commonparent
  Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

To query acceleration structure size parameters call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdWriteAccelerationStructuresPropertiesNV(
    VkCommandBuffer commandBuffer,
    uint32_t accelerationStructureCount,
    const VkAccelerationStructureNV* pAccelerationStructures,
    VkQueryType queryType,
    VkQueryPool queryPool,
    uint32_t firstQuery);
```

• commandBuffer is the command buffer into which the command will be recorded.

• accelerationStructureCount is the count of acceleration structures for which to query the property.

• pAccelerationStructures is a pointer to an array of existing previously built acceleration structures.

• queryType is a VkQueryType value specifying the type of queries managed by the pool.
• **queryPool** is the query pool that will manage the results of the query.

• **firstQuery** is the first query index within the query pool that will contain the **accelerationStructureCount** number of results.

Accesses to any of the acceleration structures listed in **pAccelerationStructures** **must** be synchronized with the **VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR** pipeline stage and an access type of **VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR**.

---

### Valid Usage

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03755
  - **queryPool** **must** have been created with a **queryType** matching **queryType**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-03756
  - The queries identified by **queryPool** and **firstQuery** **must** be **unavailable**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructure-03757
  - **accelerationStructure** **must** be bound completely and contiguously to a single **VkDeviceMemory** object via **vkBindAccelerationStructureMemoryNV**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-04958
  - All acceleration structures in **pAccelerationStructures** **must** have been built prior to the execution of this command

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-06215
  - All acceleration structures in **pAccelerationStructures** **must** have been built with **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** if **queryType** is **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-06216
  - **queryType** **must** be **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV**

---

### Valid Usage (Implicit)

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-parameter
  - **commandBuffer** **must** be a valid **VkCommandBuffer** handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-pAccelerationStructures-parameter
  - **pAccelerationStructures** **must** be a valid pointer to an array of **accelerationStructureCount** valid **VkAccelerationStructureNV** handles

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryType-parameter
  - **queryType** **must** be a valid **VkQueryType** value

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-queryPool-parameter
  - **queryPool** **must** be a valid **VkQueryPool** handle

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-recording
  - **commandBuffer** **must** be in the **recording state**

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

- VUID-vkCmdWriteAccelerationStructuresPropertiesNV-commonparent
  Each of commandBuffer, queryPool, and the elements of pAccelerationStructures must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</table>

To copy an acceleration structure call:

```c
// Provided by VK_NV_ray_tracing
void vkCmdCopyAccelerationStructureNV(
    VkCommandBuffer commandBuffer,
    VkAccelerationStructureNV dst,
    VkAccelerationStructureNV src,
    VkCopyAccelerationStructureModeKHR mode);
```

- commandBuffer is the command buffer into which the command will be recorded.
- dst is the target acceleration structure for the copy.
- src is the source acceleration structure for the copy.
- mode is a VkCopyAccelerationStructureModeKHR value specifying additional operations to perform during the copy.
Accesses to src and dst must be synchronized with the 
VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the 
VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of 
VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR or VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR as appropriate.

Valid Usage

- VUID-vkCmdCopyAccelerationStructureNV-mode-03410
  mode must be VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR or 
  VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR

- VUID-vkCmdCopyAccelerationStructureNV-src-04963
  The source acceleration structure src must have been constructed prior to the execution of this command

- VUID-vkCmdCopyAccelerationStructureNV-src-03411
  If mode is VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR, src must have been 
  constructed with VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR in the build

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03718
  The buffer used to create src must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureNV-buffer-03719
  The buffer used to create dst must be bound to device memory

- VUID-vkCmdCopyAccelerationStructureNV-dst-07791
  The range of memory backing dst that is accessed by this command must not overlap the 
  memory backing src that is accessed by this command

- VUID-vkCmdCopyAccelerationStructureNV-dst-07792
  dst must be bound completely and contiguously to a single VkDeviceMemory object via 
vkBindAccelerationStructureMemoryNV

Valid Usage (Implicit)

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyAccelerationStructureNV-dst-parameter
  dst must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdCopyAccelerationStructureNV-src-parameter
  src must be a valid VkAccelerationStructureNV handle

- VUID-vkCmdCopyAccelerationStructureNV-mode-parameter
  mode must be a valid VkCopyAccelerationStructureModeKHR value

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyAccelerationStructureNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute
To copy an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureInfoKHR` structure defining the copy operation.

This command copies the `pInfo->src` acceleration structure to the `pInfo->dst` acceleration structure in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR` or `VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR` as appropriate.
Valid Usage

• VUID-vkCmdCopyAccelerationStructureKHR-accelerationStructure-08925
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

• VUID-vkCmdCopyAccelerationStructureKHR-buffer-03737
  The buffer used to create pInfo->src must be bound to device memory

• VUID-vkCmdCopyAccelerationStructureKHR-buffer-03738
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

• VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

• VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyAccelerationStructureKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdCopyAccelerationStructureKHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyAccelerationStructureKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>
The `VkCopyAccelerationStructureInfoKHR` structure is defined as:

```c
typedef struct VkCopyAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source acceleration structure for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-03410**
  
  `mode` must be `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` or `VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR`.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-04963**
  
  The source acceleration structure `src` must have been constructed prior to the execution of this command.

- **VUID-VkCopyAccelerationStructureInfoKHR-src-03411**
  
  If `mode` is `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR`, `src` must have been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` in the build.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03718**
  
  The buffer used to create `src` must be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-buffer-03719**
  
  The buffer used to create `dst` must be bound to device memory.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-07791**
  
  The range of memory backing `dst` that is accessed by this command must not overlap the memory backing `src` that is accessed by this command.

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-07792**
  
  `dst` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.
Valid Usage (Implicit)

- **VUID-VkCopyAccelerationStructureInfoKHR-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_INFO_KHR`

- **VUID-VkCopyAccelerationStructureInfoKHR-pNext-pNext**
  
  *pNext* must be `NULL`

- **VUID-VkCopyAccelerationStructureInfoKHR-src-parameter**
  
  *src* must be a valid `VkAccelerationStructureKHR` handle

- **VUID-VkCopyAccelerationStructureInfoKHR-dst-parameter**
  
  *dst* must be a valid `VkAccelerationStructureKHR` handle

- **VUID-VkCopyAccelerationStructureInfoKHR-mode-parameter**
  
  *mode* must be a valid `VkCopyAccelerationStructureModeKHR` value

- **VUID-VkCopyAccelerationStructureInfoKHR-commonparent**
  
  Both of *dst*, and *src* must have been created, allocated, or retrieved from the same `VkDevice`

Possible values of *mode* specifying additional operations to perform during the copy, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkCopyAccelerationStructureModeKHR {
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR = 0,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR = 1,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR = 2,
    VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR = 3,
// Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_NV =
    VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR,
// Provided by VK_NV_ray_tracing
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_NV =
    VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR,
} VkCopyAccelerationStructureModeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkCopyAccelerationStructureModeKHR VkCopyAccelerationStructureModeNV;
```

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_CLONE_KHR** creates a direct copy of the acceleration structure specified in *src* into the one specified by *dst*. The *dst* acceleration structure must have been created with the same parameters as *src*. If *src* contains references to other acceleration structures, *dst* will reference the same acceleration structures.

- **VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR** creates a more compact version of an acceleration structure *src* into *dst*. The acceleration structure *dst* must have been created with
a size at least as large as that returned by `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` after the build of the acceleration structure specified by `src`. If `src` contains references to other acceleration structures, `dst` will reference the same acceleration structures.

- `VK_COPY_ACCELERATION_STRUCTURE_MODE_SERIALIZE_KHR` serializes the acceleration structure to a semi-opaque format which can be reloaded on a compatible implementation.
- `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR` deserializes the semi-opaque serialization format in the buffer to the acceleration structure.

To copy an acceleration structure to device memory call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyAccelerationStructureToMemoryKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_ACCELERATION_STRUCTURE_READ_BIT_KHR`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR` pipeline stage or the `VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR` pipeline stage, and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as `vkCopyAccelerationStructureToMemoryKHR`, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using `vkGetDeviceAccelerationStructureCompatibilityKHR`
- A 64-bit integer of the total size matching the value queried using `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`
- A 64-bit integer of the deserialized size to be passed in to `VkAccelerationStructureCreateInfoKHR::size`
- A 64-bit integer of the count of the number of acceleration structure handles following. This value matches the value queried using
VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_BOTTOM_LEVEL.Pointers_KHR. This will be zero for a bottom-level acceleration structure. For top-level acceleration structures this number is implementation-dependent; the number of and ordering of the handles may not match the instance descriptions which were used to build the acceleration structure.

The corresponding handles matching the values returned by vkGetAccelerationStructureDeviceAddressKHR or vkGetAccelerationStructureHandleNV are tightly packed in the buffer following the count. The application is expected to store a mapping between those handles and the original application-generated bottom-level acceleration structures to provide when deserializing. The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-accelerationStructure-08926**
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03739**
  pInfo->dst.deviceAddress must be a valid device address for a buffer bound to device memory

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03740**
  pInfo->dst.deviceAddress must be aligned to 256 bytes

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-03741**
  If the buffer pointed to by pInfo->dst.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-None-03559**
  The buffer used to create pInfo->src must be bound to device memory

### Valid Usage (Implicit)

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-parameter**
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-pInfo-parameter**
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureToMemoryInfoKHR structure

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-recording**
  commandBuffer must be in the recording state

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyAccelerationStructureToMemoryKHR-videocoding**
  3217
This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>

</table>

### Provided by VK_KHR_acceleration_structure

```c
typedef struct VkCopyAccelerationStructureToMemoryInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAccelerationStructureKHR src;
  VkDeviceOrHostAddressKHR dst;
  VkCopyAccelerationStructureModeKHR mode;
} VkCopyAccelerationStructureToMemoryInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **src** is the source acceleration structure for the copy.
- **dst** is the device or host address to memory which is the target for the copy.
- **mode** is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-04959**
  The source acceleration structure `src` **must** have been constructed prior to the execution of this command.

- **VUID-VkCopyAccelerationStructureToMemoryInfoKHR-dst-03561**
  The memory pointed to by `dst` **must** be at least as large as the serialization size of `src`, as reported by `vkWriteAccelerationStructuresPropertiesKHR` or `vkCmdWriteAccelerationStructuresPropertiesKHR` with a query type of `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`. 
Valid Usage (Implicit)

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_ACCELERATION_STRUCTURE_TO_MEMORY_INFO_KHR

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-src-parameter
  src must be a valid VkAccelerationStructureKHR handle

- VUID-VkCopyAccelerationStructureToMemoryInfoKHR-mode-parameter
  mode must be a valid VkCopyAccelerationStructureModeKHR value

To copy device memory to an acceleration structure call:

```c
// Provided by VK_KHR_acceleration_structure
void vkCmdCopyMemoryToAccelerationStructureKHR(
    VkCommandBuffer commandBuffer,
    const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

Accesses to `pInfo->dst` must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_ACCELERATION_STRUCTURE_WRITE_BIT_KHR. Accesses to the buffer indicated by `pInfo->src.deviceAddress` must be synchronized with the VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE_COPY_BIT_KHR pipeline stage or the VK_PIPELINE_STAGE_ACCELERATION_STRUCTURE_BUILD_BIT_KHR pipeline stage, and an access type of VK_ACCESS_TRANSFER_READ_BIT.

This command can accept acceleration structures produced by either `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`.

The structure provided as input to deserialize is as described in `vkCmdCopyAccelerationStructureToMemoryKHR`, with any acceleration structure handles filled in with the newly-queried handles to bottom level acceleration structures created before deserialization. These do not need to be built at deserialize time, but must be created.
Valid Usage

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-accelerationStructure-08927
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure` feature must be enabled

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03742
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03743
  pInfo->src.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-03744
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-buffer-03745
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid `VkCopyMemoryToAccelerationStructureInfoKHR` structure

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMemoryToAccelerationStructureKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized
The `VkCopyMemoryToAccelerationStructureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkCopyMemoryToAccelerationStructureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkAccelerationStructureKHR dst;
    VkCopyAccelerationStructureModeKHR mode;
} VkCopyMemoryToAccelerationStructureInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target acceleration structure for the copy.
- `mode` is a `VkCopyAccelerationStructureModeKHR` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-src-04960**
  The source memory pointed to by `src` **must** contain data previously serialized using `vkCmdCopyAccelerationStructureToMemoryKHR`, potentially modified to relocate acceleration structure references as described in that command.

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-03413**
  `mode` **must** be `VK_COPY_ACCELERATION_STRUCTURE_MODE_DESERIALIZE_KHR`

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pInfo-03414**
  The data in `src` **must** have a format compatible with the destination physical device as returned by `vkGetDeviceAccelerationStructureCompatibilityKHR`

- **VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-03746**
  `dst` **must** have been created with a `size` greater than or equal to that used to serialize the data in `src`
Valid Usage (Implicit)

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-sType-sType
  *sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_ACCELERATION_STRUCTURE_INFO_KHR*

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-pNext-pNext
  *pNext must be NULL*

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-dst-parameter
  *dst must be a valid VkAccelerationStructureKHR handle*

- VUID-VkCopyMemoryToAccelerationStructureInfoKHR-mode-parameter
  *mode must be a valid VkCopyAccelerationStructureModeKHR value*

To check if a serialized acceleration structure is compatible with the current device call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetDeviceAccelerationStructureCompatibilityKHR(
    VkDevice device,
    const VkAccelerationStructureVersionInfoKHR* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- **device** is the device to check the version against.
- **pVersionInfo** is a pointer to a VkAccelerationStructureVersionInfoKHR structure specifying version information to check against the device.
- **pCompatibility** is a pointer to a VkAccelerationStructureCompatibilityKHR value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-accelerationStructure-08928
  *The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructure feature must be enabled*

Valid Usage (Implicit)

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-device-parameter
  *device must be a valid VkDevice handle*

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pVersionInfo-parameter
  *pVersionInfo must be a valid pointer to a valid VkAccelerationStructureVersionInfoKHR structure*

- VUID-vkGetDeviceAccelerationStructureCompatibilityKHR-pCompatibility-parameter
  *pCompatibility must be a valid pointer to a VkAccelerationStructureCompatibilityKHR value*
The `VkAccelerationStructureVersionInfoKHR` structure is defined as:

```c
typedef struct VkAccelerationStructureVersionInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkAccelerationStructureVersionInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pVersionData** is a pointer to the version header of an acceleration structure as defined in `vkCmdCopyAccelerationStructureToMemoryKHR`

**Note**

`pVersionData` is a pointer to an array of $2 \times \text{VK_UUID_SIZE}$ `uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized acceleration structure (via `vkCmdCopyAccelerationStructureToMemoryKHR` or `vkCopyAccelerationStructureToMemoryKHR`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

**Valid Usage (Implicit)**

- `VUID-VkAccelerationStructureVersionInfoKHR-sType-sType`
  **sType** must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_VERSION_INFO_KHR`
- `VUID-VkAccelerationStructureVersionInfoKHR-pNext-pNext`
  **pNext** must be `NULL`
- `VUID-VkAccelerationStructureVersionInfoKHR-pVersionData-parameter`
  **pVersionData** must be a valid pointer to an array of $2 \times \text{VK_UUID_SIZE}$ `uint8_t` values

Possible values of **pCompatibility** returned by `vkGetDeviceAccelerationStructureCompatibilityKHR` are:

```c
typedef enum VkAccelerationStructureCompatibilityKHR {
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR = 0,
    VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR = 1,
} VkAccelerationStructureCompatibilityKHR;
```

- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_COMPATIBLE_KHR` if the `pVersionData` version acceleration structure is compatible with device.
- `VK_ACCELERATION_STRUCTURE_COMPATIBILITY_INCOMPATIBLE_KHR` if the `pVersionData` version
acceleration structure is not compatible with device.

37.2. Host Acceleration Structure Operations

Implementations are also required to provide host implementations of the acceleration structure operations if the `accelerationStructureHostCommands` feature is enabled:

- `vkBuildAccelerationStructuresKHR` corresponding to `vkCmdBuildAccelerationStructuresKHR`
- `vkCopyAccelerationStructureKHR` corresponding to `vkCmdCopyAccelerationStructureKHR`
- `vkCopyAccelerationStructureToMemoryKHR` corresponding to `vkCmdCopyAccelerationStructureToMemoryKHR`
- `vkCopyMemoryToAccelerationStructureKHR` corresponding to `vkCmdCopyMemoryToAccelerationStructureKHR`
- `vkWriteAccelerationStructuresPropertiesKHR` corresponding to `vkCmdWriteAccelerationStructuresPropertiesKHR`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.

All acceleration structures used by the host commands must be bound to host-visible memory, and all input data for acceleration structure builds must be referenced using host addresses instead of device addresses. Applications are not required to map acceleration structure memory when using the host commands.

**Note**
The `vkBuildAccelerationStructuresKHR` and `vkCmdBuildAccelerationStructuresKHR` may use different algorithms, and thus are not required to produce identical structures. The structures produced by these two commands may exhibit different memory footprints or traversal performance, but should strive to be similar where possible.

Apart from these details, the host and device operations are interchangeable. For example, an application can use `vkBuildAccelerationStructuresKHR` to build a structure, compact it on the device using `vkCmdCopyAccelerationStructureKHR`, and serialize the result using `vkCopyAccelerationStructureToMemoryKHR`.

**Note**
For efficient execution, acceleration structures manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build acceleration structures on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkBuildAccelerationStructuresKHR(
```
VkDevice device,
VkDeferredOperationKHR deferredOperation,
uint32_t infoCount,
const VkAccelerationStructureBuildGeometryInfoKHR* pInfos,
const VkAccelerationStructureBuildRangeInfoKHR* const* ppBuildRangeInfos);

- `device` is the `VkDevice` for which the acceleration structures are being built.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `infoCount` is the number of acceleration structures to build. It specifies the number of the `pInfos` structures and `ppBuildRangeInfos` pointers that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkAccelerationStructureBuildGeometryInfoKHR` structures defining the geometry used to build each acceleration structure.
- `ppBuildRangeInfos` is a pointer to an array of `infoCount` pointers to arrays of `VkAccelerationStructureBuildRangeInfoKHR` structures. Each `ppBuildRangeInfos[i]` is a pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures defining dynamic offsets to the addresses where geometry data is stored, as defined by `pInfos[i]`.

This command fulfills the same task as `vkCmdBuildAccelerationStructuresKHR` but is executed by the host.

The `vkBuildAccelerationStructuresKHR` command provides the ability to initiate multiple acceleration structures builds, however there is no ordering or synchronization implied between any of the individual acceleration structure builds.

**Note**

This means that an application cannot build a top-level acceleration structure in the same `vkBuildAccelerationStructuresKHR` call as the associated bottom-level or instance acceleration structures are being built. There also cannot be any memory aliasing between any acceleration structure memories or scratch memories being used by any of the builds.

### Valid Usage

- **VUID-vkBuildAccelerationStructuresKHR-accelerationStructureHostCommands-03581**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::accelerationStructureHostCommands feature must be enabled

- **VUID-vkBuildAccelerationStructuresKHR-mode-04628**
  The `mode` member of each element of `pInfos` must be a valid `VkBuildAccelerationStructureModeKHR` value

- **VUID-vkBuildAccelerationStructuresKHR-srcAccelerationStructure-04629**
  If the `srcAccelerationStructure` member of any element of `pInfos` is not `VK_NULL_HANDLE`, the `srcAccelerationStructure` member must be a valid `VkAccelerationStructureKHR` handle
For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, its \texttt{srcAccelerationStructure} member must not be \texttt{VK_NULL_HANDLE}.

The \texttt{srcAccelerationStructure} member of any element of \texttt{pInfos} must not be the same acceleration structure as the \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}.

The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must not be the same acceleration structure as the \texttt{dstAccelerationStructure} member of any other element of \texttt{pInfos}.

The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must be a valid \texttt{VkAccelerationStructureKHR} handle.

For each element of \texttt{pInfos}, if its \texttt{type} member is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR}, its \texttt{dstAccelerationStructure} member must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}.

For each element of \texttt{pInfos}, if its \texttt{type} member is \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR}, its \texttt{dstAccelerationStructure} member must have been created with a value of \texttt{VkAccelerationStructureCreateInfoKHR::type} equal to either \texttt{VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR} or \texttt{VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR}.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, inactive primitives in its \texttt{srcAccelerationStructure} member must not be made active.

For each element of \texttt{pInfos}, if its \texttt{mode} member is \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, active primitives in its \texttt{srcAccelerationStructure} member must not be made inactive.

The \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} must not be referenced by the \texttt{geometry.instances.data} member of any element of \texttt{pGeometries} or \texttt{ppGeometries} with a \texttt{geometryType} of \texttt{VK_GEOMETRY_TYPE_INSTANCES_KHR} in any other element of \texttt{pInfos}.

The range of memory backing the \texttt{dstAccelerationStructure} member of any element of \texttt{pInfos} that is accessed by this command must not overlap the memory backing the \texttt{srcAccelerationStructure} member of any other element of \texttt{pInfos} with a \texttt{mode} equal to \texttt{VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR}, which is accessed by this command.
The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstAccelerationStructure` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `dstAccelerationStructure` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command.

The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `srcAccelerationStructure` member of any element of `pInfos` with a `mode` equal to `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` (including the same element), which is accessed by this command.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` member must have previously been constructed with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR` set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` in the build.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `srcAccelerationStructure` and `dstAccelerationStructure` members must either be the same `VkAccelerationStructureKHR`, or not have any memory aliasing.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `geometryCount` member must have the same value which was specified when `srcAccelerationStructure` was last built.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, its `flags` member must have the same value which was specified when `srcAccelerationStructure` was last built.
For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, its type member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its geometryType member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, its flags member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.vertexFormat member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.maxVertex member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, its geometry.triangles.indexType member must have the same value which was specified when srcAccelerationStructure was last built.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL.

For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, then for each VkAccelerationStructureGeometryKHR structure referred to by its pGeometries or ppGeometries members, if geometryType is VK_GEOMETRY_TYPE_TRIANGLES_KHR, if its geometry.triangles.transformData address was NULL when srcAccelerationStructure was last built, then it must be NULL.
For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if its `geometry.triangles.transformData` address was not NULL when `srcAccelerationStructure` was last built, then it must not be NULL

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03768**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if `geometryType` is `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, and `geometry.triangles.indexType` is not `VK_INDEX_TYPE_NONE_KHR`, then the value of each index referenced must be the same as the corresponding index value when `srcAccelerationStructure` was last built

- **VUID-vkBuildAccelerationStructuresKHR-primitiveCount-03769**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, the `primitiveCount` member of its corresponding `VkAccelerationStructureBuildRangeInfoKHR` structure must have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkBuildAccelerationStructuresKHR-firstVertex-03770**
  For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR`, then for each `VkAccelerationStructureGeometryKHR` structure referred to by its `pGeometries` or `ppGeometries` members, if the geometry uses indices, the `firstVertex` member of its corresponding `VkAccelerationStructureBuildRangeInfoKHR` structure must have the same value which was specified when `srcAccelerationStructure` was last built

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03801**
  For each element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, the corresponding `ppBuildRangeInfos[i][j].primitiveCount` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

- **VUID-vkBuildAccelerationStructuresKHR-pInfos-03675**
  For each `pInfos[i]`, `dstAccelerationStructure` must have been created with a value of `VkAccelerationStructureCreateInfoKHR::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetAccelerationStructureBuildSizesKHR` with `pBuildInfo = pInfos[i]` and with each element of the `pMaxPrimitiveCounts` array greater than or equal to the equivalent `ppBuildRangeInfos[i][j].primitiveCount` values for `j` in `[0, pInfos[i].geometryCount]`

- **VUID-vkBuildAccelerationStructuresKHR-ppBuildRangeInfos-03676**
  Each element of `ppBuildRangeInfos[i]` must be a valid pointer to an array of `pInfos[i].geometryCount` `VkAccelerationStructureBuildRangeInfoKHR` structures

- **VUID-vkBuildAccelerationStructuresKHR-deferredOperation-03678**
Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03722
  For each element of pInfos, the buffer used to create its dstAccelerationStructure member must be bound to host-visible device memory

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03723
  For each element of pInfos, if its mode member is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR the buffer used to create its srcAccelerationStructure member must be bound to host-visible device memory

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03724
  For each element of pInfos, the buffer used to create each acceleration structure referenced by the geometry.instances.data member of any element of pGeometries or ppGeometries with a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR must be bound to host-visible device memory

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03725
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR, all addresses between pInfos[i].scratchData.hostAddress and pInfos[i].scratchData.hostAddress + N - 1 must be valid host memory, where N is given by the buildScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03726
  If pInfos[i].mode is VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR, all addresses between pInfos[i].scratchData.hostAddress and pInfos[i].scratchData.hostAddress + N - 1 must be valid host memory, where N is given by the updateScratchSize member of the VkAccelerationStructureBuildSizesInfoKHR structure returned from a call to vkGetAccelerationStructureBuildSizesKHR with an identical VkAccelerationStructureBuildGeometryInfoKHR structure and primitive count

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03771
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, geometry.triangles.vertexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03772
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.indexType is not VK_INDEX_TYPE_NONE_KHR, geometry.triangles.indexData.hostAddress must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03773
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR, if geometry.triangles.transformData.hostAddress is not 0, it must be a valid host address

- VUID-vkBuildAccelerationStructuresKHR-pInfos-03774
  For any element of pInfos[i].pGeometries or pInfos[i].ppGeometries with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR, geometry.aabbs.data.hostAddress must be a valid host address
For each element of `pInfos`, the buffer used to create its `dstAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

For each element of `pInfos`, if its `mode` member is `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` the buffer used to create its `srcAccelerationStructure` member **must** be bound to memory that was not allocated with multiple instances.

For each element of `pInfos`, the buffer used to create each acceleration structure referenced by the `geometry.instances.data` member of any element of `pGeometries` or `ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` **must** be bound to memory that was not allocated with multiple instances.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, `geometry.instances.data.hostAddress` **must** be a valid host address.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `VkAccelerationStructureInstanceKHR::accelerationStructureReference` value in `geometry.instances.data.hostAddress` **must** be a valid `VkAccelerationStructureKHR` object.

For any element of `pInfos[i].pGeometries` or `pInfos[i].ppGeometries` with a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR` with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` set, each `accelerationStructureReference` in any structure in `VkAccelerationStructureMotionInstanceNV` value in `geometry.instances.data.hostAddress` **must** be a valid `VkAccelerationStructureKHR` object.

**Valid Usage (Implicit)**

- **device** must be a valid `VkDevice` handle.

- If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` **must** be a valid `VkDeferredOperationKHR` handle.

- `pInfos` **must** be a valid pointer to an array of `infoCount` valid `VkAccelerationStructureBuildGeometryInfoKHR` structures.

- `ppBuildRangeInfos` **must** be a valid pointer to an array of `infoCount` `VkAccelerationStructureBuildRangeInfoKHR` structures.

- `infoCount` arraylength
infoCount must be greater than 0

- VUID-vkBuildAccelerationStructuresKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

## Return Codes

### Success
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact an acceleration structure on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureInfoKHR* pInfo);
```

- **device** is the device which owns the acceleration structures.
- **deferredOperation** is an optional VkDeferredOperationKHR to request deferral for this command.
- **pInfo** is a pointer to a VkCopyAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureKHR` but is executed by the host.

## Valid Usage

- VUID-vkCopyAccelerationStructureKHR-accelerationStructureHostCommands-03582
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::accelerationStructureHostCommands feature must be enabled

- VUID-vkCopyAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

- VUID-vkCopyAccelerationStructureKHR-buffer-03727
The buffer used to create pInfo->src must be bound to host-visible device memory

- VUID-vkCopyAccelerationStructureKHR-buffer-03728
  The buffer used to create pInfo->dst must be bound to host-visible device memory

- VUID-vkCopyAccelerationStructureKHR-buffer-03780
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

- VUID-vkCopyAccelerationStructureKHR-buffer-03781
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

- VUID-vkCopyAccelerationStructureKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

- VUID-vkCopyAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyAccelerationStructureInfoKHR structure

- VUID-vkCopyAccelerationStructureKHR-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyMemoryToAccelerationStructureKHR(  
  VkDevice device,  
  VkDeferredOperationKHR deferredOperation,  
  const VkCopyMemoryToAccelerationStructureInfoKHR* pInfo);
```
• device is the device which owns pInfo->dst.

• deferredOperation is an optional VkDeferredOperationKHR to request deferral for this command.

• pInfo is a pointer to a VkCopyMemoryToAccelerationStructureInfoKHR structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMemoryToAccelerationStructureKHR but is executed by the host.

This command can accept acceleration structures produced by either vkCmdCopyAccelerationStructureToMemoryKHR or vkCopyAccelerationStructureToMemoryKHR.

Valid Usage

• VUID-vkCopyMemoryToAccelerationStructureKHR-accelerationStructureHostCommands-03583
  The VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureHostCommands feature must be enabled

• VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03729
  pInfo->src.hostAddress must be a valid host pointer

• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-03750
  pInfo->src.hostAddress must be aligned to 16 bytes

• VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03730
  The buffer used to create pInfo->dst must be bound to host-visible device memory

• VUID-vkCopyMemoryToAccelerationStructureKHR-buffer-03782
  The buffer used to create pInfo->dst must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyMemoryToAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyMemoryToAccelerationStructureKHR-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToAccelerationStructureInfoKHR structure

• VUID-vkCopyMemoryToAccelerationStructureKHR-deferredOperation-parent

3234
If `deferredOperation` is a valid handle, it **must** have been created, allocated, or retrieved from `device`.

### Return Codes

#### Success
- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

#### Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy an acceleration structure to host accessible memory, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCopyAccelerationStructureToMemoryKHR(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyAccelerationStructureToMemoryInfoKHR* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyAccelerationStructureToMemoryInfoKHR` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyAccelerationStructureToMemoryKHR` but is executed by the host.

This command produces the same results as `vkCmdCopyAccelerationStructureToMemoryKHR`, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output **may** not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToAccelerationStructureKHR` or `vkCopyMemoryToAccelerationStructureKHR`.

### Valid Usage

- **VUID-vkCopyAccelerationStructureToMemoryKHR-accelerationStructureHostCommands-03584**
  The `VkPhysicalDeviceAccelerationStructureFeaturesKHR` ::`accelerationStructureHostCommands` feature **must** be enabled

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-03678**
Any previous deferred operation that was associated with `deferredOperation` must be complete

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03731**
The buffer used to create ` pInfo->src` must be bound to host-visible device memory

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03732**
  ` pInfo->dst.hostAddress` must be a valid host pointer

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-03751**
  ` pInfo->dst.hostAddress` must be aligned to 16 bytes

- **VUID-vkCopyAccelerationStructureToMemoryKHR-buffer-03783**
The buffer used to create ` pInfo->src` must be bound to memory that was not allocated with multiple instances

**Valid Usage (Implicit)**

- **VUID-vkCopyAccelerationStructureToMemoryKHR-device-parameter**
  ` device` must be a valid ` VkDevice` handle

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parameter**
  If ` deferredOperation` is not ` VK_NULL_HANDLE`, ` deferredOperation` must be a valid ` VkDeferredOperationKHR` handle

- **VUID-vkCopyAccelerationStructureToMemoryKHR-pInfo-parameter**
  ` pInfo` must be a valid pointer to a valid ` VkCopyAccelerationStructureToMemoryInfoKHR` structure

- **VUID-vkCopyAccelerationStructureToMemoryKHR-deferredOperation-parent**
  If ` deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from ` device`

**Return Codes**

**Success**

- ` VK_SUCCESS`
- ` VK_OPERATION_DEFERRED_KHR`
- ` VK_OPERATION_NOT_DEFERRED_KHR`

**Failure**

- ` VK_ERROR_OUT_OF_HOST_MEMORY`
- ` VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query acceleration structure size parameters on the host, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkWriteAccelerationStructuresPropertiesKHR(
```
VkDevice
uint32_t
const VkAccelerationStructureKHR*
VkQueryType
size_t
void*
size_t

device, accelerationStructureCount, pAccelerationStructures, queryType, dataSize, pData, stride);

• **device** is the device which owns the acceleration structures in `pAccelerationStructures`.

• **accelerationStructureCount** is the count of acceleration structures for which to query the property.

• `pAccelerationStructures` is a pointer to an array of existing previously built acceleration structures.

• **queryType** is a `VkQueryType` value specifying the property to be queried.

• **dataSize** is the size in bytes of the buffer pointed to by `pData`.

• **pData** is a pointer to a user-allocated buffer where the results will be written.

• **stride** is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteAccelerationStructuresPropertiesKHR` but is executed by the host.

### Valid Usage

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureHostCommands-03585**
The `VkPhysicalDeviceAccelerationStructureFeaturesKHR`:accelerationStructureHostCommands feature must be enabled

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-04964**
All acceleration structures in `pAccelerationStructures` must have been built prior to the execution of this command

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructures-03431**
All acceleration structures in `pAccelerationStructures` must have been built with `VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR` if `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06742**
`queryType` must be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03448**
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` must be a multiple of the size of `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03449**
If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `pData` must point to a `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03450**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` must be a multiple of the size of `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-03451**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `pData` must point to a `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06731**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`, then `stride` must be a multiple of the size of `VkDeviceSize`

If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `pData` must point to a `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06732**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR`, then `pData` must point to a `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06733**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `stride` must be a multiple of the size of `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-06734**
  If `queryType` is `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`, then `pData` must point to a `VkDeviceSize`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-03452**
  `dataSize` must be greater than or equal to `accelerationStructureCount*stride`

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03733**
  The `buffer` used to create each acceleration structure in `pAccelerationStructures` must be bound to host-visible device memory

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-buffer-03784**
  The `buffer` used to create each acceleration structure in `pAccelerationStructures` must be bound to memory that was not allocated with multiple instances

---

**Valid Usage (Implicit)**

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parameter**
  `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid `VkAccelerationStructureKHR` handles

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-queryType-parameter**
  `queryType` must be a valid `VkQueryType` value

- **VUID-vkWriteAccelerationStructuresPropertiesKHR-pData-parameter**
  `pData` must be a valid pointer to an array of `dataSize` bytes
• VUID-vkWriteAccelerationStructuresPropertiesKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

• VUID-vkWriteAccelerationStructuresPropertiesKHR-dataSize-arraylength
  dataSize must be greater than 0

• VUID-vkWriteAccelerationStructuresPropertiesKHR-pAccelerationStructures-parent
  Each element of pAccelerationStructures must have been created, allocated, or retrieved from device

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
Chapter 38. Micromap

38.1. Micromaps

*Acceleration structures* store and organize geometry for ray tracing, but in some cases it is beneficial to include some information within the geometry, particularly for triangles. A *micromap* organizes this data around a map of values corresponding to subdivided microtriangles which can be added to a triangle geometry when building a *bottom level acceleration structure*.

An *opacity micromap* is a type of micromap which stores information to control intersection opacity as described in *Ray Opacity Micromap*.

A *displacement micromap* is a type of micromap which stores information to displace sub-triangle vertices as described in *Displacement Micromap*.

A micromap is considered to be constructed if a *micromap build command* or *copy command* has been executed with the given acceleration structure as the destination.

### 38.1.1. Building Micromaps

To build micromaps call:

```
// Provided by VK_EXT_opacity_micromap
void vkCmdBuildMicromapsEXT(
    VkCommandBuffer commandBuffer,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `infoCount` is the number of micromaps to build. It specifies the number of the `pInfos` structures that must be provided.
- `pInfos` is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the data used to build each micromap.

The `vkCmdBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there cannot be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

Accesses to the micromap scratch buffers as identified by the `VkMicromapBuildInfoEXT` ::`scratchData` buffer device addresses must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `(VK_ACCESS_2_MICROMAP_READ_BIT_EXT | VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT)`. Accesses to
VkMicromapBuildInfoEXT::dstMicromap must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT.

Accesses to other input buffers as identified by any used values of VkMicromapBuildInfoEXT::data or VkMicromapBuildInfoEXT::triangleArray must be synchronized with the VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Valid Usage

- VUID-vkCmdBuildMicromapsEXT-pInfos-07461
  For each pInfo[i], dstMicromap must have been created with a value of VkMicromapCreateInfoEXT::size greater than or equal to the memory size required by the build operation, as returned by vkGetMicromapBuildSizesEXT with pBuildInfo = pInfo[i]

- VUID-vkCmdBuildMicromapsEXT-mode-07462
  The mode member of each element of pInfo must be a valid VkBuildMicromapModeEXT value

- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07463
  The dstMicromap member of any element of pInfo must be a valid VkMicromapEXT handle

- VUID-vkCmdBuildMicromapsEXT-pInfos-07464
  For each element of pInfo its type member must match the value of VkMicromapCreateInfoEXT::type when its dstMicromap was created

- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the dstMicromap member of any element of pInfo that is accessed by this command must not overlap the memory backing the dstMicromap member of any other element of pInfo, which is accessed by this command

- VUID-vkCmdBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the dstMicromap member of any element of pInfo that is accessed by this command must not overlap the memory backing the scratchData member of any element of pInfo (including the same element), which is accessed by this command

- VUID-vkCmdBuildMicromapsEXT-scratchData-07467
  The range of memory backing the scratchData member of any element of pInfo that is accessed by this command must not overlap the memory backing the scratchData member of any other element of pInfo, which is accessed by this command

- VUID-vkCmdBuildMicromapsEXT-pInfos-07508
  For each element of pInfo, the buffer used to create its dstMicromap member must be bound to device memory

- VUID-vkCmdBuildMicromapsEXT-pInfos-07509
  If pInfo[i].mode is VK_BUILD_MICROMAP_MODE_BUILD_EXT, all addresses between pInfo[i].scratchData.deviceAddress and pInfo[i].scratchData.deviceAddress + N - 1 must be in
the buffer device address range of the same buffer, where $N$ is given by the
\texttt{buildScratchSize} member of the \texttt{VkMicromapBuildSizesInfoEXT} structure returned from
a call to \texttt{vkGetMicromapBuildSizesEXT} with an identical \texttt{VkMicromapBuildInfoEXT}
structure and primitive count

- \textbf{VUID-vkCmdBuildMicromapsEXT-data-07510}
The buffers from which the buffer device addresses for all of the \texttt{data} and \texttt{triangleArray}
members of all \texttt{pInfos[i]} are queried \textbf{must} have been created with the
\texttt{VK_BUFFER_USAGE_MICROMAP_BUILD_INPUT_READ_ONLY_BIT_EXT} usage flag

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-07511}
For each element of \texttt{pInfos[i]} the buffer from which the buffer device address \texttt{pInfos}
[i].\texttt{scratchData.deviceAddress} is queried \textbf{must} have been created with
\texttt{VK_BUFFER_USAGE_STORAGE_BUFFER_BIT} usage flag

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-07512}
For each element of \texttt{pInfos}, its \texttt{scratchData.deviceAddress}, \texttt{data.deviceAddress}, and
\texttt{triangleArray.deviceAddress} members \textbf{must} be valid device addresses obtained from
\texttt{vkGetBufferDeviceAddress}

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-07513}
For each element of \texttt{pInfos}, if \texttt{scratchData.deviceAddress}, \texttt{data.deviceAddress}, or
\texttt{triangleArray.deviceAddress} is the address of a non-sparse buffer then it \textbf{must} be bound
completely and contiguously to a single \texttt{VkDeviceMemory} object

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-07514}
For each element of \texttt{pInfos}, its \texttt{scratchData.deviceAddress} member \textbf{must} be a multiple of
\texttt{VkPhysicalDeviceAccelerationStructurePropertiesKHR::minAccelerationStructureScratchOffsetAlignment}

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-07515}
For each element of \texttt{pInfos}, its \texttt{triangleArray.deviceAddress} and \texttt{data.deviceAddress}
members \textbf{must} be a multiple of 256

\textbf{Valid Usage (Implicit)}

- \textbf{VUID-vkCmdBuildMicromapsEXT-commandBuffer-parameter}
\texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle

- \textbf{VUID-vkCmdBuildMicromapsEXT-pInfos-parameter}
\texttt{pInfos} \textbf{must} be a valid pointer to an array of \texttt{infoCount} valid \texttt{VkMicromapBuildInfoEXT}
structures

- \textbf{VUID-vkCmdBuildMicromapsEXT-commandBuffer-recording}
\texttt{commandBuffer} \textbf{must} be in the \texttt{recording state}

- \textbf{VUID-vkCmdBuildMicromapsEXT-commandBuffer-cmdpool}
The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support compute
operations

- \textbf{VUID-vkCmdBuildMicromapsEXT-renderpass}
This command \textbf{must} only be called outside of a render pass instance
• VUID-vkCmdBuildMicromapsEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than \(0\)

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Formats which can be set in VkMicromapUsageEXT::format and VkMicromapTriangleEXT::format for micromap builds, are:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkOpacityMicromapFormatEXT {
  VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT = 1,
  VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT = 2,
} VkOpacityMicromapFormatEXT;
```

• VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT indicates that the given micromap format has one bit per subtriangle encoding either fully opaque or fully transparent.
• VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT indicates that the given micromap format has two bits per subtriangle encoding four modes which can be interpreted as described in ray traversal.

Note
For compactness, these values are stored as 16-bit in some structures.

Formats which can be set in VkMicromapUsageEXT::format and VkMicromapTriangleEXT::format for micromap builds, are:

```c
// Provided by VK_NV_displacement_micromap
typedef enum VkDisplacementMicromapFormatNV {
  VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64getBytes_NV = 1,
  VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128BYTES_NV = 2,
};
```
• **VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV** indicates that the given micromap format encodes 64 micro-triangles worth of displacements in 64 bytes as described in Displacement Micromap Encoding.

• **VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 256 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

• **VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV** indicates that the given micromap format encodes 1024 micro-triangles worth of displacements in 128 bytes as described in Displacement Micromap Encoding.

**Note**
For compactness, these values are stored as 16-bit in some structures.

The **VkMicromapBuildInfoEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapBuildInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapTypeEXT type;
    VkBuildMicromapFlagsEXT flags;
    VkBuildMicromapModeEXT mode;
    VkMicromapEXT dstMicromap;
    uint32_t usageCountsCount;
    const VkMicromapUsageEXT* pUsageCounts;
    const VkMicromapUsageEXT* const* ppUsageCounts;
    VkDeviceOrHostAddressConstKHR data;
    VkDeviceOrHostAddressKHR scratchData;
    VkDeviceOrHostAddressConstKHR triangleArray;
    VkDeviceSize triangleArrayStride;
} VkMicromapBuildInfoEXT;
```

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **type** is a **VkMicromapTypeEXT** value specifying the type of micromap being built.

• **flags** is a bitmask of **VkBuildMicromapFlagBitsEXT** specifying additional parameters of the micromap.

• **mode** is a **VkBuildMicromapModeEXT** value specifying the type of operation to perform.

• **dstMicromap** is a pointer to the target micromap for the build.

• **usageCountsCount** specifies the number of usage counts structures that will be used to determine the size of this micromap.
• **pUsageCounts** is a pointer to an array of `<VkMicromapUsageEXT>` structures.
• **ppUsageCounts** is a pointer to an array of pointers to `<VkMicromapUsageEXT>` structures.
• **data** is the device or host address to memory which contains the data for the micromap.
• **scratchData** is the device or host address to memory that will be used as scratch memory for the build.
• **triangleArray** is the device or host address to memory containing the `<VkMicromapTriangleEXT>` data.
• **triangleArrayStride** is the stride in bytes between each element of **triangleArray**.

Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**. The elements of the non-**NULL** array describe the total counts used to build each micromap. Each element contains a **count** which is the number of micromap triangles of that **format** and **subdivisionLevel** contained in the micromap. Multiple elements with the same **format** and **subdivisionLevel** are allowed and the total count for that **format** and **subdivisionLevel** is the sum of the **count** for each element.

Each micromap triangle refers to one element in **triangleArray** which contains the **format** and **subdivisionLevel** for that particular triangle as well as a **dataOffset** in bytes which is the location relative to **data** where that triangle’s micromap data begins. The data at **triangleArray** is laid out as a 4 byte unsigned integer for the **dataOffset** followed by a 2 byte unsigned integer for the subdivision level then a 2 byte unsigned integer for the format. In practice, compilers compile `<VkMicromapTriangleEXT>` to match this pattern.

For opacity micromaps, the data at **data** is packed as either one bit per element for `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or two bits per element for `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` and is packed from LSB to MSB in each byte. The data at each index in those bytes is interpreted as discussed in [Ray Opacity Micromap](#).

For displacement micromaps, the data at **data** is interpreted as discussed in [Displacement Micromap Encoding](#).

### Valid Usage

- **VUID-VkMicromapBuildInfoEXT-pUsageCounts-07516**
  Only one of **pUsageCounts** or **ppUsageCounts** can be a valid pointer, the other must be **NULL**

- **VUID-VkMicromapBuildInfoEXT-type-07517**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of **VkMicromapUsageEXT** must be a valid value from `VkOpacityMicromapFormatEXT`

- **VUID-VkMicromapBuildInfoEXT-type-07518**
  If **type** is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` the **format** member of **VkMicromapTriangleEXT** must be a valid value from `VkOpacityMicromapFormatEXT`

- **VUID-VkMicromapBuildInfoEXT-type-08704**
  If **type** is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` the **format** member of **VkMicromapUsageEXT** must be a valid value from `VkDisplacementMicromapFormatNV`

- **VUID-VkMicromapBuildInfoEXT-type-08705**
If `type` is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` the `format` member of `VkMicromapTriangleEXT` must be a valid value from `VkDisplacementMicromapFormatNV`.

### Valid Usage (Implicit)

- **VUID-VkMicromapBuildInfoEXT-sType-sType**
  
  * `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_BUILD_INFO_EXT`.

- **VUID-VkMicromapBuildInfoEXT-pNext-pNext**
  
  * `pNext` must be `NULL`.

- **VUID-VkMicromapBuildInfoEXT-type-parameter**
  
  * `type` must be a valid `VkMicromapTypeEXT` value.

- **VUID-VkMicromapBuildInfoEXT-flags-parameter**
  
  * `flags` must be a valid combination of `VkBuildMicromapFlagBitsEXT` values.

- **VUID-VkMicromapBuildInfoEXT-pUsageCounts-parameter**
  
  If `usageCountsCount` is not `0`, and `pUsageCounts` is not `NULL`, `pUsageCounts` must be a valid pointer to an array of `usageCountsCount` `VkMicromapUsageEXT` structures.

- **VUID-VkMicromapBuildInfoEXT-ppUsageCounts-parameter**
  
  If `usageCountsCount` is not `0`, and `ppUsageCounts` is not `NULL`, `ppUsageCounts` must be a valid pointer to an array of `usageCountsCount` valid pointers to `VkMicromapUsageEXT` structures.

The `VkBuildMicromapModeEXT` enumeration is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef enum VkBuildMicromapModeEXT {
    VK_BUILD_MICROMAP_MODE_BUILD_EXT = 0,
} VkBuildMicromapModeEXT;
```

- `VK_BUILD_MICROMAP_MODE_BUILD_EXT` specifies that the destination micromap will be built using the specified data.

The `VkMicromapUsageEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapUsageEXT {
    uint32_t count;
    uint32_t subdivisionLevel;
    uint32_t format;
} VkMicromapUsageEXT;
```

- `count` is the number of triangles in the usage format defined by the `subdivisionLevel` and `format` below in the micromap.
- `subdivisionLevel` is the subdivision level of this usage format.
Valid Usage

- **VUID-VkMicromapUsageEXT-format-07519**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` then **format** must be `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` or `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT`.

- **VUID-VkMicromapUsageEXT-format-07520**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and **format** is `VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT` then **subdivisionLevel** must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity2StateSubdivisionLevel`.

- **VUID-VkMicromapUsageEXT-format-07521**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_OPACITY_MICROMAP_EXT` and **format** is `VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT` then **subdivisionLevel** must be less than or equal to `VkPhysicalDeviceOpacityMicromapPropertiesEXT::maxOpacity4StateSubdivisionLevel`.

- **VUID-VkMicromapUsageEXT-format-08706**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then **format** must be `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV`, `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV` or `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV`.

- **VUID-VkMicromapUsageEXT-subdivisionLevel-08707**
  If the `VkMicromapTypeEXT` of the micromap is `VK_MICROMAP_TYPE_DISPLACEMENT_MICROMAP_NV` then **subdivisionLevel** must be less than or equal to `VkPhysicalDeviceDisplacementMicromapPropertiesNV::maxDisplacementMicromapSubdivisionLevel`.

The **format** is interpreted based on the **type** of the micromap using it.

The `VkMicromapTriangleEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkMicromapTriangleEXT {
    uint32_t dataOffset;
    uint16_t subdivisionLevel;
    uint16_t format;
} VkMicromapTriangleEXT;
```

- **dataOffset** is the offset in bytes of the start of the data for this triangle. This is a byte aligned value.
- **subdivisionLevel** is the subdivision level of this triangle.
The format is interpreted based on the type of the micromap using it.

### 38.1.2. Copying Micromaps

An additional command exists for copying micromaps without updating their contents. Before copying, an application must query the size of the resulting micromap.

To query micromap size parameters call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdWriteMicromapsPropertiesEXT(
    VkCommandBuffer   commandBuffer,
    uint32_t          micromapCount,
    const VkMicromapEXT* pmicromaps,
    VkQueryType       queryType,
    VkQueryPool       queryPool,
);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `micromapCount` is the count of micromaps for which to query the property.
• `pMicromaps` is a pointer to an array of existing previously built micromaps.
• `queryType` is a `VkQueryType` value specifying the type of queries managed by the pool.
• `queryPool` is the query pool that will manage the results of the query.
• `firstQuery` is the first query index within the query pool that will contain the `micromapCount` number of results.

Accesses to any of the micromaps listed in `pMicromaps` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`.

• If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then the value written out is the number of bytes required by a serialized micromap.
• If `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`, then the value written out is the number of bytes required by a compacted micromap.

**Valid Usage**

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07525
  `queryPool` must have been created with a `queryType` matching `queryType`

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-07526
  The queries identified by `queryPool` and `firstQuery` must be unavailable

• VUID-vkCmdWriteMicromapsPropertiesEXT-buffer-07527
  The buffer used to create each micromap in `pMicromaps` must be bound to device memory

• VUID-vkCmdWriteMicromapsPropertiesEXT-query-07528
  The sum of `query` plus `micromapCount` must be less than or equal to the number of queries in `queryPool`

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` must have been constructed prior to the execution of this command

• VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTATION_BIT_EXT` if `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`

• VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-07503
  `queryType` must be `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` or `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`
Valid Usage (Implicit)

- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdWriteMicromapsPropertiesEXT-pMicromaps-parameter
  `pMicromaps` **must** be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryType-parameter
  `queryType` **must** be a valid `VkQueryType` value
- VUID-vkCmdWriteMicromapsPropertiesEXT-queryPool-parameter
  `queryPool` **must** be a valid `VkQueryPool` handle
- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdWriteMicromapsPropertiesEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations
- VUID-vkCmdWriteMicromapsPropertiesEXT-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdWriteMicromapsPropertiesEXT-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdWriteMicromapsPropertiesEXT-micromapCount-arraylength
  `micromapCount` **must** be greater than 0
- VUID-vkCmdWriteMicromapsPropertiesEXT-commonparent
  Each of `commandBuffer`, `queryPool`, and the elements of `pMicromaps` **must** have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

<td></td>
<td></td>
</tr>
</tbody>
</table>

To copy a micromap call:
void vkCmdCopyMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapInfoEXT* pInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is a pointer to a `VkCopyMicromapInfoEXT` structure defining the copy operation.

This command copies the `pInfo->src` micromap to the `pInfo->dst` micromap in the manner specified by `pInfo->mode`.

Accesses to `pInfo->src` and `pInfo->dst` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT` or `VK_ACCESS_2_MICROMAP_WRITE_BIT_EXT` as appropriate.

### Valid Usage

- VUID-vkCmdCopyMicromapEXT-buffer-07529
  The buffer used to create `pInfo->src` must be bound to device memory
- VUID-vkCmdCopyMicromapEXT-buffer-07530
  The buffer used to create `pInfo->dst` must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdCopyMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapInfoEXT` structure
- VUID-vkCmdCopyMicromapEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdCopyMicromapEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations
- VUID-vkCmdCopyMicromapEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
synchronized

## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The ` VkCopyMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkMicromapEXT src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the source micromap for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

## Valid Usage

- VUID-VkCopyMicromapInfoEXT-mode-07531
  
  mode must be `VK_COPY_MICROMAP_MODE_COMPACT_EXT` or `VK_COPY_MICROMAP_MODE_CLONE_EXT`

- VUID-VkCopyMicromapInfoEXT-src-07532
  
  The source acceleration structure src must have been constructed prior to the execution of this command

- VUID-VkCopyMicromapInfoEXT-mode-07533
  
  If mode is `VK_COPY_MICROMAP_MODE_COMPACT_EXT`, src must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` in the build

- VUID-VkCopyMicromapInfoEXT-buffer-07534
  
  The buffer used to create src must be bound to device memory

- VUID-VkCopyMicromapInfoEXT-buffer-07535
  
  The buffer used to create dst must be bound to device memory
Valid Usage (Implicit)

- VUID-VkCopyMicromapInfoEXT-sType-sType
  
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_COPY_MICROMAP_INFO_EXT}

- VUID-VkCopyMicromapInfoEXT-pNext-pNext
  
  \textit{pNext} must be NULL

- VUID-VkCopyMicromapInfoEXT-src-parameter
  
  \textit{src} must be a valid \texttt{VkMicromapEXT} handle

- VUID-VkCopyMicromapInfoEXT-dst-parameter
  
  \textit{dst} must be a valid \texttt{VkMicromapEXT} handle

- VUID-VkCopyMicromapInfoEXT-mode-parameter
  
  \textit{mode} must be a valid \texttt{VkCopyMicromapModeEXT} value

- VUID-VkCopyMicromapInfoEXT-commonparent
  
  Both of \textit{dst}, and \textit{src} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

Possible values of \textit{mode} specifying additional operations to perform during the copy, are:

```c
typedef enum VkCopyMicromapModeEXT {
    VK_COPY_MICROMAP_MODE_CLONE_EXT = 0,
    VK_COPY_MICROMAP_MODE_SERIALIZE_EXT = 1,
    VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT = 2,
    VK_COPY_MICROMAP_MODE_COMPACT_EXT = 3,
} VkCopyMicromapModeEXT;
```

- \texttt{VK_COPY_MICROMAP_MODE_CLONE_EXT} creates a direct copy of the micromap specified in \textit{src} into the one specified by \textit{dst}. The \textit{dst} micromap \textbf{must} have been created with the same parameters as \textit{src}.

- \texttt{VK_COPY_MICROMAP_MODE_SERIALIZE_EXT} serializes the micromap to a semi-opaque format which can be reloaded on a compatible implementation.

- \texttt{VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT} deserializes the semi-opaque serialization format in the buffer to the micromap.

- \texttt{VK_COPY_MICROMAP_MODE_COMPACT_EXT} creates a more compact version of a micromap \textit{src} into \textit{dst}. The micromap \textit{dst} \textbf{must} have been created with a size at least as large as that returned by \texttt{vkCmdWriteMicromapsPropertiesEXT} after the build of the micromap specified by \textit{src}.

To copy a micromap to device memory call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMicromapToMemoryEXT(
    VkCommandBuffer commandBuffer, // Provided by VK_EXT_opacity_micromap
    // Provided by VK_EXT_opacity_micromap
    // Provided by VK_EXT_opacity_micromap
    VkCopyMicromapModeEXT;
```
const VkCopyMicromapToMemoryInfoEXT* pInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pInfo` is an a pointer to a `VkCopyMicromapToMemoryInfoEXT` structure defining the copy operation.

Accesses to `pInfo->src` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_2_MICROMAP_READ_BIT_EXT`. Accesses to the buffer indicated by `pInfo->dst.deviceAddress` must be synchronized with the `VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT` pipeline stage and an access type of `VK_ACCESS_TRANSFER_WRITE_BIT`.

This command produces the same results as `vkCopyMicromapToMemoryEXT`, but writes its result to a device address, and is executed on the device rather than the host. The output may not necessarily be bit-for-bit identical, but it can be equally used by either `vkCmdCopyMemoryToMicromapEXT` or `vkCopyMemoryToMicromapEXT`.

The defined header structure for the serialized data consists of:

- `VK_UUID_SIZE` bytes of data matching `VkPhysicalDeviceIDProperties::driverUUID`
- `VK_UUID_SIZE` bytes of data identifying the compatibility for comparison using `vkGetDeviceMicromapCompatibilityEXT`  The serialized data is written to the buffer (or read from the buffer) according to the host endianness.

### Valid Usage

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07536  
  `pInfo->dst.deviceAddress` must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07537  
  `pInfo->dst.deviceAddress` must be aligned to 256 bytes

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-07538  
  If the buffer pointed to by `pInfo->dst.deviceAddress` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyMicromapToMemoryEXT-buffer-07539  
  The buffer used to create `pInfo->src` must be bound to device memory

### Valid Usage (Implicit)

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyMicromapToMemoryEXT-pInfo-parameter  
  `pInfo` must be a valid pointer to a valid `VkCopyMicromapToMemoryInfoEXT` structure

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-recording  
  `commandBuffer` must be a valid `VkCommandBuffer` handle
commandBuffer must be in the recording state

- VUID-vkCmdCopyMicromapToMemoryEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations
- VUID-vkCmdCopyMicromapToMemoryEXT-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyMicromapToMemoryEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

</tbody>
</table>

// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMicromapToMemoryInfoEXT {
  VkStructureType sType;
  const void* pNext;
  VkMicromapEXT src;
  VkDeviceOrHostAddressKHR dst;
  VkCopyMicromapModeEXT mode;
} VkCopyMicromapToMemoryInfoEXT;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- src is the source micromap for the copy
- dst is the device or host address to memory which is the target for the copy
- mode is a VkCopyMicromapModeEXT value specifying additional operations to perform during the copy.
Valid Usage

- VUID-VkCopyMicromapToMemoryInfoEXT-src-07540
  The source micromap \texttt{src} must have been constructed prior to the execution of this command.

- VUID-VkCopyMicromapToMemoryInfoEXT-dst-07541
  The memory pointed to by \texttt{dst} must be at least as large as the serialization size of \texttt{src}, as reported by \texttt{vkWriteMicromapsPropertiesEXT} or \texttt{vkCmdWriteMicromapsPropertiesEXT} with a query type of \texttt{VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT}.

- VUID-VkCopyMicromapToMemoryInfoEXT-mode-07542
  \texttt{mode} must be \texttt{VK_COPY_MICROMAP_MODE_SERIALIZE_EXT}.

Valid Usage (Implicit)

- VUID-VkCopyMicromapToMemoryInfoEXT-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_COPY_MICROMAP_TO_MEMORY_INFO_EXT}.

- VUID-VkCopyMicromapToMemoryInfoEXT-pNext-pNext
  \texttt{pNext} must be \texttt{NULL}.

- VUID-VkCopyMicromapToMemoryInfoEXT-src-parameter
  \texttt{src} must be a valid \texttt{VkMicromapEXT} handle.

- VUID-VkCopyMicromapToMemoryInfoEXT-mode-parameter
  \texttt{mode} must be a valid \texttt{VkCopyMicromapModeEXT} value.

To copy device memory to a micromap call:

```c
// Provided by VK_EXT_opacity_micromap
void vkCmdCopyMemoryToMicromapEXT(
    VkCommandBuffer commandBuffer,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.

- \texttt{pInfo} is a pointer to a \texttt{VkCopyMicromapToMemoryInfoEXT} structure defining the copy operation.

Accesses to \texttt{pInfo->dst} must be synchronized with the \texttt{VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT} pipeline stage and an access type of \texttt{VK_ACCESS_2_MICROMAP_READ_BIT_EXT}. Accesses to the buffer indicated by \texttt{pInfo->src.deviceAddress} must be synchronized with the \texttt{VK_PIPELINE_STAGE_2_MICROMAP_BUILD_BIT_EXT} pipeline stage and an access type of \texttt{VK_ACCESS_TRANSFER_READ_BIT}.

This command can accept micromaps produced by either \texttt{vkCmdCopyMicromapToMemoryEXT} or \texttt{vkCopyMicromapToMemoryEXT}.
Valid Usage

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07543
  pInfo->src.deviceAddress must be a valid device address for a buffer bound to device memory

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07544
  pInfo->src.deviceAddress must be aligned to 256 bytes

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-07545
  If the buffer pointed to by pInfo->src.deviceAddress is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyMemoryToMicromapEXT-buffer-07546
  The buffer used to create pInfo->dst must be bound to device memory

Valid Usage (Implicit)

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyMemoryToMicromapEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMemoryToMicromapInfoEXT structure

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyMemoryToMicromapEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdCopyMemoryToMicromapEXT-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyMemoryToMicromapEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>

The `VkCopyMemoryToMicromapInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkCopyMemoryToMicromapInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkDeviceOrHostAddressConstKHR src;
    VkMicromapEXT dst;
    VkCopyMicromapModeEXT mode;
} VkCopyMemoryToMicromapInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `src` is the device or host address to memory containing the source data for the copy.
- `dst` is the target micromap for the copy.
- `mode` is a `VkCopyMicromapModeEXT` value specifying additional operations to perform during the copy.

### Valid Usage

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07547**
  The source memory pointed to by `src` must contain data previously serialized using `vkCmdCopyMicromapToMemoryEXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-mode-07548**
  `mode` must be `VK_COPY_MICROMAP_MODE_DESERIALIZE_EXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-src-07549**
  The data in `src` must have a format compatible with the destination physical device as returned by `vkGetDeviceMicromapCompatibilityEXT`

- **VUID-VkCopyMemoryToMicromapInfoEXT-dst-07550**
  `dst` must have been created with a size greater than or equal to that used to serialize the data in `src`
Valid Usage (Implicit)

- VUID-VkCopyMemoryToMicromapInfoEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_COPY_MEMORY_TO_MICROMAP_INFO_EXT

- VUID-VkCopyMemoryToMicromapInfoEXT-pNext-pNext
  
  pNext must be NULL

- VUID-VkCopyMemoryToMicromapInfoEXT-dst-parameter
  
  dst must be a valid VkMicromapEXT handle

- VUID-VkCopyMemoryToMicromapInfoEXT-mode-parameter
  
  mode must be a valid VkCopyMicromapModeEXT value

To check if a serialized micromap is compatible with the current device call:

```c
// Provided by VK_EXT_opacityMicromap

void vkGetDeviceMicromapCompatibilityEXT(
    VkDevice device,
    const VkMicromapVersionInfoEXT* pVersionInfo,
    VkAccelerationStructureCompatibilityKHR* pCompatibility);
```

- `device` is the device to check the version against.
- `pVersionInfo` is a pointer to a `VkMicromapVersionInfoEXT` structure specifying version information to check against the device.
- `pCompatibility` is a pointer to a `VkAccelerationStructureCompatibilityKHR` value in which compatibility information is returned.

Valid Usage

- VUID-vkGetDeviceMicromapCompatibilityEXT-micromap-07551
  
  The micromap feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetDeviceMicromapCompatibilityEXT-device-parameter
  
  device must be a valid `VkDevice` handle

- VUID-vkGetDeviceMicromapCompatibilityEXT-pVersionInfo-parameter
  
  pVersionInfo must be a valid pointer to a valid `VkMicromapVersionInfoEXT` structure

- VUID-vkGetDeviceMicromapCompatibilityEXT-pCompatibility-parameter
  
  pCompatibility must be a valid pointer to a `VkAccelerationStructureCompatibilityKHR` value

The `VkMicromapVersionInfoEXT` structure is defined as:
typedef struct VkMicromapVersionInfoEXT {
    VkStructureType sType;
    const void* pNext;
    const uint8_t* pVersionData;
} VkMicromapVersionInfoEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pVersionData** is a pointer to the version header of a micromap as defined in `vkCmdCopyMicromapToMemoryEXT`

**Note**

`pVersionData` is a pointer to an array of $2 \times \text{VK_UUID_SIZE}$ `uint8_t` values instead of two `VK_UUID_SIZE` arrays as the expected use case for this member is to be pointed at the header of a previously serialized micromap (via `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`) that is loaded in memory. Using arrays would necessitate extra memory copies of the UUIDs.

### Valid Usage (Implicit)

- VUID-VkMicromapVersionInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_MICROMAP_VERSION_INFO_EXT`

- VUID-VkMicromapVersionInfoEXT-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkMicromapVersionInfoEXT-pVersionData-parameter
  
  `pVersionData` must be a valid pointer to an array of $2 \times \text{VK_UUID_SIZE}$ `uint8_t` values

### 38.2. Host Micromap Operations

Implementations are also required to provide host implementations of the micromap operations if the `micromapHostCommands` feature is enabled:

- `vkBuildMicromapsEXT` corresponding to `vkCmdBuildMicromapsEXT`
- `vkCopyMicromapEXT` corresponding to `vkCmdCopyMicromapEXT`
- `vkCopyMicromapToMemoryEXT` corresponding to `vkCmdCopyMicromapToMemoryEXT`
- `vkCopyMemoryToMicromapEXT` corresponding to `vkCmdCopyMemoryToMicromapEXT`
- `vkWriteMicromapsPropertiesEXT` corresponding to `vkCmdWriteMicromapsPropertiesEXT`

These commands are functionally equivalent to their device counterparts, except that they are executed on the host timeline, rather than being enqueued into command buffers.
All micromaps used by the host commands **must** be bound to host-visible memory, and all input data for micromap builds **must** be referenced using host addresses instead of device addresses. Applications are not required to map micromap memory when using the host commands.

**Note**

The `vkBuildMicromapsEXT` and `vkCmdBuildMicromapsEXT` **may** use different algorithms, and thus are not required to produce identical structures.

Apart from these details, the host and device operations are interchangeable.

**Note**

For efficient execution, micromaps manipulated using these commands should always be bound to host cached memory, as the implementation may need to repeatedly read and write this memory during the execution of the command.

To build micromaps on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkBuildMicromapsEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    uint32_t infoCount,
    const VkMicromapBuildInfoEXT* pInfos);
```

- **device** is the `VkDevice` for which the micromaps are being built.
- **deferredOperation** is an optional `VkDeferredOperationKHR` to request deferral for this command.
- **infoCount** is the number of micromaps to build. It specifies the number of the `pInfos` that **must** be provided.
- **pInfos** is a pointer to an array of `infoCount` `VkMicromapBuildInfoEXT` structures defining the geometry used to build each micromap.

This command fulfills the same task as `vkCmdBuildMicromapsEXT` but is executed by the host.

The `vkBuildMicromapsEXT` command provides the ability to initiate multiple micromaps builds, however there is no ordering or synchronization implied between any of the individual micromap builds.

**Note**

This means that there **cannot** be any memory aliasing between any micromap memories or scratch memories being used by any of the builds.

### Valid Usage

- `VUID-vkBuildMicromapsEXT-pInfos-07461`
For each `pInfos[i]`, `dstMicromap` must have been created with a value of `VkMicromapCreateInfoEXT::size` greater than or equal to the memory size required by the build operation, as returned by `vkGetMicromapBuildSizesEXT` with `pBuildInfo = pInfos[i]`

- VUID-vkBuildMicromapsEXT-mode-07462
  The `mode` member of each element of `pInfos` must be a valid `VkBuildMicromapModeEXT` value

- VUID-vkBuildMicromapsEXT-dstMicromap-07463
  The `dstMicromap` member of any element of `pInfos` must be a valid `VkMicromapEXT` handle

- VUID-vkBuildMicromapsEXT-pInfos-07464
  For each element of `pInfos` its `type` member must match the value of `VkMicromapCreateInfoEXT::type` when its `dstMicromap` was created

- VUID-vkBuildMicromapsEXT-dstMicromap-07465
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `dstMicromap` member of any other element of `pInfos`, which is accessed by this command

- VUID-vkBuildMicromapsEXT-dstMicromap-07466
  The range of memory backing the `dstMicromap` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any element of `pInfos` (including the same element), which is accessed by this command

- VUID-vkBuildMicromapsEXT-scratchData-07467
  The range of memory backing the `scratchData` member of any element of `pInfos` that is accessed by this command must not overlap the memory backing the `scratchData` member of any other element of `pInfos`, which is accessed by this command

- VUID-vkBuildMicromapsEXT-pInfos-07552
  For each element of `pInfos`, the buffer used to create its `dstMicromap` member must be bound to host-visible device memory

- VUID-vkBuildMicromapsEXT-pInfos-07553
  For each element of `pInfos`, all referenced addresses of `pInfos[i].data.hostAddress` must be valid host memory

- VUID-vkBuildMicromapsEXT-pInfos-07554
  For each element of `pInfos`, all referenced addresses of `pInfos[i].triangleArray.hostAddress` must be valid host memory

- VUID-vkBuildMicromapsEXT-micromapHostCommands-07555
  The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- VUID-vkBuildMicromapsEXT-pInfos-07556
  If `pInfos[i].mode` is `VK_BUILD_MICROMAP_MODE_BUILD_EXT`, all addresses between `pInfos[i].scratchData.hostAddress` and `pInfos[i].scratchData.hostAddress + N - 1` must be valid host memory, where `N` is given by the `buildScratchSize` member of the `VkMicromapBuildSizesInfoEXT` structure returned from a call to
vkGetMicromapBuildSizesEXT with an identical VkMicromapBuildInfoEXT structure and primitive count

- VUID-vkBuildMicromapsEXT-pInfos-07557
  For each element of pInfos, the buffer used to create its dstMicromap member must be bound to memory that was not allocated with multiple instances

---

Valid Usage (Implicit)

- VUID-vkBuildMicromapsEXT-device-parameter
device must be a valid VkDevice handle
- VUID-vkBuildMicromapsEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle
- VUID-vkBuildMicromapsEXT-pInfos-parameter
  pInfos must be a valid pointer to an array of infoCount valid VkMicromapBuildInfoEXT structures
- VUID-vkBuildMicromapsEXT-infoCount-arraylength
  infoCount must be greater than 0
- VUID-vkBuildMicromapsEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device

---

Return Codes

Success

- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy or compact a micromap on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapInfoEXT* pInfo);
```
• **device** is the device which owns the micromaps.

• **deferredOperation** is an optional **VkDeferredOperationKHR** to **request deferral** for this command.

• **pInfo** is a pointer to a **VkCopyMicromapInfoEXT** structure defining the copy operation.

This command fulfills the same task as **vkCmdCopyMicromapEXT** but is executed by the host.

---

### Valid Usage

- **VUID-vkCopyMicromapEXT-deferredOperation-03678**
  Any previous deferred operation that was associated with **deferredOperation** **must** be complete

- **VUID-vkCopyMicromapEXT-buffer-07558**
  The **buffer** used to create **pInfo->src** **must** be bound to host-visible device memory

- **VUID-vkCopyMicromapEXT-buffer-07559**
  The **buffer** used to create **pInfo->dst** **must** be bound to host-visible device memory

- **VUID-vkCopyMicromapEXT-micromapHostCommands-07560**
  The **VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands** feature **must** be enabled

- **VUID-vkCopyMicromapEXT-buffer-07561**
  The **buffer** used to create **pInfo->src** **must** be bound to memory that was not allocated with multiple instances

- **VUID-vkCopyMicromapEXT-buffer-07562**
  The **buffer** used to create **pInfo->dst** **must** be bound to memory that was not allocated with multiple instances

---

### Valid Usage (Implicit)

- **VUID-vkCopyMicromapEXT-device-parameter**
  **device** **must** be a valid **VkDevice** handle

- **VUID-vkCopyMicromapEXT-deferredOperation-parameter**
  If **deferredOperation** is not **VK_NULL_HANDLE**, **deferredOperation** **must** be a valid **VkDeferredOperationKHR** handle

- **VUID-vkCopyMicromapEXT-pInfo-parameter**
  **pInfo** **must** be a valid pointer to a valid **VkCopyMicromapInfoEXT** structure

- **VUID-vkCopyMicromapEXT-deferredOperation-parent**
  If **deferredOperation** is a valid handle, it **must** have been created, allocated, or retrieved from **device**
Return Codes

**Success**
- VK_SUCCESS
- VK_OPERATION_DEFERRED_KHR
- VK_OPERATION_NOT_DEFERRED_KHR

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

To copy host accessible memory to a micromap, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMemoryToMicromapEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMemoryToMicromapInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->dst`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
- `pInfo` is a pointer to a `VkCopyMemoryToMicromapInfoEXT` structure defining the copy operation.

This command fulfills the same task as `vkCmdCopyMemoryToMicromapEXT` but is executed by the host.

This command can accept micromaps produced by either `vkCmdCopyMicromapToMemoryEXT` or `vkCopyMicromapToMemoryEXT`.

**Valid Usage**

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-03678
  Any previous deferred operation that was associated with `deferredOperation` must be complete

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07563
  `pInfo->src.hostAddress` must be a valid host pointer

- VUID-vkCopyMemoryToMicromapEXT-pInfo-07564
  `pInfo->src.hostAddress` must be aligned to 16 bytes

- VUID-vkCopyMemoryToMicromapEXT-buffer-07565
  The `buffer` used to create `pInfo->dst` must be bound to host-visible device memory

- VUID-vkCopyMemoryToMicromapEXT-micromapHostCommands-07566
The `VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands` feature must be enabled

- VUID-vkCopyMemoryToMicromapEXT-buffer-07567
  The buffer used to create `pInfo->dst` must be bound to memory that was not allocated with multiple instances

### Valid Usage (Implicit)

- VUID-vkCopyMemoryToMicromapEXT-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parameter
  If `deferredOperation` is not `VK_NULL_HANDLE`, `deferredOperation` must be a valid `VkDeferredOperationKHR` handle

- VUID-vkCopyMemoryToMicromapEXT-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkCopyMemoryToMicromapInfoEXT` structure

- VUID-vkCopyMemoryToMicromapEXT-deferredOperation-parent
  If `deferredOperation` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Return Codes

#### Success

- `VK_SUCCESS`
- `VK_OPERATION_DEFERRED_KHR`
- `VK_OPERATION_NOT_DEFERRED_KHR`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To copy a micromap to host accessible memory, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkCopyMicromapToMemoryEXT(
    VkDevice device,
    VkDeferredOperationKHR deferredOperation,
    const VkCopyMicromapToMemoryInfoEXT* pInfo);
```

- `device` is the device which owns `pInfo->src`.
- `deferredOperation` is an optional `VkDeferredOperationKHR` to request deferral for this command.
• pInfo is a pointer to a VkCopyMicromapToMemoryInfoEXT structure defining the copy operation.

This command fulfills the same task as vkCmdCopyMicromapToMemoryEXT but is executed by the host.

This command produces the same results as vkCmdCopyMicromapToMemoryEXT, but writes its result directly to a host pointer, and is executed on the host rather than the device. The output may not necessarily be bit-for-bit identical, but it can be equally used by either vkCmdCopyMemoryToMicromapEXT or vkCopyMemoryToMicromapEXT.

Valid Usage

• VUID-vkCopyMicromapToMemoryEXT-deferredOperation-03678
  Any previous deferred operation that was associated with deferredOperation must be complete

• VUID-vkCopyMicromapToMemoryEXT-buffer-07568
  The buffer used to create pInfo->src must be bound to host-visible device memory

• VUID-vkCopyMicromapToMemoryEXT-pInfo-07569
  pInfo->dst.hostAddress must be a valid host pointer

• VUID-vkCopyMicromapToMemoryEXT-pInfo-07570
  pInfo->dst.hostAddress must be aligned to 16 bytes

• VUID-vkCopyMicromapToMemoryEXT-micromapHostCommands-07571
  The VkPhysicalDeviceOpacityMicromapFeaturesEXT::micromapHostCommands feature must be enabled

• VUID-vkCopyMicromapToMemoryEXT-buffer-07572
  The buffer used to create pInfo->src must be bound to memory that was not allocated with multiple instances

Valid Usage (Implicit)

• VUID-vkCopyMicromapToMemoryEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parameter
  If deferredOperation is not VK_NULL_HANDLE, deferredOperation must be a valid VkDeferredOperationKHR handle

• VUID-vkCopyMicromapToMemoryEXT-pInfo-parameter
  pInfo must be a valid pointer to a valid VkCopyMicromapToMemoryInfoEXT structure

• VUID-vkCopyMicromapToMemoryEXT-deferredOperation-parent
  If deferredOperation is a valid handle, it must have been created, allocated, or retrieved from device
Return Codes

Success

• VK_SUCCESS
• VK_OPERATION_DEFERRED_KHR
• VK_OPERATION_NOT_DEFERRED_KHR

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To query micromap size parameters on the host, call:

```c
// Provided by VK_EXT_opacity_micromap
VkResult vkWriteMicromapsPropertiesEXT(
    VkDevice device,
    uint32_t micromapCount,
    const VkMicromapEXT* pMicromaps,
    VkQueryType queryType,
    size_t dataSize,
    void* pData,
    size_t stride);
```

• `device` is the device which owns the micromaps in `pMicromaps`.
• `micromapCount` is the count of micromaps for which to query the property.
• `pMicromaps` is a pointer to an array of existing previously built micromaps.
• `queryType` is a `VkQueryType` value specifying the property to be queried.
• `dataSize` is the size in bytes of the buffer pointed to by `pData`.
• `pData` is a pointer to a user-allocated buffer where the results will be written.
• `stride` is the stride in bytes between results for individual queries within `pData`.

This command fulfills the same task as `vkCmdWriteMicromapsPropertiesEXT` but is executed by the host.

Valid Usage

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07501
  All micromaps in `pMicromaps` must have been constructed prior to the execution of this command

• VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-07502
  All micromaps in `pMicromaps` must have been constructed with `VK_BUILD_MICROMAP_ALLOW_COMPACTION_BIT_EXT` if `queryType` is `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT`
**VUID-vkWriteMicromapsPropertiesEXT-queryType-07503**

queryType must be `VK_QUERY_TYPE_MICROMAP_COMPACTED_SIZE_EXT` or `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`.

**VUID-vkWriteMicromapsPropertiesEXT-queryType-07573**

If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then `stride` must be a multiple of the size of `VkDeviceSize`.

**VUID-vkWriteMicromapsPropertiesEXT-queryType-07574**

If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then `pData` must point to a `VkDeviceSize`.

**VUID-vkWriteMicromapsPropertiesEXT-queryType-07575**

If `queryType` is `VK_QUERY_TYPE_MICROMAP_SERIALIZATION_SIZE_EXT`, then `pData` must be a valid pointer to an array of `dataSize` bytes.

**VUID-vkWriteMicromapsPropertiesEXT-device-parameter**

device must be a valid `VkDevice` handle.

**VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parameter**

`pMicromaps` must be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles.

**VUID-vkWriteMicromapsPropertiesEXT-queryType-parameter**

`queryType` must be a valid `VkQueryType` value.

**VUID-vkWriteMicromapsPropertiesEXT-pData-parameter**

`pData` must be a valid pointer to an array of `dataSize` bytes.

**VUID-vkWriteMicromapsPropertiesEXT-micromapCount-arraylength**

`micromapCount` must be greater than 0.

**VUID-vkWriteMicromapsPropertiesEXT-dataSize-arraylength**

`dataSize` must be greater than 0.

**VUID-vkWriteMicromapsPropertiesEXT-pMicromaps-parent**

Each element of `pMicromaps` must have been created, allocated, or retrieved from `device`.

---

**Valid Usage (Implicit)**

- `device` must be a valid `VkDevice` handle.
- `pMicromaps` must be a valid pointer to an array of `micromapCount` valid `VkMicromapEXT` handles.
- `queryType` must be a valid `VkQueryType` value.
- `pData` must be a valid pointer to an array of `dataSize` bytes.
- `micromapCount` must be greater than 0.
- `dataSize` must be greater than 0.
- Each element of `pMicromaps` must have been created, allocated, or retrieved from `device`.

38.2.1. Displacement Micromap

A displacement micromap in an acceleration structure includes information in the
VkAccelerationStructureTrianglesDisplacementMicromapNV to define a base triangle and
displacement directions then uses displacement information encoded in the micromap to apply to
those values to generate the final position.

Displacement Base Triangle

If displacementBiasAndScaleBuffer is provided the bias and scale are fetched from that buffer. If
displacementBiasAndScaleBuffer is zero the bias and scale are assumed to be 0.0 and 1.0,
respectively.

Given an input position from the geometry, the base position and displacement vector used by the
displacement are computed by:

basePosition = inputPosition + displacementVector × bias

baseDisplacementVector = displacementVector × scale

The parameters of each micro-vertex are derived from a combination of the base triangle
parameters extracted from the bottom-level acceleration structure, the barycentrics of that micro-
vertex, and the displacement value fetched from the displacement micromap corresponding to that
micro-vertex.

microVertexBasePosition = lerp(basePositions, microVertexBarycentrics)

microVertexDisplacementVector = lerp(displacementVectors, microVertexBarycentrics)

microVertexDisplacedPosition = microVertexBasePosition + microVertexDisplacementVector ×
micromapDisplacementValue

Displacement Micromap Encoding

Displacement amounts are stored in displacement blocks, each covering a triangular region of
microvertices. Depending on the subdivision level and encoding format, one or more displacement
blocks combine to store all displacement values for a given displacement micromap.

Displacement blocks are organized along a space filling curve within a displacement micromap if
more than one block is required, then micro-vertices are organized along the same space filling
curve within a displacement micromap.

The space-filling curve is purely hierarchical with recursive splitting, similar to that for opacity micromaps but operating on vertices instead of triangles. To maintain that the hierarchical ordering is contiguous while keeping continuous winding, some triangles are flipped and wound differently.

The `VK_DISPLACEMENT_MICROMAP_FORMAT_64_TRIANGLES_64_BYTES_NV` format is an uncompressed, packed format which covers 64 microtriangles (subdivision level 3) in a block. The block contains 45 displacement values encoded as 11 bit unorm values and stored tightly packed in the vertex order described above, occupying 495 bits. This is followed by 15 unused bits then 2 reserved bits which must be 0. If this block is used to store displacement for a subdivision level below 3 the later unused values are ignored.

The `VK_DISPLACEMENT_MICROMAP_FORMAT_256_TRIANGLES_128_BYTES_NV` and `VK_DISPLACEMENT_MICROMAP_FORMAT_1024_TRIANGLES_128_BYTES_NV` formats store displacements in a compressed form to save space. Both formats use the same compression algorithm, differing in the number of bits used in the different fields.

The compression algorithm works by starting with fully specified anchor vertices, then for each level, predicting the value for the displacement and encoding the correction for that value, using fewer bits for each level of subdivision.

When adding a vertex in the recursive subdivision process between two adjacent displacement values, the predicted value is given by the rounded average of the two adjacent values as integers:

\[ \text{prediction} = \frac{A + B + 1}{2} \]

The decoded value after applying the correction is given by:

\[ \text{decoded} = \text{prediction} + (\text{SignExtend(correction)} \ll \text{shift}) \]

where correction is given by the corrections field for a given level and micro vertex and shift is given by the shifts field indexed from the level then by 4 values, selected from interior or the 3 edges in vertex order in that order.

Chapter 39. Ray Traversal

The ray traversal process identifies and handles intersections between a ray and geometries in an acceleration structure.

Ray traversal cannot be started by a Vulkan API command directly - a shader must execute `OpRayQueryProceedKHR` or a pipeline trace ray instruction. When the `rayTracingPipeline` feature is enabled, `OpTraceRayKHR` can be used for ray tracing in a ray tracing pipeline. When the `rayQuery` feature is enabled, `OpRayQueryProceedKHR` can be used in any shader stage.

39.1. Ray Intersection Candidate Determination

Once tracing begins, rays are first tested against instances in a top-level acceleration structure. A ray that intersects an instance will be transformed into the space of the instance to continue traversal within that instance; therefore the transform matrix stored in the instance must be invertible.

In case multiple instances are intersected by a ray, the ray transformation into the space of the instance is invariant under the order in which these instances are encountered in the top-level acceleration structure.

Note

Applying multiple forward and reverse transforms to a ray to transition from one instance to another could result in accumulated errors. Thus an implementation should behave as if the ray is transformed from the origin for each instance independently.

Next, rays are tested against geometries in a bottom-level acceleration structure to determine if a hit occurred between them, initially based only on their geometric properties (i.e. their vertices). The implementation performs similar operations to that of rasterization, but with the effective viewport determined by the parameters of the ray, and the geometry transformed into a space determined by that viewport.

The vertices of each primitive are transformed from acceleration structure space to ray space according to the ray origin and direction as follows:

\[
\begin{pmatrix}
    x_r \\
    y_r \\
    z_r
\end{pmatrix} =
\begin{pmatrix}
    a_x^2(1-c) + c & a_xa_y(1-c) - sa_z & a_xa_z(1-c) + sa_y \\
    a_xa_y(1-c) + sa_z & a_y^2(1-c) + c & a_ya_z(1-c) - sa_x \\
    a_xa_z(1-c) - sa_y & a_ya_z(1-c) + sa_x & a_z^2(1-c) + c
\end{pmatrix}
\begin{pmatrix}
    x_{as} - o_x \\
    y_{as} - o_y \\
    z_{as} - o_z
\end{pmatrix}
\]

\(a\) is the axis of rotation from the unnormalized ray direction vector \(d\) to the axis vector \(k\):
\[
\mathbf{a} = \begin{cases} 
\frac{\mathbf{d} \times \mathbf{k}}{\|\mathbf{d} \times \mathbf{k}\|} & \text{if } \|\mathbf{d} \times \mathbf{k}\| \neq 0 \\
\begin{pmatrix} 0 \\ 1 \\ 0 \end{pmatrix} & \text{if } \|\mathbf{d} \times \mathbf{k}\| = 0
\end{cases}
\]

\(s\) and \(c\) are the sine and cosine of the angle of rotation about \(\mathbf{a}\) from \(\mathbf{d}\) to \(\mathbf{k}\):

\[
c = \frac{\mathbf{d} \cdot \mathbf{k}}{\|\mathbf{d}\|} \\
s = \sqrt{1 - c^2}
\]

\(\mathbf{k}\) is the unit vector:

\[
\mathbf{k} = \begin{pmatrix} 0 \\ 0 \\ -1 \end{pmatrix}
\]

\(\mathbf{o}\) and \(\mathbf{d}\) are the ray origin and unnormalized direction, respectively; the vector described by \(x_{as}, y_{as}\), and \(z_{as}\) is any position in acceleration structure space; and the vector described by \(x_r, y_r,\) and \(z_r\) is the same position in ray space.

An intersection candidate is a unique point of intersection between a ray and a geometric primitive. For any primitive that has within its bounds a position \(\mathbf{x}_{as}, \mathbf{y}_{as},\) and \(\mathbf{z}_{as}\) such that

\[
x_r = 0 \\
y_r = 0 \\
t_{\text{min}} < -\frac{z_r}{\|\mathbf{d}\|} < t_{\text{max}} \quad \text{if the primitive is a triangle,}
\]

\[
t_{\text{min}} \leq -\frac{z_r}{\|\mathbf{d}\|} \leq t_{\text{max}} \quad \text{otherwise}
\]

(where \(t = -\frac{z_r}{\|\mathbf{d}\|}\)), an intersection candidate exists.

Triangle primitive bounds consist of all points on the plane formed by the three vertices and within the bounds of the edges between the vertices, subject to the watertightness constraints below. AABB primitive bounds consist of all points within an implementation-defined bound which includes the specified box.

---

**Note**

The bounds of the AABB including all points internal to the bound implies that a ray started within the AABB will hit that AABB.
Figure 28. Ray intersection candidate

The determination of this condition is performed in an implementation specific manner, and may be performed with floating point operations. Due to the complexity and number of operations involved, inaccuracies are expected, particularly as the scale of values involved begins to diverge. Implementations should take efforts to maintain as much precision as possible.

Note

One very common case is when geometries are close to each other at some distance from the origin in acceleration structure space, where an effect similar to “z-fighting” is likely to be observed. Applications can mitigate this by ensuring their detailed geometries remain close to the origin.

Another likely case is when the origin of a ray is set to a position on a previously intersected surface, and its \( t_{\text{min}} \) is zero or near zero; an intersection may be detected on the emitting surface. This case can usually be mitigated by offsetting \( t_{\text{min}} \) slightly.

For a motion primitive or a motion instance, the positions for intersection are evaluated at the time specified in the \( \text{time} \) parameter to \text{OpTraceRayMotionNV} by interpolating between the two endpoints as specified for the given motion type. If a motion acceleration structure is traced with \text{OpTraceRayKHR}, it behaves as a \text{OpTraceRayMotionNV} with \( \text{time} \) of 0.0.

In the case of AABB geometries, implementations may increase their size in an acceleration structure in order to mitigate precision issues. This may result in false positive intersections being reported to the application.

For triangle intersection candidates, the \( \text{b} \) and \( \text{c} \) barycentric coordinates on the triangle where the above condition is met are made available to future shading. If the ray was traced with a pipeline trace ray instruction, these values are available as a vector of 2 32-bit floating point values in the \text{HitAttributeKHR} storage class.

Once an intersection candidate is determined, it proceeds through the following operations, in order:

1. Ray Intersection Culling
2. Ray Intersection Confirmation
3. Ray Closest Hit Determination
4. Ray Result Determination

The sections below describe the exact details of these tests. There is no ordering guarantee between
operations performed on different intersection candidates.

### 39.1.1. Watertightness

For a set of triangles with identical transforms, within a single instance:

- Any set of two or more triangles where all triangles have one vertex with an identical position value, that vertex is a **shared vertex**.
- Any set of two triangles with two shared vertices that were specified in the same winding order in each triangle have a **shared edge** defined by those vertices.

A **closed fan** is a set of three or more triangles where:

- All triangles in the set have the same shared vertex as one of their vertices.
- All edges that include the above vertex are shared edges.
- All above shared edges are shared by exactly two triangles from the set.
- No two triangles in the set intersect, except at shared edges.
- Every triangle in the set is joined to every other triangle in the set by a series of the above shared edges.

Implementations **should** not double-hit or miss when a ray intersects a shared edge, or a shared vertex of a closed fan.

### 39.2. Ray Intersection Culling

Candidate intersections go through several phases of culling before confirmation as an actual hit. There is no particular ordering dependency between the different culling operations.

#### 39.2.1. Ray Primitive Culling

If the `rayTraversalPrimitiveCulling` or `rayQuery` features are enabled, the `SkipTrianglesKHR` and `SkipAABBsKHR` ray flags **can** be specified when tracing a ray. `SkipTrianglesKHR` and `SkipAABBsKHR` are mutually exclusive. `SkipTrianglesKHR` is also mutually exclusive with `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR`.

If `SkipTrianglesKHR` was included in the **Ray Flags** operand of the ray trace instruction, and the intersection is with a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR` was included in the pipeline, traversal with **pipeline trace ray** instructions will all behave as if `SkipTrianglesKHR` was included in their **Ray Flags** operand.

If `SkipAABBsKHR` was included in the **Ray Flags** operand of the ray trace instruction, and the intersection is with an AABB primitive, the intersection is dropped, and no further processing of this intersection occurs. If `VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR` was included in the pipeline, traversal with **pipeline trace ray** instructions will all behave as if `SkipAABBsKHR` was included in their **Ray Flags** operand.
39.2.2. Ray Mask Culling

Instances can be made invisible to particular rays based on the value of VkAccelerationStructureInstanceKHR::mask used to add that instance to a top-level acceleration structure, and the Cull Mask parameter used to trace the ray.

For the instance which is intersected, if mask & Cull Mask == 0, the intersection is dropped, and no further processing occurs.

39.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i^r y_{i+1}^r - x_{i+1}^r y_i^r \]

where \( x_i \) and \( y_i \) are the x and y ray space coordinates of the \( i \)th vertex of the \( n \)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \((i + 1) \mod n\).

By default, if \( a \) is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR is included in VkAccelerationStructureInstanceKHR::flags for the instance containing the intersected triangle, this determination is reversed. Additionally, if \( a \) is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray's perspective in a clockwise rotation order. VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR was previously annotated as VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR because of this.

If the ray was traced with a pipeline trace ray instruction, the HitKindKHR built-in is set to HitKindFrontFacingTriangleKHR if the intersection is with front-facing geometry, and HitKindBackFacingTriangleKHR if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with OpRayQueryProceedKHR, OpRayQueryGetIntersectionFrontFaceKHR will return true for intersection candidates with front faces, or false for back faces.
**Culling**

If `CullBackFacingTrianglesKHR` was included in the *Ray Flags* parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the *Ray Flags* parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (a == 0) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR` *Ray Flags* are mutually exclusive.

### 39.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

**Determination**

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in *Ray Opacity Micromap*.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the *Ray Flags* parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.
Culling

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` Ray Flags are mutually exclusive.

39.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_OPAQUE_BIT_KHR` flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from \( \lfloor u \rfloor + \lfloor v \rfloor \), clamping \( \lfloor u \rfloor \) as needed to keep the sum less than or equal to \( 1 \ll \text{subdivisionlevel} \). These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 29. Example ordering for micromap data](image)

Note

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on
VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT in the instance of the candidate intersection or ForceOpacityMicromap2StateEXT ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode. If the result of the micromap lookup is to treat the intersection candidate as ignored, no further processing of that candidate is done.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT, each element is represented by a two bit value at the index derived above.

### 39.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.
39.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with a pipeline trace ray instruction, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with a pipeline trace ray instruction, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

39.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with a pipeline trace ray instruction, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

### 39.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to t_max to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to t and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

### 39.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with pipeline trace ray instructions which can invoke a closest hit shader, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with a pipeline trace ray instruction where no hit result was identified, the miss shader identified by the Miss Index parameter of the instruction is invoked. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.
If the ray was traced with `OpRayQueryProceedKHR`, control is returned to the shader which executed `OpRayQueryProceedKHR`, returning `false`. If a closest hit was identified by Ray Closest Hit Determination, the ray query will now have a committed intersection type of `RayQueryCommittedIntersectionGeneratedKHR` or `RayQueryCommittedIntersectionTriangleKHR`. If no closest hit was identified, the committed intersection type will be `RayQueryCommittedIntersectionNoneKHR`.

No further processing of a ray query occurs after this result is determined.
Chapter 40. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray tracing pipeline execution](image)

Caption

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, a pipeline trace ray instruction can be called to perform a ray traversal that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a VkBuffer object known as a shader binding table. OpExecuteCallableKHR can also be used in ray tracing pipelines to invoke a callable shader.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. Traversal, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The Workgroup scope and variables with a storage class of Workgroup must not be used in the ray tracing pipeline.

40.1. Shader Call Instructions

A shader call is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The shader call instructions are:

- OpTraceRayKHR which may invoke intersection, any-hit, closest hit, or miss shaders,
• **OpTraceRayMotionNV** which *may* invoke intersection, any-hit, closest hit, or miss shaders,
• **OpReportIntersectionKHR** which *may* invoke any-hit shaders, and
• **OpExecuteCallableKHR** which will invoke a callable shader.

• **OpHitObjectTraceRayNV**, **OpHitObjectTraceRayMotionNV**, and **OpHitObjectExecuteShaderNV** which *may* invoke intersection, any-hit, closest hit, miss, or callable shaders.

The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups *may* be unrelated to the subgroup of the parent invocation.

**Pipeline trace ray instructions can** be used recursively; invoked shaders *can* themselves execute pipeline trace ray instructions, to a maximum depth defined by the **maxRecursionDepth** or **maxRayRecursionDepth** limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications *must* not invoke a shader with a recursion depth greater than the value of **maxRecursionDepth** or **maxPipelineRayRecursionDepth** specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. **OpExecuteCallableKHR**) but there is an upper bound determined by the stack size.

An **invocation repack instruction** is a ray tracing instruction where the implementation *may* change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which *may* result in other ray tracing shader stages executing) the new invocation ends and the original invocation is resumed, but it *may* be resumed in a different subgroup or at a different **SubgroupLocalInvocationId** within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same **SubgroupLocalInvocationId**.

The invocations that are executing before a shader call instruction, after the instruction, or are created by the instruction, are **shader-call-related**.

If the implementation changes the composition of subgroups, the values of **SubgroupSize**, **SubgroupLocalInvocationId**, **SMIDNV**, **WarpIDNV**, and built-in variables that are derived from them (**SubgroupEqMask**, **SubgroupGeMask**, **SubgroupGtMask**, **SubgroupLeMask**, **SubgroupLtMask**) *must* be changed accordingly by the invocation repack instruction. The application *must* use **Volatile semantics** on these **BuiltIn** variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application *must* use **Volatile semantics** on any **RayTmaxKHR** decorated **BuiltIn** used in an intersection shader.

**Note**

Subgroup operations are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic
instance of that instruction are potentially valid. For example, care \textbf{must} be taken when using the result of a ballot operation that was computed before an invocation repack instruction, after that repack instruction. The ballot \textit{may} be incorrect as the set of invocations could have changed.

While the \texttt{SubgroupSize} built-in is required to be declared \texttt{Volatile}, its value will never change unless \texttt{VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT} is set on pipeline creation, as without that bit set, its value is required to match that of \texttt{VkPhysicalDeviceSubgroupProperties::subgroupSize}.

For clock operations, the value of a \texttt{Subgroup} scoped \texttt{OpReadClockKHR} read before the dynamic instance of a repack instruction \textbf{should} not be compared to the result of that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by \textit{shader-call-order}.

For ray tracing invocations that are \textit{shader-call-related}:

\begin{itemize}
  \item memory operations on \texttt{StorageBuffer}, \texttt{Image}, and \texttt{ShaderRecordBufferKHR} storage classes \textbf{can} be synchronized using the \texttt{ShaderCallKHR} scope.
  \item the \texttt{CallableDataKHR}, \texttt{IncomingCallableDataKHR}, \texttt{RayPayloadKHR}, \texttt{HitAttributeKHR}, and \texttt{IncomingRayPayloadKHR} storage classes are \textit{system-synchronized} and no application availability and visibility operations are required.
  \item memory operations within a single invocation before and after the shader call instruction are ordered by \textit{program-order} and do not require explicit synchronization.
\end{itemize}

\section*{40.2. Ray Tracing Commands}

Ray \textit{tracing commands} provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline \textbf{must} be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:

\begin{verbatim}
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer raygenShaderBindingTableBuffer,
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer missShaderBindingTableBuffer,
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer hitShaderBindingTableBuffer,
    VkDeviceSize hitShaderBindingOffset,

// Provided by VK_NV_ray_tracing

// Provided by VK_NV_ray_tracing
\end{verbatim}
<table>
<thead>
<tr>
<th>VkDeviceSize</th>
<th>hitShaderBindingStride,</th>
</tr>
</thead>
<tbody>
<tr>
<td>VkBuffer</td>
<td>callableShaderBindingTableBuffer,</td>
</tr>
<tr>
<td>VkDeviceSize</td>
<td>callableShaderBindingOffset,</td>
</tr>
<tr>
<td>VkDeviceSize</td>
<td>callableShaderBindingStride,</td>
</tr>
<tr>
<td>uint32_t</td>
<td>width,</td>
</tr>
<tr>
<td>uint32_t</td>
<td>height,</td>
</tr>
<tr>
<td>uint32_t</td>
<td>depth);</td>
</tr>
</tbody>
</table>

- **commandBuffer** is the command buffer into which the command will be recorded.
- **raygenShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the ray generation shader stage.
- **raygenShaderBindingOffset** is the offset in bytes (relative to **raygenShaderBindingTableBuffer**) of the ray generation shader being used for the trace.
- **missShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the miss shader stage.
- **missShaderBindingOffset** is the offset in bytes (relative to **missShaderBindingTableBuffer**) of the miss shader being used for the trace.
- **missShaderBindingStride** is the size in bytes of each shader binding table record in **missShaderBindingTableBuffer**.
- **hitShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the hit shader stages.
- **hitShaderBindingOffset** is the offset in bytes (relative to **hitShaderBindingTableBuffer**) of the hit shader group being used for the trace.
- **hitShaderBindingStride** is the size in bytes of each shader binding table record in **hitShaderBindingTableBuffer**.
- **callableShaderBindingTableBuffer** is the buffer object that holds the shader binding table data for the callable shader stage.
- **callableShaderBindingOffset** is the offset in bytes (relative to **callableShaderBindingTableBuffer**) of the callable shader being used for the trace.
- **callableShaderBindingStride** is the size in bytes of each shader binding table record in **callableShaderBindingTableBuffer**.
- **width** is the width of the ray trace query dimensions.
- **height** is height of the ray trace query dimensions.
- **depth** is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \( width \times height \times depth \) rays is assembled.

---

**Valid Usage**

- **VUID-vkCmdTraceRaysNV-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this
command, then the image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysNV-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysNV-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdTraceRaysNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdTraceRaysNV-None-02692
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

• VUID-vkCmdTraceRaysNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageViewImageFormatProperties2

• VUID-vkCmdTraceRaysNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageViewImageFormatProperties2

• VUID-vkCmdTraceRaysNV-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

• VUID-vkCmdTraceRaysNV-reductionMode-09213
Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo`::reductionMode equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM` as a result of this command **must** sample with `VK_FILTER_CUBIC_EXT`.

- **VUID-vkCmdTraceRaysNV-selectableCubicWeights-09214**
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command **must** have `VkSamplerCubicWeightsCreateInfoQCOM`::cubicWeights equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- **VUID-vkCmdTraceRaysNV-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo`::flags containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command **must** only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysNV-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features **must** contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdTraceRaysNV-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set **must** have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysNV-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdTraceRaysNV-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the
VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysNV-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysNV-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorsetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdTraceRaysNV-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdTraceRaysNV-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any
VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdTraceRaysNV-None-08610
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdTraceRaysNV-None-08611
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdTraceRaysNV-None-08607
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdTraceRaysNV-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysNV-None-08612
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysNV-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdTraceRaysNV-None-08613
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage
corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource.

- **VUID-vkCmdTraceRaysNV-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdTraceRaysNV-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object **must** not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdTraceRaysNV-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdTraceRaysNV-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

- **VUID-vkCmdTraceRaysNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format.

- **VUID-vkCmdTraceRaysNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdTraceRaysNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdTraceRaysNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction...
must have a Width of 64

• VUID-vkCmdTraceRaysNV-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.

If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` must have been called in the current command buffer prior to this trace command.

CommandBuffer must not be a protected command buffer.

This command must not cause a pipeline trace ray instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxRecursionDepth` used to create the bound ray tracing pipeline.

If `raygenShaderBindingTableBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`raygenShaderBindingOffset` must be less than the size of `raygenShaderBindingTableBuffer`.

`raygenShaderBindingOffset` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`.
- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043
  If `missShaderBindingTableBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457
  `missShaderBindingOffset` must be less than the size of `missShaderBindingTableBuffer`.

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458
  `missShaderBindingOffset` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`.

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044
  If `hitShaderBindingTableBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459
  `hitShaderBindingOffset` must be less than the size of `hitShaderBindingTableBuffer`.

- VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460
  `hitShaderBindingOffset` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`.

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If `callableShaderBindingTableBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
  `callableShaderBindingOffset` must be less than the size of `callableShaderBindingTableBuffer`.

- VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
  `callableShaderBindingOffset` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment`.

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
  `missShaderBindingStride` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`.

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
  `hitShaderBindingStride` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`.

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
  `callableShaderBindingStride` must be a multiple of `VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupHandleSize`.

- VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
  `missShaderBindingStride` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`.

- VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
  `hitShaderBindingStride` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`.

- VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
  `callableShaderBindingStride` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride`.
VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

- VUID-vkCmdTraceRaysNV-width-02469
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

- VUID-vkCmdTraceRaysNV-height-02470
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

- VUID-vkCmdTraceRaysNV-depth-02471
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]

Valid Usage (Implicit)

- VUID-vkCmdTraceRaysNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
  raygenShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
  If missShaderBindingTableBuffer is not VK_NULL_HANDLE, missShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
  If hitShaderBindingTableBuffer is not VK_NULL_HANDLE, hitShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
  If callableShaderBindingTableBuffer is not VK_NULL_HANDLE, callableShaderBindingTableBuffer must be a valid VkBuffer handle

- VUID-vkCmdTraceRaysNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdTraceRaysNV-commonparent
  Each of callableShaderBindingTableBuffer, commandBuffer, hitShaderBindingTableBuffer, missShaderBindingTableBuffer, and raygenShaderBindingTableBuffer that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

To dispatch ray tracing use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    uint32_t width,
    uint32_t height,
    uint32_t depth);
```

• commandBuffer is the command buffer into which the command will be recorded.

• pRaygenShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.

• pMissShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the miss shader stage.

• pHitShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the hit shader stage.

• pCallableShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the callable shader stage.

• width is the width of the ray trace query dimensions.

• height is height of the ray trace query dimensions.

• depth is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of width × height × depth rays is assembled.

Valid Usage

• VUID-vkCmdTraceRaysKHR-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and
\texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- VUID-vkCmdTraceRaysKHR-mipmapMode-04770
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- VUID-vkCmdTraceRaysKHR-None-06479
  If a \texttt{VkImageView} is sampled with \texttt{depth comparison}, the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT}

- VUID-vkCmdTraceRaysKHR-None-02691
  If a \texttt{VkImageView} is accessed using atomic operations as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT}

- VUID-vkCmdTraceRaysKHR-None-07888
  If a \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_Buffer} descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT}

- VUID-vkCmdTraceRaysKHR-None-02692
  If a \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, then the image view's format features \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- VUID-vkCmdTraceRaysKHR-None-02693
  If the \texttt{VK_EXT_filter_cubic} extension is not enabled and any \texttt{VkImageView} is sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command, it \textbf{must} not have a \texttt{VkImageViewType} of \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}

- VUID-vkCmdTraceRaysKHR-filterCubic-02694
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command \textbf{must} have a \texttt{VkImageViewType} and format that supports cubic filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695
  Any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} with a reduction mode of either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} as a result of this command \textbf{must} have a \texttt{VkImageViewType} and format that supports cubic filtering together with minmax filtering, as specified by \texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax} returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- VUID-vkCmdTraceRaysKHR-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any \texttt{VkImageView} being sampled with \texttt{VK_FILTER_CUBIC_EXT} as a result of this command \textbf{must} not have a \texttt{VkSamplerReductionModeCreateInfo::reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECOMPLETE_QCOM}
• VUID-vkCmdTraceRaysKHR-reductionMode-09213
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

• VUID-vkCmdTraceRaysKHR-selectableCubicWeights-09214
If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

• VUID-vkCmdTraceRaysKHR-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysKHR-None-08600
For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysKHR-None-08601
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysKHR-maintenance4-08602
If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline
bind point, with a \texttt{VkPipelineLayout} that is compatible for push constants, with the \texttt{VkPipelineLayout} used to create the current \texttt{VkPipeline} or the \texttt{VkDescriptorSetLayout} and \texttt{VkPushConstantRange} arrays used to create the current \texttt{VkShaderEXT}, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysKHR-None-08114**
  Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, \textbf{must} be valid as described by descriptor validity if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was not created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- **VUID-vkCmdTraceRaysKHR-None-08115**
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdBindDescriptorSets}, the bound \texttt{VkPipeline} \textbf{must} have been created without \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- **VUID-vkCmdTraceRaysKHR-None-08116**
  Descriptors in bound descriptor buffers, specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, \textbf{must} be valid if they are dynamically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command and the bound \texttt{VkPipeline} was created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- **VUID-vkCmdTraceRaysKHR-None-08117**
  If the descriptors used by the \texttt{VkPipeline} bound to the pipeline bind point were specified via \texttt{vkCmdSetDescriptorBufferOffsetsEXT}, the bound \texttt{VkPipeline} \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}

- **VUID-vkCmdTraceRaysKHR-None-08119**
  If a descriptor is dynamically used with a \texttt{VkPipeline} created with \texttt{VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- **VUID-vkCmdTraceRaysKHR-None-08605**
  If a descriptor is dynamically used with a \texttt{VkShaderEXT} created with a \texttt{VkDescriptorSetLayout} that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT}, the descriptor memory \textbf{must} be resident

- **VUID-vkCmdTraceRaysKHR-None-08606**
  If the \texttt{shaderObject} feature is not enabled, a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysKHR-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdTraceRaysKHR-None-08609**
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08610**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08611**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysKHR-None-08607**
  
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysKHR-uniformBuffers-06935**
  
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08612**
  
  If the robustBufferAccess feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-storageBuffers-06936**
  
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-None-08613**
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysKHR-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders **must** not be a protected resource.

- **VUID-vkCmdTraceRaysKHR-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C aC conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdTraceRaysKHR-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in `Instruction/Sampler/Image View Validation`.

- **VUID-vkCmdTraceRaysKHR-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdTraceRaysKHR-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s `format`.

- **VUID-vkCmdTraceRaysKHR-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

- **VUID-vkCmdTraceRaysKHR-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdTraceRaysKHR-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdTraceRaysKHR-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdTraceRaysKHR-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- **VUID-vkCmdTraceRaysKHR-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM is used to read from an reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06977**
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.

If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` must have been called in the current command buffer prior to this trace command.

This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

`commandBuffer` must not be a protected command buffer.

The `size` member of `pRayGenShaderBindingTable` must be equal to its `stride` member.

If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

The `pRayGenShaderBindingTable` must be queried from the currently bound ray tracing pipeline.
The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysKHR-pRayGenShaderBindingTable-03682**
  
  `pRayGenShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03683**
  
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03684**
  
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-03685**
  
  `pMissShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysKHR-stride-03686**
  
  `pMissShaderBindingTable->stride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysKHR-stride-04029**
  
  `pMissShaderBindingTable->stride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03687**
  
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688**
  
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689**
  
  `pHitShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysKHR-stride-03690**
  
  `pHitShaderBindingTable->stride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysKHR-stride-04035**
  
  `pHitShaderBindingTable->stride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03691**
  
  If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692**
  
  The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried must
have been created with the **VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR** usage flag

- **VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693**
  pCallableShaderBindingTable->deviceAddress **must** be a multiple of **VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment**

- **VUID-vkCmdTraceRaysKHR-stride-03694**
  pCallableShaderBindingTable->stride **must** be a multiple of **VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment**

- **VUID-vkCmdTraceRaysKHR-stride-04041**
  pCallableShaderBindingTable->stride **must** be less than or equal to **VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride**

- **VUID-vkCmdTraceRaysKHR-flags-03696**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR**, pHitShaderBindingTable->deviceAddress **must** not be zero

- **VUID-vkCmdTraceRaysKHR-flags-03697**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR**, pHitShaderBindingTable->deviceAddress **must** not be zero

- **VUID-vkCmdTraceRaysKHR-flags-03511**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR**, the shader group handle identified by pMissShaderBindingTable->deviceAddress **must** not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03512**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR**, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an any-hit shader **must** not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03513**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR**, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader **must** not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03514**
  If the currently bound ray tracing pipeline was created with **flags** that included **VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR**, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader **must** not be set to zero

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a **geometryType** of **VK_GEOMETRY_TYPE_TRIANGLES_KHR** **must** have been created with **VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR**

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04736**
Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`.

- VUID-vkCmdTraceRaysKHR-width-03638
  width must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- VUID-vkCmdTraceRaysKHR-height-03639
  height must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- VUID-vkCmdTraceRaysKHR-depth-03640
  depth must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- VUID-vkCmdTraceRaysKHR-width-03641
  width × height × depth must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

**Valid Usage (Implicit)**

- VUID-vkCmdTraceRaysKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
  `pRaygenShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
  `pMissShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
  `pHitShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
  `pCallableShaderBindingTable` must be a valid pointer to a valid `VkStridedDeviceAddressRegionKHR` structure

- VUID-vkCmdTraceRaysKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdTraceRaysKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysKHR-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>

</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkStridedDeviceAddressRegionKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkStridedDeviceAddressRegionKHR {
    VkDeviceAddress deviceAddress;
    VkDeviceSize stride;
    VkDeviceSize size;
} VkStridedDeviceAddressRegionKHR;
```

- `deviceAddress` is the device address (as returned by the `vkGetBufferDeviceAddress` command) at which the region starts, or zero if the region is unused.
- `stride` is the byte stride between consecutive elements.
- `size` is the size in bytes of the region starting at `deviceAddress`.

Valid Usage

- VUID-VkStridedDeviceAddressRegionKHR-size-04631
  If `size` is not zero, all addresses between `deviceAddress` and `deviceAddress + size - 1` must be in the buffer device address range of the same buffer.
- VUID-VkStridedDeviceAddressRegionKHR-size-04632
  If `size` is not zero, `stride` must be less than or equal to the size of the buffer from which `deviceAddress` was queried.

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:

```c
// Provided by VK_HUAWEI_invocation_mask
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer commandBuffer,
```
VkImageView
VkImageLayout

- `commandBuffer` is the command buffer into which the command will be recorded
- `imageView` is an image view handle specifying the invocation mask image `imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with ones value.
- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in when the invocation mask image is accessed

### Valid Usage

- VUID-vkCmdBindInvocationMaskHUAWEI-None-04976
  The `invocationMask` feature must be enabled
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D`
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978
  If `imageView` is not `VK_NULL_HANDLE`, it must have a format of `VK_FORMAT_R8_UINT`
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979
  If `imageView` is not `VK_NULL_HANDLE`, it must have been created with `VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI` set
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_GENERAL`
- VUID-vkCmdBindInvocationMaskHUAWEI-width-04981
  Thread mask image resolution must match the width and height in `vkCmdTraceRaysKHR`
- VUID-vkCmdBindInvocationMaskHUAWEI-None-04982
  Each element in the invocation mask image must have the value 0 or 1. The value 1 means the invocation is active
- VUID-vkCmdBindInvocationMaskHUAWEI-depth-04983
  `depth` in `vkCmdTraceRaysKHR` must be 1

### Valid Usage (Implicit)

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle
- VUID-vkCmdBindInvocationMaskHUAWEI-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value
- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-recording
  `commandBuffer` must be in the `recording state`
- **VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-cmdpool**
  The *VkCommandPool* that *commandBuffer* was allocated from *must* support compute operations

- **VUID-vkCmdBindInvocationMaskHUAWEI-renderpass**
  This command *must* only be called outside of a render pass instance

- **VUID-vkCmdBindInvocationMaskHUAWEI-videocoding**
  This command *must* only be called outside of a video coding scope

- **VUID-vkCmdBindInvocationMaskHUAWEI-commonparent**
  Both of *commandBuffer*, and *imageView* that are valid handles of non-ignored parameters *must* have been created, allocated, or retrieved from the same *VkDevice*

---

**Host Synchronization**

- Host access to *commandBuffer* *must* be externally synchronized
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from *must* be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_pipeline

void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    VkDeviceAddress indirectDeviceAddress);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **pRaygenShaderBindingTable** is a *VkStridedDeviceAddressRegionKHR* that holds the shader binding table data for the ray generation shader stage.
- **pMissShaderBindingTable** is a *VkStridedDeviceAddressRegionKHR* that holds the shader binding table data for the miss shader stage.
- **pHitShaderBindingTable** is a *VkStridedDeviceAddressRegionKHR* that holds the shader binding
table data for the hit shader stage.

- **pCallableShaderBindingTable** is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.

- **indirectDeviceAddress** is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommandKHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirectKHR` behaves similarly to `vkCmdTraceRaysKHR` except that the ray trace query dimensions are read by the device from `indirectDeviceAddress` during execution.

### Valid Usage

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-07888**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-02693**
  If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic`
• VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdTraceRaysIndirectKHR-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM

• VUID-vkCmdTraceRaysIndirectKHR-reductionMode-09213
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

• VUID-vkCmdTraceRaysIndirectKHR-selectableCubicWeights-09214
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

• VUID-vkCmdTraceRaysIndirectKHR-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirectKHR-None-08600
  For each set n that is statically used by a bound shader, a descriptor set must have been
bound to n at the same pipeline bind point, with a *VkPipelineLayout* that is compatible for set n, with the *VkPipelineLayout* used to create the current *VkPipeline* or the *VkDescriptorSetLayout* array used to create the current *VkShaderEXT*, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysIndirectKHR-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a *VkPipelineLayout* that is compatible for push constants, with the *VkPipelineLayout* used to create the current *VkPipeline* or the *VkDescriptorSetLayout* array used to create the current *VkShaderEXT*, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysIndirectKHR-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a *VkPipelineLayout* that is compatible for push constants, with the *VkPipelineLayout* used to create the current *VkPipeline* or the *VkDescriptorSetLayout* and *VkPushConstantRange* arrays used to create the current *VkShaderEXT*, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysIndirectKHR-None-08114**
  Descriptors in each bound descriptor set, specified via *vkCmdBindDescriptorSets*, must be valid as described by descriptor validity if they are statically used by the *VkPipeline* bound to the pipeline bind point used by this command and the bound *VkPipeline* was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-08115**
  If the descriptors used by the *VkPipeline* bound to the pipeline bind point were specified via *vkCmdBindDescriptorSets*, the bound *VkPipeline* must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-08116**
  Descriptors in bound descriptor buffers, specified via *vkCmdSetDescriptorBufferOffsetsEXT*, must be valid if they are dynamically used by the *VkPipeline* bound to the pipeline bind point used by this command and the bound *VkPipeline* was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-08604**
  Descriptors in bound descriptor buffers, specified via *vkCmdSetDescriptorBufferOffsetsEXT*, must be valid if they are dynamically used by any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysIndirectKHR-None-08117**
  If the descriptors used by the *VkPipeline* bound to the pipeline bind point were specified via *vkCmdSetDescriptorBufferOffsetsEXT*, the bound *VkPipeline* must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysIndirectKHR-None-08119**
  If a descriptor is dynamically used with a *VkPipeline* created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident

- **VUID-vkCmdTraceRaysIndirectKHR-None-08605**
If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08606**
  If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysIndirectKHR-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08612**
If the *robustBufferAccess* feature is not enabled, and any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-storageBuffers-06936**
  If any stage of the *VkPipeline* object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the *robustBufferAccess* feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-None-08613**
  If the *robustBufferAccess* feature is not enabled, and any *VkShaderEXT* bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders **must** not be a protected resource.

- **VUID-vkCmdTraceRaysIndirectKHR-None-06550**
  If a bound shader accesses a *VkSampler* or *VkImageView* object that enables sampler Y′C_bC_a conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551**
  If a bound shader accesses a *VkSampler* or *VkImageView* object that enables sampler Y′C_bC_a conversion, that object **must** not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdTraceRaysIndirectKHR-viewType-07752**
  If a *VkImageView* is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdTraceRaysIndirectKHR-format-07753**
  If a *VkImageView* is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08795**
  If a *VkImageWrite* created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08796**
  If a *VkImageWrite* created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-04469**
  If a *VkBufferView* is accessed using `OpImageWrite` as a result of this command, then the
Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, or `OpImageBlockMatchSSDQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format must be a single-component format.

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysIndirectKHR-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdTraceRaysIndirectKHR-None-03429**
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.

- **VUID-vkCmdTraceRaysIndirectKHR-None-09458**
  If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` must have been called in the current command buffer prior to this trace command.

- **VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679**
This command **must** not cause a shader call instruction to be executed from a shader invocation with a **recursion depth** greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635**
  
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdTraceRaysIndirectKHR-size-04023**
  
  The **size** member of `pRayGenShaderBindingTable` **must** be equal to its **stride** member

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680**
  
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681**
  
  The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682**
  
  `pRayGenShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683**
  
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684**
  
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685**
  
  `pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03686**
  
  `pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04029**
  
  `pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687**
  
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688**
  
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689**
  
  `pHitShaderBindingTable->deviceAddress` **must** be a multiple of `3318`
• VUID-vkCmdTraceRaysIndirectKHR-stride-03690
  pHitShaderBindingTable->stride must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysIndirectKHR-stride-04035
  pHitShaderBindingTable->stride must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

• VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691
  If the buffer from which pCallableShaderBindingTable->deviceAddress was queried is non-
sparse then it must be bound completely and contiguously to a single VkDeviceMemory
object

• VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692
  The buffer from which the pCallableShaderBindingTable->deviceAddress is queried must
  have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

• VUID-vkCmdTraceRaysIndirectKHR-stride-03694
  pCallableShaderBindingTable->stride must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysIndirectKHR-stride-04041
  pCallableShaderBindingTable->stride must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

• VUID-vkCmdTraceRaysIndirectKHR-flags-03696
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR,
  pHitShaderBindingTable->deviceAddress must not be zero

• VUID-vkCmdTraceRaysIndirectKHR-flags-03697
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR,
  pHitShaderBindingTable->deviceAddress must not be zero

• VUID-vkCmdTraceRaysIndirectKHR-flags-03511
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle
  identified by pMissShaderBindingTable->deviceAddress must not be set to zero

• VUID-vkCmdTraceRaysIndirectKHR-flags-03512
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table
  identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command
  in order to execute an any-hit shader must not be set to zero

• VUID-vkCmdTraceRaysIndirectKHR-flags-03513
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, entries in the table
identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute a closest hit shader must not be set to zero

• VUID-vkCmdTraceRaysIndirectKHR-flags-03514
  If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATERAY_TRACING_NO.NULL.INTERSECTION.SHADERS_BIT_KHR, entries in the table identified by pHitShaderBindingTable->deviceAddress accessed as a result of this command in order to execute an intersection shader must not be set to zero

• VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04735
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_TRIANGLES_KHR must have been created with VK_RAY.TRACING.SHADER.GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR

• VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736
  Any non-zero hit shader group entries in the table identified by pHitShaderBindingTable->deviceAddress accessed by this call from a geometry with a geometryType of VK_GEOMETRY_TYPE_AABBS_KHR must have been created with VK_RAY.TRACING.SHADER.GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR

• VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632
  If the buffer from which indirectDeviceAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633
  The buffer from which indirectDeviceAddress was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634
  indirectDeviceAddress must be a multiple of 4

• VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636
  All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof(VkTraceRaysIndirectCommandKHR) - 1 must be in the buffer device address range of the same buffer

• VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637
  The rayTracingPipelineTraceRaysIndirect feature must be enabled

• VUID-vkCmdTraceRaysIndirectKHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
  If the bound ray tracing pipeline was created with VK_PIPELINE_CREATERAY_TRACING_ALLOW.MOTION_BIT_NV
  VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkTraceRaysIndirectCommandKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
};
```
uint32_t depth;
} VkTraceRaysIndirectCommandKHR;

- **width** is the width of the ray trace query dimensions.
- **height** is height of the ray trace query dimensions.
- **depth** is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommandKHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

### Valid Usage

- **VUID-VkTraceRaysIndirectCommandKHR-width-03638**
  
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- **VUID-VkTraceRaysIndirectCommandKHR-height-03639**
  
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- **VUID-VkTraceRaysIndirectCommandKHR-depth-03640**
  
  `depth` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] ×VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- **VUID-VkTraceRaysIndirectCommandKHR-width-03641**
  
  `width × height × depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(  
    VkCommandBuffer commandBuffer,  
    VkDeviceAddress indirectDeviceAddress);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **indirectDeviceAddress** is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommand2KHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to `vkCmdTraceRaysIndirectKHR` except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.

### Valid Usage

- **VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and
compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdTraceRaysIndirect2KHR-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

• VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdTraceRaysIndirect2KHR-cubicRangeClamp-09212
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM
• VUID-vkCmdTraceRaysIndirect2KHR-reductionMode-09213
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT

• VUID-vkCmdTraceRaysIndirect2KHR-selectableCubicWeights-09214
If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM

• VUID-vkCmdTraceRaysIndirect2KHR-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdTraceRaysIndirect2KHR-None-08600
For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysIndirect2KHR-None-08601
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

• VUID-vkCmdTraceRaysIndirect2KHR-maintenance4-08602
If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility
bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in `Pipeline Layout Compatibility`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08114**: Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08115**: If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08116**: Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08117**: If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08119**: If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08604**: Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08117**: If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08119**: If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08605**: If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory must be resident.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08606**: If the `shaderObject` feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08608**: If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08609**
If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-None-08610}
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-None-08611}
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command or any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-None-08607}
  If the \textit{shaderObject} is enabled, either a valid pipeline \textbf{must} be bound to the pipeline bind point used by this command, or a valid combination of valid and \texttt{VK_NULL_HANDLE} shader objects \textbf{must} be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-uniformBuffers-06935}
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-None-08612}
  If the \texttt{robustBufferAccess} feature is not enabled, and any \texttt{VkShaderEXT} bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-storageBuffers-06936}
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{storageBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- \textbf{VUID-vkCmdTraceRaysIndirect2KHR-None-08613}
If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders **must** not be a protected resource

- **VUID-vkCmdTraceRaysIndirect2KHR-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdTraceRaysIndirect2KHR-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C aC conversion, that object **must** not use the ConstOffset and Offset operands

- **VUID-vkCmdTraceRaysIndirect2KHR-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s viewType **must** match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdTraceRaysIndirect2KHR-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage **must** match

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 64

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 32

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- **VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- **VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, or `OpImageBlockMatchGatherSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s format must be a single-component format.

If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

Any shader invocation executed by this command must terminate.

Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline.

If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` must have been called in the current command buffer prior to this trace command.

This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

The buffer from which `indirectDeviceAddress` was queried must be a multiple of 4.
• VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03636
  All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof (VkTraceRaysIndirectCommand2KHR) - 1 must be in the buffer device address range of the same buffer

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingPipelineTraceRaysIndirect2-03637
  The rayTracingPipelineTraceRaysIndirect2 feature must be enabled

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
  If the bound ray tracing pipeline was created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
  VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdTraceRaysIndirect2KHR-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdTraceRaysIndirect2KHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The `VkTraceRaysIndirectCommand2KHR` structure is defined as:

```c
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress raygenShaderRecordAddress;
    VkDeviceSize  raygenShaderRecordSize;
    VkDeviceAddress missShaderBindingTableAddress;
    VkDeviceSize  missShaderBindingTableSize;
    VkDeviceSize  missShaderBindingTableStride;
    VkDeviceAddress hitShaderBindingTableAddress;
    VkDeviceSize  hitShaderBindingTableSize;
    VkDeviceSize  hitShaderBindingTableStride;
    VkDeviceAddress callableShaderBindingTableAddress;
    VkDeviceSize  callableShaderBindingTableSize;
    VkDeviceSize  callableShaderBindingTableStride;
    uint32_t      width;
    uint32_t      height;
    uint32_t      depth;
} VkTraceRaysIndirectCommand2KHR;
```

- `raygenShaderRecordAddress` is a `VkDeviceAddress` of the ray generation shader binding table record used by this command.
- `raygenShaderRecordSize` is a `VkDeviceSize` number of bytes corresponding to the ray generation shader binding table record at base address `raygenShaderRecordAddress`.
- `missShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the miss shader binding table used by this command.
- `missShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the miss shader binding table at `missShaderBindingTableAddress` that may be accessed by this command.
- `missShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the miss shader binding table.
- `hitShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the hit shader binding table used by this command.
- `hitShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the hit shader binding table at `hitShaderBindingTableAddress` that may be accessed by this command.
- `hitShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the hit shader binding table.
- `callableShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the callable shader binding table used by this command.
- `callableShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the callable shader binding table at `callableShaderBindingTableAddress` that may be accessed by this command.
- `callableShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the
callable shader binding table.

- **width** is the width of the ray trace query dimensions.
- **height** is height of the ray trace query dimensions.
- **depth** is depth of the ray trace query dimensions.

The members of `VkTraceRaysIndirectCommand2KHR` have the same meaning as the similarly named parameters of `vkCmdTraceRaysKHR`.

Indirect shader binding table buffer parameters must satisfy the same memory alignment and binding requirements as their counterparts in `vkCmdTraceRaysIndirectKHR` and `vkCmdTraceRaysKHR`.

**Valid Usage**

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680
  If the buffer from which `raygenShaderRecordAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681
  The buffer from which the `raygenShaderRecordAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682
  `raygenShaderRecordAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683
  If the buffer from which `missShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684
  The buffer from which the `missShaderBindingTableAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03685
  `missShaderBindingTableAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-03686
  `missShaderBindingTableStride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- VUID-VkTraceRaysIndirectCommand2KHR-stride-04029
  `missShaderBindingTableStride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03687
  If the buffer from which `hitShaderBindingTableAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03688
  The buffer from which the `hitShaderBindingTableAddress` is queried **must** have been
• VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-03689
  hitShaderBindingTableAddress must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

• VUID-VkTraceRaysIndirectCommand2KHR-stride-03690
  hitShaderBindingTableStride must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

• VUID-VkTraceRaysIndirectCommand2KHR-stride-04035
  hitShaderBindingTableStride must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

• VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03691
  If the buffer from which callableShaderBindingTableAddress was queried is non-sparse
  then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03692
  The buffer from which the callableShaderBindingTableAddress is queried must have been
  created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

• VUID-VkTraceRaysIndirectCommand2KHR-pCallableShaderBindingTable-03693
  callableShaderBindingTableAddress must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

• VUID-VkTraceRaysIndirectCommand2KHR-stride-03694
  callableShaderBindingTableStride must be a multiple of
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

• VUID-VkTraceRaysIndirectCommand2KHR-stride-04041
  callableShaderBindingTableStride must be less than or equal to
  VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

• VUID-VkTraceRaysIndirectCommand2KHR-flags-03696
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR,
  hitShaderBindingTableAddress must not be zero

• VUID-VkTraceRaysIndirectCommand2KHR-flags-03697
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR,
  hitShaderBindingTableAddress must not be zero

• VUID-VkTraceRaysIndirectCommand2KHR-flags-03511
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR, the shader group handle
  identified by missShaderBindingTableAddress must not be set to zero

• VUID-VkTraceRaysIndirectCommand2KHR-flags-03512
  If the currently bound ray tracing pipeline was created with flags that included
  VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR, entries in the table
  identified by hitShaderBindingTableAddress accessed as a result of this command in order
  to execute an any-hit shader must not be set to zero

• VUID-VkTraceRaysIndirectCommand2KHR-flags-03513
If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-flags-03514**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an intersection shader must not be set to zero.

- **VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`.

- **VUID-VkTraceRaysIndirectCommand2KHR-pHitShaderBindingTable-04736**
  Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`.

- **VUID-VkTraceRaysIndirectCommand2KHR-width-03638**
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`.

- **VUID-VkTraceRaysIndirectCommand2KHR-height-03639**
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`.

- **VUID-VkTraceRaysIndirectCommand2KHR-depth-03640**

- **VUID-VkTraceRaysIndirectCommand2KHR-width-03641**
  `width × height × depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`.

### 40.3. Shader Binding Table

A shader binding table is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages shader binding tables as `VkBuffer` objects.

Each entry in the shader binding table consists of `shaderGroupHandleSize` bytes of data, either as queried by `vkGetRayTracingShaderGroupHandlesKHR` to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of `VK_SHADER_UNUSED_KHR`. The remainder of the data specified by the stride is
application-visible data that can be referenced by a \texttt{ShaderRecordBufferKHR} block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the \texttt{vkCmdTraceRaysNV}, \texttt{vkCmdTraceRaysKHR}, or \texttt{vkCmdTraceRaysIndirectKHR} commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the \texttt{ShaderRecordBufferKHR} storage class are used to access the provided shader binding table. Such variables \textbf{must} be:

- typed as \texttt{OpTypeStruct}, or an array of this type,
- identified with a \texttt{Block} decoration, and
- laid out explicitly using the \texttt{Offset}, \texttt{ArrayStride}, and \texttt{MatrixStride} decorations as specified in Offset and Stride Assignment.

The \texttt{Offset} decoration for any member of a \texttt{Block}-decorated variable in the \texttt{ShaderRecordBufferKHR} storage class \textbf{must} not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Accesses to the shader binding table from ray tracing pipelines \textbf{must} be synchronized with the \texttt{VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR} pipeline stage and an access type of \texttt{VK_ACCESS_SHADER_READ_BIT}.

\begin{itemize}
\item \texttt{pRaygenShaderBindingTable->deviceAddress} parameter—there is no indexing. All data accessed \textbf{must} be less than \texttt{pRaygenShaderBindingTable->size} bytes from \texttt{deviceAddress}. \texttt{pRaygenShaderBindingTable->stride} is unused, and \textbf{must} be equal to \texttt{pRaygenShaderBindingTable->size}.
\end{itemize}
For `vkCmdTraceRaysNV`, the location of the ray generation shader is specified by the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters — there is no indexing.

**Hit Shaders**

The base for the computation of intersection, any-hit, and closest hit shader locations is the `instanceShaderBindingTableRecordOffset` value stored with each instance of a top-level acceleration structure (`VkAccelerationStructureInstanceKHR`). This value determines the beginning of the shader binding table records for a given instance.

In the following rule, `geometryIndex` refers to the `geometry index` of the intersected geometry within the instance.

The `sbtRecordOffset` and `sbtRecordStride` values are passed in as parameters to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the `SBTOffset` and `SBTStride` parameters to the `pipeline trace ray` instructions.

The result of this computation is then added to `pHitShaderBindingTable->deviceAddress`, a device address passed to `vkCmdTraceRaysKHR`, or `hitShaderBindingOffset`, a base offset passed to `vkCmdTraceRaysNV`.

For `vkCmdTraceRaysKHR`, the complete rule to compute a hit shader binding table record address in the `pHitShaderBindingTable` is:

\[
\text{pHitShaderBindingTable->deviceAddress} + \text{pHitShaderBindingTable->stride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

All data accessed **must** be less than `pHitShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the `hitShaderBindingTableBuffer` is:

\[
\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

**Miss Shaders**

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders **may** be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is `pMissShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `missShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `missIndex` value is passed in as a parameter to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for
more details. In SPIR-V, this corresponds to the `MissIndex` parameter to the pipeline trace ray instructions.

For `vkCmdTraceRaysKHR`, the complete rule to compute a miss shader binding table record address in the `pMissShaderBindingTable` is:

\[
\text{pMissShaderBindingTable->deviceAddress + pMissShaderBindingTable->stride \times missIndex}
\]

All data accessed must be less than `pMissShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the `missShaderBindingTableBuffer` is:

\[
\text{missShaderBindingOffset + missShaderBindingStride \times missIndex}
\]

**Callable Shaders**

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders may be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is `pCallableShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `callableShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `sbtRecordIndex` value is passed in as a parameter to `executeCallableNV()` or `executeCallableEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `SBTIndex` parameter to the `OpExecuteCallableNV` or `OpExecuteCallableKHR` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a callable shader binding table record address in the `pCallableShaderBindingTable` is:

\[
\text{pCallableShaderBindingTable->deviceAddress + pCallableShaderBindingTable->stride \times sbtRecordIndex}
\]

All data accessed must be less than `pCallableShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the `callableShaderBindingTableBuffer` is:

\[
\text{callableShaderBindingOffset + callableShaderBindingStride \times sbtRecordIndex}
\]

### 40.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which may be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an
implementation may use a stack of data in memory. This stack must be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

\[
\text{rayGenStackMax} + \min(1, \ max\text{PipelineRayRecursionDepth}) \times \max(\text{closestHitStackMax}, \\
\text{missStackMax}, \text{intersectionStackMax} + \text{anyHitStackMax}) + \max(0, \max\text{PipelineRayRecursionDepth} -1) \times \max(\text{closestHitStackMax}, \text{missStackMax}) + 2 \times \text{callableStackMax}
\]

where \text{rayGenStackMax}, \text{closestHitStackMax}, \text{missStackMax}, \text{anyHitStackMax}, \text{intersectionStackMax}, and \text{callableStackMax} are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application may want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

\[\text{Note}\]

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

\[
\text{rayGenStack} + \max(\text{closestHit1Stack}, \text{miss1Stack}) + \max(\text{closestHit2Stack}, \\
\text{miss2Stack})
\]

This is guaranteed to be no larger than the default stack size computation which assumes that both call levels may be the larger of the two.

### 40.5. Ray Tracing Capture Replay

In a similar way to bufferDeviceAddressCaptureReplay, the rayTracingPipelineShaderGroupHandleCaptureReplay feature allows the querying of opaque data which can be used in a future replay.

During the capture phase, capture/replay tools are expected to query opaque data for shader group handle replay using vkGetRayTracingCaptureReplayShaderGroupHandlesKHR.

Providing the opaque data during replay, using VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle at pipeline creation time, causes the implementation to generate identical shader group handles to those in the capture phase, allowing capture/replay tools to reuse previously recorded shader binding table buffer contents or to obtain the same handles by calling vkGetRayTracingCaptureReplayShaderGroupHandlesKHR again.
Chapter 41. Memory Decompression

To decompress data between one or more memory regions call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryNV(
    VkCommandBuffer commandBuffer,
    uint32_t decompressRegionCount,
    const VkDecompressMemoryRegionNV* pDecompressMemoryRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `decompressRegionCount` is the number of memory regions to decompress.
- `pDecompressMemoryRegions` is a pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures specifying decompression parameters.

Each region specified in `pDecompressMemoryRegions` is decompressed from the source to destination region based on the specified decompression method.

### Valid Usage

- VUID-vkCmdDecompressMemoryNV-None-07684
  The `memoryDecompression` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdDecompressMemoryNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDecompressMemoryNV-pDecompressMemoryRegions-parameter
  `pDecompressMemoryRegions` must be a valid pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures
- VUID-vkCmdDecompressMemoryNV-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdDecompressMemoryNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- VUID-vkCmdDecompressMemoryNV-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdDecompressMemoryNV-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdDecompressMemoryNV-decompressRegionCount-arraylength
  `decompressRegionCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkDecompressMemoryRegionNV` structure is defined as:

```c
// Provided by VK_NV_memory_decompression
typedef struct VkDecompressMemoryRegionNV {
    VkDeviceAddress srcAddress;
    VkDeviceAddress dstAddress;
    VkDeviceSize compressedSize;
    VkDeviceSize decompressedSize;
    VkMemoryDecompressionMethodFlagsNV decompressionMethod;
} VkDecompressMemoryRegionNV;
```

- `srcAddress` is the address where compressed data is stored.
- `dstAddress` is the destination address where decompressed data will be written.
- `compressedSize` is the size of compressed data in bytes.
- `decompressedSize` is the size of decompressed data in bytes.
- `decompressionMethod` is a bitmask of `VkMemoryDecompressionMethodFlagBitsNV` with a single bit set specifying the method used to decompress data.

Valid Usage

- VUID-VkDecompressMemoryRegionNV-srcAddress-07685
  The `srcAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-srcAddress-07686
  The memory in range `srcAddress` and `srcAddress + compressedSize` must be valid and bound to a `VkDeviceMemory` object
- VUID-VkDecompressMemoryRegionNV-dstAddress-07687
  The `dstAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-decompressionMethod-09395
If `decompressionMethod` is `VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV`, then `decompressedSize` must be less than or equal to 65536 bytes

- VUID-VkDecompressMemoryRegionNV-dstAddress-07688
  The memory in range `dstAddress` and `dstAddress + decompressedSize` must be valid and bound to a `VkDeviceMemory` object

- VUID-VkDecompressMemoryRegionNV-decompressedSize-07689
  The `decompressedSize` must be large enough to hold the decompressed data based on the `decompressionMethod`

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-07690
  The `decompressionMethod` must have a single bit set

- VUID-VkDecompressMemoryRegionNV-srcAddress-07691
  The `srcAddress` to `srcAddress + compressedSize` region must not overlap with the `dstAddress` and `dstAddress + decompressedSize` region

### Valid Usage (Implicit)

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-parameter
  `decompressionMethod` must be a valid combination of `VkMemoryDecompressionMethodFlagBitsNV` values

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-requiredbitmask
  `decompressionMethod` must not be 0

To decompress data between one or more memory regions by specifying decompression parameters indirectly in a buffer, call:

```c
// Provided by VK_NV_memory_decompression
def void vkCmdDecompressMemoryIndirectCountNV(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress indirectCommandsAddress,
    VkDeviceAddress indirectCommandsCountAddress,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectCommandsAddress` is the device address containing decompression parameters laid out as an array of `VkDecompressMemoryRegionNV` structures.
- `indirectCommandsCountAddress` is the device address containing the decompression count.
- `stride` is the byte stride between successive sets of decompression parameters located starting from `indirectCommandsAddress`.

Each region specified in `indirectCommandsAddress` is decompressed from the source to destination region based on the specified decompression method.
Valid Usage

- **VUID-vkCmdDecompressMemoryIndirectCountNV-None-07692**
  The memoryDecompression feature must be enabled

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsAddress-07693**
  If indirectCommandsAddress comes from a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsAddress-07694**
  The VkBuffer that indirectCommandsAddress comes from must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-vkCmdDecompressMemoryIndirectCountNV-offset-07695**
  offset must be a multiple of 4

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07696**
  If indirectCommandsCountAddress comes from a non-sparse buffer then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07697**
  The VkBuffer that indirectCommandsCountAddress comes from must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07698**
  indirectCommandsCountAddress must be a multiple of 4

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07699**
  The count stored in indirectCommandsCountAddress must be less than or equal to VkPhysicalDeviceMemoryDecompressionPropertiesNV:maxDecompressionIndirectCount

- **VUID-vkCmdDecompressMemoryIndirectCountNV-stride-07700**
  stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDecompressMemoryRegionNV)

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07701**
  If the count stored in indirectCommandsCountAddress is equal to 1, (offset + sizeof(VkDecompressMemoryRegionNV)) must be less than or equal to the size of the VkBuffer that indirectCommandsAddress comes from

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsCountAddress-07702**
  If the count stored in indirectCommandsCountAddress is greater than 1, indirectCommandsAddress + sizeof(VkDecompressMemoryRegionNV) + (stride × (count stored in countBuffer - 1)) must be less than or equal to the last valid address in the VkBuffer that indirectCommandsAddress was created from
Valid Usage (Implicit)

- VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-recording commandBuffer must be in the recording state

- VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdDecompressMemoryIndirectCountNV-renderpass This command must only be called outside of a render pass instance

- VUID-vkCmdDecompressMemoryIndirectCountNV-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>

Bits which can be set in VkDecompressMemoryRegionNV::decompressionMethod specifying the decompression method to select, or returned in VkPhysicalDeviceMemoryDecompressionPropertiesNV::decompressionMethods specifying the available decompression methods are:

```cpp
// Provided by VK_NV_memory_decompression
// Flag bits for VkMemoryDecompressionMethodFlagBitsNV
typedef VkFlags64 VkMemoryDecompressionMethodFlagBitsNV;
sstatic const VkMemoryDecompressionMethodFlagBitsNV VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV = 0x00000001ULL;
```

- VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV specifies that the GDeflate 1.0 algorithm is used to decompress data.

```
// Provided by VK_NV_memory_decompression
```
typedef VkFlags64 VkMemoryDecompressionMethodFlagsNV;

VkMemoryDecompressionMethodFlagsNV is a bitmask type for specifying a mask of one or more VkMemoryDecompressionMethodFlagBitsNV:
Chapter 42. Video Coding

Vulkan implementations may expose one or more queue families supporting video coding operations. These operations are performed by recording them into a command buffer within a video coding scope, and submitting them to queues with compatible video coding capabilities.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

42.1. Video Picture Resources

In the context of video coding, multidimensional arrays of image data that can be used as the source or target of video coding operations are referred to as video picture resources. They may store additional metadata that includes implementation-private information used during the execution of video coding operations, as discussed later.

Video picture resources are backed by VkImage objects. Individual subregions of VkImageView objects created from such resources can be used as decode output pictures, encode input pictures, reconstructed pictures, and/or reference pictures.

The parameters of a video picture resource are specified using a VkVideoPictureResourceInfoKHR structure.

The VkVideoPictureResourceInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    uint32_t baseArrayLayer;
    VkImageView imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **codedOffset** is the offset in texels of the image subregion to use.
- **codedExtent** is the size in pixels of the coded image data.
• `baseArrayLayer` is the array layer of the image view specified in `imageViewBinding` to use as the video picture resource.

• `imageViewBinding` is an image view representing the video picture resource.

The image subresource referred to by such a structure is defined as the image array layer index specified in `baseArrayLayer` relative to the image subresource range the image view specified in `imageViewBinding` was created with.

The meaning of the `codedOffset` and `codedExtent` depends on the command and context the video picture resource is used in, as well as on the used video profile and corresponding codec-specific semantics, as described later.

A video picture resource is uniquely defined by the image subresource referred to by an instance of this structure, together with the `codedOffset` and `codedExtent` members that identify the image subregion within the image subresource referenced corresponding to the video picture resource according to the particular codec-specific semantics.

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. As a result, given an effective image subregion corresponding to a video picture resource, the actual image subregion accessed may be larger than that as it may include additional padding texels due to the picture access granularity. Any writes performed by video coding operations to such padding texels will result in undefined texel values.

Two video picture resources match if they refer to the same image subresource and they specify identical `codedOffset` and `codedExtent` values.

---

**Valid Usage**

- VUID-VkVideoPictureResourceInfoKHR-baseArrayLayer-07175
  `baseArrayLayer` must be less than the `VkImageViewCreateInfo::subresourceRange.layerCount` specified when the image view `imageViewBinding` was created

**Valid Usage (Implicit)**

- VUID-VkVideoPictureResourceInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR`

- VUID-VkVideoPictureResourceInfoKHR-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter
  `imageViewBinding` must be a valid `VkImageView` handle
42.2. Decoded Picture Buffer

An integral part of video coding pipelines is the reconstruction of pictures from a compressed video bitstream. A reconstructed picture is a video picture resource resulting from this process.

Such reconstructed pictures can be used as reference pictures in subsequent video coding operations to provide predictions of the values of samples of subsequently decoded or encoded pictures. The correct use of such reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

The list of reference pictures used to provide such predictions within a single video coding operation is referred to as the list of active reference pictures.

The decoded picture buffer (DPB) is an indexed data structure that maintains the set of reference pictures available to be used in video coding operations. Individual indexed entries of the DPB are referred to as the decoded picture buffer (DPB) slots. The range of valid DPB slot indices is between zero and \( N-1 \), where \( N \) is the capacity of the DPB. Each DPB slot can refer to a reference picture containing a video frame or can refer to up to two reference pictures containing the top and/or bottom fields that, when both present, together represent a full video frame.

In Vulkan, the state and the backing store of the DPB is separated as follows:

- The state of individual DPB slots is maintained by video session objects.
- The backing store of DPB slots is provided by subregions of VKImage objects used as video picture resources.

In addition, the implementation may also maintain opaque metadata associated with DPB slots, including:

- Reference picture metadata corresponding to the video picture resource associated with the DPB slot.

Such metadata may be stored by the implementation as part of the DPB slot state maintained by the video session, or as part of the video picture resource backing the DPB slot.

Any metadata stored in the video picture resources backing DPB slots are independent of the video session used to store it, hence such video picture resources can be shared with other video sessions. Correspondingly, any metadata that is dependent on the video session will always be stored as part of the DPB slot state maintained by that video session.

The responsibility of managing the DPB is split between the application and the implementation as follows:

- The application maintains the association between DPB slot indices and corresponding video picture resources.
- The implementation maintains global and per-slot opaque reference picture metadata.

In addition, the application is also responsible for managing the mapping between the codec-specific picture IDs and DPB slots, and any other codec-specific states unless otherwise specified.
42.2.1. DPB Slot States

At a given time, each DPB slot is either in active or inactive state. Initially, all DPB slots managed by a video session are in inactive state.

A DPB slot can be activated by using it as the target of picture reconstruction in a video coding operation with the reconstructed picture requested to be set up as a reference picture, according to the codec-specific semantics, changing its state to active and associating it with a picture reference to the reconstructed pictures.

Some video coding standards allow multiple picture references to be associated with a single DPB slot. In this case the state of the individual picture references can be independently updated.

Note
As an example, H.264 decoding allows associating a separate top field and bottom field picture with the same DPB slot.

As part of reference picture setup, the implementation may also generate reference picture metadata. Such reference picture metadata is specific to each picture reference associated with the DPB slot.

If such a video coding operation completes successfully, the activated DPB slot will have a valid picture reference and the reconstructed picture is associated with the DPB slot. This is true even if the DPB slot is used as the target of a picture reconstruction that only sets up a top field or bottom field reference picture and thus does not yet refer to a complete frame. However, if any data provided as input to such a video coding operation is not compliant to the video compression standard used, that video coding operation may complete unsuccessfully, in which case the activated DPB slot will have an invalid picture reference. This is true even if the DPB slot previously had a valid picture reference to a top field or bottom field reference picture, but the reconstruction of the other field corresponding to the DPB slot failed.

The application can use queries to get feedback about the outcome of video coding operations and use the resulting VkQueryResultStatusKHR value to determine whether the video coding operation completed successfully (result status is positive) or unsuccessfully (result status is negative).

Using a reference picture associated with a DPB slot that has an invalid picture reference as an active reference picture in subsequent video coding operations is legal, however, the contents of the outputs of such operations are undefined, and any DPB slots activated by such video coding operations will also have an invalid picture reference. This is true even if such video coding operations may otherwise complete successfully.

A DPB slot can also be deactivated by the application, changing its state to inactive and invalidating any picture references and reference picture metadata associated with the DPB slot.

If an already active DPB slot is used as the target of picture reconstruction in a video coding operation, but the decoded picture is not requested to be set up as a reference picture, according to the codec-specific semantics, no reference picture setup happens and the corresponding picture reference and reference picture metadata is invalidated within the DPB slot. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly
If an already active DPB slot is used as the target of picture reconstruction when decoding a field picture that is not marked as reference, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then the DPB slot is deactivated.
- If the DPB slot is not currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the decoded picture is a bottom field picture, then the other field picture association of the DPB slot, if any, is not disturbed.
- If the DPB slot is currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is currently associated with a bottom field picture and the decoded picture is a bottom field picture, then that picture association is invalidated, without disturbing the other field picture association, if any. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly deactivated.

A DPB slot can be activated with a new frame even if it is already active. In this case all previous associations of the DPB slots with reference pictures are replaced with an association with the reconstructed picture used to activate it.

If an already active DPB slot is activated with a reconstructed field picture, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then that association is replaced with an association with the reconstructed field picture used to activate it.
- If the DPB slot is not currently associated with a top field picture and the DPB slot is activated with a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the DPB slot is activated with a bottom field picture, then the DPB slot is associated with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.
- If the DPB slot is currently associated with a top field picture and the DPB slot is activated with a new top field picture, or if the DPB slot is currently associated with a bottom field picture and the DPB slot is activated with a new bottom field picture, then that association is replaced with an association with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.

### 42.3. Video Profiles

The `VkVideoProfileInfoKHR` structure is defined as follows:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR lumaBitDepth;
} VkVideoProfileInfoKHR;
```
VkVideoProfileInfoKHR

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoCodecOperation` is a `VkVideoCodecOperationFlagBitsKHR` value specifying a video codec operation.
- `chromaSubsampling` is a bitmask of `VkVideoChromaSubsamplingFlagBitsKHR` specifying video chroma subsampling information.
- `lumaBitDepth` is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video luma bit depth information.
- `chromaBitDepth` is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video chroma bit depth information.

Video profiles are provided as input to video capability queries such as `vkGetPhysicalDeviceVideoCapabilitiesKHR` or `vkGetPhysicalDeviceVideoFormatPropertiesKHR`, as well as when creating resources to be used by video coding operations such as images, buffers, query pools, and video sessions.

The full description of a video profile is specified by an instance of this structure, and the codec-specific and auxiliary structures provided in its `pNext` chain.

When this structure is specified as an input parameter to `vkGetPhysicalDeviceVideoCapabilitiesKHR`, or through the `pProfiles` member of a `VkVideoProfileListInfoKHR` structure in the `pNext` chain of the input parameter of a query command such as `vkGetPhysicalDeviceVideoFormatPropertiesKHR` or `vkGetPhysicalDeviceImageFormatProperties2`, the following error codes indicate specific causes of the failure of the query operation:

- `VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR` indicates that the requested video picture layout (e.g. through the `pictureLayout` member of a `VkVideoDecodeH264ProfileInfoKHR` structure included in the `pNext` chain of `VkVideoProfileInfoKHR`) is not supported.
- `VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR` indicates that a video profile operation specified by `videoCodecOperation` is not supported.
- `VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR` indicates that video format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.
- `VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR` indicates that the codec-specific parameters corresponding to the video codec operation are not supported.

Valid Usage

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013
  `chromaSubsampling` must have a single bit set
- VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014
lumaBitDepth must have a single bit set

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015
  If chromaSubsampling is not VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR, then chromaBitDepth must have a single bit set

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07179
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain must include a VkVideoDecodeH264ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07180
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain must include a VkVideoDecodeH265ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-09256
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain must include a VkVideoDecodeAV1ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07181
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain must include a VkVideoEncodeH264ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07182
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain must include a VkVideoEncodeH265ProfileInfoKHR structure

Valid Usage (Implicit)

- VUID-VkVideoProfileInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter
  videoCodecOperation must be a valid VkVideoCodecOperationFlagBitsKHR value

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter
  chromaSubsampling must be a valid combination of VkVideoChromaSubsamplingFlagBitsKHR values

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-requiredBitmask
  chromaSubsampling must not be 0

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter
  lumaBitDepth must be a valid combination of VkVideoComponentBitDepthFlagBitsKHR values

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-requiredBitmask
  lumaBitDepth must not be 0

- VUID-VkVideoProfileInfoKHR-chromaBitDepth-parameter
  chromaBitDepth must be a valid combination of VkVideoComponentBitDepthFlagBitsKHR values

Possible values of VkVideoProfileInfoKHR::videoCodecOperation, specifying the type of video coding
operation and video compression standard used by a video profile, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
    // Provided by VK_KHR_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR = 0x00010000,
    // Provided by VK_KHR_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR = 0x00020000,
    // Provided by VK_KHR_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_video_decode_av1
    VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR = 0x00000004
} VkVideoCodecOperationFlagBitsKHR;
```

- **VK_VIDEO_CODEC_OPERATION_NONE_KHR** indicates no support for any video codec operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR** specifies support for H.264 encode operations.
- **VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR** specifies support for H.265 encode operations.
- **VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR** specifies support for H.264 decode operations.
- **VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR** specifies support for H.265 decode operations.
- **VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR** specifies support for AV1 decode operations.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

`VkVideoCodecOperationFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCodecOperationFlagBitsKHR`.

The video format chroma subsampling is defined with the following enums:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
    VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
    VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
    VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
    VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
    VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008
} VkVideoChromaSubsamplingFlagBitsKHR;
```

- **VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR** specifies that the format is monochrome.
- **VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR** specified that the format is 4:2:0 chroma subsampled, i.e. the two chroma components are sampled horizontally and vertically at half the sample rate.
of the luma component.

- **VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR** - the format is 4:2:2 chroma subsampled, i.e. the two chroma components are sampled horizontally at half the sample rate of luma component.

- **VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR** - the format is 4:4:4 chroma sampled, i.e. all three components of the Y′C_bC_r format are sampled at the same rate, thus there is no chroma subsampling.

Chroma subsampling is described in more detail in the Chroma Reconstruction section.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;
```

`VkVideoChromaSubsamplingFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoChromaSubsamplingFlagBitsKHR`.

Possible values for the video format component bit depth are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoComponentBitDepthFlagBitsKHR {
    VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
    VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
    VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
    VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;
```

- **VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR** specifies a component bit depth of 8 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR** specifies a component bit depth of 10 bits.
- **VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR** specifies a component bit depth of 12 bits.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
```

`VkVideoComponentBitDepthFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoComponentBitDepthFlagBitsKHR`.

Additional information about the video decode use case can be provided by adding a `VkVideoDecodeUsageInfoKHR` structure to the `pNext` chain of `VkVideoProfileInfoKHR`.

The `VkVideoDecodeUsageInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeUsageFlagsKHR videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```
- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- videoUsageHints is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR
- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints must be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits can be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    VK_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```

- VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.
- VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR specifies that video decoding is intended to be used to consume a local video bitstream.
- VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR specifies that video decoding is intended to be used to consume a video bitstream received as a continuous flow over network.

**Note**

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;
```

VkVideoDecodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more
Additional information about the video encode use case can be provided by adding a VkVideoEncodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoEncodeUsageInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType             sType;       
    const void*                 pNext;       
    VkVideoEncodeUsageFlagsKHR  videoUsageHints;  
    VkVideoEncodeContentFlagsKHR videoContentHints;  
    VkVideoEncodeTuningModeKHR  tuningMode;       
} VkVideoEncodeUsageInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `videoUsageHints` is a bitmask of VkVideoEncodeUsageFlagBitsKHR specifying hints about the intended use of the video encode profile.
- `videoContentHints` is a bitmask of VkVideoEncodeContentFlagBitsKHR specifying hints about the content to be encoded using the video encode profile.
- `tuningMode` is a VkVideoEncodeTuningModeKHR value specifying the tuning mode to use when encoding with the video profile.

Valid Usage (Implicit)

- VUID-VkVideoEncodeUsageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR
- VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints must be a valid combination of VkVideoEncodeUsageFlagBitsKHR values
- VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter
  videoContentHints must be a valid combination of VkVideoEncodeContentFlagBitsKHR values
- VUID-VkVideoEncodeUsageInfoKHR-tuningMode-parameter
  If tuningMode is not 0, tuningMode must be a valid VkVideoEncodeTuningModeKHR value

The following bits can be specified in VkVideoEncodeUsageInfoKHR::videoUsageHints as a hint about the video encode use case:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
    VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
};
```
VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;

• VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.

• VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.

• VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR specifies that video encoding is intended to be used for real-time recording for offline consumption.

• VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR specifies that video encoding is intended to be used in a video conferencing scenario.

Note
There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;

VkVideoEncodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeUsageFlagBitsKHR.

The following bits can be specified in VkVideoEncodeUsageInfoKHR::videoContentHints as a hint about the encoded video content:

// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeContentFlagBitsKHR {
    VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,
} VkVideoEncodeContentFlagBitsKHR;

• VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR specifies that video encoding is intended to be used to encode camera content.

• VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR specifies that video encoding is intended to be used to encode desktop content.

• VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR specified that video encoding is intended to be used to encode rendered (e.g. game) content.
Note

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

```
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeContentFlagsKHR;
```

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeContentFlagBitsKHR.

Possible video encode tuning mode values are as follows:

```
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeTuningModeKHR {
    VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
    VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
    VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
    VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;
```

- **VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR** specifies the default tuning mode.
- **VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR** specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation may compromise the latency of video encoding operations to improve quality.
- **VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR** specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation may compromise quality to increase the performance and lower the latency of video encode operations.
- **VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR** specifies that video encoding is tuned for ultra-low latency. When using this tuning mode, the implementation may compromise quality to maximize the performance and minimize the latency of video encoding operations.
- **VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR** specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

The VkVideoProfileListInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t profileCount;
    const VkVideoProfileInfoKHR* pProfiles;
} VkVideoProfileListInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **profileCount** is the number of elements in the **pProfiles** array.
• **pProfiles** is a pointer to an array of *VkVideoProfileInfoKHR* structures.

**Note**
Video transcoding is an example of a use case that necessitates the specification of multiple profiles in various contexts.

When the application provides a video decode profile and one or more video encode profiles in the profile list, the implementation ensures that any capabilities returned or resources created are suitable for the video transcoding use cases without the need for manual data transformations.

**Valid Usage**

• VUID-VkVideoProfileListInfoKHR-pProfiles-06813
  **pProfiles** **must** not contain more than one element whose **videoCodecOperation** member specifies a decode operation

**Valid Usage (Implicit)**

• VUID-VkVideoProfileListInfoKHR-sType-sType
  **sType** **must** be **VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR**

• VUID-VkVideoProfileListInfoKHR-pProfiles-parameter
  If **profileCount** is not 0, **pProfiles** **must** be a valid pointer to an array of **profileCount** valid *VkVideoProfileInfoKHR* structures

### 42.4. Video Capabilities

#### 42.4.1. Video Coding Capabilities

To query video coding capabilities for a specific video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
  VkPhysicalDevice physicalDevice,
  const VkVideoProfileInfoKHR* pVideoProfile,
  VkVideoCapabilitiesKHR* pCapabilities);
```

• **physicalDevice** is the physical device from which to query the video decode or encode
**pVideoProfile** is a pointer to a `VkVideoProfileInfoKHR` structure.

**pCapabilities** is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

If the video profile described by `pVideoProfile` is supported by the implementation, then this command returns `VK_SUCCESS` and `pCapabilities` is filled with the capabilities supported with the specified video profile. Otherwise, one of the video-profile-specific error codes are returned.

### Valid Usage

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07183**
  - If `pVideoProfile->videoCodecOperation` specifies a decode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeCapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07184**
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH264CapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07185**
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH265CapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-09257**
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeAV1CapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07186**
  - If `pVideoProfile->videoCodecOperation` specifies an encode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07187**
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH264CapabilitiesKHR` structure.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188**
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH265CapabilitiesKHR` structure.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle.

- **VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter**
  - `pVideoProfile` must be a valid `VkVideoProfileInfoKHR` structure.
**pVideoProfile** must be a valid pointer to a valid **VkVideoProfileInfoKHR** structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter
  **pCapabilities** must be a valid pointer to a **VkVideoCapabilitiesKHR** structure

## Return Codes

### Success
- VK_SUCCESS

### Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The **VkVideoCapabilitiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCapabilityFlagsKHR flags;
    VkDeviceSize minBitstreamBufferOffsetAlignment;
    VkDeviceSize minBitstreamBufferSizeAlignment;
    VkExtent2D pictureAccessGranularity;
    VkExtent2D minCodedExtent;
    VkExtent2D maxCodedExtent;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    VkExtensionProperties stdHeaderVersion;
} VkVideoCapabilitiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is a bitmask of **VkVideoCapabilityFlagBitsKHR** specifying capability flags.
- **minBitstreamBufferOffsetAlignment** is the minimum alignment for bitstream buffer offsets.
- **minBitstreamBufferSizeAlignment** is the minimum alignment for bitstream buffer range sizes.
- **pictureAccessGranularity** is the granularity at which image access to video picture resources happen.
- **minCodedExtent** is the minimum width and height of the coded frames.
• **maxCodedExtent** is the maximum width and height of the coded frames.

• **maxDpbSlots** is the maximum number of DPB slots supported by a single video session.

• **maxActiveReferencePictures** is the maximum number of active reference pictures a single video coding operation can use.

• **stdHeaderVersion** is a VkExtensionProperties structure reporting the Video Std header name and version supported for the video profile.

**Note**

It is common for video compression standards to allow using all reference pictures associated with active DPB slots as active reference pictures, hence for video decode profiles the values returned in **maxDpbSlots** and **maxActiveReferencePictures** are often equal. Similarly, in case of video decode profiles supporting field pictures the value of **maxActiveReferencePictures** often equals **maxDpbSlots** × 2.

**Valid Usage (Implicit)**

- VUID-VkVideoCapabilitiesKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkVideoCapabilitiesKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoDecodeAV1CapabilitiesKHR, VkVideoDecodeCapabilitiesKHR, VkVideoDecodeH264CapabilitiesKHR, VkVideoDecodeH265CapabilitiesKHR, VkVideoEncodeCapabilitiesKHR, VkVideoEncodeH264CapabilitiesKHR, or VkVideoEncodeH265CapabilitiesKHR

- VUID-VkVideoCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR

Bits which can be set in VkVideoCapabilitiesKHR::flags are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
} VkVideoCapabilityFlagBitsKHR;
```

- **VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR** indicates that video sessions support producing and consuming protected content.

- **VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR** indicates that the video picture resources associated with the DPB slots of a video session can be backed by separate VkImage objects. If this capability flag is not present, then all DPB slots of a video session must be associated with video picture resources backed by the same VkImage object (e.g. using different layers of the same image).
// Provided by VK_KHR_video_queue

typedef VkFlags VkVideoCapabilityFlagsKHR;

VkVideoCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more
VkVideoCapabilityFlagBitsKHR.

42.4.2. Video Format Capabilities

To enumerate the supported output, input and DPB image formats and corresponding capabilities
for a specific video profile, call:

// Provided by VK_KHR_video_queue

VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,
    uint32_t* pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR* pVideoFormatProperties);

• physicalDevice is the physical device from which to query the video format properties.

• pVideoFormatInfo is a pointer to a VkPhysicalDeviceVideoFormatInfoKHR structure specifying
the usage and video profiles for which supported image formats and capabilities are returned.

• pVideoFormatPropertyCount is a pointer to an integer related to the number of video format
properties available or queried, as described below.

• pVideoFormatProperties is a pointer to an array of VkVideoFormatPropertiesKHR structures in
which supported image formats and capabilities are returned.

If pVideoFormatProperties is NULL, then the number of video format properties supported for the
given physicalDevice is returned in pVideoFormatPropertyCount. Otherwise,
pVideoFormatPropertyCount must point to a variable set by the user to the number of elements in the
pVideoFormatProperties array, and on return the variable is overwritten with the number of values
actually written to pVideoFormatProperties. If the value of pVideoFormatPropertyCount is less than the
number of video format properties supported, at most pVideoFormatPropertyCount values will be
written to pVideoFormatProperties, and VK_INCOMPLETE will be returned instead of VK_SUCCESS, to
indicate that not all the available values were returned.

Video format properties are always queried with respect to a specific set of video profiles. These are
specified by chaining the VkVideoProfileListInfoKHR structure to pVideoFormatInfo.

For most use cases, the images are used by a single video session and a single video profile is
provided. For a use case such as video transcoding, where a decode session output image can be
used as encode input in one or more encode sessions, multiple video profiles corresponding to the
video sessions that will share the image must be provided.

If any of the video profiles specified via VkVideoProfileListInfoKHR::pProfiles are not supported,
then this command returns one of the video-profile-specific error codes. Furthermore, if
VkPhysicalDeviceVideoFormatInfoKHR::imageUsage includes any image usage flags not supported by
the specified video profiles, then this command returns `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

This command also returns `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR` if `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` does not include the appropriate flags as dictated by the decode capability flags returned in `VkVideoDecodeCapabilitiesKHR::flags` for any of the profiles specified in the `VkVideoProfileListInfoKHR` structure provided in the `pNext` chain of `pVideoFormatInfo`.

If the decode capability flags include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` but not `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR`, then in order to query video format properties for decode DPB and output usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include both `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR` and `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

If the decode capability flags include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR` but not `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR`, then in order to query video format properties for decode DPB usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, but not `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`. Similarly, to query video format properties for decode output usage, `VkPhysicalDeviceVideoFormatInfoKHR::imageUsage` must include `VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR`, but not `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`. Otherwise, the call will fail with `VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR`.

The `imageUsage` member of the `VkPhysicalDeviceVideoFormatInfoKHR` structure specifies the expected video usage flags that the returned video formats must support. Correspondingly, the `imageUsageFlags` member of each `VkVideoFormatPropertiesKHR` structure returned will contain at least the same set of image usage flags.

If the implementation supports using video input, output, or DPB images of a particular format in operations other than video decode/encode then the `imageUsageFlags` member of the corresponding `VkVideoFormatPropertiesKHR` structure returned will include additional image usage flags indicating that.

---

**Note**

For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcode, if the image were to be shared between decode and encode session(s), then both decode and encode related usage flags can be set.

Multiple `VkVideoFormatPropertiesKHR` entries may be returned with the same `format` member with different `componentMapping`, `imageType`, or `imageTiling` values, as described later.

In addition, a different set of `VkVideoFormatPropertiesKHR` entries may be returned depending on the `imageUsage` member of the `VkPhysicalDeviceVideoFormatInfoKHR` structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.
The application can select the parameters returned in the `VkVideoFormatPropertiesKHR` entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications should create images only with those that are necessary for the particular use case.

Before creating an image, the application can obtain the complete set of supported image format features by calling `vkGetPhysicalDeviceImageFormatProperties2` using parameters derived from the members of one of the reported `VkVideoFormatPropertiesKHR` entries and adding the same `VkVideoProfileListInfoKHR` structure to the `pNext` chain of `VkPhysicalDeviceImageFormatInfo2`.

The following applies to all `VkVideoFormatPropertiesKHR` entries returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR`:

- `vkGetPhysicalDeviceFormatProperties2` must succeed when called with `VkVideoFormatPropertiesKHR::format`.
- If `VkVideoFormatPropertiesKHR::imageTiling` is `VK_IMAGE_TILING_OPTIMAL`, then the `optimalTilingFeatures` returned by `vkGetPhysicalDeviceFormatProperties2` must include all format features required by the image usage flags reported in `VkVideoFormatPropertiesKHR::imageUsageFlags` for the format, as indicated in the Format Feature Dependent Usage Flags section.
- If `VkVideoFormatPropertiesKHR::imageTiling` is `VK_IMAGE_TILING_LINEAR`, then the `linearTilingFeatures` returned by `vkGetPhysicalDeviceFormatProperties2` must include all format features required by the image usage flags reported in `VkVideoFormatPropertiesKHR::imageUsageFlags` for the format, as indicated in the Format Feature Dependent Usage Flags section.
- `vkGetPhysicalDeviceImageFormatProperties2` must succeed when called with a `VkPhysicalDeviceImageFormatPropertiesKHR` structure containing the following information:
  - The `pNext` chain including the same `VkVideoProfileListInfoKHR` structure used to call `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.
  - `format` set to the value of `VkVideoFormatPropertiesKHR::format`.
  - `type` set to the value of `VkVideoFormatPropertiesKHR::imageType`.
  - `tiling` set to the value of `VkVideoFormatPropertiesKHR::imageTiling`.
  - `usage` set to the value of `VkVideoFormatPropertiesKHR::imageUsageFlags`.
  - `flags` set to the value of `VkVideoFormatPropertiesKHR::imageCreateFlags`.

The `componentMapping` member of `VkVideoFormatPropertiesKHR` defines the ordering of the Y’C_b component channels from the perspective of the video codec operations specified in `VkVideoProfileListInfoKHR`. For example, if the implementation produces video decode output with the format `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` where the blue and red chrominance channels are swapped then the `componentMapping` member of the corresponding `VkVideoFormatPropertiesKHR` structure will have the following member values:

```c
components.r = VK_COMPONENT_SWIZZLE_B; // Cb component
components.g = VK_COMPONENT_SWIZZLE.IDENTITY; // Y component
```
components.b = VK_COMPONENT_SWIZZLE_R; // Cr component
components.a = VK_COMPONENT_SWIZZLE.Identity; // unused, defaults to 1.0

Valid Usage

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The pNext chain of pVideoFormatInfo must include a VkVideoProfileListInfoKHR structure with profileCount greater than 0

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  pVideoFormatInfo must be a valid pointer to a valid VkPhysicalDeviceVideoFormatInfoKHR structure

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
  pVideoFormatPropertyCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by pVideoFormatPropertyCount is not 0, and pVideoFormatProperties is not NULL, pVideoFormatProperties must be a valid pointer to an array of pVideoFormatPropertyCount VkVideoFormatPropertiesKHR structures

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR
• VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
• VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
• VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
• VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR
The `VkPhysicalDeviceVideoFormatInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageUsage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the video images.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkVideoProfileListInfoKHR`
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter
  `imageUsage` must be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-requiredbitsetmask
  `imageUsage` must not be `0`

The `VkVideoFormatPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    VkComponentMapping componentMapping;
    VkImageCreateFlags imageCreateFlags;
    VkImageType imageType;
    VkImageTiling imageTiling;
    VkImageUsageFlags imageUsageFlags;
} VkVideoFormatPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- **format** is a *VkFormat* that specifies the format that *can* be used with the specified video profiles and image usages.

- **componentMapping** defines the color channel order used for the format. *format* along with *componentMapping* describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the *format* reported does not require component swizzling then all members of *componentMapping* will be set to *VK_COMPONENT_SWIZZLE.IDENTITY*.

- **imageCreateFlags** is a bitmask of *VkImageCreateFlagBits* specifying the supported image creation flags for the format.

- **imageType** is a *VkImageType* that specifies the image type the format *can* be used with.

- **imageTiling** is a *VkImageTiling* that specifies the image tiling the format *can* be used with.

- **imageUsageFlags** is a bitmask of *VkImageUsageFlagBits* specifying the supported image usage flags for the format.

### Valid Usage (Implicit)

- VUID-VkVideoFormatPropertiesKHR-sType-sType
  - *sType* **must** be *VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR*
- VUID-VkVideoFormatPropertiesKHR-pNext-pNext
  - *pNext* **must** be **NULL**

### 42.5. Video Sessions

Video sessions are objects that represent and maintain the state needed to perform video decode or encode operations using a specific video profile.

In case of video encode profiles this includes the current *rate control* configuration and the currently set *video encode quality level*.

Video sessions are represented by *VkVideoSessionKHR* handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```

### 42.5.1. Creating a Video Session

To create a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkcCreateVideoSessionKHR(
    VkDevice device,
    const VkVideoSessionCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
)`
