39.2.3. Ray Face Culling

As in polygon rasterization, one of the stages of ray traversal is to determine if a triangle primitive is back- or front-facing, and primitives can be culled based on that facing.

If the intersection candidate is with an AABB primitive, this operation is skipped.

**Determination**

When a ray intersects a triangle primitive, the order that vertices are specified for the polygon affects whether the ray intersects the front or back face. Front or back facing is determined in the same way as they are for rasterization, based on the sign of the polygon's area but using the ray space coordinates instead of framebuffer coordinates. One way to compute this area is:

\[
a = -\frac{1}{2} \sum_{i=0}^{n-1} (x_i y_{i+1} - x_{i+1} y_i)
\]

where \(x_i\) and \(y_i\) are the x and y ray space coordinates of the \(i\)th vertex of the \(n\)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \(i \oplus 1 = (i + 1) \mod n\).

By default, if \(a\) is negative then the intersection is with the front face of the triangle, otherwise it is with the back face. If `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` is included in `VkAccelerationStructureInstanceKHR::flags` for the instance containing the intersected triangle, this determination is reversed. Additionally, if \(a\) is 0, the intersection candidate is treated as not intersecting with any face, irrespective of the sign.

**Note**

In a left-handed coordinate system, an intersection will be with the front face of a triangle if the vertices of the triangle, as defined in index order, appear from the ray’s perspective in a clockwise rotation order. `VK_GEOMETRY_INSTANCE_TRIANGLE_FLIP_FACING_BIT_KHR` was previously annotated as `VK_GEOMETRY_INSTANCE_TRIANGLE_FRONT_COUNTERCLOCKWISE_BIT_KHR` because of this.

If the ray was traced with a pipeline trace ray instruction, the `HitKindKHR` built-in is set to `HitKindFrontFacingTriangleKHR` if the intersection is with front-facing geometry, and `HitKindBackFacingTriangleKHR` if the intersection is with back-facing geometry, for shader stages considering this intersection.

If the ray was traced with `OpRayQueryProceedKHR`, `OpRayQueryGetIntersectionFrontFaceKHR` will return true for intersection candidates with front faces, or false for back faces.
Culling

If `CullBackFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the back face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

If `CullFrontFacingTrianglesKHR` was included in the Ray Flags parameter of the ray trace instruction, and the intersection is determined as with the front face of a triangle primitive, the intersection is dropped, and no further processing of this intersection occurs.

This culling is disabled if `VK_GEOMETRY_INSTANCE_TRIANGLE_FACING_CULL_DISABLE_BIT_KHR` was included in `VkAccelerationStructureInstanceKHR::flags` for the instance which the intersected geometry belongs to.

Intersection candidates that have not intersected with any face (\(a == 0\)) are unconditionally culled, irrespective of ray flags and geometry instance flags.

The `CullBackFacingTrianglesKHR` and `CullFrontFacingTrianglesKHR` Ray Flags are mutually exclusive.

39.2.4. Ray Opacity Culling

Each geometry in the acceleration structure may be considered either opaque or not. Opaque geometries continue through traversal as normal, whereas non-opaque geometries need to be either confirmed or discarded by shader code. Intersection candidates can also be culled based on their opacity.

**Determination**

Each individual intersection candidate is initially determined as opaque if `VK_GEOMETRY_OPAQUE_BIT_KHR` was included in the `VkAccelerationStructureGeometryKHR::flags` when the geometry it intersected with was built, otherwise it is considered non-opaque.

If the geometry includes an opacity micromap, the opacity of the intersection at this point is instead derived as described in Ray Opacity Micromap.

If the intersection candidate was generated by an intersection shader, the intersection is initially considered to have opacity matching the AABB candidate that it was generated from.

However, this opacity can be overridden when it is built into an instance. Setting `VK_GEOMETRY_INSTANCE_FORCE_OPAQUE_BIT_KHR` in `VkAccelerationStructureInstanceKHR::flags` will force all geometries in the instance to be considered opaque. Similarly, setting `VK_GEOMETRY_INSTANCE_FORCE_NO_OPAQUE_BIT_KHR` will force all geometries in the instance to be considered non-opaque.

This can again be overridden by including `OpaqueKHR` or `NoOpaqueKHR` in the Ray Flags parameter when tracing a ray. `OpaqueKHR` forces all geometries to behave as if they are opaque, regardless of their build parameters. Similarly, `NoOpaqueKHR` forces all geometries to behave as if they are non-opaque.

If the ray was traced with `OpRayQueryProceedKHR`, to determine the opacity of AABB intersection candidates, `OpRayQueryGetIntersectionCandidateAABBOpaqueKHR` can be used. This instruction will return `true` for opaque intersection candidates, and `false` for non-opaque intersection candidates.
### Culling

If `CullOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered opaque is dropped, and no further processing occurs.

If `CullNoOpaqueKHR` is included in the Ray Flags parameter when tracing a ray, an intersection with a geometry that is considered non-opaque is dropped, and no further processing occurs.

The `OpaqueKHR`, `NoOpaqueKHR`, `CullOpaqueKHR`, and `CullNoOpaqueKHR` Ray Flags are mutually exclusive.

### 39.2.5. Ray Opacity Micromap

A `VK_GEOMETRY_TYPE_TRIANGLES_KHR` geometry in the acceleration structure may have an opacity micromap associated with it to give finer-grained opacity information.

If the intersection candidate is with a geometry with an associated opacity micromap and `VK_GEOMETRY_INSTANCE_DISABLE_OPACITY_MICROMAPS_EXT` is not set in its instance then the micromap is used to determine geometry opacity instead of the `VK_GEOMETRY_OPAQUE_BIT_KHR` flag in the geometry.

The opacity information in the micromap object is accessed using the candidate intersection u and v coordinates. The integer u and v are computed from $\lfloor u \rfloor + \lfloor v \rfloor$, clamping $\lfloor u \rfloor$ as needed to keep the sum less than or equal to $1 << \text{subdivisionlevel}$. These values are mapped into a linear index with a space filling curve which is defined recursively by traversing into the sub-triangle nearest vertex 0, then the middle triangle with ordering flipped, then nearest vertex 1 then nearest vertex 2.

![Figure 29. Example ordering for micromap data](image)

**Note**

This encoding is spatially coherent, purely hierarchical, and allows a bit-parallel conversion between barycentric address and index values.

See the appendix for reference code implementing this mapping.

The result of the opacity micromap lookup and operations is to treat the intersection as opaque, non-opaque, or ignored. The interpretation of the values depends on
VK_GEOMETRY_INSTANCE_FORCE_OPACITY_MICROMAP_2_STATE_EXT in the instance of the candidate intersection or ForceOpacityMicromap2StateEXT ray flags on the ray. If either is set, the opacity micromap information is interpreted in 2 state override mode. If the result of the micromap lookup is to treat the intersection candidate as ignored, no further processing of that candidate is done.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT, each element of the micromap is represented by a single bit at the index derived above.

If the associated opacity micromap has format VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT, each element is represented by a two bit value at the index derived above.

39.3. Ray Intersection Confirmation

Depending on the opacity of intersected geometry and whether it is a triangle or an AABB, candidate intersections are further processed to determine the eventual hit result. Candidates generated from AABB intersections run through the same confirmation process as triangle hits.
39.3.1. AABB Intersection Candidates

For an intersection candidate with an AABB geometry generated by Ray Intersection Candidate Determination, shader code is executed to determine whether any hits should be reported to the traversal infrastructure; no further processing of this intersection candidate occurs. The occurrence of an AABB intersection candidate does not guarantee the ray intersects the primitive bounds. To avoid propagating false intersections the application should verify the intersection candidate before reporting any hits.

If the ray was traced with a pipeline trace ray instruction, an intersection shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. If this shader calls OpReportIntersectionKHR, a new intersection candidate is generated as described below. If the intersection shader is VK_SHADER_UNUSED_KHR (which is only allowed for a zero shader group) then no further processing of the intersection candidate occurs.

Each new candidate generated as a result of this processing is a generated intersection candidate that intersects the AABB geometry, with a t value equal to the Hit parameter of the OpReportIntersectionKHR instruction. The new generated candidate is then independently run through Ray Intersection Confirmation as a generated intersection.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed OpRayQueryProceedKHR, returning true. The resulting ray query has a candidate intersection type of RayQueryCandidateIntersectionAABBKHR. OpRayQueryGenerateIntersectionKHR can be called to commit a new intersection candidate with committed intersection type of RayQueryCommittedIntersectionGeneratedKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. Unlike rays traced with a pipeline trace ray instruction, candidates generated in this way skip generated intersection candidate confirmation; applications should make this determination before generating the intersection.

This operation may be executed multiple times for the same intersection candidate.

39.3.2. Triangle and Generated Intersection Candidates

For triangle and generated intersection candidates, additional shader code may be executed based on the intersection’s opacity.

If the intersection is opaque, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

For non-opaque intersection candidates, shader code is executed to determine whether a hit occurred or not.

If the ray was traced with a pipeline trace ray instruction, an any-hit shader is invoked from the Shader Binding Table according to the specified indexing. If this shader calls OpIgnoreIntersectionKHR, the candidate is dropped and no further processing of the candidate occurs. If the any-hit shader identified is VK_SHADER_UNUSED_KHR, the candidate is immediately confirmed as a valid hit and passes to the next stage of processing.

If the ray was traced with OpRayQueryProceedKHR, control is returned to the shader which executed
OpRayQueryProceedKHR, returning true. As only triangle candidates participate in this operation with ray queries, the resulting candidate intersection type is always RayQueryCandidateIntersectionTriangleKHR. OpRayQueryConfirmIntersectionKHR can be called on the ray query to confirm the candidate as a hit with committed intersection type of RayQueryCommittedIntersectionTriangleKHR. Further ray query processing can be continued by executing OpRayQueryProceedKHR with the same ray query, or intersection can be terminated with OpRayQueryTerminateKHR. If OpRayQueryConfirmIntersectionKHR has not been executed, the candidate is dropped and no further processing of the candidate occurs.

This operation may be executed multiple times for the same intersection candidate unless VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR was specified for the intersected geometry.

39.4. Ray Closest Hit Determination

Unless the ray was traced with the TerminateOnFirstHitKHR ray flag, the implementation must track the closest confirmed hit until all geometries have been tested and either confirmed or dropped.

After an intersection candidate is confirmed, its t value is compared to \( t_{\text{max}} \) to determine which intersection is closer, where t is the parametric distance along the ray at which the intersection occurred.

- If \( t < t_{\text{max}} \), \( t_{\text{max}} \) is set to t and the candidate is set as the current closest hit.
- If \( t > t_{\text{max}} \), the candidate is dropped and no further processing of that candidate occurs.
- If \( t = t_{\text{max}} \), the candidate may be set as the current closest hit or dropped.

If TerminateOnFirstHitKHR was included in the Ray Flags used to trace the ray, once the first hit is confirmed, the ray trace is terminated.

39.5. Ray Result Determination

Once all candidates have finished processing the prior stages, or if the ray is forcibly terminated, the final result of the ray trace is determined.

If a closest hit result was identified by Ray Closest Hit Determination, a closest hit has occurred, otherwise the final result is a miss.

For rays traced with pipeline trace ray instructions which can invoke a closest hit shader, if a closest hit result was identified, a closest hit shader is invoked from the Shader Binding Table according to the specified indexing for the intersected geometry. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if either the ray flags included SkipClosestHitShaderKHR, or if the closest hit shader identified is VK_SHADER_UNUSED_KHR.

For rays traced with a pipeline trace ray instruction where no hit result was identified, the miss shader identified by the Miss Index parameter of the instruction is invoked. Control returns to the shader that executed the pipeline trace ray instruction once this shader returns. This shader is skipped if the miss shader identified is VK_SHADER_UNUSED_KHR.
If the ray was traced with \texttt{OpRayQueryProceedKHR}, control is returned to the shader which executed \texttt{OpRayQueryProceedKHR}, returning \texttt{false}. If a closest hit was identified by \texttt{Ray Closest Hit Determination}, the ray query will now have a committed intersection type of \texttt{RayQueryCommittedIntersectionGeneratedKHR} or \texttt{RayQueryCommittedIntersectionTriangleKHR}. If no closest hit was identified, the committed intersection type will be \texttt{RayQueryCommittedIntersectionNoneKHR}.

No further processing of a ray query occurs after this result is determined.
Chapter 40. Ray Tracing

Ray tracing uses a separate rendering pipeline from both the graphics and compute pipelines (see Ray Tracing Pipeline).

![Ray Tracing Pipeline Diagram]

**Capture**

Interaction between the different shader stages in the ray tracing pipeline

Within the ray tracing pipeline, a **pipeline trace ray** instruction can be called to perform a **ray traversal** that invokes the various ray tracing shader stages during its execution. The relationship between the ray tracing pipeline object and the geometries present in the acceleration structure traversed is passed into the ray tracing command in a **VkBuffer** object known as a **shader binding table**. **OpExecuteCallableKHR** can also be used in ray tracing pipelines to invoke a **callable shader**.

During execution, control alternates between scheduling and other operations. The scheduling functionality is implementation-specific and is responsible for workload execution. The shader stages are programmable. **Traversal**, which refers to the process of traversing acceleration structures to find potential intersections of rays with geometry, is fixed function.

The programmable portions of the pipeline are exposed in a single-ray programming model, with each invocation handling one ray at a time. Memory operations can be synchronized using standard memory barriers. The **Workgroup** scope and variables with a storage class of **Workgroup** must not be used in the ray tracing pipeline.

**40.1. Shader Call Instructions**

A **shader call** is an instruction which may cause execution to continue elsewhere by creating one or more invocations that execute a different shader stage.

The following table lists all shader call instructions and which stages each one can directly call.
The invocations created by shader call instructions are grouped into subgroups by the implementation. Those subgroups may be unrelated to the subgroup of the parent invocation.

*Pipeline trace ray instructions can* be used recursively; invoked shaders can themselves execute pipeline trace ray instructions, to a maximum depth defined by the `maxRecursionDepth` or `maxRayRecursionDepth` limit.

Shaders directly invoked from the API always have a recursion depth of 0; each shader executed by a pipeline trace ray instruction has a recursion depth one higher than the recursion depth of the shader which invoked it. Applications must not invoke a shader with a recursion depth greater than the value of `maxRecursionDepth` or `maxPipelineRayRecursionDepth` specified in the pipeline.

There is no explicit recursion limit for other shader call instructions which may recurse (e.g. `OpExecuteCallableKHR`) but there is an upper bound determined by the stack size.

An *invocation repack instruction* is a ray tracing instruction where the implementation may change the set of invocations that are executing. When a repack instruction is encountered, the invocation is suspended and a new invocation begins and executes the instruction. After executing the repack instruction (which may result in other ray tracing shader stages executing) the new invocation is resumed, but it may be resumed in a different subgroup or at a different `SubgroupLocalInvocationId` within the same subgroup. When a subset of invocations in a subgroup execute the invocation repack instruction, those that do not execute it remain in the same subgroup at the same `SubgroupLocalInvocationId`.

The invocations that are executing before a shader call instruction, after the instruction, or are created by the instruction, are shader-call-related.

If the implementation changes the composition of subgroups, the values of `SubgroupSize`, `SubgroupLocalInvocationId`, `SMIDNV`, `WarpIDNV`, and built-in variables that are derived from them (`SubgroupEqMask`, `SubgroupGeMask`, `SubgroupGtMask`, `SubgroupLeMask`, `SubgroupLtMask`) must be changed accordingly by the invocation repack instruction. The application must use Volatile semantics on
these BuiltIn variables when used in the ray generation, closest hit, miss, intersection, and callable shaders. Similarly, the application must use Volatile semantics on any RayTmaxKHR decorated Builtin used in an intersection shader.

Note

Subgroup operations are permitted in the programmable ray tracing shader stages. However, shader call instructions place a bound on where results of subgroup instructions or subgroup-scoped instructions that execute the dynamic instance of that instruction are potentially valid. For example, care must be taken when using the result of a ballot operation that was computed before an invocation repack instruction, after that repack instruction. The ballot may be incorrect as the set of invocations could have changed.

While the SubgroupSize built-in is required to be declared Volatile, its value will never change unless VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT is set on pipeline creation, as without that bit set, its value is required to match that of VkPhysicalDeviceSubgroupProperties::subgroupSize.

For clock operations, the value of a Subgroup scoped OpReadClockKHR read before the dynamic instance of a repack instruction should not be compared to the result of that clock instruction after the repack instruction.

When a ray tracing shader executes a dynamic instance of an invocation repack instruction which results in another ray tracing shader being invoked, their instructions are related by shader-call-order.

For ray tracing invocations that are shader-call-related:

- memory operations on StorageBuffer, Image, and ShaderRecordBufferKHR storage classes can be synchronized using the ShaderCallKHR scope.
- the CallableDataKHR, IncomingCallableDataKHR, RayPayloadKHR, HitAttributeKHR, and IncomingRayPayloadKHR storage classes are system-synchronized and no application availability and visibility operations are required.
- memory operations within a single invocation before and after the shader call instruction are ordered by program-order and do not require explicit synchronization.

40.2. Ray Tracing Commands

Ray tracing commands provoke work in the ray tracing pipeline. Ray tracing commands are recorded into a command buffer and when executed by a queue will produce work that executes according to the currently bound ray tracing pipeline. A ray tracing pipeline must be bound to a command buffer before any ray tracing commands are recorded in that command buffer.

To dispatch ray tracing use:
void vkCmdTraceRaysNV(
    VkCommandBuffer commandBuffer,
    VkBuffer    raygenShaderBindingTableBuffer,
    VkDeviceSize raygenShaderBindingOffset,
    VkBuffer    missShaderBindingTableBuffer,
    VkDeviceSize missShaderBindingOffset,
    VkDeviceSize missShaderBindingStride,
    VkBuffer    hitShaderBindingTableBuffer,
    VkDeviceSize hitShaderBindingOffset,
    VkDeviceSize hitShaderBindingStride,
    VkBuffer    callableShaderBindingTableBuffer,
    VkDeviceSize callableShaderBindingOffset,
    VkDeviceSize callableShaderBindingStride,
    uint32_t    width,
    uint32_t    height,
    uint32_t    depth);

• commandBuffer is the command buffer into which the command will be recorded.
• raygenShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the ray generation shader stage.
• raygenShaderBindingOffset is the offset in bytes (relative to raygenShaderBindingTableBuffer) of the ray generation shader being used for the trace.
• missShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the miss shader stage.
• missShaderBindingOffset is the offset in bytes (relative to missShaderBindingTableBuffer) of the miss shader being used for the trace.
• missShaderBindingStride is the size in bytes of each shader binding table record in missShaderBindingTableBuffer.
• hitShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the hit shader stages.
• hitShaderBindingOffset is the offset in bytes (relative to hitShaderBindingTableBuffer) of the hit shader group being used for the trace.
• hitShaderBindingStride is the size in bytes of each shader binding table record in hitShaderBindingTableBuffer.
• callableShaderBindingTableBuffer is the buffer object that holds the shader binding table data for the callable shader stage.
• callableShaderBindingOffset is the offset in bytes (relative to callableShaderBindingTableBuffer) of the callable shader being used for the trace.
• callableShaderBindingStride is the size in bytes of each shader binding table record in callableShaderBindingTableBuffer.
• width is the width of the ray trace query dimensions.
• height is height of the ray trace query dimensions.
• \textit{depth} is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \textit{width} × \textit{height} × \textit{depth} rays is assembled.

## Valid Usage

- **VUID-vkCmdTraceRaysNV-magFilter-04553**
  If a \textit{VkSampler} created with \textit{magFilter} or \textit{minFilter} equal to \textit{VK\_FILTER\_LINEAR}, \textit{reductionMode} equal to \textit{VK\_SAMPLER\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE}, and \textit{compareEnable} equal to \textit{VK\_FALSE} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}.

- **VUID-vkCmdTraceRaysNV-magFilter-09598**
  If a \textit{VkSampler} created with \textit{magFilter} or \textit{minFilter} equal to \textit{VK\_FILTER\_LINEAR} and \textit{reductionMode} equal to either \textit{VK\_SAMPLER\_REDUCTION\_MODE\_MIN} or \textit{VK\_SAMPLER\_REDUCTION\_MODE\_MAX} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_MINMAX\_BIT}.

- **VUID-vkCmdTraceRaysNV-mipmapMode-04770**
  If a \textit{VkSampler} created with \textit{mipmapMode} equal to \textit{VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR}, \textit{reductionMode} equal to \textit{VK\_SAMPLER\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE}, and \textit{compareEnable} equal to \textit{VK\_FALSE} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_LINEAR\_BIT}.

- **VUID-vkCmdTraceRaysNV-mipmapMode-09599**
  If a \textit{VkSampler} created with \textit{mipmapMode} equal to \textit{VK\_SAMPLER\_MIPMAP\_MODE\_LINEAR} and \textit{reductionMode} equal to \textit{VK\_SAMPLER\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE}, and \textit{compareEnable} equal to \textit{VK\_FALSE} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_FILTER\_MINMAX\_BIT}.

- **VUID-vkCmdTraceRaysNV-unnormalizedCoordinates-09635**
  If a \textit{VkSampler} created with \textit{unnormalizedCoordinates} equal to \textit{VK\_TRUE} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{levelCount} and \textit{layerCount} must be 1.

- **VUID-vkCmdTraceRaysNV-unnormalizedCoordinates-09636**
  If a \textit{VkSampler} created with \textit{unnormalizedCoordinates} equal to \textit{VK\_TRUE} is used to sample a \textit{VkImageView} as a result of this command, then the image view’s \textit{viewType} must be \textit{VK\_IMAGE\_VIEW\_TYPE\_1D} or \textit{VK\_IMAGE\_VIEW\_TYPE\_2D}.

- **VUID-vkCmdTraceRaysNV-None-06479**
  If a \textit{VkImageView} is sampled with \textit{depth comparison}, the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_2\_SAMPLED\_IMAGE\_DEPTH\_COMPARISON\_BIT}.

- **VUID-vkCmdTraceRaysNV-None-02691**
  If a \textit{VkImageView} is accessed using atomic operations as a result of this command, then the image view’s \textit{format features} must contain \textit{VK\_FORMAT\_FEATURE\_STORAGE\_IMAGE\_ATOMIC\_BIT}.
If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM`.

Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of...
the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysNV-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdTraceRaysNV-None-08600
  For each set $n$ that is statically used by a bound shader, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysNV-None-08601
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysNV-maintenance4-08602
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysNV-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdTraceRaysNV-None-08116
  Descriptors in bound descriptor buffers, specified via

3364
vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- **VUID-vkCmdTraceRaysNV-None-08604**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-None-08117**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline **must** have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- **VUID-vkCmdTraceRaysNV-None-08119**
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory **must** be resident

- **VUID-vkCmdTraceRaysNV-None-08605**
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory **must** be resident

- **VUID-vkCmdTraceRaysNV-None-08606**
  If the shaderObject feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdTraceRaysNV-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this
command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdTraceRaysNV-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysNV-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource

- **VUID-vkCmdTraceRaysNV-None-06550**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables sampler YC C conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdTraceRaysNV-ConstOffset-06551**
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables sampler YC C conversion, that object **must** not use the `ConstOffset` and `Offset` operands
• VUID-vkCmdTraceRaysNV-viewType-07752
If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

• VUID-vkCmdTraceRaysNV-format-07753
If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` must match.

• VUID-vkCmdTraceRaysNV-OpImageWrite-08795
If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s `format`.

• VUID-vkCmdTraceRaysNV-OpImageWrite-08796
If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

• VUID-vkCmdTraceRaysNV-OpImageWrite-04469
If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s `format`.

• VUID-vkCmdTraceRaysNV-SampledType-04470
If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

• VUID-vkCmdTraceRaysNV-SampledType-04471
If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

• VUID-vkCmdTraceRaysNV-SampledType-04472
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

• VUID-vkCmdTraceRaysNV-SampledType-04473
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

• VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04474
If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

• VUID-vkCmdTraceRaysNV-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.
• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdTraceRaysNV-OpImageWeightedSampleQCOM-06976
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format...
must be a single-component format

- VUID-vkCmdTraceRaysNV-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdTraceRaysNV-None-07288
  Any shader invocation executed by this command must terminate

- VUID-vkCmdTraceRaysNV-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

- VUID-vkCmdTraceRaysNV-None-03429
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-None-09458
  If the bound ray tracing pipeline state was created with the V Dynamic State Ray Tracing Pipeline Stack Size KHR dynamic state enabled then vkCmdSetRayTracingPipelineStackSizeKHR must have been called in the current command buffer prior to this trace command

- VUID-vkCmdTraceRaysNV-commandBuffer-04624
  commandBuffer must not be a protected command buffer

- VUID-vkCmdTraceRaysNV-maxRecursionDepth-03625
  This command must not cause a pipeline trace ray instruction to be executed from a shader invocation with a recursion depth greater than the value of maxRecursionDepth used to create the bound ray tracing pipeline

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-04042
  If raygenShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02455
  raygenShaderBindingOffset must be less than the size of raygenShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-raygenShaderBindingOffset-02456
  raygenShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-04043
  If missShaderBindingTableBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02457
  missShaderBindingOffset must be less than the size of missShaderBindingTableBuffer

- VUID-vkCmdTraceRaysNV-missShaderBindingOffset-02458
  missShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV::shaderGroupBaseAlignment
• VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-04044
  If hitShaderBindingTableBuffer is non-sparse then it must be bound completely and
  contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02459
  hitShaderBindingOffset must be less than the size of hitShaderBindingTableBuffer

• VUID-vkCmdTraceRaysNV-hitShaderBindingOffset-02460
  hitShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV
  ::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-04045
  If callableShaderBindingTableBuffer is non-sparse then it must be bound completely and
  contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02461
  callableShaderBindingOffset must be less than the size of callableShaderBindingTableBuffer

• VUID-vkCmdTraceRaysNV-callableShaderBindingOffset-02462
  callableShaderBindingOffset must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV
  ::shaderGroupBaseAlignment

• VUID-vkCmdTraceRaysNV-missShaderBindingStride-02463
  missShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV
  ::shaderGroupHandleSize

• VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02464
  hitShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV
  ::shaderGroupHandleSize

• VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02465
  callableShaderBindingStride must be a multiple of VkPhysicalDeviceRayTracingPropertiesNV
  ::shaderGroupHandleSize

• VUID-vkCmdTraceRaysNV-missShaderBindingStride-02466
  missShaderBindingStride must be less than or equal to
  VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

• VUID-vkCmdTraceRaysNV-hitShaderBindingStride-02467
  hitShaderBindingStride must be less than or equal to
  VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

• VUID-vkCmdTraceRaysNV-callableShaderBindingStride-02468
  callableShaderBindingStride must be less than or equal to
  VkPhysicalDeviceRayTracingPropertiesNV::maxShaderGroupStride

• VUID-vkCmdTraceRaysNV-width-02469
  width must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0]

• VUID-vkCmdTraceRaysNV-height-02470
  height must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1]

• VUID-vkCmdTraceRaysNV-depth-02471
  depth must be less than or equal to VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2]
Valid Usage (Implicit)

- VUID-vkCmdTraceRaysNV-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdTraceRaysNV-raygenShaderBindingTableBuffer-parameter
  
  `raygenShaderBindingTableBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdTraceRaysNV-missShaderBindingTableBuffer-parameter
  
  If `missShaderBindingTableBuffer` is not `VK_NULL_HANDLE`, `missShaderBindingTableBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdTraceRaysNV-hitShaderBindingTableBuffer-parameter
  
  If `hitShaderBindingTableBuffer` is not `VK_NULL_HANDLE`, `hitShaderBindingTableBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdTraceRaysNV-callableShaderBindingTableBuffer-parameter
  
  If `callableShaderBindingTableBuffer` is not `VK_NULL_HANDLE`, `callableShaderBindingTableBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdTraceRaysNV-commandBuffer-recording
  
  `commandBuffer` must be in the recording state

- VUID-vkCmdTraceRaysNV-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- VUID-vkCmdTraceRaysNV-renderpass
  
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysNV-videocoding
  
  This command must only be called outside of a video coding scope

- VUID-vkCmdTraceRaysNV-commonparent
  
  Each of `callableShaderBindingTableBuffer`, `commandBuffer`, `hitShaderBindingTableBuffer`, `missShaderBindingTableBuffer`, and `raygenShaderBindingTableBuffer` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
## Command Properties

To dispatch ray tracing use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
define vkCmdTraceRaysKHR(  
  VkCommandBuffer commandBuffer,  
  const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,  
  const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,  
  const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,  
  const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,  
  uint32_t width,  
  uint32_t height,  
  uint32_t depth);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pRaygenShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the ray generation shader stage.
- `pMissShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the miss shader stage.
- `pHitShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the hit shader stage.
- `pCallableShaderBindingTable` is a `VkStridedDeviceAddressRegionKHR` that holds the shader binding table data for the callable shader stage.
- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

When the command is executed, a ray generation group of \( \text{width} \times \text{height} \times \text{depth} \) rays is assembled.

### Valid Usage

- **VUID-vkCmdTraceRaysKHR-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

3372
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `levelCount` and `layerCount` must be 1.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view's `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

If a `VkImageView` is sampled with `depth comparison`, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer's format features must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of...
• VUID-vkCmdTraceRaysKHR-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

• VUID-vkCmdTraceRaysKHR-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

• VUID-vkCmdTraceRaysKHR-cubicRangeClamp-09212
If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM.

• VUID-vkCmdTraceRaysKHR-reductionMode-09213
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT.

• VUID-vkCmdTraceRaysKHR-selectableCubicWeights-09214
If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

• VUID-vkCmdTraceRaysKHR-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE WITHOUT_FORMAT_BIT.

• VUID-vkCmdTraceRaysKHR-OpTypeImage-07030
Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdTraceRaysKHR-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysKHR-None-08601**
  For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysKHR-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdTraceRaysKHR-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysKHR-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` must have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysKHR-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdTraceRaysKHR-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, must be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdTraceRaysKHR-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` must have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`
• VUID-vkCmdTraceRaysKHR-None-08119
  If a descriptor is dynamically used with a \VkPipeline created with \VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

• VUID-vkCmdTraceRaysKHR-None-08605
  If a descriptor is dynamically used with a \VkShaderEXT created with a \VkDescriptorsetLayout that was created with \VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

• VUID-vkCmdTraceRaysKHR-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

• VUID-vkCmdTraceRaysKHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

• VUID-vkCmdTraceRaysKHR-None-08609
  If the \VkPipeline object bound to the pipeline bind point used by this command or any \VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a \VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any \VkImage with a \VkImageView of the type \VK_IMAGE_VIEW_TYPE_3D, \VK_IMAGE_VIEW_TYPE_CUBE, \VK_IMAGE_VIEW_TYPE_1D_ARRAY, \VK_IMAGE_VIEW_TYPE_2D_ARRAY or \VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

• VUID-vkCmdTraceRaysKHR-None-08610
  If the \VkPipeline object bound to the pipeline bind point used by this command or any \VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a \VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \OpImageSample* or \OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

• VUID-vkCmdTraceRaysKHR-None-08611
  If the \VkPipeline object bound to the pipeline bind point used by this command or any \VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a \VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \OpImageSample* or \OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

• VUID-vkCmdTraceRaysKHR-uniformBuffers-06935
  If any stage of the \VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or \VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers.
and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysKHR-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysKHR-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysKHR-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdTraceRaysKHR-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the bound shaders **must** not be a protected resource

- **VUID-vkCmdTraceRaysKHR-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y′CbCr conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdTraceRaysKHR-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler Y′CbCr conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdTraceRaysKHR-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in `Instruction/Sampler/Image View Validation`

- **VUID-vkCmdTraceRaysKHR-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- **VUID-vkCmdTraceRaysKHR-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's `format`

- **VUID-vkCmdTraceRaysKHR-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using
**OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction must have four components

- VUID-vkCmdTraceRaysKHR-OpImageWrite-04469
  If a **VkBufferView** is accessed using **OpImageWrite** as a result of this command, then the **Type** of the **Texel** operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdTraceRaysKHR-SampledType-04470
  If a **VkImageView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 64

- VUID-vkCmdTraceRaysKHR-SampledType-04471
  If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 32

- VUID-vkCmdTraceRaysKHR-SampledType-04472
  If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 64

- VUID-vkCmdTraceRaysKHR-SampledType-04473
  If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 32

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04474
  If the **sparseImageInt64Atomics** feature is not enabled, **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag must not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdTraceRaysKHR-sparseImageInt64Atomics-04475
  If the **sparseImageInt64Atomics** feature is not enabled, **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** flag must not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06971
  If **OpImageWeightedSampleQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM**

- VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06972
  If **OpImageWeightedSampleQCOM** uses a **VkImageView** as a sample weight image as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM**

- VUID-vkCmdTraceRaysKHR-OpImageBoxFilterQCOM-06973
  If **OpImageBoxFilterQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM**

- VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM-06974
If `OpImageBlockMatchSSDQCOM` is used to read from a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchSSDQCOM-06976**
  If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysKHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format.

- **VUID-vkCmdTraceRaysKHR-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdTraceRaysKHR-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdTraceRaysKHR-None-09600**
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written.
Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline.

If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` **must** have been called in the current command buffer prior to this trace command.

This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

commandBuffer **must** not be a protected command buffer.

The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member.

If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried **must** have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

`pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

`pMissShaderBindingTable->deviceAddress` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`.

`pMissShaderBindingTable->stride` **must** be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`.

`pMissShaderBindingTable->stride` **must** be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`. 
• VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03687
   If the buffer from which \texttt{pHitShaderBindingTable->deviceAddress} was queried is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

• VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03688
   The buffer from which the \texttt{pHitShaderBindingTable->deviceAddress} is queried \textbf{must} have been created with the \texttt{VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR} usage flag.

• VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-03689
   \texttt{pHitShaderBindingTable->deviceAddress} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment}.

• VUID-vkCmdTraceRaysKHR-stride-03690
   \texttt{pHitShaderBindingTable->stride} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment}.

• VUID-vkCmdTraceRaysKHR-stride-04035
   \texttt{pHitShaderBindingTable->stride} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride}.

• VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03691
   If the buffer from which \texttt{pCallableShaderBindingTable->deviceAddress} was queried is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object.

• VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03692
   The buffer from which the \texttt{pCallableShaderBindingTable->deviceAddress} is queried \textbf{must} have been created with the \texttt{VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR} usage flag.

• VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-03693
   \texttt{pCallableShaderBindingTable->deviceAddress} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment}.

• VUID-vkCmdTraceRaysKHR-stride-03694
   \texttt{pCallableShaderBindingTable->stride} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment}.

• VUID-vkCmdTraceRaysKHR-stride-04041
   \texttt{pCallableShaderBindingTable->stride} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride}.

• VUID-vkCmdTraceRaysKHR-flags-03696
   If the currently bound ray tracing pipeline was created with \texttt{flags} that included \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR}, \texttt{pHitShaderBindingTable->deviceAddress} \textbf{must} not be zero.

• VUID-vkCmdTraceRaysKHR-flags-03697
   If the currently bound ray tracing pipeline was created with \texttt{flags} that included \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR}, \texttt{pHitShaderBindingTable->deviceAddress} \textbf{must} not be zero.

• VUID-vkCmdTraceRaysKHR-flags-03511
   If the currently bound ray tracing pipeline was created with \texttt{flags} that included \texttt{VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR}, the shader group handle
identified by `pMissShaderBindingTable->deviceAddress` must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03512**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an any-hit shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03513**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-flags-03514**
  If the currently bound ray tracing pipeline was created with flags that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an intersection shader must not be set to zero

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04735**
  Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`

- **VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-04736**
  Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`

- **VUID-vkCmdTraceRaysKHR-width-03638**
  `width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`

- **VUID-vkCmdTraceRaysKHR-height-03639**
  `height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`

- **VUID-vkCmdTraceRaysKHR-depth-03640**
  `depth` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[2] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[2]`

- **VUID-vkCmdTraceRaysKHR-width-03641**
  `width × height × depth` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxRayDispatchInvocationCount`

**Valid Usage (Implicit)**

- **VUID-vkCmdTraceRaysKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
VUID-vkCmdTraceRaysKHR-pRaygenShaderBindingTable-parameter
pRaygenShaderBindingTable must be a valid pointer to a valid
VkStridedDeviceAddressRegionKHR structure

VUID-vkCmdTraceRaysKHR-pMissShaderBindingTable-parameter
pMissShaderBindingTable must be a valid pointer to a valid
VkStridedDeviceAddressRegionKHR structure

VUID-vkCmdTraceRaysKHR-pHitShaderBindingTable-parameter
pHitShaderBindingTable must be a valid pointer to a valid
VkStridedDeviceAddressRegionKHR structure

VUID-vkCmdTraceRaysKHR-pCallableShaderBindingTable-parameter
pCallableShaderBindingTable must be a valid pointer to a valid
VkStridedDeviceAddressRegionKHR structure

VUID-vkCmdTraceRaysKHR-commandBuffer-recording
commandBuffer must be in the recording state

VUID-vkCmdTraceRaysKHR-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations

VUID-vkCmdTraceRaysKHR-renderpass
This command must only be called outside of a render pass instance

VUID-vkCmdTraceRaysKHR-videocoding
This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

When invocation mask image usage is enabled in the bound ray tracing pipeline, the pipeline uses an invocation mask image specified by the command:
```c
void vkCmdBindInvocationMaskHUAWEI(
    VkCommandBuffer commandBuffer,  // Provided by VK_HUAWEI_invocation_mask
    VkImageView imageView,         // commandBuffer is the command buffer into which the command will be recorded
    VkImageLayout imageLayout)     // imageView is an image view handle specifying the invocation mask image imageView may be set to
                                    // VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with ones value.
```

- `commandBuffer` is the command buffer into which the command will be recorded
- `imageView` is an image view handle specifying the invocation mask image `imageView` may be set to `VK_NULL_HANDLE`, which is equivalent to specifying a view of an image filled with ones value.
- `imageLayout` is the layout that the image subresources accessible from `imageView` will be in when the invocation mask image is accessed

### Valid Usage

- **VUID-vkCmdBindInvocationMaskHUAWEI-None-04976**
  The `invocationMask` feature must be enabled
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04977**
  If `imageView` is not `VK_NULL_HANDLE`, it must be a valid `VkImageView` handle of type `VK_IMAGE_VIEW_TYPE_2D`
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04978**
  If `imageView` is not `VK_NULL_HANDLE`, it must have a format of `VK_FORMAT_R8_UINT`
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04979**
  If `imageView` is not `VK_NULL_HANDLE`, it must have been created with `VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI` set
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-04980**
  If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_GENERAL`
- **VUID-vkCmdBindInvocationMaskHUAWEI-width-04981**
  Thread mask image resolution must match the `width` and `height` in `vkCmdTraceRaysKHR`
- **VUID-vkCmdBindInvocationMaskHUAWEI-None-04982**
  Each element in the invocation mask image must have the value 0 or 1. The value 1 means the invocation is active
- **VUID-vkCmdBindInvocationMaskHUAWEI-depth-04983**
  `depth` in `vkCmdTraceRaysKHR` must be 1

### Valid Usage (Implicit)

- **VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageView-parameter**
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle
- **VUID-vkCmdBindInvocationMaskHUAWEI-imageLayout-parameter**
**ImageLayout** must be a valid VkImageLayout value

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindInvocationMaskHUAWEI-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBindInvocationMaskHUAWEI-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBindInvocationMaskHUAWEI-videoencoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindInvocationMaskHUAWEI-commonparent
  Both of commandBuffer, and imageView that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirectKHR(
    VkCommandBuffer commandBuffer,
    const VkStridedDeviceAddressRegionKHR* pRaygenShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pMissShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pHitShaderBindingTable,
    const VkStridedDeviceAddressRegionKHR* pCallableShaderBindingTable,
    VkDeviceAddress indirectDeviceAddress);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pRaygenShaderBindingTable is a VkStridedDeviceAddressRegionKHR that holds the shader binding table data for the ray generation shader stage.
• \texttt{pMissShaderBindingTable} is a \texttt{VkStridedDeviceAddressRegionKHR} that holds the shader binding table data for the miss shader stage.

• \texttt{pHitShaderBindingTable} is a \texttt{VkStridedDeviceAddressRegionKHR} that holds the shader binding table data for the hit shader stage.

• \texttt{pCallableShaderBindingTable} is a \texttt{VkStridedDeviceAddressRegionKHR} that holds the shader binding table data for the callable shader stage.

• \texttt{indirectDeviceAddress} is a buffer device address which is a pointer to a \texttt{VkTraceRaysIndirectCommandKHR} structure containing the trace ray parameters.

\texttt{vkCmdTraceRaysIndirectKHR} behaves similarly to \texttt{vkCmdTraceRaysKHR} except that the ray trace query dimensions are read by the device from \texttt{indirectDeviceAddress} during execution.

### Valid Usage

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-04553**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR}, \texttt{reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdTraceRaysIndirectKHR-magFilter-09598**
  If a \texttt{VkSampler} created with \texttt{magFilter} or \texttt{minFilter} equal to \texttt{VK_FILTER_LINEAR} and \texttt{reductionMode} equal to either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT}

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-04770**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR}, \texttt{reductionMode} equal to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, and \texttt{compareEnable} equal to \texttt{VK_FALSE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- **VUID-vkCmdTraceRaysIndirectKHR-mipmapMode-09599**
  If a \texttt{VkSampler} created with \texttt{mipmapMode} equal to \texttt{VK_SAMPLER_MIPMAP_MODE_LINEAR} and \texttt{reductionMode} equal to either \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's format features must contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT}

- **VUID-vkCmdTraceRaysIndirectKHR-unnormalizedCoordinates-09635**
  If a \texttt{VkSampler} created with \texttt{unnormalizedCoordinates} equal to \texttt{VK_TRUE} is used to sample a \texttt{VkImageView} as a result of this command, then the image view's \texttt{levelCount} and \texttt{layerCount} must be 1

- **VUID-vkCmdTraceRaysIndirectKHR-unnormalizedCoordinates-09636**
  If a \texttt{VkSampler} created with \texttt{unnormalizedCoordinates} equal to \texttt{VK_TRUE} is used to sample a

---

3386
**VkImageView** as a result of this command, then the image view's **viewType** must be **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**

- **VUID-vkCmdTraceRaysIndirectKHR-None-06479**
  If a **VkImageView** is sampled with **depth comparison**, the image view's **format features** must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdTraceRaysIndirectKHR-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdTraceRaysIndirectKHR-None-07888**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the storage texel buffer's **format features** must contain **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT**

- **VUID-vkCmdTraceRaysIndirectKHR-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdTraceRaysIndirectKHR-None-02693**
  If the **VK_EXT_filter_cubic** extension is not enabled and any **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, it must not have a **VkImageViewType** of **VK_IMAGE_VIEW_TYPE_3D**, **VK_IMAGE_VIEW_TYPE_CUBE**, or **VK_IMAGE_VIEW_TYPE_CUBE_ARRAY**

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubic-02694**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic** returned by **vkGetPhysicalDeviceImageFormatProperties2**

- **VUID-vkCmdTraceRaysIndirectKHR-filterCubicMinmax-02695**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering together with minmax filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax** returned by **vkGetPhysicalDeviceImageFormatProperties2**

- **VUID-vkCmdTraceRaysIndirectKHR-cubicRangeClamp-09212**
  If the **cubicRangeClamp** feature is not enabled, then any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must not have a **VkSamplerReductionModeCreateInfo::reductionMode** equal to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM**

- **VUID-vkCmdTraceRaysIndirectKHR-reductionMode-09213**
  Any **VkImageView** being sampled with a **VkSamplerReductionModeCreateInfo::reductionMode** equal to **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM** as a result of this command must sample with **VK_FILTER_CUBIC_EXT**

- **VUID-vkCmdTraceRaysIndirectKHR-selectableCubicWeights-09214**
  If the **selectableCubicWeights** feature is not enabled, then any **VkImageView** being
sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have
`VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to
`VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`

- VUID-vkCmdTraceRaysIndirectKHR-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing
  `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be
  sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of
  the `OpTypeImage` is `Unknown`, the view's `format features` must contain
  `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the
  `OpTypeImage` is `Unknown`, the view's `format features` must contain
  `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format
  field of the `OpTypeImage` is `Unknown`, the view's `buffer features` must contain
  `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirectKHR-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of
  the `OpTypeImage` is `Unknown` then the view's `buffer features` must contain
  `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdTraceRaysIndirectKHR-None-08600
  For each set `n` that is statically used by a bound shader, a descriptor set must have been
  bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for
  set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the
  `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in
  Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirectKHR-None-08601
  For each push constant that is statically used by a bound shader, a push constant value
  must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is
  compatible for push constants, with the `VkPipelineLayout` used to create the current
  `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in
  Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirectKHR-maintenance4-08602
  If the `maintenance4` feature is not enabled, then for each push constant that is statically
  used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is
  compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and
  `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in
  Pipeline Layout Compatibility

- VUID-vkCmdTraceRaysIndirectKHR-None-08114
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be
valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysIndirectKHR-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysIndirectKHR-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysIndirectKHR-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

• VUID-vkCmdTraceRaysIndirectKHR-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

• VUID-vkCmdTraceRaysIndirectKHR-None-08119
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

• VUID-vkCmdTraceRaysIndirectKHR-None-08605
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

• VUID-vkCmdTraceRaysIndirectKHR-None-08606
  If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdTraceRaysIndirectKHR-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdTraceRaysIndirectKHR-None-08609
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage
If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
any resource accessed by **bound shaders must** not be a protected resource

- **VUID-vkCmdTraceRaysIndirectKHR-None-06550**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C₆ conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdTraceRaysIndirectKHR-ConstOffset-06551**
  If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y’C₆ conversion, that object **must** not use the ConstOffset and Offset operands

- **VUID-vkCmdTraceRaysIndirectKHR-viewType-07752**
  If a VkImageView is accessed as a result of this command, then the image view’s **viewType** **must** match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdTraceRaysIndirectKHR-format-07753**
  If a VkImageView is accessed as a result of this command, then the numeric type of the image view’s format and the Sampled Type operand of the OpTypeImage **must** match

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08795**
  If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-08796**
  If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have four components

- **VUID-vkCmdTraceRaysIndirectKHR-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 64

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 32

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 64

- **VUID-vkCmdTraceRaysIndirectKHR-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage **must** have a Width of 32
• VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdTraceRaysIndirectKHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdTraceRaysIndirectKHR-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with...
VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09215
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09216
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view’s **must** be a single-component format.

- VUID-vkCmdTraceRaysIndirectKHR-OpImageBlockMatchWindow-09217
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- VUID-vkCmdTraceRaysIndirectKHR-None-07288
  Any shader invocation executed by this command **must** terminate.

- VUID-vkCmdTraceRaysIndirectKHR-None-09600
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor **must** be in the image layout identified when the descriptor was written.

- VUID-vkCmdTraceRaysIndirectKHR-None-03429
  Any shader group handle referenced by this call **must** have been queried from the currently bound ray tracing pipeline.

- VUID-vkCmdTraceRaysIndirectKHR-None-09458
  If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` **must** have been called in the current command buffer prior to this trace command.

- VUID-vkCmdTraceRaysIndirectKHR-maxPipelineRayRecursionDepth-03679
  This command **must** not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of `maxPipelineRayRecursionDepth` used to create the bound ray tracing pipeline.

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-03635
  `commandBuffer` **must** not be a protected command buffer.

- VUID-vkCmdTraceRaysIndirectKHR-size-04023
  The `size` member of `pRayGenShaderBindingTable` **must** be equal to its `stride` member.

- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03680
  If the buffer from which `pRayGenShaderBindingTable->deviceAddress` was queried is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03681
The buffer from which the `pRayGenShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysIndirectKHR-pRayGenShaderBindingTable-03682**
  
pRayGenShaderBindingTable->deviceAddress must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03683**
  
  If the buffer from which `pMissShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03684**
  
  The buffer from which the `pMissShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-03685**
  
pMissShaderBindingTable->deviceAddress must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03686**
  
pMissShaderBindingTable->stride must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04029**
  
pMissShaderBindingTable->stride must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03687**
  
  If the buffer from which `pHitShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03688**
  
  The buffer from which the `pHitShaderBindingTable->deviceAddress` is queried must have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag.

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-03689**
  
pHitShaderBindingTable->deviceAddress must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03690**
  
pHitShaderBindingTable->stride must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04035**
  
pHitShaderBindingTable->stride must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03691**
  
  If the buffer from which `pCallableShaderBindingTable->deviceAddress` was queried is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03692**
  
  The buffer from which the `pCallableShaderBindingTable->deviceAddress` is queried must...
have been created with the `VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR` usage flag

- **VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-03693**
  - `pCallableShaderBindingTable->deviceAddress` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-03694**
  - `pCallableShaderBindingTable->stride` must be a multiple of `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment`

- **VUID-vkCmdTraceRaysIndirectKHR-stride-04041**
  - `pCallableShaderBindingTable->stride` must be less than or equal to `VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride`

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03696**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03697**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `pHitShaderBindingTable->deviceAddress` must not be zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03511**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `pMissShaderBindingTable->deviceAddress` must not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03512**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an any-hit shader must not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03513**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-flags-03514**
  - If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed as a result of this command in order to execute an intersection shader must not be set to zero

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04735**
  - Any non-zero hit shader group entries in the table identified by `pHitShaderBindingTable->deviceAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`

- **VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-04736**
Any non-zero hit shader group entries in the table identified by \text{pHitShaderBindingTable} accessed by this call from a geometry with a \text{geometryType} of \text{VK_GEOMETRY_TYPE_AABBs_KHR} must have been created with \text{VKRAYTRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR}

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03632
  If the buffer from which \text{indirectDeviceAddress} was queried is non-sparse then it must be bound completely and contiguously to a single \text{VkDeviceMemory} object

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03633
  The buffer from which \text{indirectDeviceAddress} was queried must have been created with the \text{VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT} bit set

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03634
  \text{indirectDeviceAddress} must be a multiple of 4

- VUID-vkCmdTraceRaysIndirectKHR-indirectDeviceAddress-03636
  All device addresses between \text{indirectDeviceAddress} and \text{indirectDeviceAddress} + \text{sizeof(VkTraceRaysIndirectCommandKHR)} - 1 must be in the buffer device address range of the same buffer

- VUID-vkCmdTraceRaysIndirectKHR-rayTracingPipelineTraceRaysIndirect-03637
  The \text{rayTracingPipelineTraceRaysIndirect} feature must be enabled

- VUID-vkCmdTraceRaysIndirectKHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
  If the bound ray tracing pipeline was created with \text{VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV} \text{VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect} feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-parameter
  \text{commandBuffer} must be a valid \text{VkCommandBuffer} handle

- VUID-vkCmdTraceRaysIndirectKHR-pRaygenShaderBindingTable-parameter
  \text{pRaygenShaderBindingTable} must be a valid pointer to a valid \text{VkStridedDeviceAddressRegionKHR} structure

- VUID-vkCmdTraceRaysIndirectKHR-pMissShaderBindingTable-parameter
  \text{pMissShaderBindingTable} must be a valid pointer to a valid \text{VkStridedDeviceAddressRegionKHR} structure

- VUID-vkCmdTraceRaysIndirectKHR-pHitShaderBindingTable-parameter
  \text{pHitShaderBindingTable} must be a valid pointer to a valid \text{VkStridedDeviceAddressRegionKHR} structure

- VUID-vkCmdTraceRaysIndirectKHR-pCallableShaderBindingTable-parameter
  \text{pCallableShaderBindingTable} must be a valid pointer to a valid \text{VkStridedDeviceAddressRegionKHR} structure

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-recording
  3396
commandBuffer must be in the recording state

- VUID-vkCmdTraceRaysIndirectKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdTraceRaysIndirectKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdTraceRaysIndirectKHR-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkTraceRaysIndirectCommandKHR structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommandKHR {
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommandKHR;
```

- `width` is the width of the ray trace query dimensions.
- `height` is height of the ray trace query dimensions.
- `depth` is depth of the ray trace query dimensions.

The members of VkTraceRaysIndirectCommandKHR have the same meaning as the similarly named parameters of vkCmdTraceRaysKHR.

Valid Usage

- VUID-VkTraceRaysIndirectCommandKHR-width-03638
width must be less than or equal to \(VkPhysicalDeviceLimits::\text{maxComputeWorkGroupCount}[0] \times \text{maxComputeWorkGroupSize}[0]\)

- VUID-VkTraceRaysIndirectCommandKHR-height-03639  
  height must be less than or equal to \(VkPhysicalDeviceLimits::\text{maxComputeWorkGroupCount}[1] \times \text{maxComputeWorkGroupSize}[1]\)

- VUID-VkTraceRaysIndirectCommandKHR-depth-03640  
  depth must be less than or equal to \(VkPhysicalDeviceLimits::\text{maxComputeWorkGroupCount}[2] \times \text{maxComputeWorkGroupSize}[2]\)

- VUID-VkTraceRaysIndirectCommandKHR-width-03641  
  \(\text{width} \times \text{height} \times \text{depth}\) must be less than or equal to \(VkPhysicalDeviceRayTracingPipelinePropertiesKHR::\text{maxRayDispatchInvocationCount}\)

To dispatch ray tracing, with some parameters sourced on the device, use:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
void vkCmdTraceRaysIndirect2KHR(
    VkCommandBuffer commandBuffer,  
    VkDeviceAddress indirectDeviceAddress);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectDeviceAddress` is a buffer device address which is a pointer to a `VkTraceRaysIndirectCommand2KHR` structure containing the trace ray parameters.

`vkCmdTraceRaysIndirect2KHR` behaves similarly to `vkCmdTraceRaysIndirectKHR` except that shader binding table parameters as well as dispatch dimensions are read by the device from `indirectDeviceAddress` during execution.

### Valid Usage

- VUID-vkCmdTraceRaysIndirect2KHR-magFilter-04553  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-magFilter-09598  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-04770  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable`
equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-mipmapMode-09599
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view’s levelCount and layerCount must be 1

- VUID-vkCmdTraceRaysIndirect2KHR-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view’s viewType must be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D

- VUID-vkCmdTraceRaysIndirect2KHR-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s format features must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdTraceRaysIndirect2KHR-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdTraceRaysIndirect2KHR-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageviewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdTraceRaysIndirect2KHR-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this
command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties.

- **VUID-vkCmdTraceRaysIndirect2KHR-cubicRangeClamp-09212**
  If the cubicRangeClamp feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must not have a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM.

- **VUID-vkCmdTraceRaysIndirect2KHR-reductionMode-09213**
  Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT.

- **VUID-vkCmdTraceRaysIndirect2KHR-selectableCubicWeights-09214**
  If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

- **VUID-vkCmdTraceRaysIndirect2KHR-flags-02696**
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07027**
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07028**
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07029**
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- **VUID-vkCmdTraceRaysIndirect2KHR-OpTypeImage-07030**
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- **VUID-vkCmdTraceRaysIndirect2KHR-None-08600**
  For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.
For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.

If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident.
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command.

If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by bound shaders must not be a protected resource.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_aC_b conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

If a bound shader accesses a VkSampler or VkImageView object that enables sampler Y'C_aC_b conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed as a result of this command, then the image view's viewType must match the Dim operand of the OpTypeImage as described in Instruction/Sampler/Image View Validation.

If a VkImageView is accessed as a result of this command, then the numeric type of the image view's format and the Sampled Type operand of the OpTypeImage must match.

If a VkImageView created with a format other than VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkImageView created with the format VK_FORMAT_A8_UNORM_KHR is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have four components.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdTraceRaysIndirect2KHR-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirect2KHR-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchWindowSSDQCOM`, `OpImageBlockMatchWindowSADQCOM`, `OpImageBlockMatchGatherSSDQCOM`, `OpImageBlockMatchGatherSADQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09215**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09216**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` instruction is used to read from an `VkImageView` as a result of this command, then the image view's format must be a single-component format

- **VUID-vkCmdTraceRaysIndirect2KHR-OpImageBlockMatchWindow-09217**
  If a `OpImageBlockMatchWindow*QCOM` or `OpImageBlockMatchGather*QCOM` read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- **VUID-vkCmdTraceRaysIndirect2KHR-None-07288**
  Any shader invocation executed by this command must terminate

- **VUID-vkCmdTraceRaysIndirect2KHR-None-09600**
  If a descriptor with type equal to any of `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

- **VUID-vkCmdTraceRaysIndirect2KHR-None-03429**
  Any shader group handle referenced by this call must have been queried from the currently bound ray tracing pipeline

- **VUID-vkCmdTraceRaysIndirect2KHR-None-09458**
  If the bound ray tracing pipeline state was created with the `VK_DYNAMIC_STATE_RAY_TRACING_PIPELINE_STACK_SIZE_KHR` dynamic state enabled then `vkCmdSetRayTracingPipelineStackSizeKHR` must have been called in the current command buffer prior to this trace command
• VUID-vkCmdTraceRaysIndirect2KHR-maxPipelineRayRecursionDepth-03679
This command must not cause a shader call instruction to be executed from a shader invocation with a recursion depth greater than the value of maxPipelineRayRecursionDepth used to create the bound ray tracing pipeline

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-03635
commandBuffer must not be a protected command buffer

• VUID-vkCmdTraceRaysIndirect2KHR-indirectDeviceAddress-03632
If the buffer from which indirectDeviceAddress was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdTraceRaysIndirect2KHR-indentDeviceAddress-03633
The buffer from which indirectDeviceAddress was queried must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdTraceRaysIndirect2KHR-indentDeviceAddress-03634
indirectDeviceAddress must be a multiple of 4

• VUID-vkCmdTraceRaysIndirect2KHR-indentDeviceAddress-03636
All device addresses between indirectDeviceAddress and indirectDeviceAddress + sizeof (VkTraceRaysIndirectCommand2KHR) - 1 must be in the buffer device address range of the same buffer

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingPipelineTraceRaysIndirect2-03637
The rayTracingPipelineTraceRaysIndirect2 feature must be enabled

• VUID-vkCmdTraceRaysIndirect2KHR-rayTracingMotionBlurPipelineTraceRaysIndirect-04951
If the bound ray tracing pipeline was created with VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV
VkPhysicalDeviceRayTracingMotionBlurFeaturesNV::rayTracingMotionBlurPipelineTraceRaysIndirect feature must be enabled

Valid Usage (Implicit)

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdTraceRaysIndirect2KHR-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support compute operations

• VUID-vkCmdTraceRaysIndirect2KHR-renderpass
This command must only be called outside of a render pass instance

• VUID-vkCmdTraceRaysIndirect2KHR-videocoding
This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkTraceRaysIndirectCommand2KHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1 with VK_KHR_ray_tracing_pipeline
typedef struct VkTraceRaysIndirectCommand2KHR {
    VkDeviceAddress raygenShaderRecordAddress;
    VkDeviceSize raygenShaderRecordSize;
    VkDeviceAddress missShaderBindingTableAddress;
    VkDeviceSize missShaderBindingTableSize;
    VkDeviceSize missShaderBindingTableStride;
    VkDeviceAddress hitShaderBindingTableAddress;
    VkDeviceSize hitShaderBindingTableSize;
    VkDeviceSize hitShaderBindingTableStride;
    VkDeviceAddress callableShaderBindingTableAddress;
    VkDeviceSize callableShaderBindingTableSize;
    VkDeviceSize callableShaderBindingTableStride;
    uint32_t width;
    uint32_t height;
    uint32_t depth;
} VkTraceRaysIndirectCommand2KHR;
```

- `raygenShaderRecordAddress` is a `VkDeviceAddress` of the ray generation shader binding table record used by this command.
- `raygenShaderRecordSize` is a `VkDeviceSize` number of bytes corresponding to the ray generation shader binding table record at base address `raygenShaderRecordAddress`.
- `missShaderBindingTableAddress` is a `VkDeviceAddress` of the first record in the miss shader binding table used by this command.
- `missShaderBindingTableSize` is a `VkDeviceSize` number of bytes corresponding to the total size of the miss shader binding table at `missShaderBindingTableAddress` that may be accessed by this command.
- `missShaderBindingTableStride` is a `VkDeviceSize` number of bytes between records of the miss
shader binding table.

- **hitShaderBindingTableAddress** is a *VkDeviceAddress* of the first record in the hit shader binding table used by this command.

- **hitShaderBindingTableSize** is a *VkDeviceSize* number of bytes corresponding to the total size of the hit shader binding table at **hitShaderBindingTableAddress** that may be accessed by this command.

- **hitShaderBindingTableStride** is a *VkDeviceSize* number of bytes between records of the hit shader binding table.

- **callableShaderBindingTableAddress** is a *VkDeviceAddress* of the first record in the callable shader binding table used by this command.

- **callableShaderBindingTableSize** is a *VkDeviceSize* number of bytes corresponding to the total size of the callable shader binding table at **callableShaderBindingTableAddress** that may be accessed by this command.

- **callableShaderBindingTableStride** is a *VkDeviceSize* number of bytes between records of the callable shader binding table.

- **width** is the width of the ray trace query dimensions.

- **height** is height of the ray trace query dimensions.

- **depth** is depth of the ray trace query dimensions.

The members of **VkTraceRaysIndirectCommand2KHR** have the same meaning as the similarly named parameters of **vkCmdTraceRaysKHR**.

Indirect shader binding table buffer parameters must satisfy the same memory alignment and binding requirements as their counterparts in **vkCmdTraceRaysIndirectKHR** and **vkCmdTraceRaysKHR**.

**Valid Usage**

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03680**  
  If the buffer from which **raygenShaderRecordAddress** was queried is non-sparse then it **must** be bound completely and contiguously to a single *VkDeviceMemory* object

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03681**  
  The buffer from which the **raygenShaderRecordAddress** is queried **must** have been created with the *VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR* usage flag

- **VUID-VkTraceRaysIndirectCommand2KHR-pRayGenShaderBindingTable-03682**  
  **raygenShaderRecordAddress** **must** be a multiple of *VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment*

- **VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03683**  
  If the buffer from which **missShaderBindingTableAddress** was queried is non-sparse then it **must** be bound completely and contiguously to a single *VkDeviceMemory* object

- **VUID-VkTraceRaysIndirectCommand2KHR-pMissShaderBindingTable-03684**  
  The buffer from which the **missShaderBindingTableAddress** is queried **must** have been created with the *VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR* usage flag
missShaderBindingTableAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

missShaderBindingTableStride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

missShaderBindingTableStride must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which hitShaderBindingTable was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

The buffer from which the hitShaderBindingTableAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

hitShaderBindingTableAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

hitShaderBindingTableStride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

hitShaderBindingTableStride must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the buffer from which callableShaderBindingTable was queried is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

The buffer from which the callableShaderBindingTableAddress is queried must have been created with the VK_BUFFER_USAGE_SHADER_BINDING_TABLE_BIT_KHR usage flag

callableShaderBindingTableAddress must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupBaseAlignment

callableShaderBindingTableStride must be a multiple of VkPhysicalDeviceRayTracingPipelinePropertiesKHR::shaderGroupHandleAlignment

callableShaderBindingTableStride must be less than or equal to VkPhysicalDeviceRayTracingPipelinePropertiesKHR::maxShaderGroupStride

If the currently bound ray tracing pipeline was created with flags that included VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR, hitShaderBindingTableAddress must not be zero
If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR`, `hitShaderBindingTableAddress` must not be zero.

If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR`, the shader group handle identified by `missShaderBindingTableAddress` must not be set to zero.

If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute an any-hit shader must not be set to zero.

If the currently bound ray tracing pipeline was created with `flags` that included `VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR`, entries in the table identified by `hitShaderBindingTableAddress` accessed as a result of this command in order to execute a closest hit shader must not be set to zero.

Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_TRIANGLES_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_TRIANGLES_HIT_GROUP_KHR`.

Any non-zero hit shader group entries in the table identified by `hitShaderBindingTableAddress` accessed by this call from a geometry with a `geometryType` of `VK_GEOMETRY_TYPE_AABBS_KHR` must have been created with `VK_RAY_TRACING_SHADER_GROUP_TYPE_PROCEDURAL_HIT_GROUP_KHR`.

`width` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[0] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[0]`.

`height` must be less than or equal to `VkPhysicalDeviceLimits::maxComputeWorkGroupCount[1] × VkPhysicalDeviceLimits::maxComputeWorkGroupSize[1]`.

40.3. Shader Binding Table

A shader binding table is a resource which establishes the relationship between the ray tracing pipeline and the acceleration structures that were built for the ray tracing pipeline. It indicates the shaders that operate on each geometry in an acceleration structure. In addition, it contains the resources accessed by each shader, including indices of textures, buffer device addresses, and constants. The application allocates and manages shader binding tables as VkBuffer objects.

Each entry in the shader binding table consists of shaderGroupHandleSize bytes of data, either as queried by vkGetRayTracingShaderGroupHandlesKHR to refer to those specified shaders, or all zeros to refer to a zero shader group. A zero shader group behaves as though it is a shader group consisting entirely of VK_SHADER_UNUSED_KHR. The remainder of the data specified by the stride is application-visible data that can be referenced by a ShaderRecordBufferKHR block in the shader.

The shader binding tables to use in a ray tracing pipeline are passed to the vkCmdTraceRaysNV, vkCmdTraceRaysKHR, or vkCmdTraceRaysIndirectKHR commands. Shader binding tables are read-only in shaders that are executing on the ray tracing pipeline.

Shader variables identified with the ShaderRecordBufferKHR storage class are used to access the provided shader binding table. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the ShaderRecordBufferKHR storage class must not cause the space required for that variable to extend outside the range [0, maxStorageBufferRange).

Accesses to the shader binding table from ray tracing pipelines must be synchronized with the VK_PIPELINE_STAGE_RAY_TRACING_SHADER_BIT_KHR pipeline stage and an access type of VK_ACCESS_SHADER_READ_BIT.

Note
Because different shader record buffers can be associated with the same shader, a shader variable with ShaderRecordBufferKHR storage class will not be dynamically uniform if different invocations of the same shader can reference different data in the shader record buffer, such as if the same shader occurs twice in the shader binding table with a different shader record buffer. In this case, indexing resources based on values in the ShaderRecordBufferKHR storage class, the index should be decorated as NonUniform.
40.3.1. Indexing Rules

In order to execute the correct shaders and access the correct resources during a ray tracing dispatch, the implementation must be able to locate shader binding table entries at various stages of execution. This is accomplished by defining a set of indexing rules that compute shader binding table record positions relative to the buffer's base address in memory. The application must organize the contents of the shader binding table's memory in a way that application of the indexing rules will lead to correct records.

Ray Generation Shaders

Only one ray generation shader is executed per ray tracing dispatch.

For `vkCmdTraceRaysKHR`, the location of the ray generation shader is specified by the `pRaygenShaderBindingTable->deviceAddress` parameter—there is no indexing. All data accessed must be less than `pRaygenShaderBindingTable->size` bytes from `deviceAddress`. `pRaygenShaderBindingTable->stride` is unused, and must be equal to `pRaygenShaderBindingTable->size`.

For `vkCmdTraceRaysNV`, the location of the ray generation shader is specified by the `raygenShaderBindingTableBuffer` and `raygenShaderBindingOffset` parameters—there is no indexing.

Hit Shaders

The base for the computation of intersection, any-hit, and closest hit shader locations is the `instanceShaderBindingTableRecordOffset` value stored with each instance of a top-level acceleration structure (`VkAccelerationStructureInstanceKHR`). This value determines the beginning of the shader binding table records for a given instance.

In the following rule, `geometryIndex` refers to the geometry index of the intersected geometry within the instance.

The `sbtRecordOffset` and `sbtRecordStride` values are passed in as parameters to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, these correspond to the `SBTOffset` and `SBTStride` parameters to the pipeline trace ray instructions.

The result of this computation is then added to `pHitShaderBindingTable->deviceAddress`, a device address passed to `vkCmdTraceRaysKHR`, or `hitShaderBindingOffset`, a base offset passed to `vkCmdTraceRaysNV`.

For `vkCmdTraceRaysKHR`, the complete rule to compute a hit shader binding table record address in the `pHitShaderBindingTable` is:

\[
pHitShaderBindingTable->deviceAddress + pHitShaderBindingTable->stride \times (instanceShaderBindingTableRecordOffset + geometryIndex \times sbtRecordStride + sbtRecordOffset)
\]

All data accessed must be less than `pHitShaderBindingTable->size` bytes from the base address.
For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a hit shader binding table record address in the `hitShaderBindingTableBuffer` is:

\[
\text{hitShaderBindingOffset} + \text{hitShaderBindingStride} \times (\text{instanceShaderBindingTableRecordOffset} + \text{geometryIndex} \times \text{sbtRecordStride} + \text{sbtRecordOffset})
\]

**Miss Shaders**

A miss shader is executed whenever a ray query fails to find an intersection for the given scene geometry. Multiple miss shaders may be executed throughout a ray tracing dispatch.

The base for the computation of miss shader locations is `pMissShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `missShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `missIndex` value is passed in as a parameter to `traceNV()` or `traceRayEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `MissIndex` parameter to the pipeline trace ray instructions.

For `vkCmdTraceRaysKHR`, the complete rule to compute a miss shader binding table record address in the `pMissShaderBindingTable` is:

\[
p\text{MissShaderBindingTable}->\text{deviceAddress} + p\text{MissShaderBindingTable}->\text{stride} \times \text{missIndex}
\]

All data accessed must be less than `pMissShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a miss shader binding table record address in the `missShaderBindingTableBuffer` is:

\[
\text{missShaderBindingOffset} + \text{missShaderBindingStride} \times \text{missIndex}
\]

**Callable Shaders**

A callable shader is executed when requested by a ray tracing shader. Multiple callable shaders may be executed throughout a ray tracing dispatch.

The base for the computation of callable shader locations is `pCallableShaderBindingTable->deviceAddress`, a device address passed into `vkCmdTraceRaysKHR`, or `callableShaderBindingOffset`, a base offset passed into `vkCmdTraceRaysNV`.

The `sbtRecordIndex` value is passed in as a parameter to `executeCallableNV()` or `executeCallableEXT()` calls made in the shaders. See Section 8.19 (Ray Tracing Functions) of the OpenGL Shading Language Specification for more details. In SPIR-V, this corresponds to the `SBTIndex` parameter to the `OpExecuteCallableNV` or `OpExecuteCallableKHR` instruction.

For `vkCmdTraceRaysKHR`, the complete rule to compute a callable shader binding table record
address in the `pCallableShaderBindingTable` is:

```
pCallableShaderBindingTable->deviceAddress + pCallableShaderBindingTable->stride × sbtRecordIndex
```

All data accessed **must** be less than `pCallableShaderBindingTable->size` bytes from the base address.

For `vkCmdTraceRaysNV`, the offset and stride come from direct parameters, so the full rule to compute a callable shader binding table record address in the `callableShaderBindingTableBuffer` is:

```
callableShaderBindingOffset + callableShaderBindingStride × sbtRecordIndex
```

### 40.4. Ray Tracing Pipeline Stack

Ray tracing pipelines have a potentially large set of shaders which **may** be invoked in various call chain combinations to perform ray tracing. To store parameters for a given shader execution, an implementation **may** use a stack of data in memory. This stack **must** be sized to the sum of the stack sizes of all shaders in any call chain executed by the application.

If the stack size is not set explicitly, the stack size for a pipeline is:

```
rayGenStackMax + min(1, maxPipelineRayRecursionDepth) × max(closestHitStackMax, missStackMax, intersectionStackMax + anyHitStackMax) + max(0, maxPipelineRayRecursionDepth -1) × max(closestHitStackMax, missStackMax) + 2 × callableStackMax
```

where `rayGenStackMax`, `closestHitStackMax`, `missStackMax`, `anyHitStackMax`, `intersectionStackMax`, and `callableStackMax` are the maximum stack values queried by the respective shader stages for any shaders in any shader groups defined by the pipeline.

This stack size is potentially significant, so an application **may** want to provide a more accurate stack size after pipeline compilation. The value that the application provides is the maximum value of the sum of all shaders in a call chain across all possible call chains, taking into account any application specific knowledge about the properties of the call chains.

**Note**

For example, if an application has two types of closest hit and miss shaders that it can use but the first level of rays will only use the first kind (possibly reflection) and the second level will only use the second kind (occlusion or shadow ray, for example) then the application can compute the stack size by something similar to:

```
rayGenStack + max(closestHit1Stack, miss1Stack) + max(closestHit2Stack, miss2Stack)
```

This is guaranteed to be no larger than the default stack size computation which
assumes that both call levels may be the larger of the two.

## 40.5. Ray Tracing Capture Replay

In a similar way to `bufferDeviceAddressCaptureReplay`, the `rayTracingPipelineShaderGroupHandleCaptureReplay` feature allows the querying of opaque data which can be used in a future replay.

During the capture phase, capture/replay tools are expected to query opaque data for shader group handle replay using `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR`.

Providing the opaque data during replay, using `VkRayTracingShaderGroupCreateInfoKHR::pShaderGroupCaptureReplayHandle` at pipeline creation time, causes the implementation to generate identical shader group handles to those in the capture phase, allowing capture/replay tools to reuse previously recorded shader binding table buffer contents or to obtain the same handles by calling `vkGetRayTracingCaptureReplayShaderGroupHandlesKHR` again.

## 40.6. Ray Tracing Validation

Ray tracing validation can help root cause application issues and improve performance. Unlike existing validation layers, ray tracing validation performs checks at an implementation level, which helps identify potential problems that may not be caught by the layer.

By enabling the ray tracing validation feature, warnings and errors can be delivered straight from a ray tracing implementation to the application through a messenger callback registered with the implementation, where they can be processed through existing application-side debugging or logging systems.
Chapter 41. Memory Decompression

To decompress data between one or more memory regions call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryNV(
    VkCommandBuffer commandBuffer,
    uint32_t decompressRegionCount,
    const VkDecompressMemoryRegionNV* pDecompressMemoryRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `decompressRegionCount` is the number of memory regions to decompress.
- `pDecompressMemoryRegions` is a pointer to an array of `decompressRegionCount` `VkDecompressMemoryRegionNV` structures specifying decompression parameters.

Each region specified in `pDecompressMemoryRegions` is decompressed from the source to destination region based on the specified decompression method.

**Valid Usage**

- VUID-vkCmdDecompressMemoryNV-None-07684
  The `memoryDecompression` feature must be enabled

**Valid Usage (Implicit)**

- VUID-vkCmdDecompressMemoryNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDecompressMemoryNV-pDecompressMemoryRegions-parameter
  `pDecompressMemoryRegions` must be a valid pointer to an array of `decompressRegionCount` valid `VkDecompressMemoryRegionNV` structures

- VUID-vkCmdDecompressMemoryNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDecompressMemoryNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdDecompressMemoryNV-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdDecompressMemoryNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDecompressMemoryNV-decompressRegionCount-arraylength
  `decompressRegionCount` must be greater than 0
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

The `VkDecompressMemoryRegionNV` structure is defined as:

```c
// Provided by VK_NV_memory_decompression
typedef struct VkDecompressMemoryRegionNV {
    VkDeviceAddress srcAddress;
    VkDeviceAddress dstAddress;
    VkDeviceSize compressedSize;
    VkDeviceSize decompressedSize;
    VkMemoryDecompressionMethodFlagsNV decompressionMethod;
} VkDecompressMemoryRegionNV;
```

- `srcAddress` is the address where compressed data is stored.
- `dstAddress` is the destination address where decompressed data will be written.
- `compressedSize` is the size of compressed data in bytes.
- `decompressedSize` is the size of decompressed data in bytes.
- `decompressionMethod` is a bitmask of `VkMemoryDecompressionMethodFlagBitsNV` with a single bit set specifying the method used to decompress data.

Valid Usage

- VUID-VkDecompressMemoryRegionNV-srcAddress-07685
  The `srcAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-srcAddress-07686
  The memory in range `srcAddress` and `srcAddress + compressedSize` must be valid and bound to a `VkDeviceMemory` object
- VUID-VkDecompressMemoryRegionNV-dstAddress-07687
  The `dstAddress` must be 4 byte aligned
- VUID-VkDecompressMemoryRegionNV-decompressionMethod-09395
If `decompressionMethod` is `VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV`, then `decompressedSize` must be less than or equal to 65536 bytes

- VUID-VkDecompressMemoryRegionNV-dstAddress-07688
  The memory in range `dstAddress` and `dstAddress + decompressedSize` must be valid and bound to a `VkDeviceMemory` object

- VUID-VkDecompressMemoryRegionNV-decompressedSize-07689
  The `decompressedSize` must be large enough to hold the decompressed data based on the `decompressionMethod`

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-07690
  The `decompressionMethod` must have a single bit set

- VUID-VkDecompressMemoryRegionNV-srcAddress-07691
  The `srcAddress` to `srcAddress + compressedSize` region must not overlap with the `dstAddress` and `dstAddress + decompressedSize` region

Valid Usage (Implicit)

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-parameter
  `decompressionMethod` must be a valid combination of `VkMemoryDecompressionMethodFlagBitsNV` values

- VUID-VkDecompressMemoryRegionNV-decompressionMethod-requiredbitmask
  `decompressionMethod` must not be 0

To decompress data between one or more memory regions by specifying decompression parameters indirectly in a buffer, call:

```c
// Provided by VK_NV_memory_decompression
void vkCmdDecompressMemoryIndirectCountNV(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress indirectCommandsAddress,
    VkDeviceAddress indirectCommandsCountAddress,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `indirectCommandsAddress` is the device address containing decompression parameters laid out as an array of `VkDecompressMemoryRegionNV` structures.
- `indirectCommandsCountAddress` is the device address containing the decompression count.
- `stride` is the byte stride between successive sets of decompression parameters located starting from `indirectCommandsAddress`.

Each region specified in `indirectCommandsAddress` is decompressed from the source to destination region based on the specified decompression method.
Valid Usage

- **VUID-vkCmdDecompressMemoryIndirectCountNV-None-07692**
  The `memoryDecompression` feature **must** be enabled

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indirectCommandsAddress-07693**
  If `indirectCommandsAddress` comes from a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsAddress-07694**
  The `VkBuffer` that `indirectCommandsAddress` comes from **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDecompressMemoryIndirectCountNV-offset-07695**
  `offset` **must** be a multiple of 4

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07696**
  If `indirectCommandsCountAddress` comes from a non-sparse buffer then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07697**
  The `VkBuffer` that `indirectCommandsCountAddress` comes from **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07698**
  `indirectCommandsCountAddress` **must** be a multiple of 4

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07699**
  The count stored in `indirectCommandsCountAddress` **must** be less than or equal to `VkPhysicalDeviceMemoryDecompressionPropertiesNV::maxDecompressionIndirectCount`

- **VUID-vkCmdDecompressMemoryIndirectCountNV-stride-07700**
  `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDecompressMemoryRegionNV)`

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07701**
  If the count stored in `indirectCommandsCountAddress` is equal to 1, `(offset + sizeof(VkDecompressMemoryRegionNV))` **must** be less than or equal to the size of the `VkBuffer` that `indirectCommandsAddress` comes from

- **VUID-vkCmdDecompressMemoryIndirectCountNV-indentCommandsCountAddress-07702**
  If the count stored in `indirectCommandsCountAddress` is greater than 1, `indirectCommandsAddress + sizeof(VkDecompressMemoryRegionNV) + (stride × (count stored in countBuffer - 1))` **must** be less than or equal to the last valid address in the `VkBuffer` that `indirectCommandsAddress` was created from
Valid Usage (Implicit)

- **VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-parameter**
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-recording**
  - `commandBuffer` **must** be in the **recording** state.

- **VUID-vkCmdDecompressMemoryIndirectCountNV-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations.

- **VUID-vkCmdDecompressMemoryIndirectCountNV-renderpass**
  - This command **must** only be called outside of a render pass instance.

- **VUID-vkCmdDecompressMemoryIndirectCountNV-videocoding**
  - This command **must** only be called outside of a video coding scope.

Host Synchronization

- **VUID-vkCmdDecompressMemoryIndirectCountNV-host**
  - Host access to `commandBuffer` **must** be externally synchronized.

- **VUID-vkCmdDecompressMemoryIndirectCountNV-host-pool**
  - Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

Command Properties

<table>

Bits which **can** be set in `VkDecompressMemoryRegionNV::decompressionMethod` specifying the decompression method to select, or returned in `VkPhysicalDeviceMemoryDecompressionPropertiesNV::decompressionMethods` specifying the available decompression methods are:

```
// Provided by VK_NV_memory_decompression
// Flag bits for VkMemoryDecompressionMethodFlagBitsNV
typedef VkFlags64 VkMemoryDecompressionMethodFlagBitsNV;
static const VkMemoryDecompressionMethodFlagBitsNV
  VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV = 0x00000001ULL;
```

- **VK_MEMORY_DECOMPRESSION_METHOD_GDEFLATE_1_0_BIT_NV** specifies that the GDeflate 1.0 algorithm is used to decompress data.
VkMemoryDecompressionMethodFlagsNV is a bitmask type for specifying a mask of one or more VkMemoryDecompressionMethodFlagBitsNV:
Chapter 42. Video Coding

Vulkan implementations may expose one or more queue families supporting video coding operations. These operations are performed by recording them into a command buffer within a video coding scope, and submitting them to queues with compatible video coding capabilities.

The Vulkan video functionalities are designed to be made available through a set of APIs built on top of each other, consisting of:

- A core API providing common video coding functionalities,
- APIs providing codec-independent video decode and video encode related functionalities, respectively,
- Additional codec-specific APIs built on top of those.

This chapter details the fundamental components and operations of these.

42.1. Video Picture Resources

In the context of video coding, multidimensional arrays of image data that can be used as the source or target of video coding operations are referred to as video picture resources. They may store additional metadata that includes implementation-private information used during the execution of video coding operations, as discussed later.

Video picture resources are backed by VkImage objects. Individual subregions of VkImageView objects created from such resources can be used as decode output pictures, encode input pictures, reconstructed pictures, and/or reference pictures.

The parameters of a video picture resource are specified using a VkVideoPictureResourceInfoKHR structure.

The VkVideoPictureResourceInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoPictureResourceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D codedOffset;
    VkExtent2D codedExtent;
    uint32_t baseArrayLayer;
    VkImageView imageViewBinding;
} VkVideoPictureResourceInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **codedOffset** is the offset in texels of the image subregion to use.
- **codedExtent** is the size in pixels of the coded image data.
- `baseArrayLayer` is the array layer of the image view specified in `imageViewBinding` to use as the video picture resource.
- `imageViewBinding` is an image view representing the video picture resource.

The image subresource referred to by such a structure is defined as the image array layer index specified in `baseArrayLayer` relative to the image subresource range the image view specified in `imageViewBinding` was created with.

The meaning of the `codedOffset` and `codedExtent` depends on the command and context the video picture resource is used in, as well as on the used video profile and corresponding codec-specific semantics, as described later.

A video picture resource is uniquely defined by the image subresource referred to by an instance of this structure, together with the `codedOffset` and `codedExtent` members that identify the image subregion within the image subresource referenced corresponding to the video picture resource according to the particular codec-specific semantics.

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. As a result, given an effective image subregion corresponding to a video picture resource, the actual image subregion accessed may be larger than that as it may include additional padding texels due to the picture access granularity. Any writes performed by video coding operations to such padding texels will result in undefined texel values.

Two video picture resources match if they refer to the same image subresource and they specify identical `codedOffset` and `codedExtent` values.

### Valid Usage

- VUID-VkVideoPictureResourceInfoKHR-baseArrayLayer-07175
  - `baseArrayLayer` must be less than the `VkImageViewCreateInfo::subresourceRange.layerCount` specified when the image view `imageViewBinding` was created

### Valid Usage (Implicit)

- VUID-VkVideoPictureResourceInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_PICTURE_RESOURCE_INFO_KHR`
- VUID-VkVideoPictureResourceInfoKHR-pNext-pNext
  - `pNext` must be `NULL`
- VUID-VkVideoPictureResourceInfoKHR-imageViewBinding-parameter
  - `imageViewBinding` must be a valid `VkImageView` handle
42.2. Decoded Picture Buffer

An integral part of video coding pipelines is the reconstruction of pictures from a compressed video bitstream. A reconstructed picture is a video picture resource resulting from this process.

Such reconstructed pictures can be used as reference pictures in subsequent video coding operations to provide predictions of the values of samples of subsequently decoded or encoded pictures. The correct use of such reconstructed pictures as reference pictures is driven by the video compression standard, the implementation, and the application-specific use cases.

The list of reference pictures used to provide such predictions within a single video coding operation is referred to as the list of active reference pictures.

The decoded picture buffer (DPB) is an indexed data structure that maintains the set of reference pictures available to be used in video coding operations. Individual indexed entries of the DPB are referred to as the decoded picture buffer (DPB) slots. The range of valid DPB slot indices is between zero and \( N-1 \), where \( N \) is the capacity of the DPB. Each DPB slot can refer to a reference picture containing a video frame or can refer to up to two reference pictures containing the top and/or bottom fields that, when both present, together represent a full video frame.

In Vulkan, the state and the backing store of the DPB is separated as follows:

- The state of individual DPB slots is maintained by video session objects.
- The backing store of DPB slots is provided by subregions of VkImage objects used as video picture resources.

In addition, the implementation may also maintain opaque metadata associated with DPB slots, including:

- Reference picture metadata corresponding to the video picture resource associated with the DPB slot.

Such metadata may be stored by the implementation as part of the DPB slot state maintained by the video session, or as part of the video picture resource backing the DPB slot.

Any metadata stored in the video picture resources backing DPB slots are independent of the video session used to store it, hence such video picture resources can be shared with other video sessions. Correspondingly, any metadata that is dependent on the video session will always be stored as part of the DPB slot state maintained by that video session.

The responsibility of managing the DPB is split between the application and the implementation as follows:

- The application maintains the association between DPB slot indices and corresponding video picture resources.
- The implementation maintains global and per-slot opaque reference picture metadata.

In addition, the application is also responsible for managing the mapping between the codec-specific picture IDs and DPB slots, and any other codec-specific states unless otherwise specified.
42.2.1. DPB Slot States

At a given time, each DPB slot is either in active or inactive state. Initially, all DPB slots managed by a video session are in inactive state.

A DPB slot can be activated by using it as the target of picture reconstruction in a video coding operation with the reconstructed picture requested to be set up as a reference picture, according to the codec-specific semantics, changing its state to active and associating it with a picture reference to the reconstructed pictures.

Some video coding standards allow multiple picture references to be associated with a single DPB slot. In this case the state of the individual picture references can be independently updated.

Note

As an example, H.264 decoding allows associating a separate top field and bottom field picture with the same DPB slot.

As part of reference picture setup, the implementation may also generate reference picture metadata. Such reference picture metadata is specific to each picture reference associated with the DPB slot.

If such a video coding operation completes successfully, the activated DPB slot will have a valid picture reference and the reconstructed picture is associated with the DPB slot. This is true even if the DPB slot is used as the target of a picture reconstruction that only sets up a top field or bottom field reference picture and thus does not yet refer to a complete frame. However, if any data provided as input to such a video coding operation is not compliant with the video compression standard used, that video coding operation may complete unsuccessfully, in which case the activated DPB slot will have an invalid picture reference. This is true even if the DPB slot previously had a valid picture reference to a top field or bottom field reference picture, but the reconstruction of the other field corresponding to the DPB slot failed.

The application can use queries to get feedback about the outcome of video coding operations and use the resulting VkQueryResultStatusKHR value to determine whether the video coding operation completed successfully (result status is positive) or unsuccessfully (result status is negative).

Using a reference picture associated with a DPB slot that has an invalid picture reference as an active reference picture in subsequent video coding operations is legal, however, the contents of the outputs of such operations are undefined, and any DPB slots activated by such video coding operations will also have an invalid picture reference. This is true even if such video coding operations may otherwise complete successfully.

A DPB slot can also be deactivated by the application, changing its state to inactive and invalidating any picture references and reference picture metadata associated with the DPB slot.

If an already active DPB slot is used as the target of picture reconstruction in a video coding operation, but the decoded picture is not requested to be set up as a reference picture, according to the codec-specific semantics, no reference picture setup happens and the corresponding picture reference and reference picture metadata is invalidated within the DPB slot. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly
deactivated.

If an already active DPB slot is used as the target of picture reconstruction when decoding a field picture that is not marked as reference, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then the DPB slot is deactivated.
- If the DPB slot is not currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the decoded picture is a bottom field picture, then the other field picture association of the DPB slot, if any, is not disturbed.
- If the DPB slot is currently associated with a top field picture and the decoded picture is a top field picture, or if the DPB slot is currently associated with a bottom field picture and the decoded picture is a bottom field picture, then that picture association is invalidated, without disturbing the other field picture association, if any. If the DPB slot no longer has any associated picture references after such an operation, the DPB slot is implicitly deactivated.

A DPB slot can be activated with a new frame even if it is already active. In this case all previous associations of the DPB slots with reference pictures are replaced with an association with the reconstructed picture used to activate it.

If an already active DPB slot is activated with a reconstructed field picture, then the behavior is as follows:

- If the DPB slot is currently associated with a frame, then that association is replaced with an association with the reconstructed field picture used to activate it.
- If the DPB slot is not currently associated with a top field picture and the DPB slot is activated with a top field picture, or if the DPB slot is not currently associated with a bottom field picture and the DPB slot is activated with a bottom field picture, then the DPB slot is associated with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.
- If the DPB slot is currently associated with a top field picture and the DPB slot is activated with a new top field picture, or if the DPB slot is currently associated with a bottom field picture and the DPB slot is activated with a new bottom field picture, then that association is replaced with an association with the reconstructed field picture used to activate it, without disturbing the other field picture association, if any.

### 42.3. Video Profiles

The `VkVideoProfileInfoKHR` structure is defined as follows:
typedef struct VkVideoProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodecOperationFlagBitsKHR videoCodecOperation;
    VkVideoChromaSubsamplingFlagsKHR chromaSubsampling;
    VkVideoComponentBitDepthFlagsKHR lumaBitDepth;
    VkVideoComponentBitDepthFlagsKHR chromaBitDepth;
} VkVideoProfileInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoCodecOperation** is a `VkVideoCodecOperationFlagBitsKHR` value specifying a video codec operation.
- **chromaSubsampling** is a bitmask of `VkVideoChromaSubsamplingFlagBitsKHR` specifying video chroma subsampling information.
- **lumaBitDepth** is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video luma bit depth information.
- **chromaBitDepth** is a bitmask of `VkVideoComponentBitDepthFlagBitsKHR` specifying video chroma bit depth information.

Video profiles are provided as input to video capability queries such as `vkGetPhysicalDeviceVideoCapabilitiesKHR` or `vkGetPhysicalDeviceVideoFormatPropertiesKHR`, as well as when creating resources to be used by video coding operations such as images, buffers, query pools, and video sessions.

The full description of a video profile is specified by an instance of this structure, and the codec-specific and auxiliary structures provided in its `pNext` chain.

When this structure is specified as an input parameter to `vkGetPhysicalDeviceVideoCapabilitiesKHR`, or through the `pProfiles` member of a `VkVideoProfileListInfoKHR` structure in the `pNext` chain of the input parameter of a query command such as `vkGetPhysicalDeviceVideoFormatPropertiesKHR` or `vkGetPhysicalDeviceImageFormatProperties2`, the following error codes indicate specific causes of the failure of the query operation:

- **VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR** indicates that the requested video picture layout (e.g. through the `pictureLayout` member of a `VkVideoDecodeH264ProfileInfoKHR` structure included in the `pNext` chain of `VkVideoProfileInfoKHR`) is not supported.
- **VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR** indicates that a video profile operation specified by `videoCodecOperation` is not supported.
- **VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR** indicates that video format parameters specified by `chromaSubsampling`, `lumaBitDepth`, or `chromaBitDepth` are not supported.
- **VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR** indicates that the codec-specific parameters corresponding to the video codec operation are not supported.
Valid Usage

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07013
  chromaSubsampling must have a single bit set

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-07014
  lumaBitDepth must have a single bit set

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-07015
  If chromaSubsampling is not VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR, then chromaBitDepth must have a single bit set

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07179
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the pNext chain must include a VkVideoDecodeH264ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07180
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the pNext chain must include a VkVideoDecodeH265ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-09256
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain must include a VkVideoDecodeAV1ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07181
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain must include a VkVideoEncodeH264ProfileInfoKHR structure

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-07182
  If videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain must include a VkVideoEncodeH265ProfileInfoKHR structure

Valid Usage (Implicit)

- VUID-VkVideoProfileInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_PROFILE_INFO_KHR

- VUID-VkVideoProfileInfoKHR-videoCodecOperation-parameter
  videoCodecOperation must be a valid VkVideoCodecOperationFlagBitsKHR value

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-parameter
  chromaSubsampling must be a valid combination of VkVideoChromaSubsamplingFlagBitsKHR values

- VUID-VkVideoProfileInfoKHR-chromaSubsampling-required bitmask
  chromaSubsampling must not be 0

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-parameter
  lumaBitDepth must be a valid combination of VkVideoComponentBitDepthFlagBitsKHR values

- VUID-VkVideoProfileInfoKHR-lumaBitDepth-required bitmask
  lumaBitDepth must not be 0
Possible values of `VkVideoProfileInfoKHR::videoCodecOperation`, specifying the type of video coding operation and video compression standard used by a video profile, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodecOperationFlagBitsKHR {
    VK_VIDEO_CODEC_OPERATION_NONE_KHR = 0,
    VkVideoCodecOperationFlagBitsKHR;

    // Provided by VK_KHR_video_encode_h264
    VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR = 0x00010000,
    // Provided by VK_KHR_video_encode_h265
    VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR = 0x00020000,
    // Provided by VK_KHR_video_decode_h264
    VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_decode_h265
    VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_video_decode_av1
    VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR = 0x00000004,
} VkVideoCodecOperationFlagBitsKHR;
```

- `VK_VIDEO_CODEC_OPERATION_NONE_KHR` indicates no support for any video codec operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` specifies support for H.264 encode operations.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` specifies support for H.264 decode operations.
- `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` specifies support for H.265 decode operations.
- `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` specifies support for AV1 decode operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` specifies support for H.264 encode operations.
- `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` specifies support for H.265 encode operations.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodecOperationFlagsKHR;
```

`VkVideoCodecOperationFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCodecOperationFlagBitsKHR`.

The video format chroma subsampling is defined with the following enums:
typedef enum VkVideoChromaSubsamplingFlagBitsKHR {
  VK_VIDEO_CHROMA_SUBSAMPLING_INVALID_KHR = 0,
  VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR = 0x00000001,
  VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR = 0x00000002,
  VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR = 0x00000004,
  VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR = 0x00000008,
} VkVideoChromaSubsamplingFlagBitsKHR;

• VK_VIDEO_CHROMA_SUBSAMPLING_MONOCHROME_BIT_KHR specifies that the format is monochrome.
• VK_VIDEO_CHROMA_SUBSAMPLING_420_BIT_KHR specified that the format is 4:2:0 chroma subsampled, i.e. the two chroma components are sampled horizontally and vertically at half the sample rate of the luma component.
• VK_VIDEO_CHROMA_SUBSAMPLING_422_BIT_KHR - the format is 4:2:2 chroma subsampled, i.e. the two chroma components are sampled horizontally at half the sample rate of luma component.
• VK_VIDEO_CHROMA_SUBSAMPLING_444_BIT_KHR - the format is 4:4:4 chroma sampled, i.e. all three components of the Y'CbCr format are sampled at the same rate, thus there is no chroma subsampling.

Chroma subsampling is described in more detail in the Chroma Reconstruction section.

typedef VkFlags VkVideoChromaSubsamplingFlagsKHR;

VkVideoChromaSubsamplingFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoChromaSubsamplingFlagBitsKHR.

Possible values for the video format component bit depth are:

typedef enum VkVideoComponentBitDepthFlagBitsKHR {
  VK_VIDEO_COMPONENT_BIT_DEPTH_INVALID_KHR = 0,
  VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR = 0x00000001,
  VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR = 0x00000004,
  VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR = 0x00000010,
} VkVideoComponentBitDepthFlagBitsKHR;

• VK_VIDEO_COMPONENT_BIT_DEPTH_8_BIT_KHR specifies a component bit depth of 8 bits.
• VK_VIDEO_COMPONENT_BIT_DEPTH_10_BIT_KHR specifies a component bit depth of 10 bits.
• VK_VIDEO_COMPONENT_BIT_DEPTH_12_BIT_KHR specifies a component bit depth of 12 bits.

typedef VkFlags VkVideoComponentBitDepthFlagsKHR;
VkVideoComponentBitDepthFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoComponentBitDepthFlagBitsKHR.

Additional information about the video decode use case can be provided by adding a VkVideoDecodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoDecodeUsageInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeUsageFlagsKHR videoUsageHints;
} VkVideoDecodeUsageInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **videoUsageHints** is a bitmask of VkVideoDecodeUsageFlagBitsKHR specifying hints about the intended use of the video decode profile.

Valid Usage (Implicit)

- VUID-VkVideoDecodeUsageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_USAGE_INFO_KHR
- VUID-VkVideoDecodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints must be a valid combination of VkVideoDecodeUsageFlagBitsKHR values

The following bits can be specified in VkVideoDecodeUsageInfoKHR::videoUsageHints as a hint about the video decode use case:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeUsageFlagBitsKHR {
    VK_VIDEO_DECODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR = 0x00000002,
    VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR = 0x00000004,
} VkVideoDecodeUsageFlagBitsKHR;
```

- **VK_VIDEO_DECODE_USAGE_TRANSCODING_BIT_KHR** specifies that video decoding is intended to be used in conjunction with video encoding to transcode a video bitstream with the same and/or different codecs.
- **VK_VIDEO_DECODE_USAGE_OFFLINE_BIT_KHR** specifies that video decoding is intended to be used to consume a local video bitstream.
- **VK_VIDEO_DECODE_USAGE_STREAMING_BIT_KHR** specifies that video decoding is intended to be used to
consume a video bitstream received as a continuous flow over network.

Note

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeUsageFlagsKHR;

VkVideoDecodeUsageFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeUsageFlagBitsKHR.

Additional information about the video encode use case can be provided by adding a VkVideoEncodeUsageInfoKHR structure to the pNext chain of VkVideoProfileInfoKHR.

The VkVideoEncodeUsageInfoKHR structure is defined as:

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeUsageInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeUsageFlagsKHR videoUsageHints;
    VkVideoEncodeContentFlagsKHR videoContentHints;
    VkVideoEncodeTuningModeKHR tuningMode;
} VkVideoEncodeUsageInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- videoUsageHints is a bitmask of VkVideoEncodeUsageFlagBitsKHR specifying hints about the intended use of the video encode profile.
- videoContentHints is a bitmask of VkVideoEncodeContentFlagBitsKHR specifying hints about the content to be encoded using the video encode profile.
- tuningMode is a VkVideoEncodeTuningModeKHR value specifying the tuning mode to use when encoding with the video profile.

Valid Usage (Implicit)

- VUID-VkVideoEncodeUsageInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_USAGE_INFO_KHR

- VUID-VkVideoEncodeUsageInfoKHR-videoUsageHints-parameter
  videoUsageHints must be a valid combination of VkVideoEncodeUsageFlagBitsKHR values

- VUID-VkVideoEncodeUsageInfoKHR-videoContentHints-parameter

3432
The following bits can be specified in `VkVideoEncodeUsageInfoKHR::videoUsageHints` as a hint about the video encode use case:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeUsageFlagBitsKHR {
    VK_VIDEO_ENCODE_USAGE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR = 0x00000008,
} VkVideoEncodeUsageFlagBitsKHR;
```

- `VK_VIDEO_ENCODE_USAGE_TRANSCODING_BIT_KHR` specifies that video encoding is intended to be used in conjunction with video decoding to transcode a video bitstream with the same and/or different codecs.
- `VK_VIDEO_ENCODE_USAGE_STREAMING_BIT_KHR` specifies that video encoding is intended to be used to produce a video bitstream that is expected to be sent as a continuous flow over network.
- `VK_VIDEO_ENCODE_USAGE_RECORDING_BIT_KHR` specifies that video encoding is intended to be used for real-time recording for offline consumption.
- `VK_VIDEO_ENCODE_USAGE_CONFERENCING_BIT_KHR` specifies that video encoding is intended to be used in a video conferencing scenario.

**Note**

There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular use case.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeUsageFlagsKHR;
```

`VkVideoEncodeUsageFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeUsageFlagBitsKHR`.

The following bits can be specified in `VkVideoEncodeUsageInfoKHR::videoContentHints` as a hint about the encoded video content:
typedef enum VkVideoEncodeContentFlagBitsKHR {
  VK_VIDEO_ENCODE_CONTENT_DEFAULT_KHR = 0,
  VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR = 0x00000001,
  VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR = 0x00000002,
  VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR = 0x00000004,
} VkVideoEncodeContentFlagBitsKHR;

- **VK_VIDEO_ENCODE_CONTENT_CAMERA_BIT_KHR** specifies that video encoding is intended to be used to encode camera content.
- **VK_VIDEO_ENCODE_CONTENT_DESKTOP_BIT_KHR** specifies that video encoding is intended to be used to encode desktop content.
- **VK_VIDEO_ENCODE_CONTENT_RENDERED_BIT_KHR** specified that video encoding is intended to be used to encode rendered (e.g. game) content.

**Note**
There are no restrictions on the combination of bits that can be specified by the application. However, applications should use reasonable combinations in order for the implementation to be able to select the most appropriate mode of operation for the particular content type.

typedef VkFlags VkVideoEncodeContentFlagsKHR;

VkVideoEncodeContentFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeContentFlagBitsKHR.

Possible video encode tuning mode values are as follows:

typedef enum VkVideoEncodeTuningModeKHR {
  VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR = 0,
  VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR = 1,
  VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR = 2,
  VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR = 3,
  VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR = 4,
} VkVideoEncodeTuningModeKHR;

- **VK_VIDEO_ENCODE_TUNING_MODE_DEFAULT_KHR** specifies the default tuning mode.
- **VK_VIDEO_ENCODE_TUNING_MODE_HIGH_QUALITY_KHR** specifies that video encoding is tuned for high quality. When using this tuning mode, the implementation may compromise the latency of video encoding operations to improve quality.
- **VK_VIDEO_ENCODE_TUNING_MODE_LOW_LATENCY_KHR** specifies that video encoding is tuned for low latency. When using this tuning mode, the implementation may compromise quality to increase
the performance and lower the latency of video encode operations.

- **VK_VIDEO_ENCODE_TUNING_MODE_ULTRA_LOW_LATENCY_KHR** specifies that video encoding is tuned for ultra-low latency. When using this tuning mode, the implementation may compromise quality to maximize the performance and minimize the latency of video encoding operations.

- **VK_VIDEO_ENCODE_TUNING_MODE_LOSSLESS_KHR** specifies that video encoding is tuned for lossless encoding. When using this tuning mode, video encode operations produce lossless output.

The **VkVideoProfileListInfoKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoProfileListInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t profileCount;
    const VkVideoProfileInfoKHR* pProfiles;
} VkVideoProfileListInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **profileCount** is the number of elements in the **pProfiles** array.
- **pProfiles** is a pointer to an array of **VkVideoProfileInfoKHR** structures.

**Note**

Video transcoding is an example of a use case that necessitates the specification of multiple profiles in various contexts.

When the application provides a video decode profile and one or more video encode profiles in the profile list, the implementation ensures that any capabilities returned or resources created are suitable for the video transcoding use cases without the need for manual data transformations.

**Valid Usage**

- **VUID-VkVideoProfileListInfoKHR-pProfiles-06813**
  \[pProfiles\] must not contain more than one element whose **videoCodecOperation** member specifies a decode operation

**Valid Usage (Implicit)**

- **VUID-VkVideoProfileListInfoKHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_PROFILE_LIST_INFO_KHR**
- **VUID-VkVideoProfileListInfoKHR-pProfiles-parameter**
  If **profileCount** is not 0, **pProfiles** must be a valid pointer to an array of **profileCount** valid **VkVideoProfileInfoKHR** structures
42.4. Video Capabilities

42.4.1. Video Coding Capabilities

To query video coding capabilities for a specific video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoCapabilitiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkVideoProfileInfoKHR* pVideoProfile,
    VkVideoCapabilitiesKHR* pCapabilities);
```

- `physicalDevice` is the physical device from which to query the video decode or encode capabilities.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure.
- `pCapabilities` is a pointer to a `VkVideoCapabilitiesKHR` structure in which the capabilities are returned.

If the video profile described by `pVideoProfile` is supported by the implementation, then this command returns `VK_SUCCESS` and `pCapabilities` is filled with the capabilities supported with the specified video profile. Otherwise, one of the video-profile-specific error codes are returned.

### Valid Usage

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07183
  - If `pVideoProfile->videoCodecOperation` specifies a decode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07184
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH264CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07185
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeH265CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-09257
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoDecodeAV1CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07186
  - If `pVideoProfile->videoCodecOperation` specifies an encode operation, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07187
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH264CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeH265CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07189
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeAV1CapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07190
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07191
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07192
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07193
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07194
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07195
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07196
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07197
  - If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_CODEC_TRUNCATE_KHR`, then the `pNext` chain of `pCapabilities` must include a `VkVideoEncodeCodecTruncateCapabilitiesKHR` structure.
then the pNext chain of pCapabilities must include a VkVideoEncodeH264CapabilitiesKHR structure

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-07188
  If pVideoProfile->videoCodecOperation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pCapabilities must include a VkVideoEncodeH265CapabilitiesKHR structure

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pVideoProfile-parameter
  pVideoProfile must be a valid pointer to a valid VkVideoProfileInfoKHR structure
- VUID-vkGetPhysicalDeviceVideoCapabilitiesKHR-pCapabilities-parameter
  pCapabilities must be a valid pointer to a VkVideoCapabilitiesKHR structure

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The VkVideoCapabilitiesKHR structure is defined as:
// Provided by VK_KHR_video_queue

typedef struct VkVideoCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoCapabilityFlagsKHR flags;
    VkDeviceSize minBitstreamBufferOffsetAlignment;
    VkDeviceSize minBitstreamBufferSizeAlignment;
    VkExtent2D pictureAccessGranularity;
    VkExtent2D minCodedExtent;
    VkExtent2D maxCodedExtent;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    VkExtensionProperties stdHeaderVersion;
} VkVideoCapabilitiesKHR;

• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **flags** is a bitmask of *VkVideoCapabilityFlagBitsKHR* specifying capability flags.

• **minBitstreamBufferOffsetAlignment** is the minimum alignment for bitstream buffer offsets.

• **minBitstreamBufferSizeAlignment** is the minimum alignment for bitstream buffer range sizes.

• **pictureAccessGranularity** is the granularity at which image access to video picture resources happen.

• **minCodedExtent** is the minimum width and height of the coded frames.

• **maxCodedExtent** is the maximum width and height of the coded frames.

• **maxDpbSlots** is the maximum number of DPB slots supported by a single video session.

• **maxActiveReferencePictures** is the maximum number of active reference pictures a single video coding operation can use.

• **stdHeaderVersion** is a *VkExtensionProperties* structure reporting the Video Std header name and version supported for the video profile.

---

**Note**

It is common for video compression standards to allow using all reference pictures associated with active DPB slots as active reference pictures, hence for video decode profiles the values returned in **maxDpbSlots** and **maxActiveReferencePictures** are often equal. Similarly, in case of video decode profiles supporting field pictures the value of **maxActiveReferencePictures** often equals **maxDpbSlots** × 2.

---

**Valid Usage (Implicit)**

• VUID-VkVideoCapabilitiesKHR-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_CAPABILITIES_KHR**

• VUID-VkVideoCapabilitiesKHR-pNext-pNext
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either NULL or a pointer to a valid instance of `VkVideoDecodeAV1CapabilitiesKHR`, `VkVideoDecodeH264CapabilitiesKHR`, `VkVideoDecodeH265CapabilitiesKHR`, `VkVideoDecodeCapabilitiesKHR`, `VkVideoEncodeCapabilitiesKHR`, `VkVideoEncodeH264CapabilitiesKHR`, or `VkVideoEncodeH265CapabilitiesKHR`

- VUID-VkVideoCapabilitiesKHR-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

Bits which can be set in `VkVideoCapabilitiesKHR::flags` are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCapabilityFlagBitsKHR {
    VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR = 0x00000002,
} VkVideoCapabilityFlagBitsKHR;
```

- `VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR` indicates that video sessions support producing and consuming protected content.
- `VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR` indicates that the video picture resources associated with the DPB slots of a video session can be backed by separate `VkImage` objects. If this capability flag is not present, then all DPB slots of a video session must be associated with video picture resources backed by the same `VkImage` object (e.g. using different layers of the same image).

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCapabilityFlagsKHR;
```

`VkVideoCapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoCapabilityFlagBitsKHR`.

### 42.4.2. Video Format Capabilities

To enumerate the supported output, input and DPB image formats and corresponding capabilities for a specific video profile, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetPhysicalDeviceVideoFormatPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoFormatInfoKHR* pVideoFormatInfo,
    uint32_t* pVideoFormatPropertyCount,
    VkVideoFormatPropertiesKHR* pVideoFormatProperties);
```

- `physicalDevice` is the physical device from which to query the video format properties.
- `pVideoFormatInfo` is a pointer to a `VkPhysicalDeviceVideoFormatInfoKHR` structure specifying
the usage and video profiles for which supported image formats and capabilities are returned.

- **pVideoFormatPropertyCount** is a pointer to an integer related to the number of video format properties available or queried, as described below.

- **pVideoFormatProperties** is a pointer to an array of VkVideoFormatPropertiesKHR structures in which supported image formats and capabilities are returned.

If **pVideoFormatProperties** is NULL, then the number of video format properties supported for the given **physicalDevice** is returned in **pVideoFormatPropertyCount**. Otherwise, **pVideoFormatPropertyCount must** point to a variable set by the application to the number of elements in the **pVideoFormatProperties** array, and on return the variable is overwritten with the number of values actually written to **pVideoFormatProperties**. If the value of **pVideoFormatPropertyCount** is less than the number of video format properties supported, at most **pVideoFormatPropertyCount** values will be written to **pVideoFormatProperties**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that not all the available values were returned.

Video format properties are always queried with respect to a specific set of video profiles. These are specified by chaining the **VkVideoProfileListInfoKHR** structure to **pVideoFormatInfo**.

For most use cases, the images are used by a single video session and a single video profile is provided. For a use case such as video transcoding, where a decode session output image can be used as encode input in one or more encode sessions, multiple video profiles corresponding to the video sessions that will share the image must be provided.

If any of the **video profiles** specified via **VkVideoProfileListInfoKHR::pProfiles** are not supported, then this command returns one of the **video-profile-specific error codes**. Furthermore, if **VkPhysicalDeviceVideoFormatInfoKHR::imageUsage** includes any image usage flags not supported by the specified video profiles, then this command returns **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR**.

This command also returns **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR** if **VkPhysicalDeviceVideoFormatInfoKHR::imageUsage** does not include the appropriate flags as dictated by the decode capability flags returned in **VkVideoDecodeCapabilitiesKHR::flags** for any of the profiles specified in the **VkVideoProfileListInfoKHR** structure provided in the **pNext** chain of **pVideoFormatInfo**.

If the decode capability flags include **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR** but not **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR**, then in order to query video format properties for decode DPB and output usage, ** VkPhysicalDeviceVideoFormatInfoKHR::imageUsage must** include both **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** and **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**. Otherwise, the call will fail with **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR**.

If the decode capability flags include **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR** but not **VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR**, then in order to query video format properties for decode DPB usage, **VkPhysicalDeviceVideoFormatInfoKHR::imageUsage must** include **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR**, but not **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**. Otherwise, the call will fail with **VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR**. Similarly, to query video format properties for decode output usage, **VkPhysicalDeviceVideoFormatInfoKHR::imageUsage must include** **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**, but not **
VK_IMAGE_USAGE_VIDEO_DECODE_DPBit_KHR. Otherwise, the call will fail with VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

The imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure specifies the expected video usage flags that the returned video formats must support. Correspondingly, the imageUsageFlags member of each VkVideoFormatPropertiesKHR structure returned will contain at least the same set of image usage flags.

If the implementation supports using video input, output, or DPB images of a particular format in operations other than video decode/encode then the imageUsageFlags member of the corresponding VkVideoFormatPropertiesKHR structure returned will include additional image usage flags indicating that.

Note
For most use cases, only decode or encode related usage flags are going to be specified. For a use case such as transcode, if the image were to be shared between decode and encode session(s), then both decode and encode related usage flags can be set.

Multiple VkVideoFormatPropertiesKHR entries may be returned with the same format member with different componentMapping, imageType, or imageTiling values, as described later.

In addition, a different set of VkVideoFormatPropertiesKHR entries may be returned depending on the imageUsage member of the VkPhysicalDeviceVideoFormatInfoKHR structure, even for the same set of video profiles, for example, based on whether encode input, encode DPB, decode output, and/or decode DPB usage is requested.

The application can select the parameters returned in the VkVideoFormatPropertiesKHR entries and use compatible parameters when creating the input, output, and DPB images. The implementation will report all image creation and usage flags that are valid for images used with the requested video profiles but applications should create images only with those that are necessary for the particular use case.

Before creating an image, the application can obtain the complete set of supported image format features by calling vkGetPhysicalDeviceImageFormatProperties2 using parameters derived from the members of one of the reported VkVideoFormatPropertiesKHR entries and adding the same VkVideoProfileListInfoKHR structure to the pNext chain of VkPhysicalDeviceImageFormatInfo2.

The following applies to all VkVideoFormatPropertiesKHR entries returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR:

• vkGetPhysicalDeviceFormatProperties2 must succeed when called with VkVideoFormatPropertiesKHR::format

• If VkVideoFormatPropertiesKHR::imageTiling is VK_IMAGE_TILING_OPTIMAL, then the optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties2 must include all format features required by the image usage flags reported in VkVideoFormatPropertiesKHR::imageUsageFlags for the format, as indicated in the Format Feature Dependent Usage Flags section.
• If `VkVideoFormatPropertiesKHR::imageTiling` is `VK_IMAGE_TILING_LINEAR`, then the `linearTilingFeatures` returned by `vkGetPhysicalDeviceFormatProperties2` must include all format features required by the image usage flags reported in `VkVideoFormatPropertiesKHR::imageUsageFlags` for the format, as indicated in the Format Feature Dependent Usage Flags section.

• `vkGetPhysicalDeviceImageFormatProperties2` must succeed when called with a `VkPhysicalDeviceImageFormatInfo2` structure containing the following information:
  ◦ The `pNext` chain including the same `VkVideoProfileListInfoKHR` structure used to call `vkGetPhysicalDeviceVideoFormatPropertiesKHR`.
  ◦ `format` set to the value of `VkVideoFormatPropertiesKHR::format`.
  ◦ `type` set to the value of `VkVideoFormatPropertiesKHR::imageType`.
  ◦ `tiling` set to the value of `VkVideoFormatPropertiesKHR::imageTiling`.
  ◦ `usage` set to the value of `VkVideoFormatPropertiesKHR::imageUsageFlags`.
  ◦ `flags` set to the value of `VkVideoFormatPropertiesKHR::imageCreateFlags`.

The `componentMapping` member of `VkVideoFormatPropertiesKHR` defines the ordering of the Y’CbCr color channels from the perspective of the video codec operations specified in `VkVideoProfileListInfoKHR`. For example, if the implementation produces video decode output with the format `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` where the blue and red chrominance channels are swapped then the `componentMapping` member of the corresponding `VkVideoFormatPropertiesKHR` structure will have the following member values:

```plaintext
components.r = VK_COMPONENT_SWIZZLE_B;       // Cb component
components.g = VK_COMPONENT_SWIZZLE_IDENTITY; // Y component
components.b = VK_COMPONENT_SWIZZLE_R;       // Cr component
components.a = VK_COMPONENT_SWIZZLE_IDENTITY; // unused, defaults to 1.0
```

Valid Usage

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pNext-06812
  The `pNext` chain of `pVideoFormatInfo` must include a `VkVideoProfileListInfoKHR` structure with `profileCount` greater than 0

Valid Usage (Implicit)

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatInfo-parameter
  `pVideoFormatInfo` must be a valid pointer to a valid `VkPhysicalDeviceVideoFormatInfoKHR` structure

• VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatPropertyCount-parameter
pVideoFormatPropertyCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceVideoFormatPropertiesKHR-pVideoFormatProperties-parameter
  If the value referenced by pVideoFormatPropertyCount is not 0, and pVideoFormatProperties is not NULL, pVideoFormatProperties must be a valid pointer to an array of pVideoFormatPropertyCount VkVideoFormatPropertiesKHR structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR

The VkPhysicalDeviceVideoFormatInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkPhysicalDeviceVideoFormatInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags imageUsage;
} VkPhysicalDeviceVideoFormatInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imageUsage** is a bitmask of VkImageUsageFlagBits specifying the intended usage of the video images.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_FORMAT_INFO_KHR
- VUID-VkPhysicalDeviceVideoFormatInfoKHR-pNext-pNext
**pNext** must be **NULL** or a pointer to a valid instance of **VkVideoProfileListInfoKHR**

- **VUID-VkPhysicalDeviceVideoFormatInfoKHR-sType-unique**
  The **sType** value of each struct in the **pNext** chain must be unique

- **VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-parameter**
  **imageUsage** must be a valid combination of **VkImageUsageFlagBits** values

- **VUID-VkPhysicalDeviceVideoFormatInfoKHR-imageUsage-required bitmask**
  **imageUsage** must not be 0

The **VkVideoFormatPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoFormatPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkFormat format;
    VkComponentMapping componentMapping;
    VkImageCreateFlags imageCreateFlags;
    VkImageType imageType;
    VkImageTiling imageTiling;
    VkImageUsageFlags imageUsageFlags;
} VkVideoFormatPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **format** is a **VkFormat** that specifies the format that can be used with the specified video profiles and image usages.

- **componentMapping** defines the color channel order used for the format. **format** along with **componentMapping** describe how the color channels are ordered when producing video decoder output or are expected to be ordered in video encoder input, when applicable. If the **format** reported does not require component swizzling then all members of **componentMapping** will be set to **VK_COMPONENT_SWIZZLE_IDENTITY**.

- **imageCreateFlags** is a bitmask of **VkImageCreateFlagBits** specifying the supported image creation flags for the format.

- **imageType** is a **VkImageType** that specifies the image type the format can be used with.

- **imageTiling** is a **VkImageTiling** that specifies the image tiling the format can be used with.

- **imageUsageFlags** is a bitmask of **VkImageUsageFlagBits** specifying the supported image usage flags for the format.

### Valid Usage (Implicit)

- **VUID-VkVideoFormatPropertiesKHR-sType-sType**
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_FORMAT_PROPERTIES_KHR**
42.5. Video Sessions

Video sessions are objects that represent and maintain the state needed to perform video decode or encode operations using a specific video profile.

In case of video encode profiles this includes the current rate control configuration and the currently set video encode quality level.

Video sessions are represented by VkVideoSessionKHR handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionKHR)
```

42.5.1. Creating a Video Session

To create a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionKHR(
    VkDevice device,
    const VkVideoSessionCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionKHR* pVideoSession);
```

- `device` is the logical device that creates the video session.
- `pCreateInfo` is a pointer to a VkVideoSessionCreateInfoKHR structure containing parameters to be used to create the video session.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pVideoSession` is a pointer to a VkVideoSessionKHR handle in which the resulting video session object is returned.

The resulting video session object is said to be created with the video codec operation specified in pCreateInfo->pVideoProfile->videoCodecOperation.

The name and version of the codec-specific Video Std header to be used with the video session is specified by the VkExtensionProperties structure pointed to by pCreateInfo->pStdHeaderVersion. If a non-existent or unsupported Video Std header version is specified in pCreateInfo->pStdHeaderVersion->specVersion, then this command returns VK_ERROR_VIDEO_STD_VERSION_NOT_SUPPORTED_KHR.

Video session objects are created in uninitialized state. In order to transition the video session into initial state, the application must issue a vkCmdControlVideoCodingKHR command with
Video session objects also maintain the state of the DPB. The number of DPB slots usable with the created video session is specified in `pCreateInfo->maxDpbSlots`, and each slot is initially in the inactive state.

Each DPB slot maintained by the created video session can refer to a reference picture representing a video frame.

In addition, if the `videoCodecOperation` member of the `VkVideoProfileInfoKHR` structure pointed to by `pCreateInfo->pVideoProfile` is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pictureLayout` member of the `VkVideoDecodeH264ProfileInfoKHR` structure provided in the `VkVideoProfileInfoKHR::pNext` chain is not `VK_VIDEO_CODEC_OPERATION_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR`, then the created video session supports interlaced frames and each DPB slot maintained by the created video session can instead refer to separate top field and bottom field reference pictures that together can represent a full video frame. In this case, it is up to the application, driven by the video content, whether it associates any individual DPB slot with separate top and/or bottom field pictures or a single picture representing a full frame.

The created video session can be used to perform video coding operations using video frames up to the maximum size specified in `pCreateInfo->maxCodedExtent`. The minimum frame size allowed is implicitly derived from `VkVideoCapabilitiesKHR::minCodedExtent`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pCreateInfo->pVideoProfile`. Accordingly, the created video session is said to be created with a `minCodedExtent` equal to that.

In case of video session objects created with a video encode operation, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

Applications should not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

### Valid Usage (Implicit)

- **VUID-vkCreateVideoSessionKHR-device-parameter**
  - `device` must be a valid `VkDevice` handle
- **VUID-vkCreateVideoSessionKHR-pCreateInfo-parameter**
  - `pCreateInfo` must be a valid pointer to a valid `VkVideoSessionCreateInfoKHR` structure
- **VUID-vkCreateVideoSessionKHR-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
The \texttt{VkVideoSessionCreateInfoKHR} structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    VkVideoSessionCreateFlagsKHR flags;
    const VkVideoProfileInfoKHR* pVideoProfile;
    VkFormat pictureFormat;
    VkExtent2D maxCodedExtent;
    VkFormat referencePictureFormat;
    uint32_t maxDpbSlots;
    uint32_t maxActiveReferencePictures;
    const VkExtensionProperties* pStdHeaderVersion;
} VkVideoSessionCreateInfoKHR;
```

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{queueFamilyIndex} is the index of the queue family the created video session will be used with.
- \texttt{flags} is a bitmask of \texttt{VkVideoSessionCreateFlagBitsKHR} specifying creation flags.
- \texttt{pVideoProfile} is a pointer to a \texttt{VkVideoProfileInfoKHR} structure specifying the video profile the created video session will be used with.
- \texttt{pictureFormat} is the image format the created video session will be used with. If \texttt{pVideoProfile->videoCodecOperation} specifies a decode operation, then \texttt{pictureFormat} is the image format of decode output pictures usable with the created video session. If \texttt{pVideoProfile->videoCodecOperation} specifies an encode operation, then \texttt{pictureFormat} is the image format of encode input pictures usable with the created video session.
• **maxCodedExtent** is the maximum width and height of the coded frames the created video session will be used with.

• **referencePictureFormat** is the image format of reference pictures stored in the DPB the created video session will be used with.

• **maxDpbSlots** is the maximum number of DPB Slots that can be used with the created video session.

• **maxActiveReferencePictures** is the maximum number of active reference pictures that can be used in a single video coding operation using the created video session.

• **pStdHeaderVersion** is a pointer to a VkExtensionProperties structure requesting the Video Std header version to use for the videoCodecOperation specified in pVideoProfile.

---

### Valid Usage

- **VUID-VkVideoSessionCreateInfoKHR-protectedMemory-07189**
  If the protectedMemory feature is not enabled or if VkVideoCapabilitiesKHR::flags does not include VK_VIDEO_CAPABILITY_PROTECTED_CONTENT_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile, then flags must not include VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR.

- **VUID-VkVideoSessionCreateInfoKHR-flags-08371**
  If flags includes VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then videoMaintenance1 must be enabled.

- **VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-04845**
  pVideoProfile must be a supported video profile.

- **VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04847**
  maxDpbSlots must be less than or equal to VkVideoCapabilitiesKHR::maxDpbSlots, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile.

- **VUID-VkVideoSessionCreateInfoKHR-maxActiveReferencePictures-04849**
  maxActiveReferencePictures must be less than or equal to VkVideoCapabilitiesKHR::maxActiveReferencePictures, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile.

- **VUID-VkVideoSessionCreateInfoKHR-maxDpbSlots-04850**
  If either maxDpbSlots or maxActiveReferencePictures is 0, then both must be 0.

- **VUID-VkVideoSessionCreateInfoKHR-maxCodedExtent-04851**
  maxCodedExtent must be between VkVideoCapabilitiesKHR::minCodedExtent and VkVideoCapabilitiesKHR::maxCodedExtent, inclusive, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile specified by pVideoProfile.

- **VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-04852**
  If pVideoProfile->videoCodecOperation specifies a decode operation and maxActiveReferencePictures is greater than 0, then referencePictureFormat must be one of the supported decode DPB formats, as returned by vkGetPhysicalDeviceVideoFormatPropertiesKHR in VkVideoFormatPropertiesKHR::format.
when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-06814**
  If `pVideoProfile->videoCodecOperation` specifies an encode operation and `maxActiveReferencePictures` is greater than 0, then `referencePictureFormat` must be one of the supported decode DPB formats, as returned by then `referencePictureFormat` must be one of the supported encode DPB formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04853**
  If `pVideoProfile->videoCodecOperation` specifies a decode operation, then `pictureFormat` must be one of the supported decode output formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_DEST_DPB_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pictureFormat-04854**
  If `pVideoProfile->videoCodecOperation` specifies an encode operation, then `pictureFormat` must be one of the supported encode input formats, as returned by `vkGetPhysicalDeviceVideoFormatPropertiesKHR` in `VkVideoFormatPropertiesKHR::format` when called with the `imageUsage` member of its `pVideoFormatInfo` parameter containing `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, and with a `VkVideoProfileListInfoKHR` structure specified in the `pNext` chain of its `pVideoFormatInfo` parameter whose `pProfiles` member contains an element matching `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07190**
  `pStdHeaderVersion->extensionName` must match `VkVideoCapabilitiesKHR::stdHeaderVersion.extensionName`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-07191**
  `pStdHeaderVersion->specVersion` must be less than or equal to `VkVideoCapabilitiesKHR::stdHeaderVersion.specVersion`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-08251**
  If `pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and the `pNext` chain of this structure includes a `VkVideoEncodeH264SessionCreateInfoKHR` structure, then its `maxLevelIdc` member must be less than or equal to `VkVideoEncodeH264CapabilitiesKHR::maxLevelIdc`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified by `pVideoProfile`.

- **VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-08252**
If \( pVideoProfile->videoCodecOperation \) is \( VK\_VIDEO\_CODEC\_OPERATION\_ENCODING\_H265\_BIT\_KHR \) and the \( pNext \) chain of this structure includes a \( VkVideoEncodeH265SessionCreateInfoKHR \) structure, then its \( maxLevelIdc \) member must be less than or equal to \( VkVideoEncodeH264CapabilitiesKHR::maxLevelIdc \), as returned by \( vkGetPhysicalDeviceVideoCapabilitiesKHR \) for the video profile specified in \( pVideoProfile \).

**Valid Usage (Implicit)**

- VUID-VkVideoSessionCreateInfoKHR-sType-sType  
  \( sType \) must be \( VK\_STRUCTURE\_TYPE\_VIDEO\_SESSION\_CREATE\_INFO\_KHR \)
- VUID-VkVideoSessionCreateInfoKHR-pNext-pNext  
  Each \( pNext \) member of any structure (including this one) in the \( pNext \) chain must be either \( NULL \) or a pointer to a valid instance of \( VkVideoEncodeH264SessionCreateInfoKHR \) or \( VkVideoEncodeH265SessionCreateInfoKHR \)
- VUID-VkVideoSessionCreateInfoKHR-sType-unique  
  The \( sType \) value of each struct in the \( pNext \) chain must be unique
- VUID-VkVideoSessionCreateInfoKHR-flags-parameter  
  \( flags \) must be a valid combination of \( VkVideoSessionCreateFlagBitsKHR \) values
- VUID-VkVideoSessionCreateInfoKHR-pVideoProfile-parameter  
  \( pVideoProfile \) must be a valid pointer to a valid \( VkVideoProfileInfoKHR \) structure
- VUID-VkVideoSessionCreateInfoKHR-pictureFormat-parameter  
  \( pictureFormat \) must be a valid \( VkFormat \) value
- VUID-VkVideoSessionCreateInfoKHR-referencePictureFormat-parameter  
  \( referencePictureFormat \) must be a valid \( VkFormat \) value
- VUID-VkVideoSessionCreateInfoKHR-pStdHeaderVersion-parameter  
  \( pStdHeaderVersion \) must be a valid pointer to a valid \( VkExtensionProperties \) structure

Bits which can be set in \( VkVideoSessionCreateInfoKHR::flags \) are:

```plaintext
// Provided by VK_KHR_video_queue
typedef enum VkVideoSessionCreateFlagBitsKHR {
    VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_video_maintenance1
    VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR = 0x00000004,
} VkVideoSessionCreateFlagBitsKHR;
```

- \( VK\_VIDEO\_SESSION\_CREATE\_PROTECTED\_CONTENT\_BIT\_KHR \) specifies that the video session uses protected video content.
- \( VK\_VIDEO\_SESSION\_CREATE\_ALLOW\_ENCODE\_PARAMETER\_OPTIMIZATIONS\_BIT\_KHR \) specifies that the implementation is allowed to override video session parameters and other codec-specific encoding parameters to optimize video encode operations based on the use case information.
specified in the video profile and the used video encode quality level.

**Note**
Not specifying `VK_VIDEO_SESSION_CREATE_ALLOW_ENCODE_PARAMETER_OPTIMIZATIONS_BIT_KHR` does not guarantee that the implementation will not do any codec-specific parameter overrides, as certain overrides are necessary for the correct operation of the video encoder implementation due to limitations to the available encoding tools on that implementation. This flag, however, enables the implementation to apply further optimizing overrides.

- `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR` specifies that queries within video coding scopes using the created video session are executed inline with video coding operations.

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionCreateFlagsKHR;
```

`VkVideoSessionCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoSessionCreateFlagBitsKHR`.

### 42.5.2. Destroying a Video Session

To destroy a video session, call:

```c
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the video session.
- `videoSession` is the video session to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyVideoSessionKHR-videoSession-07192
  All submitted commands that refer to `videoSession` must have completed execution
- VUID-vkDestroyVideoSessionKHR-videoSession-07193
  If `VkAllocationCallbacks` were provided when `videoSession` was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyVideoSessionKHR-videoSession-07194
  If no `VkAllocationCallbacks` were provided when `videoSession` was created, `pAllocator` must be `NULL`
Valid Usage (Implicit)

- **VUID-vkDestroyVideoSessionKHR-device-parameter**
  
  Device **must** be a valid `VkDevice` handle

- **VUID-vkDestroyVideoSessionKHR-videoSession-parameter**
  
  If `videoSession` is not `VK_NULL_HANDLE`, `videoSession` **must** be a valid `VkVideoSessionKHR` handle

- **VUID-vkDestroyVideoSessionKHR-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyVideoSessionKHR-videoSession-parent**
  
  If `videoSession` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `videoSession` **must** be externally synchronized

42.5.3. Video Session Memory Association

After creating a video session object, and before the object **can** be used to record video coding operations into command buffers using it, the application **must** allocate and bind device memory to the video session. Device memory is allocated separately (see Device Memory) and then associated with the video session.

Video sessions **may** have multiple memory bindings identified by unique unsigned integer values. Appropriate device memory **must** be bound to each such memory binding before using the video session to record command buffer commands with it.

To determine the memory requirements for a video session object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkGetVideoSessionMemoryRequirementsKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t* pMemoryRequirementsCount,
    VkVideoSessionMemoryRequirementsKHR* pMemoryRequirements);
```

- **device** is the logical device that owns the video session.
- **videoSession** is the video session to query.
- **pMemoryRequirementsCount** is a pointer to an integer related to the number of memory binding requirements available or queried, as described below.
- **pMemoryRequirements** is `NULL` or a pointer to an array of
VkVideoSessionMemoryRequirementsKHR structures in which the memory binding requirements of the video session are returned.

If pMemoryRequirements is NULL, then the number of memory bindings required for the video session is returned in pMemoryRequirementsCount. Otherwise, pMemoryRequirementsCount must point to a variable set by the application to the number of elements in the pMemoryRequirements array, and on return the variable is overwritten with the number of memory binding requirements actually written to pMemoryRequirements. If pMemoryRequirementsCount is less than the number of memory bindings required for the video session, then at most pMemoryRequirementsCount elements will be written to pMemoryRequirements, and VK_INCOMPLETE will be returned, instead of VK_SUCCESS, to indicate that not all required memory binding requirements were returned.

**Valid Usage (Implicit)**

- VUID-vkGetVideoSessionMemoryRequirementsKHR-device-parameter device must be a valid VkDevice handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parameter videoSession must be a valid VkVideoSessionKHR handle
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirementsCount-parameter pMemoryRequirementsCount must be a valid pointer to a uint32_t value
- VUID-vkGetVideoSessionMemoryRequirementsKHR-pMemoryRequirements- parameter If the value referenced by pMemoryRequirementsCount is not 0, and pMemoryRequirements is not NULL, pMemoryRequirements must be a valid pointer to an array of pMemoryRequirementsCount VkVideoSessionMemoryRequirementsKHR structures
- VUID-vkGetVideoSessionMemoryRequirementsKHR-videoSession-parent videoSession must have been created, allocated, or retrieved from device

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

None

The VkVideoSessionMemoryRequirementsKHR structure is defined as:
// Provided by VK_KHR_video_queue

typedef struct VkVideoSessionMemoryRequirementsKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryBindIndex;
    VkMemoryRequirements memoryRequirements;
} VkVideoSessionMemoryRequirementsKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryBindIndex** is the index of the memory binding.
- **memoryRequirements** is a VkMemoryRequirements structure in which the requested memory binding requirements for the binding index specified by **memoryBindIndex** are returned.

### Valid Usage (Implicit)

- VUID-VkVideoSessionMemoryRequirementsKHR-sType-sType
  - sType must be VK_STRUCTURE_TYPE_VIDEO_SESSION_MEMORY_REQUIREMENTS_KHR
- VUID-VkVideoSessionMemoryRequirementsKHR-pNext-pNext
  - pNext must be NULL

To attach memory to a video session object, call:

// Provided by VK_KHR_video_queue

VkResult vkBindVideoSessionMemoryKHR(
    VkDevice device,
    VkVideoSessionKHR videoSession,
    uint32_t bindSessionMemoryInfoCount,
    const VkBindVideoSessionMemoryInfoKHR* pBindSessionMemoryInfos);

- **device** is the logical device that owns the video session.
- **videoSession** is the video session to be bound with device memory.
- **bindSessionMemoryInfoCount** is the number of elements in **pBindSessionMemoryInfos**.
- **pBindSessionMemoryInfos** is a pointer to an array of **bindSessionMemoryInfoCount** VkBindVideoSessionMemoryInfoKHR structures specifying memory regions to be bound to specific memory bindings of the video session.

The valid usage statements below refer to the VkMemoryRequirements structure corresponding to a specific element of **pBindSessionMemoryInfos**, which is defined as follows:

- If the **memoryBindIndex** member of the element of **pBindSessionMemoryInfos** in question matches the **memoryBindIndex** member of one of the elements returned in **pMemoryRequirements** when vkGetVideoSessionMemoryRequirementsKHR is called with the same **videoSession** and with
pMemoryRequirementsCount equal to bindSessionMemoryInfoCount, then the memoryRequirements member of that element of pMemoryRequirements is the VkMemoryRequirements structure corresponding to the element of pBindSessionMemoryInfos in question.

- Otherwise the element of pBindSessionMemoryInfos in question is said to not have a corresponding VkMemoryRequirements structure.

Valid Usage

- VUID-vkBindVideoSessionMemoryKHR-videoSession-07195
  The memory binding of videoSession identified by the memoryBindIndex member of any element of pBindSessionMemoryInfos must not already be backed by a memory object

- VUID-vkBindVideoSessionMemoryKHR-memoryBindIndex-07196
  The memoryBindIndex member of each element of pBindSessionMemoryInfos must be unique within pBindSessionMemoryInfos

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07197
  Each element of pBindSessionMemoryInfos must have a corresponding VkMemoryRequirements structure

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07198
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memory member of that element of pBindSessionMemoryInfos must have been allocated using one of the memory types allowed in the memoryTypeBits member of the corresponding VkMemoryRequirements structure

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07199
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memoryOffset member of that element of pBindSessionMemoryInfos must be an integer multiple of the alignment member of the corresponding VkMemoryRequirements structure

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-07200
  If an element of pBindSessionMemoryInfos has a corresponding VkMemoryRequirements structure, then the memorySize member of that element of pBindSessionMemoryInfos must equal the size member of the corresponding VkMemoryRequirements structure

Valid Usage (Implicit)

- VUID-vkBindVideoSessionMemoryKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkBindVideoSessionMemoryKHR-videoSession-parameter
  videoSession must be a valid VkVideoSessionKHR handle

- VUID-vkBindVideoSessionMemoryKHR-pBindSessionMemoryInfos-parameter
  pBindSessionMemoryInfos must be a valid pointer to an array of bindSessionMemoryInfoCount valid VkBindVideoSessionMemoryInfoKHR structures

- VUID-vkBindVideoSessionMemoryKHR-bindSessionMemoryInfoCount-arraylength
  bindSessionMemoryInfoCount must be greater than 0
Host Synchronization

- Host access to `videoSession` must be externally synchronized

Return Codes

Success
- `VK_SUCCESS`

Failure
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBindVideoSessionMemoryInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkBindVideoSessionMemoryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t memoryBindIndex;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    VkDeviceSize memorySize;
} VkBindVideoSessionMemoryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `memoryBindIndex` is the memory binding index to bind memory to.
- `memory` is the allocated device memory to be bound to the video session’s memory binding with index `memoryBindIndex`.
- `memoryOffset` is the start offset of the region of `memory` which is to be bound.
- `memorySize` is the size in bytes of the region of `memory`, starting from `memoryOffset` bytes, to be bound.

Valid Usage

- VUID-VkBindVideoSessionMemoryInfoKHR-memoryOffset-07201
  `memoryOffset` must be less than the size of `memory`
- VUID-VkBindVideoSessionMemoryInfoKHR-memorySize-07202
  `memorySize` must be less than the size of `memory`
memorySize must be less than or equal to the size of memory minus memoryOffset

Valid Usage (Implicit)

- VUID-VkBindVideoSessionMemoryInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_VIDEO_SESSION_MEMORY_INFO_KHR
- VUID-VkBindVideoSessionMemoryInfoKHR-pNext-pNext
  pNext must be NULL
- VUID-VkBindVideoSessionMemoryInfoKHR-memory-parameter
  memory must be a valid VkDeviceMemory handle

42.6. Video Profile Compatibility

Resources and query pools used with a particular video session must be compatible with the video profile the video session was created with.

A VkBuffer is compatible with a video profile if it was created with the VkBufferCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkBufferCreateInfo::usage including at least one bit specific to video coding usage.

- VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR

A VkBuffer is also compatible with a video profile if it was created with VkBufferCreateInfo::flags including VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.

A VkImage is compatible with a video profile if it was created with the VkImageCreateInfo::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing an element matching the VkVideoProfileInfoKHR structure chain describing the video profile, and VkImageCreateInfo::usage including at least one bit specific to video coding usage.

- VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR
- VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR

A VkImage is also compatible with a video profile if all of the following conditions are true for the VkImageCreateInfo structure the image was created with:
• VkImageCreateInfo::flags included VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR.

• The list of VkVideoFormatPropertiesKHR structures, obtained by calling vkGetPhysicalDeviceVideoFormatPropertiesKHR with VkPhysicalDeviceVideoFormatInfoKHR::imageUsage equal to the VkImageCreateInfo::usage the image was created with and the VkPhysicalDeviceVideoFormatInfoKHR::pNext chain including a VkVideoProfileListInfoKHR structure with its pProfiles member containing a single array element specifying the VkVideoProfileInfoKHR structure chain describing the video profile in question, contains an element for which all of the following conditions are true with respect to the VkImageCreateInfo structure the image was created with:
  ◦ VkImageCreateInfo::format equals VkVideoFormatPropertiesKHR::format.
  ◦ VkImageCreateInfo::flags only contains bits also set in VkVideoFormatPropertiesKHR::imageCreateFlags.
  ◦ VkImageCreateInfo::imageType equals VkVideoFormatPropertiesKHR::imageType.
  ◦ VkImageCreateInfo::tiling equals VkVideoFormatPropertiesKHR::imageTiling.
  ◦ VkImageCreateInfo::usage only contains bits also set in VkVideoFormatPropertiesKHR::imageUsageFlags.

  **Note**
  While some of these rules allow creating buffer or image resources that may be compatible with any video profile, applications should still prefer to include the specific video profiles the buffer or image resource is expected to be used with (through a VkVideoProfileListInfoKHR structure included in the pNext chain of the corresponding create info structure) whenever the information about the complete set of video profiles is available at resource creation time, to enable the implementation to optimize the created resource for the specific use case. In the absence of that information, the implementation may have to make conservative decisions about the memory requirements or representation of the resource.

A VkImageView is compatible with a video profile if the VkImage it was created from is also compatible with that video profile.

A VkQueryPool is compatible with a video profile if it was created with the VkQueryPoolCreateInfo::pNext chain including a VkVideoProfileInfoKHR structure chain describing the same video profile, and VkQueryPoolCreateInfo::queryType having one of the following values:

  • VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR
  • VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR

### 42.7. Video Session Parameters

Video session parameters objects can store preprocessed codec-specific parameters used with a compatible video session, and enable reducing the number of parameters needed to be provided and processed by the implementation while recording video coding operations into command buffers.
Parameters stored in such objects are *immutable* to facilitate the concurrent use of the stored parameters in multiple threads. At the same time, new parameters can be added to existing objects using the `vkUpdateVideoSessionParametersKHR` command.

In order to support concurrent use of the stored immutable parameters while also allowing the video session parameters object to be extended with new parameters, each video session parameters object maintains an *update sequence counter* that is set to 0 at object creation time and must be incremented by each subsequent update operation.

Certain video sequences that adhere to particular video compression standards permit updating previously supplied parameters. If a parameter update is necessary, the application has the following options:

- Cache the set of parameters on the application side and create a new video session parameters object adding all the parameters with appropriate changes, as necessary; or
- Create a new video session parameters object providing only the updated parameters and the previously used object as the template, which ensures that parameters not specified at creation time will be copied unmodified from the template object.

The actual types of parameters that can be stored and the capacity for individual parameter types, and the methods of initializing, updating, and referring to individual parameters are specific to the video codec operation the video session parameters object was created with.

- For `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` these are defined in the H.264 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` these are defined in the H.265 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` these are defined in the AV1 Decode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` these are defined in the H.264 Encode Parameter Sets section.
- For `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` these are defined in the H.265 Encode Parameter Sets section.

Video session parameters objects created with an encode operation are further specialized based on the video encode quality level the video session parameters are used with, as implementations may apply different sets of parameter overrides depending on the used quality level. This enables implementations to store the potentially optimized set of parameters in these objects, further limiting the necessary processing required while recording video encode operations into command buffers.

Video session parameters are represented by `VkVideoSessionParametersKHR` handles:

```c
// Provided by VK_KHR_video_queue
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkVideoSessionParametersKHR)
```
42.7.1. Creating Video Session Parameters

To create a video session parameters object, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkCreateVideoSessionParametersKHR(
    VkDevice device,
    const VkVideoSessionParametersCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkVideoSessionParametersKHR* pVideoSessionParameters);
```

- **device** is the logical device that creates the video session parameters object.
- **pCreateInfo** is a pointer to `VkVideoSessionParametersCreateInfoKHR` structure containing parameters to be used to create the video session parameters object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pVideoSessionParameters** is a pointer to a `VkVideoSessionParametersKHR` handle in which the resulting video session parameters object is returned.

The resulting video session parameters object is said to be created with the video codec operation `pCreateInfo->videoSession` was created with.

Video session parameters objects created with an encode operation are always created with respect to a video encode quality level. By default, the created video session parameters objects are created with quality level zero, unless otherwise specified by including a `VkVideoEncodeQualityLevelInfoKHR` structure in the `pCreateInfo->pNext` chain, in which case the video session parameters object is created with the quality level specified in `VkVideoEncodeQualityLevelInfoKHR::qualityLevel`.

If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then it will be used as a template for constructing the new video session parameters object. This happens by first adding any parameters according to the additional creation parameters provided in the `pCreateInfo->pNext` chain, followed by adding any parameters from the template object that have a key that does not match the key of any of the already added parameters.

For video session parameters objects created with an encode operation, the template object specified in `pCreateInfo->videoSessionParametersTemplate` must have been created with the same video encode quality level as the newly created object.

---

**Note**

This means that codec-specific parameters stored in video session parameters objects can only be reused across different video encode quality levels by re-specifying them, as previously created video session parameters against other quality levels cannot be used as template because the original codec-specific parameters (before the implementation may have applied parameter overrides) may no longer be available in them for the purposes of constructing the derived object.
If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the created video session parameters object will initially contain the following sets of parameter entries:

- **StdVideoH264SequenceParameterSet** structures representing **H.264 SPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id`.

- **StdVideoH264PictureParameterSet** structures representing **H.264 PPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id` and `pic_parameter_set_id`.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the created video session parameters object will initially contain the following sets of parameter entries:

- **StdVideoH265VideoParameterSet** structures representing **H.265 VPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `vps_video_parameter_set_id`.

- **StdVideoH265SequenceParameterSet** structures representing **H.265 SPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id`.
• **StdVideoH265PictureParameterSet** structures representing H.265 PPS entries, as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of **StdVideoH265PictureParameterSet** entries specified in `pParametersAddInfo->pStdPPSs` are added first;

  ◦ If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each **StdVideoH265PictureParameterSet** entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id` and `pps_seq_parameter_set_id`.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the created video session parameters object will contain a single **AV1 sequence header** represented by a **StdVideoAV1SequenceHeader** structure specified through the `pStdSequenceHeader` member of the `VkVideoDecodeAV1SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain. As such video session parameters objects can only contain a single **AV1 sequence header**, it is not possible to use a previously created object as a template or subsequently update the created video session parameters object.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the created video session parameters object will initially contain the following sets of parameter entries:

• **StdVideoH264SequenceParameterSet** structures representing H.264 SPS entries, as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of **StdVideoH264SequenceParameterSet** entries specified in `pParametersAddInfo->pStdSPSs` are added first;

  ◦ If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each **StdVideoH264SequenceParameterSet** entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id`.

• **StdVideoH264PictureParameterSet** structures representing H.264 PPS entries, as follows:

  ◦ If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not NULL, then the set of **StdVideoH264PictureParameterSet** entries specified in `pParametersAddInfo->pStdPPSs` are added first;

  ◦ If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each **StdVideoH264PictureParameterSet** entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `seq_parameter_set_id` and `pic_parameter_set_id`.

If `pCreateInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the created video session parameters object
will initially contain the following sets of parameter entries:

- **StdVideoH265VideoParameterSet** structures representing **H.265 VPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `vps_video_parameter_set_id`.

- **StdVideoH265SequenceParameterSet** structures representing **H.265 SPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id` and `sps_seq_parameter_set_id`.

- **StdVideoH265PictureParameterSet** structures representing **H.265 PPS** entries, as follows:
  - If the `pParametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pCreateInfo->pNext` chain is not `NULL`, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added first;
  - If `pCreateInfo->videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it is copied to the created video session parameters object if the created object does not already contain such an entry with the same `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id`.

In case of video session parameters objects created with a video encode operation, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

**Note**

Applications **should** not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.
Valid Usage (Implicit)

- VUID-vkCreateVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateVideoSessionParametersKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkVideoSessionParametersCreateInfoKHR structure

- VUID-vkCreateVideoSessionParametersKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateVideoSessionParametersKHR-pVideoSessionParameters-parameter
  pVideoSessionParameters must be a valid pointer to a VkVideoSessionParametersKHR handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

The VkVideoSessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoSessionParametersCreateFlagsKHR flags;
    VkVideoSessionParametersKHR videoSessionParametersTemplate;
    VkVideoSessionKHR videoSession;
} VkVideoSessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- videoSessionParametersTemplate is VK_NULL_HANDLE or a valid handle to a VkVideoSessionParametersKHR object used as a template for constructing the new video session parameters object.
• `videoSession` is the video session object against which the video session parameters object is going to be created.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

• If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264SequenceParameterSet spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:
  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;
  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

• If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then let `StdVideoH264PictureParameterSet ppsAddList[]` be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:
  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` or `pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

• If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265VideoParameterSet vpsAddList[]` be the list of H.265 VPS entries to add to the created video session parameters object, defined as follows:
  ◦ If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265VideoParameterSet` entries specified in `pParametersAddInfo->pStdVPSs` are added to `vpsAddList`;
  ◦ If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it with `vps_video_parameter_set_id` not matching any of the entries already in `vpsAddList` is added to `vpsAddList`.

• If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then let `StdVideoH265SequenceParameterSet spsAddList[]` be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;

If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it with `sps_video_parameter_set_id` or `sps_seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_KHR`, then let `StdVideoH265PictureParameterSet` `ppsAddList[]` be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH265PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, or `pps_pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_KHR`, then let `StdVideoH264SequenceParameterSet` `spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_KHR`, then let `StdVideoH264PictureParameterSet` `ppsAddList[]` be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

If `videoSession` was created with an encode operation, then let `uint32_t` `qualityLevel` be the video encode quality level of the created video session parameters object, defined as follows:

- If the `pNext` chain of this structure includes a `VkVideoEncodeQualityLevelInfoKHR` structure, then `qualityLevel` is equal to `VkVideoEncodeQualityLevelInfoKHR::qualityLevel`.
- Otherwise `qualityLevel` is 0

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_KHR`, then let `StdVideoH264SequenceParameterSet` `spsAddList[]` be the list of H.264 SPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264SequenceParameterSet` entries specified in `pParametersAddInfo->pStdSPSs` are added to `spsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264SequenceParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_KHR`, then let `StdVideoH264PictureParameterSet` `ppsAddList[]` be the list of H.264 PPS entries to add to the created video session parameters object, defined as follows:

- If the `pParametersAddInfo` member of the `VkVideoEncodeH264SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not `NULL`, then the set of `StdVideoH264PictureParameterSet` entries specified in `pParametersAddInfo->pStdPPSs` are added to `ppsAddList`;
- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

3466
parametersAddInfo->pStdPPSs are added to ppsAddList;

- If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH264PictureParameterSet` entry stored in it with `seq_parameter_set_id` or `pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then let `StdVideoH265VideoParameterSet vpsAddList[]` be the list of H.265 VPS entries to add to the created video session parameters object, defined as follows:
  - If the `parametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not NULL, then the set of `StdVideoH265VideoParameterSet` entries specified in `parametersAddInfo->pStdVPSs` are added to `vpsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265VideoParameterSet` entry stored in it with `vps_video_parameter_set_id` not matching any of the entries already in `vpsAddList` is added to `vpsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then let `StdVideoH265SequenceParameterSet spsAddList[]` be the list of H.265 SPS entries to add to the created video session parameters object, defined as follows:
  - If the `parametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not NULL, then the set of `StdVideoH265SequenceParameterSet` entries specified in `parametersAddInfo->pStdSPSs` are added to `spsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265SequenceParameterSet` entry stored in it with `sps_video_parameter_set_id` or `sps_seq_parameter_set_id` not matching any of the entries already in `spsAddList` is added to `spsAddList`.

- If `videoSession` was created with the codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then let `StdVideoH265PictureParameterSet ppsAddList[]` be the list of H.265 PPS entries to add to the created video session parameters object, defined as follows:
  - If the `parametersAddInfo` member of the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure provided in the `pNext` chain is not NULL, then the set of `StdVideoH265PictureParameterSet` entries specified in `parametersAddInfo->pStdPPSs` are added to `ppsAddList`;
  - If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, then each `StdVideoH265PictureParameterSet` entry stored in it with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, or `pps_pic_parameter_set_id` not matching any of the entries already in `ppsAddList` is added to `ppsAddList`. 
Valid Usage

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-04855
  If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, it **must** have been created against `videoSession`.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-08310
  If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE` and `videoSession` was created with an encode operation, then `qualityLevel` **must** equal the video encode quality level `videoSessionParametersTemplate` was created with.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07203
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain **must** include a `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07204
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of elements of `spsAddList` **must** be less than or equal to the `maxStdSPSCount` specified in the `VkVideoDecodeH264SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07205
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of elements of `spsAddList` **must** be less than or equal to the `maxStdSPSCount` specified in the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07206
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain **must** include a `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07207
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of elements of `vpsAddList` **must** be less than or equal to the `maxStdVPSCount` specified in the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07208
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of elements of `spsAddList` **must** be less than or equal to the `maxStdSPSCount` specified in the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07209
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of elements of `ppsAddList`...
must be less than or equal to the maxStdPPSCount specified in the VkVideoDecodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-09258
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then videoSessionParametersTemplate must be VK_NULL_HANDLE

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-09259
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the pNext chain must include a VkVideoDecodeAV1SessionParametersCreateInfoKHR structure

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07210
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the pNext chain must include a VkVideoEncodeH264SessionParametersCreateInfoKHR structure

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04839
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of elements of spsAddList must be less than or equal to the maxStdSPSCount specified in the VkVideoEncodeH264SessionParametersCreateInfoKHR structure included in the pNext chain

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04840
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of elements of ppsAddList must be less than or equal to the maxStdPPSCount specified in the VkVideoEncodeH264SessionParametersCreateInfoKHR structure included in the pNext chain

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-07211
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain must include a VkVideoEncodeH265SessionParametersCreateInfoKHR structure

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04841
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of elements of vpsAddList must be less than or equal to the maxStdVPSCount specified in the VkVideoEncodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04842
  If videoSession was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of elements of spsAddList must be less than or equal to the maxStdSPSCount specified in the VkVideoEncodeH265SessionParametersCreateInfoKHR structure included in the pNext chain

• VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-04843
If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the number of elements of `ppsAddList` must be less than or equal to the `maxStdPPSCount` specified in the `VkVideoEncodeH265SessionParametersCreateInfoKHR` structure included in the `pNext` chain.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-08319**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then `num_tile_columns_minus1` must be less than `VkVideoEncodeH265CapabilitiesKHR::maxTiles.width`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile `videoSession` was created with, for each element of `ppsAddList`.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-08320**
  If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then `num_tile_rows_minus1` must be less than `VkVideoEncodeH265CapabilitiesKHR::maxTiles.height`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile `videoSession` was created with, for each element of `ppsAddList`.

**Valid Usage (Implicit)**

- **VUID-VkVideoSessionParametersCreateInfoKHR-sType-sType**
  The `sType` must be `VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_CREATE_INFO_KHR`.

- **VUID-VkVideoSessionParametersCreateInfoKHR-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeAV1SessionParametersCreateInfoKHR`, `VkVideoDecodeH264SessionParametersCreateInfoKHR`, `VkVideoDecodeH265SessionParametersCreateInfoKHR`, `VkVideoEncodeAV1SessionParametersCreateInfoKHR`, `VkVideoEncodeH264SessionParametersCreateInfoKHR`, or `VkVideoEncodeH265SessionParametersCreateInfoKHR`.

- **VUID-VkVideoSessionParametersCreateInfoKHR-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkVideoSessionParametersCreateInfoKHR-flags-zerobitmask**
  The `flags` must be `0`.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parameter**
  If `videoSessionParametersTemplate` is not `VK_NULL_HANDLE`, `videoSessionParametersTemplate` must be a valid `VkVideoSessionParametersKHR` handle.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSession-parameter**
  `videoSession` must be a valid `VkVideoSessionKHR` handle.

- **VUID-VkVideoSessionParametersCreateInfoKHR-videoSessionParametersTemplate-parent**
  If `videoSessionParametersTemplate` is a valid handle, it must have been created, allocated,
or retrieved from videoSession

• VUID-VkVideoSessionParametersCreateInfoKHR-commonparent
  Both of videoSession, and videoSessionParametersTemplate that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoSessionParametersCreateFlagsKHR;
```

VkVideoSessionParametersCreateFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

### 42.7.2. Destroying Video Session Parameters

To destroy a video session parameters object, call:

```c
// Provided by VK_KHR_video_queue
void vkDestroyVideoSessionParametersKHR(
    VkDevice device,
    VkVideoSessionParametersKHR videoSessionParameters,
    const VkAllocationCallbacks* pAllocator);
```

• device is the logical device that destroys the video session parameters object.

• videoSessionParameters is the video session parameters object to destroy.

• pAllocator controls host memory allocation as described in the Memory Allocation chapter.

#### Valid Usage

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07212
  All submitted commands that refer to videoSessionParameters must have completed execution

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07213
  If VkAllocationCallbacks were provided when videoSessionParameters was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyVideoSessionParametersKHR-videoSessionParameters-07214
  If no VkAllocationCallbacks were provided when videoSessionParameters was created, pAllocator must be NULL

#### Valid Usage (Implicit)

• VUID-vkDestroyVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle
Host Synchronization

- Host access to `videoSessionParameters` must be externally synchronized

42.7.3. Updating Video Session Parameters

To update video session parameters object with new parameters, call:

```c
// Provided by VK_KHR_video_queue
VkResult vkUpdateVideoSessionParametersKHR(
    VkDevice device, 
    VkVideoSessionParametersKHR videoSessionParameters,
    const VkVideoSessionParametersUpdateInfoKHR* pUpdateInfo);
```

- `device` is the logical device that updates the video session parameters.
- `videoSessionParameters` is the video session parameters object to update.
- `pUpdateInfo` is a pointer to a `VkVideoSessionParametersUpdateInfoKHR` structure specifying the parameter update information.

After a successful call to this command, the update sequence counter of `videoSessionParameters` is changed to the value specified in `pUpdateInfo->updateSequenceCount`.

**Note**

As each update issued to a video session parameters object needs to specify the next available update sequence count value, concurrent updates of the same video session parameters object are inherently disallowed. However, recording video coding operations to command buffers referring to parameters previously added to the video session parameters object is allowed, even if there is a concurrent update in progress adding some new entries to the object.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:
• The H.264 SPS entries specified in `VkVideoDecodeH264SessionParametersAddInfoKHR`: `pStdSPSs`.

• The H.264 PPS entries specified in `VkVideoDecodeH264SessionParametersAddInfoKHR`: `pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:

• The H.265 VPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR`: `pStdVPSs`.

• The H.265 SPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR`: `pStdSPSs`.

• The H.265 PPS entries specified in `VkVideoDecodeH265SessionParametersAddInfoKHR`: `pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoEncodeH264SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:

• The H.264 SPS entries specified in `VkVideoEncodeH264SessionParametersAddInfoKHR`: `pStdSPSs`.

• The H.264 PPS entries specified in `VkVideoEncodeH264SessionParametersAddInfoKHR`: `pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and the `pUpdateInfo->pNext` chain includes a `VkVideoEncodeH265SessionParametersAddInfoKHR` structure, then this command adds the following parameter entries to `videoSessionParameters`:

• The H.265 VPS entries specified in `VkVideoEncodeH265SessionParametersAddInfoKHR`: `pStdVPSs`.

• The H.265 SPS entries specified in `VkVideoEncodeH265SessionParametersAddInfoKHR`: `pStdSPSs`.

• The H.265 PPS entries specified in `VkVideoEncodeH265SessionParametersAddInfoKHR`: `pStdPPSs`.

In case of video session parameters objects created with a video encode operation, implementations may return the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error if any of the specified Video Std parameters do not adhere to the syntactic or semantic requirements of the used video compression standard, or if values derived from parameters according to the rules defined by the used video compression standard do not adhere to the capabilities of the video compression standard or the implementation.

Note
Applications should not rely on the `VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR` error being returned by any command as a means to verify Video Std parameters, as implementations are not required to report the error in any specific set of cases.

## Valid Usage

- **VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-07215**
  
  `pUpdateInfo->updateSequenceCount` must equal the current update sequence counter of `videoSessionParameters` plus one.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07216**
  
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH264SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching any of the elements of `videoSessionParametersCreateInfoKHR::pStdSPSs`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07217**
  
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the number of `StdVideoH264SequenceParameterSet` entries already stored in it plus the value of the `stdSPSCount` member of the `VkVideoDecodeH264SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `maxStdSPSCount`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07218**
  
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching any of the elements of `videoSessionParametersCreateInfoKHR::maxStdPPSCount`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07219**
  
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `maxStdPPSCount`.

- **VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07220**
  
  If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching any of the elements of `videoSessionParametersCreateInfoKHR::maxStdPPSCount`.
If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265VideoParameterSet` entries already stored in it plus the value of the `stdVPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdVPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265SequenceParameterSet` entry with both `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdSPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and the `pNext` chain of `pUpdateInfo` includes a `VkVideoDecodeH265SessionParametersAddInfoKHR` structure, then `videoSessionParameters` must not already contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` all matching any of the elements of `VkVideoDecodeH265SessionParametersAddInfoKHR::pStdPPSs`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the number of `StdVideoH265PictureParameterSet` entries already stored in it plus the value of the `stdPPSCount` member of the `VkVideoDecodeH265SessionParametersAddInfoKHR` structure included in the `pUpdateInfo->pNext` chain must be less than or equal to the `VkVideoDecodeH265SessionParametersCreateInfoKHR::maxStdPPSCount`.

If `videoSessionParameters` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`
VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the pNext chain of pUpdateInfo includes a
VkVideoEncodeH264SessionParametersAddInfoKHR structure, then videoSessionParameters must not already contain a StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching any of the elements of VkVideoEncodeH264SessionParametersAddInfoKHR::pStdSPSs

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06441
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the number of StdVideoH264SequenceParameterSet entries already stored in it plus the value of the stdSPSCount member of the VkVideoEncodeH264SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain must be less than or equal to the VkVideoEncodeH264SessionParametersCreateInfoKHR::maxStdSPSCount
videoSessionParameters was created with

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07227
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH264SessionParametersAddInfoKHR structure, then videoSessionParameters must not already contain a StdVideoH264PictureParameterSet entry with both seq_parameter_set_id and pic_parameter_set_id matching any of the elements of VkVideoEncodeH264SessionParametersAddInfoKHR::pStdPPSs

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06442
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH264PictureParameterSet entries already stored in it plus the value of the stdPPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain must be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdPPSCount
videoSessionParameters was created with

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07228
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters must not already contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdVPSs

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06443
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265VideoParameterSet entries already stored in it plus the value of the stdVPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain must be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdVPSCount
videoSessionParameters was created with

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07229
If videoSessionParameters was created with the video codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters must not already contain a StdVideoH265SequenceParameterSet entry with both sps_video_parameter_set_id and sps_seq_parameter_set_id matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdSPSs.

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06444
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265SequenceParameterSet entries already stored in it plus the value of the stdSPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain must be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdSPSCount videoSessionParameters was created with.

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-07230
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then videoSessionParameters must not already contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id all matching any of the elements of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs.

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-06445
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the number of StdVideoH265PictureParameterSet entries already stored in it plus the value of the stdPPSCount member of the VkVideoEncodeH265SessionParametersAddInfoKHR structure included in the pUpdateInfo->pNext chain must be less than or equal to the VkVideoEncodeH265SessionParametersCreateInfoKHR::maxStdPPSCount videoSessionParameters was created with.

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-08321
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then num_tile_columns_minus1 must be less than VkVideoEncodeH265CapabilitiesKHR::maxTiles.width, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSessionParameters was created with, for each element of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs.

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-08322
  If videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the pNext chain of pUpdateInfo includes a VkVideoEncodeH265SessionParametersAddInfoKHR structure, then num_tile_rows_minus1 must be less than VkVideoEncodeH265CapabilitiesKHR::maxTiles.height, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile videoSessionParameters was created with, for each element of VkVideoEncodeH265SessionParametersAddInfoKHR::pStdPPSs.
Valid Usage (Implicit)

- VUID-vkUpdateVideoSessionParametersKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parameter
  videoSessionParameters must be a valid VkVideoSessionParametersKHR handle

- VUID-vkUpdateVideoSessionParametersKHR-pUpdateInfo-parameter
  pUpdateInfo must be a valid pointer to a valid VkVideoSessionParametersUpdateInfoKHR structure

- VUID-vkUpdateVideoSessionParametersKHR-videoSessionParameters-parent
  videoSessionParameters must have been created, allocated, or retrieved from device

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_VIDEO_STD_PARAMETERS_KHR

The VkVideoSessionParametersUpdateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoSessionParametersUpdateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t updateSequenceCount;
} VkVideoSessionParametersUpdateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `updateSequenceCount` is the new update sequence count to set for the video session parameters object.

Valid Usage (Implicit)

- VUID-VkVideoSessionParametersUpdateInfoKHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_VIDEO_SESSION_PARAMETERS_UPDATE_INFO_KHR

- VUID-VkVideoSessionParametersUpdateInfoKHR-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either
42.8. Video Coding Scope

Applications can record video coding commands for a video session only within a video coding scope.

To begin a video coding scope, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdBeginVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoBeginCodingInfoKHR* pBeginInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pBeginInfo` is a pointer to a VkVideoBeginCodingInfoKHR structure specifying the parameters of the video coding scope, including the video session and video session parameters object to use.

After beginning a video coding scope, the video session object specified in `pBeginInfo->videoSession` is bound to the command buffer, and the command buffer is ready to record video coding operations. Similarly, if `pBeginInfo->videoSessionParameters` is not VK_NULL_HANDLE, it is also bound to the command buffer, and video coding operations can refer to the codec-specific parameters stored in it.

This command also establishes the set of bound reference picture resources that can be used as reconstructed pictures or reference pictures within the video coding scope. Each element of this set consists of a video picture resource and the DPB slot index associated with it, if there is one.

The set of bound reference picture resources is immutable within a video coding scope, however, the DPB slot index associated with any of the bound reference picture resources can change during the video coding scope in response to video coding operations.

The VkVideoReferenceSlotInfoKHR structures provided as the elements of `pBeginInfo->pReferenceSlots` are interpreted by this command as follows:

- If `slotIndex` is non-negative and `pPictureResource` is not NULL, then the video picture resource defined by the VkVideoPictureResourceInfoKHR structure pointed to by `pPictureResource` is added to the set of bound reference picture resources and is associated with the DPB slot index specified in `slotIndex`.

- If `slotIndex` is non-negative and `pPictureResource` is NULL, then the DPB slot with index `slotIndex`
is deactivated by this command.

- If `slotIndex` is negative and `pPictureResource` is not `NULL`, then the video picture resource defined by the `VkVideoPictureResourceInfoKHR` structure pointed to by `pPictureResource` is added to the set of bound reference picture resources without an associated DPB slot. Such a picture resource can be subsequently used as a reconstructed picture to associate it with a DPB slot.
- If `slotIndex` is negative and `pPictureResource` is `NULL`, then the element is ignored.

**Note**

It is possible for multiple bound reference picture resources to be associated with the same DPB slot index, or for a single bound reference picture to refer to multiple separate reference pictures. For example, in case of an H.264 decode profile with interlaced frame support a single DPB slot can refer to two separate pictures for the top and bottom fields. Depending on the picture layout used by the H.264 decode profile, the following special cases may arise:

- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`, then the top and bottom field pictures are physically co-located in the same video picture resource with even scanlines corresponding to the top field and odd scanlines corresponding to the bottom field, respectively.
- If the picture layout is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then the top and bottom field pictures are stored in separate video picture resources (in separate subregions of the same image layer, in separate layers of the same image, or in entirely separate images), hence two elements of `VkVideoBeginCodingInfoKHR::pReferenceSlots` can contain the same `slotIndex` but specify different video picture resources in their `pPictureResource` members.

All non-negative `slotIndex` values specified in the elements of `pBeginInfo->pReferenceSlots` must identify DPB slots of the video session that are in the active state at the time this command is executed on the device.

**Note**

The application does not have to specify an entry in `pBeginInfo->pReferenceSlots` corresponding to all active DPB slots of the video session, but only for those which are intended to be used in the video coding scope. This way the application can avoid any potential runtime cost associated with binding the corresponding picture resources to the command buffer.

In case of a video encode session, the application is also responsible for providing information about the current rate control state configured for the video session by including an instance of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of `pBeginInfo`. If no `VkVideoEncodeRateControlInfoKHR` is included, then the presence of an empty `VkVideoEncodeRateControlInfoKHR` structure is implied which indicates that the current rate control mode is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`. The specified state must match the
effective rate control state configured for the video session at the time the recorded command is executed on the device.

**Note**

Including an instance of the `VkVideoEncodeRateControlInfoKHR` structure in the `pNext` chain of `pBeginInfo` does not change the rate control state configured for the video session, but only specifies the expected rate control state configured at the time the recorded command is executed on the device which allows the implementation to have information about the configured rate control state at command buffer recording time. In order to change the current rate control state of a video session, the application has to issue an appropriate `vkCmdControlVideoCodingKHR` command as described in the Video Coding Control and Rate Control State sections.

### Valid Usage

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07231**
  The `VkCommandPool` that `commandBuffer` was allocated from must support the video codec operation `pBeginInfo->videoSession` was created with, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR` ::`videoCodecOperations`

- **VUID-vkCmdBeginVideoCodingKHR-None-07232**
  There must be no active queries

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07233**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pBeginInfo->videoSession` must not have been created with `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR`

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07234**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pBeginInfo->videoSession` must have been created with `VK_VIDEO_SESSION_CREATE_PROTECTED_CONTENT_BIT_KHR`

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07235**
  If `commandBuffer` is an unprotected command buffer, `protectedNoFault` is not supported, and the `pPictureResource` member of any element of `pBeginInfo->pReferenceSlots` is not `NULL`, then `pPictureResource->imageViewBinding` for that element must not specify an image view created from a protected image

- **VUID-vkCmdBeginVideoCodingKHR-commandBuffer-07236**
  If `commandBuffer` is a protected command buffer `protectedNoFault` is not supported, and the `pPictureResource` member of any element of `pBeginInfo->pReferenceSlots` is not `NULL`, then `pPictureResource->imageViewBinding` for that element must specify an image view created from a protected image

- **VUID-vkCmdBeginVideoCodingKHR-slotIndex-07239**
  If the `slotIndex` member of any element of `pBeginInfo->pReferenceSlots` is not negative, then it must specify the index of a DPB slot that is in the `active state` in `pBeginInfo-...`
Each video picture resource specified by any non-NULL `pPictureResource` member specified in the elements of `pBeginInfo->pReferenceSlots` for which `slotIndex` is not negative must match one of the video picture resources currently associated with the DPB slot index of `pBeginInfo->videoSession` specified by `slotIndex` at the time the command is executed on the device.

If `pBeginInfo->videoSession` was created with a video encode operation and the `pNext` chain of `pBeginInfo` does not include an instance of the `VkVideoEncodeRateControlInfoKHR` structure, then the rate control mode configured for `pBeginInfo->videoSession` at the time the command is executed on the device must be `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`.

If `pBeginInfo->videoSession` was created with a video encode operation and the `pNext` chain of `pBeginInfo` includes an instance of the `VkVideoEncodeRateControlInfoKHR` structure, then it must match the rate control state configured for `pBeginInfo->videoSession` at the time the command is executed on the device.

If `pBeginInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, the current rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, and `VkVideoEncodeH264CapabilitiesKHR::requiresGopRemainingFrames` is `VK_TRUE`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the `pBeginInfo->videoSession` was created with, then the `pNext` chain of `pBeginInfo` must include an instance of the `VkVideoEncodeH264GopRemainingFrameInfoKHR` with its `useGopRemainingFrames` member set to `VK_TRUE`.

If `pBeginInfo->videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, the current rate control mode is not `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, and `VkVideoEncodeH265CapabilitiesKHR::requiresGopRemainingFrames` is `VK_TRUE`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the `pBeginInfo->videoSession` was created with, then the `pNext` chain of `pBeginInfo` must include an instance of the `VkVideoEncodeH265GopRemainingFrameInfoKHR` with its `useGopRemainingFrames` member set to `VK_TRUE`.

**Valid Usage (Implicit)**

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `pBeginInfo` must be a valid `VkVideoBeginInfoKHR` structure.
**pBeginInfo** must be a valid pointer to a valid `VkVideoBeginCodingInfoKHR` structure.

- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-recording
c  
- VUID-vkCmdBeginVideoCodingKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode, or encode operations.

- VUID-vkCmdBeginVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance.

- VUID-vkCmdBeginVideoCodingKHR-vidcoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBeginVideoCodingKHR-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`.

## Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

The `VkVideoBeginCodingInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoBeginCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoBeginCodingFlagsKHR flags;
    VkVideoSessionKHR videoSession;
    VkVideoSessionParametersKHR videoSessionParameters;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
} VkVideoBeginCodingInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• flags is reserved for future use.

• videoSession is the video session object to be bound for the processing of the video commands.

• videoSessionParameters is VK_NULL_HANDLE or a handle of a VkVideoSessionParametersKHR object to be used for the processing of the video commands. If VK_NULL_HANDLE, then no video session parameters object is bound for the duration of the video coding scope.

• referenceSlotCount is the number of elements in the pReferenceSlots array.

• pReferenceSlots is a pointer to an array of VkVideoReferenceSlotInfoKHR structures specifying the information used to determine the set of bound reference picture resources for the video coding scope and their initial association with DPB slot indices.

Limiting values are defined below that are referenced by the relevant valid usage statements of this structure.

• Let VkOffset2D codedOffsetGranularity be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the x and y members of codedOffsetGranularity are 0.

  ° If videoSession was created with an H.264 decode profile with a VkVideoDecodeH264ProfileInfoKHR::pictureLayout of VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR, then codedOffsetGranularity is equal to VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for that video profile.

Valid Usage

• VUID-VkVideoBeginCodingInfoKHR-videoSession-07237 videoSession must have memory bound to all of its memory bindings returned by vkGetVideoSessionMemoryRequirementsKHR for videoSession

• VUID-VkVideoBeginCodingInfoKHR-slotIndex-04856 Each non-negative VkVideoReferenceSlotInfoKHR::slotIndex specified in the elements of pReferenceSlots must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when videoSession was created

• VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07238 Each video picture resource corresponding to any non-NULL pPictureResource member specified in the elements of pReferenceSlots must be unique within pReferenceSlots

• VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07240 If the pPictureResource member of any element of pReferenceSlots is not NULL, then the image view specified in pPictureResource->imageViewBinding for that element must be compatible with the video profile videoSession was created with

• VUID-VkVideoBeginCodingInfoKHR-pPictureResource-07241 If the pPictureResource member of any element of pReferenceSlots is not NULL, then the format of the image view specified in pPictureResource->imageViewBinding for that element must match the VkVideoSessionCreateInfoKHR::referencePictureFormat videoSession was created with
If the `pPictureResource` member of any element of `pReferenceSlots` is not `NULL`, then its `codedOffset` member **must** be an integer multiple of `codedOffsetGranularity`.

If the `pPictureResource` member of any element of `pReferenceSlots` is not `NULL`, then its `codedExtent` member **must** be between `minCodedExtent` and `maxCodedExtent`, inclusive.

If `VkVideoCapabilitiesKHR::flags` does not include `VK_VIDEO_CAPABILITY_SEPARATE_REFERENCE_IMAGES_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile `videoSession` was created with, then `pPictureResource->imageViewBinding` of all elements of `pReferenceSlots` with a non-NULL `pPictureResource` member **must** specify image views created from the same image.

If `videoSession` was created with a decode operation and the `slotIndex` member of any element of `pReferenceSlots` is not negative, then the image view specified in `pPictureResource->imageViewBinding` for that element **must** have been created with `VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR`.

If `videoSession` was created with an encode operation and the `slotIndex` member of any element of `pReferenceSlots` is not negative, then the image view specified in `pPictureResource->imageViewBinding` for that element **must** have been created with `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.

If `videoSession` was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_AV1_BIT_KHR`, then `videoSessionParameters` **must** not be `VK_NULL_HANDLE`.
If `videoSessionParameters` is not `VK_NULL_HANDLE`, it **must** have been created with `videoSession` specified in `VkVideoSessionParametersCreateInfoKHR::videoSession`.

### Valid Usage (Implicit)

1. **VUID-VkVideoBeginCodingInfoKHR-sType-sType**
   - `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_BEGIN_CODING_INFO_KHR`

2. **VUID-VkVideoBeginCodingInfoKHR-pNext-pNext**
   - Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264GopRemainingFrameInfoKHR`, `VkVideoEncodeH264RateControlInfoKHR`, `VkVideoEncodeH265GopRemainingFrameInfoKHR`, `VkVideoEncodeH265RateControlInfoKHR`, or `VkVideoEncodeRateControlInfoKHR`

3. **VUID-VkVideoBeginCodingInfoKHR-sType-unique**
   - The `sType` value of each struct in the `pNext` chain **must** be unique

4. **VUID-VkVideoBeginCodingInfoKHR-flags-zerobitmask**
   - `flags` **must** be `0`

5. **VUID-VkVideoBeginCodingInfoKHR-videoSession-parameter**
   - `videoSession` **must** be a valid `VkVideoSessionKHR` handle

6. **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parameter**
   - If `videoSessionParameters` is not `VK_NULL_HANDLE`, `videoSessionParameters` **must** be a valid `VkVideoSessionParametersKHR` handle

7. **VUID-VkVideoBeginCodingInfoKHR-pReferenceSlots-parameter**
   - If `referenceSlotCount` is not `0`, `pReferenceSlots` **must** be a valid pointer to an array of `referenceSlotCount` `VkVideoReferenceSlotInfoKHR` structures

8. **VUID-VkVideoBeginCodingInfoKHR-videoSessionParameters-parent**
   - If `videoSessionParameters` is a valid handle, it **must** have been created, allocated, or retrieved from `videoSession`

9. **VUID-VkVideoBeginCodingInfoKHR-commonparent**
   - Both of `videoSession`, and `videoSessionParameters` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

---

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoBeginCodingFlagsKHR;
```

`VkVideoBeginCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkVideoReferenceSlotInfoKHR` structure is defined as:
typedef struct VkVideoReferenceSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    int32_t slotIndex;
    const VkVideoPictureResourceInfoKHR* pPictureResource;
} VkVideoReferenceSlotInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **slotIndex** is the index of the DPB slot or a negative integer value.
- **pPictureResource** is `NULL` or a pointer to a `VkVideoPictureResourceInfoKHR` structure describing the video picture resource associated with the DPB slot index specified by **slotIndex**.

**Valid Usage (Implicit)**

- VUID-VkVideoReferenceSlotInfoKHR-sType-sType
  The **sType** value of each struct in the **pNext** chain must be unique
- VUID-VkVideoReferenceSlotInfoKHR-pNext-pNext
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either `NULL` or a pointer to a valid instance of `VkVideoDecodeAV1DpbSlotInfoKHR`, `VkVideoDecodeH264DpbSlotInfoKHR`, `VkVideoEncodeH264DpbSlotInfoKHR`, or `VkVideoEncodeH265DpbSlotInfoKHR`
- VUID-VkVideoReferenceSlotInfoKHR-sType-unique
  If **pPictureResource** is not `NULL`, **pPictureResource** must be a valid pointer to a valid `VkVideoPictureResourceInfoKHR` structure

To end a video coding scope, call:

```c
// Provided by VK_KHR_video_queue
void vkCmdEndVideoCodingKHR(
    VkCommandBuffer commandBuffer,
    const VkVideoEndCodingInfoKHR* pEndCodingInfo);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pEndCodingInfo** is a pointer to a `VkVideoEndCodingInfoKHR` structure specifying the parameters for ending the video coding scope.

After ending a video coding scope, the video session object, the optional video session parameters object, and all reference picture resources previously bound by the corresponding `vkCmdBeginVideoCodingKHR` command are **unbound**.
Valid Usage

- VUID-vkCmdEndVideoCodingKHR-None-07251
  There must be no active queries

Valid Usage (Implicit)

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndVideoCodingKHR-pEndCodingInfo-parameter
  pEndCodingInfo must be a valid pointer to a valid VkVideoEndCodingInfoKHR structure

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndVideoCodingKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support decode, or encode operations

- VUID-vkCmdEndVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdEndVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdEndVideoCodingKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

The VkVideoEndCodingInfoKHR structure is defined as:
typedef struct VkVideoEndCodingInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEndCodingFlagsKHR flags;
} VkVideoEndCodingInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is reserved for future use.

**Valid Usage (Implicit)**

- VUID-VkVideoEndCodingInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_END_CODING_INFO_KHR`
- VUID-VkVideoEndCodingInfoKHR-pNext-pNext
  `pNext` must be `NULL`
- VUID-VkVideoEndCodingInfoKHR-flags-zerobitmask
  `flags` must be `0`

typedef VkFlags VkVideoEndCodingFlagsKHR;

`VkVideoEndCodingFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

### 42.9. Video Coding Control

To apply dynamic controls to the currently bound video session object, call:

```c
void vkCmdControlVideoCodingKHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_video_queue
    const VkVideoCodingControlInfoKHR* pCodingControlInfo);
```

- **commandBuffer** is the command buffer in which to record the command.
- **pCodingControlInfo** is a pointer to a `VkVideoCodingControlInfoKHR` structure specifying the control parameters.

The control parameters provided in this call are applied to the video session at the time the command executes on the device and are in effect until a subsequent call to this command with the same video session bound changes the corresponding control parameters.
A newly created video session must be reset before performing video coding operations using it by including `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR` in `pCodingControlInfo->flags`. The reset operation also returns all DPB slots of the video session to the inactive state. Correspondingly, any DPB slot index associated with the bound reference picture resources is removed.

For encode sessions, the reset operation returns rate control configuration to implementation default settings and sets the video encode quality level to zero.

After video coding operations are performed using a video session, the reset operation can be used to return the video session to the same initial state as after the reset of a newly created video session. This can be used, for example, when different video sequences are needed to be processed with the same video session object.

If `pCodingControlInfo->flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, then the command replaces the rate control configuration maintained by the video session with the configuration specified in the `VkVideoEncodeRateControlInfoKHR` structure included in the `pCodingControlInfo->pNext` chain.

If `pCodingControlInfo->flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`, then the command changes the current video encode quality level to the value specified in the `qualityLevel` member of the `VkVideoEncodeQualityLevelInfoKHR` structure included in the `pCodingControlInfo->pNext` chain.

---

### Valid Usage

- **VUID-vkCmdControlVideoCodingKHR-flags-07017**
  If `pCodingControlInfo->flags` does not include `VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR`, then the bound video session must not be in uninitialized state at the time the command is executed on the device.

- **VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-08243**
  If the bound video session was not created with an encode operation, then `pCodingControlInfo->flags` must not include `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR` or `VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR`.

---

### Valid Usage (Implicit)

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdControlVideoCodingKHR-pCodingControlInfo-parameter**
  `pCodingControlInfo` must be a valid pointer to a valid `VkVideoCodingControlInfoKHR` structure.

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdControlVideoCodingKHR-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support decode, or encode.
operations

- VUID-vkCmdControlVideoCodingKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdControlVideoCodingKHR-videocoding
  This command must only be called inside of a video coding scope
- VUID-vkCmdControlVideoCodingKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tr>
</tbody>
</table>

The VkVideoCodingControlInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkVideoCodingControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoCodingControlFlagsKHR flags;
} VkVideoCodingControlInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of VkVideoCodingControlFlagsKHR specifying control flags.

Valid Usage

- VUID-VkVideoCodingControlInfoKHR-flags-07018
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, then the pNext chain must include a VkVideoEncodeRateControlInfoKHR structure
- VUID-VkVideoCodingControlInfoKHR-flags-08349
  If flags includes VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR, then the pNext chain must include a VkVideoEncodeQualityLevelControlInfoKHR structure
Valid Usage (Implicit)

- VUID-VkVideoCodingControlInfoKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_VIDEO_CODING_CONTROL_INFO_KHR

- VUID-VkVideoCodingControlInfoKHR-pNext-pNext
  
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264RateControlInfoKHR, VkVideoEncodeH265RateControlInfoKHR, VkVideoEncodeQualityLevelInfoKHR, or VkVideoEncodeRateControlInfoKHR

- VUID-VkVideoCodingControlInfoKHR-sType-unique
  
  The sType value of each struct in the pNext chain must be unique

- VUID-VkVideoCodingControlInfoKHR-flags-parameter
  
  flags must be a valid combination of VkVideoCodingControlFlagBitsKHR values

- VUID-VkVideoCodingControlInfoKHR-flags-requiredbitmask
  
  flags must not be 0

Bits which can be set in VkVideoCodingControlInfoKHR::flags, specifying the video coding control parameters to be modified, are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkVideoCodingControlFlagBitsKHR {
    VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR = 0x00000001,
    // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR = 0x00000002,
    // Provided by VK_KHR_video_encode_queue
    VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR = 0x00000004,
} VkVideoCodingControlFlagBitsKHR;
```

- **VK_VIDEO_CODING_CONTROL_RESET_BIT_KHR** indicates a request for the bound video session to be reset before other coding control parameters are applied.

- **VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR** indicates that the coding control parameters include video encode rate control parameters (see VkVideoEncodeRateControlInfoKHR).

- **VK_VIDEO_CODING_CONTROL_ENCODE_QUALITY_LEVEL_BIT_KHR** indicates that the coding control parameters include video encode quality level parameters (see VkVideoEncodeQualityLevelInfoKHR).

```c
// Provided by VK_KHR_video_queue
typedef VkFlags VkVideoCodingControlFlagsKHR;
```

VkVideoCodingControlFlagsKHR is a bitmask type for setting a mask of zero or more
**42.10. Inline Queries**

If a video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, beginning queries using commands such as `vkCmdBeginQuery` within a video coding scope is not allowed. Instead, queries are executed inline by including an instance of the `VkVideoInlineQueryInfoKHR` structure in the `pNext` chain of the parameters of one of the video coding commands, with its `queryPool` member set to a valid `VkQueryPool` handle.

The `VkVideoInlineQueryInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_maintenance1
typedef struct VkVideoInlineQueryInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkQueryPool queryPool;
    uint32_t firstQuery;
    uint32_t queryCount;
} VkVideoInlineQueryInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queryPool` is `VK_NULL_HANDLE` or a valid handle to a `VkQueryPool` object that will manage the results of the queries.
- `firstQuery` is the query index within the query pool that will contain the query results for the first video coding operation. The query results of subsequent video coding operations will be contained by subsequent query indices.
- `queryCount` is the number of queries to execute.

**Note**

In practice, if `queryPool` is not `VK_NULL_HANDLE`, then `queryCount` will always have to match the number of video coding operations issued by the video coding command this structure is specified to, meaning that using inline queries in a video coding command will always execute a query for each issued video coding operation.

This structure can be included in the `pNext` chain of the input parameter structure of video coding commands.

- In the `pNext` chain of the `pDecodeInfo` parameter of the `vkCmdDecodeVideoKHR` command to execute a query for each video decode operation issued by the command.
- In the `pNext` chain of the `pEncodeInfo` parameter of the `vkCmdEncodeVideoKHR` command to execute a query for each video encode operation issued by the command.
42.11. Video Decode Operations

Video decode operations consume compressed video data from a video bitstream buffer and zero or more reference pictures, and produce a *decode output picture* and an optional *reconstructed picture*.

*Note*

Such decode output pictures can be shared with the **Decoded Picture Buffer**, and can also be used as the *input* of video encode operations, with graphics or compute operations, or with **Window System Integration** APIs, depending on the capabilities of the implementation.

Video decode operations **may** access the following resources in the **VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR** stage:

- The source video bitstream buffer range and the image subregions corresponding to the list of *active reference pictures* with access **VK_ACCESS_2_VIDEO_DECODE_READ_BIT_KHR**.
- The image subregions corresponding to the target *decode output picture* and *reconstructed picture* with access **VK_ACCESS_2_VIDEO_DECODE_WRITE_BIT_KHR**.

The image subresource of each *video picture resource* accessed by the video decode operation is specified using a corresponding **VkVideoPictureResourceInfoKHR** structure. Each such image subresource **must** be in the appropriate image layout as follows:

- If the image subresource is used in the video decode operation only as *decode output picture*, then it **must** be in the **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** layout.
- If the image subresource is used in the video decode operation both as *decode output picture* and *reconstructed picture*, then it **must** be in the **VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR** layout.
• If the image subresource is used in the video decode operation only as reconstructed picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

• If the image subresource is used in the video decode operation as a reference picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR layout.

A video decode operation may complete unsuccessfully. In this case the decode output picture will have undefined contents. Similarly, if reference picture setup is requested, the reconstructed picture will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

42.11.1. Codec-Specific Semantics

The following aspects of video decode operations are codec-specific:

• The interpretation of the contents of the source video bitstream buffer range.

• The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.

• The construction and interpretation of information related to the decode output picture and the generation of picture data to the corresponding image subregion.

• The decision on reference picture setup.

• The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.

These codec-specific behaviors are defined for each video codec operation separately.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.264 Decode Operations section.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the H.265 Decode Operations section.

• If the used video codec operation is VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, then the codec-specific aspects of the video decoding process are performed as defined in the AV1 Decode Operations section.

42.11.2. Video Decode Operation Steps

Each video decode operation performs the following steps in the VK_PIPELINE_STAGE_2_VIDEO_DECODE_BIT_KHR stage:

1. Reads the encoded video data from the source video bitstream buffer range.

2. Performs picture reconstruction of the encoded video data according to the codec-specific semantics, applying any prediction data read from the active reference pictures in the process;

3. Writes the decoded picture data to the decode output picture, and optionally to the reconstructed picture, if one is specified and is different from the decode output picture, according to the codec-specific semantics;
4. If reference picture setup is requested, the DPB slot index specified in the reconstructed picture information is activated with the reconstructed picture.

When reconstructed picture information is provided, the specified DPB slot index is associated with the corresponding bound reference picture resource, indifferent of whether reference picture setup is requested.

42.11.3. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specifying a decode operation, the `VkVideoDecodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video decoding.

The `VkVideoDecodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_queue
typedef struct VkVideoDecodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoDecodeCapabilityFlagsKHR flags;
} VkVideoDecodeCapabilitiesKHR;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkVideoDecodeCapabilityFlagBitsKHR` describing the supported video decoding capabilities.

**Valid Usage (Implicit)**

• VUID-VkVideoDecodeCapabilitiesKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_CAPABILITIES_KHR`

Bits which may be set in `VkVideoDecodeCapabilitiesKHR::flags`, indicating the decoding capabilities supported, are:

```c
// Provided by VK_KHR_video_decode_queue
typedef enum VkVideoDecodeCapabilityFlagBitsKHR {
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR = 0x00000002,
} VkVideoDecodeCapabilityFlagBitsKHR;
```

• `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR` indicates support for using the same video picture resource as the reconstructed picture and decode output picture in a video decode operation.
VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR indicates support for using distinct video picture resources as the reconstructed picture and decode output picture in a video decode operation.

**Note**
Some video profiles allow using distinct video picture resources as the reconstructed picture and decode output picture in specific video decode operations even when the video decode profile does not support VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR. Even if the implementation only reports coincide, the decode output picture for film grain enabled frames must be a different video picture resource from the reconstructed picture because film grain is applied outside of the coding loop.

Implementations are only required to support one of VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR and VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR. Accordingly, applications should handle both cases to maximize portability.

**Note**
If both VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR and VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR are supported, an application can choose to create separate images for decode DPB and decode output. E.g. in cases when linear tiling is preferred (and supported) for the decode output picture and the DPB requires optimal tiling, this avoids the need for a separate copy at the expense of additional memory bandwidth requirements during decoding.

```c
// Provided by VK_KHR_video_decode_queue
typedef VkFlags VkVideoDecodeCapabilityFlagsKHR;
```

VkVideoDecodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoDecodeCapabilityFlagBitsKHR.

### 42.11.4. Video Decode Commands

To launch video decode operations, call:

```c
// Provided by VK_KHR_video_decode_queue
void vkCmdDecodeVideoKHR(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer in which to record the command.
    const VkVideoDecodeInfoKHR* pDecodeInfo);  // pDecodeInfo is a pointer to a VkVideoDecodeInfoKHR structure specifying the parameters of the video decode operations.
```
Each call issues one or more video decode operations. The implicit parameter `opCount` corresponds to the number of video decode operations issued by the command. After calling this command, the active query index of each active query is incremented by `opCount`.

Currently each call to this command results in the issue of a single video decode operation.

If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR` and the pNext chain of `pDecodeInfo` includes a `VkVideoInlineQueryInfoKHR` structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then this command will execute a query for each video decode operation issued by it.

### Active Reference Picture Information

The list of active reference pictures used by a video decode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the `VkVideoReferenceSlotInfoKHR` structures provided as the elements of the `pDecodeInfo->pReferenceSlots` array. For each element of `pDecodeInfo->pReferenceSlots`, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:

- The image subregion within the image subresource referred to by the video picture resource used as the reference picture.
- The DPB slot index the reference picture is associated with.
- The codec-specific reference information related to the reference picture.

### Reconstructed Picture Information

Information related to the optional reconstructed picture used by a video decode operation is derived from the `VkVideoReferenceSlotInfoKHR` structure pointed to by `pDecodeInfo->pSetupReferenceSlot`, if not `NULL`, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.
- The DPB slot index to use for picture reconstruction.
- The codec-specific reference information related to the reconstructed picture.

Specifying a valid `VkVideoReferenceSlotInfoKHR` structure in `pDecodeInfo->pSetupReferenceSlot` is always required, unless the video session was created with `VkVideoSessionCreateInfoKHR::maxDpbSlot` equal to zero. However, the DPB slot identified by `pDecodeInfo->pSetupReferenceSlot->slotIndex` is only activated with the reconstructed picture specified in `pDecodeInfo->pSetupReferenceSlot->pPictureResource` if reference picture setup is requested according to the codec-specific semantics.

If reconstructed picture information is specified, and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` refers to a video picture resource different than that of the decode output picture, but reference picture setup is not requested, the contents of the video picture resource corresponding to the reconstructed picture will be undefined after the video decode operation.

---

**Note**
Some implementations may always output the reconstructed picture or use it as temporary storage during the video decode operation even when the reconstructed picture is not marked for future reference.

**Decode Output Picture Information**

Information related to the decode output picture used by a video decode operation is derived from `pDecodeInfo->dstPictureResource` and any codec-specific parameters provided in the `pDecodeInfo->pNext` chain, as defined by the codec-specific semantics, and consists of the following:

- The image subregion within the image subresource referred to by the video picture resource used as the decode output picture.
- The codec-specific picture information related to the decode output picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

- Let `uint32_t activeReferencePictureCount` be the size of the list of active reference pictures used by the video decode operation. Unless otherwise defined, `activeReferencePictureCount` is set to the value of `pDecodeInfo->referenceSlotCount`.
  - If the bound video session was created with an H.264 decode profile, then let `activeReferencePictureCount` be the value of `pDecodeInfo->referenceSlotCount` plus the number of elements of the `pDecodeInfo->pReferenceSlots` array that have a `VkVideoDecodeH264DpbSlotInfoKHR` structure included in their `pNext` chain with both `pStdReferenceInfo->flags.top_field_flag` and `pStdReferenceInfo->flags.bottom_field_flag` set.

  **Note**

  This means that the elements of `pDecodeInfo->pReferenceSlots` that include both a top and bottom field reference are counted as two separate active reference pictures, as described in the active reference picture list construction rules for H.264 decode operations.

- Let `VkOffset2D codedOffsetGranularity` be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the x and y members of `codedOffsetGranularity` are 0.
  - If the bound video session was created with an H.264 decode profile with a `VkVideoDecodeH264ProfileInfoKHR::pictureLayout` of `VK_VIDEO_Decode_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`, then `codedOffsetGranularity` is equal to `VkVideoDecodeH264CapabilitiesKHR::fieldOffsetGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for that video profile.

- Let `uint32_t dpbFrameUseCount[]` be an array of size `maxDpbSlots`, where `maxDpbSlots` is the `VkVideoSessionCreateInfoKHR::maxDpbSlots` the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of
If \( pDecodeInfo->pSetupReferenceSlot \) is not \( \text{NULL} \), then \( \text{dpbFrameUseCount}[i] \) is incremented by one, where \( i \) equals \( pDecodeInfo->pSetupReferenceSlot->slotIndex \). If the bound video session object was created with an H.264 decode profile, then \( \text{dpbFrameUseCount}[i] \) is decremented by one if either \( pStdReferenceInfo->flags.top_field_flag \) or \( pStdReferenceInfo->flags.bottom_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( pDecodeInfo->pSetupReferenceSlot->pNext \) chain.

For each element of \( pDecodeInfo->pReferenceSlots \), \( \text{dpbFrameUseCount}[i] \) is incremented by one, where \( i \) equals the \( \text{slotIndex} \) member of the corresponding element. If the bound video session object was created with an H.264 decode profile, then \( \text{dpbFrameUseCount}[i] \) is decremented by one if either \( pStdReferenceInfo->flags.top_field_flag \) or \( pStdReferenceInfo->flags.bottom_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( \text{pNext} \) chain of the corresponding element of \( pDecodeInfo->pReferenceSlots \).

Let \( \text{uint32_t dpbTopFieldUseCount[]} \) and \( \text{uint32_t dpbBottomFieldUseCount[]} \) be arrays of size \( \text{maxDpbSlots} \), where \( \text{maxDpbSlots} \) is the \( 
\text{VkVideoSessionCreateInfoKHR::maxDpbSlots} \) the bound video session was created with, with each element indicating the number of times the top field or the bottom field, respectively, associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the arrays be \( 0 \).

If the bound video session object was created with an H.264 decode profile and \( pDecodeInfo->pSetupReferenceSlot \) is not \( \text{NULL} \), then perform the following:

- If \( pStdReferenceInfo->flags.top_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( pDecodeInfo->pSetupReferenceSlot->pNext \) chain, then \( \text{dpbTopFieldUseCount}[i] \) is incremented by one, where \( i \) equals \( pDecodeInfo->pSetupReferenceSlot->slotIndex \).

- If \( pStdReferenceInfo->flags.bottom_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( pDecodeInfo->pSetupReferenceSlot->pNext \) chain, then \( \text{dpbBottomFieldUseCount}[i] \) is incremented by one, where \( i \) equals \( pDecodeInfo->pSetupReferenceSlot->slotIndex \).

If the bound video session object was created with an H.264 decode profile, then perform the following for each element of \( pDecodeInfo->pReferenceSlots \):

- If \( pStdReferenceInfo->flags.top_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( \text{pNext} \) chain of the element, then \( \text{dpbTopFieldUseCount}[i] \) is incremented by one, where \( i \) equals the \( \text{slotIndex} \) member of the element.

- If \( pStdReferenceInfo->flags.bottom_field_flag \) is set in the \( 
\text{VkVideoDecodeH264DpbSlotInfoKHR} \) structure in the \( \text{pNext} \) chain of the element, then \( \text{dpbBottomFieldUseCount}[i] \) is incremented by one, where \( i \) equals the \( \text{slotIndex} \) member of the element.

**Valid Usage**

- VUID-vkCmdDecodeVideoKHR-None-08249
The bound video session **must** have been created with a decode operation

- **VUID-vkCmdDecodeVideoKHR-None-07011**
  The bound video session **must** not be in **uninitialized** state at the time the command is executed on the device

- **VUID-vkCmdDecodeVideoKHR-opCount-07134**
  For each **active** query, the **active query index** corresponding to the query type of that query plus **opCount** **must** be less than or equal to the **last activatable query index** corresponding to the query type of that query plus one

- **VUID-vkCmdDecodeVideoKHR-pNext-08365**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `pNext` chain of `pDecodeInfo` includes a `VkVideoInlineQueryInfoKHR` structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then `VkVideoInlineQueryInfoKHR::queryCount` **must** equal `opCount`

- **VUID-vkCmdDecodeVideoKHR-pNext-08366**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `pNext` chain of `pDecodeInfo` includes a `VkVideoInlineQueryInfoKHR` structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then all the queries used by the command, as specified by the `VkVideoInlineQueryInfoKHR` structure, **must** be **unavailable**

- **VUID-vkCmdDecodeVideoKHR-queryType-08367**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, then the `queryType` used to create the `queryPool` specified in the `VkVideoInlineQueryInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` **must** be `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`

- **VUID-vkCmdDecodeVideoKHR-queryPool-08368**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, then the `queryPool` specified in the `VkVideoInlineQueryInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` **must** have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR::pVideoProfile` the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-queryType-08369**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `queryType` used to create the `queryPool` specified in the `VkVideoInlineQueryInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` is `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then the `VkCommandPool` that `commandBuffer` was allocated from **must** have been created with a queue family index that supports result status queries, as indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR::queryResultStatusSupport`

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07135**
  `pDecodeInfo->srcBuffer` **must** be **compatible** with the video profile the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-commandBuffer-07136**
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->srcBuffer` must not be a protected buffer

- **VUID-vkCmdDecodeVideoKHR-commandBuffer-07137**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pDecodeInfo->srcBuffer` must be a protected buffer

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07138**
  `pDecodeInfo->srcBufferOffset` must be an integer multiple of `VkVideoCapabilitiesKHR::minBitstreamBufferOffsetAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07139**
  `pDecodeInfo->srcBufferRange` must be an integer multiple of `VkVideoCapabilitiesKHR::minBitstreamBufferSizeAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07140**
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL` and `VkVideoDecodeCapabilitiesKHR::flags` does not include `VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_COINCIDE_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must not match

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07141**
  If `pDecodeInfo->pSetupReferenceSlot` is not `NULL` and none of the following is true:

  - `VkVideoDecodeCapabilitiesKHR::flags` includes `VK_VIDEO_DECODER_CODEC_OPERATION_DECODER_AV1_BIT_KHR` and `VkVideoDecodeAV1ProfileInfoKHR::filmGrainSupport` set to `VK_TRUE`, and `film grain` is enabled for the decoded picture

  then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must match

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07142**
  `pDecodeInfo->dstPictureResource.imageViewBinding` must be compatible with the video profile the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07143**
  The format of `pDecodeInfo->dstPictureResource.imageViewBinding` must match the `VkVideoSessionCreateInfoKHR::pictureFormat` the bound video session was created with

- **VUID-vkCmdDecodeVideoKHR-pDecodeInfo-07144**
  `pDecodeInfo->dstPictureResource.codedOffset` must be an integer multiple of `codedOffsetGranularity`
pDecodeInfo->dstPictureResource.codedExtent must be between minCodedExtent and maxCodedExtent, inclusive, the bound video session was created with

pDecodeInfo->dstPictureResource.imageViewBinding must have been created with VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding must not have been created from a protected image

If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pDecodeInfo->dstPictureResource.imageViewBinding must have been created from a protected image

pDecodeInfo->pSetupReferenceSlot must not be NULL unless the bound video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlots equal to zero

If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->slotIndex must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->pPictureResource->codedOffset must be an integer multiple of codedOffsetGranularity

If pDecodeInfo->pSetupReferenceSlot is not NULL, then pDecodeInfo->pSetupReferenceSlot->pPictureResource must match one of the bound reference picture resource

activeReferencePictureCount must be less than or equal to the VkVideoSessionCreateInfoKHR::maxActiveReferencePictures specified when the bound video session was created

The slotIndex member of each element of pDecodeInfo->pReferenceSlots must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pDecodeInfo->pReferenceSlots must be an integer multiple of codedOffsetGranularity

The pPictureResource member of each element of pDecodeInfo->pReferenceSlots must match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element
Each video picture resource corresponding to the `pPictureResource` member specified in the elements of `pDecodeInfo->pReferenceSlots` must be unique within `pDecodeInfo->pReferenceSlots`.

All elements of `dpbFrameUseCount` must be less than or equal to 1.

All elements of `dpbTopFieldUseCount` must be less than or equal to 1.

All elements of `dpbBottomFieldUseCount` must be less than or equal to 1.

If `pDecodeInfo->pSetupReferenceSlot` is `NULL` or `pDecodeInfo->pSetupReferenceSlot->pPictureResource` does not refer to the same image subresource as `pDecodeInfo->dstPictureResource`, then the image subresource referred to by `pDecodeInfo->dstPictureResource` must be in the `VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR` layout at the time the video decode operation is executed on the device.

If `pDecodeInfo->pSetupReferenceSlot` is not `NULL` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` refers to the same image subresource as `pDecodeInfo->dstPictureResource`, then the image subresource referred to by `pDecodeInfo->dstPictureResource` must be in the `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` layout at the time the video decode operation is executed on the device.

If `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the image subresource referred to by the `pPictureResource` member of each element of `pDecodeInfo->pReferenceSlots` must be in the `VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR` layout at the time the video decode operation is executed on the device.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` must include a `VkVideoDecodeH264PictureInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, then the decode output picture must represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then all elements of the `pSliceOffsets` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must be less than `pDecodeInfo->srcBufferRange`. 
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264PictureParameterSet` entry with `seq_parameter_set_id` and `pic_parameter_set_id` matching `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH264PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not NULL, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, and `pDecodeInfo->pSetupReferenceSlot` is not NULL, then the reconstructed picture must represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then the `pNext` chain of each element of `pDecodeInfo->pReferenceSlots` must include a `VkVideoDecodeH264DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` but was not created with interlaced frame support, then each active reference picture corresponding to the elements of `pDecodeInfo->pReferenceSlots` must represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, `pDecodeInfo->pSetupReferenceSlot` is not NULL, and the decode output picture represents a frame, then the reconstructed picture must also represent a frame.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, `pDecodeInfo->pSetupReferenceSlot` is not NULL, and the decode output picture represents a top field, then the reconstructed picture must also represent a top field.
If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H264\_BIT\_KHR}, and the \texttt{pSetupReferenceSlot} is not
\texttt{NULL}, and the decode output picture represents a bottom field, then the reconstructed
picture \textbf{must} also represent a bottom field.

If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H264\_BIT\_KHR} and an active reference picture
corresponding to any element of \texttt{pReferenceSlots} represents a frame, then the DPB slot index of the bound video session specified by the \texttt{slotIndex} member of that element \textbf{must} be currently associated with a frame picture matching the video picture resource specified by the \texttt{pPictureResource} member of the same element at the time the command is executed on the device.

If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H264\_BIT\_KHR} and an active reference picture
corresponding to any element of \texttt{pReferenceSlots} represents a top field, then the DPB slot index of the bound video session specified by the \texttt{slotIndex} member of that element \textbf{must} be currently associated with a top field picture matching the video picture resource specified by the \texttt{pPictureResource} member of the same element at the time the command is executed on the device.

If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H265\_BIT\_KHR}, then the \texttt{pNext} chain of \texttt{pDecodeInfo} \textbf{must} include a \texttt{VkVideoDecodeH265PictureInfoKHR} structure.

If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H265\_BIT\_KHR}, then all elements of the \texttt{pSourceSegmentOffsets} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo} \textbf{must} be less than \texttt{pDecodInfo->srcBufferRange}.

If the bound video session was created with the video codec operation
\texttt{VK\_VIDEO\_CODEC\_OPERATION\_DECODE\_H265\_BIT\_KHR}, then the bound video session parameters
object \textbf{must} contain a \texttt{StdVideoH265VideoParameterSet} entry with
\texttt{vps_video_parameter_set_id} matching \texttt{StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id} that is provided in the \texttt{pStdPictureInfo} member of the \texttt{VkVideoDecodeH265PictureInfoKHR} structure included in the \texttt{pNext} chain of \texttt{pDecodeInfo}. 
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH265SequenceParameterSet` entry with `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id` and `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` matching `StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id`, `StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id`, and `StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoDecodeH265PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` must include a `VkVideoDecodeH265DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then the `pNext` chain of each element of `pDecodeInfo->pReferenceSlots` must include a `VkVideoDecodeH265DpbSlotInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and `VkVideoDecodeAV1ProfileInfoKHR::filmGrainSupport` set to `VK_FALSE`, then film grain must not be enabled for the decoded picture.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, and film grain is enabled for the decoded picture, then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must not match.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` must include a `VkVideoDecodeAV1PictureInfoKHR` structure.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and `filmGrainSupport` is not `VK_FALSE`, then film grain must not be enabled for the decoded picture.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, and film grain is enabled for the decoded picture, then the video picture resources specified by `pDecodeInfo->dstPictureResource` and `pDecodeInfo->pSetupReferenceSlot->pPictureResource` must not match.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of `pDecodeInfo` must include a `VkVideoDecodeAV1PictureInfoKHR` structure.
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `frameHeaderOffset` member of the `VkVideoDecodeAV1PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must be less than the minimum of `pDecodeInfo->srcBufferRange`.

- VUID-vkCmdDecodeVideoKHR-pTileOffsets-09253
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then all elements of the `pTileOffsets` member of the `VkVideoDecodeAV1PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must be less than `pDecodeInfo->srcBufferRange`.

- VUID-vkCmdDecodeVideoKHR-pTileOffsets-09252
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then for each element `i` of the `pTileOffsets` and `pTileSizes` members of the `VkVideoDecodeAV1PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` the sum of `pTileOffsets[i]` and `pTileSizes[i]` must be less than or equal to `pDecodeInfo->srcBufferRange`.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-09254
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and `pDecodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pDecodeInfo->pSetupReferenceSlot` must include a `VkVideoDecodeAV1DpbSlotInfoKHR` structure.

- VUID-vkCmdDecodeVideoKHR-pNext-09255
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `pNext` chain of each element of `pDecodeInfo->pReferenceSlots` must include a `VkVideoDecodeAV1DpbSlotInfoKHR` structure.

- VUID-vkCmdDecodeVideoKHR-referenceNameSlotIndices-09262
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then each element of the `referenceNameSlotIndices` array member of the `VkVideoDecodeAV1PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo` must either be negative or must equal the `slotIndex` member of one of the elements of `pDecodeInfo->pReferenceSlots`.

- VUID-vkCmdDecodeVideoKHR-slotIndex-09263
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, then the `slotIndex` member of each element of `pDecodeInfo->pReferenceSlots` must equal one of the elements of the `referenceNameSlotIndices` array member of the `VkVideoDecodeAV1PictureInfoKHR` structure included in the `pNext` chain of `pDecodeInfo`.

---

**Valid Usage (Implicit)**

- VUID-vkCmdDecodeVideoKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDecodeVideoKHR-pDecodeInfo-parameter
  `pDecodeInfo` must be a valid pointer to a valid `VkVideoDecodeInfoKHR` structure.
- VUID-vkCmdDecodeVideoKHR-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDecodeVideoKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support decode operations
- VUID-vkCmdDecodeVideoKHR-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdDecodeVideoKHR-videocoding
  This command must only be called inside of a video coding scope
- VUID-vkCmdDecodeVideoKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

The VkVideoDecodeInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoDecodeFlagsKHR flags;
    VkBuffer srcBuffer;
    VkDeviceSize srcBufferOffset;
    VkDeviceSize srcBufferRange;
    VkVideoPictureResourceInfoKHR dstPictureResource;
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
} VkVideoDecodeInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• **flags** is reserved for future use.
• **srcBuffer** is the source video bitstream buffer to read the encoded bitstream from.
• **srcBufferOffset** is the starting offset in bytes from the start of **srcBuffer** to read the encoded bitstream from.
• **srcBufferRange** is the size in bytes of the encoded bitstream to decode from **srcBuffer**, starting from **srcBufferOffset**.
• **dstPictureResource** is the video picture resource to use as the decode output picture.
• **pSetupReferenceSlot** is **NULL** or a pointer to a VkVideoReferenceSlotInfoKHR structure specifying the reconstructed picture information.
• **referenceSlotCount** is the number of elements in the **pReferenceSlots** array.
• **pReferenceSlots** is **NULL** or a pointer to an array of VkVideoReferenceSlotInfoKHR structures describing the DPB slots and corresponding reference picture resources to use in this video decode operation (the set of active reference pictures).

### Valid Usage

- VUID-VkVideoDecodeInfoKHR-srcBuffer-07165
  **srcBuffer** must have been created with **VK_BUFFER_USAGE_VIDEO_DECODE_SRC_BIT_KHR** set
- VUID-VkVideoDecodeInfoKHR-srcBufferOffset-07166
  **srcBufferOffset** must be less than the size of **srcBuffer**
- VUID-VkVideoDecodeInfoKHR-srcBufferRange-07167
  **srcBufferRange** must be less than or equal to the size of **srcBuffer** minus **srcBufferOffset**
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07168
  If **pSetupReferenceSlot** is not **NULL**, then its **slotIndex** member must not be negative
- VUID-VkVideoDecodeInfoKHR-pSetupReferenceSlot-07169
  If **pSetupReferenceSlot** is not **NULL**, then its **pPictureResource** must not be **NULL**
- VUID-VkVideoDecodeInfoKHR-slotIndex-07171
  The **slotIndex** member of each element of **pReferenceSlots** must not be negative
- VUID-VkVideoDecodeInfoKHR-pPictureResource-07172
  The **pPictureResource** member of each element of **pReferenceSlots** must not be **NULL**

### Valid Usage (Implicit)

- VUID-VkVideoDecodeInfoKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_DECODE_INFO_KHR**
- VUID-VkVideoDecodeInfoKHR-pNext-pNext
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of VkVideoDecodeAV1PictureInfoKHR, VkVideoDecodeH264PictureInfoKHR, VkVideoDecodeH265PictureInfoKHR, or VkVideoInlineQueryInfoKHR
42.12. H.264 Decode Operations

Video decode operations using an H.264 decode profile can be used to decode elementary video stream sequences compliant to the ITU-T H.264 Specification.

**Note**
Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video decode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.264 Specification as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH264SequenceParameterSet` structure corresponding to the **active SPS** specifying the H.264 sequence parameter set.
  - The `StdVideoH264PictureParameterSet` structure corresponding to the **active PPS** specifying the H.264 picture parameter set.
  - The `StdVideoDecodeH264PictureInfo` structure specifying the H.264 picture information.
  - The `StdVideoDecodeH264ReferenceInfo` structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.

// Provided by VK_KHR_video_decode_queue

typedef VkFlags VkVideoDecodeFlagsKHR;

**VkVideoDecodeFlagsKHR** is a bitmask type for setting a mask, but is currently reserved for future use.
• The contents of the provided video bitstream buffer range are interpreted as defined in the **H.264 Decode Bitstream Data Access** section.

• Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the **H.264 Decode Picture Data Access** section.

• The decision on reference picture setup is made according to the parameters specified in the **H.264 picture information**.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the **ITU-T H.264 Specification**, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

### 42.12.1. H.264 Decode Bitstream Data Access

If the target decode output picture is a frame, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing an entire frame, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the **ITU-T H.264 Specification**, respectively.

If the target decode output picture is a field, then the video bitstream buffer range should contain a VCL NAL unit comprised of the slice headers and data of a picture representing a field, as defined in sections 7.3.3 and 7.3.4, and this data is interpreted as defined in sections 7.4.3 and 7.4.4 of the **ITU-T H.264 Specification**, respectively.

The offsets provided in `VkVideoDecodeH264PictureInfoKHR::pSliceOffsets` should specify the starting offsets corresponding to each slice header within the video bitstream buffer range.

### 42.12.2. H.264 Decode Picture Data Access

The effective `imageOffset` and `imageExtent` corresponding to a decode output picture, reference picture, or reconstructed picture used in video decode operations with an H.264 decode profile are defined as follows:

- **imageOffset** is `(codedOffset.x, codedOffset.y)` and **imageExtent** is `(codedExtent.width, codedExtent.height)`, if the picture represents a frame.

- **imageOffset** is `(codedOffset.x, codedOffset.y)` and **imageExtent** is `(codedExtent.width, codedExtent.height)`, if the picture represents a field and the picture layout of the used H.264 decode profile is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR`.

- **imageOffset** is `(codedOffset.x, codedOffset.y)` and **imageExtent** is `(codedExtent.width, codedExtent.height / 2)`, if the picture represents a field and the picture layout of the used H.264 decode profile is `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`.

Where **codedOffset** and **codedExtent** are the members of the `VkVideoPictureResourceInfoKHR` structure corresponding to the picture.

However, accesses to image data within a video picture resource happen at the granularity...
indicated by \texttt{VkVideoCapabilitiesKHR::pictureAccessGranularity}, as returned by \texttt{vkGetPhysicalDeviceVideoCapabilitiesKHR} for the used video profile. This means that the complete image subregion accessed by video coding operations using an H.264 decode profile for the video picture resource is defined as the set of texels within the coordinate range:

\[(startX, endX), (startY, endY)\]

Where:

- \(startX\) equals \(\text{imageOffset.x}\) rounded down to the nearest integer multiple of \(\text{pictureAccessGranularity.width}\);
- \(endX\) equals \(\text{imageOffset.x} + \text{imageExtent.width}\) rounded up to the nearest integer multiple of \(\text{pictureAccessGranularity.width}\) and clamped to the width of the image subresource referred to by the corresponding \texttt{VkVideoPictureResourceInfoKHR} structure;
- \(startY\) equals \(\text{imageOffset.y}\) rounded down to the nearest integer multiple of \(\text{pictureAccessGranularity.height}\);
- \(endY\) equals \(\text{imageOffset.y} + \text{imageExtent.height}\) rounded up to the nearest integer multiple of \(\text{pictureAccessGranularity.height}\) and clamped to the height of the image subresource referred to by the corresponding \texttt{VkVideoPictureResourceInfoKHR} structure.

In case of video decode operations using an H.264 decode profile, any access to a picture at the coordinates \((x, y)\), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding \texttt{VkVideoPictureResourceInfoKHR} structure at the texel coordinates specified below:

- \((x, y)\), if the accessed picture represents a frame.
- \((x, y \times 2)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \texttt{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}.
- \((x, y \times 2 + 1)\), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is \texttt{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR}.
- \((x, y)\), if the accessed picture represents a top field and the picture layout of the used H.264 decode profile is \texttt{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}.
- \((\text{codedOffset.x} + x, \text{codedOffset.y} + y)\), if the accessed picture represents a bottom field and the picture layout of the used H.264 decode profile is \texttt{VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR}.

Where \(\text{codedOffset}\) is the member of the corresponding \texttt{VkVideoPictureResourceInfoKHR} structure.

### 42.12.3. H.264 Decode Profile

A video profile supporting H.264 video decode operations is specified by setting \texttt{VkVideoProfileInfoKHR::videoCodecOperation} to \texttt{VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR} and adding a \texttt{VkVideoDecodeH264ProfileInfoKHR} structure to the \texttt{VkVideoProfileInfoKHR::pNext} chain.

The \texttt{VkVideoDecodeH264ProfileInfoKHR} structure is defined as:
typedef struct VkVideoDecodeH264ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
    VkVideoDecodeH264PictureLayoutFlagBitsKHR pictureLayout;
} VkVideoDecodeH264ProfileInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdProfileIdc** is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.
- **pictureLayout** is a VkVideoDecodeH264PictureLayoutFlagBitsKHR value specifying the picture layout used by the H.264 video sequence to be decoded.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264ProfileInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PROFILE_INFO_KHR

- VUID-VkVideoDecodeH264ProfileInfoKHR-pictureLayout-parameter
  If pictureLayout is not 0, pictureLayout must be a valid VkVideoDecodeH264PictureLayoutFlagBitsKHR value

The H.264 video decode picture layout flags are defined as follows:

typedef enum VkVideoDecodeH264PictureLayoutFlagBitsKHR {
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR = 0,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR = 0x00000001,
    VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR = 0x00000002,
} VkVideoDecodeH264PictureLayoutFlagBitsKHR;

- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_PROGRESSIVE_KHR** specifies support for progressive content. This flag has the value 0.
- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to the top field are decoded to the even-numbered lines within the picture resource, and all lines belonging to the bottom field are decoded to the odd-numbered lines within the picture resource.
- **VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR** specifies support for or use of a picture layout for interlaced content where all lines belonging to a field are grouped together in a single image subregion, and the two fields comprising the frame can be stored in...
separate image subregions of the same image subresource or in separate image subresources.

```c
// Provided by VK_KHR_video_decode_h264
typedef VkFlags VkVideoDecodeH264PictureLayoutFlagsKHR;
```

`VkVideoDecodeH264PictureLayoutFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoDecodeH264PictureLayoutFlagBitsKHR`.

### 42.12.4. H.264 Decode Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for an H.264 decode profile, the `VkVideoCapabilitiesKHR::pNext` chain must include a `VkVideoDecodeH264CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoDecodeH264CapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH264LevelIdc maxLevelIdc;
    VkOffset2D fieldOffsetGranularity;
} VkVideoDecodeH264CapabilitiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxLevelIdc** is a `StdVideoH264LevelIdc` value indicating the maximum H.264 level supported by the profile, where enum constant `STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>` identifies H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification.
- **fieldOffsetGranularity** is the minimum alignment for `VkVideoPictureResourceInfoKHR::codedOffset` specified for a video picture resource when using the picture layout `VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR`.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264CapabilitiesKHR-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_CAPABILITIES_KHR`

### 42.12.5. H.264 Decode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR` can contain the following types of parameters:
**H.264 Sequence Parameter Sets (SPS)**

Represented by `StdVideoH264SequenceParameterSet` structures and interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- `seq_parameter_set_id` is used as the key of the SPS entry;
- `level_idc` is one of the enum constants `STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>` identifying the H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification;
- if `flags.seq_scaling_matrix_present_flag` is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `scaling_list_present_mask` is a bitmask where bit index `i` corresponds to `seq_scaling_list_present_flag[i]` as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - `use_default_scaling_matrix_mask` is a bitmask where bit index `i` corresponds to `UseDefaultScalingMatrix4x4Flag[i]`, when `i < 6`, or corresponds to `UseDefaultScalingMatrix8x8Flag[i-6]`, otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - `ScalingList4x4` and `ScalingList8x8` correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;
- if `flags.vui_parameters_present_flag` is set, then `pSequenceParameterSetVui` is a pointer to a `StdVideoH264SequenceParameterSetVui` structure that is interpreted as follows:
  - `reserved1` is used only for padding purposes and is otherwise ignored;
  - if `flags.nal_hrd_parameters_present_flag` or `flags.vcl_hrd_parameters_present_flag` is set, then the `StdVideoH264HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
    - `reserved1` is used only for padding purposes and is otherwise ignored;
    - all other members of `StdVideoH264HrdParameters` are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;
  - all other members of `StdVideoH264SequenceParameterSetVui` are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;
- all other members of `StdVideoH264SequenceParameterSet` are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.

**H.264 Picture Parameter Sets (PPS)**

Represented by `StdVideoH264PictureParameterSet` structures and interpreted as follows:

- the pair constructed from `seq_parameter_set_id` and `pic_parameter_set_id` is used as the key of the PPS entry;
- if `flags.pic_scaling_matrix_present_flag` is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `scaling_list_present_mask` is a bitmask where bit index `i` corresponds to
pic_scaling_list_present_flag[i] as defined in section 7.4.2.2 of the ITU-T H.264 Specification;

- use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;

- ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;

- all other members of StdVideoH264PictureParameterSet are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeH264SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH264SessionParametersCreateInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeH264SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH264SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH264SessionParametersCreateInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxStdSPSCount is the maximum number of H.264 SPS entries the created VkVideoSessionParametersKHR can contain.
- maxStdPPSCount is the maximum number of H.264 PPS entries the created VkVideoSessionParametersKHR can contain.
- pParametersAddInfo is NULL or a pointer to a VkVideoDecodeH264SessionParametersAddInfoKHR structure specifying H.264 parameters to add upon object creation.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-sType-sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoDecodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter If pParametersAddInfo is not NULL, pParametersAddInfo must be a valid pointer to a valid VkVideoDecodeH264SessionParametersAddInfoKHR structure
The VkVideoDecodeH264SessionParametersAddInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoDecodeH264SessionParametersAddInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdSPSCount` is the number of elements in the `pStdSPSs` array.
- `pStdSPSs` is a pointer to an array of StdVideoH264SequenceParameterSet structures describing the H.264 SPS entries to add.
- `stdPPSCount` is the number of elements in the `pStdPPSs` array.
- `pStdPPSs` is a pointer to an array of StdVideoH264PictureParameterSet structures describing the H.264 PPS entries to add.

This structure can be specified in the following places:

- In the `pParametersAddInfo` member of the VkVideoDecodeH264SessionParametersCreateInfoKHR structure specified in the `pNext` chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).

- In the `pNext` chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H264_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

### Valid Usage

- **VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04825**
  The `seq_parameter_set_id` member of each StdVideoH264SequenceParameterSet structure specified in the elements of `pStdSPSs` must be unique within `pStdSPSs`

- **VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-None-04826**
  The pair constructed from the `seq_parameter_set_id` and `pic_parameter_set_id` members of each StdVideoH264PictureParameterSet structure specified in the elements of `pStdPPSs` must be unique within `pStdPPSs`
Valid Usage (Implicit)

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, pStdSPSs must be a valid pointer to an array of stdSPSCount
  StdVideoH264SequenceParameterSet values

• VUID-VkVideoDecodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, pStdPPSs must be a valid pointer to an array of stdPPSCount
  StdVideoH264PictureParameterSet values

42.12.6. H.264 Decoding Parameters

The VkVideoDecodeH264PictureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264PictureInfo* pStdPictureInfo;
    uint32_t sliceCount;
    const uint32_t* pSliceOffsets;
} VkVideoDecodeH264PictureInfoKHR;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• pStdPictureInfo is a pointer to a StdVideoDecodeH264PictureInfo structure specifying H.264 picture information.
• sliceCount is the number of elements in pSliceOffsets.
• pSliceOffsets is a pointer to an array of sliceCount offsets specifying the start offset of the slices of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.264 decode operation.

Decode Output Picture Information

When this structure is specified in the pNext chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

• If pStdPictureInfo->flags.field_pic_flag is not set, then the picture represents a frame.
• If pStdPictureInfo->flags.field_pic_flag is set, then the picture represents a field. Specifically:
If `pStdPictureInfo->flags.bottom_field_flag` is not set, then the picture represents the top field of the frame.

If `pStdPictureInfo->flags.bottom_field_flag` is set, then the picture represents the bottom field of the frame.

- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- The decode output picture is associated with the H.264 picture information provided in `pStdPictureInfo`.

**Std Picture Information**

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are interpreted as follows:

- `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;
- `flags.is_intra` as defined in section 3.73 of the ITU-T H.264 Specification;
- `flags.is_reference` as defined in section 3.136 of the ITU-T H.264 Specification;
- `flags.complementary_field_pair` as defined in section 3.35 of the ITU-T H.264 Specification;
- `seq_parameter_set_id` and `pic_parameter_set_id` are used to identify the active parameter sets, as described below;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Reference picture setup is controlled by the value of `StdVideoDecodeH264PictureInfo::flags.is_reference`. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in `pDecodeInfo->pSetupReferenceSlot->slotIndex`. If `StdVideoDecodeH264PictureInfo::flags.is_reference` is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

**Active Parameter Sets**

The members of the `StdVideoDecodeH264PictureInfo` structure pointed to by `pStdPictureInfo` are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The active SPS is the SPS identified by the key specified in `StdVideoDecodeH264PictureInfo::seq_parameter_set_id`.
- The active PPS is the PPS identified by the key specified by the pair constructed from `StdVideoDecodeH264PictureInfo::seq_parameter_set_id` and `StdVideoDecodeH264PictureInfo::pic_parameter_set_id`.

**Valid Usage (Implicit)**

- `VUID-VkVideoDecodeH264PictureInfoKHR-sType-sType` sType must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_PICTURE_INFO_KHR`
- `VUID-VkVideoDecodeH264PictureInfoKHR-pStdPictureInfo-parameter`
pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeH264PictureInfo value

• VUID-VkVideoDecodeH264PictureInfoKHR-pSliceOffsets-parameter
  pSliceOffsets must be a valid pointer to an array of sliceCount uint32_t values

• VUID-VkVideoDecodeH264PictureInfoKHR-sliceCount-arraylength
  sliceCount must be greater than 0

The VkVideoDecodeH264DpbSlotInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h264
typedef struct VkVideoDecodeH264DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH264DpbSlotInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• pStdReferenceInfo is a pointer to a StdVideoDecodeH264ReferenceInfo structure specifying H.264 reference information.

This structure is specified in the pNext chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, if not NULL, and the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots to specify the codec-specific reference picture information for an H.264 decode operation.

**Active Reference Picture Information**

When this structure is specified in the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots, one or two elements are added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::pReferenceSlots as follows:

• If neither pStdReferenceInfo->flags.top_field_flag nor pStdReferenceInfo->flags.bottom_field_flag is set, then the picture is added as a frame reference to the list of active reference pictures.

• If pStdReferenceInfo->flags.top_field_flag is set, then the picture is added as a top field reference to the list of active reference pictures.

• If pStdReferenceInfo->flags.bottom_field_flag is set, then the picture is added as a bottom field reference to the list of active reference pictures.

• For each added reference picture, the corresponding image subregion used is determined according to the H.264 Decode Picture Data Access section.

• Each added reference picture is associated with the DPB slot index specified in the slotIndex member of the corresponding element of VkVideoDecodeInfoKHR::pReferenceSlots.

• Each added reference picture is associated with the H.264 reference information provided in pStdReferenceInfo.
Note

When both the top and bottom field of an interlaced frame currently associated with a DPB slot is intended to be used as an active reference picture and both fields are stored in the same image subregion (which is the case when using VK_VIDEO_DECODER_H264_PICTURE_LAYOUT_INTERLACED_INTERLEAVED_LINES_BIT_KHR which stores the two fields at even and odd scanlines of the same image subregion), both references have to be provided through a single VkVideoReferenceSlotInfoKHR structure that has both flags.top_field_flag and flags.bottom_field_flag set in the StdVideoDecodeH264ReferenceInfo structure pointed to by the pStdReferenceInfo member of the VkVideoDecodeH264DpbSlotInfoKHR structure included in the corresponding VkVideoReferenceSlotInfoKHR structure's pNext chain. However, this approach can only be used when both fields are stored in the same image subregion. If that is not the case (e.g. when using VK_VIDEO_DECODER_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR which requires separate codedOffset values for the two fields and also allows storing the two fields of a frame in separate image layers or entirely separate images), then a separate VkVideoReferenceSlotInfoKHR structure needs to be provided for referencing the two fields, each only setting one of flags.top_field_flag or flags.bottom_field_flag, and providing the appropriate video picture resource information in VkVideoReferenceSlotInfoKHR::pPictureResource.

Reconstructed Picture Information

When this structure is specified in the pNext chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

- If neither pStdReferenceInfo->flags.top_field_flag nor pStdReferenceInfo->flags.bottom_field_flag is set, then the picture represents a frame.
- If pStdReferenceInfo->flags.top_field_flag is set, then the picture represents a field, specifically, the top field of the frame.
- If pStdReferenceInfo->flags.bottom_field_flag is set, then the picture represents a field, specifically, the bottom field of the frame.
- The image subregion used is determined according to the H.264 Decode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the H.264 reference information provided in pStdReferenceInfo.

Std Reference Information

The members of the StdVideoDecodeH264ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:

- flags.top_field_flag is used to indicate whether the reference is used as top field reference;
- flags.bottom_field_flag is used to indicate whether the reference is used as bottom field
• flags.used_for_long_term_reference is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.2.5.1 of the ITU-T H.264 Specification;
• flags.is_non-existing is used to indicate whether the picture is marked as “non-existing” as defined in section 8.2.5.2 of the ITU-T H.264 Specification;
• all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

• VUID-VkVideoDecodeH264DpbSlotInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H264_DPB_SLOT_INFO_KHR
• VUID-VkVideoDecodeH264DpbSlotInfoKHR-pStdReferenceInfo-parameter
  pStdReferenceInfo must be a valid pointer to a valid StdVideoDecodeH264ReferenceInfo value

42.12.7. H.264 Decode Requirements

This section describes the required H.264 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation VK_VIDEO_CODEC_OPERATION_DECODER_H264_BIT_KHR, as returned by vkGetPhysicalDeviceQueueFamilyProperties2 in VkQueueFamilyVideoPropertiesKHR::videoCodecOperations.

| fieldOffsetGranularity                               | (0,0) except for profiles using VK_VIDEO_DECODE_H264_PICTURE_LAYOUT_INTERLACED_SEPARATE_PLANES_BIT_KHR | implementation-dependent |

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

### 42.13. H.265 Decode Operations

Video decode operations using an H.265 decode profile **can** be used to decode elementary video stream sequences compliant to the **ITU-T H.265 Specification**.

**Note**

Refer to the Preamble for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the **video decode operation steps** with the codec-specific semantics defined in section 8 of **ITU-T H.265 Specification**:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The **StdVideoH265VideoParameterSet** structure corresponding to the **active VPS** specifying the H.265 video parameter set.
  - The **StdVideoH265SequenceParameterSet** structure corresponding to the **active SPS** specifying the H.265 sequence parameter set.
  - The **StdVideoH265PictureParameterSet** structure corresponding to the **active PPS** specifying the H.265 picture parameter set.
  - The **StdVideoDecodeH265PictureInfo** structure specifying the H.265 picture information.
The `StdVideoDecodeH265ReferenceInfo` structures specifying the H.265 reference information corresponding to the optional reconstructed picture and any active reference pictures.

- The contents of the provided video bitstream buffer range are interpreted as defined in the H.265 Decode Bitstream Data Access section.
- Picture data in the video picture resources corresponding to the used active reference pictures, decode output picture, and optional reconstructed picture is accessed as defined in the H.265 Decode Picture Data Access section.
- The decision on reference picture setup is made according to the parameters specified in the H.265 picture information.

If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

### 42.13.1. H.265 Decode Bitstream Data Access

The video bitstream buffer range should contain a VCL NAL unit comprised of the slice segment headers and data of a picture representing a frame, as defined in sections 7.3.6 and 7.3.8, and this data is interpreted as defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively.

The offsets provided in `VkVideoDecodeH265PictureInfoKHR::pSliceSegmentOffsets` should specify the starting offsets corresponding to each slice segment header within the video bitstream buffer range.

### 42.13.2. H.265 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 decode profile is defined as the set of texels within the coordinate range:

```
([0,endX],[0,endY])
```

Where:

- `endX` equals `codedExtent.width` rounded up to the nearest integer multiple of `pictureAccessGranularity.width` and clamped to the width of the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure;
- `endY` equals `codedExtent.height` rounded up to the nearest integer multiple of `pictureAccessGranularity.height` and clamped to the height of the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure;
Where `codedExtent` is the member of the `VkVideoPictureResourceInfoKHR` structure corresponding to the picture.

In case of video decode operations using an H.265 decode profile, any access to a picture at the coordinates `(x, y)`, as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure at the texel coordinates `(x, y)`.

### 42.13.3. H.265 Decode Profile

A video profile supporting H.265 video decode operations is specified by setting `VkVideoProfileInfoKHR::videoCodecOperation` to `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` and adding a `VkVideoDecodeH265ProfileInfoKHR` structure to the `VkVideoProfileInfoKHR::pNext` chain.

The `VkVideoDecodeH265ProfileInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoDecodeH265ProfileInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC, as defined in section A.3 of the ITU-T H.265 Specification.

**Valid Usage (Implicit)**

- VUID-VkVideoDecodeH265ProfileInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PROFILE_INFO_KHR`

### 42.13.4. H.265 Decode Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for an H.265 decode profile, the `VkVideoCapabilitiesKHR::pNext` chain must include a `VkVideoDecodeH265CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoDecodeH265CapabilitiesKHR` structure is defined as:
typedef struct VkVideoDecodeH265CapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoDecodeH265CapabilitiesKHR;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxLevelIdc` is a `StdVideoH265LevelIdc` value indicating the maximum H.265 level supported by the profile, where enum constant `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifies H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification.

### Valid Usage (Implicit)

- `VUID-VkVideoDecodeH265CapabilitiesKHR-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_CAPABILITIES_KHR`

### 42.13.5. H.265 Decode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR` can contain the following types of parameters:

#### H.265 Video Parameter Sets (VPS)

Represented by `StdVideoH265VideoParameterSet` structures and interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
- `vps_video_parameter_set_id` is used as the key of the VPS entry;
- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `vps_max_latency_increase_plus1`, `vps_max_dec_pic_buffering_minus1`, and `vps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.1 of the ITU-T H.265 Specification;
- the `StdVideoH265HrdParameters` structure pointed to by `pHrdParameters` is interpreted as follows:
  - `reserved` is used only for padding purposes and is otherwise ignored;
  - `flags.fixed_pic_rate_general_flag` is a bitmask where bit index i corresponds to `fixed_pic_rate_general_flag[i]` as defined in section E.3.2 of the ITU-T H.265 Specification;
  - `flags.fixed_pic_rate_within_cvs_flag` is a bitmask where bit index i corresponds to
fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

- flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

- if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of vps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where vps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of vps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where vps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

- the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as follows:
  - general_level_idc is one of the enum constants STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifying the H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265ProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265VideoParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

H.265 Sequence Parameter Sets (SPS)

Represented by StdVideoH265SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- the pair constructed from sps_video_parameter_set_id and sps_seq_parameter_set_id is used as the key of the SPS entry;
- the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted
as follows:

- `general_level_idc` is one of the enum constants `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;

- all other members of `StdVideoH265ProfileTierLevel` are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;

- the `max_latency_increase_plus1`, `max_dec_pic_buffering_minus1`, and `max_num_reorder_pics` members of the `StdVideoH265DecPicBufMgr` structure pointed to by `pDecPicBufMgr` correspond to `sps_max_latency_increase_plus1`, `sps_max_dec_pic_buffering_minus1`, and `sps_max_num_reorder_pics`, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

- if `flags.sps_scaling_list_data_present_flag` is set, then the `StdVideoH265ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `ScalingListDCCoef16x16` and `ScalingListDCCoef32x32` correspond to `scaling_list_dc_coef_minus8[0]` and `scaling_list_dc_coef_minus8[1]`, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

- `pShortTermRefPicSet` is a pointer to an array of `num_short_term_ref_pic_sets` number of `StdVideoH265ShortTermRefPicSet` structures where each element is interpreted as follows:
  - `reserved1`, `reserved2`, and `reserved3` are used only for padding purposes and are otherwise ignored;
  - `used_by_curr_pic_flag` is a bitmask where bit index `i` corresponds to `used_by_curr_pic_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `use_delta_flag` is a bitmask where bit index `i` corresponds to `use_delta_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s0_flag` is a bitmask where bit index `i` corresponds to `used_by_curr_pic_s0_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - `used_by_curr_pic_s1_flag` is a bitmask where bit index `i` corresponds to `used_by_curr_pic_s1_flag[i]` as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - all other members of `StdVideoH265ShortTermRefPicSet` are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;

- if `flags.long_term_ref_pics_present_flag` is set then the `StdVideoH265LongTermRefPicsSps` structure pointed to by `pLongTermRefPicsSps` is interpreted as follows:
  - `used_by_curr_pic_lt_sps_flag` is a bitmask where bit index `i` corresponds to `used_by_curr_pic_lt_sps_flag[i]` as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

- all other members of `StdVideoH265LongTermRefPicsSps` are interpreted as defined in section 7.4.3.2 of the ITU-T H.265 Specification;

- if `flags.vui_parameters_present_flag` is set, then the `StdVideoH265SequenceParameterSetVui`
structure pointed to by pSequenceParameterSetVui is interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;

- the StdVideoH265HrdParameters structure pointed to by pHrdParameters is interpreted as follows:
  - flags.fixed_pic_rate_general_flag is a bitmask where bit index i corresponds to fixed_pic_rate_general_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
  - flags.fixed_pic_rate_within_cvs_flag is a bitmask where bit index i corresponds to fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
  - flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;

- if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;

- if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
  - cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;

- all other members of pSequenceParameterSetVui are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;

- if flags.sps_palette_predictor_initializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;

- all other members of StdVideoH265SequenceParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.
H.265 Picture Parameter Sets (PPS)

Represented by StdVideoH265PictureParameterSet structures and interpreted as follows:

- reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
- the triplet constructed from sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id is used as the key of the PPS entry;
- if flags.pps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  - ScalingListDCCoef16x16 and ScalingListDCCoef32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
- if flags.pps_palette_predictor_initializer_present_flag is set, then the PredictorPaletteEntries member of the StdVideoH265PredictorPaletteEntries structure pointed to by pPredictorPaletteEntries is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;
- all other members of StdVideoH265PictureParameterSet are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeH265SessionParametersCreateInfoKHR structure specifying the capacity and initial contents of the object.

The VkVideoDecodeH265SessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_h265
typedef struct VkVideoDecodeH265SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoDecodeH265SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoDecodeH265SessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `maxStdVPSCount` is the maximum number of H.265 VPS entries the created VkVideoSessionParametersKHR can contain.
• **maxStdSPSCount** is the maximum number of H.265 SPS entries the created VkVideoSessionParametersKHR can contain.

• **maxStdPPSCount** is the maximum number of H.265 PPS entries the created VkVideoSessionParametersKHR can contain.

• **pParametersAddInfo** is NULL or a pointer to a VkVideoDecodeH265SessionParametersAddInfoKHR structure specifying H.265 parameters to add upon object creation.

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR`

- **VUID-VkVideoDecodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter**
  - If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid VkVideoDecodeH265SessionParametersAddInfoKHR structure

The VkVideoDecodeH265SessionParametersAddInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeH265SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoDecodeH265SessionParametersAddInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.

- `pNext` is NULL or a pointer to a structure extending this structure.

- `stdVPSCount` is the number of elements in the `pStdVPSs` array.

- `pStdVPSs` is a pointer to an array of StdVideoH265VideoParameterSet structures describing the H.265 VPS entries to add.

- `stdSPSCount` is the number of elements in the `pStdSPSs` array.

- `pStdSPSs` is a pointer to an array of StdVideoH265SequenceParameterSet structures describing the H.265 SPS entries to add.

- `stdPPSCount` is the number of elements in the `pStdPPSs` array.

- `pStdPPSs` is a pointer to an array of StdVideoH265PictureParameterSet structures describing the H.265 PPS entries to add.

This structure can be specified in the following places:
• In the `pParametersAddInfo` member of the `VkVideoDecodeH265SessionParametersCreateInfoKHR` structure specified in the `pNext` chain of `VkVideoSessionParametersCreateInfoKHR` used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).

• In the `pNext` chain of `VkVideoSessionParametersUpdateInfoKHR`. In this case, if the video codec operation the video session parameters object to be updated was created with is `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

### Valid Usage

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04833**
  The `vps_video_parameter_set_id` member of each `StdVideoH265VideoParameterSet` structure specified in the elements of `pStdVPSs` **must** be unique within `pStdVPSs`

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04834**
  The pair constructed from the `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` members of each `StdVideoH265SequenceParameterSet` structure specified in the elements of `pStdSPSs` **must** be unique within `pStdSPSs`

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-None-04835**
  The triplet constructed from the `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` members of each `StdVideoH265PictureParameterSet` structure specified in the elements of `pStdPPSs` **must** be unique within `pStdPPSs`

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR`

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter**
  If `stdVPSCount` is not 0, `pStdVPSs` **must** be a valid pointer to an array of `stdVPSCount` `StdVideoH265VideoParameterSet` values

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter**
  If `stdSPSCount` is not 0, `pStdSPSs` **must** be a valid pointer to an array of `stdSPSCount` `StdVideoH265SequenceParameterSet` values

- **VUID-VkVideoDecodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter**
  If `stdPPSCount` is not 0, `pStdPPSs` **must** be a valid pointer to an array of `stdPPSCount` `StdVideoH265PictureParameterSet` values

### 42.13.6. H.265 Decoding Parameters

The `VkVideoDecodeH265PictureInfoKHR` structure is defined as:
typedef struct VkVideoDecodeH265PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265PictureInfo* pStdPictureInfo;
    uint32_t sliceSegmentCount;
    const uint32_t* pSliceSegmentOffsets;
} VkVideoDecodeH265PictureInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pStdPictureInfo** is a pointer to a StdVideoDecodeH265PictureInfo structure specifying H.265 picture information.
- **sliceSegmentCount** is the number of elements in **pSliceSegmentOffsets**.
- **pSliceSegmentOffsets** is a pointer to an array of sliceSegmentCount offsets specifying the start offset of the slice segments of the picture within the video bitstream buffer range specified in VkVideoDecodeInfoKHR.

This structure is specified in the **pNext** chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR to specify the codec-specific picture information for an H.265 decode operation.

### Decode Output Picture Information

When this structure is specified in the **pNext** chain of the VkVideoDecodeInfoKHR structure passed to vkCmdDecodeVideoKHR, the information related to the decode output picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The decode output picture is associated with the H.265 picture information provided in pStdPictureInfo.

### Std Picture Information

The members of the StdVideoDecodeH265PictureInfo structure pointed to by pStdPictureInfo are interpreted as follows:

- **reserved** is used only for padding purposes and is otherwise ignored;
- **flags.IrapPicFlag** as defined in section 3.73 of the ITU-T H.265 Specification;
- **flags.IdrPicFlag** as defined in section 3.67 of the ITU-T H.265 Specification;
- **flags.IsReference** as defined in section 3.132 of the ITU-T H.265 Specification;
- **sps_video_parameter_set_id**, **pps_seq_parameter_set_id**, and **pps_pic_parameter_set_id** are used to identify the active parameter sets, as described below;
- **PicOrderCntVal** as defined in section 8.3.1 of the ITU-T H.265 Specification;
- **NumBitsForSTRefPicSetInSlice** is the number of bits used in st_ref_pic_set when
short_term_ref_pic_set_sps_flag is 0, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;

- NumDeltaPocsOfRefRpsIdx is the value of NumDeltaPocs[RefRpsIdx] when short_term_ref_pic_set_sps_flag is 1, or 0 otherwise, as defined in sections 7.4.7 and 7.4.8 of the ITU-T H.265 Specification;

- RefPicSetStCurrBefore, RefPicSetStCurrAfter, and RefPicSetLtCurr are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value STD_VIDEO_H265_NO_REFERENCE_PICTURE to indicate “no reference picture”;

- all other members are interpreted as defined in section 8.3.2 of the ITU-T H.265 Specification.

Reference picture setup is controlled by the value of StdVideoDecodeH265PictureInfo::flags.IsReference. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the corresponding DPB slot. If StdVideoDecodeH265PictureInfo::flags.IsReference is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The members of the StdVideoDecodeH265PictureInfo structure pointed to by pStdPictureInfo are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The active VPS is the VPS identified by the key specified in StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id.

- The active SPS is the SPS identified by the key specified by the pair constructed from StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id and StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id.

- The active PPS is the PPS identified by the key specified by the triplet constructed from StdVideoDecodeH265PictureInfo::sps_video_parameter_set_id, StdVideoDecodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoDecodeH265PictureInfo::pps_pic_parameter_set_id.

Valid Usage (Implicit)

- VUID-VkVideoDecodeH265PictureInfoKHR-sType-sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_H265_PICTURE_INFO_KHR

- VUID-VkVideoDecodeH265PictureInfoKHR-pStdPictureInfo-parameter pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeH265PictureInfo value

- VUID-VkVideoDecodeH265PictureInfoKHR-pSliceSegmentOffsets-parameter pSliceSegmentOffsets must be a valid pointer to an array of sliceSegmentCount uint32_t values

- VUID-VkVideoDecodeH265PictureInfoKHR-sliceSegmentCount-arraylength sliceSegmentCount must be greater than 0
The VkVideoDecodeH265DpbSlotInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeH265DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeH265DpbSlotInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pStdReferenceInfo** is a pointer to a StdVideoDecodeH265ReferenceInfo structure specifying reference picture information described in section 8.3 of the ITU-T H.265 Specification.

This structure is specified in the **pNext** chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, if not NULL, and the pNext chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots to specify the codec-specific reference picture information for an H.265 decode operation.

### Active Reference Picture Information

When this structure is specified in the **pNext** chain of the elements of VkVideoDecodeInfoKHR::pReferenceSlots, one element is added to the list of active reference pictures used by the video decode operation for each element of VkVideoDecodeInfoKHR::pReferenceSlots as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the slotIndex member of the corresponding element of VkVideoDecodeInfoKHR::pReferenceSlots.
- The reference picture is associated with the H.265 reference information provided in pStdReferenceInfo.

### Reconstructed Picture Information

When this structure is specified in the **pNext** chain of VkVideoDecodeInfoKHR::pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Decode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->slotIndex.
- The reconstructed picture is associated with the H.265 reference information provided in pStdReferenceInfo.

### Std Reference Information

The members of the StdVideoDecodeH265ReferenceInfo structure pointed to by pStdReferenceInfo are interpreted as follows:
• `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;

• `flags.unused_for_reference` is used to indicate whether the picture is marked as “unused for reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;

• all other members are interpreted as defined in section 8.3 of the ITU-T H.265 Specification.

### 42.13.7. H.265 Decode Requirements

This section describes the **required** H.265 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_H265_BIT_KHR`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

## 42.14. AV1 Decode Operations

Video decode operations using an **AV1 decode profile** **can** be used to decode elementary video stream sequences compliant with the **AV1 Specification**.

---

**Note**

Refer to the **Preamble** for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the **video decode operation steps** with the codec-specific semantics defined in section 7 of the **AV1 Specification**:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The **StdVideoAV1SequenceHeader** structure stored in the bound video session parameters object specifying the **active sequence header**.
  - The **StdVideoDecodeAV1PictureInfo** structure specifying the **AV1 picture information**.
  - The **StdVideoDecodeAV1ReferenceInfo** structures specifying the **AV1 reference information** corresponding to the optional reconstructed picture and any **active reference pictures**.

- The contents of the provided video bitstream buffer range are interpreted as defined in the **AV1 Decode Bitstream Data Access** section.

- Picture data in the **video picture resources** corresponding to the used **active reference pictures**, **decode output picture**, and optional reconstructed picture is accessed as defined in the **AV1 Decode Picture Data Access** section.

- The decision on **reference picture setup** is made according to the parameters specified in the **AV1 picture information**.
If the parameters and the bitstream adhere to the syntactic and semantic requirements defined in the corresponding sections of the AV1 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video decode operation will complete successfully. Otherwise, the video decode operation may complete unsuccessfully.

42.14.1. AV1 Decode Bitstream Data Access

The video bitstream buffer range **should** contain one or more frame OBUs, comprised of a frame header OBU and tile group OBU, that together represent an entire frame, as defined in sections 5.10, 5.9, and 5.11, and this data is interpreted as defined in sections 6.9, 6.8, and 6.10 of the AV1 Specification, respectively.

The offset specified in `VkVideoDecodeAV1PictureInfoKHR::frameHeaderOffset` **should** specify the starting offset of the frame header OBU of the frame.

**Note**

When the tiles of the frame are encoded into multiple tile groups, each frame OBU has a separate frame header OBU but their content is expected to match per the requirements of the AV1 Specification. Accordingly, the offset specified in `frameHeaderOffset` **can** be the offset of any of the otherwise identical frame header OBUs when multiple tile groups are present.

The offsets and sizes provided in `VkVideoDecodeAV1PictureInfoKHR::pTileOffsets` and `VkVideoDecodeAV1PictureInfoKHR::pTileSizes`, respectively, **should** specify the starting offsets and sizes corresponding to each tile within the video bitstream buffer range.

42.14.2. AV1 Decode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. Accordingly, the complete image subregion of a decode output picture, reference picture, or reconstructed picture accessed by video coding operations using an AV1 decode profile is defined as the set of texels within the coordinate range:

$$([0, endX],[0, endY])$$

Where:

- `endX` equals `codedExtent.width` rounded up to the nearest integer multiple of `pictureAccessGranularity.width` and clamped to the width of the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure;
- `endY` equals `codedExtent.height` rounded up to the nearest integer multiple of `pictureAccessGranularity.height` and clamped to the height of the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure;
Where `codedExtent` is the member of the `VkVideoPictureResourceInfoKHR` structure corresponding to the picture.

In case of video decode operations using an AV1 decode profile, any access to a picture at the coordinates \((x,y)\), as defined by the AV1 Specification, is an access to the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure at the texel coordinates \((x,y)\).

### 42.14.3. AV1 Reference Names and Semantics

Individual reference frames used in the decoding process have different semantics, as defined in section 6.10.24 of the AV1 Specification. The AV1 semantics associated with a reference picture are indicated by the corresponding enumeration constant defined in the Video Std enumeration type `StdVideoAV1ReferenceName`:

- `STD_VIDEO_AV1_REFERENCE_NAME_INTRA_FRAME` identifies the reference used for intra coding (INTRA_FRAME), as defined in sections 2 and 7.11.2 of the AV1 Specification.
- All other enumeration constants refer to backward or forward references used for inter coding, as defined in sections 2 and 7.11.3 of the AV1 Specification:
  - `STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME` identifies the LAST_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_LAST2_FRAME` identifies the LAST2_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_LAST3_FRAME` identifies the LAST3_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_GOLDEN_FRAME` identifies the GOLDEN_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_BWDREF_FRAME` identifies the BWDREF_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_ALTREF2_FRAME` identifies the ALTREF2_FRAME reference
  - `STD_VIDEO_AV1_REFERENCE_NAME_ALTREF_FRAME` identifies the ALTREF_FRAME reference

These enumeration constants are not directly used in any APIs but are used to indirectly index into certain Video Std and Vulkan API parameter arrays.

### 42.14.4. AV1 Decode Profile

A video profile supporting AV1 video decode operations is specified by setting `VkVideoProfileInfoKHR::videoCodecOperation` to `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR` and adding a `VkVideoDecodeAV1ProfileInfoKHR` structure to the `VkVideoProfileInfoKHR::pNext` chain.

The `VkVideoDecodeAV1ProfileInfoKHR` structure is defined as:

```c
typedef struct VkVideoDecodeAV1ProfileInfoKHR {
    VkStructureType  sType;
    const void*      pNext;
    StdVideoAV1Profile stdProfile;
    VkBool32         filmGrainSupport;
} VkVideoDecodeAV1ProfileInfoKHR;
```
sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

stdProfile is a StdVideoAV1Profile value specifying the AV1 codec profile, as defined in section A.2 of the AV1 Specification.

filmGrainSupport specifies whether AV1 film grain, as defined in section 7.8.3 of the AV1 Specification, can be used with the video profile. When this member is set to VK_TRUE, video session objects created against the video profile will be able to decode pictures that have film grain enabled.

Note
Enabling filmGrainSupport may increase the memory requirements of video sessions and/or video picture resources on some implementations.

Valid Usage (Implicit)

VUID-VkVideoDecodeAV1ProfileInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_VIDEO_DECODER_AV1_PROFILE_INFO_KHR

42.14.5. AV1 Decode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an AV1 decode profile, the VkVideoCapabilitiesKHR::pNext chain must include a VkVideoDecodeAV1CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoDecodeAV1CapabilitiesKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1CapabilitiesKHR {
    VkStructureType sType;
    void*           pNext;
    StdVideoAV1Level maxLevel;
} VkVideoDecodeAV1CapabilitiesKHR;
```

sType is a VkStructureType value identifying this structure.

pNext is NULL or a pointer to a structure extending this structure.

maxLevel is a StdVideoAV1Level value specifying the maximum AV1 level supported by the profile, as defined in section A.3 of the AV1 Specification.

Valid Usage (Implicit)

VUID-VkVideoDecodeAV1CapabilitiesKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_VIDEO_DECODER_AV1_CAPABILITIES_KHR
42.14.6. AV1 Decode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR contain a single instance of the following parameter set:

AV1 Sequence Header

Represented by StdVideoAV1SequenceHeader structures and interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- the StdVideoAV1ColorConfig structure pointed to by `pColorConfig` is interpreted as follows:
  - `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
  - all other members of StdVideoAV1ColorConfig are interpreted as defined in section 6.4.2 of the AV1 Specification;
- if `flags.timing_info_present_flag` is set, then the StdVideoAV1TimingInfo structure pointed to by `pTimingInfo` is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of StdVideoAV1TimingInfo are interpreted as defined in section 6.4.3 of the AV1 Specification;
- all other members of StdVideoAV1SequenceHeader are interpreted as defined in section 6.4 of the AV1 Specification.

When a video session parameters object is created with the codec operation VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext chain must include a VkVideoDecodeAV1SessionParametersCreateInfoKHR structure specifying the contents of the object.

The VkVideoDecodeAV1SessionParametersCreateInfoKHR structure is defined as:

```c
typedef struct VkVideoDecodeAV1SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoAV1SequenceHeader* pStdSequenceHeader;
} VkVideoDecodeAV1SessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pStdSequenceHeader` is a pointer to a StdVideoAV1SequenceHeader structure describing the AV1 sequence header entry to store in the created object.

Note
As AV1 video session parameters objects will only ever contain a single AV1 sequence header, this has to be specified at object creation time and such video session parameters objects cannot be updated using the `vkUpdateVideoSessionParametersKHR` command. When a new AV1 sequence header is decoded from the input video bitstream the application needs to create a new video session parameters object to store it.

### Valid Usage (Implicit)

- **VUID-VkVideoDecodeAV1SessionParametersCreateInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_SESSION_PARAMETERS_CREATE_INFO_KHR`
- **VUID-VkVideoDecodeAV1SessionParametersCreateInfoKHR-pStdSequenceHeader-parameter**
  - `pStdSequenceHeader` must be a valid pointer to a valid `StdVideoAV1SequenceHeader` value

### 42.14.7. AV1 Decoding Parameters

The `VkVideoDecodeAV1PictureInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeAV1PictureInfo* pStdPictureInfo;
    int32_t referenceNameSlotIndices[VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR];
    uint32_t frameHeaderOffset;
    uint32_t tileCount;
    const uint32_t* pTileOffsets;
    const uint32_t* pTileSizes;
} VkVideoDecodeAV1PictureInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pStdPictureInfo** is a pointer to a `StdVideoDecodeAV1PictureInfo` structure specifying AV1 picture information.
- **referenceNameSlotIndices** is an array of seven (`VK_MAX_VIDEO_AV1_REFERENCES_PER_FRAME_KHR`, which is equal to the Video Std definition `STD_VIDEO_AV1_REFS_PER_FRAME`) signed integer values specifying the index of the DPB slot or a negative integer value for each AV1 reference name used for inter coding. In particular, the DPB slot index for the AV1 reference name `frame` is specified in `referenceNameSlotIndices[frame - STD_VIDEO_AV1_REFERENCE_NAME_LAST_FRAME]`.
- **frameHeaderOffset** is the byte offset of the AV1 frame header OBU, as defined in section 5.9 of the AV1 Specification, within the video bitstream buffer range specified in `VkVideoDecodeInfoKHR`.
- **tileCount** is the number of elements in `pTileOffsets` and `pTileSizes`. 
• **pTileOffsets** is a pointer to an array of *tileCount* integers specifying the byte offset of the tiles of the picture within the video bitstream buffer range specified in *VkVideoDecodeInfoKHR*.

• **pTileSizes** is a pointer to an array of *tileCount* integers specifying the byte size of the tiles of the picture within the video bitstream buffer range specified in *VkVideoDecodeInfoKHR*.

This structure is specified in the **pNext** chain of the *VkVideoDecodeInfoKHR* structure passed to *vkCmdDecodeVideoKHR* to specify the codec-specific picture information for an **AV1 decode operation**.

**Decode Output Picture Information**

When this structure is specified in the **pNext** chain of the *VkVideoDecodeInfoKHR* structure passed to *vkCmdDecodeVideoKHR*, the information related to the **decode output picture** is defined as follows:

• The image subregion used is determined according to the **AV1 Decode Picture Data Access** section.

• The decode output picture is associated with the **AV1 picture information** provided in **pStdPictureInfo**.

**Std Picture Information**

The members of the **StdVideoDecodeAV1PictureInfo** structure pointed to by **pStdPictureInfo** are interpreted as follows:

• **flags.reserved**, **reserved1**, and **reserved2** are used only for padding purposes and are otherwise ignored;

• **flags.apply_grain** indicates that film grain is enabled for the decoded picture, as defined in section 6.8.20 of the **AV1 Specification**;

• **tg_start** and **tg_end** are interpreted as defined in section 6.10.1 of the **AV1 Specification**;

• **OrderHint**, **OrderHints**, and **expectedFrameId** are interpreted as defined in section 6.8.2 of the **AV1 Specification**;

• the **StdVideoAV1TileInfo** structure pointed to by **pTileInfo** is interpreted as follows:
  • **flags.reserved** and **reserved1** are used only for padding purposes and are otherwise ignored;
  • **pMiColStarts** is a pointer to an array of **TileCols** number of unsigned integers that corresponds to **MiColStarts** defined in section 6.8.14 of the **AV1 Specification**;
  • **pMiRowStarts** is a pointer to an array of **TileRows** number of unsigned integers that corresponds to **MiRowStarts** defined in section 6.8.14 of the **AV1 Specification**;
  • **pWidthInSbsMinus1** is a pointer to an array of **TileCols** number of unsigned integers that corresponds to **width_in_sbs_minus_1** defined in section 6.8.14 of the **AV1 Specification**;
  • **pHeightInSbsMinus1** is a pointer to an array of **TileRows** number of unsigned integers that corresponds to **height_in_sbs_minus_1** defined in section 6.8.14 of the **AV1 Specification**;
  • all other members of **StdVideoAV1TileInfo** are interpreted as defined in section 6.8.14 of the **AV1 Specification**;
• the **StdVideoAV1Quantization** structure pointed to by `pQuantization` is interpreted as follows:
  ◦ `flags.reserved` is used only for padding purposes and is otherwise ignored;
  ◦ all other members of **StdVideoAV1Quantization** are interpreted as defined in section 6.8.11 of the **AV1 Specification**;

• if `flags.segmentation_enabled` is set, then the **StdVideoAV1Segmentation** structure pointed to by `pSegmentation` is interpreted as follows:
  ◦ the elements of `FeatureEnabled` are bitmasks where bit index `j` of element `i` corresponds to `FeatureEnabled[i][j]` as defined in section 6.8.13 of the **AV1 Specification**;
  ◦ `FeatureData` is interpreted as defined in section 6.8.13 of the **AV1 Specification**;

• the **StdVideoAV1LoopFilter** structure pointed to by `pLoopFilter` is interpreted as follows:
  ◦ `flags.reserved` is used only for padding purposes and is otherwise ignored;
  ◦ `update_ref_delta` is a bitmask where bit index `i` is interpreted as the value of `update_ref_delta` corresponding to element `i` of `loop_filter_ref_deltas` as defined in section 6.8.10 of the **AV1 Specification**;
  ◦ `update_mode_delta` is a bitmask where bit index `i` is interpreted as the value of `update_mode_delta` corresponding to element `i` of `loop_filter_mode_deltas` as defined in section 6.8.10 of the **AV1 Specification**;
  ◦ all other members of **StdVideoAV1LoopFilter** are interpreted as defined in section 6.8.10 of the **AV1 Specification**;

• if `flags.enable_cdef` is set in the **active sequence header**, then the members of the **StdVideoAV1CDEF** structure pointed to by `pCDEF` are interpreted as follows:
  ◦ `cdef_y_sec_strength` and `cdef_uv_sec_strength` are the bitstream values of the corresponding syntax elements defined in section 5.9.19 of the **AV1 Specification**;
  ◦ all other members of **StdVideoAV1CDEF** are interpreted as defined in section 6.10.14 of the **AV1 Specification**;

• the **StdVideoAV1LoopRestoration** structure pointed to by `pLoopRestoration` is interpreted as follows:
  ◦ `LoopRestorationSize[plane]` is interpreted as `log2(size) - 5`, where `size` is the value of `LoopRestorationSize[plane]` as defined in section 6.10.15 of the **AV1 Specification**.
  ◦ all other members of **StdVideoAV1LoopRestoration** are defined as in section 6.10.15 of the **AV1 Specification**;

• the members of the **StdVideoAV1GlobalMotion** structure provided in `global_motion` are interpreted as defined in section 7.10 of the **AV1 Specification**;

• if `flags.film_grain_params_present` is set in the **active sequence header**, then the **StdVideoAV1FilmGrain** structure pointed to by `pFilmGrain` is interpreted as follows:
  ◦ `flags.reserved` is used only for padding purposes and is otherwise ignored;
  ◦ all other members of **StdVideoAV1FilmGrain** are interpreted as defined in section 6.8.20 of the **AV1 Specification**;

• all other members are interpreted as defined in section 6.8 of the **AV1 Specification**.
When film grain is enabled for the decoded frame, the flags.update_grain and film_grain_params_ref_idx values specified in StdVideoAV1FilmGrain are ignored by AV1 decode operations and the load_grain_params function, as defined in section 6.8.20 of the AV1 Specification, is not executed. Instead, the application is responsible for specifying the effective film grain parameters for the frame in StdVideoAV1FilmGrain.

When film grain is enabled for the decoded frame, the application is required to specify a different decode output picture resource in VkVideoDecodeInfoKHR::dstPictureResource compared to the reconstructed picture specified in VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource even if the implementation does not report support for VK_VIDEO_DECODE_CAPABILITY_DPB_AND_OUTPUT_DISTINCT_BIT_KHR in VkVideoDecodeCapabilitiesKHR ::flags for the video decode profile.

Reference picture setup is controlled by the value of StdVideoDecodeAV1PictureInfo ::refresh_frame_flags. If it is not zero and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in pDecodeInfo->pSetupReferenceSlot->slotIndex. If StdVideoDecodeAV1PictureInfo::refresh_frame_flags is zero, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

Active Parameter Sets

The active sequence header is the AV1 sequence header stored in the bound video session parameters object.

Valid Usage (Implicit)

- VUID-VkVideoDecodeAV1PictureInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_PICTURE_INFO_KHR
- VUID-VkVideoDecodeAV1PictureInfoKHR-pStdPictureInfo-parameter
  pStdPictureInfo must be a valid pointer to a valid StdVideoDecodeAV1PictureInfo value
- VUID-VkVideoDecodeAV1PictureInfoKHR-pTileOffsets-parameter
  pTileOffsets must be a valid pointer to an array of tileCount uint32_t values
- VUID-VkVideoDecodeAV1PictureInfoKHR-pTileSizes-parameter
  pTileSizes must be a valid pointer to an array of tileCount uint32_t values
- VUID-VkVideoDecodeAV1PictureInfoKHR-tileCount-arraylength
  tileCount must be greater than 0

The VkVideoDecodeAV1DpbSlotInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_decode_av1
typedef struct VkVideoDecodeAV1DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoDecodeAV1ReferenceInfo* pStdReferenceInfo;
} VkVideoDecodeAV1DpbSlotInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **pStdReferenceInfo** is a pointer to a *StdVideoDecodeAV1ReferenceInfo* structure specifying AV1 reference information.

This structure is specified in the **pNext** chain of *VkVideoDecodeInfoKHR::*pSetupReferenceSlot, if not NULL, and the **pNext** chain of the elements of *VkVideoDecodeInfoKHR::*pReferenceSlots to specify the codec-specific reference picture information for an AV1 decode operation.

**Active Reference Picture Information**

When this structure is specified in the **pNext** chain of the elements of *VkVideoDecodeInfoKHR::*pReferenceSlots, one element is added to the list of active reference pictures used by the video decode operation for each element of *VkVideoDecodeInfoKHR::*pReferenceSlots as follows:

• The image subregion used is determined according to the AV1 Decode Picture Data Access section.

• The reference picture is associated with the DPB slot index specified in the **slotIndex** member of the corresponding element of *VkVideoDecodeInfoKHR::*pReferenceSlots.

• The reference picture is associated with the AV1 reference information provided in **pStdReferenceInfo**.

**Reconstructed Picture Information**

When this structure is specified in the **pNext** chain of *VkVideoDecodeInfoKHR::*pSetupReferenceSlot, the information related to the reconstructed picture is defined as follows:

• The image subregion used is determined according to the AV1 Decode Picture Data Access section.

• If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in *VkVideoDecodeInfoKHR::*pSetupReferenceSlot->slotIndex.

• The reconstructed picture is associated with the AV1 reference information provided in **pStdReferenceInfo**.

**Std Reference Information**

The members of the *StdVideoDecodeAV1ReferenceInfo* structure pointed to by **pStdReferenceInfo** are interpreted as follows:

• **flags.reserved** and **reserved1** are used only for padding purposes and are otherwise ignored;

• **flags.disable_frame_end_update_cdf** is interpreted as defined in section 6.8.2 of the AV1 Specification;

• **flags.segmentation_enabled** is interpreted as defined in section 6.8.13 of the AV1 Specification;

• **frame_type** is interpreted as defined in section 6.8.2 of the AV1 Specification;

---

*Note*
The `frame_type` member is defined with the type `uint8_t`, but it takes the same values defined in the `StdVideoAV1FrameType` enumeration type as `StdVideoDecodeAV1PictureInfo::frame_type`.

- `ReframeSignBias` is a bitmask where bit index `i` corresponds to `ReframeSignBias[i]` as defined in section 6.8.2 of the AV1 Specification;
- `OrderHint` is interpreted as defined in section 6.8.2 of the AV1 Specification;
- `SavedOrderHints` is interpreted as defined in section 7.20 of the AV1 Specification.

Note

When the AV1 reference information is provided for the reconstructed picture, certain parameters (e.g. `frame_type`) are specified both in the AV1 picture information and in the AV1 reference information. This is necessary because unlike the AV1 picture information, which is only used for the purposes of the video decode operation in question, the AV1 reference information specified for the reconstructed picture may be associated with the activated DPB slot, meaning that some implementations may maintain it as part of the reference picture metadata corresponding to the video picture resource associated with the DPB slot. When the AV1 reference information is provided for an active reference picture, the specified parameters correspond to the parameters specified when the DPB slot was activated (set up) with the reference picture, as usual, in order to communicate these parameters for implementations that do not maintain any subset of these parameters as part of the DPB slot's reference picture metadata.

**Valid Usage (Implicit)**

- `VUID-VkVideoDecodeAV1DpbSlotInfoKHR-sType-sType` must be `VK_STRUCTURE_TYPE_VIDEO_DECODE_AV1_DPB_SLOT_INFO_KHR`
- `VUID-VkVideoDecodeAV1DpbSlotInfoKHR-pStdReferenceInfo-parameter` `pStdReferenceInfo` must be a valid pointer to a valid `StdVideoDecodeAV1ReferenceInfo` value

### 42.14.8. AV1 Decode Requirements

This section describes the required AV1 decoding capabilities for physical devices that have at least one queue family that supports the video codec operation `VK_VIDEO_CODEC_OPERATION_DECODE_AV1_BIT_KHR`, as returned by `vkGetPhysicalDeviceQueueFamilyProperties2` in `VkQueueFamilyVideoPropertiesKHR::videoCodecOperations`.

**VkVideoDecodeAV1CapabilitiesKHR**

| maxLevel | STD_VIDEO_AV1_LEVEL_2_0 | min |

1

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.

### 42.15. Video Encode Operations

Video encode operations consume an **encode input picture** and zero or more reference pictures, and produce compressed video data to a video bitstream buffer and an optional **reconstructed picture**.

**Note**

Such encode input pictures can be used as the **output** of video decode operations, with graphics or compute operations, or with Window System Integration APIs, depending on the capabilities of the implementation.

Video encode operations **may** access the following resources in the VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR stage:

- The image subregions corresponding to the source **encode input picture** and **active reference pictures** with access VK_ACCESS_2_VIDEO_ENCODE_READ_BIT_KHR.
The destination video bitstream buffer range and the optional reconstructed picture with access VK_ACCESS_2_VIDEO_ENCODE_WRITE_BIT_KHR.

The image subresource of each video picture resource accessed by the video encode operation is specified using a corresponding VkVideoPictureResourceInfoKHR structure. Each such image subresource must be in the appropriate image layout as follows:

- If the image subresource is used in the video encode operation as an encode input picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR layout.
- If the image subresource is used in the video encode operation as a reconstructed picture or reference picture, then it must be in the VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR layout.

A video encode operation may complete unsuccessfully. In this case the target video bitstream buffer will have undefined contents. Similarly, if reference picture setup is requested, the reconstructed-picture will also have undefined contents, and the activated DPB slot will have an invalid picture reference.

If a video encode operation completes successfully and the codec-specific parameters provided by the application adhere to the syntactic and semantic requirements defined in the corresponding video compression standard, then the target video bitstream buffer will contain compressed video data after the execution of the video encode operation according to the respective codec-specific semantics.

### 42.15.1. Codec-Specific Semantics

The following aspects of video encode operations are codec-specific:

- The compressed video data written to the target video bitstream buffer range.
- The construction and interpretation of the list of active reference pictures and the interpretation of the picture data referred to by the corresponding image subregions.
- The construction and interpretation of information related to the encode input picture and the interpretation of the picture data referred to by the corresponding image subregion.
- The decision on reference picture setup.
- The construction and interpretation of information related to the optional reconstructed picture and the generation of picture data to the corresponding image subregion.
- Certain aspects of rate control.

These codec-specific behaviors are defined for each video codec operation separately.

- If the used video codec operation is VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the codec-specific aspects of the video encoding process are performed as defined in the H.264 Encode Operations section.
- If the used video codec operation is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the codec-specific aspects of the video encoding process are performed as defined in the H.265 Encode Operations section.
Video Encode Parameter Overrides

Implementations supporting video encode operations for any particular video codec operation often support only a subset of the available encoding tools defined by the corresponding video compression standards. Accordingly, certain implementation-dependent limitations may apply to codec-specific parameters provided through the structures defined in the Video Std headers corresponding to the used video codec operation.

Exposing all of these restrictions on particular codec-specific parameter values or combinations thereof in the form of application-queryable capabilities is impractical, hence this specification allows implementations to override the value of any of the codec-specific parameters, unless otherwise specified, as long as all of the following conditions are met:

- If the application-provided codec-specific parameters adhere to the syntactic and semantic requirements and rules defined by the used video compression standard, and thus would be usable to produce a video bitstream compliant with that standard, then the codec-specific parameters resulting from the process of implementation overrides must also adhere to the same requirements and rules, and any video bitstream produced using the overridden parameters must also be compliant.

- The overridden codec-specific parameter values must not have an impact on the codec-independent behaviors defined for video encode operations.

- The implementation must not override any codec-specific parameters specified to a command that may cause application-provided codec-specific parameters specified to subsequent commands to no longer adhere to the semantic requirements and rules defined by the used video compression standard, unless the implementation also overrides those parameters to adhere to any such requirements and rules.

- The overridden codec-specific parameter values must not have an impact on the codec-specific picture data access semantics.

- The overridden codec-specific parameter values may change the contents of the codec-specific bitstream elements produced by video encode operations or otherwise retrieved by the application (e.g. using the vkGetEncodedVideoSessionParametersKHR command) but must still adhere to the codec-specific semantics defined for that video codec operation, including, but not limited to, the number, type, and order of the encoded codec-specific bitstream elements.

Besides codec-specific parameter overrides performed for implementation-dependent reasons, applications can enable the implementation to apply additional optimizing overrides that may improve the efficiency or performance of video encoding operations. However, implementations must meet the conditions listed above even in case of such optimizing overrides.

**Note**

Unless the application opts in for optimizing overrides, implementations are not expected to override any of the codec-specific parameters, except when such overrides are necessary for the correct operation of video encoder implementation due to limitations to the available encoding tools on that implementation.
42.15.2. Video Encode Operation Steps

Each video encode operation performs the following steps in the `VK_PIPELINE_STAGE_2_VIDEO_ENCODE_BIT_KHR` stage:

1. Reads the input picture data from the `encode input picture`;
2. Determine derived encoding quality parameters according to the `codec-specific semantics` and the current `rate control` state;
3. Compresses the input picture data according to the `codec-specific semantics`, applying any prediction data read from the `active reference pictures` and rate control restrictions in the process;
4. Writes the encoded bitstream data to the destination video bitstream buffer range;
5. Performs picture reconstruction of the encoded video data according to the `codec-specific semantics`, applying any prediction data read from the `active reference pictures` in the process, if a `reconstructed picture` is specified and `reference picture setup` is requested;
6. If `reference picture setup` is requested, the `DPB slot index` specified in the `reconstructed picture information` is activated with the `reconstructed picture`;
7. Writes the reconstructed picture data to the `reconstructed picture`, if one is specified, according to the `codec-specific semantics`.

When `reconstructed picture information` is provided, the specified `DPB slot index` is associated with the corresponding `bound reference picture resource`, indifferent of whether `reference picture setup` is requested.

42.15.3. Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` with `pVideoProfile->videoCodecOperation` specifying an encode operation, the `VkVideoEncodeCapabilitiesKHR` structure must be included in the `pNext` chain of the `VkVideoCapabilitiesKHR` structure to retrieve capabilities specific to video encoding.

The `VkVideoEncodeCapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeCapabilitiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeCapabilityFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagsKHR rateControlModes;
    uint32_t maxRateControlLayers;
    uint64_t maxBitrate;
    uint32_t maxQualityLevels;
    VkExtent2D encodeInputPictureGranularity;
    VkVideoEncodeFeedbackFlagsKHR supportedEncodeFeedbackFlags;
} VkVideoEncodeCapabilitiesKHR;
```
- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkVideoEncodeCapabilityFlagBitsKHR` describing supported encoding features.
- **rateControlModes** is a bitmask of `VkVideoEncodeRateControlModeFlagBitsKHR` indicating supported rate control modes.
- **maxRateControlLayers** indicates the maximum number of rate control layers supported.
- **maxBitrate** indicates the maximum supported bitrate.
- **maxQualityLevels** indicates the number of discrete video encode quality levels supported. Implementations **must** support at least one quality level.
- **encodeInputPictureGranularity** indicates the granularity at which encode input picture data is encoded and **may** indicate a texel granularity up to the size of the codec-specific coding block size. This capability does not impose any valid usage constraints on the application, however, depending on the contents of the encode input picture, it **may** have effects on the encoded bitstream, as described in more detail below.
- **supportedEncodeFeedbackFlags** is a bitmask of `VkVideoEncodeFeedbackFlagBitsKHR` values specifying the supported flags for video encode feedback queries.

Implementations **must** include support for at least `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BUFFER_OFFSET_BIT_KHR` and `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_BYTES_WRITTEN_BIT_KHR` in `supportedEncodeFeedbackFlags`.

- **Note**

  For example, the application requests the coded extent to be 1920x1080, but the implementation is only able to source the encode input picture data at the granularity of the codec-specific coding block size which is 16x16 pixels (or as otherwise indicated in `encodeInputPictureGranularity`). In this example, the content is horizontally aligned with the coding block size, but not vertically aligned with it. Thus encoding of the last row of coding blocks will be impacted by the contents of the input image at texel rows 1080 to 1087 (the latter being the next row which is vertically aligned with the coding block size, assuming a zero-based texel row index).

  If `codedExtent` rounded up to the next integer multiple of `encodeInputPictureGranularity` is greater than the extent of the image subresource specified for the encode input picture, then the texel values corresponding to texel coordinates outside of the bounds of the image subresource **may** be undefined. However, implementations **should** use well-defined default values for such texels in order to maximize the encoding efficiency for the last coding block row/column, and/or to ensure consistent encoding results across repeated encoding of the same input content. Nonetheless, the
values used for such texels must not have an effect on whether the video encode operation produces a compliant bitstream, and must not have any other effects on the encoded picture data beyond what may otherwise result from using these texel values as input to any compression algorithm, as defined in the used video compression standard.

Note
While not required, it is generally a good practice for applications to make sure that the image subresource used for the encode input picture has an extent that is an integer multiple of the codec-specific coding block size (or at least encodeInputPictureGranularity) and that this padding area is filled with known values in order to improve encoding efficiency, portability, and reproducibility.

Valid Usage (Implicit)

- VUID-VkVideoEncodeCapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_CAPABILITIES_KHR

Bits which may be set in VkVideoEncodeCapabilitiesKHR::flags, indicating the encoding tools supported, are:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeCapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR = 0x00000002,
} VkVideoEncodeCapabilityFlagBitsKHR;
```

- VK_VIDEO_ENCODE_CAPABILITY_PRECEDING_EXTERNALLY_ENCODED_BYTES_BIT_KHR indicates that the implementation supports the use of VkVideoEncodeInfoKHR::precedingExternallyEncodedBytes.
- VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR indicates that the implementation is able to detect and report when the destination video bitstream buffer range provided by the application is not sufficiently large to fit the encoded bitstream data produced by a video encode operation by reporting the VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR query result status code.

Note
Some implementations may not be able to reliably detect insufficient bitstream buffer range conditions in all situations. Such implementations will not report support for the VK_VIDEO_ENCODE_CAPABILITY_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_DETECTION_BIT_KHR encode capability flag for the video profile, but may still report the VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR query result status code in certain cases. Applications should always check for the specific query result status code.
VK_QUERY_RESULT_STATUS_INSUFFICIENT_BITSTREAM_BUFFER_RANGE_KHR even when this encode capability flag is not supported by the implementation for the video profile in question. However, applications must not assume that a different negative query result status code indicating an unsuccessful completion of a video encode operation is not the result of an insufficient bitstream buffer condition unless this encode capability flag is supported.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeCapabilityFlagsKHR;
```

VkVideoEncodeCapabilityFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeCapabilityFlagBitsKHR.

### 42.15.4. Video Encode Quality Levels

Implementations can support more than one video encode quality levels for a video encode profile, which control the number and type of implementation-specific encoding tools and algorithms utilized in the encoding process.

**Note**

Generally, using higher video encode quality levels may produce higher quality video streams at the cost of additional processing time. However, as the final quality of an encoded picture depends on the contents of the encode input picture, the contents of the active reference pictures, the codec-specific encode parameters, and the particular implementation-specific tools used corresponding to the individual video encode quality levels, there are no guarantees that using a higher video encode quality level will always produce a higher quality encoded picture for any given set of inputs.

To query properties for a specific video encode quality level supported by a video encode profile, call:

```c
// Provided by VK_KHR_video_encode_queue
VkResult vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR* pQualityLevelInfo,
    VkVideoEncodeQualityLevelPropertiesKHR* pQualityLevelProperties);
```

- **physicalDevice** is the physical device to query the video encode quality level properties for.
- **pQualityLevelInfo** is a pointer to a VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR structure specifying the video encode profile and quality level to query properties for.
- **pQualityLevelProperties** is a pointer to a VkVideoEncodeQualityLevelPropertiesKHR structure in which the properties are returned.
Valid Usage

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-08257
  If `pQualityLevelInfo->pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pQualityLevelProperties` must include a `VkVideoEncodeH264QualityLevelPropertiesKHR` structure.

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-08258
  If `pQualityLevelInfo->pVideoProfile->videoCodecOperation` is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of `pQualityLevelProperties` must include a `VkVideoEncodeH265QualityLevelPropertiesKHR` structure.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle.

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelInfo-parameter
  `pQualityLevelInfo` must be a valid pointer to a valid `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure.

- VUID-vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR-pQualityLevelProperties-parameter
  `pQualityLevelProperties` must be a valid pointer to a `VkVideoEncodeQualityLevelPropertiesKHR` structure.

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_FORMAT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PICTURE_LAYOUT_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_CODEC_NOT_SUPPORTED_KHR
The `VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const VkVideoProfileInfoKHR* pVideoProfile;
    uint32_t qualityLevel;
} VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pVideoProfile` is a pointer to a `VkVideoProfileInfoKHR` structure specifying the video profile to query the video encode quality level properties for.
- `qualityLevel` is the video encode quality level to query properties for.

### Valid Usage

- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-08259**
  - `pVideoProfile` must be a supported video profile
- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-08260**
  - `pVideoProfile->videoCodecOperation` must specify an encode operation
- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-qualityLevel-08261**
  - `qualityLevel` must be less than `VkVideoEncodeCapabilitiesKHR::maxQualityLevels`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile specified in `pVideoProfile`

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`
- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pNext-pNext**
  - `pNext` must be `NULL`
- **VUID-VkPhysicalDeviceVideoEncodeQualityLevelInfoKHR-pVideoProfile-parameter**
  - `pVideoProfile` must be a valid pointer to a valid `VkVideoProfileInfoKHR` structure

The `VkVideoEncodeQualityLevelPropertiesKHR` structure is defined as:
// Provided by VK_KHR_video_encode_queue

typedef struct VkVideoEncodeQualityLevelPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeRateControlModeFlagBitsKHR preferredRateControlMode;
    uint32_t preferredRateControlLayerCount;
} VkVideoEncodeQualityLevelPropertiesKHR;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **preferredRateControlMode** is a **VkVideoEncodeRateControlModeFlagBitsKHR** value indicating the preferred rate control mode to use with the video encode quality level.
• **preferredRateControlLayerCount** indicates the preferred number of rate control layers to use with the video encode quality level.

**Valid Usage (Implicit)**

• VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_PROPERTIES_KHR**
• VUID-VkVideoEncodeQualityLevelPropertiesKHR-pNext-pNext
  Each **pNext** member of any structure (including this one) in the **pNext** chain must be either **NULL** or a pointer to a valid instance of **VkVideoEncodeH264QualityLevelPropertiesKHR** or **VkVideoEncodeH265QualityLevelPropertiesKHR**
• VUID-VkVideoEncodeQualityLevelPropertiesKHR-sType-unique
  The **sType** value of each struct in the **pNext** chain must be unique

The **VkVideoEncodeQualityLevelInfoKHR** structure is defined as:

// Provided by VK_KHR_video_encode_queue

typedef struct VkVideoEncodeQualityLevelInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t qualityLevel;
} VkVideoEncodeQualityLevelInfoKHR;

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **qualityLevel** is the used video encode quality level.

This structure can be specified in the following places:

• In the **pNext** chain of **VkVideoSessionParametersCreateInfoKHR** to specify the video encode quality level to use for a video session parameters object created for a video encode session. If
no instance of this structure is included in the `pNext` chain of `VkVideoSessionParametersCreateInfoKHR`, then the video session parameters object is created with a video encode quality level of zero.

- In the `pNext` chain of `VkVideoCodingControlInfoKHR` to change the video encode quality level state of the bound video session.

### Valid Usage

- VUID-VkVideoEncodeQualityLevelInfoKHR-qualityLevel-08311
  
  `qualityLevel` **must** be less than `VkVideoEncodeCapabilitiesKHR::maxQualityLevels`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeQualityLevelInfoKHR-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_QUALITY_LEVEL_INFO_KHR`.

### 42.15.5. Retrieving Encoded Session Parameters

Any codec-specific parameters stored in video session parameters objects **may** need to be separately encoded and included in the final video bitstream data, depending on the used video compression standard. In such cases the application **must** call the `vkGetEncodedVideoSessionParametersKHR` command to retrieve the encoded parameter data from the used video session parameters object in order to be able to produce a compliant video bitstream.

**Note**

This is needed because implementations **may** have changed some of the codec-specific parameters stored in the video session parameters object, as defined in the Video Encode Parameter Overrides section. In addition, the `vkGetEncodedVideoSessionParametersKHR` command enables the application to retrieve the encoded parameter data without having to encode these codec-specific parameters manually.

Encoded parameter data **can** be retrieved from a video session parameters object created with a video encode operation using the command:

```c
// Provided by VK_KHR_video_encode_queue
VkResult vkGetEncodedVideoSessionParametersKHR(
    VkDevice device,
    const VkVideoEncodeSessionParametersGetInfoKHR* pVideoSessionParametersInfo,
    VkVideoEncodeSessionParametersFeedbackInfoKHR* pFeedbackInfo,
    size_t* pDataSize,
    void* pData);
```
• **device** is the logical device that owns the video session parameters object.

• **pVideoSessionParametersInfo** is a pointer to a `VkVideoEncodeSessionParametersGetInfoKHR` structure specifying the parameters of the encoded parameter data to retrieve.

• **pFeedbackInfo** is either `NULL` or a pointer to a `VkVideoEncodeSessionParametersFeedbackInfoKHR` structure in which feedback about the requested parameter data is returned.

• **pDataSize** is a pointer to a `size_t` value related to the amount of encode parameter data returned, as described below.

• **pData** is either `NULL` or a pointer to a buffer to write the encoded parameter data to.

If **pData** is `NULL`, then the size of the encoded parameter data, in bytes, that can be retrieved is returned in **pDataSize**. Otherwise, **pDataSize** must point to a variable set by the application to the size of the buffer, in bytes, pointed to by **pData**, and on return the variable is overwritten with the number of bytes actually written to **pData**. If **pDataSize** is less than the size of the encoded parameter data that can be retrieved, then no data will be written to **pData**, zero will be written to **pDataSize**, and **VK_INCOMPLETE** will be returned instead of **VK_SUCCESS**, to indicate that no encoded parameter data was returned.

If **pFeedbackInfo** is not `NULL` then the members of the `VkVideoEncodeSessionParametersFeedbackInfoKHR` structure and any additional structures included in its **pNext** chain that are applicable to the video session parameters object specified in **pVideoSessionParametersInfo->videoSessionParameters** will be filled with feedback about the requested parameter data on all successful calls to this command.

**Note**
This includes the cases when **pData** is `NULL` or when **VK_INCOMPLETE** is returned by the command, and enables the application to determine whether the implementation overrode any of the requested video session parameters without actually needing to retrieve the encoded parameter data itself.

### Valid Usage

- **VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08359**
  `pVideoSessionParametersInfo->videoSessionParameters` must have been created with an encode operation

- **VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08262**
  If **pVideoSessionParametersInfo->videoSessionParameters** was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the **pNext** chain of **pVideoSessionParametersInfo** must include a `VkVideoEncodeH264SessionParametersGetInfoKHR` structure

- **VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08263**
  If **pVideoSessionParametersInfo->videoSessionParameters** was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then for the `VkVideoEncodeH264SessionParametersGetInfoKHR` structure included in the **pNext** chain of **pVideoSessionParametersInfo**, if its **writeStdSPS** member is **VK_TRUE**, then
pVideoSessionParametersInfo->videoSessionParameters must contain a StdVideoH264SequenceParameterSet entry with seq_parameter_set_id matching VkVideoEncodeH264SessionParametersGetInfoKHR::stdSPSId

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08264
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then for the VkVideoEncodeH264SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdPPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters must contain a StdVideoH264PictureParameterSet entry with seq_parameter_set_id and pic_parameter_set_id matching VkVideoEncodeH264SessionParametersGetInfoKHR::stdSPSId and VkVideoEncodeH264SessionParametersGetInfoKHR::stdPPSId, respectively

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08265
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the pNext chain of pVideoSessionParametersInfo must include a VkVideoEncodeH265SessionParametersGetInfoKHR structure

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08266
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdVPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters must contain a StdVideoH265VideoParameterSet entry with vps_video_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08267
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdSPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters must contain a StdVideoH265SequenceParameterSet entry with sps_video_parameter_set_id and sps_seq_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId and VkVideoEncodeH265SessionParametersGetInfoKHR::stdSPSId, respectively

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-08268
  If pVideoSessionParametersInfo->videoSessionParameters was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then for the VkVideoEncodeH265SessionParametersGetInfoKHR structure included in the pNext chain of pVideoSessionParametersInfo, if its writeStdPPS member is VK_TRUE, then pVideoSessionParametersInfo->videoSessionParameters must contain a StdVideoH265PictureParameterSet entry with sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id matching VkVideoEncodeH265SessionParametersGetInfoKHR::stdVPSId, VkVideoEncodeH265SessionParametersGetInfoKHR::stdSPSId, and VkVideoEncodeH265SessionParametersGetInfoKHR::stdPPSId, respectively
Valid Usage (Implicit)

- VUID-vkGetEncodedVideoSessionParametersKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetEncodedVideoSessionParametersKHR-pVideoSessionParametersInfo-parameter
pVideoSessionParametersInfo must be a valid pointer to a valid VkVideoEncodeSessionParametersGetInfoKHR structure

- VUID-vkGetEncodedVideoSessionParametersKHR-pFeedbackInfo-parameter
If pFeedbackInfo is not NULL, pFeedbackInfo must be a valid pointer to a VkVideoEncodeSessionParametersFeedbackInfoKHR structure

- VUID-vkGetEncodedVideoSessionParametersKHR-pDataSize-parameter
pDataSize must be a valid pointer to a size_t value

- VUID-vkGetEncodedVideoSessionParametersKHR-pData-parameter
If the value referenced by pDataSize is not 0, and pData is not NULL, pData must be a valid pointer to an array of pDataSize bytes

Return Codes

Success
- VK_SUCCESS
- VK_INCOMPLETE

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkVideoEncodeSessionParametersGetInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersGetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeSessionParametersKHR videoSessionParameters;
} VkVideoEncodeSessionParametersGetInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- videoSessionParameters is the VkVideoEncodeSessionParametersKHR object to retrieve encoded parameter data from.

Depending on the used video encode operation, additional codec-specific structures may need to be
included in the `pNext` chain of this structure to identify the specific video session parameters to retrieve encoded parameter data for, as described in the corresponding sections.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_GET_INFO_KHR`.

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264SessionParametersGetInfoKHR` or `VkVideoEncodeH265SessionParametersGetInfoKHR`.

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkVideoEncodeSessionParametersGetInfoKHR-videoSessionParameters-parameter**
  
  The `videoSessionParameters` must be a valid `VkVideoSessionParametersKHR` handle.

The `VkVideoEncodeSessionParametersFeedbackInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeSessionParametersFeedbackInfoKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasOverrides;
} VkVideoEncodeSessionParametersFeedbackInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **hasOverrides** indicates whether any of the requested parameter data were overridden by the implementation.

Depending on the used video encode operation, additional codec-specific structures can be included in the `pNext` chain of this structure to capture codec-specific feedback information about the requested parameter data, as described in the corresponding sections.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_SESSION_PARAMETERS_FEEDBACK_INFO_KHR`.

- **VUID-VkVideoEncodeSessionParametersFeedbackInfoKHR-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkVideoEncodeH264SessionParametersFeedbackInfoKHR` or `VkVideoEncodeH265SessionParametersFeedbackInfoKHR`. 
42.15.6. Video Encode Commands

To launch video encode operations, call:

```c
// Provided by VK_KHR_video_encode_queue
data type void vkCmdEncodeVideoKHR(
  VkCommandBuffer commandBuffer,
  const VkVideoEncodeInfoKHR* pEncodeInfo);
```

- `commandBuffer` is the command buffer in which to record the command.
- `pEncodeInfo` is a pointer to a `VkVideoEncodeInfoKHR` structure specifying the parameters of the video encode operations.

Each call issues one or more video encode operations. The implicit parameter `opCount` corresponds to the number of video encode operations issued by the command. After calling this command, the active query index of each active query is incremented by `opCount`.

Currently each call to this command results in the issue of a single video encode operation.

If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR` and the `pNext` chain of `pEncodeInfo` includes a `VkVideoInlineQueryInfoKHR` structure with its `queryPool` member specifying a valid `VkQueryPool` handle, then this command will execute a query for each video encode operation issued by it.

**Active Reference Picture Information**

The list of active reference pictures used by a video encode operation is a list of image subregions used as the source of reference picture data and related parameters, and is derived from the `VkVideoReferenceSlotInfoKHR` structures provided as the elements of the `pEncodeInfo->pReferenceSlots` array. For each element of `pEncodeInfo->pReferenceSlots`, one or more elements are added to the active reference picture list, as defined by the codec-specific semantics. Each element of this list contains the following information:

- The image subregion within the image subresource referred to by the video picture resource used as the reference picture.
- The DPB slot index the reference picture is associated with.
- The codec-specific reference information related to the reference picture.

**Reconstructed Picture Information**

Information related to the optional reconstructed picture used by a video encode operation is derived from the `VkVideoReferenceSlotInfoKHR` structure pointed to by `pEncodeInfo->pSetupReferenceSlot`, if not `NULL`, as defined by the codec-specific semantics, and consists of the following:
• The image subregion within the image subresource referred to by the video picture resource used as the reconstructed picture.

• The DPB slot index to use for picture reconstruction.

• The codec-specific reference information related to the reconstructed picture.

Specifying a valid VkVideoReferenceSlotInfoKHR structure in pEncodeInfo->pSetupReferenceSlot is always required, unless the video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlot equal to zero. However, the DPB slot identified by pEncodeInfo->pSetupReferenceSlot->slotIndex is only activated with the reconstructed picture specified in pEncodeInfo->pSetupReferenceSlot->pPictureResource if reference picture setup is requested according to the codec-specific semantics.

If reconstructed picture information is specified, but reference picture setup is not requested, according to the codec-specific semantics, the contents of the video picture resource corresponding to the reconstructed picture will be undefined after the video encode operation.

**Note**

Some implementations may always output the reconstructed picture or use it as temporary storage during the video encode operation even when the reconstructed picture is not marked for future reference.

**Encode Input Picture Information**

Information related to the encode input picture used by a video encode operation is derived from pEncodeInfo->srcPictureResource and any codec-specific parameters provided in the pEncodeInfo->pNext chain, as defined by the codec-specific semantics, and consists of the following:

• The image subregion within the image subresource referred to by the video picture resource used as the encode input picture.

• The codec-specific picture information related to the encoded picture.

Several limiting values are defined below that are referenced by the relevant valid usage statements of this command.

• Let uint32_t activeReferencePictureCount be the size of the list of active reference pictures used by the video encode operation. Unless otherwise defined, activeReferencePictureCount is set to the value of pEncodeInfo->referenceSlotCount.

• Let VkOffset2D codedOffsetGranularity be the minimum alignment requirement for the coded offset of video picture resources. Unless otherwise defined, the value of the x and y members of codedOffsetGranularity are 0.

• Let uint32_t dpbFrameUseCount[] be an array of size maxDpbSlots, where maxDpbSlots is the VkVideoSessionCreateInfoKHR::maxDpbSlots the bound video session was created with, with each element indicating the number of times a frame associated with the corresponding DPB slot index is referred to by the video coding operation. Let the initial value of each element of the array be 0.

  ◦ If pEncodeInfo->pSetupReferenceSlot is not NULL, then dpbFrameUseCount[i] is incremented by
one, where $i$ equals \( p\text{EncodeInfo->pSetupReferenceSlot->slotIndex} \).

- For each element of \( p\text{EncodeInfo->pReferenceSlots} \), \( dpb\text{FrameUseCount}[i] \) is incremented by one, where $i$ equals the \( \text{slotIndex} \) member of the corresponding element.

- Let \( \text{VkExtent2D maxCodingBlockSize} \) be the maximum codec-specific coding block size that \textbf{may} be used by the video encode operation.
  
  - If the bound video session object was created with an \textbf{H.264} encode profile, then let \( \text{maxCodingBlockSize} \) be equal to the size of an H.264 macroblock, i.e. \{16,16\}.
  
  - If the bound video session object was created with an \textbf{H.265} encode profile, then let \( \text{maxCodingBlockSize} \) be equal to the maximum H.265 coding block size that \textbf{may} be used by the video encode operation derived as the maximum of the CTB sizes corresponding to the \( \text{VkVideoEncodeH265CtbSizeFlagBitsKHR} \) bits set in \( \text{VkVideoEncodeH265CapabilitiesKHR::ctbSizes} \), as returned by \( \text{vkGetPhysicalDeviceVideoCapabilitiesKHR} \) for the video profile the bound video session was created with.
  
  - Otherwise, \( \text{maxCodingBlockSize} \) is undefined.

- If \( \text{maxCodingBlockSize} \) is defined, then let \( \text{VkExtent2D minCodingBlockExtent} \) be the coded extent of the \textbf{encode input picture} expressed in terms of codec-specific coding blocks, assuming the maximum size of such coding blocks, as defined by \( \text{maxCodingBlockSize} \), calculated from the value of the \( \text{codedExtent} \) member of \( p\text{EncodeInfo->srcPictureResource} \) as follows:
  
  - \( \text{minCodingBlockExtent.width} = (\text{codedExtent.width} - 1)/\text{maxCodingBlockSize.width} \)
  
  - \( \text{minCodingBlockExtent.height} = (\text{codedExtent.height} - 1)/\text{maxCodingBlockSize.height} \)

- If the bound video session object was created with an \textbf{H.264} encode profile, then:
  
  - Let \( \text{StdVideoH264PictureType h264PictureType} \) be the picture type of the encoded picture set to the value of \( p\text{StdPictureInfo->primary_pic_type} \) specified in the \( \text{VkVideoEncodeH264PictureInfoKHR} \) structure included in the \( p\text{EncodeInfo->pNext} \) chain.
  
  - Let \( \text{StdVideoH264PictureType h264L0PictureTypes[]} \) and \( \text{StdVideoH264PictureType h264L1PictureTypes[]} \) be the picture types of the reference pictures in the L0 and L1 reference lists, respectively. If \( p\text{StdPictureInfo->pRefLists} \) specified in the \( \text{VkVideoEncodeH264PictureInfoKHR} \) structure included in the \( p\text{EncodeInfo->pNext} \) chain is not \textbf{NULL}, then for each reference index specified in the elements of the \( p\text{StdPictureInfo->pRefLists->RefPicList0} \) and \( p\text{StdPictureInfo->pRefLists->RefPicList1} \) arrays, if the reference index is not \textbf{STD_VIDEO_H264_NO_REFERENCE_PICTURE}, \( p\text{StdReferenceInfo->primary_pic_type} \) is added to \( h264L0PictureTypes[] \) or \( h264L1PictureTypes[] \), respectively, where \( p\text{StdReferenceInfo} \) is the member of the \( \text{VkVideoEncodeH264DpbSlotInfoKHR} \) structure included in the \( p\text{next} \) chain of the element of \( p\text{EncodeInfo->pReferenceSlots} \) for which \( \text{slotIndex} \) equals the reference index in question.

- If the bound video session object was created with an \textbf{H.265} encode profile, then:
  
  - Let \( \text{StdVideoH265PictureType h265PictureType} \) be the picture type of the encoded picture set to the value of \( p\text{StdPictureInfo->pic_type} \) specified in the \( \text{VkVideoEncodeH265PictureInfoKHR} \) structure included in the \( p\text{EncodeInfo->pNext} \) chain.
  
  - Let \( \text{StdVideoH265PictureType h265L0PictureTypes[]} \) and \( \text{StdVideoH265PictureType h265L1PictureTypes[]} \) be the picture types of the reference pictures in the L0 and L1 reference lists, respectively. If \( p\text{StdPictureInfo->pRefLists} \) specified in the \( \text{VkVideoEncodeH265PictureInfoKHR} \) structure included in the \( p\text{EncodeInfo->pNext} \) chain is not \textbf{NULL}, then for each reference index specified in the elements of the \( p\text{StdPictureInfo->pRefLists->RefPicList0} \) and \( p\text{StdPictureInfo->pRefLists->RefPicList1} \) arrays, if the reference index is not \textbf{STD_VIDEO_H265_NO_REFERENCE_PICTURE}, \( p\text{StdReferenceInfo->primary_pic_type} \) is added to \( h265L0PictureTypes[] \) or \( h265L1PictureTypes[] \), respectively, where \( p\text{StdReferenceInfo} \) is the member of the \( \text{VkVideoEncodeH265DpbSlotInfoKHR} \) structure included in the \( p\text{next} \) chain of the element of \( p\text{EncodeInfo->pReferenceSlots} \) for which \( \text{slotIndex} \) equals the reference index in question.
**Valid Usage**

- **VUID-vkCmdEncodeVideoKHR-None-08250**
  The bound video session must have been created with an encode operation.

- **VUID-vkCmdEncodeVideoKHR-None-07012**
  The bound video session must not be in uninitialized state at the time the command is executed on the device.

- **VUID-vkCmdEncodeVideoKHR-None-08318**
  The bound video session parameters object must have been created with the currently set video encode quality level for the bound video session at the time the command is executed on the device.

- **VUID-vkCmdEncodeVideoKHR-opCount-07174**
  For each active query, the active query index corresponding to the query type of that query plus opCount must be less than or equal to the last activatable query index corresponding to the query type of that query plus one.

- **VUID-vkCmdEncodeVideoKHR-pNext-08360**
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the pNext chain of pEncodeInfo includes a VkVideoInlineQueryInfoKHR structure with its queryPool member specifying a valid VkQueryPool handle, then VkVideoInlineQueryInfoKHR::queryCount must equal opCount.

- **VUID-vkCmdEncodeVideoKHR-pNext-08361**
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, and the pNext chain of pEncodeInfo includes a VkVideoInlineQueryInfoKHR structure with its queryPool member specifying a valid VkQueryPool handle, then all the queries used by the command, as specified by the VkVideoInlineQueryInfoKHR structure, must be unavailable.

- **VUID-vkCmdEncodeVideoKHR-queryType-08362**
  If the bound video session was created with VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR, then the queryType used to create the queryPool specified in the VkVideoInlineQueryInfoKHR structure included in the pNext chain of pEncodeInfo must be VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR or VK_QUERY_TYPE_VIDEO_ENCODE_FEEDBACK_KHR.

- **VUID-vkCmdEncodeVideoKHR-queryPool-08363**

h265L1PictureTypes[] be the picture types of the reference pictures in the L0 and L1 reference lists, respectively. If pStdPictureInfo->pRefLists specified in the VkVideoEncodeH265PictureInfoKHR structure included in the pEncodeInfo->pNext chain is not NULL, then for each reference index specified in the elements of the pStdPictureInfo->pRefLists->RefPicList0 and pStdPictureInfo->pRefLists->RefPicList1 arrays, if the reference index is not STD_VIDEO_H265_NO_REFERENCE_PICTURE, pStdReferenceInfo->pic_type is added to h265L0PictureTypes or h265L1PictureTypes, respectively, where pStdReferenceInfo is the member of the VkVideoEncodeH265DpbSlotInfoKHR structure included in the pNext chain of the element of pEncodeInfo->pReferenceSlots for which slotIndex equals the reference index in question.
If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, then the queryPool specified in the `VkVideoInlineQueryInfoKHR` structure included in the `pNext` chain of `pEncodeInfo` must have been created with a `VkVideoProfileInfoKHR` structure included in the `pNext` chain of `VkQueryPoolCreateInfo` identical to the one specified in `VkVideoSessionCreateInfoKHR` `::pVideoProfile` the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-queryType-08364**
  If the bound video session was created with `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`, and the `queryType` used to create the `queryPool` specified in the `VkVideoInlineQueryInfoKHR` structure included in the `pNext` chain of `pEncodeInfo` is `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, then the `VkCommandPool` that `commandBuffer` was allocated from must have been created with a queue family index that supports result status queries, as indicated by `VkQueueFamilyQueryResultStatusPropertiesKHR` `::queryResultStatusSupport`.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08201**
  `pEncodeInfo->dstBuffer` must be compatible with the video profile the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-commandBuffer-08202**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, then `pEncodeInfo->dstBuffer` must not be a protected buffer.

- **VUID-vkCmdEncodeVideoKHR-commandBuffer-08203**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, then `pEncodeInfo->dstBuffer` must be a protected buffer.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08204**
  `pEncodeInfo->dstBufferOffset` must be an integer multiple of `VkVideoCapabilitiesKHR` `::minBitstreamBufferOffsetAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08205**
  `pEncodeInfo->dstBufferRange` must be an integer multiple of `VkVideoCapabilitiesKHR` `::minBitstreamBufferSizeAlignment`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08206**
  `pEncodeInfo->srcPictureResource.imageViewBinding` must be compatible with the video profile the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08207**
  The format of `pEncodeInfo->srcPictureResource.imageViewBinding` must match the `VkVideoSessionCreateInfoKHR` `::pictureFormat` the bound video session was created with.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08208**
  `pEncodeInfo->srcPictureResource.codedOffset` must be an integer multiple of `codedOffsetGranularity`.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08209**
  `pEncodeInfo->srcPictureResource.codedExtent` must be between `minCodedExtent` and
maxCodedExtent, inclusive, the bound video session was created with

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08210
  pEncodeInfo->srcPictureResource.imageViewBinding must have been created with VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR

- VUID-vkCmdEncodeVideoKHR-commandBuffer-08211
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, then pEncodeInfo->srcPictureResource.imageViewBinding must not have been created from a protected image

- VUID-vkCmdEncodeVideoKHR-commandBuffer-08212
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, then pEncodeInfo->srcPictureResource.imageViewBinding must have been created from a protected image

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08377
  pEncodeInfo->pSetupReferenceSlot must not be NULL unless the bound video session was created with VkVideoSessionCreateInfoKHR::maxDpbSlots equal to zero

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08213
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->slotIndex must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08214
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->pPictureResource->codedOffset must be an integer multiple of codedOffsetGranularity

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08215
  If pEncodeInfo->pSetupReferenceSlot is not NULL, then pEncodeInfo->pSetupReferenceSlot->pPictureResource must match one of the bound reference picture resource

- VUID-vkCmdEncodeVideoKHR-activeReferencePictureCount-08216
  activeReferencePictureCount must be less than or equal to the VkVideoSessionCreateInfoKHR::maxActiveReferencePictures specified when the bound video session was created

- VUID-vkCmdEncodeVideoKHR-slotIndex-08217
  The slotIndex member of each element of pEncodeInfo->pReferenceSlots must be less than the VkVideoSessionCreateInfoKHR::maxDpbSlots specified when the bound video session was created

- VUID-vkCmdEncodeVideoKHR-codedOffset-08218
  The codedOffset member of the VkVideoPictureResourceInfoKHR structure pointed to by the pPictureResource member of each element of pEncodeInfo->pReferenceSlots must be an integer multiple of codedOffsetGranularity

- VUID-vkCmdEncodeVideoKHR-pPictureResource-08219
  The pPictureResource member of each element of pEncodeInfo->pReferenceSlots must match one of the bound reference picture resource associated with the DPB slot index specified in the slotIndex member of that element

- VUID-vkCmdEncodeVideoKHR-pPictureResource-08220
  Each video picture resource corresponding to the pPictureResource member specified in
the elements of `pEncodeInfo->pReferenceSlots` must be unique within `pEncodeInfo->pReferenceSlots`.

- **VUID-vkCmdEncodeVideoKHR-dpbFrameUseCount-08221**
  All elements of `dpbFrameUseCount` must be less than or equal to 1.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08222**
  The image subresource referred to by `pEncodeInfo->srcPictureResource` must be in the `VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR` layout at the time the video encode operation is executed on the device.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08223**
  If `pEncodeInfo->pSetupReferenceSlot` is not `NULL`, then the image subresource referred to by `pEncodeInfo->pSetupReferenceSlot->pPictureResource` must be in the `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` layout at the time the video encode operation is executed on the device.

- **VUID-vkCmdEncodeVideoKHR-pPictureResource-08224**
  The image subresource referred to by the `pPictureResource` member of each element of `pEncodeInfo->pReferenceSlots` must be in the `VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR` layout at the time the video encode operation is executed on the device.

- **VUID-vkCmdEncodeVideoKHR-pNext-08225**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of `pEncodeInfo` must include a `VkVideoEncodeH264PictureInfoKHR` structure.

- **VUID-vkCmdEncodeVideoKHR-StdVideoH264SequenceParameterSet-08226**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264SequenceParameterSet` entry with `seq_parameter_set_id` matching `StdVideoEncodeH264PictureInfo::seq_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoEncodeH264PictureInfoKHR` structure included in the `pNext` chain of `pEncodeInfo`.

- **VUID-vkCmdEncodeVideoKHR-StdVideoH264PictureParameterSet-08227**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH264PictureParameterSet` entry with `seq_parameter_set_id` and `pic_parameter_set_id` matching `StdVideoEncodeH264PictureInfo::seq_parameter_set_id` and `StdVideoEncodeH264PictureInfo::pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoEncodeH264PictureInfoKHR` structure included in the `pNext` chain of `pEncodeInfo`.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08228**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and `pEncodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pEncodeInfo->pSetupReferenceSlot` must include a `VkVideoEncodeH264DpbSlotInfoKHR` structure.

- **VUID-vkCmdEncodeVideoKHR-pNext-08229**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then the `pNext` chain of each element of `pEncodeInfo->pReferenceSlots` must be unique within `pEncodeInfo->pReferenceSlots`.
pEncodeInfo->pReferenceSlots must include a VkVideoEncodeH264DpbSlotInfoKHR structure

- VUID-vkCmdEncodeVideoKHR-constantQp-08269
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the current rate control mode is not VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp must be zero for each element of the pNaluSliceEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-constantQp-08270
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and the current rate control mode is VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp must be between VkVideoEncodeH264CapabilitiesKHR::minQp and VkVideoEncodeH264CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, for each element of the pNaluSliceEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-constantQp-08271
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then VkVideoEncodeH264NaluSliceInfoKHR::constantQp must have the same value for each element of the pNaluSliceEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

- VUID-vkCmdEncodeVideoKHR-naluSliceEntryCount-08302
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, then the naluSliceEntryCount member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo must be less than or equal to minCodingBlockExtent.width multiplied by minCodingBlockExtent.height

- VUID-vkCmdEncodeVideoKHR-naluSliceEntryCount-08312
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and VkVideoEncodeH264CapabilitiesKHR::flags does not include VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then the naluSliceEntryCount member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo must be less than or equal to minCodingBlockExtent.height

- VUID-vkCmdEncodeVideoKHR-pNext-08352
  If the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the pNext chain of pEncodeInfo includes a VkVideoEncodeH264PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, the `pNext` chain of `pEncodeInfo` includes a `VkVideoEncodeH264PictureInfoKHR` structure, and `VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists` is not NULL, then each element of the `RefPicList0` and `RefPicList1` array members of the `StdVideoEncodeH264ReferenceListsInfo` structure pointed to by `VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists` must either be `STD_VIDEO_H264_NO_REFERENCE_PICTURE` or must equal the `slotIndex` member of one of the elements of `pEncodeInfo->pReferenceSlots`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, the `pNext` chain of `pEncodeInfo` includes a `VkVideoEncodeH264PictureInfoKHR` structure, and `pEncodeInfo->referenceSlotCount` is greater than zero, then the `slotIndex` member of each element of `pEncodeInfo->pReferenceSlots` must equal one of the elements of the `RefPicList0` or `RefPicList1` array members of the `StdVideoEncodeH264ReferenceListsInfo` structure pointed to by `VkVideoEncodeH264PictureInfoKHR::pStdPictureInfo->pRefLists`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and `VkVideoEncodeH264CapabilitiesKHR::maxPPictureL0ReferenceCount` is zero, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then `h264PictureType` and each element of `h264L0PictureTypes` and `h264L1PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_P`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and `VkVideoEncodeH264CapabilitiesKHR::maxBPictureL0ReferenceCount` and `VkVideoEncodeH264CapabilitiesKHR::maxL1ReferenceCount` are both zero, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then `h264PictureType` and each element of `h264L0PictureTypes` and `h264L1PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_B`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and `VkVideoEncodeH264CapabilitiesKHR::flags` does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then each element of `h264L0PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_B`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` and `VkVideoEncodeH264CapabilitiesKHR::flags` does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then each element of `h264L1PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_B`.
returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then each element of `h264L1PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_B`.

- **VUID-vkCmdEncodeVideoKHR-pNext-08230**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of `pEncodeInfo` must include a `VkVideoEncodeH265PictureInfoKHR` structure.

- **VUID-vkCmdEncodeVideoKHR-StdVideoH265VideoParameterSet-08231**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH265VideoParameterSet` entry with `vps_video_parameter_set_id` matching `StdVideoH265PictureInfo::sps_video_parameter_set_id` that is provided in the `pStdPictureInfo` member of the `VkVideoEncodeH265PictureInfoKHR` structure included in the `pNext` chain of `pEncodeInfo`.

- **VUID-vkCmdEncodeVideoKHR-StdVideoH265SequenceParameterSet-08232**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH265SequenceParameterSet` entry with `sps_video_parameter_set_id` and `sps_seq_parameter_set_id` matching `StdVideoH265PictureInfo::sps_video_parameter_set_id` and `StdVideoH265PictureInfo::pps_seq_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoEncodeH265PictureInfoKHR` structure included in the `pNext` chain of `pEncodeInfo`.

- **VUID-vkCmdEncodeVideoKHR-StdVideoH265PictureParameterSet-08233**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the bound video session parameters object must contain a `StdVideoH265PictureParameterSet` entry with `sps_video_parameter_set_id`, `pps_seq_parameter_set_id`, and `pps_pic_parameter_set_id` matching `StdVideoH265PictureInfo::sps_video_parameter_set_id`, `StdVideoH265PictureInfo::pps_seq_parameter_set_id`, and `StdVideoH265PictureInfo::pps_pic_parameter_set_id`, respectively, that are provided in the `pStdPictureInfo` member of the `VkVideoEncodeH265PictureInfoKHR` structure included in the `pNext` chain of `pEncodeInfo`.

- **VUID-vkCmdEncodeVideoKHR-pEncodeInfo-08234**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `pEncodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pEncodeInfo->pSetupReferenceSlot` must include a `VkVideoEncodeH265DpbSlotInfoKHR` structure.

- **VUID-vkCmdEncodeVideoKHR-pNext-08235**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then the `pNext` chain of each element of `pEncodeInfo->pReferenceSlots` must include a `VkVideoEncodeH265DpbSlotInfoKHR` structure.

- **VUID-vkCmdEncodeVideoKHR-constantQp-08272**
  If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `pEncodeInfo->pSetupReferenceSlot` is not `NULL`, then the `pNext` chain of `pEncodeInfo->pSetupReferenceSlot` must include a `VkVideoEncodeH265DpbSlotInfoKHR` structure.
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the current rate control mode is not
VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then

VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp must be zero for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo

• VUID-vkCmdEncodeVideoKHR-constantQp-08273
  If the bound video session was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and the current rate control mode is
  VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR, then
  VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp must be between
  VkVideoEncodeH265CapabilitiesKHR::minQp and VkVideoEncodeH265CapabilitiesKHR::maxQp, as returned by
  vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo

• VUID-vkCmdEncodeVideoKHR-constantQp-08274
  If the bound video session was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include
  VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR, as returned by
  vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then
  VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp must have the same value for each element of the pNaluSliceSegmentEntries member of the VkVideoEncodeH264PictureInfoKHR structure included in the pNext chain of pEncodeInfo

• VUID-vkCmdEncodeVideoKHR-naluSliceSegmentEntryCount-08307
  If the bound video session was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then the naluSliceSegmentEntryCount member of the
  VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo must be less than or equal to minCodingBlockExtent.width multiplied by minCodingBlockExtent.height

• VUID-vkCmdEncodeVideoKHR-naluSliceSegmentEntryCount-08313
  If the bound video session was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR and VkVideoEncodeH265CapabilitiesKHR::flags does not include
  VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR, as returned by
  vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile the bound video session was created with, then
  the naluSliceSegmentEntryCount member of the VkVideoEncodeH265PictureInfoKHR structure included in the pNext chain of pEncodeInfo must be less than or equal to minCodingBlockExtent.height

• VUID-vkCmdEncodeVideoKHR-pNext-08354
  If the bound video session was created with the video codec operation
  VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the pNext chain of pEncodeInfo includes a
  VkVideoEncodeH265PictureInfoKHR structure, and pEncodeInfo->referenceSlotCount is greater than zero, then
  VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists must not be NULL
If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, the `pNext` chain of `pEncodeInfo` includes a `VkVideoEncodeH265PictureInfoKHR` structure, and `VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists` is not NULL, then each element of the `RefPicList0` and `RefPicList1` array members of the `StdVideoEncodeH265ReferenceListsInfo` structure pointed to by `VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists` must either be `STD_VIDEO_H265_NO_REFERENCE_PICTURE` or must equal the `slotIndex` member of one of the elements of `pEncodeInfo->pReferenceSlots`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, the `pNext` chain of `pEncodeInfo` includes a `VkVideoEncodeH265PictureInfoKHR` structure, and `pEncodeInfo->referenceSlotCount` is greater than zero, then the `slotIndex` member of each element of `pEncodeInfo->pReferenceSlots` must equal one of the elements of the `RefPicList0` or `RefPicList1` array members of the `StdVideoEncodeH265ReferenceListsInfo` structure pointed to by `VkVideoEncodeH265PictureInfoKHR::pStdPictureInfo->pRefLists`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `VkVideoEncodeH265CapabilitiesKHR::maxPPictureL0ReferenceCount` is zero, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then `h265PictureType` and each element of `h265L0PictureTypes` and `h265L1PictureTypes` must not be `STD_VIDEO_H265_PICTURE_TYPE_P`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `VkVideoEncodeH265CapabilitiesKHR::maxBPictureL0ReferenceCount` and `VkVideoEncodeH265CapabilitiesKHR::maxL1ReferenceCount` are both zero, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then `h265PictureType` and each element of `h265L0PictureTypes` and `h265L1PictureTypes` must not be `STD_VIDEO_H265_PICTURE_TYPE_B`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `VkVideoEncodeH265CapabilitiesKHR::flags` does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then each element of `h265L0PictureTypes` must not be `STD_VIDEO_H264_PICTURE_TYPE_B`.

If the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR` and `VkVideoEncodeH265CapabilitiesKHR::flags` does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile the bound video session was created with, then each element of `h265L1PictureTypes` must not be `STD_VIDEO_H265_PICTURE_TYPE_B`.
Valid Usage (Implicit)

- VUID-vkCmdEncodeVideoKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEncodeVideoKHR-pEncodeInfo-parameter
  pEncodeInfo must be a valid pointer to a valid VkVideoEncodeInfoKHR structure

- VUID-vkCmdEncodeVideoKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEncodeVideoKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support encode operations

- VUID-vkCmdEncodeVideoKHR-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdEncodeVideoKHR-videocoding
  This command must only be called inside of a video coding scope

- VUID-vkCmdEncodeVideoKHR-bufferlevel
  commandBuffer must be a primary VkCommandBuffer

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkVideoEncodeInfoKHR structure is defined as:
typedef struct VkVideoEncodeInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeFlagsKHR flags;
    VkBuffer dstBuffer;
    VkDeviceSize dstBufferOffset;
    VkDeviceSize dstBufferRange;
    VkVideoPictureResourceInfoKHR srcPictureResource;
    const VkVideoReferenceSlotInfoKHR* pSetupReferenceSlot;
    uint32_t referenceSlotCount;
    const VkVideoReferenceSlotInfoKHR* pReferenceSlots;
    uint32_t precedingExternallyEncodedBytes;
} VkVideoEncodeInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **dstBuffer** is the destination video bitstream buffer to write the encoded bitstream to.
- **dstBufferOffset** is the starting offset in bytes from the start of **dstBuffer** to write the encoded bitstream to.
- **dstBufferRange** is the maximum bitstream size in bytes that can be written to **dstBuffer**, starting from **dstBufferOffset**.
- **srcPictureResource** is the video picture resource to use as the encode input picture.
- **pSetupReferenceSlot** is NULL or a pointer to a `VkVideoReferenceSlotInfoKHR` structure specifying the reconstructed picture information.
- **referenceSlotCount** is the number of elements in the **pReferenceSlots** array.
- **pReferenceSlots** is NULL or a pointer to an array of `VkVideoReferenceSlotInfoKHR` structures describing the DPB slots and corresponding reference picture resources to use in this video encode operation (the set of active reference pictures).
- **precedingExternallyEncodedBytes** is the number of bytes externally encoded by the application to the video bitstream and is used to update the internal state of the implementation's rate control algorithm to account for the bitrate budget consumed by these externally encoded bytes.

**Valid Usage**

- VUID-VkVideoEncodeInfoKHR-dstBuffer-08236
  dstBuffer must have been created with VK_BUFFER_USAGE_VIDEO_ENCODE_DST_BIT_KHR set
- VUID-VkVideoEncodeInfoKHR-dstBufferOffset-08237
  dstBufferOffset must be less than the size of dstBuffer
- VUID-VkVideoEncodeInfoKHR-dstBufferRange-08238
  dstBufferRange must be less than or equal to the size of dstBuffer minus dstBufferOffset
Valid Usage (Implicit)

- VUID-VkVideoEncodeInfoKHR-sType-sType
  
  *sType* must be *VK_STRUCTURE_TYPE_VIDEO_ENCODE_INFO_KHR*

- VUID-VkVideoEncodeInfoKHR-pNext-pNext
  
  Each *pNext* member of any structure (including this one) in the *pNext* chain must be either *NULL* or a pointer to a valid instance of *VkVideoEncodeH264PictureInfoKHR*, *VkVideoEncodeH265PictureInfoKHR*, or *VkVideoInlineQueryInfoKHR*

- VUID-VkVideoEncodeInfoKHR-sType-unique
  
  The *sType* value of each struct in the *pNext* chain must be unique

- VUID-VkVideoEncodeInfoKHR-flags-zerobitmask
  
  *flags* must be 0

- VUID-VkVideoEncodeInfoKHR-dstBuffer-parameter
  
  *dstBuffer* must be a valid *VkBuffer* handle

- VUID-VkVideoEncodeInfoKHR-srcPictureResource-parameter
  
  *srcPictureResource* must be a valid *VkVideoPictureResourceInfoKHR* structure

- VUID-VkVideoEncodeInfoKHR-pSetupReferenceSlot-parameter
  
  If *pSetupReferenceSlot* is not *NULL*, *pSetupReferenceSlot* must be a valid pointer to a valid *VkVideoReferenceSlotInfoKHR* structure

- VUID-VkVideoEncodeInfoKHR-pReferenceSlots-parameter
  
  If *referenceSlotCount* is not 0, *pReferenceSlots* must be a valid pointer to an array of *referenceSlotCount* valid *VkVideoReferenceSlotInfoKHR* structures

// Provided by VK_KHR_video_encode_queue

typedef VkFlags VkVideoEncodeFlagsKHR;

*VkVideoEncodeFlagsKHR* is a bitmask type for setting a mask, but is currently reserved for future use.

**42.16. Video Encode Rate Control**

The size of the encoded bitstream data produced by video encode operations is a function of the
following set of constraints:

- The capabilities of the compression algorithms defined and employed by the used video compression standard;
- Restrictions imposed by the selected video profile according to the rules defined by the used video compression standard;
- Further restrictions imposed by the capabilities supported by the implementation for the selected video profile;
- The image data in the encode input picture and the set of active reference pictures (as these affect the effectiveness of the compression algorithms employed by the video encode operations);
- The set of codec-specific and codec-independent encoding parameters provided by the application.

These also inherently define the set of decoder capabilities required for reconstructing and processing the picture data in the encoded bitstream.

Video coding uses bitrate as the quantitative metric associated with encoded bitstream data size which expresses the rate at which video bitstream data can be transferred or processed, measured in number of bits per second. This bitrate is both a function of the encoded bitstream data size of the encoded pictures as well as the frame rate used by the video sequence.

Rate control algorithms are used by video encode operations to enable adjusting encoding parameters to achieve a target bitrate, or otherwise directly or indirectly control the bitrate of the generated video bitstream data. These algorithms are usually not defined by the used video compression standard, although some video compression standards do provide non-normative guidelines for implementations.

Accordingly, this specification does not mandate implementations to produce identical encoded bitstream data outputs in response to video encode operations, however, it does define a set of codec-independent and codec-specific parameters that enable the application to control the behavior of the rate control algorithms supported by the implementation. Some of these parameters guarantee certain implementation behavior while others provide guidance for implementations to apply various rate control heuristics.

Note

Applications need to make sure that they configure rate control parameters appropriately and that they follow the promises made to the implementation through parameters providing guidance for the implementation's rate control algorithms and heuristics in order to be able to get the desired rate control behavior and to be able to hit the set bitrate targets. In addition, the behavior of rate control may also differ across implementations even if the capabilities of the used video profile match between those implementations. This may happen due to implementations applying different rate control algorithms or heuristics internally, and thus even the same set of guidance parameter values may have different effects on the rate control behavior across implementations.
42.16.1. Rate Control Modes

After a video session is reset to the initial state, the default behavior and parameters of video encode rate control are entirely implementation-dependent and the application cannot affect the bitrate or quality parameters of the encoded bitstream data produced by video encode operations unless the application changes the rate control configuration of the video session, as described in the Video Coding Control section.

For each supported video profile, the implementation may expose a set of rate control modes that are available for use by the application when encoding bitstreams targeting that video profile. These modes allow using different rate control algorithms that fall into one of the following two categories:

1. Per-operation rate control
2. Stream-level rate control

In case of per-operation rate control, the bitrate of the generated video bitstream data is indirectly controlled by quality, size, or other encoding parameters specified by the application for each individual video encode operation.

In case of stream-level rate control, the application can directly specify target bitrates besides other encoding parameters to control the behavior of the rate control algorithm used by the implementation across multiple video encode operations.

The rate control modes are defined with the following enums:

```c
// Provided by VK_KHR_video_encode_queue
typedef enum VkVideoEncodeRateControlModeFlagBitsKHR {
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR = 0,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR = 0x00000004,
} VkVideoEncodeRateControlModeFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR** specifies the use of implementation-specific rate control.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR** specifies that rate control is disabled and the application will specify per-operation rate control parameters controlling the encoding quality. In this mode implementations will encode pictures independently of the output bitrate of prior video encode operations.
  - When using an H.264 encode profile, implementations will use the QP value specified in `VkVideoEncodeH264NaluSliceInfoKHR::constantQp` to control the quality of the encoded picture.
  - When using an H.265 encode profile, implementations will use the QP value specified in `VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp` to control the quality of the encoded picture.
- **VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR** specifies the use of constant bitrate (CBR) rate...
control mode. In this mode the implementation will attempt to produce the encoded bitstream at a constant bitrate while conforming to the constraints of other rate control parameters.

- `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR` specifies the use of variable bitrate (VBR) rate control mode. In this mode the implementation will produce the encoded bitstream at a variable bitrate according to the constraints of other rate control parameters.

```c
// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlModeFlagsKHR;
```

`VkVideoEncodeRateControlModeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeRateControlModeFlagBitsKHR`.

### 42.16.2. Leaky Bucket Model

Video encoding implementations use the *leaky bucket model* for stream-level rate control. The leaky bucket is a concept referring to the interface between the video encoder and the consumer (for example, a network connection), where the video encoder produces encoded bitstream data corresponding to the encoded pictures and adds them in the leaky bucket while its content are drained by the consumer.

Analogously, a similar leaky bucket is considered to exist at the input interface of a video decoder, into which encoded bitstream data is continuously added and is subsequently consumed by the video decoder. It is desirable to avoid overflowing or underflowing this leaky bucket because:

- In case of an underflow, the video decoder will be unable to consume encoded bitstream data in order to decode pictures (and optionally display them).
- In case of an overflow, the leaky bucket will be unable to accommodate more encoded bitstream data and such data may need to be thrown away, leading to the loss of the corresponding encoded pictures.

These requirements can be satisfied by imposing various constraints on the encoder-side leaky bucket to avoid its overflow or underflow, depending on the used rate control algorithm and codec parameters. However, enumerating these constraints is outside the scope of this specification.

The term *virtual buffer* is often used as an alternative to refer to the leaky bucket.

This virtual buffer model is defined by the following parameters:

- The bitrate ($R$) at which the encoded bitstream is expected to be processed.
- The size ($B$) of the virtual buffer.
- The initial occupancy ($F$) of the virtual buffer.

In this model the virtual buffer is used to smooth out fluctuations in the bitrate of the encoded bitstream over time without experiencing buffer overflow or underflow, as long as the bitrate of the encoded stream does not diverge from the target bitrate for extended periods of time.

This buffering may inherently impose a processing delay, as the goal of the model is to enable
decoders maintain a consistent processing rate of an encoded bitstream with varying data rate.

The initial or start-up delay \( D \) is computed as:

\[
D = \frac{F}{R}
\]

**Note**
Applications need to configure the virtual buffer with sufficient size to avoid or minimize buffer overflows and underflows while also keeping it small enough to meet their latency goals.

### 42.16.3. Rate Control Layers

Some video compression standards and video profiles allow associating encoded pictures with specific video coding layers. The name, identification, and semantics associated with such video coding layers are defined by the corresponding video compression standards.

Analogously, stream-level rate control can be configured to use one or more rate control layers:

- When a single rate control layer is configured, it is applied to all encoded pictures, regardless of the picture’s video coding layer. In this case the distribution of the available bitrate budget across video coding layers is implementation-dependent.
- When multiple rate control layers are configured, each rate control layer is applied to the corresponding video coding layer, i.e. only across encoded pictures pertaining to the corresponding video coding layer.

Individual rate control layers are identified using layer indices between zero and \( N-1 \), where \( N \) is the number of active rate control layers.

Rate control layers are only applicable when using stream-level rate control modes.

### 42.16.4. Rate Control State

Rate control state is maintained by the implementation in the video session objects and its parameters are specified using an instance of the \( \text{VkVideoEncodeRateControlInfoKHR} \) structure. The complete rate control state of a video session is defined by the following set of parameters:

- The values of the members of the \( \text{VkVideoEncodeRateControlInfoKHR} \) structure used to configure the rate control state.
- The values of the members of any \( \text{VkVideoEncodeRateControlLayerInfoKHR} \) structures specified in \( \text{VkVideoEncodeRateControlInfoKHR}::\text{pLayers} \) used to configure the state of individual rate control layers.
- If the video session was created with an H.264 encode profile:
  - The values of the members of the \( \text{VkVideoEncodeH264RateControlInfoKHR} \) structure, if one is specified in the \( \text{pNext} \) chain of the \( \text{VkVideoEncodeRateControlInfoKHR} \) used to configure the rate control state.
The values of the members of any `VkVideoEncodeH264RateControlLayerInfoKHR` structures included in the `pNext` chain of a `VkVideoEncodeRateControlLayerInfoKHR` structure used to configure the state of a rate control layer.

- If the video session was created with an H.265 encode profile:
  - The values of the members of the `VkVideoEncodeH265RateControlInfoKHR` structure, if one is specified in the `pNext` chain of the `VkVideoEncodeRateControlInfoKHR` used to configure the rate control state.
  - The values of the members of any `VkVideoEncodeH265RateControlLayerInfoKHR` structures included in the `pNext` chain of a `VkVideoEncodeRateControlLayerInfoKHR` structure used to configure the state of a rate control layer.

Two rate control states match if all the parameters listed above match between them.

The `VkVideoEncodeRateControlInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeRateControlFlagsKHR flags;
    VkVideoEncodeRateControlModeFlagBitsKHR rateControlMode;
    uint32_t layerCount;
    const VkVideoEncodeRateControlLayerInfoKHR* pLayers;
    uint32_t virtualBufferSizeInMs;
    uint32_t initialVirtualBufferSizeInMs;
} VkVideoEncodeRateControlInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `rateControlMode` is a `VkVideoEncodeRateControlModeFlagBitsKHR` value specifying the rate control mode.
- `layerCount` specifies the number of rate control layers to use.
- `pLayers` is a pointer to an array of `layerCount` `VkVideoEncodeRateControlLayerInfoKHR` structures, each specifying the rate control configuration of the corresponding rate control layer.
- `virtualBufferSizeInMs` is the size in milliseconds of the virtual buffer used by the implementation’s rate control algorithm for the leaky bucket model, with respect to the average bitrate of the stream calculated by summing the values of the `averageBitrate` members of the elements of the `pLayers` array.
- `initialVirtualBufferSizeInMs` is the initial occupancy in milliseconds of the virtual buffer used by the implementation’s rate control algorithm for the leaky bucket model.

If `layerCount` is zero then the values of `virtualBufferSizeInMs` and `initialVirtualBufferSizeInMs` are
This structure can be specified in the following places:

- In the `pNext` chain of `VkVideoBeginCodingInfoKHR` to specify the current rate control state expected to be configured when beginning a video coding scope.
- In the `pNext` chain of `VkVideoCodingControlInfoKHR` to change the rate control configuration of the bound video session.

Including this structure in the `pNext` chain of `VkVideoCodingControlInfoKHR` and including `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR` in `VkVideoCodingControlInfoKHR::flags` enables updating the rate control configuration of the bound video session. This replaces the entire rate control configuration of the bound video session and may reset the state of all enabled rate control layers to an initial state according to the codec-specific rate control semantics defined in the corresponding sections listed below.

When `layerCount` is greater than one, multiple rate control layers are configured, and each rate control layer is applied to the corresponding video coding layer identified by the index of the corresponding element of `pLayer`.

- If the video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, then this index specifies the H.264 temporal layer ID of the video coding layer the rate control layer is applied to.
- If the video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, then this index specifies the H.265 temporal ID of the video coding layer the rate control layer is applied to.

Additional structures providing codec-specific rate control parameters can be included in the `pNext` chain of `VkVideoCodingControlInfoKHR` depending on the video profile the bound video session was created. For further details see:

- Video Coding Control
- H.264 Encode Rate Control
- H.265 Encode Rate Control

The new rate control configuration takes effect when the corresponding `vkCmdControlVideoCodingKHR` is executed on the device, and only impacts video encode operations that follow in execution order.

**Valid Usage**

- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08248
  If `rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`, then `layerCount` must be 0
- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-08275
  If `rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR` or `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR`, then `layerCount` must be greater than 0
If `rateControlMode` is **not** `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DEFAULT_KHR`, then it **must** specify one of the bits included in `VkVideoEncodeCapabilitiesKHR::rateControlModes`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

The `layerCount` member **must** be less than or equal to `VkVideoEncodeCapabilitiesKHR::maxRateControlLayers`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

For each element of `pLayers`, its `averageBitrate` member **must** be between 1 and `VkVideoEncodeCapabilitiesKHR::maxBitrate`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

For each element of `pLayers`, its `maxBitrate` member **must** be between 1 and `VkVideoEncodeCapabilitiesKHR::maxBitrate`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

If `rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_CBR_BIT_KHR`, then for each element of `pLayers`, its `averageBitrate` member **must** equal its `maxBitrate` member.

If `rateControlMode` is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_VBR_BIT_KHR`, then for each element of `pLayers`, its `averageBitrate` member **must** be less than or equal to its `maxBitrate` member.

If `layerCount` is not zero, then `virtualBufferSizeInMs` **must** be greater than zero.

If `layerCount` is not zero, then `initialVirtualBufferSizeInMs` **must** be less than `virtualBufferSizeInMs`.

If the `videoCodecOperation` of the used video profile is `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, the `pNext` chain this structure is included in also includes an instance of the `VkVideoEncodeH264RateControlInfoKHR` structure, and `layerCount` is greater than 1, then `layerCount` **must** equal `VkVideoEncodeH264RateControlInfoKHR::temporalLayerCount`.

If the `videoCodecOperation` of the used video profile is `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, the `pNext` chain this structure is included in also includes an instance of the `VkVideoEncodeH265RateControlInfoKHR` structure, and `layerCount` is greater than 1, then `layerCount` **must** equal `VkVideoEncodeH265RateControlInfoKHR::subLayerCount`. 
Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_INFO_KHR

- VUID-VkVideoEncodeRateControlInfoKHR-flags-zero bitmask
  flags must be 0

- VUID-VkVideoEncodeRateControlInfoKHR-rateControlMode-parameter
  If rateControlMode is not 0, rateControlMode must be a valid
  VkVideoEncodeRateControlModeFlagBitsKHR value

- VUID-VkVideoEncodeRateControlInfoKHR-pLayers-parameter
  If layerCount is not 0, pLayers must be a valid pointer to an array of layerCount valid
  VkVideoEncodeRateControlLayerInfoKHR structures

// Provided by VK_KHR_video_encode_queue
typedef VkFlags VkVideoEncodeRateControlFlagsKHR;

VkVideoEncodeRateControlFlagsKHR is a bitmask type for setting a mask, but currently reserved for
future use.

Rate Control Layer State

The configuration of individual rate control layers is specified using an instance of the
VkVideoEncodeRateControlLayerInfoKHR structure.

The VkVideoEncodeRateControlLayerInfoKHR structure is defined as:

// Provided by VK_KHR_video_encode_queue
typedef struct VkVideoEncodeRateControlLayerInfoKHR {
  VkStructureType sType;
  const void* pNext;
  uint64_t averageBitrate;
  uint64_t maxBitrate;
  uint32_t frameRateNumerator;
  uint32_t frameRateDenominator;
} VkVideoEncodeRateControlLayerInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is a pointer to a structure extending this structure.
- averageBitrate is the average bitrate to be targeted by the implementation’s rate control
  algorithm.
- maxBitrate is the peak bitrate to be targeted by the implementation’s rate control algorithm.
- frameRateNumerator is the numerator of the frame rate assumed by the implementation’s rate
  control algorithm.
frameRateDenominator is the denominator of the frame rate assumed by the implementation’s rate control algorithm.

Note
The ability of the implementation’s rate control algorithm to be able to match the requested average and/or peak bitrates may be limited by the set of other codec-independent and codec-specific rate control parameters specified by the application, the input content, as well as the application conforming to the rate control guidance provided to the implementation, as described earlier.

Additional structures providing codec-specific rate control parameters can be included in the pNext chain of VkVideoEncodeRateControlLayerInfoKHR depending on the video profile the bound video session was created with. For further details see:

- Video Coding Control
- H.264 Encode Rate Control
- H.265 Encode Rate Control

Valid Usage

- VUID-VkVideoEncodeRateControlLayerInfoKHR-frameRateNumerator-08350
  frameRateNumerator must be greater than zero
- VUID-VkVideoEncodeRateControlLayerInfoKHR-frameRateDenominator-08351
  frameRateDenominator must be greater than zero

Valid Usage (Implicit)

- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_RATE_CONTROL_LAYER_INFO_KHR
- VUID-VkVideoEncodeRateControlLayerInfoKHR-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkVideoEncodeH264RateControlLayerInfoKHR or VkVideoEncodeH265RateControlLayerInfoKHR
- VUID-VkVideoEncodeRateControlLayerInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

42.17. H.264 Encode Operations

Video encode operations using an H.264 encode profile can be used to encode elementary video stream sequences compliant to the ITU-T H.264 Specification.

Note
Refer to the Preamble for information on how the Khronos Intellectual Property
Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the video encode operation steps with the codec-specific semantics defined in section 8 of the ITU-T H.264 Specification as follows:

• Syntax elements, derived values, and other parameters are applied from the following structures:
  ◦ The StdVideoH264SequenceParameterSet structure corresponding to the active SPS specifying the H.264 sequence parameter set.
  ◦ The StdVideoH264PictureParameterSet structure corresponding to the active PPS specifying the H.264 picture parameter set.
  ◦ The StdVideoEncodeH264PictureInfo structure specifying the H.264 picture information.
  ◦ The StdVideoEncodeH264SliceHeader structures specifying the H.264 slice header parameters for each encoded H.264 slice.
  ◦ The StdVideoEncodeH264ReferenceInfo structures specifying the H.264 reference information corresponding to the optional reconstructed picture and any active reference pictures.

• The encoded bitstream data is written to the destination video bitstream buffer range as defined in the H.264 Encode Bitstream Data Access section.

• Picture data in the video picture resources corresponding to the used encode input picture, active reference pictures, and optional reconstructed picture is accessed as defined in the H.264 Encode Picture Data Access section.

• The decision on reference picture setup is made according to the parameters specified in the H.264 picture information.

If the parameters adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.264 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video encode operation will complete successfully. Otherwise, the video encode operation may complete unsuccessfully.

### 42.17.1. H.264 Encode Parameter Overrides

Implementations may override, unless otherwise specified, any of the H.264 encode parameters specified in the following Video Std structures:

• StdVideoH264SequenceParameterSet
• StdVideoH264PictureParameterSet
• StdVideoEncodeH264PictureInfo
• StdVideoEncodeH264SliceHeader
• StdVideoEncodeH264ReferenceInfo

All such H.264 encode parameter overrides must fulfill the conditions defined in the Video Encode Parameter Overrides section.
In addition, implementations must not override any of the following H.264 encode parameters:

- `StdVideoEncodeH264PictureInfo::primary_pic_type`
- `StdVideoEncodeH264SliceHeader::slice_type`

In case of H.264 encode parameters stored in video session parameters objects, applications need to use the `vkGetEncodedVideoSessionParametersKHR` command to determine whether any implementation overrides happened. If the query indicates that implementation overrides were applied, then the application needs to retrieve and use the encoded H.264 parameter sets in the bitstream in order to be able to produce a compliant H.264 video bitstream using the H.264 encode parameters stored in the video session parameters object.

In case of any H.264 encode parameters stored in the encoded bitstream produced by video encode operations, if the implementation supports the `VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR` video encode feedback query flag, the application can use such queries to retrieve feedback about whether any implementation overrides have been applied to those H.264 encode parameters.

### 42.17.2. H.264 Encode Bitstream Data Access

Each video encode operation writes one or more VCL NAL units comprising of slice headers and data of the encoded picture, in the format defined in sections 7.3.3 and 7.3.4, according to the semantics defined in sections 7.4.3 and 7.4.4 of the ITU-T H.264 Specification, respectively. The number of VCL NAL units written is specified by `VkVideoEncodeH264PictureInfoKHR::naluSliceEntryCount`.

In addition, if `VkVideoEncodeH264PictureInfoKHR::generatePrefixNalu` is set to `VK_TRUE` for the video encode operation, then an additional prefix NAL unit is written before each VCL NAL unit corresponding to individual slices in the format defined in section 7.3.2.12, according to the semantics defined in section 7.4.2.12 of the ITU-T H.264 Specification, respectively.

### 42.17.3. H.264 Encode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by `VkVideoCapabilitiesKHR::pictureAccessGranularity`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile. Accordingly, the complete image subregion of a encode input picture, reference picture, or reconstructed picture accessed by video coding operations using an H.264 encode profile is defined as the set of texels within the coordinate range:

\[(0, endX), (0, endY)\]

Where:

- `endX` equals `codedExtent.width` rounded up to the nearest integer multiple of `pictureAccessGranularity.width` and clamped to the width of the image subresource referred to by the corresponding `VkVideoPictureResourceInfoKHR` structure;
- `endY` equals `codedExtent.height` rounded up to the nearest integer multiple of
pictureAccessGranularity.height and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where codedExtent is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video encode operations using an H.264 encode profile, any access to a picture at the coordinates \((x,y)\), as defined by the ITU-T H.264 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates \((x,y)\).

Implementations may choose not to access some or all texels within particular reference pictures available to a video encode operation (e.g. due to video encode parameter overrides restricting the effective set of used reference pictures, or if the encoding algorithm chooses not to use certain subregions of the reference picture data for sample prediction).

42.17.4. H.264 Frame, Picture, and Slice

H.264 pictures are partitioned into slices, as defined in section 6.3 of the ITU-T H.264 Specification.

Video encode operations using an H.264 encode profile can encode slices of different types, as defined in section 7.4.3 of the ITU-T H.264 Specification, by specifying the corresponding enumeration constant value in StdVideoEncodeH264SliceHeader::slice_type in the H.264 slice header parameters from the Video Std enumeration type StdVideoH264SliceType:

- STD_VIDEO_H264_SLICE_TYPE_P indicates that the slice is a \(P\) slice as defined in section 3.109 of the ITU-T H.264 Specification.
- STD_VIDEO_H264_SLICE_TYPE_B indicates that the slice is a \(B\) slice as defined in section 3.9 of the ITU-T H.264 Specification.
- STD_VIDEO_H264_SLICE_TYPE_I indicates that the slice is an \(I\) slice as defined in section 3.66 of the ITU-T H.264 Specification.

Pictures constructed from such slices can be of different types, as defined in section 7.4.2.4 of the ITU-T H.264 Specification. Video encode operations using an H.264 encode profile can encode pictures of a specific type by specifying the corresponding enumeration constant value in StdVideoEncodeH264PictureInfo::primary_pic_type in the H.264 picture information from the Video Std enumeration type StdVideoH264PictureType:

- STD_VIDEO_H264_PICTURE_TYPE_P indicates that the picture is a \(P\) picture. A frame consisting of a \(P\) picture is also referred to as a \(P\) frame.
- STD_VIDEO_H264_PICTURE_TYPE_B indicates that the picture is a \(B\) picture. A frame consisting of a \(B\) picture is also referred to as a \(B\) frame.
- STD_VIDEO_H264_PICTURE_TYPE_I indicates that the picture is an \(I\) picture. A frame consisting of an \(I\) picture is also referred to as an \(I\) frame.
- STD_VIDEO_H264_PICTURE_TYPE_IDR indicates that the picture is a special type of \(I\) picture called an IDR picture as defined in section 3.69 of the ITU-T H.264 Specification. A frame consisting of an IDR picture is also referred to as an IDR frame.
42.17.5. H.264 Encode Profile

A video profile supporting H.264 video encode operations is specified by setting VkVideoProfileInfoKHR::videoCodecOperation to VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR and adding a VkVideoEncodeH264ProfileInfoKHR structure to the VkVideoProfileInfoKHR::pNext chain.

The VkVideoEncodeH264ProfileInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH264ProfileIdc stdProfileIdc;
} VkVideoEncodeH264ProfileInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **stdProfileIdc** is a StdVideoH264ProfileIdc value specifying the H.264 codec profile IDC, as defined in section A.2 of the ITU-T H.264 Specification.

### Valid Usage (Implicit)

- VUID-VkVideoEncodeH264ProfileInfoKHR-sType-sType
  - **sType** must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PROFILE_INFO_KHR

42.17.6. H.264 Encode Capabilities

When calling vkGetPhysicalDeviceVideoCapabilitiesKHR to query the capabilities for an H.264 encode profile, the VkVideoCapabilitiesKHR::pNext chain must include a VkVideoEncodeH264CapabilitiesKHR structure that will be filled with the profile-specific capabilities.

The VkVideoEncodeH264CapabilitiesKHR structure is defined as:
// Provided by VK_KHR_video_encode_h264

typedef struct VkVideoEncodeH264CapabilitiesKHR {
    VkStructureType sType;
    void*pNext;
    VkVideoEncodeH264CapabilityFlagsKHR flags;
    StdVideoH264LevelIdc maxLevelIdc;
    uint32_t maxSliceCount;
    uint32_t maxPPictureL0ReferenceCount;
    uint32_t maxBPictureL0ReferenceCount;
    uint32_t maxL1ReferenceCount;
    uint32_t maxTemporalLayerCount;
    VkBool32 expectDyadicTemporalLayerPattern;
    int32_t minQp;
    int32_t maxQp;
    VkBool32 prefersGopRemainingFrames;
    VkBool32 requiresGopRemainingFrames;
    VkVideoEncodeH264StdFlagsKHR stdSyntaxFlags;
} VkVideoEncodeH264CapabilitiesKHR;

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is a bitmask of VkVideoEncodeH264CapabilityFlagBitsKHR indicating supported H.264 encoding capabilities.

• maxLevelIdc is a StdVideoH264LevelIdc value indicating the maximum H.264 level supported by the profile, where enum constant STD_VIDEO_H264_LEVEL_IDC_<major>_<minor> identifies H.264 level <major>.<minor> as defined in section A.3 of the ITU-T H.264 Specification.

• maxSliceCount indicates the maximum number of slices that can be encoded for a single picture. Further restrictions may apply to the number of slices that can be encoded for a single picture depending on other capabilities and codec-specific rules.

• maxPPictureL0ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.

Note
As implementations may override the reference lists, maxPPictureL0ReferenceCount does not limit the number of elements that the application can specify in the L0 reference list for P pictures. However, if maxPPictureL0ReferenceCount is zero, then the use of P pictures is not allowed.

• maxBPictureL0ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures.

• maxL1ReferenceCount indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported.

Note
As implementations may override the reference lists,
maxBPictureL0ReferenceCount and maxL1ReferenceCount does not limit the number of elements that the application can specify in the L0 and L1 reference lists for B pictures. However, if maxBPictureL0ReferenceCount and maxL1ReferenceCount are both zero, then the use of B pictures is not allowed.

- **maxTemporalLayerCount** indicates the maximum number of H.264 temporal layers supported by the implementation.
- **expectDyadicTemporalLayerPattern** indicates that the implementation's rate control algorithms expect the application to use a dyadic temporal layer pattern when encoding multiple temporal layers.
- **minQp** indicates the minimum QP value supported.
- **maxQp** indicates the maximum QP value supported.
- **prefersGopRemainingFrames** indicates that the implementation's rate control algorithm prefers the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- **requiresGopRemainingFrames** indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type remaining in the current group of pictures when beginning a video coding scope.
- **stdSyntaxFlags** is a bitmask of VkVideoEncodeH264StdFlagBitsKHR indicating capabilities related to H.264 syntax elements.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264CapabilitiesKHR-sType-sType **sType** must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_CAPABILITIES_KHR

Bits which may be set in VkVideoEncodeH264CapabilitiesKHR::flags, indicating the H.264 encoding capabilities supported, are:

```c
// Provided by VK_KHR_video_encode_h264
typedef enum VkVideoEncodeH264CapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR = 0x00000080,
    VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR = 0x00000100,
} VkVideoEncodeH264CapabilityFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR** indicates whether the implementation
may be able to generate HRD compliant bitstreams if any of the
nal_hrd_parameters_present_flag or vcl_hrd_parameters_present_flag members of
StdVideoH264SpsVuiFlags are set to 1 in the active SPS.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR** indicates that if
StdVideoH264PpsFlags::weighted_pred_flag is set to 1 or StdVideoH264PictureParameterSet::weighted_bipred_idc is set to
STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT in the active PPS
when encoding a P picture or B picture, respectively, then the implementation is able
to internally decide syntax for pred_weight_table, as defined in section 7.4.3.2 of the ITU-T H.264
Specification, and the application is not required to provide a weight table in the 
H.264 slice header parameters.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_ROW_UNALIGNED_SLICE_BIT_KHR** indicates that each slice in a
frame with multiple slices may begin or finish at any offset in a macroblock row. If not
supported, all slices in the frame must begin at the start of a macroblock row (and hence each slice must finish at the end of a macroblock row).

• **VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR** indicates that when a frame is
encoded with multiple slices, the implementation allows encoding each slice with a different
StdVideoEncodeH264SliceHeader::slice_type specified in the 
H.264 slice header parameters. If not supported, all slices of the frame must be encoded with the same slice_type which corresponds
to the picture type of the frame.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR** indicates support for using a B
frame as L0 reference, as specified in
StdVideoEncodeH264ReferenceListsInfo::RefPicList0 in the
H.264 picture information.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR** indicates support for using a B
frame as L1 reference, as specified in
StdVideoEncodeH264ReferenceListsInfo::RefPicList1 in the
H.264 picture information.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR** indicates support for
specifying different QP values in the members of
VkVideoEncodeH264QpKHR.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_PER_SLICE_CONSTANT_QP_BIT_KHR** indicates support for
specifying different constant QP values for each slice.

• **VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR** indicates support for generating
prefix NAL units by setting
VkVideoEncodeH264PictureInfoKHR::generatePrefixNalu to VK_TRUE.

// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264CapabilityFlagsKHR;

VkVideoEncodeH264CapabilityFlagsKHR is a bitmask type for setting a mask of zero or more
VkVideoEncodeH264CapabilityFlagBitsKHR.

Bits which may be set in VkVideoEncodeH264CapabilitiesKHR::stdSyntaxFlags, indicating the
capabilities related to the H.264 syntax elements, are:
// Provided by VK_KHR_video_encode_h264

typedef enum VkVideoEncodeH264StdFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR = 0x00000001,

    VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_KHR = 0x00080000,
    VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR = 0x00100000,
} VkVideoEncodeH264StdFlagBitsKHR;

• VK_VIDEO_ENCODE_H264_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoH264SpsFlags::separate_colour_plane_flag in the SPS when that value is 1.

• VK_VIDEO_ENCODE_H264_STD_QPPRIME_Y_ZERO_TRANSFORM_BYPASS_FLAG_SET_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoH264SpsFlags::qpprime_y_zero_transform_bypass_flag in the SPS when that value is 1.

• VK_VIDEO_ENCODE_H264_STD_SCALING_MATRIX_PRESENT_FLAG_SET_BIT_KHR indicates whether the implementation supports using the application-provided values for StdVideoH264SpsFlags::seq_scaling_matrix_present_flag in the SPS and StdVideoH264PpsFlags::pic_scaling_matrix_present_flag in the PPS when any of those values are 1.

• VK_VIDEO_ENCODE_H264_STD_CHROMA_QP_INDEX_OFFSET_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::chroma_qp_index_offset in the PPS when that value is non-zero.

• VK_VIDEO_ENCODE_H264_STD_SECOND_CHROMA_QP_INDEX_OFFSET_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::second_chroma_qp_index_offset in the PPS when that value is non-zero.

• VK_VIDEO_ENCODE_H264_STD_PIC_INIT_QP_MINUS26_BIT_KHR indicates whether the implementation supports using the application-provided value for StdVideoH264PictureParameterSet::pic_init_qp_minus26 in the PPS when that value is non-zero.
• **VK_VIDEO_ENCODE_H264_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH264PpsFlags::weighted_pred_flag` in the PPS when that value is 1.

• **VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_EXPLICIT_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH264PictureParameterSet::weighted_bipred_idc` in the PPS when that value is `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT`.

• **VK_VIDEO_ENCODE_H264_STD_WEIGHTED_BIPRED_IDC_IMPLICIT_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH264PictureParameterSet::weighted_bipred_idc` in the PPS when that value is `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_IMPLICIT`.

• **VK_VIDEO_ENCODE_H264_STD_TRANSFORM_8X8_MODE_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH264PpsFlags::transform_8x8_mode_flag` in the PPS when that value is 1.

• **VK_VIDEO_ENCODE_H264_STD_DIRECT_SPATIAL_MV_PRED_FLAG_UNSET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeaderFlags::direct_spatial_mv_pred_flag` in the H.264 slice header parameters when that value is 0.

• **VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_DISABLED_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc` in the H.264 slice header parameters when that value is `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED`.

• **VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_ENABLED_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc` in the H.264 slice header parameters when that value is `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_ENABLED`.

• **VK_VIDEO_ENCODE_H264_STD_DEBLOCKING_FILTER_PARTIAL_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeader::disable_deblocking_filter_idc` in the H.264 slice header parameters when that value is `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_DISABLED`.

• **VK_VIDEO_ENCODE_H264_STD_DIRECT_8X8_INFERENCE_FLAG_UNSET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH264SpsFlags::direct_8x8_inference_flag` in the SPS when that value is 0.
parameters when that value is `STD_VIDEO_H264_DISABLE_DEBLOCKING_FILTER_IDC_PARTIAL`.

- **`VK_VIDEO_ENCODE_H264_STD_SLICE_QP_DELTA_BIT_KHR`** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeader::slice_qp_delta` in the H.264 slice header parameters when that value is identical across the slices of the encoded frame.

- **`VK_VIDEO_ENCODE_H264_STD_DIFFERENT_SLICE_QP_DELTA_BIT_KHR`** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH264SliceHeader::slice_qp_delta` in the H.264 slice header parameters when that value is different across the slices of the encoded frame.

These capability flags provide information to the application about specific H.264 syntax element values that the implementation supports without having to override them and do not otherwise restrict the values that the application can specify for any of the mentioned H.264 syntax elements.

```c
// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264StdFlagsKHR;
```

**VkVideoEncodeH264StdFlagsKHR** is a bitmask type for setting a mask of zero or more `VkVideoEncodeH264StdFlagBitsKHR`.

### 42.17.7. H.264 Encode Quality Level Properties

When calling `vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR` with `pVideoProfile->videoCodecOperation` specified as `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR`, the **VkVideoEncodeH264QualityLevelPropertiesKHR** structure must be included in the `pNext` chain of the **VkVideoEncodeQualityLevelPropertiesKHR** structure to retrieve additional video encode quality level properties specific to H.264 encoding.

The **VkVideoEncodeH264QualityLevelPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VKVideoEncodeH264QualityLevelPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH264RateControlFlagsKHR preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
    uint32_t preferredConsecutiveBFrameCount;
    uint32_t preferredTemporalLayerCount;
    VkVideoEncodeH264QpKHR preferredConstantQp;
    uint32_t preferredMaxL0ReferenceCount;
    uint32_t preferredMaxL1ReferenceCount;
    VkBool32 preferredStdEntropyCodingModeFlag;
} VkVideoEncodeH264QualityLevelPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `preferredRateControlFlags` is a bitmask of `VkVideoEncodeH264RateControlFlagBitsKHR` values indicating the preferred flags to use for `VkVideoEncodeH264RateControlInfoKHR::flags`.

• `preferredGopFrameCount` indicates the preferred value to use for `VkVideoEncodeH264RateControlInfoKHR::gopFrameCount`.

• `preferredIdrPeriod` indicates the preferred value to use for `VkVideoEncodeH264RateControlInfoKHR::idrPeriod`.

• `preferredConsecutiveBFramesCount` indicates the preferred value to use for `VkVideoEncodeH264RateControlInfoKHR::consecutiveBFramesCount`.

• `preferredTemporalLayerCount` indicates the preferred value to use for `VkVideoEncodeH264RateControlInfoKHR::temporalLayerCount`.

• `preferredConstantQp` indicates the preferred values to use for `VkVideoEncodeH264NaluSliceInfoKHR::constantQp` for each picture type when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.

• `preferredMaxL0ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L0.

• `preferredMaxL1ReferenceCount` indicates the preferred maximum number of reference pictures to use in the reference list L1.

• `preferredStdEntropyCodingModeFlag` indicates the preferred value to use for `entropy_coding_mode_flag` in `StdVideoH264PpsFlags`.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264QualityLevelPropertiesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_QUALITY_LEVEL_PROPERTIES_KHR`.

### 42.17.8. H.264 Encode Session

Additional parameters can be specified when creating a video session with an H.264 encode profile by including an instance of the `VkVideoEncodeH264SessionCreateInfoKHR` structure in the `pNext` chain of `VkVideoSessionCreateInfoKHR`.

The `VkVideoEncodeH264SessionCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionCreateInfoKHR {
    VkStructureType         sType;
    const void*             pNext;
    VkBool32                useMaxLevelIdc;
    StdVideoH264LevelIdc    maxLevelIdc;
} VkVideoEncodeH264SessionCreateInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `useMaxLevelIdc` indicates whether the value of `maxLevelIdc` should be used by the implementation. When it is set to `VK_FALSE`, the implementation ignores the value of `maxLevelIdc` and uses the value of `VkVideoEncodeH264CapabilitiesKHR::maxLevelIdc`, as reported by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the video profile.

• `maxLevelIdc` is a `StdVideoH264LevelIdc` value specifying the upper bound on the H.264 level for the video bitstreams produced by the created video session, where enum constant `STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>` identifies H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH264SessionCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_CREATE_INFO_KHR`.

42.17.9. H.264 Encode Parameter Sets

Video session parameters objects created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR` can contain the following types of parameters:

H.264 Sequence Parameter Sets (SPS)

Represented by `StdVideoH264SequenceParameterSet` structures and interpreted as follows:

• `reserved1` and `reserved2` are used only for padding purposes and are otherwise ignored;

• `seq_parameter_set_id` is used as the key of the SPS entry;

• `level_idc` is one of the enum constants `STD_VIDEO_H264_LEVEL_IDC_<major>_<minor>` identifying the H.264 level `<major>.<minor>` as defined in section A.3 of the ITU-T H.264 Specification;

• if flags.seq_scaling_matrix_present_flag is set, then the `StdVideoH264ScalingLists` structure pointed to by `pScalingLists` is interpreted as follows:
  - `seq_list_present_mask` is a bitmask where bit index i corresponds to `seq_scaling_list_present_flag[i]` as defined in section 7.4.2.1 of the ITU-T H.264 Specification;
  - `use_default_scaling_matrix_mask` is a bitmask where bit index i corresponds to `UseDefaultScalingMatrix4x4Flag[i]`, when i < 6, or corresponds to `UseDefaultScalingMatrix8x8Flag[i-6]`, otherwise, as defined in section 7.3.2.1 of the ITU-T H.264 Specification;
  - `ScalingList4x4` and `ScalingList8x8` correspond to the identically named syntax elements defined in section 7.3.2.1 of the ITU-T H.264 Specification;

• if flags.vui_parameters_present_flag is set, then `pSequenceParameterSetVui` is a pointer to a `StdVideoH264SequenceParameterSetVui` structure that is interpreted as follows:
  - `reserved1` is used only for padding purposes and is otherwise ignored;
if flags.nal_hrd_parameters_present_flag or flags.vcl_hrd_parameters_present_flag is set, then the StdVideoH264HrdParameters structure pointed to by pHrdParameters is interpreted as follows:

- reserved1 is used only for padding purposes and is otherwise ignored;
- all other members of StdVideoH264HrdParameters are interpreted as defined in section E.2.2 of the ITU-T H.264 Specification;

- all other members of StdVideoH264SequenceParameterSetVui are interpreted as defined in section E.2.1 of the ITU-T H.264 Specification;

- all other members of StdVideoH264SequenceParameterSet are interpreted as defined in section 7.4.2.1 of the ITU-T H.264 Specification.

H.264 Picture Parameter Sets (PPS)

Represented by StdVideoH264PictureParameterSet structures and interpreted as follows:

- the pair constructed from seq_parameter_set_id and pic_parameter_set_id is used as the key of the PPS entry;
- if flags.pic_scaling_matrix_present_flag is set, then the StdVideoH264ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - scaling_list_present_mask is a bitmask where bit index i corresponds to pic_scaling_list_present_flag[i] as defined in section 7.4.2.2 of the ITU-T H.264 Specification;
  - use_default_scaling_matrix_mask is a bitmask where bit index i corresponds to UseDefaultScalingMatrix4x4Flag[i], when i < 6, or corresponds to UseDefaultScalingMatrix8x8Flag[i-6], otherwise, as defined in section 7.3.2.2 of the ITU-T H.264 Specification;
  - ScalingList4x4 and ScalingList8x8 correspond to the identically named syntax elements defined in section 7.3.2.2 of the ITU-T H.264 Specification;
- all other members of StdVideoH264PictureParameterSet are interpreted as defined in section 7.4.2.2 of the ITU-T H.264 Specification.

Implementations may override any of these parameters according to the semantics defined in the Video Encode Parameter Overrides section before storing the resulting H.264 parameter sets into the video session parameters object. Applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened and to retrieve the encoded H.264 parameter sets in order to be able to produce a compliant H.264 video bitstream.

Such H.264 parameter set overrides may also have cascading effects on the implementation overrides applied to the encoded bitstream produced by video encode operations. If the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, then the application can use such queries to retrieve feedback about whether any implementation overrides have been applied to the encoded bitstream.
When a video session parameters object is created with the codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext
chain must include a VkVideoEncodeH264SessionParametersCreateInfoKHR structure specifying the
capacity and initial contents of the object.

The VkVideoEncodeH264SessionParametersCreateInfoKHR structure is defined as:

```
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH264SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoEncodeH264SessionParametersCreateInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `maxStdSPSCount` is the maximum number of H.264 SPS entries the created
  VkVideoSessionParametersKHR can contain.
- `maxStdPPSCount` is the maximum number of H.264 PPS entries the created
  VkVideoSessionParametersKHR can contain.
- `pParametersAddInfo` is NULL or a pointer to a VkVideoEncodeH264SessionParametersAddInfoKHR
  structure specifying H.264 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersCreateInfoKHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_CREATE_INFO_KHR
- VUID-VkVideoEncodeH264SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If `pParametersAddInfo` is not NULL, `pParametersAddInfo` must be a valid pointer to a valid
  VkVideoEncodeH264SessionParametersAddInfoKHR structure

The VkVideoEncodeH264SessionParametersAddInfoKHR structure is defined as:
typedef struct VkVideoEncodeH264SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdSPSCount;
    const StdVideoH264SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH264PictureParameterSet* pStdPPSs;
} VkVideoEncodeH264SessionParametersAddInfoKHR;

• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8VkStructureType) value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **stdSPSCount** is the number of elements in the pStdSPSs array.

• **pStdSPSs** is a pointer to an array of [StdVideoH264SequenceParameterSet](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8StdVideoH264SequenceParameterSet) structures describing the H.264 SPS entries to add.

• **stdPPSCount** is the number of elements in the pStdPPSs array.

• **pStdPPSs** is a pointer to an array of [StdVideoH264PictureParameterSet](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8StdVideoH264PictureParameterSet) structures describing the H.264 PPS entries to add.

This structure can be specified in the following places:

• In the **pNext** member of the [VkVideoEncodeH264SessionParametersCreateInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8VkVideoEncodeH264SessionParametersCreateInfoKHR) structure specified in the **pNext** chain of [VkVideoSessionParametersCreateInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8VkVideoSessionParametersCreateInfoKHR) used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR**, then it defines the set of initial parameters to add to the created object (see [Creating Video Session Parameters](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8Creating%20Video%20Session%20Parameters)).

• In the **pNext** chain of [VkVideoSessionParametersUpdateInfoKHR](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8VkVideoSessionParametersUpdateInfoKHR). In this case, if the video codec operation the video session parameters object to be updated was created with is **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR**, then it defines the set of parameters to add to it (see [Updating Video Session Parameters](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-gpu-api.html#8Updating%20Video%20Session%20Parameters)).

### Valid Usage

- **VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-None-04837**
  The seq_parameter_set_id member of each StdVideoH264SequenceParameterSet structure specified in the elements of pStdSPSs must be unique within pStdSPSs

- **VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-None-04838**
  The pair constructed from the seq_parameter_set_id and pic_parameter_set_id members of each StdVideoH264PictureParameterSet structure specified in the elements of pStdPPSs must be unique within pStdPPSs
Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_ADD_INFO_KHR

- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, and pStdSPSs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH264SequenceParameterSet values.

- VUID-VkVideoEncodeH264SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, and pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH264PictureParameterSet values.

The VkVideoEncodeH264SessionParametersGetInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264SessionParametersGetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH264SessionParametersGetInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- writeStdSPS indicates whether the encoded H.264 sequence parameter set identified by stdSPSId is requested to be retrieved.
- writeStdPPS indicates whether the encoded H.264 picture parameter set identified by the pair constructed from stdSPSId and stdPPSId is requested to be retrieved.
- stdSPSId specifies the H.264 sequence parameter set ID used to identify the retrieved H.264 sequence and/or picture parameter set(s).
- stdPPSId specifies the H.264 picture parameter set ID used to identify the retrieved H.264 picture parameter set when writeStdPPS is set to VK_TRUE.

When this structure is specified in the pNext chain of the VkVideoEncodeSessionParametersGetInfoKHR structure passed to vkGetEncodedVideoSessionParametersKHR, the command will write encoded parameter data to the output buffer in the following order:

1. The H.264 sequence parameter set identified by stdSPSId, if writeStdSPS is set to VK_TRUE.
2. The H.264 picture parameter set identified by the pair constructed from stdSPSId and stdPPSId, if writeStdPPS is set to VK_TRUE.
Valid Usage

- VUID-VkVideoEncodeH264SessionParametersGetInfoKHR-writeStdSPS-08279
  At least one of writeStdSPS and writeStdPPS must be set to VK_TRUE

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersGetInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_GET_INFO_KHR

The VkVideoEncodeH264SessionParametersFeedbackInfoKHR structure is defined as:

```c
typedef struct VkVideoEncodeH264SessionParametersFeedbackInfoKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasStdSPSOverrides;
    VkBool32 hasStdPPSOverrides;
} VkVideoEncodeH264SessionParametersFeedbackInfoKHR;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `hasStdSPSOverrides` indicates whether any of the parameters of the requested H.264 sequence parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoKHR::writeStdSPS, were overridden by the implementation.
- `hasStdPPSOverrides` indicates whether any of the parameters of the requested H.264 picture parameter set, if one was requested via VkVideoEncodeH264SessionParametersGetInfoKHR::writeStdPPS, were overridden by the implementation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264SessionParametersFeedbackInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_SESSION_PARAMETERS_FEEDBACK_INFO_KHR

42.17.10. H.264 Encoding Parameters

The VkVideoEncodeH264PictureInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264PictureInfoKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 hasStdSPS;
    VkBool32 hasStdPPS;
    VkBool32 hasStdQp);
} VkVideoEncodeH264PictureInfoKHR;
```
typedef struct VkVideoEncodeH264PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t naluSliceEntryCount;
    const VkVideoEncodeH264NaluSliceInfoKHR* pNaluSliceEntries;
    const StdVideoEncodeH264PictureInfo* pStdPictureInfo;
    VkBool32 generatePrefixNalu;
} VkVideoEncodeH264PictureInfoKHR;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- naluSliceEntryCount is the number of elements in pNaluSliceEntries.
- pNaluSliceEntries is a pointer to an array of naluSliceEntryCount
  VkVideoEncodeH264NaluSliceInfoKHR structures specifying the parameters of the individual
  H.264 slices to encode for the input picture.
- pStdPictureInfo is a pointer to a StdVideoEncodeH264PictureInfo structure specifying
  H.264 picture information.
- generatePrefixNalu controls whether prefix NALUs are generated before slice NALUs into the
  target bitstream, as defined in sections 7.3.2.12 and 7.4.2.12 of the ITU-T H.264 Specification.

This structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to
vkCmdEncodeVideoKHR to specify the codec-specific picture information for an H.264 encode
operation.

Encode Input Picture Information

When this structure is specified in the pNext chain of the VkVideoEncodeInfoKHR structure passed to
vkCmdEncodeVideoKHR, the information related to the encode input picture is defined as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access
  section.
- The encode input picture is associated with the H.264 picture information provided in
  pStdPictureInfo.

Std Picture Information

The members of the StdVideoEncodeH264PictureInfo structure pointed to by pStdPictureInfo are
interpreted as follows:

- flags.reserved and reserved1 are used only for padding purposes and are otherwise ignored;
- flags.IdrPicFlag as defined in section 7.4.1 of the ITU-T H.264 Specification;
- flags.is_reference as defined in section 3.136 of the ITU-T H.264 Specification;
- seq_parameter_set_id and pic_parameter_set_id are used to identify the active parameter sets,
  as described below;
• **primary_pic_type** as defined in section 7.4.2 of the ITU-T H.264 Specification;

• **PicOrderCnt** as defined in section 8.2 of the ITU-T H.264 Specification;

• **temporal_id** as defined in section G.7.4.1.1 of the ITU-T H.264 Specification;

• if **pRefLists** is not NULL, then it is a pointer to a **StdVideoEncodeH264ReferenceListsInfo** structure that is interpreted as follows:
  
  ◦ **flags.reserved** is used only for padding purposes and is otherwise ignored;
  
  ◦ **ref_pic_list_modification_flag_l0** and **ref_pic_list_modification_flag_l1** as defined in section 7.4.3.1 of the ITU-T H.264 Specification;

  ◦ **num_ref_idx_l0_active_minus1** and **num_ref_idx_l1_active_minus1** as defined in section 7.4.3 of the ITU-T H.264 Specification;

  ◦ **RefPicList0** and **RefPicList1** as defined in section 8.2.4 of the ITU-T H.264 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value **STD_VIDEO_H264_NO_REFERENCE_PICTURE** to indicate “no reference picture”;

  ◦ if **refList0ModOpCount** is not zero, then **pRefList0ModOperations** is a pointer to an array of **refList0ModOpCount** number of **StdVideoEncodeH264RefListModEntry** structures specifying the modification parameters for the reference list L0 as defined in section 7.4.3.1 of the ITU-T H.264 Specification;

  ◦ if **refList1ModOpCount** is not zero, then **pRefList1ModOperations** is a pointer to an array of **refList1ModOpCount** number of **StdVideoEncodeH264RefListModEntry** structures specifying the modification parameters for the reference list L1 as defined in section 7.4.3.1 of the ITU-T H.264 Specification;

  ◦ if **refPicMarkingOpCount** is not zero, then **refPicMarkingOperations** is a pointer to an array of **refPicMarkingOpCount** number of **StdVideoEncodeH264RefPicMarkingEntry** structures specifying the reference picture marking parameters as defined in section 7.4.3.3 of the ITU-T H.264 Specification;

  ◦ all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

Reference picture setup is controlled by the value of **StdVideoEncodeH264PictureInfo::flags.is_reference**. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in **pEncodeInfo->pSetupReferenceSlot->slotIndex**. If **StdVideoEncodeH264PictureInfo::flags.is_reference** is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

**Active Parameter Sets**

The members of the **StdVideoEncodeH264PictureInfo** structure pointed to by **pStdPictureInfo** are used to select the active parameter sets to use from the bound video session parameters object, as follows:

• The **active SPS** is the SPS identified by the key specified in **StdVideoEncodeH264PictureInfo::seq_parameter_set_id**.

• The **active PPS** is the PPS identified by the key specified by the pair constructed from **StdVideoEncodeH264PictureInfo::seq_parameter_set_id** and **StdVideoEncodeH264PictureInfo::seq_parameter_set_id**.
H.264 encoding uses *explicit weighted sample prediction* for a slice, as defined in section 8.4.2.3 of the ITU-T H.264 Specification, if any of the following conditions are true for the active PPS and the `pStdSliceHeader` member of the corresponding element of `pNaluSliceEntries`:

- `pStdSliceHeader->slice_type` is `STD_VIDEO_H264_SLICE_TYPE_P` and `weighted_pred_flag` is enabled in the active PPS.
- `pStdSliceHeader->slice_type` is `STD_VIDEO_H264_SLICE_TYPE_B` and `weighted_bipred_idc` in the active PPS equals `STD_VIDEO_H264_WEIGHTED_BIPRED_IDC_EXPLICIT`.

### Valid Usage

- **VUID-VkVideoEncodeH264PictureInfoKHR-naluSliceEntryCount-08301**
  `naluSliceEntryCount` must be between 1 and `VkVideoEncodeH264CapabilitiesKHR::maxSliceCount`, inclusive, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

- **VUID-VkVideoEncodeH264PictureInfoKHR-flags-08304**
  If `VkVideoEncodeH264CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_GENERATE_PREFIX_NALU_BIT_KHR`, then `generatePrefixNalu` must be `VK_FALSE`.

- **VUID-VkVideoEncodeH264PictureInfoKHR-flags-08314**
  If `VkVideoEncodeH264CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR` and the slice corresponding to any element of `pNaluSliceEntries` uses explicit weighted sample prediction, then `VkVideoEncodeH264NaluSliceInfoKHR::pStdSliceHeader->pWeightTable` must not be `NULL` for that element of `pNaluSliceEntries`.

- **VUID-VkVideoEncodeH264PictureInfoKHR-flags-08315**
  If `VkVideoEncodeH264CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_DIFFERENT_SLICE_TYPE_BIT_KHR`, then `VkVideoEncodeH264NaluSliceInfoKHR::pStdSliceHeader->slice_type` must be identical for all elements of `pNaluSliceEntries`.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264PictureInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_PICTURE_INFO_KHR`.

- **VUID-VkVideoEncodeH264PictureInfoKHR-pNaluSliceEntries-parameter**
  `pNaluSliceEntries` must be a valid pointer to an array of `naluSliceEntryCount` valid `VkVideoEncodeH264NaluSliceInfoKHR` structures.

- **VUID-VkVideoEncodeH264PictureInfoKHR-pStdPictureInfo-parameter**
The `VkVideoEncodeH264NaluSliceInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264NaluSliceInfoKHR {
    VkStructureType sType;
    const void* pNext;
    int32_t constantQp;
    const StdVideoEncodeH264SliceHeader* pStdSliceHeader;
} VkVideoEncodeH264NaluSliceInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `constantQp` is the QP to use for the slice if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- `pStdSliceHeader` is a pointer to a `StdVideoEncodeH264SliceHeader` structure specifying H.264 slice header parameters for the slice.

**Std Slice Header Parameters**

The members of the `StdVideoEncodeH264SliceHeader` structure pointed to by `pStdSliceHeader` are interpreted as follows:

- `flags.reserved` and `reserved1` are used only for padding purposes and are otherwise ignored;
- if `pWeightTable` is not `NULL`, then it is a pointer to a `StdVideoEncodeH264WeightTable` that is interpreted as follows:
  - `flags.reserved` is used only for padding purposes and is otherwise ignored;
  - all other members of `StdVideoEncodeH264WeightTable` are interpreted as defined in section 7.4.3.2 of the ITU-T H.264 Specification;
- all other members are interpreted as defined in section 7.4.3 of the ITU-T H.264 Specification.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH264NaluSliceInfoKHR-sType-sType `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_NALU_SLICE_INFO_KHR`
- VUID-VkVideoEncodeH264NaluSliceInfoKHR-pNext-pNext `pNext` must be `NULL`
- VUID-VkVideoEncodeH264NaluSliceInfoKHR-pStdSliceHeader-parameter `pStdSliceHeader` must be a valid pointer to a valid `StdVideoEncodeH264SliceHeader` value
The `VkVideoEncodeH264DpbSlotInfoKHR` structure is defined as:

```c
typedef struct VkVideoEncodeH264DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoEncodeH264ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH264DpbSlotInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH264ReferenceInfo` structure specifying H.264 reference information.

This structure is specified in the `pNext` chain of `VkVideoEncodeInfoKHR::pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of `VkVideoEncodeInfoKHR::pReferenceSlots` to specify the codec-specific reference picture information for an H.264 encode operation.

### Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of `VkVideoEncodeInfoKHR::pReferenceSlots`, one element is added to the list of active reference pictures used by the video encode operation for each element of `VkVideoEncodeInfoKHR::pReferenceSlots` as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of `VkVideoEncodeInfoKHR::pReferenceSlots`.
- The reference picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

### Reconstructed Picture Information

When this structure is specified in the `pNext` chain of `VkVideoEncodeInfoKHR::pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.264 Encode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in `VkVideoEncodeInfoKHR::pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.264 reference information provided in `pStdReferenceInfo`.

### Std Reference Information

The members of the `StdVideoEncodeH264ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:
flags.reserved is used only for padding purposes and is otherwise ignored;

flags.used_for_long_term_reference is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.2.5.1 of the ITU-T H.264 Specification;

primary_pic_type as defined in section 7.4.2 of the ITU-T H.264 Specification;

long_term_pic_num and long_term_frame_idx as defined in section 7.4.3 of the ITU-T H.264 Specification;

temporal_id as defined in section G.7.4.1.1 of the ITU-T H.264 Specification;

all other members are interpreted as defined in section 8.2 of the ITU-T H.264 Specification.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH264DpbSlotInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_DPB_SLOT_INFO_KHR

- VUID-VkVideoEncodeH264DpbSlotInfoKHR-pStdReferenceInfo-parameter
  pStdReferenceInfo must be a valid pointer to a valid StdVideoEncodeH264ReferenceInfo value

42.17.11. H.264 Encode Rate Control

Group of Pictures

In case of H.264 encoding it is common practice to follow a regular pattern of different picture types in display order when encoding subsequent frames. This pattern is referred to as the group of pictures (GOP).

A regular GOP is defined by the following parameters:

- The number of frames in the GOP;
- The number of consecutive B frames between I and/or P frames in display order.

GOPs are further classified as open and closed GOPs.

Frame types in an open GOP follow each other in display order according to the following algorithm:

1. The first frame is always an I frame.
2. This is followed by a number of consecutive B frames, as defined above.
3. If the number of frames in the GOP is not reached yet, then the next frame is a P frame and the algorithm continues from step 2.
In case of a closed GOP, an **IDR frame** is used at a certain period.

- **Flat Reference Pattern**
  - Each P frame uses the last non-B frame, in display order, as reference.
  - Each B frame uses the last non-B frame, in display order, as its forward reference, and uses the next non-B frame, in display order, as its backward reference.

- **Dyadic Reference Pattern**
  - Each P frame uses the last non-B frame, in display order, as reference.
• The following algorithm is applied to the sequence of consecutive B frames between I and/or P frames in display order:

1. The B frame in the middle of this sequence uses the frame preceding the sequence as its forward reference, and uses the frame following the sequence as its backward reference.
2. The algorithm is executed recursively for the following frame sequences:
   • The B frames of the original sequence preceding the frame in the middle, if any.
   • The B frames of the original sequence following the frame in the middle, if any.

Figure 34. H.264 dyadic reference pattern

The application can provide guidance to the implementation's rate control algorithm about the structure of the GOP used by the application. Any such guidance about the GOP and its structure does not mandate that specific GOP structure to be used by the application, as the picture type of individual encoded pictures is still application-controlled, however, any deviation from the provided guidance may result in undesired rate control behavior including, but not limited, to the implementation not being able to conform to the expected average or target bitrates, or other rate control parameters specified by the application.

When an H.264 encode session is used to encode multiple temporal layers, it is also common practice to follow a regular pattern for the H.264 temporal ID for the encoded pictures in display order when encoding subsequent frames. This pattern is referred to as the temporal GOP. The most common temporal layer pattern used is as follows:

**Dyadic Temporal Layer Pattern**

• The number of frames in the temporal GOP is \(2^{n-1}\), where \(n\) is the number of temporal layers.

• The \(i^{th}\) frame in the temporal GOP uses temporal ID \(t\), if and only if the index of the least significant bit set in \(i\) equals \(n-t-1\), except for the first frame, which is the only frame in the temporal GOP using temporal ID zero.

• The \(i^{th}\) frame in the temporal GOP uses the \(r^{th}\) frame as reference, where \(r\) is calculated from \(i\) by clearing the least significant bit set in it, except for the first frame in the temporal GOP, which uses the first frame of the previous temporal GOP, if any, as reference.
Figure 35. H.264 dyadic temporal layer pattern

*Note*
Multi-layer rate control and multi-layer coding are typically used for streaming cases where low latency is expected, hence B pictures with backward prediction are usually not used.

The `VkVideoEncodeH264RateControlInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264RateControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH264RateControlFlagsKHR flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t temporalLayerCount;
} VkVideoEncodeH264RateControlInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH264RateControlFlagBitsKHR` specifying H.264 rate control flags.
- `gopFrameCount` is the number of frames within a group of pictures (GOP) intended to be used by the application. If it is set to 0, the rate control algorithm may assume an implementation-dependent GOP length. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames (see IDR period). If it is set to 0, the rate control algorithm may assume an implementation-dependent IDR period. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
• **consecutiveBFrameCount** is the number of consecutive B frames between I and/or P frames within the GOP.

• **temporalLayerCount** specifies the number of H.264 temporal layers that the application intends to use.

When an instance of this structure is included in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command, and the `VkVideoCodingControlInfoKHR::flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the parameters in this structure are used as guidance for the implementation's rate control algorithm (see Video Coding Control).

If `flags` includes `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`, then the rate control state is reset to an initial state to meet HRD compliance requirements. Otherwise the new rate control state may be applied without a reset depending on the implementation and the specified rate control parameters.

**Note**
It would be possible to infer the picture type to be used when encoding a frame, on the basis of the values provided for `consecutiveBFrameCount`, `idrPeriod`, and `gopFrameCount`, but this inferred picture type will not be used by implementations to override the picture type provided to the video encode operation.

### Valid Usage

- **VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08280**
  If `VkVideoEncodeH264CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H264_CAPABILITY_HRD_COMPLIANCE_BIT_KHR`, then `flags` must not contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`.

- **VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08281**
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` or `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`, then it must also contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR`.

- **VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08282**
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR`, then it must not also contain `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`.

- **VUID-VkVideoEncodeH264RateControlInfoKHR-flags-08283**
  If `flags` contains `VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR`, then `gopFrameCount` must be greater than 0.

- **VUID-VkVideoEncodeH264RateControlInfoKHR-idrPeriod-08284**
  If `idrPeriod` is not 0, then it must be greater than or equal to `gopFrameCount`.

- **VUID-VkVideoEncodeH264RateControlInfoKHR-consecutiveBFrameCount-08285**
  If `consecutiveBFrameCount` is not 0, then it must be less than `gopFrameCount`.
Valid Usage (Implicit)

- VUID-VkVideoEncodeH264RateControlInfoKHR-sType-sType
  
  $sType$ must be $VK\_STRUCTURE\_TYPE\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_INFO\_KHR$

- VUID-VkVideoEncodeH264RateControlInfoKHR-flags-parameter
  
  $flags$ must be a valid combination of $VkVideoEncodeH264RateControlFlagBitsKHR$ values

Bits which can be set in $VkVideoEncodeH264RateControlInfoKHR::flags$, specifying H.264 rate control flags, are:

```c
// Provided by VK_KHR_video_encode_h264
typedef enum VkVideoEncodeH264RateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REGULAR_GOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H264_RATE_CONTROL_TEMPORAL_LAYER_PATTERN_DYADIC_BIT_KHR = 0x00000010,
} VkVideoEncodeH264RateControlFlagBitsKHR;
```

- $VK\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_ATTEMPT\_HRD\_COMPLIANCE\_BIT\_KHR$ specifies that rate control should attempt to produce an HRD compliant bitstream, as defined in annex C of the ITU-T H.264 Specification.

- $VK\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_REGULAR\_GOP\_BIT\_KHR$ specifies that the application intends to use a regular GOP structure according to the parameters specified in the $gopFrameCount$, $idrPeriod$, and $consecutiveBFrameCount$ members of the $VkVideoEncodeH264RateControlInfoKHR$ structure.

- $VK\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_REFERENCE\_PATTERN\_FLAT\_BIT\_KHR$ specifies that the application intends to follow a flat reference pattern in the GOP.

- $VK\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_REFERENCE\_PATTERN\_DYADIC\_BIT\_KHR$ specifies that the application intends to follow a dyadic reference pattern in the GOP.

- $VK\_VIDEO\_ENCODE\_H264\_RATE\_CONTROL\_TEMPORAL\_LAYER\_PATTERN\_DYADIC\_BIT\_KHR$ specifies that the application intends to follow a dyadic temporal layer pattern.

```c
// Provided by VK_KHR_video_encode_h264
typedef VkFlags VkVideoEncodeH264RateControlFlagsKHR;
```

$VkVideoEncodeH264RateControlFlagsKHR$ is a bitmask type for setting a mask of zero or more $VkVideoEncodeH264RateControlFlagBitsKHR$.

Rate Control Layers

The $VkVideoEncodeH264RateControlLayerInfoKHR$ structure is defined as:
typedef struct VkVideoEncodeH264RateControlLayerInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH264QpKHR minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH264QpKHR maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH264FrameSizeKHR maxFrameSize;
} VkVideoEncodeH264RateControlLayerInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useMinQp** indicates whether the QP values determined by rate control will be clamped to the lower bounds on the QP values specified in **minQp**.
- **minQp** specifies the lower bounds on the QP values, for each picture type, that the implementation’s rate control algorithm will use when **useMinQp** is set to VK_TRUE.
- **useMaxQp** indicates whether the QP values determined by rate control will be clamped to the upper bounds on the QP values specified in **maxQp**.
- **maxQp** specifies the upper bounds on the QP values, for each picture type, that the implementation’s rate control algorithm will use when **useMaxQp** is set to VK_TRUE.
- **useMaxFrameSize** indicates whether the implementation’s rate control algorithm should use the values specified in **maxFrameSize** as the upper bounds on the encoded frame size for each picture type.
- **maxFrameSize** specifies the upper bounds on the encoded frame size, for each picture type, when **useMaxFrameSize** is set to VK_TRUE.

When used, the values in **minQp** and **maxQp** guarantee that the effective QP values used by the implementation will respect those lower and upper bounds, respectively. However, limiting the range of QP values that the implementation is able to use will also limit the capabilities of the implementation’s rate control algorithm to comply to other constraints. In particular, the implementation may not be able to comply to the following:

- The average and/or peak bitrate values to be used for the encoded bitstream specified in the **averageBitrate** and **maxBitrate** members of the VkVideoEncodeRateControlLayerInfoKHR structure.
- The upper bounds on the encoded frame size, for each picture type, specified in the **maxFrameSize** member of VkVideoEncodeH264RateControlLayerInfoKHR.

**Note**

In general, applications need to configure rate control parameters appropriately in order to be able to get the desired rate control behavior, as described in the Video Encode Rate Control section.
When an instance of this structure is included in the pNext chain of a VkVideoEncodeRateControlLayerInfoKHR structure specified in one of the elements of the pLayers array member of the VkVideoEncodeRateControlInfoKHR structure passed to the vkCmdControlVideoCodingKHR command, VkVideoCodingControlInfoKHR::flags includes VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR, and the bound video session was created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR, it specifies the H.264-specific rate control parameters of the rate control layer corresponding to that element of pLayers.

### Valid Usage

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08286**
  
  If useMinQp is VK_TRUE, then the qpI, qpP, and qpB members of minQp must all be between VkVideoEncodeH264CapabilitiesKHR::minQp and VkVideoEncodeH264CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMaxQp-08287**
  
  If useMaxQp is VK_TRUE, then the qpI, qpP, and qpB members of maxQp must all be between VkVideoEncodeH264CapabilitiesKHR::minQp and VkVideoEncodeH264CapabilitiesKHR::maxQp, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08288**
  
  If useMinQp is VK_TRUE and VkVideoEncodeH264CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR, then the qpI, qpP, and qpB members of minQp must all specify the same value.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMaxQp-08289**
  
  If useMaxQp is VK_TRUE and VkVideoEncodeH264CapabilitiesKHR::flags, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile, does not include VK_VIDEO_ENCODE_H264_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR, then the qpI, qpP, and qpB members of maxQp must all specify the same value.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-useMinQp-08374**
  
  If useMinQp and useMaxQp are both VK_TRUE, then the qpI, qpP, and qpB members of minQp must all be less than or equal to the respective members of maxQp.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-sType-sType**
  
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_RATE_CONTROL_LAYER_INFO_KHR.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-minQp-parameter**
  
  minQp must be a valid VkVideoEncodeH264QpKHR structure.

- **VUID-VkVideoEncodeH264RateControlLayerInfoKHR-maxQp-parameter**
  
  maxQp must be a valid VkVideoEncodeH264QpKHR structure.
The `VkVideoEncodeH264QpKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264QpKHR {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH264QpKHR;
```

- `qpI` is the QP to be used for I pictures.
- `qpP` is the QP to be used for P pictures.
- `qpB` is the QP to be used for B pictures.

The `VkVideoEncodeH264FrameSizeKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264FrameSizeKHR {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH264FrameSizeKHR;
```

- `frameISize` is the size in bytes to be used for I pictures.
- `framePSize` is the size in bytes to be used for P pictures.
- `frameBSize` is the size in bytes to be used for B pictures.

**GOP Remaining Frames**

Besides session level rate control configuration, the application can specify the number of frames per frame type remaining in the group of pictures (GOP).

The `VkVideoEncodeH264GopRemainingFrameInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h264
typedef struct VkVideoEncodeH264GopRemainingFrameInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useGopRemainingFrames;
    uint32_t gopRemainingI;
    uint32_t gopRemainingP;
    uint32_t gopRemainingB;
} VkVideoEncodeH264GopRemainingFrameInfoKHR;
```
• **sType** is a *VkStructureType* value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **useGopRemainingFrames** indicates whether the implementation's rate control algorithm **should** use the values specified in **gopRemainingI**, **gopRemainingP**, and **gopRemainingB**. If **useGopRemainingFrames** is **VK_FALSE**, then the values of **gopRemainingI**, **gopRemainingP**, and **gopRemainingB** are ignored.

• **gopRemainingI** specifies the number of **I frames** the implementation's rate control algorithm **should** assume to be remaining in the **GOP** prior to executing the video encode operation.

• **gopRemainingP** specifies the number of **P frames** the implementation's rate control algorithm **should** assume to be remaining in the **GOP** prior to executing the video encode operation.

• **gopRemainingB** specifies the number of **B frames** the implementation's rate control algorithm **should** assume to be remaining in the **GOP** prior to executing the video encode operation.

Setting **useGopRemainingFrames** to **VK_TRUE** and including this structure in the **pNext** chain of **VkVideoBeginCodingInfoKHR** is only mandatory if the **VkVideoEncodeH264CapabilitiesKHR**::**requiresGopRemainingFrames** reported for the used video profile is **VK_TRUE**. However, implementations **may** use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular **GOP** structure, these values **may** provide additional guidance for the implementation's rate control algorithm.

The **VkVideoEncodeH264CapabilitiesKHR**::**prefersGopRemainingFrames** capability is also used to indicate that the implementation's rate control algorithm **may** operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation's rate control algorithm **may** deviate from the one expected by the application.

### Valid Usage (Implicit)

• VUID-VkVideoEncodeH264GopRemainingFrameInfoKHR-sType-sType

  **sType** **must** be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H264_GOP_REMAINING_FRAME_INFO_KHR**

### 42.17.12. H.264 Encode Requirements

This section describes the **required** H.264 encoding capabilities for physical devices that have at least one queue family that supports the video codec operation **VK_VIDEO_CODEC_OPERATION_ENCODE_H264_BIT_KHR**, as returned by **vkGetPhysicalDeviceQueueFamilyProperties2** in **VkQueueFamilyVideoPropertiesKHR**::**videoCodecOperations**.

The **Requirement Type** column specifies the requirement is either the minimum value all implementations must support, the maximum value all implementations must support, or the exact value all implementations must support. For bitmasks a minimum value is the least bits all implementations must set, but they may have additional bits set beyond this minimum.

### 42.18. H.265 Encode Operations

Video encode operations using an **H.265 encode profile** can be used to encode elementary video stream sequences compliant to the **ITU-T H.265 Specification**.

**Note**

Refer to the [Preamble](#) for information on how the Khronos Intellectual Property Rights Policy relates to normative references to external materials not created by Khronos.

This process is performed according to the **video encode operation steps** with the codec-specific semantics defined in section 8 of the **ITU-T H.265 Specification** as follows:

- Syntax elements, derived values, and other parameters are applied from the following structures:
  - The `StdVideoH265VideoParameterSet` structure corresponding to the active VPS specifying the H.265 video parameter set.
  - The `StdVideoH265SequenceParameterSet` structure corresponding to the active SPS specifying the H.265 sequence parameter set.
  - The `StdVideoH265PictureParameterSet` structure corresponding to the active PPS specifying the H.265 picture parameter set.
  - The `StdVideoEncodeH265PictureInfo` structure specifying the H.265 picture information.
  - The `StdVideoEncodeH265SliceSegmentHeader` structures specifying the H.265 slice segment header parameters for each encoded H.265 slice segment.
  - The `StdVideoEncodeH265ReferenceInfo` structures specifying the H.265 reference information corresponding to the optional reconstructed picture and any active reference pictures.

- The encoded bitstream data is written to the destination video bitstream buffer range as defined in the **H.265 Encode Bitstream Data Access** section.

- Picture data in the video picture resources corresponding to the used encode input picture,
active reference pictures, and optional reconstructed picture is accessed as defined in the H.265 Encode Picture Data Access section.

• The decision on reference picture setup is made according to the parameters specified in the H.265 picture information.

If the parameters adhere to the syntactic and semantic requirements defined in the corresponding sections of the ITU-T H.265 Specification, as described above, and the DPB slots associated with the active reference pictures all refer to valid picture references, then the video encode operation will complete successfully. Otherwise, the video encode operation may complete unsuccessfully.

42.18.1. H.265 Encode Parameter Overrides

Implementations may override, unless otherwise specified, any of the H.265 encode parameters specified in the following Video Std structures:

• StdVideoH265VideoParameterSet
• StdVideoH265SequenceParameterSet
• StdVideoH265PictureParameterSet
• StdVideoEncodeH265PictureInfo
• StdVideoEncodeH265SliceSegmentHeader
• StdVideoEncodeH265ReferenceInfo

All such H.265 encode parameter overrides must fulfill the conditions defined in the Video Encode Parameter Overrides section.

In addition, implementations must not override any of the following H.265 encode parameters:

• StdVideoEncodeH265PictureInfo::pic_type
• StdVideoEncodeH265SliceSegmentHeader::slice_type

In case of H.265 encode parameters stored in video session parameters objects, applications need to use the vkGetEncodedVideoSessionParametersKHR command to determine whether any implementation overrides happened. If the query indicates that implementation overrides were applied, then the application needs to retrieve and use the encoded H.265 parameter sets in the bitstream in order to be able to produce a compliant H.265 video bitstream using the H.265 encode parameters stored in the video session parameters object.

In case of any H.265 encode parameters stored in the encoded bitstream produced by video encode operations, if the implementation supports the VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR video encode feedback query flag, the application can use such queries to retrieve feedback about whether any implementation overrides have been applied to those H.265 encode parameters.

42.18.2. H.265 Encode Bitstream Data Access

Each video encode operation writes one or more VCL NAL units comprising of slice segment headers and data of the encoded picture, in the format defined in sections 7.3.6 and 7.3.8, according
to the semantics defined in sections 7.4.7 and 7.4.9 of the ITU-T H.265 Specification, respectively. The number of VCL NAL units written is specified by VkVideoEncodeH265PictureInfoKHR::naluSliceSegmentEntryCount.

42.18.3. H.265 Encode Picture Data Access

Accesses to image data within a video picture resource happen at the granularity indicated by VkVideoCapabilitiesKHR::pictureAccessGranularity, as returned by vkGetPhysicalDeviceVideoCapabilitiesKHR for the used video profile. Accordingly, the complete image subregion of a encode input picture, reference picture, or reconstructed picture accessed by video coding operations using an H.265 encode profile is defined as the set of texels within the coordinate range:

$$((0, endX), (0, endY))$$

Where:

- $endX$ equals `codedExtent.width` rounded up to the nearest integer multiple of `pictureAccessGranularity.width` and clamped to the width of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;
- $endY$ equals `codedExtent.height` rounded up to the nearest integer multiple of `pictureAccessGranularity.height` and clamped to the height of the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure;

Where `codedExtent` is the member of the VkVideoPictureResourceInfoKHR structure corresponding to the picture.

In case of video encode operations using an H.265 encode profile, any access to a picture at the coordinates $(x, y)$, as defined by the ITU-T H.265 Specification, is an access to the image subresource referred to by the corresponding VkVideoPictureResourceInfoKHR structure at the texel coordinates $(x, y)$.

Implementations may choose not to access some or all texels within particular reference pictures available to a video encode operation (e.g. due to video encode parameter overrides restricting the effective set of used reference pictures, or if the encoding algorithm chooses not to use certain subregions of the reference picture data for sample prediction).

42.18.4. H.265 Frame, Picture, Slice Segments, and Tiles

H.265 pictures consist of one or more slices, slice segments, and tiles, as defined in section 6.3.1 of the ITU-T H.265 Specification.

Video encode operations using an H.265 encode profile can encode slice segments of different types, as defined in section 7.4.7.1 of the ITU-T H.265 Specification, by specifying the corresponding enumeration constant value in StdVideoEncodeH265SliceSegmentHeader::slice_type in the H.265 slice segment header parameters from the Video Std enumeration type StdVideoH265SliceType:

- `STD_VIDEO_H265_SLICE_TYPE_B` indicates that the slice segment is part of a B slice as defined in
section 3.12 of the ITU-T H.265 Specification.

- `STD_VIDEO_H265_SLICE_TYPE_P` indicates that the slice segment is part of a *P slice* as defined in section 3.111 of the ITU-T H.265 Specification.
- `STD_VIDEO_H265_SLICE_TYPE_I` indicates that the slice segment is part of an *I slice* as defined in section 3.74 of the ITU-T H.265 Specification.

Pictures constructed from such slice segments **can** be of different types, as defined in section 7.4.3.5 of the ITU-T H.265 Specification. Video encode operations using an H.265 encode profile **can** encode pictures of a specific type by specifying the corresponding enumeration constant value in `StdVideoEncodeH265PictureInfo::pic_type` in the H.265 picture information from the Video Std enumeration type `StdVideoH265PictureType`:

- `STD_VIDEO_H265_PICTURE_TYPE_P` indicates that the picture is a *P picture*. A frame consisting of a P picture is also referred to as a *P frame*.
- `STD_VIDEO_H265_PICTURE_TYPE_B` indicates that the picture is a *B picture*. A frame consisting of a B picture is also referred to as a *B frame*.
- `STD_VIDEO_H265_PICTURE_TYPE_I` indicates that the picture is an *I picture*. A frame consisting of an I picture is also referred to as an *I frame*.
- `STD_VIDEO_H265_PICTURE_TYPE_IDR` indicates that the picture is a special type of I picture called an *IDR picture* as defined in section 3.67 of the ITU-T H.265 Specification. A frame consisting of an IDR picture is also referred to as an *IDR frame*.

### 42.18.5. H.265 Encode Profile

A video profile supporting H.265 video encode operations is specified by setting `VkVideoProfileInfoKHR::videoCodecOperation` to `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_KHR` and adding a `VkVideoEncodeH265ProfileInfoKHR` structure to the `VkVideoProfileInfoKHR::pNext` chain.

The `VkVideoEncodeH265ProfileInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265ProfileInfoKHR {
    VkStructureType sType;
    const void* pNext;
    StdVideoH265ProfileIdc stdProfileIdc;
} VkVideoEncodeH265ProfileInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `stdProfileIdc` is a `StdVideoH265ProfileIdc` value specifying the H.265 codec profile IDC, as defined in section A.3 of the ITU-T H.265 Specification.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH265ProfileInfoKHR-sType-sType`
42.18.6. H.265 Encode Capabilities

When calling `vkGetPhysicalDeviceVideoCapabilitiesKHR` to query the capabilities for an H.265 encode profile, the `VkVideoCapabilitiesKHR::pNext` chain must include a `VkVideoEncodeH265CapabilitiesKHR` structure that will be filled with the profile-specific capabilities.

The `VkVideoEncodeH265CapabilitiesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265CapabilitiesKHR {
    VkStructureType   sType;        
    void*             pNext;        
    VkVideoEncodeH265CapabilityFlagsKHR flags;     
    StdVideoH265LevelIdc maxLevelIdc;      
    uint32_t          maxSliceSegmentCount;    
    VkExtent2D        maxTiles;        
    VkVideoEncodeH265CtbSizeFlagsKHR ctbSizes;       
    VkVideoEncodeH265TransformBlockSizeFlagsKHR transformBlockSizes;  
    uint32_t          maxPPictureL0ReferenceCount; 
    uint32_t          maxBPictureL0ReferenceCount; 
    uint32_t          maxL1ReferenceCount;        
    uint32_t          maxSubLayerCount;           
    VkBool32          expectDyadicTemporalSubLayerPattern;   
    int32_t           minQp;          
    int32_t           maxQp;          
    VkBool32          prefersGopRemainingFrames;    
    VkBool32          requiresGopRemainingFrames;   
    VkVideoEncodeH265StdFlagsKHR stdSyntaxFlags;    
} VkVideoEncodeH265CapabilitiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH265CapabilityFlagBitsKHR` indicating supported H.265 encoding capabilities.
- `maxLevelIdc` is a `StdVideoH265LevelIdc` value indicating the maximum H.265 level supported by the profile, where enum constant `STD_VIDEO_H265_LEVEL_IDC_<major>_<minor>` identifies H.265 level `<major>..<minor>` as defined in section A.4 of the ITU-T H.265 Specification.
- `maxSliceSegmentCount` indicates the maximum number of slice segments that can be encoded for a single picture. Further restrictions may apply to the number of slice segments that can be encoded for a single picture depending on other capabilities and codec-specific rules.
- `maxTiles` indicates the maximum number of H.265 tile columns and rows, as defined in sections 3.175 and 3.176 of the ITU-T H.265 Specification that can be encoded for a single picture. Further restrictions may apply to the number of H.265 tiles that can be encoded for a single picture...
picture depending on other capabilities and codec-specific rules.

- **ctbSizes** is a bitmask of `VkVideoEncodeH265CtbSizeFlagBitsKHR` describing the supported CTB sizes.
- **transformBlockSizes** is a bitmask of `VkVideoEncodeH265TransformBlockSizeFlagBitsKHR` describing the supported transform block sizes.
- **maxPPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for P pictures.

  **Note**
  As implementations **may override** the reference lists, **maxPPictureL0ReferenceCount** does not limit the number of elements that the application **can** specify in the L0 reference list for P pictures. However, if **maxPPictureL0ReferenceCount** is zero, then the use of P pictures is not allowed. In case of H.265 encoding, pictures **can** be encoded using only forward prediction even if P pictures are not supported, as the ITU-T H.265 Specification supports **generalized P & B frames** (also known as low delay B frames) whereas B frames **can** refer to past frames through both the L0 and L1 reference lists.

- **maxBPictureL0ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L0 for B pictures.
- **maxL1ReferenceCount** indicates the maximum number of reference pictures the implementation supports in the reference list L1 if encoding of B pictures is supported.

  **Note**
  As implementations **may override** the reference lists, **maxBPictureL0ReferenceCount** and **maxL1ReferenceCount** does not limit the number of elements that the application **can** specify in the L0 and L1 reference lists for B pictures. However, if **maxBPictureL0ReferenceCount** and **maxL1ReferenceCount** are both zero, then the use of B pictures is not allowed.

- **maxSubLayerCount** indicates the maximum number of H.265 sub-layers supported by the implementation.
- **expectDyadicTemporalSubLayerPattern** indicates that the implementation’s rate control algorithms expect the application to use a **dyadic temporal sub-layer pattern** when encoding multiple temporal sub-layers.
- **minQp** indicates the minimum QP value supported.
- **maxQp** indicates the maximum QP value supported.
- **prefersGopRemainingFrames** indicates that the implementation’s rate control algorithm prefers the application to specify the number of frames of each type **remaining** in the current group of pictures when beginning a video coding scope.
- **requiresGopRemainingFrames** indicates that the implementation's rate control algorithm requires the application to specify the number of frames of each type **remaining** in the current group of pictures when beginning a video coding scope.
• stdSyntaxFlags is a bitmask of VkVideoEncodeH265StdFlagBitsKHR indicating capabilities related to H.265 syntax elements.

Valid Usage (Implicit)

• VUID-VkVideoEncodeH265CapabilitiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_CAPABILITIES_KHR

Bits which may be set in VkVideoEncodeH265CapabilitiesKHR::flags, indicating the H.265 encoding capabilities supported, are:

```c
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265CapabilityFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR =
    0x00000002,
    VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR = 0x00000010,
    VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR = 0x00000020,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR = 0x00000040,
    VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR =
    0x00000080,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR =
    0x00000100,
    VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR =
    0x00000200,
    } VkVideoEncodeH265CapabilityFlagBitsKHR;
```

• VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR indicates if the implementation may be able to generate HRD compliant bitstreams if any of the nal_hrd_parameters_present_flag, vcl_hrd_parameters_present_flag, or sub_pic_hrd_params_present_flag members of StdVideoH265HrdFlags are set to 1 in the HRD parameters of the active VPS or active SPS, or if StdVideoH265SpsVuiFlags::vui_hrd_parameters_present_flag is set to 1 in the active SPS.

• VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR indicates that if the weighted_pred_flag or the weighted_bipred_flag member of StdVideoH265PpsFlags is set to 1 in the active PPS when encoding a P picture or B picture, respectively, then the implementation is able to internally decide syntax for pred_weight_table, as defined in section 7.4.7.3 of the ITU-T H.265 Specification, and the application is not required to provide a weight table in the H.265 slice segment header parameters.

• VK_VIDEO_ENCODE_H265_CAPABILITY_ROW_UNALIGNED_SLICE_SEGMENT_BIT_KHR indicates that each slice segment in a frame with a single or multiple tiles per slice may begin or finish at any offset in a CTB row. If not supported, all slice segments in such a frame must begin at the start of a CTB row (and hence each slice segment must finish at the end of a CTB row). Also indicates that each slice segment in a frame with multiple slices per tile may begin or finish at any offset within the enclosing tile’s CTB row. If not supported, slice segments in such a frame must begin at the start
of the enclosing tile’s CTB row (and hence each slice segment must finish at the end of the enclosing tile’s CTB row).

- **VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR** indicates that when a frame is encoded with multiple slice segments, the implementation allows encoding each slice segment with a different `StdVideoEncodeH265SliceSegmentHeader::slice_type` specified in the H.265 slice segment header parameters. If not supported, all slice segments of the frame must be encoded with the same `slice_type` which corresponds to the picture type of the frame.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L0_LIST_BIT_KHR** indicates support for using a B frame as L0 reference, as specified in `StdVideoEncodeH265ReferenceListsInfo::RefPicList0` in the H.265 picture information.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_B_FRAME_IN_L1_LIST_BIT_KHR** indicates support for using a B frame as L1 reference, as specified in `StdVideoEncodeH265ReferenceListsInfo::RefPicList1` in the H.265 picture information.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR** indicates support for specifying different QP values in the members of `VkVideoEncodeH265QpKHR`.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_PER_SLICE_SEGMENT_CONSTANT_QP_BIT_KHR** indicates support for specifying different constant QP values for each slice segment.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR** indicates if encoding multiple tiles per slice segment, as defined in section 6.3.1 of the ITU-T H.265 Specification, is supported. If this capability flag is not present, then the implementation is only able to encode a single tile for each slice segment.

- **VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR** indicates if encoding multiple slice segments per tile, as defined in section 6.3.1 of the ITU-T H.265 Specification, is supported. If this capability flag is not present, then the implementation is only able to encode a single slice segment for each tile.

```c
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265CapabilityFlagsKHR;
```

`VkVideoEncodeH265CapabilityFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CapabilityFlagBitsKHR`.

Bits which may be set in `VkVideoEncodeH265CapabilitiesKHR::stdSyntaxFlags`, indicating the capabilities related to the H.265 syntax elements, are:
```c
typedef enum VkVideoEncodeH265StdFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_KHR = 0x00000004,

```

- `VK_VIDEO_ENCODE_H265_STD_SEPARATE_COLOR_PLANE_FLAG_SET_BIT_KHR` indicates whether the implementation supports using the application-provided value for `StdVideoH265SpsFlags::separate_colour_plane_flag` in the SPS when that value is 1.
- `VK_VIDEO_ENCODE_H265_STD_SAMPLE_ADAPTIVE_OFFSET_ENABLED_FLAG_SET_BIT_KHR` indicates whether the implementation supports using the application-provided value for `StdVideoH265SpsFlags::sample_adaptive_offset_enabled_flag` in the SPS when that value is 1.
- `VK_VIDEO_ENCODE_H265_STD_SCALING_LIST_DATA_PRESENT_FLAG_SET_BIT_KHR` indicates whether the implementation supports using the application-provided value for the `scaling_list_enabled_flag` and `sps_scaling_list_data_present_flag` members of `StdVideoH265SpsFlags` in the SPS, and the application-provided value for `StdVideoH265PpsFlags::pps_scaling_list_data_present_flag` in the PPS when those values are 1.
- `VK_VIDEO_ENCODE_H265_STD_PCM_ENABLED_FLAG_SET_BIT_KHR` indicates whether the implementation supports using the application-provided value for `StdVideoH265SpsFlags::pcm_enable_flag` in the SPS when that value is 1.
- `VK_VIDEO_ENCODE_H265_STD_SPS_TEMPORAL_MVP_ENABLED_FLAG_SET_BIT_KHR` indicates whether the implementation supports using the application-provided value for `StdVideoH265SpsFlags::sps_temporal_mvp_enabled_flag` in the SPS when that value is 1.
- **VK_VIDEO_ENCODE_H265_STD_INIT_qp_MINUS26_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PictureParameterSet::init_qp_minus26` in the **PPS** when that value is non-zero.

- **VK_VIDEO_ENCODE_H265_STD_WEIGHTED_PRED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::weighted_pred_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_WEIGHTED_BIPRED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::weighted_bipred_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_LOG2_PARALLEL_MERGE_LEVEL_MINUS2_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PictureParameterSet::log2_parallel_merge_level_minus2` in the **PPS** when that value is non-zero.

- **VK_VIDEO_ENCODE_H265_STD_SIGN_DATA_HIDING_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::sign_data_hiding_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::transform_skip_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_TRANSFORM_SKIP_ENABLED_FLAG_UNSET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::transform_skip_enabled_flag` in the **PPS** when that value is 0.

- **VK_VIDEO_ENCODE_H265_STD_PPS_SLICE_CHROMA_qp_OFFSETS_PRESENT_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::pps_slice_chroma_qp_offsets_present_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_TRANSQUANT_BYPASS_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::transquant_bypass_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_CONSTRAINED_INTRA_PRED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::constrained_intra_pred_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_ENTROPY_CODING_SYNC_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::entropy_coding_sync_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STDDebeblocking_FILTER_OVERRIDE_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::deblocking_filter_override_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENTS_ENABLED_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoH265PpsFlags::dependent_slice_segments_enabled_flag` in the **PPS** when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD_DEPENDENT_SLICE_SEGMENT_FLAG_SET_BIT_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH265SliceSegmentHeader::dependent_slice_segment_flag` in the H.265 slice segment.
header parameters when that value is 1.

- **VK_VIDEO_ENCODE_H265_STD.Slice.QP.Delta.Bit_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta` in the H.265 slice segment header parameters when that value is identical across the slice segments of the encoded frame.

- **VK_VIDEO_ENCODE_H265_STD_DIFFERENT.Slice.QP.Delta.Bit_KHR** indicates whether the implementation supports using the application-provided value for `StdVideoEncodeH265SliceSegmentHeader::slice_qp_delta` in the H.265 slice segment header parameters when that value is different across the slice segments of the encoded frame.

These capability flags provide information to the application about specific H.265 syntax element values that the implementation supports without having to override them and do not otherwise restrict the values that the application can specify for any of the mentioned H.265 syntax elements.

```c
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265StdFlagsKHR;
```

`VkVideoEncodeH265StdFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265StdFlagBitsKHR`.

Bits which may be set in `VkVideoEncodeH265CapabilitiesKHR::ctbSizes`, indicating the CTB sizes supported by the implementation, are:

```c
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265CtbSizeFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_KHR = 0x00000004,
} VkVideoEncodeH265CtbSizeFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_H265_CTB_SIZE_16_BIT_KHR** specifies that a CTB size of 16x16 is supported.
- **VK_VIDEO_ENCODE_H265_CTB_SIZE_32_BIT_KHR** specifies that a CTB size of 32x32 is supported.
- **VK_VIDEO_ENCODE_H265_CTB_SIZE_64_BIT_KHR** specifies that a CTB size of 64x64 is supported.

```c
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265CtbSizeFlagsKHR;
```

`VkVideoEncodeH265CtbSizeFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265CtbSizeFlagBitsKHR`.

Implementations must support at least one of `VkVideoEncodeH265CtbSizeFlagBitsKHR`.

Bits which may be set in `VkVideoEncodeH265CapabilitiesKHR::transformBlockSizes`, indicating the transform block sizes supported by the implementation, are:
// Provided by VK_KHR_video_encode_h265

typedef enum VkVideoEncodeH265TransformBlockSizeFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_KHR = 0x00000008,
} VkVideoEncodeH265TransformBlockSizeFlagBitsKHR;

• VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_4_BIT_KHR specifies that a transform block size of 4x4 is supported.
• VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_8_BIT_KHR specifies that a transform block size of 8x8 is supported.
• VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_16_BIT_KHR specifies that a transform block size of 16x16 is supported.
• VK_VIDEO_ENCODE_H265_TRANSFORM_BLOCK_SIZE_32_BIT_KHR specifies that a transform block size of 32x32 is supported.

// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265TransformBlockSizeFlagsKHR;

VkVideoEncodeH265TransformBlockSizeFlagsKHR is a bitmask type for setting a mask of zero or more VkVideoEncodeH265TransformBlockSizeFlagBitsKHR.

Implementations must support at least one of VkVideoEncodeH265TransformBlockSizeFlagBitsKHR.

42.18.7. H.265 Encode Quality Level Properties

When calling vkGetPhysicalDeviceVideoEncodeQualityLevelPropertiesKHR with pVideoProfile->videoCodecOperation specified as VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the VkVideoEncodeH265QualityLevelPropertiesKHR structure must be included in the pNext chain of the VkVideoEncodeQualityLevelPropertiesKHR structure to retrieve additional video encode quality level properties specific to H.265 encoding.

The VkVideoEncodeH265QualityLevelPropertiesKHR structure is defined as:
```c
typedef struct VkVideoEncodeH265QualityLevelPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkVideoEncodeH265RateControlFlagsKHR preferredRateControlFlags;
    uint32_t preferredGopFrameCount;
    uint32_t preferredIdrPeriod;
    uint32_t preferredConsecutiveBFrameCount;
    uint32_t preferredSubLayerCount;
    VkVideoEncodeH265QpKHR preferredConstantQp;
    uint32_t preferredMaxL0ReferenceCount;
    uint32_t preferredMaxL1ReferenceCount;
} VkVideoEncodeH265QualityLevelPropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **preferredRateControlFlags** is a bitmask of `VkVideoEncodeH265RateControlFlagBitsKHR` values indicating the preferred flags to use for `VkVideoEncodeH265RateControlInfoKHR::flags`.
- **preferredGopFrameCount** indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoKHR::gopFrameCount`.
- **preferredIdrPeriod** indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoKHR::idrPeriod`.
- **preferredConsecutiveBFrameCount** indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoKHR::consecutiveBFrameCount`.
- **preferredSubLayerCount** indicates the preferred value to use for `VkVideoEncodeH265RateControlInfoKHR::subLayerCount`.
- **preferredConstantQp** indicates the preferred values to use for `VkVideoEncodeH265NaluSliceSegmentInfoKHR::constantQp` for each picture type when using rate control mode `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- **preferredMaxL0ReferenceCount** indicates the preferred maximum number of reference pictures to use in the reference list L0.
- **preferredMaxL1ReferenceCount** indicates the preferred maximum number of reference pictures to use in the reference list L1.

**Valid Usage (Implicit)**

- `VUID-VkVideoEncodeH265QualityLevelPropertiesKHR-sType-sType` **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_QUALITY_LEVEL_PROPERTIES_KHR`.

### 42.18.8. H.265 Encode Session

Additional parameters can be specified when creating a video session with an H.265 encode profile by including an instance of the `VkVideoEncodeH265SessionCreateInfoKHR` structure in the `pNext`
chain of VkVideoSessionCreateInfoKHR.

The VkVideoEncodeH265SessionCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMaxLevelIdc;
    StdVideoH265LevelIdc maxLevelIdc;
} VkVideoEncodeH265SessionCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useMaxLevelIdc** indicates whether the value of **maxLevelIdc** should be used by the implementation. When it is set to VK_FALSE, the implementation ignores the value of **maxLevelIdc** and uses the value of VkVideoEncodeH265CapabilitiesKHR::maxLevelIdc, as reported by vkGetPhysicalDeviceVideoCapabilitiesKHR for the video profile.
- **maxLevelIdc** is a StdVideoH265LevelIdc value specifying the upper bound on the H.265 level for the video bitstreams produced by the created video session, where enum constant STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifies H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265SessionCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_CREATE_INFO_KHR

### 42.18.9. H.265 Encode Parameter Sets

Video session parameters objects created with the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR can contain the following types of parameters:

**H.265 Video Parameter Sets (VPS)**

Represented by StdVideoH265VideoParameterSet structures and interpreted as follows:

- **reserved1, reserved2, and reserved3** are used only for padding purposes and are otherwise ignored;
- **vps_video_parameter_set_id** is used as the key of the VPS entry;
- **the max_latency_increase_plus1, max_dec_pic_buffering_minus1, and max_num_reorder_pics** members of the StdVideoH265DecPicBufMgr structure pointed to by pDecPicBufMgr correspond to vps_max_latency_increase_plus1, vps_max_dec_pic_buffering_minus1, and vps_max_num_reorder_pics, respectively, as defined in section 7.4.3.1 of the ITU-T H.265
the StdVideoH265HrdParameters structure pointed to by pHrdParameters is interpreted as follows:

- **reserved** is used only for padding purposes and is otherwise ignored;
- **flags.fixed_pic_rate_general_flag** is a bitmask where bit index $i$ corresponds to $\text{fixed_pic_rate_general_flag}[i]$ as defined in section E.3.2 of the ITU-T H.265 Specification;
- **flags.fixed_pic_rate_within_cvs_flag** is a bitmask where bit index $i$ corresponds to $\text{fixed_pic_rate_within_cvs_flag}[i]$ as defined in section E.3.2 of the ITU-T H.265 Specification;
- **flags.low_delay_hrd_flag** is a bitmask where bit index $i$ corresponds to $\text{low_delay_hrd_flag}[i]$ as defined in section E.3.2 of the ITU-T H.265 Specification;
- if **flags.nal_hrd_parameters_present_flag** is set, then $pSubLayerHrdParametersNal$ is a pointer to an array of $vps\_max\_sub\_layers\_minus1 + 1$ number of StdVideoH265SubLayerHrdParameters structures where $vps\_max\_sub\_layers\_minus1$ is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  - **cbr_flag** is a bitmask where bit index $i$ corresponds to $\text{cbr_flag}[i]$ as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
- if **flags.vcl_hrd_parameters_present_flag** is set, then $pSubLayerHrdParametersVcl$ is a pointer to an array of $vps\_max\_sub\_layers\_minus1 + 1$ number of StdVideoH265SubLayerHrdParameters structures where $vps\_max\_sub\_layers\_minus1$ is the corresponding member of the encompassing StdVideoH265VideoParameterSet structure and each element is interpreted as follows:
  - **cbr_flag** is a bitmask where bit index $i$ corresponds to $\text{cbr_flag}[i]$ as defined in section E.3.3 of the ITU-T H.265 Specification;
  - all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
- all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;
- the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as follows:
  - **general_level_idc** is one of the enum constants STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifying the H.265 level `<major>.<minor>` as defined in section A.4 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265ProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;
- all other members of StdVideoH265VideoParameterSet are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.
H.265 Sequence Parameter Sets (SPS)

Represented by StdVideoH265SequenceParameterSet structures and interpreted as follows:

- reserved1 and reserved2 are used only for padding purposes and are otherwise ignored;
- the pair constructed from sps_video_parameter_set_id and sps_seq_parameter_set_id is used as the key of the SPS entry;
- the StdVideoH265ProfileTierLevel structure pointed to by pProfileTierLevel are interpreted as follows:
  - general_level_idc is one of the enum constants STD_VIDEO_H265_LEVEL_IDC_<major>_<minor> identifying the H.265 level <major>.<minor> as defined in section A.4 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265ProfileTierLevel are interpreted as defined in section 7.4.4 of the ITU-T H.265 Specification;
- the max_latency_increase_plus1, max_dec_pic_buffering_minus1, and max_num_reorder_pics members of the StdVideoH265DecPicBufMgr structure pointed to by pDecPicBufMgr correspond to sps_max_latency_increase_plus1, sps_max_dec_pic_buffering_minus1, and sps_max_num_reorder_pics, respectively, as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
- if flags.sps_scaling_list_data_present_flag is set, then the StdVideoH265ScalingLists structure pointed to by pScalingLists is interpreted as follows:
  - ScalingList4x4, ScalingList8x8, ScalingList16x16, and ScalingList32x32 correspond to ScalingList[0], ScalingList[1], ScalingList[2], and ScalingList[3], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  - ScalingListDCoeff16x16 and ScalingListDCoeff32x32 correspond to scaling_list_dc_coef_minus8[0] and scaling_list_dc_coef_minus8[1], respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
- pShortTermRefPicSet is a pointer to an array of num_short_term_ref_pic_sets number of StdVideoH265ShortTermRefPicSet structures where each element is interpreted as follows:
  - reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
  - used_by_curr_pic_flag is a bitmask where bit index i corresponds to used_by_curr_pic_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - use_delta_flag is a bitmask where bit index i corresponds to use_delta_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - used_by_curr_pic_s0_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s0_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - used_by_curr_pic_s1_flag is a bitmask where bit index i corresponds to used_by_curr_pic_s1_flag[i] as defined in section 7.4.8 of the ITU-T H.265 Specification;
  - all other members of StdVideoH265ShortTermRefPicSet are interpreted as defined in section 7.4.8 of the ITU-T H.265 Specification;
• if flags.long_term_ref_pics_present_flag is set then the StdVideoH265LongTermRefPicsSps structure pointed to by pLongTermRefPicsSps is interpreted as follows:
  ◦ used_by_curr_pic_lt_sps_flag is a bitmask where bit index i corresponds to used_by_curr_pic_lt_sps_flag[i] as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
  ◦ all other members of StdVideoH265LongTermRefPicsSps are interpreted as defined in section 7.4.3.2 of the ITU-T H.265 Specification;
• if flags.vui_parameters_present_flag is set, then the StdVideoH265SequenceParameterSetVui structure pointed to by pSequenceParameterSetVui is interpreted as follows:
  ◦ reserved1, reserved2, and reserved3 are used only for padding purposes and are otherwise ignored;
  ◦ the StdVideoH265HrdParameters structure pointed to by pHrdParameters is interpreted as follows:
    ▪ flags.fixed_pic_rate_general_flag is a bitmask where bit index i corresponds to fixed_pic_rate_general_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
    ▪ flags.fixed_pic_rate_within_cvs_flag is a bitmask where bit index i corresponds to fixed_pic_rate_within_cvs_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
    ▪ flags.low_delay_hrd_flag is a bitmask where bit index i corresponds to low_delay_hrd_flag[i] as defined in section E.3.2 of the ITU-T H.265 Specification;
    ▪ if flags.nal_hrd_parameters_present_flag is set, then pSubLayerHrdParametersNal is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
      ▪ cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
      ▪ all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
    ▪ if flags.vcl_hrd_parameters_present_flag is set, then pSubLayerHrdParametersVcl is a pointer to an array of sps_max_sub_layers_minus1 + 1 number of StdVideoH265SubLayerHrdParameters structures where sps_max_sub_layers_minus1 is the corresponding member of the encompassing StdVideoH265SequenceParameterSet structure and each element is interpreted as follows:
      ▪ cbr_flag is a bitmask where bit index i corresponds to cbr_flag[i] as defined in section E.3.3 of the ITU-T H.265 Specification;
      ▪ all other members of the StdVideoH265SubLayerHrdParameters structure are interpreted as defined in section E.3.3 of the ITU-T H.265 Specification;
    ▪ all other members of StdVideoH265HrdParameters are interpreted as defined in section E.3.2 of the ITU-T H.265 Specification;
all other members of \texttt{pSequenceParameterSetVui} are interpreted as defined in section E.3.1 of the ITU-T H.265 Specification;

- if \texttt{flags.sps_palette_predictor_initializer_present_flag} is set, then the \texttt{PredictorPaletteEntries} member of the \texttt{StdVideoH265PredictorPaletteEntries} structure pointed to by \texttt{pPredictorPaletteEntries} is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;

- all other members of \texttt{StdVideoH265SequenceParameterSet} are interpreted as defined in section 7.4.3.1 of the ITU-T H.265 Specification.

**H.265 Picture Parameter Sets (PPS)**

Represented by \texttt{StdVideoH265PictureParameterSet} structures and interpreted as follows:

- \texttt{reserved1}, \texttt{reserved2}, and \texttt{reserved3} are used only for padding purposes and are otherwise ignored;

- the triplet constructed from \texttt{sps_video_parameter_set_id}, \texttt{pps_seq_parameter_set_id}, and \texttt{pps_pic_parameter_set_id} is used as the key of the PPS entry;

- if \texttt{flags.pps_scaling_list_data_present_flag} is set, then the \texttt{StdVideoH265ScalingLists} structure pointed to by \texttt{pScalingLists} is interpreted as follows:
  - \texttt{ScalingList4x4}, \texttt{ScalingList8x8}, \texttt{ScalingList16x16}, and \texttt{ScalingList32x32} correspond to \texttt{ScalingList[0]}, \texttt{ScalingList[1]}, \texttt{ScalingList[2]}, and \texttt{ScalingList[3]}, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;
  - \texttt{ScalingListDCCoef16x16} and \texttt{ScalingListDCCoef32x32} correspond to \texttt{scaling_list_dc_coef_minus8[0]} and \texttt{scaling_list_dc_coef_minus8[1]}, respectively, as defined in section 7.3.4 of the ITU-T H.265 Specification;

- if \texttt{flags.pps_palette_predictor_initializer_present_flag} is set, then the \texttt{PredictorPaletteEntries} member of the \texttt{StdVideoH265PredictorPaletteEntries} structure pointed to by \texttt{pPredictorPaletteEntries} is interpreted as defined in section 7.4.9.13 of the ITU-T H.265 Specification;

- all other members of \texttt{StdVideoH265PictureParameterSet} are interpreted as defined in section 7.4.3.3 of the ITU-T H.265 Specification.

Implementations may override any of these parameters according to the semantics defined in the Video Encode Parameter Overrides section before storing the resulting H.265 parameter sets into the video session parameters object. Applications need to use the \texttt{vkGetEncodedVideoSessionParametersKHR} command to determine whether any implementation overrides happened and to retrieve the encoded H.265 parameter sets in order to be able to produce a compliant H.265 video bitstream.

Such H.265 parameter set overrides may also have cascading effects on the implementation overrides applied to the encoded bitstream produced by video encode operations. If the implementation supports the \texttt{VK_VIDEO_ENCODE_FEEDBACK_BITSTREAM_HAS_OVERRIDES_BIT_KHR} video encode feedback query flag, then the application can use such queries to retrieve feedback about whether any implementation overrides have been applied to the encoded bitstream.
When a video session parameters object is created with the codec operation
VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, the VkVideoSessionParametersCreateInfoKHR::pNext
chain must include a VkVideoEncodeH265SessionParametersCreateInfoKHR structure specifying the
capacity and initial contents of the object.

The VkVideoEncodeH265SessionParametersCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxStdVPSCount;
    uint32_t maxStdSPSCount;
    uint32_t maxStdPPSCount;
    const VkVideoEncodeH265SessionParametersAddInfoKHR* pParametersAddInfo;
} VkVideoEncodeH265SessionParametersCreateInfoKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxStdVPSCount** is the maximum number of H.265 VPS entries the created
  VkVideoSessionParametersKHR can contain.
- **maxStdSPSCount** is the maximum number of H.265 SPS entries the created
  VkVideoSessionParametersKHR can contain.
- **maxStdPPSCount** is the maximum number of H.265 PPS entries the created
  VkVideoSessionParametersKHR can contain.
- **pParametersAddInfo** is NULL or a pointer to a VkVideoEncodeH265SessionParametersAddInfoKHR
  structure specifying H.265 parameters to add upon object creation.

Valid Usage (Implicit)

- VUID-VkVideoEncodeH265SessionParametersCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_CREATE_INFO_KHR

- VUID-VkVideoEncodeH265SessionParametersCreateInfoKHR-pParametersAddInfo-parameter
  If pParametersAddInfo is not NULL, pParametersAddInfo must be a valid pointer to a valid
  VkVideoEncodeH265SessionParametersAddInfoKHR structure

The VkVideoEncodeH265SessionParametersAddInfoKHR structure is defined as:
typedef struct VkVideoEncodeH265SessionParametersAddInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t stdVPSCount;
    const StdVideoH265VideoParameterSet* pStdVPSs;
    uint32_t stdSPSCount;
    const StdVideoH265SequenceParameterSet* pStdSPSs;
    uint32_t stdPPSCount;
    const StdVideoH265PictureParameterSet* pStdPPSs;
} VkVideoEncodeH265SessionParametersAddInfoKHR;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• stdVPSCount is the number of elements in the pStdVPSs array.
• pStdVPSs is a pointer to an array of StdVideoH265VideoParameterSet structures describing the H.265 VPS entries to add.
• stdSPSCount is the number of elements in the pStdSPSs array.
• pStdSPSs is a pointer to an array of StdVideoH265SequenceParameterSet structures describing the H.265 SPS entries to add.
• stdPPSCount is the number of elements in the pStdPPSs array.
• pStdPPSs is a pointer to an array of StdVideoH265PictureParameterSet structures describing the H.265 PPS entries to add.

This structure can be specified in the following places:

• In the pParametersAddInfo member of the VkVideoEncodeH265SessionParametersCreateInfoKHR structure specified in the pNext chain of VkVideoSessionParametersCreateInfoKHR used to create a video session parameters object. In this case, if the video codec operation the video session parameters object is created with is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then it defines the set of initial parameters to add to the created object (see Creating Video Session Parameters).

• In the pNext chain of VkVideoSessionParametersUpdateInfoKHR. In this case, if the video codec operation the video session parameters object to be updated was created with is VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, then it defines the set of parameters to add to it (see Updating Video Session Parameters).

Valid Usage (Implicit)

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_ADD_INFO_KHR

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdVPSs-parameter
  If stdVPSCount is not 0, and pStdVPSs is not NULL, pStdVPSs must be a valid pointer to an array of stdVPSCount StdVideoH265VideoParameterSet values
• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdSPSs-parameter
  If stdSPSCount is not 0, and pStdSPs is not NULL, pStdSPSs must be a valid pointer to an array of stdSPSCount StdVideoH265SequenceParameterSet values

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-pStdPPSs-parameter
  If stdPPSCount is not 0, and pStdPPSs is not NULL, pStdPPSs must be a valid pointer to an array of stdPPSCount StdVideoH265PictureParameterSet values

Valid Usage

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06438
  The vps_video_parameter_set_id member of each StdVideoH265VideoParameterSet structure specified in the elements of pStdVPSs must be unique within pStdVPSs

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06439
  The pair constructed from the sps_video_parameter_set_id and sps_seq_parameter_set_id members of each StdVideoH265SequenceParameterSet structure specified in the elements of pStdSPSs must be unique within pStdSPSs

• VUID-VkVideoEncodeH265SessionParametersAddInfoKHR-None-06440
  The triplet constructed from the sps_video_parameter_set_id, pps_seq_parameter_set_id, and pps_pic_parameter_set_id members of each StdVideoH265PictureParameterSet structure specified in the elements of pStdPPSs must be unique within pStdPPSs

The VkVideoEncodeH265SessionParametersGetInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersGetInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 writeStdVPS;
    VkBool32 writeStdSPS;
    VkBool32 writeStdPPS;
    uint32_t stdVPSId;
    uint32_t stdSPSId;
    uint32_t stdPPSId;
} VkVideoEncodeH265SessionParametersGetInfoKHR;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• writeStdVPS indicates whether the encoded H.265 video parameter set identified by stdVPSId is requested to be retrieved.

• writeStdSPS indicates whether the encoded H.265 sequence parameter set identified by the pair constructed from stdVPSId and stdSPSId is requested to be retrieved.

• writeStdPPS indicates whether the encoded H.265 picture parameter set identified by the triplet constructed from stdVPSId, stdSPSId, and stdPPSId is requested to be retrieved.
• **stdVPSId** specifies the H.265 video parameter set ID used to identify the retrieved H.265 video, sequence, and/or picture parameter set(s).

• **stdSPSId** specifies the H.265 sequence parameter set ID used to identify the retrieved H.265 sequence and/or picture parameter set(s) when `writeStdSPS` and/or `writeStdPPS` is set to **VK_TRUE**.

• **stdPPSId** specifies the H.265 picture parameter set ID used to identify the retrieved H.265 picture parameter set when `writeStdPPS` is set to **VK_TRUE**.

When this structure is specified in the `pNext` chain of the `VkVideoEncodeSessionParametersGetInfoKHR` structure passed to `vkGetEncodedVideoSessionParametersKHR`, the command will write encoded parameter data to the output buffer in the following order:

1. The **H.265 video parameter set** identified by `stdVPSId`, if `writeStdVPS` is set to **VK_TRUE**.
2. The **H.265 sequence parameter set** identified by the pair constructed from `stdVPSId` and `stdSPSId`, if `writeStdSPS` is set to **VK_TRUE**.
3. The **H.265 picture parameter set** identified by the triplet constructed from `stdVPSId`, `stdSPSId`, and `stdPPSId`, if `writeStdPPS` is set to **VK_TRUE**.

---

### Valid Usage

- **VUID-VkVideoEncodeH265SessionParametersGetInfoKHR-writeStdVPS-08290**
  
  At least one of `writeStdVPS`, `writeStdSPS`, and `writeStdPPS` must be set to **VK_TRUE**

---

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH265SessionParametersGetInfoKHR-sType-sType**
  
  `sType` must be **VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_GET_INFO_KHR**

---

The `VkVideoEncodeH265SessionParametersFeedbackInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265SessionParametersFeedbackInfoKHR {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          hasStdVPSOverrides;
    VkBool32          hasStdSPSOversrides;
    VkBool32          hasStdPPSOverrides;
} VkVideoEncodeH265SessionParametersFeedbackInfoKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.

- **pNext** is **NULL** or a pointer to a structure extending this structure.

- **hasStdVPSOverrides** indicates whether any of the parameters of the requested **H.265 video parameter set**, if one was requested via `VkVideoEncodeH265SessionParametersGetInfoKHR`
\texttt{writeStdVPS}, were \textit{overridden} by the implementation.

- \texttt{hasStdSPSOverides} indicates whether any of the parameters of the requested \textit{H.265 sequence parameter set}, if one was requested via \texttt{VkVideoEncodeH265SessionParametersGetInfoKHR} \texttt{::writeStdSPS}, were \textit{overridden} by the implementation.

- \texttt{hasStdPPSOverides} indicates whether any of the parameters of the requested \textit{H.265 picture parameter set}, if one was requested via \texttt{VkVideoEncodeH265SessionParametersGetInfoKHR} \texttt{::writeStdPPS}, were \textit{overridden} by the implementation.

\begin{center}
\textbf{Valid Usage (Implicit)}
\end{center}

- \texttt{VUID-VkVideoEncodeH265SessionParametersFeedbackInfoKHR-sType-sType} \texttt{sType} \texttt{must} \texttt{be} \texttt{VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_SESSION_PARAMETERS_FEEDBACK_INFO_KHR}

\subsection*{42.18.10. \textit{H.265 Encoding Parameters}}

The \texttt{VkVideoEncodeH265PictureInfoKHR} structure is defined as:

\begin{verbatim}
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265PictureInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t naluSliceSegmentEntryCount;
    const VkVideoEncodeH265NaluSliceSegmentInfoKHR* pNaluSliceSegmentEntries;
    const StdVideoEncodeH265PictureInfo* pStdPictureInfo;
} VkVideoEncodeH265PictureInfoKHR;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.

- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.

- \texttt{naluSliceSegmentEntryCount} is the number of elements in \texttt{pNaluSliceSegmentEntries}.

- \texttt{pNaluSliceSegmentEntries} is a pointer to an array of \texttt{naluSliceSegmentEntryCount} \texttt{VkVideoEncodeH265NaluSliceSegmentInfoKHR} structures specifying the parameters of the individual \textit{H.265 slice segments} to encode for the input picture.

- \texttt{pStdPictureInfo} is a pointer to a \texttt{StdVideoEncodeH265PictureInfo} structure specifying \textit{H.265 picture information}.

This structure is specified in the \texttt{pNext} chain of the \texttt{VkVideoEncodeInfoKHR} structure passed to \texttt{vkCmdEncodeVideoKHR} to specify the codec-specific picture information for an \textit{H.265 encode operation}.

\textbf{Encode Input Picture Information}

When this structure is specified in the \texttt{pNext} chain of the \texttt{VkVideoEncodeInfoKHR} structure passed to \texttt{vkCmdEncodeVideoKHR}, the information related to the \textit{encode input picture} is defined as follows:
The image subregion used is determined according to the H.265 Encode Picture Data Access section.

The encode input picture is associated with the H.265 picture information provided in pStdPictureInfo.

**Std Picture Information**

The members of the StdVideoEncodeH265PictureInfo structure pointed to by pStdPictureInfo are interpreted as follows:

- **flags.reserved** and **reserved1** are used only for padding purposes and are otherwise ignored;
- **flags.is_reference** as defined in section 3.132 of the ITU-T H.265 Specification;
- **flags.IrapPicFlag** as defined in section 3.73 of the ITU-T H.265 Specification;
- **flags.used_for_long_term_reference** is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
- **flags.discardable_flag** and **cross_layer_bla_flag** as defined in section F.7.4.7.1 of the ITU-T H.265 Specification;
- **pic_type** as defined in section 7.4.3.5 of the ITU-T H.265 Specification;
- **sps_video_parameter_set_id**, **pps_seq_parameter_set_id**, and **pps_pic_parameter_set_id** are used to identify the active parameter sets, as described below;
- **PicOrderCntVal** as defined in section 8.3.1 of the ITU-T H.265 Specification;
- **TemporalId** as defined in section 7.4.2.2 of the ITU-T H.265 Specification;
- if **pRefLists** is not NULL, then it is a pointer to a StdVideoEncodeH265ReferenceListsInfo structure that is interpreted as follows:
  - **flags.reserved** is used only for padding purposes and is otherwise ignored;
  - **ref_pic_list_modification_flag_l0** and **ref_pic_list_modification_flag_l1** as defined in section 7.4.7.2 of the ITU-T H.265 Specification;
  - **num_ref_idx_l0_active_minus1** and **num_ref_idx_l1_active_minus1** as defined in section 7.4.7.1 of the ITU-T H.265 Specification;
  - **RefPicList0** and **RefPicList1** as defined in section 8.3.4 of the ITU-T H.265 Specification where each element of these arrays either identifies an active reference picture using its DPB slot index or contains the value **STD_VIDEO_H265_NO_REFERENCE_PICTURE** to indicate “no reference picture”;
  - **list_entry_l0** and **list_entry_l1** as defined in section 7.4.7.2 of the ITU-T H.265 Specification;
- if **flags.short_term_ref_pic_set_sps_flag** is set, then the StdVideoH265ShortTermRefPicSet structure pointed to by **pShortTermRefPicSet** is interpreted as defined for the elements of the **pShortTermRefPicSet** array specified in H.265 sequence parameter sets.
- if **flags.long_term_ref_pics_present_flag** is set in the active SPS, then the StdVideoEncodeH265LongTermRefPics structure pointed to by **pLongTermRefPics** is interpreted as follows:
  - **used_by_curr_pic_lt_flag** is a bitmask where bit index i corresponds to
used_by_curr_pic_lt_flag[i] as defined in section 7.4.7.1 of the ITU-T H.265 Specification;

- all other members of StdVideoEncodeH265LongTermRefPics are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification;

- all other members are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification.

Reference picture setup is controlled by the value of StdVideoEncodeH265PictureInfo::flags.is_reference. If it is set and a reconstructed picture is specified, then the latter is used as the target of picture reconstruction to activate the DPB slot specified in pEncodeInfo->pSetupReferenceSlot->slotIndex. If StdVideoEncodeH265PictureInfo::flags.is_reference is not set, but a reconstructed picture is specified, then the corresponding picture reference associated with the DPB slot is invalidated, as described in the DPB Slot States section.

**Active Parameter Sets**

The members of the StdVideoEncodeH265PictureInfo structure pointed to by pStdPictureInfo are used to select the active parameter sets to use from the bound video session parameters object, as follows:

- The active VPS is the VPS identified by the key specified in StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id.

- The active SPS is the SPS identified by the key specified by the pair constructed from StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id and StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id.

- The active PPS is the PPS identified by the key specified by the triplet constructed from StdVideoEncodeH265PictureInfo::sps_video_parameter_set_id, StdVideoEncodeH265PictureInfo::pps_seq_parameter_set_id, and StdVideoEncodeH265PictureInfo::pps_pic_parameter_set_id.

H.265 encoding uses *explicit weighted sample prediction* for a slice segment, as defined in section 8.5.3.3.4 of the ITU-T H.265 Specification, if any of the following conditions are true for the active PPS and the pStdSliceSegmentHeader member of the corresponding element of pNaluSliceSegmentEntries:

- pStdSliceSegmentHeader->slice_type is STD_VIDEO_H265_SLICE_TYPE_P and weighted_pred_flag is enabled in the active PPS.

- pStdSliceSegmentHeader->slice_type is STD_VIDEO_H265_SLICE_TYPE_B and weighted_bipred_flag is enabled in the active PPS.

The number of H.265 tiles, as defined in section 3.174 of the ITU-T H.265 Specification, is derived from the num_tile_columns_minus1 and num_tile_rows_minus1 members of the active PPS as follows:

\[(\text{num_tile_columns_minus1} + 1) \times (\text{num_tile_rows_minus1} + 1)\]

**Valid Usage**

- VUID-VkVideoEncodeH265PictureInfoKHR-naluSliceSegmentEntryCount-08306 naluSliceSegmentEntryCount must be between 1 and VkVideoEncodeH265CapabilitiesKHR
maxSliceSegmentCount, inclusive, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile

- **VUID-VkVideoEncodeH265PictureInfoKHR-flags-08323**
  If `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_TILES_PER_SLICE_SEGMENT_BIT_KHR`, then `naluSliceSegmentEntryCount` must be greater than or equal to the number of H.265 tiles in the picture.

- **VUID-VkVideoEncodeH265PictureInfoKHR-flags-08324**
  If `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_MULTIPLE_SLICE_SEGMENTS_PER_TILE_BIT_KHR`, then `naluSliceSegmentEntryCount` must be less than or equal to the number of H.265 tiles in the picture.

- **VUID-VkVideoEncodeH265PictureInfoKHR-flags-08316**
  If `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_PREDICTION_WEIGHT_TABLE_GENERATED_BIT_KHR` and the slice segment corresponding to any element of `pNaluSliceSegmentEntries` uses explicit weighted sample prediction, then `VkVideoEncodeH265NaluSliceSegmentInfoKHR::pStdSliceSegmentHeader->pWeightTable` must not be `NULL` for that element of `pNaluSliceSegmentEntries`.

- **VUID-VkVideoEncodeH265PictureInfoKHR-flags-08317**
  If `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_DIFFERENT_SLICE_SEGMENT_TYPE_BIT_KHR`, then `VkVideoEncodeH265NaluSliceSegmentInfoKHR::pStdSliceSegmentHeader->slice_type` must be identical for all elements of `pNaluSliceSegmentEntries`.

**Valid Usage (Implicit)**

- **VUID-VkVideoEncodeH265PictureInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_PICTURE_INFO_KHR`.

- **VUID-VkVideoEncodeH265PictureInfoKHR-pNaluSliceSegmentEntries-parameter**
  `pNaluSliceSegmentEntries` must be a valid pointer to an array of `naluSliceSegmentEntryCount` valid `VkVideoEncodeH265NaluSliceSegmentInfoKHR` structures.

- **VUID-VkVideoEncodeH265PictureInfoKHR-pStdPictureInfo-parameter**
  `pStdPictureInfo` must be a valid pointer to a valid `StdVideoEncodeH265PictureInfo` value.

- **VUID-VkVideoEncodeH265PictureInfoKHR-naluSliceSegmentEntryCount-arraylength**
  `naluSliceSegmentEntryCount` must be greater than 0.

The `VkVideoEncodeH265NaluSliceSegmentInfoKHR` structure is defined as:
typedef struct VkVideoEncodeH265NaluSliceSegmentInfoKHR {
    VkStructureType sType;
    const void *pNext;
    int32_t constantQp;
    const StdVideoEncodeH265SliceSegmentHeader *pStdSliceSegmentHeader;
} VkVideoEncodeH265NaluSliceSegmentInfoKHR;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **constantQp** is the QP to use for the slice segment if the current rate control mode configured for the video session is `VK_VIDEO_ENCODE_RATE_CONTROL_MODE_DISABLED_BIT_KHR`.
- **pStdSliceSegmentHeader** is a pointer to a `StdVideoEncodeH265SliceSegmentHeader` structure specifying **H.265 slice segment header parameters** for the slice segment.

**Std Slice Segment Header Parameters**

The members of the `StdVideoEncodeH265SliceSegmentHeader` structure pointed to by **pStdSliceSegmentHeader** are interpreted as follows:

- **flags.reserved** and **reserved1** are used only for padding purposes and are otherwise ignored;
- if **pWeightTable** is not NULL, then it is a pointer to a `StdVideoEncodeH265WeightTable` that is interpreted as follows:
  - **flags.luma_weight_l0_flag**, **flags.chroma_weight_l0_flag**, **flags.luma_weight_l1_flag**, and **flags.chroma_weight_l1_flag** are bitmasks where bit index `i` corresponds to **luma_weight_l0_flag[i]**, **chroma_weight_l0_flag[i]**, **luma_weight_l1_flag[i]**, and **chroma_weight_l1_flag[i]**, respectively, as defined in section 7.4.7.3 of the ITU-T H.265 Specification;
  - all other members of `StdVideoEncodeH265WeightTable` are interpreted as defined in section 7.4.7.3 of the ITU-T H.265 Specification;
- all other members are interpreted as defined in section 7.4.7.1 of the ITU-T H.265 Specification.

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_NALU_SLICE_SEGMENT_INFO_KHR`
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-pNext-pNext
  **pNext** must be NULL
- VUID-VkVideoEncodeH265NaluSliceSegmentInfoKHR-pStdSliceSegmentHeader-parameter
  **pStdSliceSegmentHeader** must be a valid pointer to a valid `StdVideoEncodeH265SliceSegmentHeader` value
The `VkVideoEncodeH265DpbSlotInfoKHR` structure is defined as:

```c
typedef struct VkVideoEncodeH265DpbSlotInfoKHR {
    VkStructureType sType;
    const void* pNext;
    const StdVideoEncodeH265ReferenceInfo* pStdReferenceInfo;
} VkVideoEncodeH265DpbSlotInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pStdReferenceInfo` is a pointer to a `StdVideoEncodeH265ReferenceInfo` structure specifying H.265 reference information.

This structure is specified in the `pNext` chain of `VkVideoEncodeInfoKHR::pSetupReferenceSlot`, if not `NULL`, and the `pNext` chain of the elements of `VkVideoEncodeInfoKHR::pReferenceSlots` to specify the codec-specific reference picture information for an H.265 encode operation.

### Active Reference Picture Information

When this structure is specified in the `pNext` chain of the elements of `VkVideoEncodeInfoKHR::pReferenceSlots`, one element is added to the list of active reference pictures used by the video encode operation for each element of `VkVideoEncodeInfoKHR::pReferenceSlots` as follows:

- The image subregion used is determined according to the H.265 Encode Picture Data Access section.
- The reference picture is associated with the DPB slot index specified in the `slotIndex` member of the corresponding element of `VkVideoEncodeInfoKHR::pReferenceSlots`.
- The reference picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

### Reconstructed Picture Information

When this structure is specified in the `pNext` chain of `VkVideoEncodeInfoKHR::pSetupReferenceSlot`, the information related to the reconstructed picture is defined as follows:

- The image subregion used is determined according to the H.265 Encode Picture Data Access section.
- If reference picture setup is requested, then the reconstructed picture is used to activate the DPB slot with the index specified in `VkVideoEncodeInfoKHR::pSetupReferenceSlot->slotIndex`.
- The reconstructed picture is associated with the H.265 reference information provided in `pStdReferenceInfo`.

### Std Reference Information

The members of the `StdVideoEncodeH265ReferenceInfo` structure pointed to by `pStdReferenceInfo` are interpreted as follows:
• `flags.reserved` is used only for padding purposes and is otherwise ignored;
• `flags.used_for_long_term_reference` is used to indicate whether the picture is marked as “used for long-term reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
• `flags.unused_for_reference` is used to indicate whether the picture is marked as “unused for reference” as defined in section 8.3.2 of the ITU-T H.265 Specification;
• `pic_type` as defined in section 7.4.3.5 of the ITU-T H.265 Specification;
• `PicOrderCntVal` as defined in section 8.3.1 of the ITU-T H.265 Specification;
• `TemporalId` as defined in section 7.4.2.2 of the ITU-T H.265 Specification.

Valid Usage (Implicit)

• `VUID-VkVideoEncodeH265DpbSlotInfoKHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_DPB_SLOT_INFO_KHR`
• `VUID-VkVideoEncodeH265DpbSlotInfoKHR-pStdReferenceInfo-parameter`  
  `pStdReferenceInfo` must be a valid pointer to a valid `StdVideoEncodeH265ReferenceInfo` value

42.18.11. H.265 Encode Rate Control

Group of Pictures

In case of H.265 encoding it is common practice to follow a regular pattern of different picture types in display order when encoding subsequent frames. This pattern is referred to as the group of pictures (GOP).

A regular GOP is defined by the following parameters:

• The number of frames in the GOP;
• The number of consecutive B frames between I and/or P frames in display order.

GOPs are further classified as open and closed GOPs.

Frame types in an open GOP follow each other in display order according to the following algorithm:

1. The first frame is always an I frame.
2. This is followed by a number of consecutive B frames, as defined above.
3. If the number of frames in the GOP is not reached yet, then the next frame is a P frame and the algorithm continues from step 2.
In case of a closed GOP, an IDR frame is used at a certain period.

It is also typical for H.265 encoding to use specific reference picture usage patterns across the frames of the GOP. The two most common reference patterns used are as follows:

**Flat Reference Pattern**
- Each P frame uses the last non-B frame, in display order, as reference.
- Each B frame uses the last non-B frame, in display order, as its forward reference, and uses the next non-B frame, in display order, as its backward reference.

**Dyadic Reference Pattern**
- Each P frame uses the last non-B frame, in display order, as reference.
The following algorithm is applied to the sequence of consecutive B frames between I and/or P frames in display order:

1. The B frame in the middle of this sequence uses the frame preceding the sequence as its forward reference, and uses the frame following the sequence as its backward reference.
2. The algorithm is executed recursively for the following frame sequences:
   - The B frames of the original sequence preceding the frame in the middle, if any.
   - The B frames of the original sequence following the frame in the middle, if any.

![Figure 39. H.265 dyadic reference pattern](text is not SVG - cannot display)

The application can provide guidance to the implementation's rate control algorithm about the structure of the GOP used by the application. Any such guidance about the GOP and its structure does not mandate that specific GOP structure to be used by the application, as the picture type of individual encoded pictures is still application-controlled, however, any deviation from the provided guidance may result in undesired rate control behavior including, but not limited, to the implementation not being able to conform to the expected average or target bitrates, or other rate control parameters specified by the application.

When an H.265 encode session is used to encode multiple temporal sub-layers, it is also common practice to follow a regular pattern for the H.265 temporal ID for the encoded pictures in display order when encoding subsequent frames. This pattern is referred to as the temporal GOP. The most common temporal layer pattern used is as follows:

**Dyadic Temporal Sub-Layer Pattern**

- The number of frames in the temporal GOP is $2^{n-1}$, where $n$ is the number of temporal sub-layers.
- The $i^{th}$ frame in the temporal GOP uses temporal ID $t$, if and only if the index of the least significant bit set in $i$ equals $n-t-1$, except for the first frame, which is the only frame in the temporal GOP using temporal ID zero.
- The $i^{th}$ frame in the temporal GOP uses the $r^{th}$ frame as reference, where $r$ is calculated from $i$ by clearing the least significant bit set in it, except for the first frame in the temporal GOP, which uses the first frame of the previous temporal GOP, if any, as reference.
Figure 40. H.265 dyadic temporal sub-layer pattern

**Note**
Multi-layer rate control and multi-layer coding are typically used for streaming cases where low latency is expected, hence B pictures with backward prediction are usually not used.

The `VkVideoEncodeH265RateControlInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265RateControlInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkVideoEncodeH265RateControlFlagsKHR flags;
    uint32_t gopFrameCount;
    uint32_t idrPeriod;
    uint32_t consecutiveBFrameCount;
    uint32_t subLayerCount;
} VkVideoEncodeH265RateControlInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkVideoEncodeH265RateControlFlagBitsKHR` specifying H.265 rate control flags.
- `gopFrameCount` is the number of frames within a group of pictures (GOP) intended to be used by the application. If it is set to 0, the rate control algorithm may assume an implementation-dependent GOP length. If it is set to `UINT32_MAX`, the GOP length is treated as infinite.
- `idrPeriod` is the interval, in terms of number of frames, between two IDR frames (see IDR period). If it is set to 0, the rate control algorithm may assume an implementation-dependent IDR period. If it is set to `UINT32_MAX`, the IDR period is treated as infinite.
• **consecutiveBFrameCount** is the number of consecutive B frames between I and/or P frames within the GOP.

• **temporalLayerCount** specifies the number of H.265 sub-layers that the application intends to use.

When an instance of this structure is included in the `pNext` chain of the `VkVideoCodingControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command, and `VkVideoCodingControlInfoKHR::flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, the parameters in this structure are used as guidance for the implementation's rate control algorithm (see Video Coding Control).

If `flags` includes `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`, then the rate control state is reset to an initial state to meet HRD compliance requirements. Otherwise the new rate control state **may** be applied without a reset depending on the implementation and the specified rate control parameters.

---

**Valid Usage**

- **VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08291**
  If `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_HRD_COMPLIANCE_BIT_KHR`, then `flags` must not contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR`.

- **VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08292**
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR` or `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`, then it must also contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR`.

- **VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08293**
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR`, then it must not also contain `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR`.

- **VUID-VkVideoEncodeH265RateControlInfoKHR-flags-08294**
  If `flags` contains `VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR`, then `gopFrameCount` must be greater than 0.

- **VUID-VkVideoEncodeH265RateControlInfoKHR-idrPeriod-08295**
  If `idrPeriod` is not 0, then it must be greater than or equal to `gopFrameCount`.

- **VUID-VkVideoEncodeH265RateControlInfoKHR-consecutiveBFrameCount-08296**
  If `consecutiveBFrameCount` is not 0, then it must be less than `gopFrameCount`.
Valid Usage (Implicit)

- **VUID-VkVideoEncodeH265RateControlInfoKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_INFO_KHR`

- **VUID-VkVideoEncodeH265RateControlInfoKHR-flags-parameter**
  - `flags` must be a valid combination of `VkVideoEncodeH265RateControlFlagBitsKHR` values

Bits which can be set in `VkVideoEncodeH265RateControlInfoKHR::flags`, specifying H.265 rate control flags, are:

```plaintext
// Provided by VK_KHR_video_encode_h265
typedef enum VkVideoEncodeH265RateControlFlagBitsKHR {
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR = 0x00000001,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR = 0x00000002,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR = 0x00000004,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR = 0x00000008,
    VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_KHR = 0x00000010,
} VkVideoEncodeH265RateControlFlagBitsKHR;
```

- **VK_VIDEO_ENCODE_H265_RATE_CONTROL_ATTEMPT_HRD_COMPLIANCE_BIT_KHR** specifies that rate control should attempt to produce an HRD compliant bitstream, as defined in annex C of the ITU-T H.265 Specification.

- **VK_VIDEO_ENCODE_H265_RATE_CONTROL_REGULAR_GOP_BIT_KHR** specifies that the application intends to use a regular GOP structure according to the parameters specified in the `gopFrameCount`, `idrPeriod`, and `consecutiveBFrameCount` members of the `VkVideoEncodeH265RateControlInfoKHR` structure.

- **VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_FLAT_BIT_KHR** specifies that the application intends to follow a flat reference pattern in the GOP.

- **VK_VIDEO_ENCODE_H265_RATE_CONTROL_REFERENCE_PATTERN_DYADIC_BIT_KHR** specifies that the application intends to follow a dyadic reference pattern in the GOP.

- **VK_VIDEO_ENCODE_H265_RATE_CONTROL_TEMPORAL_SUB_LAYER_PATTERN_DYADIC_BIT_KHR** specifies that the application intends to follow a dyadic temporal sub-layer pattern.

```plaintext
// Provided by VK_KHR_video_encode_h265
typedef VkFlags VkVideoEncodeH265RateControlFlagsKHR;
```

`VkVideoEncodeH265RateControlFlagsKHR` is a bitmask type for setting a mask of zero or more `VkVideoEncodeH265RateControlFlagBitsKHR`.

Rate Control Layers

The `VkVideoEncodeH265RateControlLayerInfoKHR` structure is defined as:
typedef struct VkVideoEncodeH265RateControlLayerInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useMinQp;
    VkVideoEncodeH265QpKHR minQp;
    VkBool32 useMaxQp;
    VkVideoEncodeH265QpKHR maxQp;
    VkBool32 useMaxFrameSize;
    VkVideoEncodeH265FrameSizeKHR maxFrameSize;
} VkVideoEncodeH265RateControlLayerInfoKHR;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **useMinQp** indicates whether the QP values determined by rate control will be clamped to the lower bounds on the QP values specified in minQp.
- **minQp** specifies the lower bounds on the QP values, for each picture type, that the implementation’s rate control algorithm will use when useMinQp is set to VK_TRUE.
- **useMaxQp** indicates whether the QP values determined by rate control will be clamped to the upper bounds on the QP values specified in maxQp.
- **maxQp** specifies the upper bounds on the QP values, for each picture type, that the implementation’s rate control algorithm will use when useMaxQp is set to VK_TRUE.
- **useMaxFrameSize** indicates whether the implementation’s rate control algorithm should use the values specified in maxFrameSize as the upper bounds on the encoded frame size for each picture type.
- **maxFrameSize** specifies the upper bounds on the encoded frame size, for each picture type, when useMaxFrameSize is set to VK_TRUE.

When used, the values in minQp and maxQp guarantee that the effective QP values used by the implementation will respect those lower and upper bounds, respectively. However, limiting the range of QP values that the implementation is able to use will also limit the capabilities of the implementation’s rate control algorithm to comply to other constraints. In particular, the implementation may not be able to comply to the following:

- The average and/or peak bitrate values to be used for the encoded bitstream specified in the averageBitrate and maxBitrate members of the VkVideoEncodeRateControlLayerInfoKHR structure.
- The upper bounds on the encoded frame size, for each picture type, specified in the maxFrameSize member of VkVideoEncodeH265RateControlLayerInfoKHR.

**Note**

In general, applications need to configure rate control parameters appropriately in order to be able to get the desired rate control behavior, as described in the Video Encode Rate Control section.
When an instance of this structure is included in the `pNext` chain of a `VkVideoEncodeRateControlLayerInfoKHR` structure specified in one of the elements of the `pLayers` array member of the `VkVideoEncodeRateControlInfoKHR` structure passed to the `vkCmdControlVideoCodingKHR` command, `VkVideoCodingControlInfoKHR::flags` includes `VK_VIDEO_CODING_CONTROL_ENCODE_RATE_CONTROL_BIT_KHR`, and the bound video session was created with the video codec operation `VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR`, it specifies the H.265-specific rate control parameters of the rate control layer corresponding to that element of `pLayers`.

### Valid Usage

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08297**
  If `useMinQp` is `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `minQp` must all be between `VkVideoEncodeH265CapabilitiesKHR::minQp` and `VkVideoEncodeH265CapabilitiesKHR::maxQp`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMaxQp-08298**
  If `useMaxQp` is `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `maxQp` must all be between `VkVideoEncodeH265CapabilitiesKHR::minQp` and `VkVideoEncodeH265CapabilitiesKHR::maxQp`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08299**
  If `useMinQp` is `VK_TRUE` and `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR`, then the `qpI`, `qpP`, and `qpB` members of `minQp` must all specify the same value.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMaxQp-08300**
  If `useMaxQp` is `VK_TRUE` and `VkVideoEncodeH265CapabilitiesKHR::flags`, as returned by `vkGetPhysicalDeviceVideoCapabilitiesKHR` for the used video profile, does not include `VK_VIDEO_ENCODE_H265_CAPABILITY_PER_PICTURE_TYPE_MIN_MAX_QP_BIT_KHR`, then the `qpI`, `qpP`, and `qpB` members of `maxQp` must all specify the same value.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-useMinQp-08375**
  If `useMinQp` and `useMaxQp` are both `VK_TRUE`, then the `qpI`, `qpP`, and `qpB` members of `minQp` must all be less than or equal to the respective members of `maxQp`.

### Valid Usage (Implicit)

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_RATE_CONTROL_LAYER_INFO_KHR`.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-minQp-parameter**
  `minQp` must be a valid `VkVideoEncodeH265QpKHR` structure.

- **VUID-VkVideoEncodeH265RateControlLayerInfoKHR-maxQp-parameter**
  `maxQp` must be a valid `VkVideoEncodeH265QpKHR` structure.
• maxFrameSize must be a valid VkVideoEncodeH265FrameSizeKHR structure

The VkVideoEncodeH265QpKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265QpKHR {
    int32_t qpI;
    int32_t qpP;
    int32_t qpB;
} VkVideoEncodeH265QpKHR;
```

- qpI is the QP to be used for I pictures.
- qpP is the QP to be used for P pictures.
- qpB is the QP to be used for B pictures.

The VkVideoEncodeH265FrameSizeKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265FrameSizeKHR {
    uint32_t frameISize;
    uint32_t framePSize;
    uint32_t frameBSize;
} VkVideoEncodeH265FrameSizeKHR;
```

- frameISize is the size in bytes to be used for I frames.
- framePSize is the size in bytes to be used for P frames.
- frameBSize is the size in bytes to be used for B frames.

GOP Remaining Frames

Besides session level rate control configuration, the application can specify the number of frames per frame type remaining in the group of pictures (GOP).

The VkVideoEncodeH265GopRemainingFrameInfoKHR structure is defined as:

```c
// Provided by VK_KHR_video_encode_h265
typedef struct VkVideoEncodeH265GopRemainingFrameInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkBool32 useGopRemainingFrames;
    uint32_t gopRemainingI;
    uint32_t gopRemainingP;
    uint32_t gopRemainingB;
} VkVideoEncodeH265GopRemainingFrameInfoKHR;
```
• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **useGopRemainingFrames** indicates whether the implementation’s rate control algorithm should use the values specified in **gopRemainingI**, **gopRemainingP**, and **gopRemainingB**. If **useGopRemainingFrames** is VK_FALSE, then the values of **gopRemainingI**, **gopRemainingP**, and **gopRemainingB** are ignored.

• **gopRemainingI** specifies the number of **I frames** the implementation’s rate control algorithm should assume to be remaining in the **GOP** prior to executing the video encode operation.

• **gopRemainingP** specifies the number of **P frames** the implementation’s rate control algorithm should assume to be remaining in the **GOP** prior to executing the video encode operation.

• **gopRemainingB** specifies the number of **B frames** the implementation’s rate control algorithm should assume to be remaining in the **GOP** prior to executing the video encode operation.

Setting **useGopRemainingFrames** to VK_TRUE and including this structure in the pNext chain of VkVideoBeginCodingInfoKHR is only mandatory if the VkVideoEncodeH265CapabilitiesKHR::requiresGopRemainingFrames reported for the used video profile is VK_TRUE. However, implementations may use these remaining frame counts, when specified, even when it is not required. In particular, when the application does not use a regular GOP structure, these values may provide additional guidance for the implementation’s rate control algorithm.

The VkVideoEncodeH265CapabilitiesKHR::prefersGopRemainingFrames capability is also used to indicate that the implementation’s rate control algorithm may operate more accurately if the application specifies the remaining frame counts using this structure.

As with other rate control guidance values, if the effective order and number of frames encoded by the application are not in line with the remaining frame counts specified in this structure at any given point, then the behavior of the implementation’s rate control algorithm may deviate from the one expected by the application.

---

**Valid Usage (Implicit)**

- VUID-VkVideoEncodeH265GopRemainingFrameInfoKHR-sType-sType
  - sType **must** be VK_STRUCTURE_TYPE_VIDEO_ENCODE_H265_GOP_REMAINING_FRAME_INFO_KHR

---

### 42.18.12. H.265 Encode Requirements

This section described the **required** H.265 encoding capabilities for physical devices that have at least one queue family that supports the video codec operation VK_VIDEO_CODEC_OPERATION_ENCODE_H265_BIT_KHR, as returned by vkGetPhysicalDeviceQueueFamilyProperties2 in VkQueueFamilyVideoPropertiesKHR::videoCodecOperations.

The **Requirement Type** column specifies the requirement is either the minimum value all implementations **must** support, the maximum value all implementations **must** support, or the exact value all implementations **must** support. For bitmasks a minimum value is the least bits all implementations **must** set, but they **may** have additional bits set beyond this minimum.
Chapter 43. Optical Flow

43.1. Optical Flow Queues

VK_NV_optical_flow adds a optical flow queue type bit VK_QUEUE_OPTICAL_FLOW_BIT_NV to VkQueueFlagBits. Optical flow operations are supported by queues with an advertised queue capability of VK_QUEUE_OPTICAL_FLOW_BIT_NV. As in the case of other queue types, an application must use vkGetPhysicalDeviceQueueFamilyProperties to query whether the physical device has support for the Optical Flow Queue. When the implementation reports the VK_QUEUE_OPTICAL_FLOW_BIT_NV bit for a queue family, it advertises general support for Vulkan queue operations described in Devices and Queues.

43.2. Optical Flow Image Formats

To enumerate the supported image formats for a specific optical flow usage, call:

```c
// Provided by VK_NV_optical_flow
VkResult vkGetPhysicalDeviceOpticalFlowImageFormatsNV(
    VkPhysicalDevice physicalDevice,
    const VkOpticalFlowImageFormatInfoNV* pOpticalFlowImageFormatInfo,
    uint32_t* pFormatCount,
    VkOpticalFlowImageFormatPropertiesNV* pImageFormatProperties
);
```

- `physicalDevice` is the physical device being queried.
- `pOpticalFlowImageFormatInfo` is a pointer to a VkOpticalFlowImageFormatInfoNV structure specifying the optical flow usage for which information is returned.
- `pFormatCount` is a pointer to an integer related to the number of optical flow properties available or queried, as described below.
- `pImageFormatProperties` is a pointer to an array of VkOpticalFlowImageFormatPropertiesNV structures in which supported formats and image parameters are returned.

If `pImageFormatProperties` is NULL, then the number of optical flow properties supported for the given `physicalDevice` is returned in `pFormatCount`. Otherwise, `pFormatCount` must point to a variable set by the application to the number of elements in the `pImageFormatProperties` array, and on return the variable is overwritten with the number of values actually written to `pImageFormatProperties`. If the value of `pFormatCount` is less than the number of optical flow properties supported, at most `pFormatCount` values will be written to `pImageFormatProperties`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available values were returned.

Before creating an image to be used as a optical flow frame, obtain the supported image creation parameters by querying with vkGetPhysicalDeviceFormatProperties2 and vkGetPhysicalDeviceImageFormatProperties2 using one of the reported formats and adding VkOpticalFlowImageFormatInfoNV to the `pNext` chain of VkPhysicalDeviceImageFormatInfo2.

When querying the parameters with vkGetPhysicalDeviceImageFormatProperties2 for images used
for optical flow operations, the `VkOpticalFlowImageFormatInfoNV::usage` field must contain one or more of the bits defined in `VkOpticalFlowUsageFlagBitsNV`.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-pFormatCount-parameter `pFormatCount` must be a valid pointer to a `uint32_t` value
- VUID-vkGetPhysicalDeviceOpticalFlowImageFormatsNV-pImageFormatProperties-parameter If the value referenced by `pFormatCount` is not 0, and `pImageFormatProperties` is not NULL, `pImageFormatProperties` must be a valid pointer to an array of `pFormatCount` `VkOpticalFlowImageFormatPropertiesNV` structures

**Return Codes**

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_EXTENSION_NOT_PRESENT
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_FORMAT_NOT_SUPPORTED

**Note**

`VK_FORMAT_B8G8R8A8_UNORM`, `VK_FORMAT_R8_UNORM` and `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` are initially supported for images with optical usage `VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV`.

`VK_FORMAT_R16G16_SFIXED5_NV` is initially supported for images with optical flow usage `VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV`, `VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV` and `VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV`.

`VK_FORMAT_R8_UINT` and `VK_FORMAT_R32_UINT` are initially supported for images with optical flow usage `VK_OPTICAL_FLOW_USAGE_COST_BIT_NV`. It is recommended to use `VK_FORMAT_R8_UINT` because of the lower bandwidth.

The `VkOpticalFlowImageFormatInfoNV` structure is defined as:

---

3662
 typedef struct VkOpticalFlowImageFormatInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkOpticalFlowUsageFlagsNV usage;
} VkOpticalFlowImageFormatInfoNV;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkOpticalFlowUsageFlagBitsNV` describing the intended optical flow usage of the image.

**Valid Usage (Implicit)**

- `VUID-VkOpticalFlowImageFormatInfoNV-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_INFO_NV`
- `VUID-VkOpticalFlowImageFormatInfoNV-usage-parameter` `usage` must be a valid combination of `VkOpticalFlowUsageFlagBitsNV` values
- `VUID-VkOpticalFlowImageFormatInfoNV-usage-requiredbitmask` `usage` must not be `0`

Bits which can be set in `VkOpticalFlowImageFormatInfoNV::usage`, controlling optical flow usage, are:

 typedef enum VkOpticalFlowUsageFlagBitsNV {
    VK_OPTICAL_FLOW_USAGE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_USAGE_COST_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV = 0x00000010,
} VkOpticalFlowUsageFlagBitsNV;

- `VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV` specifies that the image can be used as input or reference frame for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV` specifies that the image can be used as output flow vector map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_HINT_BIT_NV` specifies that the image can be used as hint flow vector map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_COST_BIT_NV` specifies that the image can be used as output cost map for an optical flow operation.
- `VK_OPTICAL_FLOW_USAGE_GLOBAL_FLOW_BIT_NV` specifies that the image can be used as global flow
vector for an optical flow operation.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowUsageFlagsNV;
```

`VkOpticalFlowUsageFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowUsageFlagBitsNV`.

The `VkOpticalFlowImageFormatPropertiesNV` structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowImageFormatPropertiesNV {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
} VkOpticalFlowImageFormatPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is a `VkFormat` that specifies the format that can be used with the specified optical flow image usages.

### Valid Usage (Implicit)

- VUID-VkOpticalFlowImageFormatPropertiesNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_OPTICAL_FLOW_IMAGE_FORMAT_PROPERTIES_NV`

- VUID-VkOpticalFlowImageFormatPropertiesNV-pNext-pNext
  `pNext` must be `NULL`

### 43.3. Optical Flow Session

#### 43.3.1. Optical Flow Session Object

Optical flow session objects are abstracted and represented by `VkOpticalFlowSessionNV` handles:

```c
// Provided by VK_NV_optical_flow
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkOpticalFlowSessionNV)
```

Creating an Optical Flow Session

To create an optical flow session object, call:
```c
VkResult vkCreateOpticalFlowSessionNV(
    VkDevice device,
    const VkOpticalFlowSessionCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkOpticalFlowSessionNV* pSession);
```

- **device** is the logical device that creates the optical flow session object.
- **pCreateInfo** is a pointer to a `VkOpticalFlowSessionCreateInfoNV` structure containing parameters specifying the creation of the optical flow session.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSession** is a pointer to a `VkOpticalFlowSessionNV` handle specifying the optical flow session object which will be created by this function when it returns `VK_SUCCESS`.

### Valid Usage (Implicit)

- VUID-vkCreateOpticalFlowSessionNV-device-parameter
  - The **device** must be a valid `VkDevice` handle.
- VUID-vkCreateOpticalFlowSessionNV-pCreateInfo-parameter
  - The **pCreateInfo** must be a valid pointer to a valid `VkOpticalFlowSessionCreateInfoNV` structure.
- VUID-vkCreateOpticalFlowSessionNV-pAllocator-parameter
  - If **pAllocator** is not `NULL`, the **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- VUID-vkCreateOpticalFlowSessionNV-pSession-parameter
  - The **pSession** must be a valid pointer to a `VkOpticalFlowSessionNV` handle.

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkOpticalFlowSessionCreateInfoNV` structure is defined as:
// Provided by VK_NV_optical_flow

typedef struct VkOpticalFlowSessionCreateInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t width;
    uint32_t height;
    VkFormat imageFormat;
    VkFormat flowVectorFormat;
    VkFormat costFormat;
    VkOpticalFlowGridSizeFlagsNV outputGridSize;
    VkOpticalFlowGridSizeFlagsNV hintGridSize;
    VkOpticalFlowPerformanceLevelNV performanceLevel;
    VkOpticalFlowSessionCreateFlagsNV flags;
} VkOpticalFlowSessionCreateInfoNV;

- **sType** is a VkStructureType value identifying this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **width** is the width in pixels of the input or reference frame to be bound to this optical flow session.

- **height** is the height in pixels of the input or reference frame to be bound to this optical flow session.

- **imageFormat** is the VkFormat of the input and reference frame to be bound to this optical flow session.

- **flowVectorFormat** is the VkFormat of the flow vector maps (output or hint) to be bound to this optical flow session.

- **costFormat** is the VkFormat of the cost maps to be bound to this optical flow session.

- **outputGridSize** is exactly one bit of VkOpticalFlowGridSizeFlagsNV specifying the grid size of the output flow and cost maps to be bound to this optical flow session. The size of the output flow and cost maps is determined by VkOpticalFlowSessionCreateInfoNV::width and VkOpticalFlowSessionCreateInfoNV::height divided by VkOpticalFlowSessionCreateInfoNV::outputGridSize.

- **hintGridSize** is one exactly bit of VkOpticalFlowGridSizeFlagsNV specifying the grid size of the hint flow vector maps to be bound to this optical flow session. The size of the hint maps is determined by VkOpticalFlowSessionCreateInfoNV::width and VkOpticalFlowSessionCreateInfoNV::height divided by VkOpticalFlowSessionCreateInfoNV::hintGridSize.

- **performanceLevel** is the VkOpticalFlowPerformanceLevelNV used for this optical flow session.

- **flags** are the VkOpticalFlowSessionCreateFlagsNV used for this optical flow session.

**Valid Usage**

- VUID-VkOpticalFlowSessionCreateInfoNV-width-07581
  width must be greater than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::minWidth and less than or equal to VkPhysicalDeviceOpticalFlowPropertiesNV::maxWidth
• VUID-VkOpticalFlowSessionCreateInfoNV-height-07582
  height must be greater than or equal to \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::minHeight}\) and less than or equal to \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::maxHeight}\)

• VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-07583
  imageFormat must be one of the formats returned by \(\text{vkGetPhysicalDeviceOpticalFlowImageFormatsNV}\) for VK_OPTICAL_FLOW_USAGE_INPUT_BIT_NV

• VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-07584
  flowVectorFormat must be one of the formats returned by \(\text{vkGetPhysicalDeviceOpticalFlowImageFormatsNV}\) for VK_OPTICAL_FLOW_USAGE_OUTPUT_BIT_NV

• VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-07585
  costFormat must be one of the formats returned by \(\text{vkGetPhysicalDeviceOpticalFlowImageFormatsNV}\) for VK_OPTICAL_FLOW_USAGE_COST_BIT_NV
  if VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV is set in flags

• VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-07586
  outputGridSize must be exactly one of the bits reported in \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes}\)

• VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-07587
  hintGridSize must be exactly one of the bits reported in \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes}\)
  if VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV is set in flags

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07588
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT.Bit_NV must not be set in flags if \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::hintSupported}\) is VK_FALSE

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07589
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV must not be set in flags if \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::costSupported}\) is VK_FALSE

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07590
  VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV must not be set in flags if \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::globalFlowSupported}\) is VK_FALSE

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07591
  VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV must not be set in flags if \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::maxNumRegionsOfInterest}\) is 0

• VUID-VkOpticalFlowSessionCreateInfoNV-flags-07592
  VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV must not be set in flags if \(\text{VkPhysicalDeviceOpticalFlowPropertiesNV::bidirectionalFlowSupported}\) is VK_FALSE

Valid Usage (Implicit)

• VUID-VkOpticalFlowSessionCreateInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_INFO_NV

• VUID-VkOpticalFlowSessionCreateInfoNV-pNext-pNext
**pNext** must be **NULL** or a pointer to a valid instance of `VkOpticalFlowSessionCreatePrivateDataInfoNV`.

- **VUID-VkOpticalFlowSessionCreateInfoNV-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkOpticalFlowSessionCreateInfoNV-imageFormat-parameter**
  `imageFormat` must be a valid `VkFormat` value.

- **VUID-VkOpticalFlowSessionCreateInfoNV-flowVectorFormat-parameter**
  `flowVectorFormat` must be a valid `VkFormat` value.

- **VUID-VkOpticalFlowSessionCreateInfoNV-costFormat-parameter**
  If `costFormat` is not 0, `costFormat` must be a valid `VkFormat` value.

- **VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-parameter**
  `outputGridSize` must be a valid combination of `VkOpticalFlowGridSizeFlagBitsNV` values.

- **VUID-VkOpticalFlowSessionCreateInfoNV-outputGridSize-requiredbitmask**
  `outputGridSize` must not be 0.

- **VUID-VkOpticalFlowSessionCreateInfoNV-hintGridSize-parameter**
  `hintGridSize` must be a valid combination of `VkOpticalFlowGridSizeFlagBitsNV` values.

- **VUID-VkOpticalFlowSessionCreateInfoNV-performanceLevel-parameter**
  If `performanceLevel` is not 0, `performanceLevel` must be a valid `VkOpticalFlowPerformanceLevelNV` value.

- **VUID-VkOpticalFlowSessionCreateInfoNV-flags-parameter**
  `flags` must be a valid combination of `VkOpticalFlowSessionCreateFlagBitsNV` values.

The `VkOpticalFlowSessionCreatePrivateDataInfoNV` structure is for NV internal use only and is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowSessionCreatePrivateDataInfoNV {
    VkStructureType sType;
    void* pNext;
    uint32_t id;
    uint32_t size;
    const void* pPrivateData;
} VkOpticalFlowSessionCreatePrivateDataInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `id` is an identifier for data which is passed at a memory location specified in `VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData`.
- `size` is the size of data in bytes which is passed at a memory location specified in `VkOpticalFlowSessionCreatePrivateDataInfoNV::pPrivateData`.
- `pPrivateData` is a pointer to NV internal data.
Valid Usage (Implicit)

- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_SESSION_CREATE_PRIVATE_DATA_INFO_NV
- VUID-VkOpticalFlowSessionCreatePrivateDataInfoNV-pPrivateData-parameter
  pPrivateData must be a pointer value

Optical flow vectors are generated block-wise, one vector for each block of NxN pixels (referred to as grid).

Bits which can be set in VkOpticalFlowSessionCreateInfoNV::outputGridSize and VkOpticalFlowSessionCreateInfoNV::hintGridSize, or which are returned in VkPhysicalDeviceOpticalFlowPropertiesNV::supportedOutputGridSizes and VkPhysicalDeviceOpticalFlowPropertiesNV::supportedHintGridSizes controlling optical flow grid sizes, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowGridSizeFlagBitsNV {
    VK_OPTICAL_FLOW_GRID_SIZE_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV = 0x00000008,
} VkOpticalFlowGridSizeFlagBitsNV;
```

- VK_OPTICAL_FLOW_GRID_SIZE_1X1_BIT_NV specifies that grid is 1x1 pixel.
- VK_OPTICAL_FLOW_GRID_SIZE_2X2_BIT_NV specifies that grid is 2x2 pixel.
- VK_OPTICAL_FLOW_GRID_SIZE_4X4_BIT_NV specifies that grid is 4x4 pixel.
- VK_OPTICAL_FLOW_GRID_SIZE_8X8_BIT_NV specifies that grid is 8x8 pixel.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowGridSizeFlagsNV;
```

VkOpticalFlowGridSizeFlagsNV is a bitmask type for setting a mask of zero or more VkOpticalFlowGridSizeFlagBitsNV.

Optical flow exposes performance levels which the application can choose based on the desired performance and quality requirement.

The optical flow performance level types are defined with the following:
typedef enum VkOpticalFlowPerformanceLevelNV {
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV = 1,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV = 2,
    VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV = 3,
} VkOpticalFlowPerformanceLevelNV;

- VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_SLOW_NV is a level with slower performance but higher quality.
- VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_MEDIUM_NV is a level with medium performance and medium quality.
- VK_OPTICAL_FLOW_PERFORMANCE_LEVEL_FAST_NV is a preset with higher performance but lower quality.

Bits which **can** be set in VkOpticalFlowSessionCreateInfoNV::flags, controlling optical flow session operations, are:

typedef enum VkOpticalFlowSessionCreateFlagBitsNV {
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV = 0x00000001,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV = 0x00000002,
    VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV = 0x00000004,
    VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV = 0x00000008,
    VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV = 0x00000010,
} VkOpticalFlowSessionCreateFlagBitsNV;

- VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_HINT_BIT_NV specifies that a VkImageView with external flow vectors will be used as hints in performing the motion search and **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV.
- VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_COST_BIT_NV specifies that the cost for the forward flow is generated in a VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV. Additionally, if VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV is also set, the cost for backward flow is generated in a VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV. The cost is the confidence level of the flow vector for each grid in the frame. The Cost implies how (in)accurate the flow vector is. Higher cost value implies the flow vector to be less accurate and vice-versa.
- VK_OPTICAL_FLOW_SESSION_CREATE_ENABLE_GLOBAL_FLOW_BIT_NV specifies that a global flow vector is estimated from forward flow in a single pixel VkImageView which **must** be bound to VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV.
- VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV specifies that regions of interest **can** be specified in VkOpticalFlowExecuteInfoNV.
- VK_OPTICAL_FLOW_SESSION_CREATE_BOTH_DIRECTIONS_BIT_NV specifies that backward flow is
generated in addition to forward flow which is always generated.

`VkOpticalFlowSessionCreateFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowSessionCreateFlagBitsNV`.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowSessionCreateFlagsNV;
```

### Destroying an Optical Flow Session

To destroy a optical flow session object, call:

```c
// Provided by VK_NV_optical_flow
void vkDestroyOpticalFlowSessionNV(
    VkDevice device,
    VkOpticalFlowSessionNV session,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the device that was used for the creation of the optical flow session.
- `session` is the optical flow session to be destroyed.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage (Implicit)

- VUID-vkDestroyOpticalFlowSessionNV-device-parameter
  `device` **must** be a valid `VkDevice` handle
- VUID-vkDestroyOpticalFlowSessionNV-session-parameter
  `session` **must** be a valid `VkOpticalFlowSessionNV` handle
- VUID-vkDestroyOpticalFlowSessionNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkDestroyOpticalFlowSessionNV-session-parent
  `session` **must** have been created, allocated, or retrieved from `device`

### 43.3.2. Binding Vulkan Image Views to an Optical Flow Session

To bind a vulkan image to an optical flow session object, call:
// Provided by VK_NV_optical_flow

VkResult vkBindOpticalFlowSessionImageNV(
    VkDevice device, 
    VkOpticalFlowSessionNV session, 
    VkOpticalFlowSessionBindingPointNV bindingPoint, 
    VkImageView view, 
    VkImageLayout layout);

- `device` is the device which owns the optical flow session object `session`.
- `session` is the optical flow session object to which the image view is to be bound.
- `bindingPoint` specifies the binding point `VkOpticalFlowSessionBindingPointNV` to which the image view is bound.
- `view` is a `VkImageView` to be bound.
- `layout` must specify the layout that the image subresources accessible from `view` will be in at the time the optical flow vectors are calculated with `vkCmdOpticalFlowExecuteNV` on a `VkDevice`.

### Valid Usage (Implicit)

- VUID-vkBindOpticalFlowSessionImageNV-device-parameter  
  `device` must be a valid `VkDevice` handle
- VUID-vkBindOpticalFlowSessionImageNV-session-parameter  
  `session` must be a valid `VkOpticalFlowSessionNV` handle
- VUID-vkBindOpticalFlowSessionImageNV-bindingPoint-parameter  
  `bindingPoint` must be a valid `VkOpticalFlowSessionBindingPointNV` value
- VUID-vkBindOpticalFlowSessionImageNV-view-parameter  
  If `view` is not `VK_NULL_HANDLE`, `view` must be a valid `VkImageView` handle
- VUID-vkBindOpticalFlowSessionImageNV-layout-parameter  
  `layout` must be a valid `VkImageLayout` value
- VUID-vkBindOpticalFlowSessionImageNV-session-parent  
  `session` must have been created, allocated, or retrieved from `device`
- VUID-vkBindOpticalFlowSessionImageNV-view-parent  
  If `view` is a valid handle, it must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`
The optical flow session binding points are defined with the following:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowSessionBindingPointNV {
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_UNKNOWN_NV = 0,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV = 1,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV = 2,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV = 3,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV = 4,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV = 5,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV = 6,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV = 7,
    VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV = 8,
} VkOpticalFlowSessionBindingPointNV;
```

- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_INPUT_NV` specifies the binding point for the input frame.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_REFERENCE_NV` specifies the binding point for the input reference frame.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_HINT_NV` specifies the binding point for the optional external hint flow vectors.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_FLOW_VECTOR_NV` specifies the binding point for output flow vectors of default forward flow calculation.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_FLOW_VECTOR_NV` specifies the binding point for the optional output flow vector map of optional backward flow calculation.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_COST_NV` specifies the binding point for the optional output cost map of default forward flow calculation.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_BACKWARD_COST_NV` specifies the binding point for the optional output cost map of optional backward flow calculation.
- `VK_OPTICAL_FLOW_SESSION_BINDING_POINT_GLOBAL_FLOW_NV` specifies the binding point for the optional global flow value of default forward flow calculation.

### 43.3.3. Optical Flow Execution

Default direction of flow estimation is forward which calculates the optical flow from input frame to reference frame. Optionally backward flow estimation can be additionally calculated. An output flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of input frame can be found at location \((x+V_x, y+V_y)\) in reference frame. A backward flow vector \((V_x, V_y)\) means that current pixel \((x, y)\) of reference frame can be found at location \((x+V_x, y+V_y)\) in input frame.

To calculate optical flow vectors from two input frames, call:
void vkCmdOpticalFlowExecuteNV(
  VkCommandBuffer commandBuffer,
  VkOpticalFlowSessionNV session,
  const VkOpticalFlowExecuteInfoNV* pExecuteInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `session` is the optical flow session object on which this command is operating.
- `pExecuteInfo` Info is a pointer to a `VkOpticalFlowExecuteInfoNV`.

### Valid Usage (Implicit)

- **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdOpticalFlowExecuteNV-session-parameter**
  - `session` must be a valid `VkOpticalFlowSessionNV` handle
- **VUID-vkCmdOpticalFlowExecuteNV-pExecuteInfo-parameter**
  - `pExecuteInfo` must be a valid pointer to a valid `VkOpticalFlowExecuteInfoNV` structure
- **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdOpticalFlowExecuteNV-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support optical flow operations
- **VUID-vkCmdOpticalFlowExecuteNV-renderpass**
  - This command must only be called outside of a render pass instance
- **VUID-vkCmdOpticalFlowExecuteNV-videocoding**
  - This command must only be called outside of a video coding scope
- **VUID-vkCmdOpticalFlowExecuteNV-commonparent**
  - Both of `commandBuffer`, and `session` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The *VkOpticalFlowExecuteInfoNV* structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkOpticalFlowExecuteInfoNV {
    VkStructureType sType;
    void* pNext;
    VkOpticalFlowExecuteFlagsNV flags;
    uint32_t regionCount;
    const VkRect2D* pRegions;
} VkOpticalFlowExecuteInfoNV;
```

- `sType` is a *VkStructureType* value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` are the *VkOpticalFlowExecuteFlagsNV* used for this command.
- `regionCount` is the number of regions of interest specified in `pRegions`.
- `pRegions` is a pointer to `regionCount` *VkRect2D* regions of interest.

**Valid Usage**

- VUID-VkOpticalFlowExecuteInfoNV-regionCount-07593
  `regionCount must be 0 if VK_OPTICAL_FLOW_SESSION_CREATE_ALLOW_REGIONS_BIT_NV was not set for VkOpticalFlowSessionNV on which this command is operating`

**Valid Usage (Implicit)**

- VUID-VkOpticalFlowExecuteInfoNV-sType-sType
  `sType must be VK_STRUCTURE_TYPE_OPTICAL_FLOW_EXECUTE_INFO_NV`
- VUID-VkOpticalFlowExecuteInfoNV-pNext-pNext
  `pNext must be NULL`
- VUID-VkOpticalFlowExecuteInfoNV-flags-parameter
  `flags must be a valid combination of VkOpticalFlowExecuteFlagBitsNV values`
- VUID-VkOpticalFlowExecuteInfoNV-pRegions-parameter
  If `regionCount` is not 0, `pRegions must be a valid pointer to an array of regionCount VkRect2D structures`
Bits which can be set in `VkOpticalFlowExecuteInfoNV::flags`, controlling optical flow execution, are:

```c
// Provided by VK_NV_optical_flow
typedef enum VkOpticalFlowExecuteFlagBitsNV {
    VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV = 0x00000001,
} VkOpticalFlowExecuteFlagBitsNV;
```

- `VK_OPTICAL_FLOW_EXECUTE_DISABLE_TEMPORAL_HINTS_BIT_NV` specifies that temporal hints from previously generated flow vectors are not used. If temporal hints are enabled, optical flow vectors from previous `vkCmdOpticalFlowExecuteNV` call are automatically used as hints for the current `vkCmdOpticalFlowExecuteNV` call, to take advantage of temporal correlation in a video sequence. Temporal hints should be disabled if there is a-priori knowledge of no temporal correlation (e.g. a scene change, independent successive frame pairs).

`VkOpticalFlowExecuteFlagsNV` is a bitmask type for setting a mask of zero or more `VkOpticalFlowExecuteFlagBitsNV`.

```c
// Provided by VK_NV_optical_flow
typedef VkFlags VkOpticalFlowExecuteFlagsNV;
```
Chapter 44. Execution Graphs

Execution graphs provide a way for applications to dispatch multiple operations dynamically from a single initial command on the host. To achieve this, a new execution graph pipeline is provided, that links together multiple shaders or pipelines which each describe one or more operations that can be dispatched within the execution graph. Each linked pipeline or shader describes an execution node within the graph, which can be dispatched dynamically from another shader within the same graph. This allows applications to describe much richer execution topologies at a finer granularity than would typically be possible with API commands alone.

44.1. Pipeline Creation

To create execution graph pipelines, call:

```c
// Provided by VK_AMDX_shader_enqueue
VkResult vkCreateExecutionGraphPipelinesAMDX(
    VkDevice device,
    VkPipelineCache pipelineCache,
    uint32_t createInfoCount,
    const VkExecutionGraphPipelineCreateInfoAMDX* pCreateInfos,
    const VkAllocationCallbacks* pAllocator,
    VkPipeline* pPipelines);
```

- **device** is the logical device that creates the execution graph pipelines.
- **pipelineCache** is either VK_NULL_HANDLE, indicating that pipeline caching is disabled; or the handle of a valid pipeline cache object, in which case use of that cache is enabled for the duration of the command.
- **createInfoCount** is the length of the **pCreateInfos** and **pPipelines** arrays.
- **pCreateInfos** is a pointer to an array of VkExecutionGraphPipelineCreateInfoAMDX structures.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelines** is a pointer to an array of VkPipeline handles in which the resulting execution graph pipeline objects are returned.

Pipelines are created and returned as described for Multiple Pipeline Creation.

Valid Usage

- VUID-vkCreateExecutionGraphPipelinesAMDX-shaderEnqueue-09124
  The shaderEnqueue feature must be enabled
- VUID-vkCreateExecutionGraphPipelinesAMDX-flags-09125
  If the flags member of any element of **pCreateInfos** contains the VK_PIPELINE_CREATE_DERIVATIVE_BIT flag, and the basePipelineIndex member of that same element is not -1, **basePipelineIndex** must be less than the index into **pCreateInfos** that corresponds to that element

3677
If the `flags` member of any element of `pCreateInfos` contains the `VK_PIPELINE_CREATE_DERIVATIVE_BIT` flag, the base pipeline must have been created with the `VK_PIPELINE_CREATE_ALLOW_DERIVATIVES_BIT` flag set.

If `pipelineCache` was created with `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`, host access to `pipelineCache` must be externally synchronized.

**Valid Usage (Implicit)**

- `device` must be a valid `VkDevice` handle.
- If `pipelineCache` is not `VK_NULL_HANDLE`, `pipelineCache` must be a valid `VkPipelineCache` handle.
- `pCreateInfos` must be a valid pointer to an array of `createInfoCount` valid `VkExecutionGraphPipelineCreateInfoAMDX` structures.
- If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.
- `pPipelines` must be a valid pointer to an array of `createInfoCount` `VkPipeline` handles.
- `createInfoCount` must be greater than 0.
- If `pipelineCache` is a valid handle, it must have been created, allocated, or retrieved from `device`.

**Return Codes**

**Success**
- `VK_SUCCESS`
- `VK_PIPELINE_COMPILE_REQUIRED_EXT`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkExecutionGraphPipelineCreateInfoAMDX` structure is defined as:
typedef struct VkExecutionGraphPipelineCreateInfoAMDX {
    VkStructureType sType;
    const void* pNext;
    VkPipelineCreateFlags flags;
    uint32_t stageCount;
    const VkPipelineShaderStageCreateInfo* pStages;
    const VkPipelineLibraryCreateInfoKHR* pLibraryInfo;
    VkPipelineLayout layout;
    VkPipeline basePipelineHandle;
    int32_t basePipelineIndex;
} VkExecutionGraphPipelineCreateInfoAMDX;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is a bitmask of `VkPipelineCreateFlagBits` specifying how the pipeline will be generated.
- **stageCount** is the number of entries in the **pStages** array.
- **pStages** is a pointer to an array of `stageCount` `VkPipelineShaderStageCreateInfo` structures describing the set of the shader stages to be included in the execution graph pipeline.
- **pLibraryInfo** is a pointer to a `VkPipelineLibraryCreateInfoKHR` structure defining pipeline libraries to include.
- **layout** is the description of binding locations used by both the pipeline and descriptor sets used with the pipeline.
- **basePipelineHandle** is a pipeline to derive from
- **basePipelineIndex** is an index into the **pCreateInfos** parameter to use as a pipeline to derive from

The parameters **basePipelineHandle** and **basePipelineIndex** are described in more detail in **Pipeline Derivatives**.

Each shader stage provided when creating an execution graph pipeline (including those in libraries) is associated with a name and an index, determined by the inclusion or omission of a `VkPipelineShaderStageNodeCreateInfoAMDX` structure in its **pNext** chain.

In addition to the shader name and index, an internal "node index" is also generated for each node, which can be queried with `vkGetExecutionGraphPipelineNodeIndexAMDX`, and is used exclusively for initial dispatch of an execution graph.

### Valid Usage

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-None-09497**
  If the **pNext** chain does not include a `VkPipelineCreateFlags2CreateInfoKHR` structure, **flags** must be a valid combination of `VkPipelineCreateFlagBits` values
- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07984**
If \( flags \) contains the \( VK_PIPELINE_CREATE_DERIVATIVE_BIT \) flag, and \( basePipelineIndex \) is -1, \( basePipelineHandle \) must be a valid execution graph \( VkPipeline \) handle.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07985**
  If \( flags \) contains the \( VK_PIPELINE_CREATE_DERIVATIVE_BIT \) flag, and \( basePipelineHandle \) is \( VK_NULL_HANDLE \), \( basePipelineIndex \) must be a valid index into the calling command's \( pCreateInfos \) parameter.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-07986**
  If \( flags \) contains the \( VK_PIPELINE_CREATE_DERIVATIVE_BIT \) flag, \( basePipelineHandle \) must be \( VK_NULL_HANDLE \) or \( basePipelineIndex \) must be -1.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07987**
  If a push constant block is declared in a shader, a push constant range in \( layout \) must match both the shader stage and range.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07988**
  If a resource variables is declared in a shader, a descriptor slot in \( layout \) must match the shader stage.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07990**
  If a resource variables is declared in a shader, and the descriptor type is not \( VK_DESCRIPTOR_TYPE_MUTABLE_EXT \), a descriptor slot in \( layout \) must match the descriptor type.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-07991**
  If a resource variables is declared in a shader as an array, a descriptor slot in \( layout \) must match the descriptor count.

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03365**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_ANY_HIT_SHADERS_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03366**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_CLOSEST_HIT_SHADERS_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03367**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_MISS_SHADERS_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03368**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_NO_NULL_INTERSECTION_SHADERS_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03369**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_SKIP_TRIANGLES_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-03370**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_SKIP_AABBS_BIT_KHR \).

- **VUID-VkExecutionGraphPipelineCreateInfoAMDX-flags-04945**
  \( flags \) must not include \( VK_PIPELINE_CREATE_RAY_TRACING_ALLOW_MOTION_BIT_NV \).
If the `VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV::deviceGeneratedComputePipelines` is not enabled, flags must not include `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`.

If `flags` includes `VK_PIPELINE_CREATE_INDIRECT_BINDABLE_BIT_NV`, then the `pNext` chain must include a pointer to a valid instance of `VkComputePipelineIndirectBufferInfoNV` specifying the address where the pipeline's metadata will be saved.

If the `pipelineCreationCacheControl` feature is not enabled, flags must not include `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT` or `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`.

The `stage` member of any element of `pStages` must be `VK_SHADER_STAGE_COMPUTE_BIT`.

The shader code for the entry point identified by each element of `pStages` and the rest of the state identified by this structure must adhere to the pipeline linking rules described in the Shader Interfaces chapter.

`layout` must be consistent with the layout of the shaders specified in `pStages`.

If `pLibraryInfo` is not `NULL`, each element of its `pLibraries` member must have been created with a `layout` that is compatible with the `layout` in this pipeline.

The number of resources in `layout` accessible to each shader stage that is used by the pipeline must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageResources`.

If `pLibraryInfo` is not `NULL`, each element of `pLibraryInfo->libraries` must be either a compute pipeline or an execution graph pipeline.

There must be no two nodes in the pipeline that share both the same shader name and index, as specified by `VkPipelineShaderStageNodeCreateInfoAMDX`.

There must be no two nodes in the pipeline that share the same shader name and have input payload declarations with different sizes.

There must be no two nodes in the pipeline that share the same name but have different execution models.

There must be no two nodes in the pipeline that share the same name where one includes `CoalescedInputCountAMDX` and the other does not.

There must be no two nodes in the pipeline that share the same name where one includes `StaticNumWorkgroupsAMDX` and the other does not.
StaticNumWorkgroupsAMDX and the other does not

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-PayloadNodeNameAMDX-09139
  If an output payload declared in any shader in the pipeline has a PayloadNodeNameAMDX decoration with a Node Name that matches the shader name of any other node in the graph, the size of the output payload must match the size of the input payload in the matching node.

Valid Usage (Implicit)

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-sType-sType
  stype must be VK_STRUCTURE_TYPE_EXECUTION_GRAPH_PIPELINE_CREATE_INFO_AMDX

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCompilerControlCreateInfoAMD or VkPipelineCreationFeedbackCreateInfo

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-sType-unique
  The stype value of each struct in the pNext chain must be unique

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-pStages-parameter
  If stageCount is not 0, and pStages is not NULL, pStages must be a valid pointer to an array of stageCount valid VkPipelineShaderStageCreateInfo structures

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-pLibraryInfo-parameter
  If pLibraryInfo is not NULL, pLibraryInfo must be a valid pointer to a valid VkPipelineLibraryCreateInfoKHR structure

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-VkExecutionGraphPipelineCreateInfoAMDX-commonparent
  Both of basePipelineHandle, and layout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

VK_SHADER_INDEX_UNUSED_AMDX is a special shader index used to indicate that the created node does not override the index. In this case, the shader index is determined through other means. It is defined as:

```
#define VK_SHADER_INDEX_UNUSED_AMDX (~0U)
```

The VkPipelineShaderStageNodeCreateInfoAMDX structure is defined as:
typedef struct VkPipelineShaderStageNodeCreateInfoAMDX {
    VkStructureType sType;
    const void* pNext;
    const char* pName;
    uint32_t index;
} VkPipelineShaderStageNodeCreateInfoAMDX;

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pName is the shader name to use when creating a node in an execution graph. If pName is NULL, the name of the entry point specified in SPIR-V is used as the shader name.
- index is the shader index to use when creating a node in an execution graph. If index is VK_SHADER_INDEX_UNUSED_AMDX then the original index is used, either as specified by the ShaderIndexAMDX execution mode, or 0 if that too is not specified.

When included in the pNext chain of a VkPipelineShaderStageCreateInfo structure, this structure specifies the shader name and shader index of a node when creating an execution graph pipeline. If this structure is omitted, the shader name is set to the name of the entry point in SPIR-V and the shader index is set to 0.

When dispatching a node from another shader, the name is fixed at pipeline creation, but the index can be set dynamically. By associating multiple shaders with the same name but different indexes, applications can dynamically select different nodes to execute. Applications must ensure each node has a unique name and index.

### Valid Usage (Implicit)

- VUID-VkPipelineShaderStageNodeCreateInfoAMDX-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SHADER_STAGE_NODE_CREATE_INFO_AMDX

- VUID-VkPipelineShaderStageNodeCreateInfoAMDX-pName-parameter
  If pName is not NULL, pName must be a null-terminated UTF-8 string

To query the internal node index for a particular node in an execution graph, call:

```
// Provided by VK_AMD_shader_enqueue
VkResult vkGetExecutionGraphPipelineNodeIndexAMDX(
    VkDevice device,                   
    VkPipeline executionGraph,        
    const VkPipelineShaderStageNodeCreateInfoAMDX* pNodeInfo, 
    uint32_t* pNodeIndex);
```

- device is the that executionGraph was created on.
- executionGraph is the execution graph pipeline to query the internal node index for.
• pNodeInfo is a pointer to a VkPipelineShaderStageNodeCreateInfoAMDX structure identifying the name and index of the node to query.

• pNodeIndex is the returned internal node index of the identified node.

Once this function returns, the contents of pNodeIndex contain the internal node index of the identified node.

### Valid Usage

- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-09140
  pNodeInfo->pName must not be NULL
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-09141
  pNodeInfo->index must not be VK_SHADER_INDEX_UNUSED_AMDX
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-09142
  There must be a node in executionGraph with a shader name and index equal to pNodeInfo->pName and pNodeInfo->index

### Valid Usage (Implicit)

- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-device-parameter
  device must be a valid VkDevice handle
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-parameter
  executionGraph must be a valid VkPipeline handle
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeInfo-parameter
  pNodeInfo must be a valid pointer to a valid VkPipelineShaderStageNodeCreateInfoAMDX structure
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-pNodeIndex-parameter
  pNodeIndex must be a valid pointer to a uint32_t value
- VUID-vkGetExecutionGraphPipelineNodeIndexAMDX-executionGraph-parent
  executionGraph must have been created, allocated, or retrieved from device

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

### 44.2. Initializing Scratch Memory

Implementations may need scratch memory to manage dispatch queues or similar when executing
a pipeline graph, and this is explicitly managed by the application.

To query the scratch space required to dispatch an execution graph, call:

```c
// Provided by VK_AMDX_shader_enqueue
VkResult vkGetExecutionGraphPipelineScratchSizeAMDX(
    VkDevice device, 
    VkPipeline executionGraph, 
    VkExecutionGraphPipelineScratchSizeAMDX* pSizeInfo);
```

- `device` is the device that `executionGraph` was created on.
- `executionGraph` is the execution graph pipeline to query the scratch space for.
- `pSizeInfo` is a pointer to a `VkExecutionGraphPipelineScratchSizeAMDX` structure that will contain the required scratch size.

After this function returns, information about the scratch space required will be returned in `pSizeInfo`.

### Valid Usage (Implicit)

- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-device-parameter
  - `device must` be a valid `VkDevice` handle

- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-executionGraph-parameter
  - `executionGraph must` be a valid `VkPipeline` handle

- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-pSizeInfo-parameter
  - `pSizeInfo must` be a valid pointer to a `VkExecutionGraphPipelineScratchSizeAMDX` structure

- VUID-vkGetExecutionGraphPipelineScratchSizeAMDX-executionGraph-parent
  - `executionGraph must` have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkExecutionGraphPipelineScratchSizeAMDX` structure is defined as:
typedef struct VkExecutionGraphPipelineScratchSizeAMDX {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize size;
} VkExecutionGraphPipelineScratchSizeAMDX;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `size` indicates the scratch space required for dispatch the queried execution graph.

**Valid Usage (Implicit)**

- VUID-VkExecutionGraphPipelineScratchSizeAMDX-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_EXECUTION_GRAPH_PIPELINE_SCRATCH_SIZE_AMDX`

To initialize scratch memory for a particular execution graph, call:

```c
void vkCmdInitializeGraphScratchMemoryAMDX(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress scratch);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scratch` is a pointer to the scratch memory to be initialized.

This command **must** be called before using `scratch` to dispatch the currently bound execution graph pipeline.

Execution of this command **may** modify any memory locations in the range `[scratch, scratch + size)`, where `size` is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

If any portion of `scratch` is modified by any command other than `vkCmdDispatchGraphAMDX`, `vkCmdDispatchGraphIndirectAMDX`, `vkCmdDispatchGraphIndirectCountAMDX`, or `vkCmdInitializeGraphScratchMemoryAMDX` with the same execution graph, it **must** be reinitialized for the execution graph again before dispatching against it.

**Valid Usage**

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-scratch-09143
  `scratch` **must** be the device address of an allocated memory range at least as large as the
value of `VkExecutionGraphPipelineScratchSizeAMDX::size` returned by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline.

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-scratch-09144 scratch must be a multiple of 64

### Valid Usage (Implicit)

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdInitializeGraphScratchMemoryAMDX-bufferlevel
  `commandBuffer` must be a primary `VkCommandBuffer`

### Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

### 44.3. Dispatching a Graph

Initial dispatch of an execution graph is done from the host in the same way as any other command, and can be used in a similar way to compute dispatch commands, with indirect variants available.
To record an execution graph dispatch, call:

```c
// Provided by VK_AMDX_shader_enqueue
void vkCmdDispatchGraphAMDX(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress scratch,
    const VkDispatchGraphCountInfoAMDX* pCountInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scratch` is a pointer to the scratch memory to be used.
- `pCountInfo` is a host pointer to a `VkDispatchGraphCountInfoAMDX` structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in `pCountInfo` are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all device/host pointers in substructures are treated as host pointers and read only during host execution of this command. Once this command returns, no reference to the original pointers is retained.

Execution of this command may modify any memory locations in the range `[scratch, scratch + size)`, where `size` is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

**Valid Usage**

- VUID-vkCmdDispatchGraphAMDX-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDispatchGraphAMDX-magFilter-09598
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`

- VUID-vkCmdDispatchGraphAMDX-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the
image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDispatchGraphAMDX-mipmapMode-09599
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- VUID-vkCmdDispatchGraphAMDX-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view’s levelCount and layerCount must be 1

- VUID-vkCmdDispatchGraphAMDX-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a VkImageView as a result of this command, then the image view’s viewType must be VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D

- VUID-vkCmdDispatchGraphAMDX-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDispatchGraphAMDX-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDispatchGraphAMDX-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatchGraphAMDX-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDispatchGraphAMDX-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphAMDX-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering
together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDispatchGraphAMDX-cubicRangeClamp-09212**
  If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM`.

- **VUID-vkCmdDispatchGraphAMDX-reductionMode-09213**
  Any `VkImageView` being sampled with a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM` as a result of this command must sample with `VK_FILTER_CUBIC_EXT`.

- **VUID-vkCmdDispatchGraphAMDX-selectableCubicWeights-09214**
  If the `selectableCubicWeights` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have `VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights` equal to `VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM`.

- **VUID-vkCmdDispatchGraphAMDX-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDispatchGraphAMDX-OptypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphAMDX-OptypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphAMDX-OptypeImage-07029**
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphAMDX-OptypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDispatchGraphAMDX-None-08600**
  For each set `n` that is statically used by a bound shader, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchGraphAMDX-None-08601**
For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` array used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchGraphAMDX-maintenance4-08602**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline` or the `VkDescriptorSetLayout` and `VkPushConstantRange` arrays used to create the current `VkShaderEXT`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDispatchGraphAMDX-None-08114**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid as described by descriptor validity if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was not created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchGraphAMDX-None-08115**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdBindDescriptorSets`, the bound `VkPipeline` **must** have been created without `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchGraphAMDX-None-08116**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by the `VkPipeline` bound to the pipeline bind point used by this command and the bound `VkPipeline` was created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchGraphAMDX-None-08604**
  Descriptors in bound descriptor buffers, specified via `vkCmdSetDescriptorBufferOffsetsEXT`, **must** be valid if they are dynamically used by any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command

- **VUID-vkCmdDispatchGraphAMDX-None-08117**
  If the descriptors used by the `VkPipeline` bound to the pipeline bind point were specified via `vkCmdSetDescriptorBufferOffsetsEXT`, the bound `VkPipeline` **must** have been created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`

- **VUID-vkCmdDispatchGraphAMDX-None-08119**
  If a descriptor is dynamically used with a `VkPipeline` created with `VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- **VUID-vkCmdDispatchGraphAMDX-None-08605**
  If a descriptor is dynamically used with a `VkShaderEXT` created with a `VkDescriptorSetLayout` that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT`, the descriptor memory **must** be resident

- **VUID-vkCmdDispatchGraphAMDX-None-08606**

3691
If the shaderObject feature is not enabled, a valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDispatchGraphAMDX-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDispatchGraphAMDX-None-08609**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

- **VUID-vkCmdDispatchGraphAMDX-None-08610**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

- **VUID-vkCmdDispatchGraphAMDX-None-08611**
  If the VkPipeline object bound to the pipeline bind point used by this command or any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchGraphAMDX-None-08607**
  If the shaderObject is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and VK_NULL_HANDLE shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchGraphAMDX-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphAMDX-None-08612**
  If the robustBufferAccess feature is not enabled, and any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphAMDX-storageBuffers-06936**
If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchGraphAMDX-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDispatchGraphAMDX-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource

- **VUID-vkCmdDispatchGraphAMDX-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C_aC_bC_r` conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDispatchGraphAMDX-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C_aC_bC_r` conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDispatchGraphAMDX-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view's `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- **VUID-vkCmdDispatchGraphAMDX-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view's `format` and the `Sampled Type` operand of the `OpTypeImage` must match

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components

- **VUID-vkCmdDispatchGraphAMDX-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format

- **VUID-vkCmdDispatchGraphAMDX-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction
must have a Width of 64

- VUID-vkCmdDispatchGraphAMDX-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatchGraphAMDX-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatchGraphAMDX-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatchGraphAMDX-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchGraphAMDX-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchGraphAMDX-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an Vk ImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a
reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphAMDX-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format

• VUID-vkCmdDispatchGraphAMDX-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphAMDX-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDispatchGraphAMDX-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

• VUID-vkCmdDispatchGraphAMDX-commandBuffer-09181
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatchGraphAMDX-commandBuffer-09182
  commandBuffer must be a primary command buffer

• VUID-vkCmdDispatchGraphAMDX-scratch-09183
  scratch must be the device address of an allocated memory range at least as large as the value of VkExecutionGraphPipelineScratchSizeAMDX::size returned by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline
• VUID-vkCmdDispatchGraphAMDX-scratch-09184
  scratch must be a device address within a VkBuffer created with the
  VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX or
  VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX flag

• VUID-vkCmdDispatchGraphAMDX-scratch-09185
  Device memory in the range [scratch, scratch
  VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with
  vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph
  pipeline, and not modified after that by anything other than another execution graph
  dispatch command

• VUID-vkCmdDispatchGraphAMDX-maxComputeWorkGroupCount-09186
  Execution of this command must not cause a node to be dispatched with a larger number
  of workgroups than that specified by either a MaxNumWorkgroupsAMDX decoration in the
  dispatched node or maxComputeWorkGroupCount

• VUID-vkCmdDispatchGraphAMDX-maxExecutionGraphShaderPayloadCount-09187
  Execution of this command must not cause any shader to initialize more than
  maxExecutionGraphShaderPayloadCount output payloads

• VUID-vkCmdDispatchGraphAMDX-NodeMaxPayloadsAMDX-09188
  Execution of this command must not cause any shader that declares NodeMaxPayloadsAMDX
to initialize more output payloads than specified by the max number of payloads for that
  decoration. This requirement applies to each NodeMaxPayloadsAMDX decoration separately

• VUID-vkCmdDispatchGraphAMDX-pCountInfo-09145
  pCountInfo->infos must be a host pointer to a memory allocation at least as large as the
  product of count and stride

• VUID-vkCmdDispatchGraphAMDX-infos-09146
  Host memory locations at indexes in the range [infos, infos + (count*stride)), at a
  granularity of stride must contain valid VkDispatchGraphInfoAMDX structures in the
  first 24 bytes

• VUID-vkCmdDispatchGraphAMDX-pCountInfo-09147
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a
  host pointer to a memory allocation at least as large as the product of payloadCount and
  payloadStride

• VUID-vkCmdDispatchGraphAMDX-pCountInfo-09148
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, nodeIndex must be a
  valid node index in the currently bound execution graph pipeline, as returned by
  vkGetExecutionGraphPipelineNodeIndexAMDX

• VUID-vkCmdDispatchGraphAMDX-pCountInfo-09149
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, host memory
  locations at indexes in the range [payloads, payloads + (payloadCount * payloadStride)),
at a granularity of payloadStride must contain a payload matching the size of the input
  payload expected by the node in nodeIndex in the first bytes
Valid Usage (Implicit)

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDispatchGraphAMDX-pCountInfo-parameter
  
  `pCountInfo` must be a valid pointer to a valid `VkDispatchGraphCountInfoAMDX` structure.

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDispatchGraphAMDX-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdDispatchGraphAMDX-renderpass
  
  This command must only be called outside of a render pass instance.

- VUID-vkCmdDispatchGraphAMDX-videocoding
  
  This command must only be called outside of a video coding scope.

- VUID-vkCmdDispatchGraphAMDX-bufferlevel
  
  `commandBuffer` must be a primary `VkCommandBuffer`.

Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</tbody>
</table>

To record an execution graph dispatch with node and payload parameters read on device, call:

```c
// Provided by VK_AMDX_shader_enqueue
void vkCmdDispatchGraphIndirectAMDX(
    VkCommandBuffer commandBuffer,      
    VkDeviceAddress scratch,            
    const VkDispatchGraphCountInfoAMDX* pCountInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scratch` is a pointer to the scratch memory to be used.
pCountInfo is a host pointer to a VkDispatchGraphCountInfoAMDX structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in pCountInfo are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all device/host pointers in substructures are treated as device pointers and read during device execution of this command. The allocation and contents of these pointers only needs to be valid during device execution. All of these addresses will be read in the VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT pipeline stage with the VK_ACCESS_2_SHADER_STORAGE_READ_BIT access flag.

Execution of this command may modify any memory locations in the range [scratch, scratch + size), where size is the value returned in VkExecutionGraphPipelineScratchSizeAMDX::size by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline. Accesses to this memory range are performed in the VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT pipeline stage with the VK_ACCESS_2_SHADER_STORAGE_READ_BIT and VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT access flags.

Valid Usage

- **VUID-vkCmdDispatchGraphIndirectAMDX-magFilter-04553**
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-magFilter-09598**
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-mipmapMode-04770**
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR, reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDispatchGraphIndirectAMDX-mipmapMode-09599**
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT
If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `levelCount` and `layerCount` must be 1.

If a `VkSampler` created with `unnormalizedCoordinates` equal to `VK_TRUE` is used to sample a `VkImageView` as a result of this command, then the image view’s `viewType` must be `VK_IMAGE_VIEW_TYPE_1D` or `VK_IMAGE_VIEW_TYPE_2D`.

If a `VkImageView` is sampled with `depth comparison`, the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor is accessed using atomic operations as a result of this command, then the storage texel buffer’s `format features` must contain `VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

If the `VK_EXT_filter_cubic` extension is not enabled and any `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, it must not have a `VkImageViewType` of `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

If the `cubicRangeClamp` feature is not enabled, then any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must not have a `VkSamplerReductionModeCreateInfo::reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGECOMPAT_QCOM`. 
Any VkImageView being sampled with a VkSamplerReductionModeCreateInfo::reductionMode equal to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_RANGE_CLAMP_QCOM as a result of this command must sample with VK_FILTER_CUBIC_EXT.

If the selectableCubicWeights feature is not enabled, then any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights equal to VK_CUBIC_FILTER_WEIGHTS_CATMULL_ROM_QCOM.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

Any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set n that is statically used by a bound shader, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

For each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value must have been set for the same pipeline bind point.
bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08114
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08115
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline must have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08116
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08604
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, must be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08117
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline must have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08605
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08606
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory must be resident

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08608
  If a pipeline is bound to the pipeline bind point used by this command, there must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDispatchGraphIndirectAMDX-None-08609
If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline must be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects must be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchGraphIndirectAMDX-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectAMDX-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectAMDX-None-08613**
If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-02707
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by `bound shaders` **must** not be a protected resource

- VUID-vkCmdDispatchGraphIndirectAMDX-None-06550
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C aC` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- VUID-vkCmdDispatchGraphIndirectAMDX-ConstOffset-06551
  If a `bound shader` accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'C aC` conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDispatchGraphIndirectAMDX-viewType-07752
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` **must** match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation

- VUID-vkCmdDispatchGraphIndirectAMDX-format-07753
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled Type` operand of the `OpTypeImage` **must** match

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-08795
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s `format`

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-08796
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have four components

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s `format`

- VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDispatchGraphIndirectAMDX-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDispatchGraphIndirectAMDX-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchGraphIndirectAMDX-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

- VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchSSDQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM
• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageWeightedSampleQCOM-06978
If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchGatherSSDQCOM, or OpImageBlockMatchSSDQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09215
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09216
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format

• VUID-vkCmdDispatchGraphIndirectAMDX-OpImageBlockMatchWindow-09217
If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphIndirectAMDX-None-07288
Any shader invocation executed by this command must terminate

• VUID-vkCmdDispatchGraphIndirectAMDX-None-09600
If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

• VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-09181
commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-09182
commandBuffer must be a primary command buffer

• VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09183
scratch must be the device address of an allocated memory range at least as large as the value of VkExecutionGraphPipelineScratchSizeAMDX::size returned by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline

• VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09184
scratch must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX or VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX flag

• VUID-vkCmdDispatchGraphIndirectAMDX-scratch-09185
Device memory in the range [scratch, scratch + VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph
pipeline, and not modified after that by anything other than another execution graph dispatch command

- VUID-vkCmdDispatchGraphIndirectAMDX-maxComputeWorkGroupCount-09186
  Execution of this command must not cause a node to be dispatched with a larger number of workgroups than that specified by either a MaxNumWorkgroupsAMDX decoration in the dispatched node or maxComputeWorkGroupCount

- VUID-vkCmdDispatchGraphIndirectAMDX-maxExecutionGraphShaderPayloadCount-09187
  Execution of this command must not cause any shader to initialize more than maxExecutionGraphShaderPayloadCount output payloads

- VUID-vkCmdDispatchGraphIndirectAMDX-NodeMaxPayloadsAMDX-09188
  Execution of this command must not cause any shader that declares NodeMaxPayloadsAMDX to initialize more output payloads than specified by the max number of payloads for that decoration. This requirement applies to each NodeMaxPayloadsAMDX decoration separately

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09150
  pCountInfo->infos must be a device pointer to a memory allocation at least as large as the product of count and stride when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09151
  pCountInfo->infos must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09152
  pCountInfo->infos must be a multiple of executionGraphDispatchAddressAlignment

- VUID-vkCmdDispatchGraphIndirectAMDX-infos-09153
  Device memory locations at indexes in the range [infos, infos + (count*stride)), at a granularity of stride must contain valid VkDispatchGraphInfoAMDX structures in the first 24 bytes when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09154
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a device pointer to a memory allocation at least as large as the product of payloadCount and payloadStride when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09155
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09156
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, payloads must be a multiple of executionGraphDispatchAddressAlignment

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09157
  For each VkDispatchGraphInfoAMDX structure in pCountInfo->infos, nodeIndex must be a valid node index in the currently bound execution graph pipeline, as returned by vkGetExecutionGraphPipelineNodeIndexAMDX when this command is executed on the device

- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-09158
For each `VkDispatchGraphInfoAMDX` structure in `pCountInfo->infos`, device memory locations at indexes in the range `[(payloads, payloads + (payloadCount * payloadStride))]`, at a granularity of `payloadStride` must contain a payload matching the size of the input payload expected by the node in `nodeIndex` in the first bytes when this command is executed on the device.

**Valid Usage (Implicit)**

- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-parameter 
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDispatchGraphIndirectAMDX-pCountInfo-parameter 
  `pCountInfo` must be a valid pointer to a valid `VkDispatchGraphCountInfoAMDX` structure
- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-recording 
  `commandBuffer` must be in the recording state
- VUID-vkCmdDispatchGraphIndirectAMDX-commandBuffer-cmdpool 
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- VUID-vkCmdDispatchGraphIndirectAMDX-renderpass 
  This command must only be called outside of a render pass instance
- VUID-vkCmdDispatchGraphIndirectAMDX-videocoding 
  This command must only be called outside of a video coding scope
- VUID-vkCmdDispatchGraphIndirectAMDX-bufferlevel 
  `commandBuffer` must be a primary `VkCommandBuffer`

**Host Synchronization**

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

To record an execution graph dispatch with all parameters read on device, call:
void vkCmdDispatchGraphIndirectCountAMDX(
    VkCommandBuffer commandBuffer,
    VkDeviceAddress scratch,
    VkDeviceAddress countInfo);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scratch` is a pointer to the scratch memory to be used.
- `countInfo` is a device address of a `VkDispatchGraphCountInfoAMDX` structure defining the nodes which will be initially executed.

When this command is executed, the nodes specified in `countInfo` are executed. Nodes executed as part of this command are not implicitly synchronized in any way against each other once they are dispatched.

For this command, all pointers in substructures are treated as device pointers and read during device execution of this command. The allocation and contents of these pointers only needs to be valid during device execution. All of these addresses will be read in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` access flag.

Execution of this command may modify any memory locations in the range `[scratch, scratch + size)`, where `size` is the value returned in `VkExecutionGraphPipelineScratchSizeAMDX::size` by `VkExecutionGraphPipelineScratchSizeAMDX` for the currently bound execution graph pipeline. Accesses to this memory range are performed in the `VK_PIPELINE_STAGE_2_COMPUTE_SHADER_BIT` pipeline stage with the `VK_ACCESS_2_SHADER_STORAGE_READ_BIT` and `VK_ACCESS_2_SHADER_STORAGE_WRITE_BIT` access flags.

### Valid Usage

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-magFilter-04553**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-magFilter-09598**
  
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `reductionMode` equal to either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-mipmapMode-04770**
  
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR`, `reductionMode` equal to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.
image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-mipmapMode-09599
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and
  reductionMode equal to either VK_SAMPLER_REDUCTION_MODE_MIN or
  VK_SAMPLER_REDUCTION_MODE_MAX is used to sample a VkImageView as a result of this
  command, then the image view’s format features must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-unnormalizedCoordinates-09635
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a
  VkImageView as a result of this command, then the image view’s levelCount and
  layerCount must be 1

- VUID-vkCmdDispatchGraphIndirectCountAMDX-unnormalizedCoordinates-09636
  If a VkSampler created with unnormalizedCoordinates equal to VK_TRUE is used to sample a
  VkImageView as a result of this command, then the image view’s viewType must be
  VK_IMAGE_VIEW_TYPE_1D or VK_IMAGE_VIEW_TYPE_2D

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features
  must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then
  the image view’s format features must contain
  VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-07888
  If a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor is accessed using atomic
  operations as a result of this command, then the storage texel buffer’s format features
  must contain VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then
  the image view’s format features must contain
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-02693
  If the VK_EXT_filter_cubic extension is not enabled and any VkImageView is sampled with
  VK_FILTER_CUBIC_EXT as a result of this command, it must not have a VkImageViewType of
  VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-vkCmdDispatchGraphIndirectCountAMDX-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command
  must have a VkImageViewType and format that supports cubic filtering, as specified by
  VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by
  vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDispatchGraphIndirectCountAMDX-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of
  either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this
  command must have a VkImageViewType and format that supports cubic filtering
together with minmax filtering, as specified by
\texttt{VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax}
returned by \texttt{vkGetPhysicalDeviceImageFormatProperties2}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-cubicRangeClamp-09212
  If the \texttt{cubicRangeClamp} feature is not enabled, then any \texttt{VkImageView} being sampled with \texttt{VK\_FILTER\_CUBIC\_EXT} as a result of this command \textbf{must} not have a \texttt{VkSamplerReductionModeCreateInfo::reductionMode} equal to \texttt{VK\_SAMPLE\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE\_RANGECLAMP\_QCOM}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-reductionMode-09213
  Any \texttt{VkImageView} being sampled with a \texttt{VkSamplerReductionModeCreateInfo::reductionMode} equal to \texttt{VK\_SAMPLE\_REDUCTION\_MODE\_WEIGHTED\_AVERAGE\_RANGECLAMP\_QCOM} as a result of this command \textbf{must} sample with \texttt{VK\_FILTER\_CUBIC\_EXT}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-selectableCubicWeights-09214
  If the \texttt{selectableCubicWeights} feature is not enabled, then any \texttt{VkImageView} being sampled with \texttt{VK\_FILTER\_CUBIC\_EXT} as a result of this command \textbf{must} have \texttt{VkSamplerCubicWeightsCreateInfoQCOM::cubicWeights} equal to \texttt{VK\_CUBIC\_FILTER\_WEIGHTS\_CATMULL\_ROM\_QCOM}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-flags-02696
  Any \texttt{VkImage} created with a \texttt{VkImageCreateInfo::flags} containing \texttt{VK\_IMAGE\_CREATE\_CORNER\_SAMPLED\_BIT\_NV} sampled as a result of this command \textbf{must} only be sampled using a \texttt{VkSamplerAddressMode} of \texttt{VK\_SAMPLE\_ADDRESS\_MODE\_CLAMP\_TO\_EDGE}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07027
  For any \texttt{VkImageView} being written as a storage image where the image format field of the \texttt{OpTypeImage} is Unknown, the view’s format features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_STORAGE\_WRITE\_WITHOUT\_FORMAT\_BIT}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07028
  For any \texttt{VkImageView} being read as a storage image where the image format field of the \texttt{OpTypeImage} is Unknown, the view’s format features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_STORAGE\_READ\_WITHOUT\_FORMAT\_BIT}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07029
  For any \texttt{VkBufferView} being written as a storage texel buffer where the image format field of the \texttt{OpTypeImage} is Unknown, the view’s buffer features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_STORAGE\_WRITE\_WITHOUT\_FORMAT\_BIT}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-OpTypeImage-07030
  Any \texttt{VkBufferView} being read as a storage texel buffer where the image format field of the \texttt{OpTypeImage} is Unknown then the view’s buffer features \textbf{must} contain \texttt{VK\_FORMAT\_FEATURE\_2\_STORAGE\_READ\_WITHOUT\_FORMAT\_BIT}

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08600
  For each set \texttt{n} that is statically used by a bound shader, a descriptor set \textbf{must} have been bound to \texttt{n} at the same pipeline bind point, with a \texttt{VkPipelineLayout} that is compatible for set \texttt{n}, with the \texttt{VkPipelineLayout} used to create the current \texttt{VkPipeline} or the \texttt{VkDescriptorsetLayout} array used to create the current \texttt{VkShaderEXT}, as described in Pipeline Layout Compatibility

- VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08601
For each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout array used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-maintenance4-08602**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by a bound shader, a push constant value **must** have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline or the VkDescriptorSetLayout and VkPushConstantRange arrays used to create the current VkShaderEXT, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08114**
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, **must** be valid as described by descriptor validity if they are statically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was not created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08115**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdBindDescriptorSets, the bound VkPipeline **must** have been created without VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08116**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by the VkPipeline bound to the pipeline bind point used by this command and the bound VkPipeline was created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08604**
  Descriptors in bound descriptor buffers, specified via vkCmdSetDescriptorBufferOffsetsEXT, **must** be valid if they are dynamically used by any VkShaderEXT bound to a stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08117**
  If the descriptors used by the VkPipeline bound to the pipeline bind point were specified via vkCmdSetDescriptorBufferOffsetsEXT, the bound VkPipeline **must** have been created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08119**
  If a descriptor is dynamically used with a VkPipeline created with VK_PIPELINE_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory **must** be resident.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08605**
  If a descriptor is dynamically used with a VkShaderEXT created with a VkDescriptorSetLayout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_DESCRIPTOR_BUFFER_BIT_EXT, the descriptor memory **must** be resident.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08606**
If the `shaderObject` feature is not enabled, a valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08608**
  If a pipeline is bound to the pipeline bind point used by this command, there **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08609**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08610**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08611**
  If the `VkPipeline` object bound to the pipeline bind point used by this command or any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08607**
  If the `shaderObject` is enabled, either a valid pipeline **must** be bound to the pipeline bind point used by this command, or a valid combination of valid and `VK_NULL_HANDLE` shader objects **must** be bound to every supported shader stage corresponding to the pipeline bind point used by this command.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08612**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a uniform buffer, it **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-storageBuffers-06936**

3712
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-08613**
  If the `robustBufferAccess` feature is not enabled, and any `VkShaderEXT` bound to a stage corresponding to the pipeline bind point used by this command accesses a storage buffer, it must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by bound shaders must not be a protected resource.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-None-06550**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler YCbCr conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-ConstOffset-06551**
  If a bound shader accesses a `VkSampler` or `VkImageView` object that enables sampler YCbCr conversion, that object must not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-viewType-07752**
  If a `VkImageView` is accessed as a result of this command, then the image view’s `viewType` must match the `Dim` operand of the `OpTypeImage` as described in Instruction/Sampler/Image View Validation.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-format-07753**
  If a `VkImageView` is accessed as a result of this command, then the numeric type of the image view’s `format` and the `Sampled` `Type` operand of the `OpTypeImage` must match.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWrite-08795**
  If a `VkImageView` created with a format other than `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s `format`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWrite-08796**
  If a `VkImageView` created with the format `VK_FORMAT_A8_UNORM_KHR` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have four components.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s `format`.

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction...
**must** have a **Width** of 64

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-SampledType-04471**
  If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-SampledType-04472**
  If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 64

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-SampledType-04473**
  If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-sparseImageInt64Atomics-04474**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-sparseImageInt64Atomics-04475**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** flag **must** not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWeightedSampleQCOM-06971**
  If **OpImageWeightedSampleQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM**

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWeightedSampleQCOM-06972**
  If **OpImageWeightedSampleQCOM** uses a **VkImageView** as a sample weight image as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM**

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockFilterQCOM-06973**
  If **OpImageBoxFilterQCOM** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM**

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchSSDQCOM-06974**
  If **OpImageBlockMatchSSDQCOM** is used to read from an **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM**

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchSADQCOM-06975**
  If **OpImageBlockMatchSADQCOM** is used to read from an **VkImageView** as a result of this command, then the image view’s **format features** **must** contain **VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM**

- **VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchSADQCOM-06976**
  If **OpImageBlockMatchSADQCOM** or **OpImageBlockMatchSSDQCOM** is used to read from a
reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchWindowSSDQCOM, OpImageBlockMatchWindowSADQCOM, OpImageBlockMatchGatherSSDQCOM, OpImageBlockMatchGatherSADQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchWindow-09215
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MISMATCHING_BIT_QCOM

• VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchWindow-09216
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM instruction is used to read from an VkImageView as a result of this command, then the image view's format must be a single-component format

• VUID-vkCmdDispatchGraphIndirectCountAMDX-OpImageBlockMatchWindow-09217
  If a OpImageBlockMatchWindow*QCOM or OpImageBlockMatchGather*QCOM read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation

• VUID-vkCmdDispatchGraphIndirectCountAMDX-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDispatchGraphIndirectCountAMDX-None-09600
  If a descriptor with type equal to any of VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT is accessed as a result of this command, the image subresource identified by that descriptor must be in the image layout identified when the descriptor was written

• VUID-vkCmdDispatchGraphIndirectCountAMDX-commandBuffer-09181
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDispatchGraphIndirectCountAMDX-commandBuffer-09182
  commandBuffer must be a primary command buffer

• VUID-vkCmdDispatchGraphIndirectCountAMDX-scratch-09183
  scratch must be the device address of an allocated memory range at least as large as the value of VkExecutionGraphPipelineScratchSizeAMDX::size returned by VkExecutionGraphPipelineScratchSizeAMDX for the currently bound execution graph pipeline.
 scratch must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_EXECUTION_GRAPH_SCRATCH_BIT_AMDX or VK_BUFFER_USAGE_2_EXECUTION_GRAPH_SCRATCH_BIT_AMDX flag

Device memory in the range [scratch, scratch VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph pipeline, and not modified after that by anything other than another execution graph dispatch command

Device memory in the range [scratch, scratch VkExecutionGraphPipelineScratchSizeAMDX::size) must have been initialized with vkCmdInitializeGraphScratchMemoryAMDX using the currently bound execution graph pipeline, and not modified after that by anything other than another execution graph dispatch command

Execution of this command must not cause a node to be dispatched with a larger number of workgroups than that specified by either a MaxNumWorkgroupsAMDX decoration in the dispatched node or maxComputeWorkGroupCount

Execution of this command must not cause any shader to initialize more than maxExecutionGraphShaderPayloadCount output payloads

Execution of this command must not cause any shader that declares NodeMaxPayloadsAMDX to initialize more output payloads than specified by the max number of payloads for that decoration. This requirement applies to each NodeMaxPayloadsAMDX decoration separately

countInfo must be a device pointer to a memory allocation containing a valid VkDispatchGraphCountInfoAMDX structure when this command is executed on the device

countInfo must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

countInfo must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

countInfo must be a multiple of executionGraphDispatchAddressAlignment

countInfo->infos must be a device pointer to a memory allocation at least as large as the product of count and stride when this command is executed on the device

countInfo->infos must be a device address within a VkBuffer created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT flag

countInfo->infos must be a multiple of executionGraphDispatchAddressAlignment

Device memory locations at indexes in the range [infos, infos + (count*stride)), at a granularity of stride must contain valid VkDispatchGraphInfoAMDX structures in the first 24 bytes when this command is executed on the device
For each `VkDispatchGraphInfoAMDX` structure in `countInfo->infos`, `payloads` must be a device pointer to a memory allocation at least as large as the product of `payloadCount` and `payloadStride` when this command is executed on the device.

For each `VkDispatchGraphInfoAMDX` structure in `countInfo->infos`, `payloads` must be a device address within a `VkBuffer` created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` flag.

For each `VkDispatchGraphInfoAMDX` structure in `countInfo->infos`, `payloads` must be a multiple of `executionGraphDispatchAddressAlignment`.

For each `VkDispatchGraphInfoAMDX` structure in `countInfo->infos`, `nodeIndex` must be a valid node index in the currently bound execution graph pipeline, as returned by `vkGetExecutionGraphPipelineNodeIndexAMDX` when this command is executed on the device.

For each `VkDispatchGraphInfoAMDX` structure in `countInfo->infos`, device memory locations at indexes in the range `[payloads, payloads + (payloadCount * payloadStride)]`, at a granularity of `payloadStride` must contain a payload matching the size of the input payload expected by the node in `nodeIndex` in the first bytes when this command is executed on the device.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.
- This command must only be called outside of a render pass instance.
- This command must only be called outside of a video coding scope.
- `commandBuffer` must be a primary `VkCommandBuffer`.

Host Synchronization

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
The `VkDeviceOrHostAddressConstAMDX` union is defined as:

```c
// Provided by VK_AMDX_shader_enqueue
typedef union VkDeviceOrHostAddressConstAMDX {
    VkDeviceAddress deviceAddress;
    const void* hostAddress;
} VkDeviceOrHostAddressConstAMDX;
```

- `deviceAddress` is a buffer device address as returned by the `vkGetBufferDeviceAddressKHR` command.
- `hostAddress` is a const host memory address.

The `VkDispatchGraphCountInfoAMDX` structure is defined as:

```c
// Provided by VK_AMDX_shader_enqueue
typedef struct VkDispatchGraphCountInfoAMDX {
    uint32_t count;
    VkDeviceOrHostAddressConstAMDX infos;
    uint64_t stride;
} VkDispatchGraphCountInfoAMDX;
```

- `count` is the number of dispatches to perform.
- `infos` is the device or host address of a flat array of `VkDispatchGraphInfoAMDX` structures
- `stride` is the byte stride between successive `VkDispatchGraphInfoAMDX` structures in `infos`

Whether `infos` is consumed as a device or host pointer is defined by the command this structure is used in.

The `VkDispatchGraphInfoAMDX` structure is defined as:
```c
typedef struct VkDispatchGraphInfoAMDX {
  uint32_t nodeIndex;
  uint32_t payloadCount;
  VkDeviceOrHostAddressConstAMDX payloads;
  uint64_t payloadStride;
} VkDispatchGraphInfoAMDX;
```

- **nodeIndex** is the index of a node in an execution graph to be dispatched.
- **payloadCount** is the number of payloads to dispatch for the specified node.
- **payloads** is a device or host address pointer to a flat array of payloads with size equal to the product of **payloadCount** and **payloadStride**.
- **payloadStride** is the byte stride between successive payloads in **payloads**.

Whether **payloads** is consumed as a device or host pointer is defined by the command this structure is used in.

### Valid Usage

- VUID-VkDispatchGraphInfoAMDX-payloadCount-09171
  
  **payloadCount** must be no greater than **maxExecutionGraphShaderPayloadCount**

### 44.4. Shader Enqueue

Compute shaders in an execution graph **can** use the **OpInitializeNodePayloadsAMDX** to initialize nodes for dispatch. Any node payload initialized in this way will be enqueued for dispatch once the shader is done writing to the payload. As compilers **may** be conservative when making this determination, shaders **can** further call **OpFinalizeNodePayloadsAMDX** to guarantee that the payload is no longer being written.

The **Node Name** operand of the **PayloadNodeNameAMDX** decoration on a payload identifies the shader name of the node to be enqueued, and the **Shader Index** operand of **OpInitializeNodePayloadsAMDX** identifies the shader index. A node identified in this way is dispatched as described in the following sections.

### 44.4.1. Compute Nodes

Compute shaders added as nodes to an execution graph are executed differently based on the presence or absence of the **StaticNumWorkgroupsAMDX** or **CoalescingAMDX** execution modes.

Dispatching a compute shader node that does not declare either the **StaticNumWorkgroupsAMDX** or **CoalescingAMDX** execution mode will execute a number of workgroups in each dimension specified by the first 12 bytes of the payload, interpreted as a **VkDispatchIndirectCommand**. The same payload will be broadcast to each workgroup in the same dispatch. Additional values in the payload are have no effect on execution.
Dispatching a compute shader node with the StaticNumWorkgroupsAMDX execution mode will execute workgroups in each dimension according to the $x$, $y$, and $z$ size operands to the StaticNumWorkgroupsAMDX execution mode. The same payload will be broadcast to each workgroup in the same dispatch. Any values in the payload have no effect on execution.

Dispatching a compute shader node with the CoalescingAMDX execution mode will enqueue a single invocation for execution. Implementations may combine multiple such dispatches into the same workgroup, up to the size of the workgroup. The number of invocations coalesced into a given workgroup in this way can be queried via the CoalescedInputCountAMDX built-in. Any values in the payload have no effect on execution.
Chapter 45. Low Latency 2

45.1. Latency Reduction

To enable or disable low latency mode on a swapchain, call:

```c
// Provided by VK_NV_low_latency2
VkResult vkSetLatencySleepModeNV(
    VkDevice device,
    VkSwapchainKHR swapchain,
    const VkLatencySleepModeInfoNV* pSleepModeInfo);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to enable or disable low latency mode on.
- `pSleepModeInfo` is `NULL` or a pointer to a `VkLatencySleepModeInfoNV` structure specifying the parameters of the latency sleep mode.

If `pSleepModeInfo` is `NULL`, `vkSetLatencySleepModeNV` will disable low latency mode, low latency boost, and set the minimum present interval previously specified by `VkLatencySleepModeInfoNV` to zero on `swapchain`. As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to `vkSetLatencySleepModeNV` may be simultaneously used by other threads in calls to functions other than `vkDestroySwapchainKHR`. Access to the swapchain data associated with this extension must be atomic within the implementation.

### Valid Usage (Implicit)

- VUID-vkSetLatencySleepModeNV-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetLatencySleepModeNV-swapchain-parameter
  - `swapchain` must be a valid `VkSwapchainKHR` handle
- VUID-vkSetLatencySleepModeNV-pSleepModeInfo-parameter
  - `pSleepModeInfo` must be a valid pointer to a valid `VkLatencySleepModeInfoNV` structure
- VUID-vkSetLatencySleepModeNV-swapchain-parent
  - `swapchain` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_INITIALIZATION_FAILED`
The `VkLatencySleepModeInfoNV` structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkLatencySleepModeInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 lowLatencyMode;
    VkBool32 lowLatencyBoost;
    uint32_t minimumIntervalUs;
} VkLatencySleepModeInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lowLatencyMode` is the toggle to enable or disable low latency mode.
- `lowLatencyBoost` allows an application to hint to the GPU to increase performance to provide additional latency savings at a cost of increased power consumption.
- `minimumIntervalUs` is the microseconds between `vkQueuePresentKHR` calls for a given swapchain that `vkLatencySleepNV` will enforce.

If `lowLatencyMode` is set to `VK_FALSE`, `lowLatencyBoost` will still hint to the GPU to increase its power state and `vkLatencySleepNV` will still enforce `minimumIntervalUs` between `vkQueuePresentKHR` calls.

**Valid Usage (Implicit)**

- `VUID-VkLatencySleepModeInfoNV-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_LATENCY_SLEEP_MODE_INFO_NV`

To provide the synchronization primitive used to delay host CPU work for lower latency rendering, call:

```c
// Provided by VK_NV_low_latency2
VkResult vkLatencySleepNV(
    VkDevice device,
    VkSwapchainKHR swapchain,
    const VkLatencySleepInfoNV* pSleepInfo);
```

- `device` is the device associated with `swapchain`.
- `swapchain` is the swapchain to delay associated CPU work based on `VkLatencySubmissionPresentIdNV` submissions.
- `pSleepInfo` is a pointer to a `VkLatencySleepInfoNV` structure specifying the parameters of the latency sleep.

`vkLatencySleepNV` returns immediately. Applications should use `vkWaitSemaphores` with `pSleepInfo->signalSemaphore` to delay host CPU work. CPU work refers to application work done
before presenting which includes but is not limited to: input sampling, simulation, command buffer recording, command buffer submission, and present submission. It is recommended to call this function before input sampling. When using this function, it should be called exactly once between presents.

## Valid Usage (Implicit)

- VUID-vkLatencySleepNV-device-parameter
  device must be a valid VkDevice handle
- VUID-vkLatencySleepNV-swapchain-parameter
  swapchain must be a valid VkSwapchainKHR handle
- VUID-vkLatencySleepNV-pSleepInfo-parameter
  pSleepInfo must be a valid pointer to a valid VkLatencySleepInfoNV structure
- VUID-vkLatencySleepNV-swapchain-parent
  swapchain must have been created, allocated, or retrieved from device

## Return Codes

**Success**
- VK_SUCCESS

**Failure**
None

The VkLatencySleepInfoNV structure is defined as:

```c
// Provided by VK_NV_low_latency
typedef struct VkLatencySleepInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkSemaphore signalSemaphore;
    uint64_t value;
} VkLatencySleepInfoNV;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **signalSemaphore** is a semaphore that is signaled to indicate that the application should resume input sampling work.
- **value** is the value that signalSemaphore is set to for resuming sampling work.

## Valid Usage

- VUID-VkLatencySleepInfoNV-signalSemaphore-09361
**signalSemaphore must** be a timeline semaphore

---

**Valid Usage (Implicit)**

- VUID-VkLatencySleepInfoNV-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_LATENCY_SLEEP_INFO_NV

- VUID-VkLatencySleepInfoNV-signalSemaphore-parameter
  
  signalSemaphore **must** be a valid VkSemaphore handle

An application can provide timestamps at various stages of its frame generation work by calling:

```c
// Provided by VK_NV_low_latency2
void vkSetLatencyMarkerNV(
    VkDevice device, 
    VkSwapchainKHR swapchain, 
    const VkSetLatencyMarkerInfoNV* pLatencyMarkerInfo);
```

- **device** is the device associated with **swapchain**.
- **swapchain** is the swapchain to capture timestamps on.
- **pSetLatencyMarkerInfo** is a pointer to a VkSetLatencyMarkerInfoNV structure specifying the parameters of the marker to set.

At the beginning and end of simulation and render threads and beginning and end of vkQueuePresentKHR calls, **vkSetLatencyMarkerNV can** be called to provide timestamps for the application's reference. These timestamps are returned with a call to vkGetLatencyTimingsNV alongside driver provided timestamps at various points of interest with regards to latency within the application. As an exception to the normal rules for objects which are externally synchronized, the swapchain passed to **vkSetLatencyMarkerNV may** be simultaneously used by other threads in calls to functions other than vkDestroySwapchainKHR. Access to the swapchain data associated with this extension **must** be atomic within the implementation.

---

**Valid Usage (Implicit)**

- VUID-vkSetLatencyMarkerNV-device-parameter
  
  device **must** be a valid VkDevice handle

- VUID-vkSetLatencyMarkerNV-swapchain-parameter
  
  swapchain **must** be a valid VkSwapchainKHR handle

- VUID-vkSetLatencyMarkerNV-pLatencyMarkerInfo-parameter
  
  pLatencyMarkerInfo **must** be a valid pointer to a valid VkSetLatencyMarkerInfoNV structure

- VUID-vkSetLatencyMarkerNV-swapchain-parent
  
  swapchain **must** have been created, allocated, or retrieved from device
The **VkSetLatencyMarkerInfoNV** structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkSetLatencyMarkerInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint64_t presentID;
    VkLatencyMarkerNV marker;
} VkSetLatencyMarkerInfoNV;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **presentId** is an application provided value that is used to associate the timestamp with a `vkQueuePresentKHR` command using `VkPresentIdKHR::pPresentIds` for a given present.
- **marker** is the type of timestamp to be recorded.

### Valid Usage (Implicit)

- VUID-VkSetLatencyMarkerInfoNV-sType-sType  
  sType **must** be **VK_STRUCTURE_TYPE_SET_LATENCY_MARKER_INFO_NV**
- VUID-VkSetLatencyMarkerInfoNV-marker-parameter  
  marker **must** be a valid **VkLatencyMarkerNV** value

The **VkLatencyMarkerNV** enum is defined as:

```c
// Provided by VK_NV_low_latency2
typedef enum VkLatencyMarkerNV {
    VK_LATENCY_MARKER_SIMULATION_START_NV = 0,
    VK_LATENCY_MARKER_SIMULATION_END_NV = 1,
    VK_LATENCY_MARKER_RENDERSUBMIT_START_NV = 2,
    VK_LATENCY_MARKER_RENDERSUBMIT_END_NV = 3,
    VK_LATENCY_MARKER_PRESENT_START_NV = 4,
    VK_LATENCY_MARKER_PRESENT_END_NV = 5,
    VK_LATENCY_MARKER_INPUT_SAMPLE_NV = 6,
    VK_LATENCY_MARKER_TRIGGER_FLASH_NV = 7,
    VK_LATENCY_MARKER_OUT_OF_BAND_RENDERSUBMIT_START_NV = 8,
    VK_LATENCY_MARKER_OUT_OF_BAND_RENDERSUBMIT_END_NV = 9,
    VK_LATENCY_MARKER_OUT_OF_BAND_PRESENT_START_NV = 10,
    VK_LATENCY_MARKER_OUT_OF_BAND_PRESENT_END_NV = 11,
} VkLatencyMarkerNV;
```

The members of the **VkLatencyMarkerNV** are used as arguments for `vkSetLatencyMarkerNV` in the use cases described below:

- **VK_LATENCY_MARKER_SIMULATION_START_NV** **should** be called at the start of the simulation execution
each frame, but after the call to `vkLatencySleepNV`.

- **VK_LATENCY_MARKER_SIMULATION_END_NV** should be called at the end of the simulation execution each frame.

- **VK_LATENCY_MARKER_RENDERSUBMIT_START_NV** should be called at the beginning of the render submission execution each frame. This should be wherever Vulkan API calls are made and must not span into asynchronous rendering.

- **VK_LATENCY_MARKER_RENDERSUBMIT_END_NV** should be called at the end of the render submission execution each frame.

- **VK_LATENCY_MARKER_PRESENT_START_NV** should be called just before `vkQueuePresentKHR`.

- **VK_LATENCY_MARKER_PRESENT_END_NV** should be called when `vkQueuePresentKHR` returns.

- **VK_LATENCY_MARKER_INPUT_SAMPLE_NV** should be called just before the application gathers input data.

- **VK_LATENCY_MARKER_TRIGGER_FLASH_NV** should be called anywhere between **VK_LATENCY_MARKER_SIMULATION_START_NV** and **VK_LATENCY_MARKER_SIMULATION_END_NV** whenever a left mouse click occurs.

To get an array containing the newest collected latency data, call:

```c
// Provided by VK_NV_low_latency2
void vkGetLatencyTimingsNV(
    VkDevice device,
    VkSwapchainKHR swapchain,
    VkGetLatencyMarkerInfoNV* pLatencyMarkerInfo);
```

- **device** is the device associated with **swapchain**.

- **swapchain** is the swapchain to return data from.

- **pGetLatencyMarkerInfo** is a pointer to a **VkGetLatencyMarkerInfoNV** structure specifying the parameters for returning latency information.

The timings returned by `vkGetLatencyTimingsNV` contain the timestamps requested from `vkSetLatencyMarkerNV` and additional implementation-specific markers defined in **VkLatencyTimingsFrameReportNV**.

**Valid Usage (Implicit)**

- VUID-vkGetLatencyTimingsNV-device-parameter
  - **device** must be a valid **VkDevice** handle

- VUID-vkGetLatencyTimingsNV-swapchain-parameter
  - **swapchain** must be a valid **VkSwapchainKHR** handle

- VUID-vkGetLatencyTimingsNV-pLatencyMarkerInfo-parameter
  - **pLatencyMarkerInfo** must be a valid pointer to a **VkGetLatencyMarkerInfoNV** structure

- VUID-vkGetLatencyTimingsNV-swapchain-parent
  - **swapchain** must have been created, allocated, or retrieved from **device**
The **VkGetLatencyMarkerInfoNV** structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkGetLatencyMarkerInfoNV {
    VkStructureType       sType;
    const void*            pNext;
    uint32_t               timingCount;
    VkLatencyTimingsFrameReportNV* pTimings;
} VkGetLatencyMarkerInfoNV;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is either **NULL** or a pointer to a structure extending this structure.
- **timingCount** is an integer related to the number of previous frames of latency data available or queried, as described below.
- **pTimings** is either **NULL** or a pointer to an array of **VkLatencyTimingsFrameReportNV** structures.

If **pTimings** is **NULL** then the maximum number of queryable frame data is returned in **timingCount**. Otherwise, **timingCount must** be set by the application to the number of elements in the **pTimings** array, and on return the variable is overwritten with the number of values actually written to **pTimings**. The elements of **pTimings** are arranged in the order they were requested in, with the oldest data in the first entry.

---

### Valid Usage (Implicit)

- VUID-VkGetLatencyMarkerInfoNV-sType-sType
  - **sType must** be **VK_STRUCTURE_TYPE_GET_LATENCY_MARKER_INFO_NV**

- VUID-VkGetLatencyMarkerInfoNV-pTimings-parameter
  - If **timingCount** is not 0, and **pTimings** is not **NULL**, **pTimings must** be a valid pointer to an array of **timingCount** **VkLatencyTimingsFrameReportNV** structures

The **VkLatencyTimingsFrameReportNV** structure describes latency data returned by **vkGetLatencyTimingsNV**
typedef struct VkLatencyTimingsFrameReportNV {
    VkStructureType sType;
    const void* pNext;
    uint64_t presentID;
    uint64_t inputSampleTimeUs;
    uint64_t simStartTimeUs;
    uint64_t simEndTimeUs;
    uint64_t renderSubmitStartTimeUs;
    uint64_t renderSubmitEndTimeUs;
    uint64_t presentStartTimeUs;
    uint64_t presentEndTimeUs;
    uint64_t driverStartTimeUs;
    uint64_t driverEndTimeUs;
    uint64_t osRenderQueueStartTimeUs;
    uint64_t osRenderQueueEndTimeUs;
    uint64_t gpuRenderStartTimeUs;
    uint64_t gpuRenderEndTimeUs;
} VkLatencyTimingsFrameReportNV;

The members of the VkLatencyTimingsFrameReportNV structure describe the following:

- **presentID** is the application provided value that is used to associate the timestamp with a vkQueuePresentKHR command using VkPresentIdKHR::pPresentIds for a given present.
- **simStartTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_SIMULATION_START_NV.
- **simEndTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_SIMULATION_END_NV.
- **renderStartSubmitTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_RENDERSUBMIT_START_NV.
- **renderEndSubmitTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_RENDERSUBMIT_END_NV.
- **presentStartTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_PRESENT_START_NV.
- **presentEndTimeUs** is the timestamp written when vkSetLatencyMarkerNV is called with the VkLatencyMarkerNV enum VK_LATENCY_MARKER_PRESENT_END_NV.
- **driverStartTimeUs** is the timestamp written when the first vkQueueSubmit for the frame is called.
- **driverEndTimeUs** is the timestamp written when the final vkQueueSubmit hands off from the Vulkan Driver.
- **osRenderQueueStartSubmitTimeUs** is the timestamp written when the final vkQueueSubmit hands off from the Vulkan Driver.
- **osRenderQueueEndTimeUs** is the timestamp written when the first submission reaches the GPU.
- **gpuRenderStartSubmitTimeUs** is the timestamp written when the first submission reaches the GPU.
• `gpuRenderEndTimeUs` is the timestamp written when the final submission finishes on the GPU for the frame.

### Valid Usage (Implicit)

- **VUID-VkLatencyTimingsFrameReportNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_LATENCY_TIMINGS_FRAME_REPORT_NV`

The `VkLatencySubmissionPresentIdNV` structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkLatencySubmissionPresentIdNV {
    VkStructureType sType;
    const void* pNext;
    uint64_t presentID;
} VkLatencySubmissionPresentIdNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentId` is used to associate the `vkQueueSubmit` with the `presentId` used for a given `vkQueuePresentKHR` via `VkPresentIdKHR::pPresentIds`.

For any submission to be tracked with low latency mode pacing, it needs to be associated with other submissions in a given present. Applications **must** include the `VkLatencySubmissionPresentIdNV` in the `pNext` chain of `vkQueueSubmit` to associate that submission with the `presentId` present for low latency mode.

### Valid Usage (Implicit)

- **VUID-VkLatencySubmissionPresentIdNV-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_LATENCY_SUBMISSION_PRESENT_ID_NV`

An application can mark a queue as Out of Band to indicate that all `vkQueueSubmit` calls on this queue are ignored for latency evaluation by calling:

```c
// Provided by VK_NV_low_latency2
void vkQueueNotifyOutOfBandNV(
    VkQueue queue,
    const VkOutOfBandQueueTypeInfoNV* pQueueTypeInfo);
```

- `queue` is the `VkQueue` to be marked as out of band.
- `pQueueTypeInfo` is a pointer to a `VkOutOfBandQueueTypeInfoNV` structure specifying the queue type.
Valid Usage (Implicit)

- VUID-vkQueueNotifyOutOfBandNV-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueNotifyOutOfBandNV-pQueueTypeInfo-parameter
  pQueueTypeInfo must be a valid pointer to a valid VkOutOfBandQueueTypeInfoNV structure

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

The VkOutOfBandQueueTypeInfoNV structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkOutOfBandQueueTypeInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkOutOfBandQueueTypeNV queueType;
} VkOutOfBandQueueTypeInfoNV;
```

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `queueType` describes the usage of the queue to be marked as out of band.

Valid Usage (Implicit)

- VUID-VkOutOfBandQueueTypeInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_OUT_OF_BAND_QUEUE_TYPE_INFO_NV

- VUID-VkOutOfBandQueueTypeInfoNV-queueType-parameter
  queueType must be a valid VkOutOfBandQueueTypeNV value

The VkOutOfBandQueueTypeNV enum is defined as:

```c
// Provided by VK_NV_low_latency2
typedef enum VkOutOfBandQueueTypeNV {
    VK_OUT_OF_BAND_QUEUE_TYPE_RENDER_NV = 0,
    VK_OUT_OF_BAND_QUEUE_TYPE_PRESENT_NV = 1,
} VkOutOfBandQueueTypeNV;
```
The members of the `VkOutOfBandQueueTypeNV` are used to describe the queue type in `VkOutOfBandQueueTypeInfoNV` as described below:

- `VK_OUT_OF_BAND_QUEUE_TYPE_RENDER_NV` indicates that work will be submitted to this queue.
- `VK_OUT_OF_BAND_QUEUE_TYPE_PRESENT_NV` indicates that this queue will be presented from.

To allow low latency mode to be used by a swapchain, add a `VkSwapchainLatencyCreateInfoNV` structure to the `pNext` chain of `VkSwapchainCreateInfoKHR`.

The `VkSwapchainLatencyCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkSwapchainLatencyCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 latencyModeEnable;
} VkSwapchainLatencyCreateInfoNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `latencyModeEnable` indicates if the swapchain created will utilize low latency mode.

Valid Usage (Implicit)

- `VUID-VkSwapchainLatencyCreateInfoNV-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_SWAPCHAIN_LATENCY_CREATE_INFO_NV`

The `VkLatencySurfaceCapabilitiesNV` structure is defined as:

```c
// Provided by VK_NV_low_latency2
typedef struct VkLatencySurfaceCapabilitiesNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t presentModeCount;
    VkPresentModeKHR* pPresentModes;
} VkLatencySurfaceCapabilitiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentModeCount` is the number of presentation modes provided.
- `pPresentModes` is list of presentation modes optimized for use with low latency mode with `presentModeCount` entries.

If `pPresentModes` is `NULL`, then the number of present modes that are optimized for use with low latency mode.
latency mode returned in `presentModeCount`. Otherwise, `presentModeCount` must be set by the application to the number of elements in the `pPresentModes` array, and on return the variable is overwritten with the number of values actually written to `pPresentModes`. If the value of `presentModeCount` is less than the number of optimized present modes, at most `presentModeCount` values will be written to `pPresentModes`.

### Valid Usage (Implicit)

- VUID-VkLatencySurfaceCapabilitiesNV-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_LATENCY_SURFACE_CAPABILITIES_NV`

- VUID-VkLatencySurfaceCapabilitiesNV-pPresentModes-parameter
  
  If `presentModeCount` is not 0, and `pPresentModes` is not NULL, `pPresentModes` **must** be a valid pointer to an array of `presentModeCount` `VkPresentModeKHR` values.
Chapter 46. Extending Vulkan

New functionality may be added to Vulkan via either new extensions or new versions of the core, or new versions of an extension in some cases.

This chapter describes how Vulkan is versioned, how compatibility is affected between different versions, and compatibility rules that are followed by the Vulkan Working Group.

46.1. Instance and Device Functionality

Commands that enumerate instance properties, or that accept a VkInstance object as a parameter, are considered instance-level functionality.

Commands that dispatch from a VkDevice object or a child object of a VkDevice, or take any of them as a parameter, are considered device-level functionality. Types defined by a device extension are also considered device-level functionality.

Commands that dispatch from VkPhysicalDevice, or accept a VkPhysicalDevice object as a parameter, are considered either instance-level or device-level functionality depending if the functionality is specified by an instance extension or device extension respectively.

Additionally, commands that enumerate physical device properties are considered device-level functionality.

Note
Applications usually interface to Vulkan using a loader that implements only instance-level functionality, passing device-level functionality to implementations of the full Vulkan API on the system. In some circumstances, as these may be implemented independently, it is possible that the loader and device implementations on a given installation will support different versions. To allow for this and call out when it happens, the Vulkan specification enumerates device and instance level functionality separately - they have independent version queries.

Note
Vulkan 1.0 initially specified new physical device enumeration functionality as instance-level, requiring it to be included in an instance extension. As the capabilities of device-level functionality require discovery via physical device enumeration, this led to the situation where many device extensions required an instance extension as well. To alleviate this extra work, VK_KHR_get_physical_device_properties2 (and subsequently Vulkan 1.1) redefined device-level functionality to include physical device enumeration.

46.2. Core Versions

The Vulkan Specification is regularly updated with bug fixes and clarifications. Occasionally new
functionality is added to the core and at some point it is expected that there will be a desire to perform a large, breaking change to the API. In order to indicate to developers how and when these changes are made to the specification, and to provide a way to identify each set of changes, the Vulkan API maintains a version number.

46.2.1. Version Numbers

The Vulkan version number comprises four parts indicating the variant, major, minor and patch version of the Vulkan API Specification.

The variant indicates the variant of the Vulkan API supported by the implementation. This is always 0 for the Vulkan API.

Note
A non-zero variant indicates the API is a variant of the Vulkan API and applications will typically need to be modified to run against it. The variant field was a later addition to the version number, added in version 1.2.175 of the Specification. As Vulkan uses variant 0, this change is fully backwards compatible with the previous version number format for Vulkan implementations. New version number macros have been added for this change and the old macros deprecated. For existing applications using the older format and macros, an implementation with non-zero variant will decode as a very high Vulkan version. The high version number should be detectable by applications performing suitable version checking.

The major version indicates a significant change in the API, which will encompass a wholly new version of the specification.

The minor version indicates the incorporation of new functionality into the core specification.

The patch version indicates bug fixes, clarifications, and language improvements have been incorporated into the specification.

Compatibility guarantees made about versions of the API sharing any of the same version numbers are documented in Core Versions.

The version number is used in several places in the API. In each such use, the version numbers are packed into a 32-bit integer as follows:

- The variant is a 3-bit integer packed into bits 31-29.
- The major version is a 7-bit integer packed into bits 28-22.
- The minor version number is a 10-bit integer packed into bits 21-12.
- The patch version number is a 12-bit integer packed into bits 11-0.

`VK_API_VERSION_VARIANT` extracts the API variant number from a packed version number:
VK_API_VERSION_VARIANT extracts the API major version number from a packed version number:

```c
#define VK_API_VERSION_VARIANT(version) ((uint32_t)(version) >> 29U)
```

VK_API_VERSION_MAJOR extracts the API major version number from a packed version number:

```c
#define VK_API_VERSION_MAJOR(version) (((uint32_t)(version) >> 22U) & 0x7FU)
```

VK_VERSION_MAJOR extracts the API major version number from a packed version number:

```c
#define VK_VERSION_MAJOR(version) ((uint32_t)(version) >> 22U)
```

// DEPRECATED: This define is deprecated. VK_API_VERSION_MAJOR should be used instead.
```

VK_API_VERSION_MINOR extracts the API minor version number from a packed version number:

```c
#define VK_API_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

VK_VERSION_MINOR extracts the API minor version number from a packed version number:

```c
#define VK_VERSION_MINOR(version) (((uint32_t)(version) >> 12U) & 0x3FFU)
```

// DEPRECATED: This define is deprecated. VK_API_VERSION_MINOR should be used instead.
```

VK_API_VERSION_PATCH extracts the API patch version number from a packed version number:

```c
#define VK_API_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

VK_VERSION_PATCH extracts the API patch version number from a packed version number:

```c
#define VK_VERSION_PATCH(version) ((uint32_t)(version) & 0xFFFU)
```

// DEPRECATED: This define is deprecated. VK_API_VERSION_PATCH should be used instead.
```

VK_MAKE_API_VERSION constructs an API version number.
• **variant** is the variant number.
• **major** is the major version number.
• **minor** is the minor version number.
• **patch** is the patch version number.

**VK_MAKE_VERSION** constructs an API version number.

// Provided by VK_VERSION_1_0
// Deprecated: This define is deprecated. VK_MAKE_API_VERSION should be used instead.
#define VK_MAKE_VERSION(major, minor, patch) 
    (((uint32_t)(major)) << 22U) | (((uint32_t)(minor)) << 12U) | ((uint32_t)(patch))

• **major** is the major version number.
• **minor** is the minor version number.
• **patch** is the patch version number.

**VK_API_VERSION_1_0** returns the API version number for Vulkan 1.0.0.

// Provided by VK_VERSION_1_0
// Vulkan 1.0 version number
#define VK_API_VERSION_1_0 VK_MAKE_API_VERSION(0, 1, 0, 0)// Patch version should always be set to 0

**VK_API_VERSION_1_1** returns the API version number for Vulkan 1.1.0.

// Provided by VK_VERSION_1_1
// Vulkan 1.1 version number
#define VK_API_VERSION_1_1 VK_MAKE_API_VERSION(0, 1, 1, 0)// Patch version should always be set to 0

**VK_API_VERSION_1_2** returns the API version number for Vulkan 1.2.0.

// Provided by VK_VERSION_1_2
// Vulkan 1.2 version number
#define VK_API_VERSION_1_2 VK_MAKE_API_VERSION(0, 1, 2, 0)// Patch version should always be set to 0
VK_API_VERSION_1_3 returns the API version number for Vulkan 1.3.0.

```c
// Provided by VK_VERSION_1_3
// Vulkan 1.3 version number
#define VK_API_VERSION_1_3 VK_MAKE_API_VERSION(0, 1, 3, 0) // Patch version should always be set to 0
```

### 46.2.2. Querying Version Support

The version of instance-level functionality can be queried by calling `vkEnumerateInstanceVersion`.

The version of device-level functionality can be queried by calling `vkGetPhysicalDeviceProperties` or `vkGetPhysicalDeviceProperties2`, and is returned in `VkPhysicalDeviceProperties::apiVersion`, encoded as described in Version Numbers.

### 46.3. Layers

When a layer is enabled, it inserts itself into the call chain for Vulkan commands the layer is interested in. Layers can be used for a variety of tasks that extend the base behavior of Vulkan beyond what is required by the specification - such as call logging, tracing, validation, or providing additional extensions.

**Note**

For example, an implementation is not expected to check that the value of enums used by the application fall within allowed ranges. Instead, a validation layer would do those checks and flag issues. This avoids a performance penalty during production use of the application because those layers would not be enabled in production.

**Note**

Vulkan layers may wrap object handles (i.e. return a different handle value to the application than that generated by the implementation). This is generally discouraged, as it increases the probability of incompatibilities with new extensions. The validation layers wrap handles in order to track the proper use and destruction of each object. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

To query the available layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceLayerProperties(
        uint32_t* pPropertyCount,
        VkLayerProperties* pProperties);
```

- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or
queried, as described below.

- \texttt{pProperties} is either \texttt{NULL} or a pointer to an array of \texttt{VkLayerProperties} structures.

If \texttt{pProperties} is \texttt{NULL}, then the number of layer properties available is returned in \texttt{pPropertyCount}. Otherwise, \texttt{pPropertyCount} must point to a variable set by the application to the number of elements in the \texttt{pProperties} array, and on return the variable is overwritten with the number of structures actually written to \texttt{pProperties}. If \texttt{pPropertyCount} is less than the number of layer properties available, at most \texttt{pPropertyCount} structures will be written, and \texttt{VK_INCOMPLETE} will be returned instead of \texttt{VK_SUCCESS}, to indicate that not all the available properties were returned.

The list of available layers may change at any time due to actions outside of the Vulkan implementation, so two calls to \texttt{vkEnumerateInstanceLayerProperties} with the same parameters may return different results, or retrieve different \texttt{pPropertyCount} values or \texttt{pProperties} contents. Once an instance has been created, the layers enabled for that instance will continue to be enabled and valid for the lifetime of that instance, even if some of them become unavailable for future instances.

### Valid Usage (Implicit)

- VUID-vkEnumerateInstanceLayerProperties-pPropertyCount-parameter \texttt{pPropertyCount} must be a valid pointer to a \texttt{uint32_t} value
- VUID-vkEnumerateInstanceLayerProperties-pProperties-parameter If the value referenced by \texttt{pPropertyCount} is not 0, and \texttt{pProperties} is not \texttt{NULL}, \texttt{pProperties} must be a valid pointer to an array of \texttt{pPropertyCount} \texttt{VkLayerProperties} structures

### Return Codes

**Success**

- \texttt{VK_SUCCESS}
- \texttt{VK_INCOMPLETE}

**Failure**

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

The \texttt{VkLayerProperties} structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkLayerProperties {
    char        layerName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t    specVersion;
    uint32_t    implementationVersion;
    char        description[VK_MAX_DESCRIPTION_SIZE];
} VkLayerProperties;
```
• `layerName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` `char` containing a null-terminated UTF-8 string which is the name of the layer. Use this name in the `pEnabledLayerNames` array passed in the `VkInstanceCreateInfo` structure to enable this layer for an instance.

• `specVersion` is the Vulkan version the layer was written to, encoded as described in `Version Numbers`.

• `implementationVersion` is the version of this layer. It is an integer, increasing with backward compatible changes.

• `description` is an array of `VK_MAX_DESCRIPTION_SIZE` `char` containing a null-terminated UTF-8 string which provides additional details that can be used by the application to identify the layer.

`VK_MAX_EXTENSION_NAME_SIZE` is the length in `char` values of an array containing a layer or extension name string, as returned in `VkLayerProperties::layerName`, `VkExtensionProperties::extensionName`, and other queries.

```
#define VK_MAX_EXTENSION_NAME_SIZE        256U
```

`VK_MAX_DESCRIPTION_SIZE` is the length in `char` values of an array containing a string with additional descriptive information about a query, as returned in `VkLayerProperties::description` and other queries.

```
#define VK_MAX_DESCRIPTION_SIZE           256U
```

To enable a layer, the name of the layer **should** be added to the `pEnabledLayerNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

Loader implementations **may** provide mechanisms outside the Vulkan API for enabling specific layers. Layers enabled through such a mechanism are *implicitly enabled*, while layers enabled by including the layer name in the `pEnabledLayerNames` member of `VkInstanceCreateInfo` are *explicitly enabled*. Implicitly enabled layers are loaded before explicitly enabled layers, such that implicitly enabled layers are closer to the application, and explicitly enabled layers are closer to the driver. Except where otherwise specified, implicitly enabled and explicitly enabled layers differ only in the way they are enabled, and the order in which they are loaded. Explicitly enabling a layer that is implicitly enabled results in this layer being loaded as an implicitly enabled layer; it has no additional effect.

### 46.3.1. Device Layer Deprecation

Previous versions of this specification distinguished between instance and device layers. Instance layers were only able to intercept commands that operate on `VkInstance` and `VkPhysicalDevice`, except they were not able to intercept `vkCreateDevice`. Device layers were enabled for individual devices when they were created, and could only intercept commands operating on that device or its child objects.

Device-only layers are now deprecated, and this specification no longer distinguishes between instance and device layers. Layers are enabled during instance creation, and are able to intercept all commands operating on that instance or any of its child objects. At the time of deprecation there
were no known device-only layers and no compelling reason to create one.

In order to maintain compatibility with implementations released prior to device-layer deprecation, applications should still enumerate and enable device layers. The behavior of `vkEnumerateDeviceLayerProperties` and valid usage of the `ppEnabledLayerNames` member of `VkDeviceCreateInfo` maximizes compatibility with applications written to work with the previous requirements.

To enumerate device layers, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceLayerProperties(
    VkPhysicalDevice physicalDevice, // The physical device that will be queried.
    uint32_t* pPropertyCount,        // A pointer to an integer related to the number of layer properties available or queried.
    VkLayerProperties* pProperties); // Either NULL or a pointer to an array of VkLayerProperties structures.
```

- `physicalDevice` is the physical device that will be queried.
- `pPropertyCount` is a pointer to an integer related to the number of layer properties available or queried.
- `pProperties` is either NULL or a pointer to an array of `VkLayerProperties` structures.

If `pProperties` is NULL, then the number of layer properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of layer properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

The list of layers enumerated by `vkEnumerateDeviceLayerProperties` must be exactly the sequence of layers enabled for the instance. The members of `VkLayerProperties` for each enumerated layer must be the same as the properties when the layer was enumerated by `vkEnumerateInstanceLayerProperties`.

**Note**

Due to platform details on Android, `vkEnumerateDeviceLayerProperties` may be called with `physicalDevice` equal to NULL during layer discovery. This behavior will only be observed by layer implementations, and not the underlying Vulkan driver.

**Valid Usage (Implicit)**

- `VUID-vkEnumerateDeviceLayerProperties-physicalDevice-parameter` `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- `VUID-vkEnumerateDeviceLayerProperties-pPropertyCount-parameter` `pPropertyCount` must be a valid pointer to a `uint32_t` value.
- `VUID-vkEnumerateDeviceLayerProperties-pProperties-parameter` If the value referenced by `pPropertyCount` is not 0, and `pProperties` is not NULL, `pProperties`
**must** be a valid pointer to an array of `pPropertyCount` `VkLayerProperties` structures

### Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `ppEnabledLayerNames` and `enabledLayerCount` members of `VkDeviceCreateInfo` are deprecated and their values **must** be ignored by implementations. However, for compatibility, only an empty list of layers or a list that exactly matches the sequence enabled at instance creation time are valid, and validation layers **should** issue diagnostics for other cases.

Regardless of the enabled layer list provided in `VkDeviceCreateInfo`, the sequence of layers active for a device will be exactly the sequence of layers enabled when the parent instance was created.

### 46.4. Extensions

Extensions **may** define new Vulkan commands, structures, and enumerants. For compilation purposes, the interfaces defined by registered extensions, including new structures and enumerants as well as function pointer types for new commands, are defined in the Khronos-supplied `vulkan_core.h` together with the core API. However, commands defined by extensions **may** not be available for static linking - in which case function pointers to these commands **should** be queried at runtime as described in Command Function Pointers. Extensions **may** be provided by layers as well as by a Vulkan implementation.

Because extensions **may** extend or change the behavior of the Vulkan API, extension authors **should** add support for their extensions to the Khronos validation layers. This is especially important for new commands whose parameters have been wrapped by the validation layers. See the “Architecture of the Vulkan Loader Interfaces” document for additional information.

---

**Note**

To enable an instance extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkInstanceCreateInfo` when creating a `VkInstance`.

To enable a device extension, the name of the extension **can** be added to the `ppEnabledExtensionNames` member of `VkDeviceCreateInfo` when creating a `VkDevice`.

Physical-Device-Level functionality does not have any enabling mechanism and **can** be used as long as the `VkPhysicalDevice` supports the device extension as determined by `vkEnumerateDeviceExtensionProperties`. 
Enabling an extension (with no further use of that extension) does not change the behavior of functionality exposed by the core Vulkan API or any other extension, other than making valid the use of the commands, enums and structures defined by that extension.

Valid Usage sections for individual commands and structures do not currently contain which extensions have to be enabled in order to make their use valid, although they might do so in the future. It is defined only in the Valid Usage for Extensions section.

### 46.4.1. Instance Extensions

Instance extensions add new instance-level functionality to the API, outside of the core specification.

To query the available instance extensions, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateInstanceExtensionProperties(
    const char* pLayerName,
    uint32_t* pPropertyCount,
    VkExtensionProperties* pProperties);
```

- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, as described below.
- `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the instance extensions provided by that layer are returned.

If `pProperties` is `NULL`, then the number of extensions properties available is returned in `pPropertyCount`. Otherwise, `pPropertyCount` must point to a variable set by the application to the number of elements in the `pProperties` array, and on return the variable is overwritten with the number of structures actually written to `pProperties`. If `pPropertyCount` is less than the number of extension properties available, at most `pPropertyCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available properties were returned.

Because the list of available layers may change externally between calls to `vkEnumerateInstanceExtensionProperties`, two calls may retrieve different results if a `pLayerName` is available in one call but not in another. The extensions supported by a layer may also change between two calls, e.g. if the layer implementation is replaced by a different version between those calls.

Implementations must not advertise any pair of extensions that cannot be enabled together due to
behavioral differences, or any extension that cannot be enabled against the advertised version.

Valid Usage (Implicit)

- **VUID-vkEnumerateInstanceExtensionProperties-pLayerName-parameter**
  If `pLayerName` is not `NULL`, `pLayerName` must be a null-terminated UTF-8 string

- **VUID-vkEnumerateInstanceExtensionProperties-pPropertyCount-parameter**
  `pPropertyCount` must be a valid pointer to a `uint32_t` value

- **VUID-vkEnumerateInstanceExtensionProperties-pProperties-parameter**
  If the value referenced by `pPropertyCount` is not `0`, and `pProperties` is not `NULL`, `pProperties` must be a valid pointer to an array of `pPropertyCount` `VkExtensionProperties` structures

Return Codes

**Success**
- `VK_SUCCESS`
- `VK_INCOMPLETE`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_LAYER_NOT_PRESENT`

46.4.2. Device Extensions

Device extensions add new device-level functionality to the API, outside of the core specification.

To query the extensions available to a given physical device, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkEnumerateDeviceExtensionProperties(  
    VkPhysicalDevice physicalDevice,  
    const char* pLayerName,  
    uint32_t* pPropertyCount,  
    VkExtensionProperties* pProperties);
```

- `physicalDevice` is the physical device that will be queried.
- `pLayerName` is either `NULL` or a pointer to a null-terminated UTF-8 string naming the layer to retrieve extensions from.
- `pPropertyCount` is a pointer to an integer related to the number of extension properties available or queried, and is treated in the same fashion as the `vkEnumerateInstanceExtensionProperties::pPropertyCount` parameter.
• `pProperties` is either `NULL` or a pointer to an array of `VkExtensionProperties` structures.

When `pLayerName` parameter is `NULL`, only extensions provided by the Vulkan implementation or by implicitly enabled layers are returned. When `pLayerName` is the name of a layer, the device extensions provided by that layer are returned.

Implementations must not advertise any pair of extensions that cannot be enabled together due to behavioral differences, or any extension that cannot be enabled against the advertised version.

Implementations claiming support for the Roadmap 2022 profile must advertise the `VK_KHR_global_priority` extension in `pProperties`.

Implementations claiming support for the Roadmap 2024 profile must advertise the following extensions in `pProperties`:

- `VK_KHR_dynamic_rendering_local_read`
- `VK_KHR_load_store_op_none`
- `VK_KHR_shader_quad_control`
- `VK_KHR_shader_maximal_reconvergence`
- `VK_KHR_shader_subgroup_uniform_control_flow`
- `VK_KHR_shader_subgroup_rotate`
- `VK_KHR_shader_float_controls2`
- `VK_KHR_shader_expect_assume`
- `VK_KHR_verticx_attribute_divisor`
- `VK_KHR_index_type_uint8`
- `VK_KHR_map_memory2`
- `VK_KHR_maintenance5`
- `VK_KHR_push_descriptor`

Note
Due to platform details on Android, `vkEnumerateDeviceExtensionProperties` may be called with `physicalDevice` equal to `NULL` during layer discovery. This behavior will only be observed by layer implementations, and not the underlying Vulkan driver.

Valid Usage (Implicit)

- `VUID-vkEnumerateDeviceExtensionProperties-physicalDevice-parameter` physicalDevice must be a valid `VkPhysicalDevice` handle
- `VUID-vkEnumerateDeviceExtensionProperties-pLayerName-parameter` If `pLayerName` is not `NULL`, `pLayerName` must be a null-terminated UTF-8 string
- `VUID-vkEnumerateDeviceExtensionProperties-pPropertyCount-parameter`
**Return Codes**

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_LAYER_NOT_PRESENT

The `VkExtensionProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkExtensionProperties {
    char extensionName[VK_MAX_EXTENSION_NAME_SIZE];
    uint32_t specVersion;
} VkExtensionProperties;
```

- `extensionName` is an array of `VK_MAX_EXTENSION_NAME_SIZE` char containing a null-terminated UTF-8 string which is the name of the extension.
- `specVersion` is the version of this extension. It is an integer, incremented with backward compatible changes.

### Accessing Device-Level Functionality From a `VkPhysicalDevice`

Some device extensions also add support for physical-device-level functionality. Physical-device-level functionality can be used, if the required extension is supported as advertised by `vkEnumerateDeviceExtensionProperties` for a given `VkPhysicalDevice`.

### Accessing Device-Level Functionality From a `VkDevice`

For commands that are dispatched from a `VkDevice`, or from a child object of a `VkDevice`, device extensions must be enabled in `vkCreateDevice`.

### 46.5. Extension Dependencies

Some extensions are dependent on other extensions, or on specific core API versions, to function. To enable extensions with dependencies, any required extensions must also be enabled through the
same API mechanisms when creating an instance with **vkCreateInstance** or a device with **vkCreateDevice**. Each extension which has such dependencies documents them in the **appendix** summarizing that extension.

If an extension is supported (as queried by **vkEnumerateInstanceExtensionProperties** or **vkEnumerateDeviceExtensionProperties**), then **required extensions** of that extension **must** also be supported for the same instance or physical device.

Any device extension that has an instance extension dependency that is not enabled by **vkCreateInstance** is considered to be unsupported, hence it **must** not be returned by **vkEnumerateDeviceExtensionProperties** for any **VkPhysicalDevice** child of the instance. Instance extensions do not have dependencies on device extensions.

If a required extension has been **promoted** to another extension or to a core API version, then as a **general** rule, the dependency is also satisfied by the promoted extension or core version. This will be true so long as any features required by the original extension are also required or enabled by the promoted extension or core version. However, in some cases an extension is promoted while making some of its features optional in the promoted extension or core version. In this case, the dependency **may** not be satisfied. The only way to be certain is to look at the descriptions of the original dependency and the promoted version in the **Layers & Extensions** and **Core Revisions** appendices.

**Note**

There is metadata in **vk.xml** describing some aspects of promotion, especially **requires**, **promotedto** and **deprecatedby** attributes of **<extension>** tags. However, the metadata does not yet fully describe this scenario. In the future, we may extend the XML schema to describe the full set of extensions and versions satisfying a dependency. As discussed in more detail for **Promotion** below, when an extension is promoted it does not mean that a mechanical substitution of an extension API by the corresponding promoted API will work in exactly the same fashion; be supported at runtime; or even exist.

### 46.6. Compatibility Guarantees (Informative)

This section is marked as informal as there is no binding responsibility on implementations of the Vulkan API - these guarantees are however a contract between the Vulkan Working Group and developers using this Specification.

#### 46.6.1. Core Versions

Each of the **major**, **minor**, and **patch versions** of the Vulkan specification provide different compatibility guarantees.

**Patch Versions**

A difference in the patch version indicates that a set of bug fixes or clarifications have been made to the Specification. Informative enums returned by Vulkan commands that will not affect the runtime behavior of a valid application may be added in a patch version (e.g. **VkVendorId**).
The specification’s patch version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the patch version being increased by 1. Patch versions are applied to all minor versions, even if a given minor version is not affected by the provoking change.

Specifications with different patch versions but the same major and minor version are fully compatible with each other - such that a valid application written against one will work with an implementation of another.

**Note**

If a patch version includes a bug fix or clarification that could have a significant impact on developer expectations, these will be highlighted in the change log. Generally the Vulkan Working Group tries to avoid these kinds of changes, instead fixing them in either an extension or core version.

**Minor Versions**

Changes in the minor version of the specification indicate that new functionality has been added to the core specification. This will usually include new interfaces in the header, and may also include behavior changes and bug fixes. Core functionality may be deprecated in a minor version, but will not be obsoleted or removed.

The specification’s minor version is strictly increasing for a given major version of the specification; any change to a specification as described above will result in the minor version being increased by 1. Changes that can be accommodated in a patch version will not increase the minor version.

Specifications with a lower minor version are backwards compatible with an implementation of a specification with a higher minor version for core functionality and extensions issued with the KHR vendor tag. Vendor and multi-vendor extensions are not guaranteed to remain functional across minor versions, though in general they are with few exceptions - see Obsoletion for more information.

**Major Versions**

A difference in the major version of specifications indicates a large set of changes which will likely include interface changes, behavioral changes, removal of deprecated functionality, and the modification, addition, or replacement of other functionality.

The specification’s major version is monotonically increasing; any change to the specification as described above will result in the major version being increased. Changes that can be accommodated in a patch or minor version will not increase the major version.

The Vulkan Working Group intends to only issue a new major version of the Specification in order to realize significant improvements to the Vulkan API that will necessarily require breaking compatibility.

A new major version will likely include a wholly new version of the specification to be issued - which could include an overhaul of the versioning semantics for the minor and patch versions. The
patch and minor versions of a specification are therefore not meaningful across major versions. If a major version of the specification includes similar versioning semantics, it is expected that the patch and the minor version will be reset to 0 for that major version.

### 46.6.2. Extensions

A KHR extension **must** be able to be enabled alongside any other KHR extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A multi-vendor extension **should** be able to be enabled alongside any KHR extension or other multi-vendor extension, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **should** be able to be enabled alongside any KHR extension, multi-vendor extension, or other vendor extension from the same vendor, and for any minor or patch version of the core Specification beyond the minimum version it requires. A vendor extension **may** be able to be enabled alongside vendor extensions from another vendor.

The one other exception to this is if a vendor or multi-vendor extension is made obsolete by either a core version or another extension, which will be highlighted in the extension appendix.

**Promotion**

Extensions, or features of an extension, **may** be promoted to a new core version of the API, or a newer extension which an equal or greater number of implementors are in favor of.

When extension functionality is promoted, minor changes **may** be introduced, limited to the following:

- Naming
- Non-intrusive parameter changes
- **Feature advertisement/enablement**
- Combining structure parameters into larger structures
- Author ID suffixes changed or removed

**Note**

If extension functionality is promoted, there is no guarantee of direct compatibility, however it should require little effort to port code from the original feature to the promoted one.

The Vulkan Working Group endeavors to ensure that larger changes are marked as either deprecated or obsoleted as appropriate, and can do so retroactively if necessary.

Extensions that are promoted are listed as being promoted in their extension appendices, with reference to where they were promoted to.

When an extension is promoted, any backwards compatibility aliases which exist in the extension will **not** be promoted.

**Note**
As a hypothetical example, if the `VK_KHR_surface` extension were promoted to part of a future core version, the `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR` token defined by that extension would be promoted to `VK_COLOR_SPACE_SRGB_NONLINEAR`. However, the `VK_COLORSPACE_SRGB_NONLINEAR_KHR` token aliases `VK_COLOR_SPACE_SRGB_NONLINEAR_KHR`. The `VK_COLORSPACE_SRGB_NONLINEAR_KHR` would not be promoted, because it is a backwards compatibility alias that exists only due to a naming mistake when the extension was initially published.

### Deprecation

Extensions **may** be marked as deprecated when the intended use cases either become irrelevant or can be solved in other ways. Generally, a new feature will become available to solve the use case in another extension or core version of the API, but it is not guaranteed.

*Note*

Features that are intended to replace deprecated functionality have no guarantees of compatibility, and applications may require drastic modification in order to make use of the new features.

Extensions that are deprecated are listed as being deprecated in their extension appendices, with an explanation of the deprecation and any features that are relevant.

### Obsoletion

Occasionally, an extension will be marked as obsolete if a new version of the core API or a new extension is fundamentally incompatible with it. An obsoleted extension **must** not be used with the extension or core version that obsoleted it.

Extensions that are obsoleted are listed as being obsoleted in their extension appendices, with reference to what they were obsoleted by.

### Aliases

When an extension is promoted or deprecated by a newer feature, some or all of its functionality may be replicated into the newer feature. Rather than duplication of all the documentation and definitions, the specification instead identifies the identical commands and types as *aliases* of one another. Each alias is mentioned together with the definition it aliases, with the older aliases marked as “equivalents”. Each alias of the same command has identical behavior, and each alias of the same type has identical meaning - they can be used interchangeably in an application with no compatibility issues.

*Note*

For promoted types, the aliased extension type is semantically identical to the new core type. The C99 headers simply `typedef` the older aliases to the promoted types.

For promoted command aliases, however, there are two separate command definitions, due to the fact that the C99 ABI has no way to alias command definitions without resorting to macros. Calling either command will produce
identical behavior within the bounds of the specification, and should still invoke the same path in the implementation. Debug tools may use separate commands with different debug behavior; to write the appropriate command name to an output log, for instance.

**Special Use Extensions**

Some extensions exist only to support a specific purpose or specific class of application. These are referred to as “special use extensions”. Use of these extensions in applications not meeting the special use criteria is not recommended.

Special use cases are restricted, and only those defined below are used to describe extensions:

**Table 61. Extension Special Use Cases**

<table>
<thead>
<tr>
<th>Special Use</th>
<th>XML Tag</th>
<th>Full Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CAD support</td>
<td>cadsupport</td>
<td>Extension is intended to support specialized functionality used by CAD/CAM applications.</td>
</tr>
<tr>
<td>D3D support</td>
<td>d3demulation</td>
<td>Extension is intended to support D3D emulation layers, and applications ported from D3D, by adding functionality specific to D3D.</td>
</tr>
<tr>
<td>Developer tools</td>
<td>devtools</td>
<td>Extension is intended to support developer tools such as capture-replay libraries.</td>
</tr>
<tr>
<td>Debugging tools</td>
<td>debugging</td>
<td>Extension is intended for use by applications when debugging.</td>
</tr>
<tr>
<td>OpenGL / ES support</td>
<td>glemulation</td>
<td>Extension is intended to support OpenGL and/or OpenGL ES emulation layers, and applications ported from those APIs, by adding functionality specific to those APIs.</td>
</tr>
</tbody>
</table>

Special use extensions are identified in the metadata for each such extension in the *Layers & Extensions* appendix, using the name in the “Special Use” column above.

Special use extensions are also identified in *vk.xml* with the short name in “XML Tag” column above, as described in the “API Extensions (extension tag)” section of the registry schema documentation.
Chapter 47. Features

Features describe functionality which is not supported on all implementations. Features are properties of the physical device. Features are optional, and must be explicitly enabled before use. Support for features is reported and enabled on a per-feature basis.

Note
Features are reported via the basic VkPhysicalDeviceFeatures structure, as well as the extensible structure VkPhysicalDeviceFeatures2, which was added in the VK_KHR_get_physical_device_properties2 extension and included in Vulkan 1.1. When new features are added in future Vulkan versions or extensions, each extension should introduce one new feature structure, if needed. This structure can be added to the pNext chain of the VkPhysicalDeviceFeatures2 structure.

For convenience, new core versions of Vulkan may introduce new unified feature structures for features promoted from extensions. At the same time, the extension’s original feature structure (if any) is also promoted to the core API, and is an alias of the extension’s structure. This results in multiple names for the same feature: in the original extension’s feature structure and the promoted structure alias, in the unified feature structure. When a feature was implicitly supported and enabled in the extension, but an explicit name was added during promotion, then the extension itself acts as an alias for the feature as listed in the table below.

All aliases of the same feature in the core API must be reported consistently: either all must be reported as supported, or none of them. When a promoted extension is available, any corresponding feature aliases must be supported.

Table 62. Extension Feature Aliases

<table>
<thead>
<tr>
<th>Extension</th>
<th>Feature(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_KHR_shader_draw_parameters</td>
<td>shaderDrawParameters</td>

<td>samplerMirrorClampToEdge</td>
</tr>
<tr>
<td>VK_EXT_descriptor_indexing</td>
<td>descriptorIndexing</td>
</tr>
<tr>
<td>VK_EXT_sampler_filter_minmax</td>
<td>samplerFilterMinmax</td>
</tr>
<tr>
<td>VK_EXT_shader_viewport_index_layer</td>
<td>shaderOutputViewportIndex, shaderOutputLayer</td>
</tr>
</tbody>
</table>

To query supported features, call:

```c
// Provided by VK_VERSION_1_0
void vkGetPhysicalDeviceFeatures(VkPhysicalDevice physicalDevice, VkPhysicalDeviceFeatures* pFeatures);
```

- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a VkPhysicalDeviceFeatures structure in which the physical device
features are returned. For each feature, a value of `VK_TRUE` specifies that the feature is supported on this physical device, and `VK_FALSE` specifies that the feature is not supported.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceFeatures-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFeatures-pFeatures-parameter
  `pFeatures` must be a valid pointer to a `VkPhysicalDeviceFeatures` structure

Fine-grained features used by a logical device must be enabled at `VkDevice` creation time. If a feature is enabled that the physical device does not support, `VkDevice` creation will fail and return `VK_ERROR_FEATURE_NOT_PRESENT`.

The fine-grained features are enabled by passing a pointer to the `VkPhysicalDeviceFeatures` structure via the `pEnabledFeatures` member of the `VkDeviceCreateInfo` structure that is passed into the `vkCreateDevice` call. If a member of `pEnabledFeatures` is set to `VK_TRUE` or `VK_FALSE`, then the device will be created with the indicated feature enabled or disabled, respectively. Features can also be enabled by using the `VkPhysicalDeviceFeatures2` structure.

If an application wishes to enable all features supported by a device, it can simply pass in the `VkPhysicalDeviceFeatures` structure that was previously returned by `vkGetPhysicalDeviceFeatures`. To disable an individual feature, the application can set the desired member to `VK_FALSE` in the same structure. Setting `pEnabledFeatures` to `NULL` and not including a `VkPhysicalDeviceFeatures2` in the `pNext` chain of `VkDeviceCreateInfo` is equivalent to setting all members of the structure to `VK_FALSE`.

**Note**

Some features, such as `robustBufferAccess`, may incur a runtime performance cost. Application writers should carefully consider the implications of enabling all supported features.

To query supported features defined by the core or extensions, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceFeatures2(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```

or the equivalent command

```c
// Provided by VK_KHR_get_physical_device_properties2
void vkGetPhysicalDeviceFeatures2KHR(
    VkPhysicalDevice physicalDevice,
    VkPhysicalDeviceFeatures2* pFeatures);
```
- `physicalDevice` is the physical device from which to query the supported features.
- `pFeatures` is a pointer to a `VkPhysicalDeviceFeatures2` structure in which the physical device features are returned.

Each structure in `pFeatures` and its `pNext` chain contains members corresponding to fine-grained features. `vkGetPhysicalDeviceFeatures2` writes each member to a boolean value indicating whether that feature is supported.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFeatures2-physicalDevice-parameter
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceFeatures2-pFeatures-parameter
  - `pFeatures` must be a valid pointer to a `VkPhysicalDeviceFeatures2` structure

The `VkPhysicalDeviceFeatures2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFeatures2 {
    VkStructureType sType;
    void* pNext;
    VkPhysicalDeviceFeatures features;
} VkPhysicalDeviceFeatures2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceFeatures2 VkPhysicalDeviceFeatures2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `features` is a `VkPhysicalDeviceFeatures` structure describing the fine-grained features of the Vulkan 1.0 API.

The `pNext` chain of this structure is used to extend the structure with features defined by extensions. This structure can be used in `vkGetPhysicalDeviceFeatures2` or can be included in the `pNext` chain of a `VkDeviceCreateInfo` structure, in which case it controls which features are enabled on the device in lieu of `pEnabledFeatures`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFeatures2-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FEATURES_2`
The `VkPhysicalDeviceFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceFeatures {
    VkBool32 robustBufferAccess;
    VkBool32 fullDrawIndexUint32;
    VkBool32 imageCubeArray;
    VkBool32 independentBlend;
    VkBool32 geometryShader;
    VkBool32 tessellationShader;
    VkBool32 sampleRateShading;
    VkBool32 dualSrcBlend;
    VkBool32 logicOp;
    VkBool32 multiDrawIndirect;
    VkBool32 drawIndirectFirstInstance;
    VkBool32 depthClamp;
    VkBool32 depthBiasClamp;
    VkBool32 fillModeNonSolid;
    VkBool32 depthBounds;
    VkBool32 wideLines;
    VkBool32 largePoints;
    VkBool32 alphaToOne;
    VkBool32 multiViewport;
    VkBool32 samplerAnisotropy;
    VkBool32 textureCompressionETC2;
    VkBool32 textureCompressionASTC_LDR;
    VkBool32 textureCompressionBC;
    VkBool32 occlusionQueryPrecise;
    VkBool32 pipelineStatisticsQuery;
    VkBool32 vertexPipelineStoresAndAtomics;
    VkBool32 fragmentStoresAndAtomics;
    VkBool32 shaderTessellationAndGeometryPointSize;
    VkBool32 shaderImageGatherExtended;
    VkBool32 shaderStorageImageExtendedFormats;
    VkBool32 shaderStorageImageMultisample;
    VkBool32 shaderStorageImageReadWithoutFormat;
    VkBool32 shaderStorageImageWriteWithoutFormat;
    VkBool32 shaderUniformBufferArrayDynamicIndexing;
    VkBool32 shaderSampledImageArrayDynamicIndexing;
    VkBool32 shaderStorageBufferArrayDynamicIndexing;
    VkBool32 shaderStorageImageArrayDynamicIndexing;
    VkBool32 shaderClipDistance;
    VkBool32 shaderCullDistance;
    VkBool32 shaderFloat64;
    VkBool32 shaderInt64;
    VkBool32 shaderInt16;
    VkBool32 shaderResourceResidency;
    VkBool32 shaderResourceMinLod;
    VkBool32 sparseBinding;
    VkBool32 sparseResidencyBuffer;
```

3754
VkBool32 sparseResidencyImage2D;
VkBool32 sparseResidencyImage3D;
VkBool32 sparseResidency2Samples;
VkBool32 sparseResidency4Samples;
VkBool32 sparseResidency8Samples;
VkBool32 sparseResidency16Samples;
VkBool32 sparseResidencyAliased;
VkBool32 variableMultisampleRate;
VkBool32 inheritedQueries;
} VkPhysicalDeviceFeatures;

This structure describes the following features:

- **robustBufferAccess** specifies that accesses to buffers are bounds-checked against the range of the buffer descriptor (as determined by VkDescriptorBufferInfo::range, VkBufferViewCreateInfo::range, or the size of the buffer). Out of bounds accesses must not cause application termination, and the effects of shader loads, stores, and atomics must conform to an implementation-dependent behavior as described below.

  ◦ A buffer access is considered to be out of bounds if any of the following are true:

    - The pointer was formed by OpImageTexelPointer and the coordinate is less than zero or greater than or equal to the number of whole elements in the bound range.

    - The pointer was not formed by OpImageTexelPointer and the object pointed to is not wholly contained within the bound range. This includes accesses performed via variable pointers where the buffer descriptor being accessed cannot be statically determined. Uninitialized pointers and pointers equal to OpConstantNull are treated as pointing to a zero-sized object, so all accesses through such pointers are considered to be out of bounds. Buffer accesses through buffer device addresses are not bounds-checked.

    - If the VkPhysicalDeviceCooperativeMatrixFeaturesNV::cooperativeMatrixRobustBufferAccess feature is not enabled, then accesses using OpCooperativeMatrixLoadNV and OpCooperativeMatrixStoreNV may not be bounds-checked.

    - If the VkPhysicalDeviceCooperativeMatrixFeaturesKHR::cooperativeMatrixRobustBufferAccess feature is not enabled, then accesses using OpCooperativeMatrixLoadKHR and OpCooperativeMatrixStoreKHR may not be bounds-checked.

  

  - **Note**

    If a SPIR-V OpLoad instruction loads a structure and the tail end of the structure is out of bounds, then all members of the structure are considered out of bounds even if the members at the end are not statically used.

    - If robustBufferAccess2 is not enabled and any buffer access is determined to be out of bounds, then any other access of the same type (load, store, or atomic) to the same buffer that accesses an address less than 16 bytes away from the out of bounds address may also be considered out of bounds.
If the access is a load that reads from the same memory locations as a prior store in the same shader invocation, with no other intervening accesses to the same memory locations in that shader invocation, then the result of the load may be the value stored by the store instruction, even if the access is out of bounds. If the load is Volatile, then an out of bounds load must return the appropriate out of bounds value.

- Accesses to descriptors written with a VK_NULL_HANDLE resource or view are not considered to be out of bounds. Instead, each type of descriptor access defines a specific behavior for accesses to a null descriptor.

- Out-of-bounds buffer loads will return any of the following values:
  - If the access is to a uniform buffer and robustBufferAccess2 is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustUniformBufferAccessSizeAlignment bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of robustUniformBufferAccessSizeAlignment bytes must return zero values.
  - If the access is to a storage buffer and robustBufferAccess2 is enabled, loads of offsets between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes must return either zero values or the contents of the memory at the offset being loaded. Loads of offsets past the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes must return zero values. Similarly, stores to addresses between the end of the descriptor range and the end of the descriptor range rounded up to a multiple of robustStorageBufferAccessSizeAlignment bytes may be discarded.
  - Non-atomic accesses to storage buffers that are a multiple of 32 bits may be decomposed into 32-bit accesses that are individually bounds-checked.
  - If the access is to an index buffer and robustBufferAccess2 is enabled, zero values must be returned.
  - If the access is to a uniform texel buffer or storage texel buffer and robustBufferAccess2 is enabled, zero values must be returned, and then Conversion to RGBA is applied based on the buffer view's format.
  - Values from anywhere within the memory range(s) bound to the buffer (possibly including bytes of memory past the end of the buffer, up to the end of the bound range).
  - Zero values, or (0,0,0,x) vectors for vector reads where x is a valid value represented in the type of the vector components and may be any of:
    - 0, 1, or the maximum representable positive integer value, for signed or unsigned integer components
    - 0.0 or 1.0, for floating-point components
- Out-of-bounds writes may modify values within the memory range(s) bound to the buffer, but must not modify any other memory.
  - If robustBufferAccess2 is enabled, out of bounds writes must not modify any memory.
  - Out-of-bounds atomics may modify values within the memory range(s) bound to the buffer, but must not modify any other memory, and return an undefined value.
• If robustBufferAccess2 is enabled, out of bounds atomics must not modify any memory, and return an undefined value.

  ◦ If robustBufferAccess2 is disabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than either:

    • vertexBufferRangeSize, if bindingStride == 0; or
    • (vertexBufferRangeSize - (vertexBufferRangeSize % bindingStride))

    where vertexBufferRangeSize is the byte size of the memory range bound to the vertex buffer binding and bindingStride is the byte stride of the corresponding vertex input binding. Further, if any vertex input attribute using a specific vertex input binding is out of bounds, then all vertex input attributes using that vertex input binding for that vertex shader invocation are considered out of bounds.

    • If a vertex input attribute is out of bounds, it will be assigned one of the following values:

      • Values from anywhere within the memory range(s) bound to the buffer, converted according to the format of the attribute.
      • Zero values, format converted according to the format of the attribute.
      • Zero values, or (0,0,0,x) vectors, as described above.

    ◦ If robustBufferAccess2 is enabled, vertex input attributes are considered out of bounds if the offset of the attribute in the bound vertex buffer range plus the size of the attribute is greater than the byte size of the memory range bound to the vertex buffer binding.

    • If a vertex input attribute is out of bounds, the raw data extracted are zero values, and missing G, B, or A components are filled with (0,0,1).

    ◦ If robustBufferAccess is not enabled, applications must not perform out of bounds accesses except under the conditions enabled by the pipelineRobustness feature.

• fullDrawIndexUint32 specifies the full 32-bit range of indices is supported for indexed draw calls when using a VkIndexType of VK_INDEX_TYPE_UINT32. maxDrawIndexedIndexValue is the maximum index value that may be used (aside from the primitive restart index, which is always 2^{32}-1 when the VkIndexType is VK_INDEX_TYPE_UINT32). If this feature is supported, maxDrawIndexedIndexValue must be 2^{32}-1; otherwise it must be no smaller than 2^{24}-1. See maxDrawIndexedIndexValue.

• imageCubeArray specifies whether image views with a VkImageViewType of VK_IMAGE_VIEW_TYPE_CUBE_ARRAY can be created, and that the corresponding SampledCubeArray and ImageCubeArray SPIR-V capabilities can be used in shader code.

• independentBlend specifies whether the VkPipelineColorBlendAttachmentState settings are controlled independently per-attachment. If this feature is not enabled, the VkPipelineColorBlendAttachmentState settings for all color attachments must be identical. Otherwise, a different VkPipelineColorBlendAttachmentState can be provided for each bound color attachment.

• geometryShader specifies whether geometry shaders are supported. If this feature is not enabled, the VK_SHADER_STAGE_GEOMETRY_BIT and VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT enum values must
not be used. This also specifies whether shader modules can declare the Geometry capability.

- **tessellationShader** specifies whether tessellation control and evaluation shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT, VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT, VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT, and VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO` enum values must not be used. This also specifies whether shader modules can declare the Tessellation capability.

- **sampleRateShading** specifies whether Sample Shading and multisample interpolation are supported. If this feature is not enabled, the `sampleShadingEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure must be set to `VK_FALSE` and the `minSampleShading` member is ignored. This also specifies whether shader modules can declare the SampleRateShading capability.

- **dualSrcBlend** specifies whether blend operations which take two sources are supported. If this feature is not enabled, the `VK_BLEND_FACTOR_SRC1_COLOR, VK_BLEND_FACTOR_ONE_MINUS_SRC1_COLOR, VK_BLEND_FACTOR_SRC1_ALPHA, and VK_BLEND_FACTOR_ONE_MINUS_SRC1_ALPHA` enum values must not be used as source or destination blending factors. See Dual-Source Blending.

- **logicOp** specifies whether logic operations are supported. If this feature is not enabled, the `logicOpEnable` member of the `VkPipelineColorBlendStateCreateInfo` structure must be set to `VK_FALSE`, and the `logicOp` member is ignored.

- **multiDrawIndirect** specifies whether multiple draw indirect is supported. If this feature is not enabled, the `drawCount` parameter to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands must be 0 or 1. The `maxDrawIndirectCount` member of the `VkPhysicalDeviceLimits` structure must also be 1 if this feature is not supported. See maxDrawIndirectCount.

- **drawIndirectFirstInstance** specifies whether indirect drawing calls support the `firstInstance` parameter. If this feature is not enabled, the `firstInstance` member of all `VkDrawIndirectCommand` and `VkDrawIndexedIndirectCommand` structures that are provided to the `vkCmdDrawIndirect` and `vkCmdDrawIndexedIndirect` commands must be 0.

- **depthClamp** specifies whether depth clamping is supported. If this feature is not enabled, the `depthClampEnable` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to `VK_FALSE`. Otherwise, setting `depthClampEnable` to `VK_TRUE` will enable depth clamping.

- **depthBiasClamp** specifies whether depth bias clamping is supported. If this feature is not enabled, the `depthBiasClamp` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to 0.0 unless the `VK_DYNAMIC_STATE_DEPTH_BIAS` dynamic state is enabled, and the `depthBiasClamp` parameter to `vkCmdSetDepthBias` must be set to 0.0.

- **fillModeNonSolid** specifies whether point and wireframe fill modes are supported. If this feature is not enabled, the `VK_POLYGON_MODE_POINT` and `VK_POLYGON_MODE_LINE` enum values must not be used.

- **depthBounds** specifies whether depth bounds tests are supported. If this feature is not enabled, the `depthBoundsTestEnable` member of the `VkPipelineDepthStencilStateCreateInfo` structure must be set to `VK_FALSE`. When `depthBoundsTestEnable` is set to `VK_FALSE`, the `minDepthBounds` and `maxDepthBounds` members of the `VkPipelineDepthStencilStateCreateInfo` structure are ignored.

- **wideLines** specifies whether lines with width other than 1.0 are supported. If this feature is not
enabled, the `lineWidth` member of the `VkPipelineRasterizationStateCreateInfo` structure must be set to 1.0 unless the `VK_DYNAMIC_STATE_LINE_WIDTH` dynamic state is enabled, and the `lineWidth` parameter to `vkCmdSetLineWidth` must be set to 1.0. When this feature is supported, the range and granularity of supported line widths are indicated by the `lineWidthRange` and `lineWidthGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- **largePoints** specifies whether points with size greater than 1.0 are supported. If this feature is not enabled, only a point size of 1.0 written by a shader is supported. The range and granularity of supported point sizes are indicated by the `pointSizeRange` and `pointSizeGranularity` members of the `VkPhysicalDeviceLimits` structure, respectively.

- **alphaToOne** specifies whether the implementation is able to replace the alpha value of the fragment shader color output in the Multisample Coverage fragment operation. If this feature is not enabled, then the `alphaToOneEnable` member of the `VkPipelineMultisampleStateCreateInfo` structure must be set to `VK_FALSE`. Otherwise setting `alphaToOneEnable` to `VK_TRUE` will enable alpha-to-one behavior.

- **multiViewport** specifies whether more than one viewport is supported. If this feature is not enabled:
  - The `viewportCount` and `scissorCount` members of the `VkPipelineViewportStateCreateInfo` structure must be set to 1.
  - The `firstViewport` and `viewportCount` parameters to the `vkCmdSetViewport` command must be set to 0 and 1, respectively.
  - The `firstScissor` and `scissorCount` parameters to the `vkCmdSetScissor` command must be set to 0 and 1, respectively.
  - The `exclusiveScissorCount` member of the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure must be set to 0 or 1.
  - The `firstExclusiveScissor` and `exclusiveScissorCount` parameters to the `vkCmdSetExclusiveScissorNV` command must be set to 0 and 1, respectively.

- **samplerAnisotropy** specifies whether anisotropic filtering is supported. If this feature is not enabled, the `anisotropyEnable` member of the `VkSamplerCreateInfo` structure must be `VK_FALSE`.

- **textureCompressionETC2** specifies whether all of the ETC2 and EAC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK`
  - `VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK`
  - `VK_FORMAT_EAC_R11_UNORM_BLOCK`
  - `VK_FORMAT_EAC_R11_SNORM_BLOCK`
To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `textureCompressionASTC_LDR` specifies whether all of the ASTC LDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_ASTC_4x4_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_4x4_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_5x4_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_5x4_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_5x5_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_5x5_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_6x5_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_6x5_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_6x6_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_6x6_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_8x5_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_8x5_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_8x6_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_8x6_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_8x8_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_8x8_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_10x5_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_10x5_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_10x6_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_10x6_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_10x8_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_10x8_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_10x10_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_10x10_SRGB_BLOCK`
  - `VK_FORMAT_ASTC_12x10_UNORM_BLOCK`
  - `VK_FORMAT_ASTC_12x10_SRGB_BLOCK`
- VK_FORMAT_ASTC_12x12_UNORM_BLOCK
- VK_FORMAT_ASTC_12x12_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `textureCompressionBC` specifies whether all of the BC compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - VK_FORMAT_BC1_RGB_UNORM_BLOCK
  - VK_FORMAT_BC1_RGB_SRGB_BLOCK
  - VK_FORMAT_BC1_RGBA_UNORM_BLOCK
  - VK_FORMAT_BC1_RGBA_SRGB_BLOCK
  - VK_FORMAT_BC2_UNORM_BLOCK
  - VK_FORMAT_BC2_SRGB_BLOCK
  - VK_FORMAT_BC3_UNORM_BLOCK
  - VK_FORMAT_BC3_SRGB_BLOCK
  - VK_FORMAT_BC4_UNORM_BLOCK
  - VK_FORMAT_BC4_SNORM_BLOCK
  - VK_FORMAT_BC5_UNORM_BLOCK
  - VK_FORMAT_BC5_SNORM_BLOCK
  - VK_FORMAT_BC6H_UFLOAT_BLOCK
  - VK_FORMAT_BC6H_SFLOAT_BLOCK
  - VK_FORMAT_BC7_UNORM_BLOCK
  - VK_FORMAT_BC7_SRGB_BLOCK

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.

- `occlusionQueryPrecise` specifies whether occlusion queries returning actual sample counts are supported. Occlusion queries are created in a `VkQueryPool` by specifying the `queryType` of `VK_QUERY_TYPE_OCCLUSION` in the `VkQueryPoolCreateInfo` structure which is passed to `vkCreateQueryPool`. If this feature is enabled, queries of this type can enable `VK_QUERY_CONTROL_PRECISE_BIT` in the `flags` parameter to `vkCmdBeginQuery`. If this feature is not supported, the implementation supports only boolean occlusion queries. When any samples are passed, boolean queries will return a non-zero result value, otherwise a result value of zero is returned. When this feature is enabled and `VK_QUERY_CONTROL_PRECISE_BIT` is set, occlusion queries will report the actual number of samples passed.

- `pipelineStatisticsQuery` specifies whether the pipeline statistics queries are supported. If this
feature is not enabled, queries of type `VK_QUERY_TYPE_PIPELINE_STATISTICS` cannot be created, and none of the `VkQueryPipelineStatisticFlagBits` bits can be set in the `pipelineStatistics` member of the `VkQueryPoolCreateInfo` structure.

- **vertexPipelineStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the vertex, tessellation, and geometry shader stages. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by these stages in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **fragmentStoresAndAtomics** specifies whether storage buffers and images support stores and atomic operations in the fragment shader stage. If this feature is not enabled, all storage image, storage texel buffer, and storage buffer variables used by the fragment stage in shader modules must be decorated with the `NonWritable` decoration (or the `readonly` memory qualifier in GLSL).

- **shaderTessellationAndGeometryPointSize** specifies whether the `PointSize` built-in decoration is available in the tessellation control, tessellation evaluation, and geometry shader stages. If this feature is not enabled, members decorated with the `PointSize` built-in decoration must not be read from or written to and all points written from a tessellation or geometry shader will have a size of 1.0. This also specifies whether shader modules can declare the `TessellationPointSize` capability for tessellation control and evaluation shaders, or if the shader modules can declare the `GeometryPointSize` capability for geometry shaders. An implementation supporting this feature must also support one or both of the `tessellationShader` or `geometryShader` features.

- **shaderImageGatherExtended** specifies whether the extended set of image gather instructions are available in shader code. If this feature is not enabled, the `OpImage*Gather` instructions do not support the `Offset` and `ConstOffsets` operands. This also specifies whether shader modules can declare the `ImageGatherExtended` capability.

- **shaderStorageImageExtendedFormats** specifies whether all the “storage image extended formats” below are supported; if this feature is supported, then the `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT` must be supported in `optimalTilingFeatures` for the following formats:

  - `VK_FORMAT_R16G16_SFLOAT`
  - `VK_FORMAT_B10G11R11_UFLOAT_PACK32`
  - `VK_FORMAT_R16_SFLOA T`
  - `VK_FORMAT_R16G16B16A16_UNORM`
  - `VK_FORMAT_A2B10G10R10_UNORM_PACK32`
  - `VK_FORMAT_R16G16_UNORM`
  - `VK_FORMAT_R8G8_UNORM`
  - `VK_FORMAT_R16_UNORM`
  - `VK_FORMAT_R8_UNORM`
  - `VK_FORMAT_R16G16B16A16_SNORM`
  - `VK_FORMAT_R16G16_SNORM`
  - `VK_FORMAT_R8G8_SNORM`
  - `VK_FORMAT_R16_SNORM`
- VK_FORMAT_R8_SNORM
- VK_FORMAT_R16G16_SINT
- VK_FORMAT_R8G8_SINT
- VK_FORMAT_R16_SINT
- VK_FORMAT_R8_SINT
- VK_FORMAT_A2B10G10R10_UINT_PACK32
- VK_FORMAT_R16G16_UINT
- VK_FORMAT_R8G8_UINT
- VK_FORMAT_R16_UINT
- VK_FORMAT_R8_UINT

**Note**

The `shaderStorageImageExtendedFormats` feature only adds a guarantee of format support, which is specified for the whole physical device. Therefore enabling or disabling the feature via `vkCreateDevice` has no practical effect.

To query for additional properties, or if the feature is not supported, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats, as usual rules allow.

`VK_FORMAT_R32G32_UINT`, `VK_FORMAT_R32G32_SINT`, and `VK_FORMAT_R32G32_SFLOAT` from `StorageImageExtendedFormats` SPIR-V capability, are already covered by core Vulkan mandatory format support.

- `shaderStorageImageMultisample` specifies whether multisampled storage images are supported. If this feature is not enabled, images that are created with a `usage` that includes `VK_IMAGE_USAGE_STORAGE_BIT` must be created with `samples` equal to `VK_SAMPLE_COUNT_1_BIT`. This also specifies whether shader modules can declare the `StorageImageMultisample` and `ImageMSArray` capabilities.

- `shaderStorageImageReadWithoutFormat` specifies whether storage images and storage texel buffers require a format qualifier to be specified when reading. `shaderStorageImageReadWithoutFormat` applies only to formats listed in the `storage without format` list.

- `shaderStorageImageWriteWithoutFormat` specifies whether storage images and storage texel buffers require a format qualifier to be specified when writing. `shaderStorageImageWriteWithoutFormat` applies only to formats listed in the `storage without format` list.

- `shaderUniformBufferArrayDynamicIndexing` specifies whether arrays of uniform buffers can be indexed by *dynamically uniform* integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `UniformBufferArrayDynamicIndexing` capability.
• **shaderSampledImageArrayDynamicIndexing** specifies whether arrays of samplers or sampled images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `SampledImageArrayDynamicIndexing` capability.

• **shaderStorageBufferArrayDynamicIndexing** specifies whether arrays of storage buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageBufferArrayDynamicIndexing` capability.

• **shaderStorageImageArrayDynamicIndexing** specifies whether arrays of storage images can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also specifies whether shader modules can declare the `StorageImageArrayDynamicIndexing` capability.

• **shaderClipDistance** specifies whether clip distances are supported in shader code. If this feature is not enabled, any members decorated with the `ClipDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `ClipDistance` capability.

• **shaderCullDistance** specifies whether cull distances are supported in shader code. If this feature is not enabled, any members decorated with the `CullDistance` built-in decoration must not be read from or written to in shader modules. This also specifies whether shader modules can declare the `CullDistance` capability.

• **shaderFloat64** specifies whether 64-bit floats (doubles) are supported in shader code. If this feature is not enabled, 64-bit floating-point types must not be used in shader code. This also specifies whether shader modules can declare the `Float64` capability. Declaring and using 64-bit floats is enabled for all storage classes that SPIR-V allows with the `Float64` capability.

• **shaderInt64** specifies whether 64-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 64-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int64` capability. Declaring and using 64-bit integers is enabled for all storage classes that SPIR-V allows with the `Int64` capability.

• **shaderInt16** specifies whether 16-bit integers (signed and unsigned) are supported in shader code. If this feature is not enabled, 16-bit integer types must not be used in shader code. This also specifies whether shader modules can declare the `Int16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int16` SPIR-V capability: Declaring and using 16-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

• **shaderResourceResidency** specifies whether image operations that return resource residency information are supported in shader code. If this feature is not enabled, the `OpImageSparse*` instructions must not be used in shader code. This also specifies whether shader modules can declare the `SparseResidency` capability. The feature requires at least one of the `sparseResidency*`
features to be supported.

- **shaderResourceMinLod** specifies whether image operations specifying the minimum resource LOD are supported in shader code. If this feature is not enabled, the `MinLod` image operand must not be used in shader code. This also specifies whether shader modules can declare the `MinLod` capability.

- **sparseBinding** specifies whether resource memory can be managed at opaque sparse block level instead of at the object level. If this feature is not enabled, resource memory must be bound only on a per-object basis using the `vkBindBufferMemory` and `vkBindImageMemory` commands. In this case, buffers and images must not be created with `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` and `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` set in the flags member of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively. Otherwise resource memory can be managed as described in Sparse Resource Features.

- **sparseResidencyBuffer** specifies whether the device can access partially resident buffers. If this feature is not enabled, buffers must not be created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkBufferCreateInfo` structure.

- **sparseResidencyImage2D** specifies whether the device can access partially resident 2D images with 1 sample per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_1_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- **sparseResidencyImage3D** specifies whether the device can access partially resident 3D images. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_3D` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- **sparseResidency2Samples** specifies whether the physical device can access partially resident 2D images with 2 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_2_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- **sparseResidency4Samples** specifies whether the physical device can access partially resident 2D images with 4 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_4_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- **sparseResidency8Samples** specifies whether the physical device can access partially resident 2D images with 8 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_8_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.

- **sparseResidency16Samples** specifies whether the physical device can access partially resident 2D images with 16 samples per pixel. If this feature is not enabled, images with an `imageType` of `VK_IMAGE_TYPE_2D` and `samples` set to `VK_SAMPLE_COUNT_16_BIT` must not be created with `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` set in the flags member of the `VkImageCreateInfo` structure.
• **sparseResidencyAliased** specifies whether the physical device can correctly access data aliased into multiple locations. If this feature is not enabled, the `VK_BUFFER_CREATE_SPARSE_ALIASED_BIT` and `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT` enum values must not be used in flags members of the `VkBufferCreateInfo` and `VkImageCreateInfo` structures, respectively.

• **variableMultisampleRate** specifies whether all pipelines that will be bound to a command buffer during a subpass which uses no attachments must have the same value for `VkPipelineMultisampleStateCreateInfo::rasterizationSamples`. If set to `VK_TRUE`, the implementation supports variable multisample rates in a subpass which uses no attachments. If set to `VK_FALSE`, then all pipelines bound in such a subpass must have the same multisample rate. This has no effect in situations where a subpass uses any attachments.

• **inheritedQueries** specifies whether a secondary command buffer may be executed while a query is active.

The **VkPhysicalDeviceVulkan11Features** structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan11Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer16BitAccess;
    VkBool32 uniformAndStorageBuffer16BitAccess;
    VkBool32 storagePushConstant16;
    VkBool32 storageInputOutput16;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
    VkBool32 protectedMemory;
    VkBool32 samplerYcbcrConversion;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceVulkan11Features;
```

This structure describes the following features:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **storageBuffer16BitAccess** specifies whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `StorageBuffer16BitAccess` capability.

• **uniformAndStorageBuffer16BitAccess** specifies whether objects in the `Uniform` storage class with the `Block` decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the `UniformAndStorageBuffer16BitAccess` capability.
storagePushConstant16 specifies whether objects in the PushConstant storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StoragePushConstant16 capability.

storageInputOutput16 specifies whether objects in the Input and Output storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageInputOutput16 capability.

multiview specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass must always be zero.

multiviewGeometryShader specifies whether the implementation supports multiview rendering within a render pass, with geometry shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include a geometry shader.

multiviewTessellationShader specifies whether the implementation supports multiview rendering within a render pass, with tessellation shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask must not include any tessellation shaders.

variablePointersStorageBuffer specifies whether the implementation supports the SPIR-V VariablePointersStorageBuffer capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_variable_pointers extension or the VariablePointersStorageBuffer capability.

variablePointers specifies whether the implementation supports the SPIR-V VariablePointers capability. When this feature is not enabled, shader modules must not declare the VariablePointers capability.

protectedMemory specifies whether protected memory is supported.

tsamplerYcbcrConversion specifies whether the implementation supports sampler Y’CbCr conversion. If samplerYcbcrConversion is VK_FALSE, sampler Y’CbCr conversion is not supported, and samplers using sampler Y’CbCr conversion must not be used.

shaderDrawParameters specifies whether the implementation supports the SPIR-V DrawParameters capability. When this feature is not enabled, shader modules must not declare the SPV_KHR_shader_draw_parameters extension or the DrawParameters capability.

If the VkPhysicalDeviceVulkan11Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan11Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkan11Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_1_FEATURES
The `VkPhysicalDeviceVulkan12Features` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkan12Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 samplerMirrorClampToEdge;

    VkBool32 shaderSubgroupExtendedTypes;
    VkBool32 separateDepthStencilLayouts;
    VkBool32 hostQueryReset;
    VkBool32 timelineSemaphore;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
    VkBool32 vulkanMemoryModel;
    VkBool32 vulkanMemoryModelDeviceScope;
    VkBool32 vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkan12Features;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **samplerMirrorClampToEdge** indicates whether the implementation supports the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode. If this feature is not enabled, the `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE` sampler address mode must not be used.

- **drawIndirectCount** indicates whether the implementation supports the `vkCmdDrawIndirectCount` and `vkCmdDrawIndexedIndirectCount` functions. If this feature is not enabled, these functions must not be used.

- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StorageBuffer8BitAccess` capability.

- **uniformAndStorageBuffer8BitAccess** indicates whether objects in the `Uniform` storage class with the `Block` decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `UniformAndStorageBuffer8BitAccess` capability.

- **storagePushConstant8** indicates whether objects in the `PushConstant` storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the `StoragePushConstant8` capability.

- **shaderBufferInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.

- **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

- **shaderFloat16** indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules can declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

- **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g.,
UniformConstant, Uniform, StorageBuffer, Input, Output, and PushConstant) is not enabled.

- descriptorIndexing indicates whether the implementation supports the minimum set of descriptor indexing features as described in the Feature Requirements section. Enabling the descriptorIndexing member when vkCreateDevice is called does not imply the other minimum descriptor indexing features are also enabled. Those other descriptor indexing features must be enabled individually as needed by the application.

- shaderInputAttachmentArrayDynamicIndexing indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the InputAttachmentArrayDynamicIndexing capability.

- shaderUniformTexelBufferArrayDynamicIndexing indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformTexelBufferArrayDynamicIndexing capability.

- shaderStorageTexelBufferArrayDynamicIndexing indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageTexelBufferArrayDynamicIndexing capability.

- shaderUniformBufferArrayNonUniformIndexing indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformBufferArrayNonUniformIndexing capability.

- shaderSampledImageArrayNonUniformIndexing indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the SampledImageArrayNonUniformIndexing capability.

- shaderStorageBufferArrayNonUniformIndexing indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageBufferArrayNonUniformIndexing capability.

- shaderStorageImageArrayNonUniformIndexing indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled,
resources with a descriptor type of \texttt{VK\_DESCRIPTION\_TYPE\_STORAGE\_IMAGE} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{StorageImageArrayNonUniformIndexing} capability.

- \texttt{shaderInputAttachmentArrayNonUniformIndexing} indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK\_DESCRIPTION\_TYPE\_INPUT\_ATTACHMENT} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{InputAttachmentArrayNonUniformIndexing} capability.

- \texttt{shaderUniformTexelBufferArrayNonUniformIndexing} indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK\_DESCRIPTION\_TYPE\_UNIFORM\_TEXEL\_BUFFER} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{UniformTexelBufferArrayNonUniformIndexing} capability.

- \texttt{shaderStorageTexelBufferArrayNonUniformIndexing} indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of \texttt{VK\_DESCRIPTION\_TYPE\_STORAGE\_TEXEL\_BUFFER} must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the \texttt{StorageTexelBufferArrayNonUniformIndexing} capability.

- \texttt{descriptorBindingUniformBufferUpdateAfterBind} indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_UNIFORM\_BUFFER}.

- \texttt{descriptorBindingSampledImageUpdateAfterBind} indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_SAMPLER}, \texttt{VK\_DESCRIPTION\_TYPE\_COMBINED\_IMAGE\_SAMPLER}, or \texttt{VK\_DESCRIPTION\_TYPE\_SAMPLED\_IMAGE}.

- \texttt{descriptorBindingStorageImageUpdateAfterBind} indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_STORAGE\_IMAGE}.

- \texttt{descriptorBindingStorageBufferUpdateAfterBind} indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_STORAGE\_BUFFER}.

- \texttt{descriptorBindingUniformTexelBufferUpdateAfterBind} indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_UNIFORM\_TEXEL\_BUFFER}.

- \texttt{descriptorBindingStorageTexelBufferUpdateAfterBind} indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, \texttt{VK\_DESCRIPTION\_BINDING\_UPDATE\_AFTER\_BIND\_BIT} must not be used with \texttt{VK\_DESCRIPTION\_TYPE\_STORAGE\_TEXEL\_BUFFER}.
supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.

- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATEUNUSEDWHILEPENDING_BIT` must not be used.

- `descriptorBindingPartiallyBound` indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` must not be used.

- `descriptorBindingVariableDescriptorCount` indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT` must not be used.

- `runtimeDescriptorArray` indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

- `samplerFilterMinmax` indicates whether the implementation supports a minimum set of required formats supporting min/max filtering as defined by the `filterMinmaxSingleComponentFormats` property minimum requirements. If this feature is not enabled, then `VkSamplerReductionModeCreateInfo` must only use `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`.

- `scalarBlockLayout` indicates that the implementation supports the layout of resource blocks in shaders using scalar alignment.

- `imagelessFramebuffer` indicates that the implementation supports specifying the image view for attachments at render pass begin time via `VkRenderPassAttachmentBeginInfo`.

- `uniformBufferStandardLayout` indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

- `separateDepthStencilLayouts` indicates whether the implementation supports a `VkImageMemoryBarrier` for a depth/stencil image with only one of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT` set, and whether `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL`, `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, `VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL`, or `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL` can be used.

- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

- `timelineSemaphore` indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

- `bufferDeviceAddress` indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.

- `bufferDeviceAddressCaptureReplay` indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
• **bufferDeviceAddressMultiDevice** indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses **must** not be queried on a logical device created with more than one physical device.

• **vulkanMemoryModel** indicates whether shader modules **can** declare the `VulkanMemoryModel` capability.

• **vulkanMemoryModelDeviceScope** indicates whether the Vulkan Memory Model can use `Device` scope synchronization. This also indicates whether shader modules **can** declare the `VulkanMemoryModelDeviceScope` capability.

• **vulkanMemoryModelAvailabilityVisibilityChains** indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

• **shaderOutputViewportIndex** indicates whether the implementation supports the `ShaderViewportIndex` SPIR-V capability enabling variables decorated with the `ViewportIndex` built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the `ViewportIndex` built-in decoration **must** not be used on outputs in mesh, vertex or tessellation evaluation shaders.

• **shaderOutputLayer** indicates whether the implementation supports the `ShaderLayer` SPIR-V capability enabling variables decorated with the `Layer` built-in to be exported from mesh, vertex or tessellation evaluation shaders. If this feature is not enabled, the `Layer` built-in decoration **must** not be used on outputs in mesh, vertex or tessellation evaluation shaders.

• If `subgroupBroadcastDynamicId` is `VK_TRUE`, the “Id” operand of `OpGroupNonUniformBroadcast` **can** be dynamically uniform within a subgroup, and the “Index” operand of `OpGroupNonUniformQuadBroadcast` **can** be dynamically uniform within the derivative group. If it is `VK_FALSE`, these operands **must** be constants.

If the `VkPhysicalDeviceVulkan12Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVulkan12Features` **can** also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVulkan12Features-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_2_FEATURES`

The `VkPhysicalDeviceVulkan13Features` structure is defined as:
typedef struct VkPhysicalDeviceVulkan13Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
    VkBool32 pipelineCreationCacheControl;
    VkBool32 privateData;
    VkBool32 shaderDemoteToHelperInvocation;
    VkBool32 shaderTerminateInvocation;
    VkBool32 subgroupSizeControl;
    VkBool32 computeFullSubgroups;
    VkBool32 synchronization2;
    VkBool32 textureCompressionASTC_HDR;
    VkBool32 shaderZeroInitializeWorkgroupMemory;
    VkBool32 dynamicRendering;
    VkBool32 shaderIntegerDotProduct;
    VkBool32 maintenance4;
} VkPhysicalDeviceVulkan13Features;

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.

- **robustImageAccess** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Invalid texels resulting from out of bounds image loads will be replaced as described in Texel Replacement, with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

- **inlineUniformBlock** indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not be used.

- **descriptorBindingInlineUniformBlockUpdateAfterBind** indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK.

- **pipelineCreationCacheControl** indicates that the implementation supports:
  - The following can be used in Vk*PipelineCreateInfo::flags:
    - VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT
    - VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT
  - The following can be used in VkPipelineCacheCreateInfo::flags:
    - VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT

- **privateData** indicates whether the implementation supports private data. See Private Data.
• **shaderDemoteToHelperInvocation** indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.

• **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that use the SPV_KHR_terminate_invocation extension.

• **subgroupSizeControl** indicates whether the implementation supports controlling shader subgroup sizes via the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag and the VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure.

• **computeFullSubgroups** indicates whether the implementation supports requiring full subgroups in compute, mesh, or task shaders via the VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT flag.

• **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in VK_KHR_synchronization2.

• **textureCompressionASTC_HDR** indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT, VK_FORMAT_FEATURE_BLIT_SRC_BIT and VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT features must be supported in optimalTilingFeatures for the following formats:

  - VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK
  - VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK

To query for additional properties, or if the feature is not enabled, vkGetPhysicalDeviceFormatProperties and vkGetPhysicalDeviceImageFormatProperties can be used to check for supported properties of individual formats as normal.

• **shaderZeroInitializeWorkgroupMemory** specifies whether the implementation supports initializing a variable in Workgroup storage class.

• **dynamicRendering** specifies that the implementation supports dynamic render pass instances using the vkCmdBeginRendering command.

• **shaderIntegerDotProduct** specifies whether shader modules can declare the
• maintenance4 indicates that the implementation supports the following:
  ◦ The application may destroy a VkPipelineLayout object immediately after using it to create another object.
  ◦ LocalSizeId can be used as an alternative to LocalSize to specify the local workgroup size with specialization constants.
  ◦ Images created with identical creation parameters will always have the same alignment requirements.
  ◦ The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
  ◦ Push constants do not have to be initialized before they are dynamically accessed.
  ◦ The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the VkPhysicalDeviceVulkan13Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkan13Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceVulkan13Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_1_3_FEATURES

The VkPhysicalDeviceVariablePointersFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceVariablePointersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 variablePointersStorageBuffer;
    VkBool32 variablePointers;
} VkPhysicalDeviceVariablePointersFeatures;
```

or the equivalent
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **variablePointersStorageBuffer** specifies whether the implementation supports the SPIR-V `VariablePointersStorageBuffer` capability. When this feature is not enabled, shader modules must not declare the `SPV_KHR_variable_pointers` extension or the `VariablePointersStorageBuffer` capability.
- **variablePointers** specifies whether the implementation supports the SPIR-V `VariablePointers` capability. When this feature is not enabled, shader modules must not declare the `VariablePointers` capability.

If the `VkPhysicalDeviceVariablePointersFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVariablePointersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage

- **VUID-VkPhysicalDeviceVariablePointersFeatures-variablePointers-01431**
  If **variablePointers** is enabled then **variablePointersStorageBuffer** must also be enabled

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceVariablePointersFeatures-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VARIABLE_POINTERS_FEATURES`
typedef struct VkPhysicalDeviceMultiviewFeatures {
    VkStructureType sType;
    void*pNext;
    VkBool32 multiview;
    VkBool32 multiviewGeometryShader;
    VkBool32 multiviewTessellationShader;
} VkPhysicalDeviceMultiviewFeatures;

or the equivalent

typedef VkPhysicalDeviceMultiviewFeatures VkPhysicalDeviceMultiviewFeaturesKHR;

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **multiview** specifies whether the implementation supports multiview rendering within a render pass. If this feature is not enabled, the view mask of each subpass **must** always be zero.
- **multiviewGeometryShader** specifies whether the implementation supports multiview rendering within a render pass, with *geometry shaders*. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a geometry shader.
- **multiviewTessellationShader** specifies whether the implementation supports multiview rendering within a render pass, with *tessellation shaders*. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include any tessellation shaders.

If the *VkPhysicalDeviceMultiviewFeatures* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceMultiviewFeatures* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

**Valid Usage**

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewGeometryShader-00580
  If **multiviewGeometryShader** is enabled then **multiview** **must** also be enabled

- VUID-VkPhysicalDeviceMultiviewFeatures-multiviewTessellationShader-00581
  If **multiviewTessellationShader** is enabled then **multiview** **must** also be enabled

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceMultiviewFeatures-sType-sType
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_FEATURES

The VkPhysicalDeviceShaderAtomicFloatFeaturesEXT structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderAtomicFloatFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferFloat32Atomics;
    VkBool32 shaderBufferFloat32AtomicAdd;
    VkBool32 shaderBufferFloat64Atomics;
    VkBool32 shaderBufferFloat64AtomicAdd;
    VkBool32 shaderSharedFloat32Atomics;
    VkBool32 shaderSharedFloat32AtomicAdd;
    VkBool32 shaderSharedFloat64Atomics;
    VkBool32 shaderSharedFloat64AtomicAdd;
    VkBool32 shaderImageFloat32Atomics;
    VkBool32 shaderImageFloat32AtomicAdd;
    VkBool32 sparseImageFloat32Atomics;
    VkBool32 sparseImageFloat32AtomicAdd;
} VkPhysicalDeviceShaderAtomicFloatFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderBufferFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat32AtomicAdd** indicates whether shaders **can** perform 32-bit floating-point add atomic operations on storage buffers.
- **shaderBufferFloat64Atomics** indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on storage buffers.
- **shaderBufferFloat64AtomicAdd** indicates whether shaders **can** perform 64-bit floating-point add atomic operations on storage buffers.
- **shaderSharedFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat32AtomicAdd** indicates whether shaders **can** perform 32-bit floating-point add atomic operations on shared and payload memory.
- **shaderSharedFloat64Atomics** indicates whether shaders **can** perform 64-bit floating-point load, store and exchange atomic operations on shared and payload memory.
- **shaderSharedFloat64AtomicAdd** indicates whether shaders **can** perform 64-bit floating-point add atomic operations on shared and payload memory.
- **shaderImageFloat32Atomics** indicates whether shaders **can** perform 32-bit floating-point load,
store and exchange atomic image operations.

- `shaderImageFloat32AtomicAdd` indicates whether shaders can perform 32-bit floating-point add atomic image operations.
- `sparseImageFloat32Atomics` indicates whether 32-bit floating-point load, store and exchange atomic operations can be used on sparse images.
- `sparseImageFloat32AtomicAdd` indicates whether 32-bit floating-point add atomic operations can be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloatFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceShaderAtomicFloatFeaturesEXT-sType-sType`

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_FEATURES_EXT`

The `VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_atomic_float2
typedef struct VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderBufferFloat16Atomics;
    VkBool32 shaderBufferFloat16AtomicAdd;
    VkBool32 shaderBufferFloat16AtomicMinMax;
    VkBool32 shaderBufferFloat32AtomicMinMax;
    VkBool32 shaderBufferFloat64AtomicMinMax;
    VkBool32 shaderSharedFloat16Atomics;
    VkBool32 shaderSharedFloat16AtomicAdd;
    VkBool32 shaderSharedFloat16AtomicMinMax;
    VkBool32 shaderSharedFloat32AtomicMinMax;
    VkBool32 shaderSharedFloat64AtomicMinMax;
    VkBool32 shaderImageFloat32AtomicMinMax;
    VkBool32 sparseImageFloat32AtomicMinMax;
} VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderBufferFloat16Atomics` indicates whether shaders can perform 16-bit floating-point load, store, and exchange atomic operations on storage buffers.
• **shaderBufferFloat16AtomicAdd** indicates whether shaders can perform 16-bit floating-point add atomic operations on storage buffers.

• **shaderBufferFloat16AtomicMinMax** indicates whether shaders can perform 16-bit floating-point min and max atomic operations on storage buffers.

• **shaderBufferFloat32AtomicMinMax** indicates whether shaders can perform 32-bit floating-point min and max atomic operations on storage buffers.

• **shaderBufferFloat64AtomicMinMax** indicates whether shaders can perform 64-bit floating-point min and max atomic operations on storage buffers.

• **shaderSharedFloat16Atomics** indicates whether shaders can perform 16-bit floating-point load, store and exchange atomic operations on shared and payload memory.

• **shaderSharedFloat16AtomicAdd** indicates whether shaders can perform 16-bit floating-point add atomic operations on shared and payload memory.

• **shaderSharedFloat16AtomicMinMax** indicates whether shaders can perform 16-bit floating-point min and max atomic operations on shared and payload memory.

• **shaderSharedFloat32AtomicMinMax** indicates whether shaders can perform 32-bit floating-point min and max atomic operations on shared and payload memory.

• **shaderSharedFloat64AtomicMinMax** indicates whether shaders can perform 64-bit floating-point min and max atomic operations on shared and payload memory.

• **shaderImageFloat32AtomicMinMax** indicates whether shaders can perform 32-bit floating-point image operations.

• **sparseImageFloat32AtomicMinMax** indicates whether 32-bit floating-point min and max atomic operations can be used on sparse images.

If the **VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT** structure is included in the `pNext` chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT** can also be used in the `pNext` chain of **VkDeviceCreateInfo** to selectively enable these features.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceShaderAtomicFloat2FeaturesEXT-sType-sType**

  `sType` must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT_2_FEATURES_EXT**

The **VkPhysicalDeviceShaderAtomicInt64Features** structure is defined as:
# VkPhysicalDeviceShaderAtomicInt64Features

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderBufferInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on buffers.
- **shaderSharedInt64Atomics** indicates whether shaders can perform 64-bit unsigned and signed integer atomic operations on shared and payload memory.

If the `VkPhysicalDeviceShaderAtomicInt64Features` structure is included in the pNext chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64Features` can also be used in the pNext chain of `VkDeviceCreateInfo` to selectively enable these features.

## Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderAtomicInt64Features-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_INT64_FEATURES`.

The `VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_image_atomic_int64
typedef struct VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderImageInt64Atomics;
    VkBool32 sparseImageInt64Atomics;
} VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderImageInt64Atomics** indicates whether shaders **can** support 64-bit unsigned and signed integer atomic operations on images.
- **sparseImageInt64Atomics** indicates whether 64-bit integer atomics **can** be used on sparse images.

If the `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicInt64FeaturesEXT` **can** also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderImageAtomicInt64FeaturesEXT-sType-sType**
  
  * **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_ATOMIC_INT64_FEATURES_EXT`

The `VkPhysicalDevice8BitStorageFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDevice8BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer8BitAccess;
    VkBool32 uniformAndStorageBuffer8BitAccess;
    VkBool32 storagePushConstant8;
} VkPhysicalDevice8BitStorageFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_8bit_storage
typedef VkPhysicalDevice8BitStorageFeatures VkPhysicalDevice8BitStorageFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **storageBuffer8BitAccess** indicates whether objects in the `StorageBuffer`, `ShaderRecordBufferKHR`, or `PhysicalStorageBuffer` storage class with the `Block` decoration **can** have 8-bit integer members. If this feature is not enabled, 8-bit integer members **must** not be used in such objects. This also indicates whether shader modules **can** declare the StorageBuffer8BitAccess capability.
• uniformAndStorageBuffer8BitAccess indicates whether objects in the Uniform storage class with the Block decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the UniformAndStorageBuffer8BitAccess capability.

• storagePushConstant8 indicates whether objects in the PushConstant storage class can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the StoragePushConstant8 capability.

If the VkPhysicalDevice8BitStorageFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevice8BitStorageFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevice8BitStorageFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_8BIT_STORAGE_FEATURES

The VkPhysicalDevice16BitStorageFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevice16BitStorageFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 storageBuffer16BitAccess;
    VkBool32 uniformAndStorageBuffer16BitAccess;
    VkBool32 storagePushConstant16;
    VkBool32 storageInputOutput16;
} VkPhysicalDevice16BitStorageFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_16bit_storage
typedef VkPhysicalDevice16BitStorageFeatures VkPhysicalDevice16BitStorageFeaturesKHR;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **storageBuffer16BitAccess** specifies whether objects in the StorageBuffer, ShaderRecordBufferKHR, or PhysicalStorageBuffer storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageBuffer16BitAccess capability.
• uniformAndStorageBuffer16BitAccess specifies whether objects in the Uniform storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the UniformAndStorageBuffer16BitAccess capability.

• storagePushConstant16 specifies whether objects in the PushConstant storage class can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StoragePushConstant16 capability.

• storageInputOutput16 specifies whether objects in the Input and Output storage classes can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also specifies whether shader modules can declare the StorageInputOutput16 capability.

If the VkPhysicalDevice16BitStorageFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevice16BitStorageFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDevice16BitStorageFeatures-sType-sType

sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_16BIT_STORAGE_FEATURES

The VkPhysicalDeviceShaderFloat16Int8Features structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderFloat16Int8Features {
    VkStructureType       sType;
    void*                 pNext;
    VkBool32              shaderFloat16;
    VkBool32              shaderInt8;
} VkPhysicalDeviceShaderFloat16Int8Features;
```

or the equivalent

```c
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceShaderFloat16Int8FeaturesKHR;
```

```c
// Provided by VK_KHR_shader_float16_int8
typedef VkPhysicalDeviceShaderFloat16Int8Features
VkPhysicalDeviceFloat16Int8FeaturesKHR;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.

- **shaderFloat16** indicates whether 16-bit floats (halves) are supported in shader code. This also indicates whether shader modules can declare the `Float16` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Float16` SPIR-V capability: Declaring and using 16-bit floats in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

- **shaderInt8** indicates whether 8-bit integers (signed and unsigned) are supported in shader code. This also indicates whether shader modules can declare the `Int8` capability. However, this only enables a subset of the storage classes that SPIR-V allows for the `Int8` SPIR-V capability: Declaring and using 8-bit integers in the `Private`, `Workgroup` (for non-Block variables), and `Function` storage classes is enabled, while declaring them in the interface storage classes (e.g., `UniformConstant`, `Uniform`, `StorageBuffer`, `Input`, `Output`, and `PushConstant`) is not enabled.

If the `VkPhysicalDeviceShaderFloat16Int8Features` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderFloat16Int8Features` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderFloat16Int8Features-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT16_INT8_FEATURES`

The `VkPhysicalDeviceShaderClockFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_shader_clock
typedef struct VkPhysicalDeviceShaderClockFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupClock;
    VkBool32 shaderDeviceClock;
} VkPhysicalDeviceShaderClockFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderSubgroupClock** indicates whether shaders can perform Subgroup scoped clock reads.
- **shaderDeviceClock** indicates whether shaders can perform Device scoped clock reads.
If the `VkPhysicalDeviceShaderClockFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderClockFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderClockFeaturesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CLOCK_FEATURES_KHR`

The `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSamplerYcbcrConversionFeatures {
    VkStructureType  sType;
    void*             pNext;
    VkBool32          samplerYcbcrConversion;
} VkPhysicalDeviceSamplerYcbcrConversionFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkPhysicalDeviceSamplerYcbcrConversionFeatures
VkPhysicalDeviceSamplerYcbcrConversionFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `samplerYcbcrConversion` specifies whether the implementation supports `sampler Y′C_bC_r` conversion. If `samplerYcbcrConversion` is `VK_FALSE`, `sampler Y′C_bC_r` conversion is not supported, and samplers using `sampler Y′C_bC_r` conversion must not be used.

If the `VkPhysicalDeviceSamplerYcbcrConversionFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSamplerYcbcrConversionFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSamplerYcbcrConversionFeatures-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_YCBCR_CONVERSION_FEATURES`
The VkPhysicalDeviceProtectedMemoryFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryFeatures {
    VkStructureType      sType;
    void*                 pNext;
    VkBool32              protectedMemory;
} VkPhysicalDeviceProtectedMemoryFeatures;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `protectedMemory` specifies whether protected memory is supported.

If the VkPhysicalDeviceProtectedMemoryFeatures structure is included in the `pNext` chain of the VkPhysicalDeviceFeatures2 structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceProtectedMemoryFeatures can also be used in the `pNext` chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceProtectedMemoryFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_FEATURES`

The VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT {
    VkStructureType      sType;
    void*                 pNext;
    VkBool32              advancedBlendCoherentOperations;
} VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `advancedBlendCoherentOperations` specifies whether blending using advanced blend operations is guaranteed to execute atomically and in primitive order. If this is `VK_TRUE`, `VK_ACCESS_COLOR_ATTACHMENT_READ_NONCOHERENT_BIT_EXT` is treated the same as `VK_ACCESS_COLOR_ATTACHMENT_READ_BIT`, and advanced blending needs no additional synchronization over basic blending. If this is `VK_FALSE`, then memory dependencies are
required to guarantee order between two advanced blending operations that occur on the same sample.

If the `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceBlendOperationAdvancedFeaturesEXT-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BLEND_OPERATION_ADVANCED_FEATURES_EXT`.

---

The `VkPhysicalDeviceConditionalRenderingFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkPhysicalDeviceConditionalRenderingFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 conditionalRendering;
    VkBool32 inheritedConditionalRendering;
} VkPhysicalDeviceConditionalRenderingFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conditionalRendering` specifies whether conditional rendering is supported.
- `inheritedConditionalRendering` specifies whether a secondary command buffer can be executed while conditional rendering is active in the primary command buffer.

If the `VkPhysicalDeviceConditionalRenderingFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceConditionalRenderingFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceConditionalRenderingFeaturesEXT-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONDITIONAL_RENDERING_FEATURES_EXT`.

---

The `VkPhysicalDeviceShaderDrawParametersFeatures` structure is defined as:
typedef struct VkPhysicalDeviceShaderDrawParametersFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDrawParameters;
} VkPhysicalDeviceShaderDrawParametersFeatures;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderDrawParameters** specifies whether the implementation supports the SPIR-V `DrawParameters` capability. When this feature is not enabled, shader modules must not declare the `SPV_KHR_shader_draw_parameters` extension or the `DrawParameters` capability.

If the ` VkPhysicalDeviceShaderDrawParametersFeatures ` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDrawParametersFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDrawParametersFeatures-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DRAW_PARAMETERS_FEATURES`

The `VkPhysicalDeviceMeshShaderFeaturesNV` structure is defined as:

// Provided by VK_NV_mesh_shader
typedef struct VkPhysicalDeviceMeshShaderFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 taskShader;
    VkBool32 meshShader;
} VkPhysicalDeviceMeshShaderFeaturesNV;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
• **taskShader** specifies whether task shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TASK_BIT_NV` and `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV` enum values **must** not be used.

• **meshShader** specifies whether mesh shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_MESH_BIT_NV` and `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` enum values **must** not be used.

If the `VkPhysicalDeviceMeshShaderFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMeshShaderFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceMeshShaderFeaturesNV-sType-sType
  - `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_NV`

The `VkPhysicalDeviceMeshShaderFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_mesh_shader
typedef struct VkPhysicalDeviceMeshShaderFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 taskShader;
    VkBool32 meshShader;
    VkBool32 multiviewMeshShader;
    VkBool32 primitiveFragmentShadingRateMeshShader;
    VkBool32 meshShaderQueries;
} VkPhysicalDeviceMeshShaderFeaturesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- **taskShader** specifies whether task shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_TASK_BIT_EXT` and `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT` enum values **must** not be used.
- **meshShader** specifies whether mesh shaders are supported. If this feature is not enabled, the `VK_SHADER_STAGE_MESH_BIT_EXT` and `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT` enum values **must** not be used.
- **multiviewMeshShader** specifies whether the implementation supports multiview rendering within a render pass, with mesh shaders. If this feature is not enabled, then a pipeline compiled against a subpass with a non-zero view mask **must** not include a mesh shader.
- **primitiveFragmentShadingRateMeshShader** indicates that the implementation supports the **primitive fragment shading rate** in mesh shaders.
- **meshShaderQueries** indicates that the implementation supports creating query pools using the
If the `VkPhysicalDeviceMeshShaderFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMeshShaderFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The corresponding features of the `VkPhysicalDeviceMeshShaderFeaturesNV` structure must match those in `VkPhysicalDeviceMeshShaderFeaturesEXT`.

### Valid Usage

- **VUID-VkPhysicalDeviceMeshShaderFeaturesEXT-multiviewMeshShader-07032**
  If `multiviewMeshShader` is enabled then `VkPhysicalDeviceMultiviewFeaturesKHR::multiview` must also be enabled

- **VUID-VkPhysicalDeviceMeshShaderFeaturesEXT-primitiveFragmentShadingRateMeshShader-07033**
  If `primitiveFragmentShadingRateMeshShader` is enabled then `VkPhysicalDeviceFragmentShadingRateFeaturesKHR::primitiveFragmentShadingRate` must also be enabled

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMeshShaderFeaturesEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_FEATURES_EXT`

The `VkPhysicalDeviceMemoryDecompressionFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceMemoryDecompressionFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 memoryDecompression;
} VkPhysicalDeviceMemoryDecompressionFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryDecompression` indicates whether memory decompression is supported.

If the `VkPhysicalDeviceMemoryDecompressionFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to
indicate whether each corresponding feature is supported. 

`VkPhysicalDeviceMemoryDecompressionFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryDecompressionFeaturesNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_DECOMPRESSION_FEATURES_NV`

The `VkPhysicalDeviceDescriptorIndexingFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDescriptorIndexingFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderInputAttachmentArrayDynamicIndexing;
    VkBool32 shaderUniformTexelBufferArrayDynamicIndexing;
    VkBool32 shaderStorageTexelBufferArrayDynamicIndexing;
    VkBool32 shaderUniformBufferArrayNonUniformIndexing;
    VkBool32 shaderSampledImageArrayNonUniformIndexing;
    VkBool32 shaderStorageBufferArrayNonUniformIndexing;
    VkBool32 shaderInputAttachmentArrayNonUniformIndexing;
    VkBool32 shaderUniformTexelBufferArrayNonUniformIndexing;
    VkBool32 shaderStorageTexelBufferArrayNonUniformIndexing;
    VkBool32 descriptorBindingUniformBufferUpdateAfterBind;
    VkBool32 descriptorBindingSampledImageUpdateAfterBind;
    VkBool32 descriptorBindingStorageImageUpdateAfterBind;
    VkBool32 descriptorBindingStorageBufferUpdateAfterBind;
    VkBool32 descriptorBindingUniformTexelBufferUpdateAfterBind;
    VkBool32 descriptorBindingStorageTexelBufferUpdateAfterBind;
    VkBool32 descriptorBindingUpdateUnusedWhilePending;
    VkBool32 descriptorBindingPartiallyBound;
    VkBool32 descriptorBindingVariableDescriptorCount;
    VkBool32 runtimeDescriptorArray;
} VkPhysicalDeviceDescriptorIndexingFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkPhysicalDeviceDescriptorIndexingFeatures
        VkPhysicalDeviceDescriptorIndexingFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
• shaderInputAttachmentArrayDynamicIndexing indicates whether arrays of input attachments can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the InputAttachmentArrayDynamicIndexing capability.

• shaderUniformTexelBufferArrayDynamicIndexing indicates whether arrays of uniform texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformTexelBufferArrayDynamicIndexing capability.

• shaderStorageTexelBufferArrayDynamicIndexing indicates whether arrays of storage texel buffers can be indexed by dynamically uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must be indexed only by constant integral expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageTexelBufferArrayDynamicIndexing capability.

• shaderUniformBufferArrayNonUniformIndexing indicates whether arrays of uniform buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the UniformBufferArrayNonUniformIndexing capability.

• shaderSampledImageArrayNonUniformIndexing indicates whether arrays of samplers or sampled images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the SampledImageArrayNonUniformIndexing capability.

• shaderStorageBufferArrayNonUniformIndexing indicates whether arrays of storage buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageBufferArrayNonUniformIndexing capability.

• shaderStorageImageArrayNonUniformIndexing indicates whether arrays of storage images can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the StorageImageArrayNonUniformIndexing capability.

• shaderInputAttachmentArrayNonUniformIndexing indicates whether arrays of input attachments can be indexed by non-uniform integer expressions in shader code. If this feature is not
enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `InputAttachmentArrayNonUniformIndexing` capability.

- `shaderUniformTexelBufferArrayNonUniformIndexing` indicates whether arrays of uniform texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `UniformTexelBufferArrayNonUniformIndexing` capability.

- `shaderStorageTexelBufferArrayNonUniformIndexing` indicates whether arrays of storage texel buffers can be indexed by non-uniform integer expressions in shader code. If this feature is not enabled, resources with a descriptor type of `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` must not be indexed by non-uniform integer expressions when aggregated into arrays in shader code. This also indicates whether shader modules can declare the `StorageTexelBufferArrayNonUniformIndexing` capability.

- `descriptorBindingUniformBufferUpdateAfterBind` indicates whether the implementation supports updating uniform buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`.

- `descriptorBindingSampledImageUpdateAfterBind` indicates whether the implementation supports updating sampled image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`.

- `descriptorBindingStorageImageUpdateAfterBind` indicates whether the implementation supports updating storage image descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`.

- `descriptorBindingStorageBufferUpdateAfterBind` indicates whether the implementation supports updating storage buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`.

- `descriptorBindingUniformTexelBufferUpdateAfterBind` indicates whether the implementation supports updating uniform texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`.

- `descriptorBindingStorageTexelBufferUpdateAfterBind` indicates whether the implementation supports updating storage texel buffer descriptors after a set is bound. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` must not be used with `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`.

- `descriptorBindingUpdateUnusedWhilePending` indicates whether the implementation supports updating descriptors while the set is in use. If this feature is not enabled, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT` must not be used.
• descriptorBindingPartiallyBound indicates whether the implementation supports statically using a descriptor set binding in which some descriptors are not valid. If this feature is not enabled, VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT must not be used.

• descriptorBindingVariableDescriptorCount indicates whether the implementation supports descriptor sets with a variable-sized last binding. If this feature is not enabled, VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT must not be used.

• runtimeDescriptorArray indicates whether the implementation supports the SPIR-V RuntimeDescriptorArray capability. If this feature is not enabled, descriptors must not be declared in runtime arrays.

If the VkPhysicalDeviceDescriptorIndexingFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDescriptorIndexingFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceDescriptorIndexingFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_FEATURES

The VkPhysicalDeviceCopyMemoryIndirectFeaturesNV structure is defined as:

```
// Provided by VK_NV_copy_memory_indirect
typedef struct VkPhysicalDeviceCopyMemoryIndirectFeaturesNV {
    VkStructureType               sType;
    void*                         pNext;
    VkBool32                       indirectCopy;
} VkPhysicalDeviceCopyMemoryIndirectFeaturesNV;
```

This structure describes the following features:

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• indirectCopy indicates whether indirect copies are supported.

If the VkPhysicalDeviceCopyMemoryIndirectFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCopyMemoryIndirectFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceCopyMemoryIndirectFeaturesNV-sType-sType
The `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexAttributeInstanceRateDivisor;
    VkBool32 vertexAttributeInstanceRateZeroDivisor;
} VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR
    VkPhysicalDeviceVertexAttributeDivisorFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexAttributeInstanceRateDivisor` specifies whether vertex attribute fetching may be repeated in the case of instanced rendering.
- `vertexAttributeInstanceRateZeroDivisor` specifies whether a zero value for `VkVertexInputBindingDivisorDescriptionEXT::divisor` is supported.

If the `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorFeaturesKHR-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_FEATURES_KHR`

The `VkPhysicalDeviceASTCDecodeFeaturesEXT` structure is defined as:
typedef struct VkPhysicalDeviceASTCDecodeFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 decodeModeSharedExponent;
} VkPhysicalDeviceASTCDecodeFeaturesEXT;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **decodeModeSharedExponent** indicates whether the implementation supports decoding ASTC compressed formats to *VK_FORMAT_E5B9G9R9_UFLOAT_PACK32* internal precision.

If the *VkPhysicalDeviceASTCDecodeFeaturesEXT* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceASTCDecodeFeaturesEXT* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectly enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceASTCDecodeFeaturesEXT-sType-sType
  
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ASTC_DECODE_FEATURES_EXT*

The *VkPhysicalDeviceTransformFeedbackFeaturesEXT* structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPhysicalDeviceTransformFeedbackFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 transformFeedback;
    VkBool32 geometryStreams;
} VkPhysicalDeviceTransformFeedbackFeaturesEXT;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **transformFeedback** indicates whether the implementation supports transform feedback and shader modules can declare the *TransformFeedback* capability.
- **geometryStreams** indicates whether the implementation supports the *GeometryStreams* SPIR-V capability.

If the *VkPhysicalDeviceTransformFeedbackFeaturesEXT* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to...
indicate whether each corresponding feature is supported. VkPhysicalDeviceTransformFeedbackFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTransformFeedbackFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_FEATURES_EXT

The VkPhysicalDeviceVulkanMemoryModelFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceVulkanMemoryModelFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 vulkanMemoryModel;
    VkBool32 vulkanMemoryModelDeviceScope;
    VkBool32 vulkanMemoryModelAvailabilityVisibilityChains;
} VkPhysicalDeviceVulkanMemoryModelFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_vulkan_memory_model
typedef VkPhysicalDeviceVulkanMemoryModelFeatures
    VkPhysicalDeviceVulkanMemoryModelFeaturesKHR;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **vulkanMemoryModel** indicates whether shader modules can declare the VulkanMemoryModel capability.
- **vulkanMemoryModelDeviceScope** indicates whether the Vulkan Memory Model can use Device scope synchronization. This also indicates whether shader modules can declare the VulkanMemoryModelDeviceScope capability.
- **vulkanMemoryModelAvailabilityVisibilityChains** indicates whether the Vulkan Memory Model can use availability and visibility chains with more than one element.

If the VkPhysicalDeviceVulkanMemoryModelFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceVulkanMemoryModelFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVulkanMemoryModelFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VULKAN_MEMORY_MODEL_FEATURES

The VkPhysicalDeviceInlineUniformBlockFeatures structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceInlineUniformBlockFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 inlineUniformBlock;
    VkBool32 descriptorBindingInlineUniformBlockUpdateAfterBind;
} VkPhysicalDeviceInlineUniformBlockFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
typedef VkPhysicalDeviceInlineUniformBlockFeatures
    VkPhysicalDeviceInlineUniformBlockFeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **inlineUniformBlock** indicates whether the implementation supports inline uniform block descriptors. If this feature is not enabled, VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not be used.
- **descriptorBindingInlineUniformBlockUpdateAfterBind** indicates whether the implementation supports updating inline uniform block descriptors after a set is bound. If this feature is not enabled, VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT must not be used with VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK.

If the VkPhysicalDeviceInlineUniformBlockFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported.VkPhysicalDeviceInlineUniformBlockFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceInlineUniformBlockFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_FEATURES
The `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_representative_fragment_test
typedef struct VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 representativeFragmentTest;
} VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **representativeFragmentTest** indicates whether the implementation supports the representative fragment test. See [Representative Fragment Test](#).

If the `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceRepresentativeFragmentTestFeaturesNV-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_REPRESENTATIVE_FRAGMENT_TEST_FEATURES_NV`.

---

The `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_scissor_exclusive
typedef struct VkPhysicalDeviceExclusiveScissorFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 exclusiveScissor;
} VkPhysicalDeviceExclusiveScissorFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **exclusiveScissor** indicates that the implementation supports the exclusive scissor test.

See [Exclusive Scissor Test](#) for more information.
If the `VkPhysicalDeviceExclusiveScissorFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceExclusiveScissorFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceExclusiveScissorFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXCLUSIVE_SCISSOR_FEATURES_NV`.

The `VkPhysicalDeviceCornerSampledImageFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_corner_sampled_image
typedef struct VkPhysicalDeviceCornerSampledImageFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 cornerSampledImage;
} VkPhysicalDeviceCornerSampledImageFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cornerSampledImage` specifies whether images can be created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`. See Corner-Sampled Images.

If the `VkPhysicalDeviceCornerSampledImageFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCornerSampledImageFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceCornerSampledImageFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CORNER_SAMPLED_IMAGE_FEATURES_NV`.

The `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_compute_shader_derivatives
```
```
// Provided by VK_NV_compute_shader_derivatives
typedef struct VkPhysicalDeviceComputeShaderDerivativesFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 computeDerivativeGroupQuads;
    VkBool32 computeDerivativeGroupLinear;
} VkPhysicalDeviceComputeShaderDerivativesFeaturesNV;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **computeDerivativeGroupQuads** indicates that the implementation supports the `ComputeDerivativeGroupQuadsNV` SPIR-V capability.
- **computeDerivativeGroupLinear** indicates that the implementation supports the `ComputeDerivativeGroupLinearNV` SPIR-V capability.

See [Quad shader scope](#) for more information.

If the `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceComputeShaderDerivativesFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceComputeShaderDerivativesFeaturesNV-sType-sType must be
  `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COMPUTE_SHADER_DERIVATIVES_FEATURES_NV`

The `VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR` structure is defined as:

```
// Provided by VK_KHR_fragment_shader_barycentric
typedef struct VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShaderBarycentric;
} VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR;
```

or the equivalent
typedef VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR
VkPhysicalDeviceFragmentShaderBarycentricFeaturesNV;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentShaderBarycentric** indicates that the implementation supports the `BaryCoordKHR` and `BaryCoordNoPerspKHR` SPIR-V fragment shader built-ins and supports the `PerVertexKHR` SPIR-V decoration on fragment shader input variables.

See [Barycentric Interpolation](#) for more information.

If the `VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentShaderBarycentricFeaturesKHR-sType-sType` must be
  
  `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_FEATURES_KHR`

The `VkPhysicalDeviceShaderImageFootprintFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderImageFootprintFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageFootprint;
} VkPhysicalDeviceShaderImageFootprintFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageFootprint** specifies whether the implementation supports the `ImageFootprintNV` SPIR-V capability.

See [Texel Footprint Evaluation](#) for more information.

If the `VkPhysicalDeviceShaderImageFootprintFeaturesNV` structure is included in the `pNext` chain of
the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderImageFootprintFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderImageFootprintFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_IMAGE_FOOTPRINT_FEATURES_NV`

The `VkPhysicalDeviceShaderImageFootprintFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPhysicalDeviceShadingRateImageFeaturesNV {
    VkStructureType     sType;
    void*                pNext;
    VkBool32             shadingRateImage;
    VkBool32             shadingRateCoarseSampleOrder;
} VkPhysicalDeviceShadingRateImageFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shadingRateImage` indicates that the implementation supports the use of a shading rate image to derive an effective shading rate for fragment processing. It also indicates that the implementation supports the `ShadingRateNV` SPIR-V execution mode.
- `shadingRateCoarseSampleOrder` indicates that the implementation supports an application-configurable ordering of coverage samples in fragments larger than one pixel.

See Shading Rate Image for more information.

If the `VkPhysicalDeviceShadingRateImageFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShadingRateImageFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShadingRateImageFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADING_RATE_IMAGE_FEATURES_NV`

The `VkPhysicalDeviceFragmentDensityMapFeaturesEXT` structure is defined as:
typedef struct VkPhysicalDeviceFragmentDensityMapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMap;
    VkBool32 fragmentDensityMapDynamic;
    VkBool32 fragmentDensityMapNonSubsampledImages;
} VkPhysicalDeviceFragmentDensityMapFeaturesEXT;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **fragmentDensityMap** specifies whether the implementation supports render passes with a fragment density map attachment. If this feature is not enabled and the **pNext** chain of `VkRenderPassCreateInfo` includes a `VkRenderPassFragmentDensityMapCreateInfoEXT` structure, `fragmentDensityMapAttachment` must be `VK_ATTACHMENT_UNUSED`.
- **fragmentDensityMapDynamic** specifies whether the implementation supports dynamic fragment density map image views. If this feature is not enabled, `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` must not be included in `VkImageViewCreateInfo::flags`.
- **fragmentDensityMapNonSubsampledImages** specifies whether the implementation supports regular non-subsampled image attachments with fragment density map render passes. If this feature is not enabled, render passes with a fragment density map attachment must only have subsampled attachments bound.

If the `VkPhysicalDeviceFragmentDensityMapFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.

The `VkPhysicalDeviceFragmentDensityMapFeaturesEXT` structure can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceFragmentDensityMapFeaturesEXT-sType-sType**
  - **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT DENSITY_MAP FEATURES_EXT`
typedef struct VkPhysicalDeviceFragmentDensityMap2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMapDeferred;
} VkPhysicalDeviceFragmentDensityMap2FeaturesEXT;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentDensityMapDeferred** specifies whether the implementation supports deferred reads of fragment density map image views. If this feature is not enabled, VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT must not be included in VkImageViewCreateInfo::flags.

If the VkPhysicalDeviceFragmentDensityMap2FeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceFragmentDensityMap2FeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentDensityMap2FeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_FEATURES_EXT

The VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM structure is defined as:

// Provided by VK_QCOM_fragment_density_map_offset
typedef struct VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentDensityMapOffset;
} VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentDensityMapOffsets** specifies whether the implementation supports fragment density map offsets.

If the VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is
filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceFragmentDensityMapOffsetFeaturesQCOM-sType-sType**
  
  - *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_OFFSET_FEATURES_QCOM`.

The *VkPhysicalDeviceInvocationMaskFeaturesHUAWEI* structure is defined as:

```c
// Provided by VK_HUAWEI_invocation_mask
typedef struct VkPhysicalDeviceInvocationMaskFeaturesHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkBool32 invocationMask;
} VkPhysicalDeviceInvocationMaskFeaturesHUAWEI;
```

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **invocationMask** indicates that the implementation supports the use of an invocation mask image to optimize the ray dispatch.

If the *VkPhysicalDeviceInvocationMaskFeaturesHUAWEI* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceInvocationMaskFeaturesHUAWEI* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceInvocationMaskFeaturesHUAWEI-sType-sType**
  
  - *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INVOCATION_MASK_FEATURES_HUAWEI`.

The *VkPhysicalDeviceScalarBlockLayoutFeatures* structure is defined as:

```c
3808
```
```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceScalarBlockLayoutFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 scalarBlockLayout;
} VkPhysicalDeviceScalarBlockLayoutFeatures;

or the equivalent

// Provided by VK_EXT_scalar_block_layout
typedef VkPhysicalDeviceScalarBlockLayoutFeatures
VkPhysicalDeviceScalarBlockLayoutFeaturesEXT;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is *NULL* or a pointer to a structure extending this structure.
- **scalarBlockLayout** indicates that the implementation supports the layout of resource blocks in shaders using *scalar alignment*.

If the *VkPhysicalDeviceScalarBlockLayoutFeatures* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceScalarBlockLayoutFeatures* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceScalarBlockLayoutFeatures-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCALAR_BLOCK_LAYOUT_FEATURES**

The *VkPhysicalDeviceUniformBufferStandardLayoutFeatures* structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceUniformBufferStandardLayoutFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 uniformBufferStandardLayout;
} VkPhysicalDeviceUniformBufferStandardLayoutFeatures;

or the equivalent

// Provided by VK_EXT_scalar_block_layout
```

```c
typedef VkPhysicalDeviceUniformBufferStandardLayoutFeatures
VkPhysicalDeviceUniformBufferStandardLayoutFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **uniformBufferStandardLayout** indicates that the implementation supports the same layouts for uniform buffers as for storage and other kinds of buffers. See Standard Buffer Layout.

If the `VkPhysicalDeviceUniformBufferStandardLayoutFeatures` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceUniformBufferStandardLayoutFeatures-sType-sType

  The `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is defined as:

  ```
  // Provided by VK_EXT_depth_clip_enable
typedef struct VkPhysicalDeviceDepthClipEnableFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClipEnable;
  } VkPhysicalDeviceDepthClipEnableFeaturesEXT;
  
  This structure describes the following feature:

  - **sType** is a `VkStructureType` value identifying this structure.
  - **pNext** is `NULL` or a pointer to a structure extending this structure.
  - **depthClipEnable** indicates that the implementation supports setting the depth clipping operation explicitly via the `VkPipelineRasterizationDepthClipStateCreateInfoEXT` pipeline state. Otherwise depth clipping is only enabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is set to `VK_FALSE`.

  If the `VkPhysicalDeviceDepthClipEnableFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceDepthClipEnableFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDepthClipEnableFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_ENABLE_FEATURES_EXT

The VkPhysicalDeviceMemoryPriorityFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_memory_priority
typedef struct VkPhysicalDeviceMemoryPriorityFeaturesEXT {
    VkStructureType      sType;
    void*                pNext;
    VkBool32             memoryPriority;
} VkPhysicalDeviceMemoryPriorityFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **memoryPriority** indicates that the implementation supports memory priorities specified at memory allocation time via VkMemoryPriorityAllocateInfoEXT.

If the VkPhysicalDeviceMemoryPriorityFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMemoryPriorityFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMemoryPriorityFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_PRIORITY_FEATURES_EXT

The VkPhysicalDeviceBufferDeviceAddressFeatures structure is defined as:
```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceBufferDeviceAddressFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 bufferDeviceAddress;
    VkBool32 bufferDeviceAddressCaptureReplay;
    VkBool32 bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkPhysicalDeviceBufferDeviceAddressFeatures
    VkPhysicalDeviceBufferDeviceAddressFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from `vkGetBufferDeviceAddress`.
- **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer and device addresses, e.g. for trace capture and replay.
- **bufferDeviceAddressMultiDevice** indicates that the implementation supports the `bufferDeviceAddress`, `rayTracingPipeline` and `rayQuery` features for logical devices created with multiple physical devices. If this feature is not supported, buffer and acceleration structure addresses must not be queried on a logical device created with more than one physical device.

**Note**

`bufferDeviceAddressMultiDevice` exists to allow certain legacy platforms to be able to support `bufferDeviceAddress` without needing to support shared GPU virtual addresses for multi-device configurations.

See `vkGetBufferDeviceAddress` for more information.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBufferDeviceAddressFeatures can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceBufferDeviceAddressFeatures-sType-sType
The **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_buffer_device_address
typedef struct VkPhysicalDeviceBufferDeviceAddressFeaturesEXT {
    VkStructureType         sType;
    void*                   pNext;
    VkBool32                bufferDeviceAddress;
    VkBool32                bufferDeviceAddressCaptureReplay;
    VkBool32                bufferDeviceAddressMultiDevice;
} VkPhysicalDeviceBufferDeviceAddressFeaturesEXT;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **bufferDeviceAddress** indicates that the implementation supports accessing buffer memory in shaders as storage buffers via an address queried from *vkGetBufferDeviceAddressEXT*.
- **bufferDeviceAddressCaptureReplay** indicates that the implementation supports saving and reusing buffer addresses, e.g. for trace capture and replay.
- **bufferDeviceAddressMultiDevice** indicates that the implementation supports the **bufferDeviceAddress** feature for logical devices created with multiple physical devices. If this feature is not supported, buffer addresses **must** not be queried on a logical device created with more than one physical device.

If the **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

**Note**

The **VkPhysicalDeviceBufferDeviceAddressFeaturesEXT** structure has the same members as the **VkPhysicalDeviceBufferDeviceAddressFeatures** structure, but the functionality indicated by the members is expressed differently. The features indicated by the **VkPhysicalDeviceBufferDeviceAddressFeatures** structure requires additional flags to be passed at memory allocation time, and the capture and replay mechanism is built around opaque capture addresses for buffer and memory objects.
The `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_dedicated_allocation_image_aliasing
typedef struct VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 dedicatedAllocationImageAliasing;
} VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dedicatedAllocationImageAliasing` indicates that the implementation supports aliasing of compatible image objects on a dedicated allocation.

If the `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDedicatedAllocationImageAliasingFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceImagelessFramebufferFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceImagelessFramebufferFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 imagelessFramebuffer;
} VkPhysicalDeviceImagelessFramebufferFeatures;
```

or the equivalent
typedef VkPhysicalDeviceImagelessFramebufferFeatures
VkPhysicalDeviceImagelessFramebufferFeaturesKHR;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imagelessFramebuffer** indicates that the implementation supports specifying the image view for attachments at render pass begin time via *VkRenderPassAttachmentBeginInfo*.

If the *VkPhysicalDeviceImagelessFramebufferFeatures* structure is included in the **pNext** chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceImagelessFramebufferFeatures* can also be used in the **pNext** chain of *VkDeviceCreateInfo* to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceImagelessFramebufferFeatures-sType-sType**
  - *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGELESS_FRAMEBUFFER_FEATURES*

The *VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT* structure is defined as:

```c
// Provided by VK_EXT_fragment_shader_interlock
typedef struct VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShaderSampleInterlock;
    VkBool32 fragmentShaderPixelInterlock;
    VkBool32 fragmentShaderShadingRateInterlock;
} VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **fragmentShaderSampleInterlock** indicates that the implementation supports the *FragmentShaderSampleInterlockEXT* SPIR-V capability.
- **fragmentShaderPixelInterlock** indicates that the implementation supports the *FragmentShaderPixelInterlockEXT* SPIR-V capability.
- **fragmentShaderShadingRateInterlock** indicates that the implementation supports the *FragmentShaderShadingRateInterlockEXT* SPIR-V capability.
If the `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentShaderInterlockFeaturesEXT-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_INTERLOCK_FEATURES_EXT`

The `VkPhysicalDeviceCooperativeMatrixFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 cooperativeMatrix;
    VkBool32 cooperativeMatrixRobustBufferAccess;
} VkPhysicalDeviceCooperativeMatrixFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `cooperativeMatrix` indicates that the implementation supports the `CooperativeMatrixNV` SPIR-V capability.
- `cooperativeMatrixRobustBufferAccess` indicates that the implementation supports robust buffer access for SPIR-V `OpCooperativeMatrixLoadNV` and `OpCooperativeMatrixStoreNV` instructions.

If the `VkPhysicalDeviceCooperativeMatrixFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCooperativeMatrixFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceCooperativeMatrixFeaturesNV-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_NV`

The `VkPhysicalDeviceCooperativeMatrixFeaturesKHR` structure is defined as:
// Provided by VK_KHR_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 cooperativeMatrix;
    VkBool32 cooperativeMatrixRobustBufferAccess;
} VkPhysicalDeviceCooperativeMatrixFeaturesKHR;

This structure describes the following features:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{cooperativeMatrix} indicates that the implementation supports the \texttt{CooperativeMatrixKHR} SPIR-V capability.
- \texttt{cooperativeMatrixRobustBufferAccess} indicates that the implementation supports robust buffer access for SPIR-V \texttt{OpCooperativeMatrixLoadKHR} and \texttt{OpCooperativeMatrixStoreKHR} instructions.

If the \texttt{VkPhysicalDeviceCooperativeMatrixFeaturesKHR} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceCooperativeMatrixFeaturesKHR} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixFeaturesKHR-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_FEATURES_KHR}

The \texttt{VkPhysicalDeviceYcbcrImageArraysFeaturesEXT} structure is defined as:

// Provided by VK_EXT_ycbcr_image_arrays
typedef struct VkPhysicalDeviceYcbcrImageArraysFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 ycbcrImageArrays;
} VkPhysicalDeviceYcbcrImageArraysFeaturesEXT;

This structure describes the following feature:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is NULL or a pointer to a structure extending this structure.
- \texttt{ycbcrImageArrays} indicates that the implementation supports creating images with a format that requires \texttt{Y'CbCr} conversion and has multiple array layers.

If the \texttt{VkPhysicalDeviceYcbcrImageArraysFeaturesEXT} structure is included in the \texttt{pNext} chain of the
The `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcrImageArraysFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceYcbcrImageArraysFeaturesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_IMAGE_ARRAYS_FEATURES_EXT`

The `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupExtendedTypes;
} VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_shader_subgroup_extended_types
typedef VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures
VkPhysicalDeviceShaderSubgroupExtendedTypesFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSubgroupExtendedTypes` is a boolean specifying whether subgroup operations can use 8-bit integer, 16-bit integer, 64-bit integer, 16-bit floating-point, and vectors of these types in group operations with subgroup scope, if the implementation supports the types.

If the `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderSubgroupExtendedTypesFeatures-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_EXTENDED_TYPES_FEATURES`
The `VkPhysicalDeviceHostQueryResetFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceHostQueryResetFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 hostQueryReset;
} VkPhysicalDeviceHostQueryResetFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_host_query_reset
typedef VkPhysicalDeviceHostQueryResetFeatures
    VkPhysicalDeviceHostQueryResetFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `hostQueryReset` indicates that the implementation supports resetting queries from the host with `vkResetQueryPool`.

If the `VkPhysicalDeviceHostQueryResetFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceHostQueryResetFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)
- VUID-VkPhysicalDeviceHostQueryResetFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_QUERY_RESET_FEATURES`.

The `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL` structure is defined as:

```c
// Provided by VK_INTEL_shader_integer_functions2
typedef struct VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderIntegerFunctions2;
} VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.

• `shaderIntegerFunctions2` indicates that the implementation supports the `IntegerFunctions2INTEL` SPIR-V capability.

If the `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTELfeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTELfeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderIntegerFunctions2FeaturesINTEL-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_FUNCTIONS_2_FEATURES_INTEL`.

The `VkPhysicalDeviceCoverageReductionModeFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceCoverageReductionModeFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 coverageReductionMode;
} VkPhysicalDeviceCoverageReductionModeFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `coverageReductionMode` indicates whether the implementation supports coverage reduction modes. See [Coverage Reduction](#).

If the `VkPhysicalDeviceCoverageReductionModeFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCoverageReductionModeFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCoverageReductionModeFeaturesNV-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COVERAGE_REDUCTION_MODE_FEATURES_NV`.

The `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is defined as:
typedef struct VkPhysicalDeviceTimelineSemaphoreFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 timelineSemaphore;
} VkPhysicalDeviceTimelineSemaphoreFeatures;

or the equivalent

typedef VkPhysicalDeviceTimelineSemaphoreFeaturesKHR

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **timelineSemaphore** indicates whether semaphores created with a `VkSemaphoreType` of `VK_SEMAPHORE_TYPE_TIMELINE` are supported.

If the `VkPhysicalDeviceTimelineSemaphoreFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTimelineSemaphoreFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreFeatures-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_FEATURES`

The `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure is defined as:

typedef struct VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX {
    VkStructureType sType;
    void* pNext;
    VkBool32 screenBufferImport;
} VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX;

The members of the `VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX` structure describe the following features:

- **screenBufferImport** indicates whether QNX Screen buffer import functionality is supported. If
screenBufferImport is set to VK_TRUE, VkDeviceMemory supports importing _screen_buffer from applications. In this case, the application is responsible for the resource management of the _screen_buffer.

Table 63. Functionality supported for QNX Screen Buffer features

<table>
<thead>
<tr>
<th>Features</th>
<th>Functionality</th>
</tr>
</thead>
<tbody>
<tr>
<td>screenBufferImport</td>
<td>VkImportScreenBufferInfoQNX</td>
</tr>
<tr>
<td>Always supported¹</td>

<td>VkScreenBufferFormatPropertiesQNX,</td>
</tr>
<tr>
<td></td>
<td>VkExternalFormatQNX</td>
</tr>
</tbody>
</table>

¹ Functionality in this row is always available.

The Functionality supported for QNX Screen buffer features table summarizes the functionality enabled by the VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX structure. Each entry in the body of the table summarizes the functionality that can be used when the given features are supported and enabled. This summarizes Valid Usage statements that are added elsewhere in this specification.

If the VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryScreenBufferFeaturesQNX-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_SCREEN_BUFFER_FEATURES_QNX

The VkPhysicalDeviceIndexTypeUint8FeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_index_type_uint8
typedef struct VkPhysicalDeviceIndexTypeUint8FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 indexTypeUint8;
} VkPhysicalDeviceIndexTypeUint8FeaturesKHR;
```

or the equivalent
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **indexTypeUint8** indicates that `VK_INDEX_TYPE_UINT8_KHR` can be used with `vkCmdBindIndexBuffer2KHR` and `vkCmdBindIndexBuffer`.

If the `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceIndexTypeUint8FeaturesKHR-sType-sType
  
  The `VkPhysicalDeviceIndexTypeUint8FeaturesKHR` structure is defined as:

  ```
  typedef struct VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 primitiveTopologyListRestart;
    VkBool32 primitiveTopologyPatchListRestart;
  } VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT;
  ```

  This structure describes the following features:

  - **sType** is a `VkStructureType` value identifying this structure.
  - **pNext** is `NULL` or a pointer to a structure extending this structure.
  - **primitiveTopologyListRestart** indicates that list type primitives, `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` can use the primitive restart index value in index buffers.
  - **primitiveTopologyPatchListRestart** indicates that the `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` topology can use the primitive restart index value in index buffers.
If the `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevicePrimitiveTopologyListRestartFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRIMITIVE_TOPOLOGY_LIST_RESTART_FEATURES_EXT`.

The `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderSMBuiltinsFeaturesNV
{
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSMBuiltins;
} VkPhysicalDeviceShaderSMBuiltinsFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderSMBuiltins` indicates whether the implementation supports the SPIR-V `ShaderSMBuiltinsNV` capability.

If the `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSMBuiltinsFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderSMBuiltinsFeaturesNV-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_FEATURES_NV`.

The `VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures` structure is defined as:
**// Provided by VK_VERSION_1_2**

typedef struct VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 separateDepthStencilLayouts;
} VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures;

or the equivalent

**// Provided by VK_KHR_separate_depth_stencil_layouts**

typedef VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures
VkPhysicalDeviceSeparateDepthStencilLayoutsFeaturesKHR;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **separateDepthStencilLayouts** indicates whether the implementation supports a VkImageMemoryBarrier for a depth/stencil image with only one of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT set, and whether VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL, VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL, or VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL can be used.

If the VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceSeparateDepthStencilLayoutsFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SEPARATE_DEPTH_STENCIL_LAYOUTS_FEATURES

The VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR structure is defined as:

**// Provided by VK_KHR_pipeline_executable_properties**

typedef struct VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineExecutableInfo;
} VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR;
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineExecutableInfo** indicates that the implementation supports reporting properties and statistics about the pipeline executables associated with a compiled pipeline.

If the `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePipelineExecutablePropertiesFeaturesKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_EXECUTABLE_PROPERTIES_FEATURES_KHR`.

The `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderDemoteToHelperInvocation;
} VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_shader_demote_to_helper_invocation
typedef VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures VkPhysicalDeviceShaderDemoteToHelperInvocationFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderDemoteToHelperInvocation** indicates whether the implementation supports the SPIR-V DemoteToHelperInvocationEXT capability.

If the `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures` can also be used in the `pNext` chain of
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderDemoteToHelperInvocationFeatures-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_DEMOTE_TO_HELPER_INVOCATION_FEATURES

The VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_texel_buffer_alignment
typedef struct VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 texelBufferAlignment;
} VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **texelBufferAlignment** indicates whether the implementation uses more specific alignment requirements advertised in VkPhysicalDeviceTexelBufferAlignmentProperties rather than VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.

If the VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTexelBufferAlignmentFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_FEATURES_EXT

The VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_attachment_feedback_loop_dynamic_state
typedef struct VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 attachmentFeedbackLoopDynamicState;
} VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT;
```
This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **attachmentFeedbackLoopDynamicState** specifies whether dynamic feedback loops are supported.

If the `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceAttachmentFeedbackLoopDynamicStateFeaturesEXT-sType-sType` **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ATTACHMENT_FEEDBACK_LOOP_DYNAMIC_STATE_FEATURES_EXT`

---

The `VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_legacy_vertex_attributes
typedef struct VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 legacyVertexAttributes;
} VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **legacyVertexAttributes** specifies whether compatibility features for vertex attributes are supported when using dynamic vertex input state.

If the `VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceLegacyVertexAttributesFeaturesEXT-sType-sType` **sType** must be `VK_STRUCTURE_TYPE_PHYSICALDEVICE_LEGACY_VERTEX_ATTRIBUTES_FEATURES_EXT`
The `VkPhysicalDeviceTextureCompressionASTCHDRFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceTextureCompressionASTCHDRFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureCompressionASTC_HDR;
} VkPhysicalDeviceTextureCompressionASTCHDRFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_texture_compression_astc_hdr
typedef VkPhysicalDeviceTextureCompressionASTCHDRFeatures
    VkPhysicalDeviceTextureCompressionASTCHDRFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `textureCompressionASTC_HDR` indicates whether all of the ASTC HDR compressed texture formats are supported. If this feature is enabled, then the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`, `VK_FORMAT_FEATURE_BLIT_SRC_BIT` and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT` features must be supported in `optimalTilingFeatures` for the following formats:
  - `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK`
  - `VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK`

To query for additional properties, or if the feature is not enabled, `vkGetPhysicalDeviceFormatProperties` and `vkGetPhysicalDeviceImageFormatProperties` can be used to check for supported properties of individual formats as normal.
If the \texttt{VkPhysicalDeviceTextureCompressionASTCHDRFeatures} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceFeatures2} structure passed to \texttt{vkGetPhysicalDeviceFeatures2}, it is filled in to indicate whether each corresponding feature is supported. \texttt{VkPhysicalDeviceTextureCompressionASTCHDRFeatures} can also be used in the \texttt{pNext} chain of \texttt{VkDeviceCreateInfo} to selectively enable these features.

### Valid Usage (Implicit)

- \textbf{VUID-VkPhysicalDeviceTextureCompressionASTCHDRFeatures-sType-sType} 
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXTURE_COMPRESSION_ASTC_HDR_FEATURES}

The \texttt{VkPhysicalDeviceLineRasterizationFeaturesKHR} structure is defined as:

```c
// Provided by VK_KHR_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rectangularLines;
    VkBool32 bresenhamLines;
    VkBool32 smoothLines;
    VkBool32 stippledRectangularLines;
    VkBool32 stippledBresenhamLines;
    VkBool32 stippledSmoothlines;
} VkPhysicalDeviceLineRasterizationFeaturesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_line_rasterization
typedef VkPhysicalDeviceLineRasterizationFeaturesKHR
VkPhysicalDeviceLineRasterizationFeaturesEXT;
```

This structure describes the following features:

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{rectangularLines} indicates whether the implementation supports \texttt{rectangular line rasterization}.
- \texttt{bresenhamLines} indicates whether the implementation supports Bresenham-style \texttt{line rasterization}.
- \texttt{smoothLines} indicates whether the implementation supports \texttt{smooth line rasterization}.
- \texttt{stippledRectangularLines} indicates whether the implementation supports \texttt{stippled line rasterization} with \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_KHR} lines.
- \texttt{stippledBresenhamLines} indicates whether the implementation supports \texttt{stippled line rasterization} with \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_KHR} lines.
• **stippledSmoothLines** indicates whether the implementation supports stippled line rasterization with `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_KHR` lines.

If the `VkPhysicalDeviceLineRasterizationFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLineRasterizationFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceLineRasterizationFeaturesKHR-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_FEATURES_KHR`

The `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSubgroupSizeControlFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 subgroupSizeControl;
    VkBool32 computeFullSubgroups;
} VkPhysicalDeviceSubgroupSizeControlFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlFeatures
    VkPhysicalDeviceSubgroupSizeControlFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subgroupSizeControl` indicates whether the implementation supports controlling shader subgroup sizes via the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag and the `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure.
- `computeFullSubgroups` indicates whether the implementation supports requiring full subgroups in compute, mesh, or task shaders via the `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` flag.

If the `VkPhysicalDeviceSubgroupSizeControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSubgroupSizeControlFeatures` can also be used in the `pNext` chain of...
VkDeviceCreateInfo to selectively enable these features.

**Note**
The VkPhysicalDeviceSubgroupSizeControlFeaturesEXT structure was added in version 2 of the VK_EXT_subgroup_size_control extension. Version 1 implementations of this extension will not fill out the features structure but applications may assume that both subgroupSizeControl and computeFullSubgroups are supported if the extension is supported. (See also the Feature Requirements section.) Applications are advised to add a VkPhysicalDeviceSubgroupSizeControlFeaturesEXT structure to the pNext chain of VkDeviceCreateInfo to enable the features regardless of the version of the extension supported by the implementation. If the implementation only supports version 1, it will safely ignore the VkPhysicalDeviceSubgroupSizeControlFeaturesEXT structure.

Vulkan 1.3 implementations always support the features structure.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlFeatures-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_FEATURES

The VkPhysicalDeviceCoherentMemoryFeaturesAMD structure is defined as:

```c
// Provided by VK_AMD_device_coherent_memory
typedef struct VkPhysicalDeviceCoherentMemoryFeaturesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceCoherentMemory;
} VkPhysicalDeviceCoherentMemoryFeaturesAMD;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceCoherentMemory** indicates that the implementation supports device coherent memory.

If the VkPhysicalDeviceCoherentMemoryFeaturesAMD structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceCoherentMemoryFeaturesAMD can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceCoherentMemoryFeaturesAMD-sType-sType**

  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COHERENT_MEMORY_FEATURES_AMD**

The *VkPhysicalDeviceAccelerationStructureFeaturesKHR* structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkPhysicalDeviceAccelerationStructureFeaturesKHR {
  VkStructureType sType;
  void* pNext;
  VkBool32 accelerationStructure;
  VkBool32 accelerationStructureCaptureReplay;
  VkBool32 accelerationStructureIndirectBuild;
  VkBool32 accelerationStructureHostCommands;
  VkBool32 descriptorBindingAccelerationStructureUpdateAfterBind;
} VkPhysicalDeviceAccelerationStructureFeaturesKHR;
```

This structure describes the following features:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **accelerationStructure** indicates whether the implementation supports the acceleration structure functionality. See Acceleration Structures.
- **accelerationStructureCaptureReplay** indicates whether the implementation supports saving and reusing acceleration structure device addresses, e.g. for trace capture and replay.
- **accelerationStructureIndirectBuild** indicates whether the implementation supports indirect acceleration structure build commands, e.g. `vkCmdBuildAccelerationStructuresIndirectKHR`.
- **accelerationStructureHostCommands** indicates whether the implementation supports host side acceleration structure commands, e.g. `vkBuildAccelerationStructuresKHR`, `vkCopyAccelerationStructureKHR`, `vkCopyAccelerationStructureToMemoryKHR`, `vkCopyMemoryToAccelerationStructureKHR`, `vkWriteAccelerationStructuresPropertiesKHR`.
- **descriptorBindingAccelerationStructureUpdateAfterBind** indicates whether the implementation supports updating acceleration structure descriptors after a set is bound. If this feature is not enabled, **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** must not be used with **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**.

If the *VkPhysicalDeviceAccelerationStructureFeaturesKHR* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceAccelerationStructureFeaturesKHR* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAccelerationStructureFeaturesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_FEATURES_KHR

The `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkPhysicalDeviceRayTracingPipelineFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingPipeline;
    VkBool32 rayTracingPipelineShaderGroupHandleCaptureReplay;
    VkBool32 rayTracingPipelineShaderGroupHandleCaptureReplayMixed;
    VkBool32 rayTracingPipelineTraceRaysIndirect;
    VkBool32 rayTraversalPrimitiveCulling;
} VkPhysicalDeviceRayTracingPipelineFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **rayTracingPipeline** indicates whether the implementation supports the ray tracing pipeline functionality. See Ray Tracing.
- **rayTracingPipelineShaderGroupHandleCaptureReplay** indicates whether the implementation supports saving and reusing shader group handles, e.g. for trace capture and replay.
- **rayTracingPipelineShaderGroupHandleCaptureReplayMixed** indicates whether the implementation supports reuse of shader group handles being arbitrarily mixed with creation of non-reused shader group handles. If this is `VK_FALSE`, all reused shader group handles must be specified before any non-reused handles may be created.
- **rayTracingPipelineTraceRaysIndirect** indicates whether the implementation supports indirect ray tracing commands, e.g. `vkCmdTraceRaysIndirectKHR`.
- **rayTraversalPrimitiveCulling** indicates whether the implementation supports primitive culling during ray traversal.

If the `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingPipelineFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-
If the `rayTracingPipelineShaderGroupHandleCaptureReplayMixed` is `VK_TRUE`, `rayTracingPipelineShaderGroupHandleCaptureReplay` must also be `VK_TRUE`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPipelineFeaturesKHR-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_FEATURES_KHR`.

The `VkPhysicalDeviceRayQueryFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_query
typedef struct VkPhysicalDeviceRayQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayQuery;
} VkPhysicalDeviceRayQueryFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **rayQuery** indicates whether the implementation supports ray query (OpRayQueryProceedKHR) functionality.

If the `VkPhysicalDeviceRayQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayQueryFeaturesKHR-sType-sType
  
sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_QUERY_FEATURES_KHR`.

The `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_maintenance1
typedef struct VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingMaintenance1;
    VkBool32 rayTracingPipelineTraceRaysIndirect2;
} VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR;
```
This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rayTracingMaintenance1` indicates that the implementation supports the following:
  - The `CullMaskKHR` SPIR-V builtin using the `SPV_KHR_ray_cull_mask` SPIR-V extension.
  - A new access flag `VK_ACCESS_2_SHADER_BINDING_TABLE_READ_BIT_KHR`.
  - A new pipeline stage flag bit `VK_PIPELINE_STAGE_2_ACCELERATION_STRUCTURE.Copy_BIT_KHR`.
- `rayTracingPipelineTraceRaysIndirect2` indicates whether the implementation supports the extended indirect ray tracing command `vkCmdTraceRaysIndirect2KHR`.

If the `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceRayTracingMaintenance1FeaturesKHR-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_MAINTENANCE_1_FEATURES_KHR`.

The `VkPhysicalDeviceVideoMaintenance1FeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_video_maintenance1
typedef struct VkPhysicalDeviceVideoMaintenance1FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 videoMaintenance1;
} VkPhysicalDeviceVideoMaintenance1FeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `videoMaintenance1` indicates that the implementation supports the following:
  - The new buffer creation flag `VK_BUFFER_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`.
  - The new image creation flag `VK_IMAGE_CREATE_VIDEO_PROFILE_INDEPENDENT_BIT_KHR`.

3836
The new video session creation flag `VK_VIDEO_SESSION_CREATE_INLINE_QUERIES_BIT_KHR`.

If the `VkPhysicalDeviceVideoMaintenance1FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVideoMaintenance1FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVideoMaintenance1FeaturesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VIDEO_MAINTENANCE_1_FEATURES_KHR`

The `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state
typedef struct VkPhysicalDeviceExtendedDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState;
} VkPhysicalDeviceExtendedDynamicStateFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedDynamicState` indicates that the implementation supports the following dynamic states:
  
  - `VK_DYNAMIC_STATE_CULL_MODE`
  - `VK_DYNAMIC_STATE_FRONT_FACE`
  - `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY`
  - `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`
  - `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE`
  - `VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_WRITE_ENABLE`
  - `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP`
  - `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE`
  - `VK_DYNAMIC_STATE_STENCIL_OP`

If the `VkPhysicalDeviceExtendedDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to
indicate whether each corresponding feature is supported. VkPhysicalDeviceExtendedDynamicStateFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExtendedDynamicStateFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_FEATURES_EXT

The VkPhysicalDeviceExtendedDynamicState2FeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state2
typedef struct VkPhysicalDeviceExtendedDynamicState2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedDynamicState2;
    VkBool32 extendedDynamicState2LogicOp;
    VkBool32 extendedDynamicState2PatchControlPoints;
} VkPhysicalDeviceExtendedDynamicState2FeaturesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **extendedDynamicState2** indicates that the implementation supports the following dynamic states:
  - VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE
  - VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE
  - VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE
- **extendedDynamicState2LogicOp** indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_LOGIC_OP_EXT
- **extendedDynamicState2PatchControlPoints** indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT

If the VkPhysicalDeviceExtendedDynamicState2FeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceExtendedDynamicState2FeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceExtendedDynamicState2FeaturesEXT-sType-sType**
  
  *sType* must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_2_FEATURES_EXT**

The **VkPhysicalDeviceExtendedDynamicState3FeaturesEXT** structure is defined as:

```c
typedef struct VkPhysicalDeviceExtendedDynamicState3FeaturesEXT {
    VkStructureType   sType;
    void*              pNext;
    VkBool32           extendedDynamicState3TessellationDomainOrigin;
    VkBool32           extendedDynamicState3DepthClampEnable;
    VkBool32           extendedDynamicState3PolygonMode;
    VkBool32           extendedDynamicState3RasterizationSamples;
    VkBool32           extendedDynamicState3SampleMask;
    VkBool32           extendedDynamicState3AlphaToCoverageEnable;
    VkBool32           extendedDynamicState3AlphaToOneEnable;
    VkBool32           extendedDynamicState3LogicOpEnable;
    VkBool32           extendedDynamicState3ColorBlendEnable;
    VkBool32           extendedDynamicState3ColorBlendEquation;
    VkBool32           extendedDynamicState3ColorWriteMask;
    VkBool32           extendedDynamicState3RasterizationStream;
    VkBool32           extendedDynamicState3ConservativeRasterizationMode;
    VkBool32           extendedDynamicState3ExtraPrimitiveOverestimationSize;
    VkBool32           extendedDynamicState3DepthClipEnable;
    VkBool32           extendedDynamicState3SampleLocationsEnable;
    VkBool32           extendedDynamicState3ColorBlendAdvanced;
    VkBool32           extendedDynamicState3ProvokingVertexMode;
    VkBool32           extendedDynamicState3LineRasterizationMode;
    VkBool32           extendedDynamicState3LineStippleEnable;
    VkBool32           extendedDynamicState3DepthClipNegativeOneToOne;
    VkBool32           extendedDynamicState3ViewportWScalingEnable;
    VkBool32           extendedDynamicState3ViewportSwizzle;
    VkBool32           extendedDynamicState3CoverageToColorEnable;
    VkBool32           extendedDynamicState3CoverageToColorLocation;
    VkBool32           extendedDynamicState3CoverageModulationMode;
    VkBool32           extendedDynamicState3CoverageModulationTableEnable;
    VkBool32           extendedDynamicState3CoverageModulationTable;
    VkBool32           extendedDynamicState3CoverageReductionMode;
    VkBool32           extendedDynamicState3RepresentativeFragmentTestEnable;
    VkBool32           extendedDynamicState3ShadingRateImageEnable;
} VkPhysicalDeviceExtendedDynamicState3FeaturesEXT;
```

This structure describes the following features:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• extendedDynamicState3TessellationDomainOrigin indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_TESSELLATION_DOMAIN_ORIGIN_EXT
• extendedDynamicState3DepthClampEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_DEPTH_CLAMP_ENABLE_EXT
• extendedDynamicState3PolygonMode indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_POLYGON_MODE_EXT
• extendedDynamicState3RasterizationSamples indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_RASTERIZATION_SAMPLES_EXT
• extendedDynamicState3SampleMask indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_SAMPLE_MASK_EXT
• extendedDynamicState3AlphaToCoverageEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_ALPHA_TO_COVERAGE_ENABLE_EXT
• extendedDynamicState3AlphaToOneEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_ALPHA_TO_ONE_ENABLE_EXT
• extendedDynamicState3LogicOpEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_LOGIC_OP_ENABLE_EXT
• extendedDynamicState3ColorBlendEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COLOR_BLEND_ENABLE_EXT
• extendedDynamicState3ColorBlendEquation indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COLOR_BLEND_EQUATION_EXT
• extendedDynamicState3ColorWriteMask indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COLOR_WRITE_MASK_EXT
• extendedDynamicState3RasterizationStream indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_RASTERIZATION_STREAM_EXT
• extendedDynamicState3ConservativeRasterizationMode indicates that the implementation supports the following dynamic state:
• VK_DYNAMIC_STATE_CONSERVATIVE_RASTERIZATION_MODE_EXT

• extendedDynamicState3ExtraPrimitiveOverestimationSize indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_EXTRA_PRIMITIVE_OVERESTIMATION_SIZE_EXT

• extendedDynamicState3DepthClipEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_DEPTH_CLIP_ENABLE_EXT

• extendedDynamicState3SampleLocationsEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_ENABLE_EXT

• extendedDynamicState3ColorBlendAdvanced indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COLOR_BLEND_ADVANCED_EXT

• extendedDynamicState3ProvokingVertexMode indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_PROVOKING_VERTEX_MODE_EXT

• extendedDynamicState3LineRasterizationMode indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_LINE_RASTERIZATION_MODE_EXT

• extendedDynamicState3LineStippleEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_LINE_STIPPLE_ENABLE_EXT

• extendedDynamicState3DepthClipNegativeOneToOne indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_DEPTH_CLIP_NEGATIVE_ONE_TO_ONE_EXT

• extendedDynamicState3ViewportWScalingEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_ENABLE_NV

• extendedDynamicState3ViewportSwizzle indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_VIEWPORT_SWIZZLE_NV

• extendedDynamicState3CoverageToColorEnable indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_ENABLE_NV

• extendedDynamicState3CoverageToColorLocation indicates that the implementation supports the following dynamic state:
  ◦ VK_DYNAMIC_STATE_COVERAGE_TO_COLOR_LOCATION_NV

• extendedDynamicState3CoverageModulationMode indicates that the implementation supports the
The following dynamic state:
  - VK_DYNAMIC_STATE_COVERAGE_MODULATION_MODE_NV

• extendedDynamicState3CoverageModulationTableEnable indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_ENABLE_NV

• extendedDynamicState3CoverageModulationTable indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_COVERAGE_MODULATION_TABLE_NV

• extendedDynamicState3CoverageReductionMode indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_COVERAGE_REDUCTION_MODE_NV

• extendedDynamicState3RepresentativeFragmentTestEnable indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_REPRESENTATIVE_FRAGMENT_TEST_ENABLE_NV

• extendedDynamicState3ShadingRateImageEnable indicates that the implementation supports the following dynamic state:
  - VK_DYNAMIC_STATE_SHADING_RATE_IMAGE_ENABLE_NV

If the VkPhysicalDeviceExtendedDynamicState3FeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceExtendedDynamicState3FeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceExtendedDynamicState3FeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_FEATURES_EXT

The VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV structure is defined as:

```c
// Provided by VK_NV_device_generated_commands
typedef struct VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV {
  VkStructureType sType;
  void* pNext;
  VkBool32 deviceGeneratedCommands;
} VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.
deviceGeneratedCommands indicates whether the implementation supports functionality to generate commands on the device. See Device-Generated Commands.

If the VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_FEATURES_NV

The VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV structure is defined as:

```c
typedef struct VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceGeneratedCompute;
    VkBool32 deviceGeneratedComputePipelines;
    VkBool32 deviceGeneratedComputeCaptureReplay;
} VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV;
```

This structure describes the following features:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceGeneratedCompute indicates whether the implementation supports functionality to generate dispatch commands and push constants for the compute pipeline on the device. See Device-Generated Commands.
- deviceGeneratedComputePipelines indicates whether the implementation supports functionality to generate commands to bind compute pipelines on the device. See Device-Generated Commands.
- deviceGeneratedComputeCaptureReplay indicates whether the implementation supports functionality to capture compute pipeline address and reuse later for replay in Device-Generated Commands.

If the VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsComputeFeaturesNV-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_COMPUTE_FEATURES_NV

The VkPhysicalDeviceDiagnosticsConfigFeaturesNV structure is defined as:

```c
// Provided by VK_NV_device_diagnostics_config
typedef struct VkPhysicalDeviceDiagnosticsConfigFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 diagnosticsConfig;
} VkPhysicalDeviceDiagnosticsConfigFeaturesNV;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **diagnosticsConfig** indicates whether the implementation supports the ability to configure diagnostic tools.

If the VkPhysicalDeviceDiagnosticsConfigFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDiagnosticsConfigFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDiagnosticsConfigFeaturesNV-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DIAGNOSTICS_CONFIG_FEATURES_NV

The VkPhysicalDeviceDeviceMemoryReportFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_device_memory_report
typedef struct VkPhysicalDeviceDeviceMemoryReportFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 deviceMemoryReport;
} VkPhysicalDeviceDeviceMemoryReportFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• deviceMemoryReport indicates whether the implementation supports the ability to register device memory report callbacks.

If the VkPhysicalDeviceDeviceMemoryReportFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDeviceMemoryReportFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDeviceMemoryReportFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_MEMORY_REPORT_FEATURES_EXT

The VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_global_priority
typedef struct VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR {
  VkStructureType sType;
  void* pNext;
  VkBool32 globalPriorityQuery;
} VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_global_priority_query
typedef VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR
VkPhysicalDeviceGlobalPriorityQueryFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- globalPriorityQuery indicates whether the implementation supports the ability to query global queue priorities.

If the VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceGlobalPriorityQueryFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
The `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePipelineCreationCacheControlFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineCreationCacheControl;
} VkPhysicalDevicePipelineCreationCacheControlFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_pipeline_creation_cache_control
typedef VkPhysicalDevicePipelineCreationCacheControlFeatures
    VkPhysicalDevicePipelineCreationCacheControlFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **pipelineCreationCacheControl** indicates that the implementation supports:
  - The following can be used in `VkPipelineCreateInfo::flags`:
    - `VK_PIPELINE_CREATE_FAIL_ON_PIPELINE_COMPILE_REQUIRED_BIT`
    - `VK_PIPELINE_CREATE_EARLY_RETURN_ON_FAILURE_BIT`
  - The following can be used in `VkPipelineCacheCreateInfo::flags`:
    - `VK_PIPELINE_CACHE_CREATE_EXTERNALLY_SYNCHRONIZED_BIT`

If the `VkPhysicalDevicePipelineCreationCacheControlFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineCreationCacheControlFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
The `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderZeroInitializeWorkgroupMemory;
} VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_zero_initialize_workgroup_memory
typedef VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures
    VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderZeroInitializeWorkgroupMemory` specifies whether the implementation supports initializing a variable in Workgroup storage class.

If the `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceZeroInitializeWorkgroupMemoryFeatures-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ZERO_INITIALIZE_WORKGROUP_MEMORY_FEATURES`

The `VkPhysicalDevicePrivateDataFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDevicePrivateDataFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 privateData;
} VkPhysicalDevicePrivateDataFeatures;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **privateData** indicates whether the implementation supports private data. See Private Data.

If the `VkPhysicalDevicePrivateDataFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrivateDataFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePrivateDataFeatures-sType-sType

The `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_shader_subgroup_uniform_control_flow
typedef struct VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupUniformControlFlow;
} VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderSubgroupUniformControlFlow** specifies whether the implementation supports the shader execution mode `SubgroupUniformControlFlowKHR`

If the `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderSubgroupUniformControlFlowFeaturesKHR-sType-sType
The `VkPhysicalDeviceRobustness2FeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_robustness2
typedef struct VkPhysicalDeviceRobustness2FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustBufferAccess2;
    VkBool32 robustImageAccess2;
    VkBool32 nullDescriptor;
} VkPhysicalDeviceRobustness2FeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **robustBufferAccess2** indicates whether buffer accesses are tightly bounds-checked against the range of the descriptor. Uniform buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustUniformBufferAccessSizeAlignment`. Storage buffers **must** be bounds-checked to the range of the descriptor, where the range is rounded up to a multiple of `robustStorageBufferAccessSizeAlignment`. Out of bounds buffer loads will return zero values, and image load, sample, and atomic operations from texel buffers will have (0,0,1) values inserted for missing G, B, or A components based on the format.

- **robustImageAccess2** indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Out of bounds image load, sample, and atomic operations from images will return zero values, with (0,0,1) values inserted for missing G, B, or A components based on the format.

- **nullDescriptor** indicates whether descriptors **can** be written with a `VK_NULL_HANDLE` resource or view, which are considered valid to access and act as if the descriptor were bound to nothing.

If the `VkPhysicalDeviceRobustness2FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRobustness2FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage**

- VUID-VkPhysicalDeviceRobustness2FeaturesEXT-robustBufferAccess2-04000
  If robustBufferAccess2 is enabled then robustBufferAccess **must** also be enabled
The `VkPhysicalDeviceImageRobustnessFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceImageRobustnessFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 robustImageAccess;
} VkPhysicalDeviceImageRobustnessFeatures;
```

or the equivalent

```c
// Provided by VK_EXT_image_robustness
typedef VkPhysicalDeviceImageRobustnessFeatures
    VkPhysicalDeviceImageRobustnessFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `robustImageAccess` indicates whether image accesses are tightly bounds-checked against the dimensions of the image view. Invalid texels resulting from out of bounds image loads will be replaced as described in Texel Replacement, with either (0,0,1) or (0,0,0) values inserted for missing G, B, or A components based on the format.

If the `VkPhysicalDeviceImageRobustnessFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageRobustnessFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is defined as:
## VkPhysicalDeviceShaderTerminateInvocationFeatures

```
typedef struct VkPhysicalDeviceShaderTerminateInvocationFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderTerminateInvocation;
} VkPhysicalDeviceShaderTerminateInvocationFeatures;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderTerminateInvocation** specifies whether the implementation supports SPIR-V modules that use the `SPV_KHR_terminate_invocation` extension.

If the `VkPhysicalDeviceShaderTerminateInvocationFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderTerminateInvocationFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTerminateInvocationFeatures-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TERMINATE_INVOCATION_FEATURES`.

## VkPhysicalDeviceCustomBorderColorFeaturesEXT

```
typedef struct VkPhysicalDeviceCustomBorderColorFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 customBorderColors;
    VkBool32 customBorderColorWithoutFormat;
} VkPhysicalDeviceCustomBorderColorFeaturesEXT;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **customBorderColorValues** indicates that the implementation supports providing a **borderColor** value with one of the following values at sampler creation time:
  
  ◦ **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK**
  ◦ **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK**

• **customBorderColorWithoutFormat** indicates that explicit formats are not required for custom border colors and the value of the **format** member of the **VkSamplerBorderColorComponentMappingCreateInfoEXT** structure **may** be **VK_FORMAT_UNDEFINED**. If this feature bit is not set, applications **must** provide the **VkFormat** of the image view(s) being sampled by this sampler in the **format** member of the **VkSamplerBorderColorComponentMappingCreateInfoEXT** structure.

If the **VkPhysicalDeviceBorderColorFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceBorderColorFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

## Valid Usage (Implicit)

• VUID-VkPhysicalDeviceBorderColorFeaturesEXT-sType-sType  
  
  **sType** **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_FEATURES_EXT**

The **VkPhysicalDeviceBorderColorSwizzleFeaturesEXT** structure is defined as:

```c
typedef struct VkPhysicalDeviceBorderColorSwizzleFeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          borderColorSwizzle;
    VkBool32          borderColorSwizzleFromImage;
} VkPhysicalDeviceBorderColorSwizzleFeaturesEXT;
```

This structure describes the following features:

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **borderColorSwizzle** indicates that defined values are returned by sampled image operations when used with a sampler that uses a **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK**, **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK**, **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT**, or **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** **borderColor** and an image view that uses a non-identity component mapping, when either **borderColorSwizzleFromImage** is enabled or the **VkSamplerBorderColorComponentMappingCreateInfoEXT** is specified.

• **borderColorSwizzleFromImage** indicates that the implementation will return the correct border
color values from sampled image operations under the conditions expressed above, without the application having to specify the border color component mapping when creating the sampler object. If this feature bit is not set, applications can chain a `VkSamplerBorderColorComponentMappingCreateInfoEXT` structure when creating samplers for use with image views that do not have an identity swizzle and, when those samplers are combined with image views using the same component mapping, sampled image operations that use opaque black or custom border colors will return the correct border color values.

If the `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceBorderColorSwizzleFeaturesEXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_BORDER_COLOR_SWIZZLE_FEATURES_EXT`.

The `VkPhysicalDevicePortabilitySubsetFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_portability_subset
typedef struct VkPhysicalDevicePortabilitySubsetFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 constantAlphaColorBlendFactors;
    VkBool32 events;
    VkBool32 imageViewFormatReinterpretation;
    VkBool32 imageViewFormatSwizzle;
    VkBool32 imageView2DOn3DImage;
    VkBool32 multisampleArrayImage;
    VkBool32 mutableComparisonSamplers;
    VkBool32 pointPolygons;
    VkBool32 samplerMipLodBias;
    VkBool32 separateStencilMaskRef;
    VkBool32 shaderSampleRateInterpolationFunctions;
    VkBool32 tessellationIsolines;
    VkBool32 tessellationPointMode;
    VkBool32 triangleFans;
    VkBool32 vertexAttributeAccessBeyondStride;
} VkPhysicalDevicePortabilitySubsetFeaturesKHR;
```

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **constantAlphaColorBlendFactors** indicates whether this implementation supports constant `alpha`
Blend Factors used as source or destination color Blending.

- **events** indicates whether this implementation supports synchronization using Events.

- **imageViewFormatReinterpretation** indicates whether this implementation supports a VkImageView being created with a texel format containing a different number of components, or a different number of bits in each component, than the texel format of the underlying VkImage.

- **imageViewFormatSwizzle** indicates whether this implementation supports remapping format components using VkImageViewCreateInfo::components.

- **imageView2DOn3DImage** indicates whether this implementation supports aVkImage being created with the VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT flag set, permitting a 2D or 2D array image view to be created on a 3D VkImage.

- **multisampleArrayImage** indicates whether this implementation supports a VkImage being created as a 2D array with multiple samples per texel.

- **mutableComparisonSamplers** indicates whether this implementation allows descriptors with comparison samplers to be updated.

- **pointPolygons** indicates whether this implementation supports Rasterization using a point Polygon Mode.

- **samplerMipLodBias** indicates whether this implementation supports setting a mipmap LOD bias value when creating a sampler.

- **separateStencilMaskRef** indicates whether this implementation supports separate front and back Stencil Test reference values.

- **shaderSampleRateInterpolationFunctions** indicates whether this implementation supports fragment shaders which use the InterpolationFunction capability and the extended instructions InterpolateAtCentroid, InterpolateAtOffset, and InterpolateAtSample from the GLSL.std.450 extended instruction set. This member is only meaningful if the sampleRateShading feature is supported.

- **tessellationIsolines** indicates whether this implementation supports isoline output from the Tessellation stage of a graphics pipeline. This member is only meaningful if tessellationShader are supported.

- **tessellationPointMode** indicates whether this implementation supports point output from the Tessellation stage of a graphics pipeline. This member is only meaningful if tessellationShader are supported.

- **triangleFans** indicates whether this implementation supports Triangle Fans primitive topology.

- **vertexAttributeAccessBeyondStride** indicates whether this implementation supports accessing a vertex input attribute beyond the stride of the corresponding vertex input binding.

If the VkPhysicalDevicePortabilitySubsetFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDevicePortabilitySubsetFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.
The `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 performanceCounterQueryPools;
    VkBool32 performanceCounterMultipleQueryPools;
} VkPhysicalDevicePerformanceQueryFeaturesKHR;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `performanceCounterQueryPools` indicates whether the implementation supports performance counter query pools.
- `performanceCounterMultipleQueryPools` indicates whether the implementation supports using multiple performance query pools in a primary command buffer and secondary command buffers executed within it.

If the `VkPhysicalDevicePerformanceQueryFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePerformanceQueryFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDevice4444FormatsFeaturesEXT` structure is defined as:
// Provided by VK_EXT_4444_formats

typedef struct VkPhysicalDevice4444FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 formatA4R4G4B4;
    VkBool32 formatA4B4G4R4;
} VkPhysicalDevice4444FormatsFeaturesEXT;

This structure describes the following features:

• **sType** is a [VkStructureType](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkStructureType.html) value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **formatA4R4G4B4** indicates that the implementation **must** support using a [VkFormat](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkFormat.html) of **VK_FORMAT_A4R4G4B4_UNORM_PACK16_EXT** with at least the following [VkFormatFeatureFlagBits](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkFormatFeatureFlagBits.html):

  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**
  - **VK_FORMAT_FEATURE_BLIT_SRC_BIT**
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

• **formatA4B4G4R4** indicates that the implementation **must** support using a [VkFormat](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkFormat.html) of **VK_FORMAT_A4B4G4R4_UNORM_PACK16_EXT** with at least the following [VkFormatFeatureFlagBits](https://www.khronos.org/registry/vulkan/specs/1.2-extensions/man/html/VkFormatFeatureFlagBits.html):

  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**
  - **VK_FORMAT_FEATURE_BLIT_SRC_BIT**
  - **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

If the **VkPhysicalDevice4444FormatsFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDevice4444FormatsFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevice4444FormatsFeaturesEXT-sType-sType**
  
  **sType** **must** be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_4444_FORMATS_FEATURES_EXT**

**Note**

Although the formats defined by the [VK_EXT_4444_formats](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/VK_EXT_4444_formats.html) extension were promoted to Vulkan 1.3 as optional formats, the **VkPhysicalDevice4444FormatsFeaturesEXT** structure was not promoted to Vulkan 1.3.

The **VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT** structure is defined as:
This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorType` indicates that the implementation must support using the `VkDescriptorType` of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` with at least the following descriptor types, where any combination of the types must be supported:
  - `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`
  - `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER`
  - `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`
  - `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`

- Additionally, `mutableDescriptorType` indicates that:
  - Non-uniform descriptor indexing must be supported if all descriptor types in a `VkMutableDescriptorTypeListEXT` for `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` have the corresponding non-uniform indexing features enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.
  - `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` with descriptorType of `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` relaxes the list of required descriptor types to the descriptor types which have the corresponding update-after-bind feature enabled in `VkPhysicalDeviceDescriptorIndexingFeatures`.
  - Dynamically uniform descriptor indexing must be supported if all descriptor types in a `VkMutableDescriptorTypeListEXT` for `VK_DESCRIPTOR_TYPE_MUTABLE_EXT` have the corresponding dynamic indexing features enabled.
  - `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` must be supported.
  - `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` must be supported.
If the `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MUTABLE_DESCRIPTOR_TYPE_FEATURES_EXT`

The `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
typedef struct VkPhysicalDeviceDepthClipControlFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClipControl;
} VkPhysicalDeviceDepthClipControlFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `depthClipControl` indicates that the implementation supports setting `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` to `VK_TRUE`.

If the `VkPhysicalDeviceDepthClipControlFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDepthClipControlFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDepthClipControlFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLIP_CONTROL_FEATURES_EXT`

The `VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR` structure is defined as:
typedef struct VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 workgroupMemoryExplicitLayout;
    VkBool32 workgroupMemoryExplicitLayoutScalarBlockLayout;
    VkBool32 workgroupMemoryExplicitLayout8BitAccess;
    VkBool32 workgroupMemoryExplicitLayout16BitAccess;
} VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR;

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **workgroupMemoryExplicitLayout** indicates whether the implementation supports the SPIR-V WorkgroupMemoryExplicitLayoutKHR capability.
- **workgroupMemoryExplicitLayoutScalarBlockLayout** indicates whether the implementation supports scalar alignment for laying out Workgroup Blocks.
- **workgroupMemoryExplicitLayout8BitAccess** indicates whether objects in the Workgroup storage class with the Block decoration can have 8-bit integer members. If this feature is not enabled, 8-bit integer members must not be used in such objects. This also indicates whether shader modules can declare the WorkgroupMemoryExplicitLayout8BitAccessKHR capability.
- **workgroupMemoryExplicitLayout16BitAccess** indicates whether objects in the Workgroup storage class with the Block decoration can have 16-bit integer and 16-bit floating-point members. If this feature is not enabled, 16-bit integer or 16-bit floating-point members must not be used in such objects. This also indicates whether shader modules can declare the WorkgroupMemoryExplicitLayout16BitAccessKHR capability.

If the VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceWorkgroupMemoryExplicitLayoutFeaturesKHR-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_WORKGROUP_MEMORY_EXPLICIT_LAYOUT_FEATURES_KHR

The VkPhysicalDeviceSynchronization2Features structure is defined as:
typedef struct VkPhysicalDeviceSynchronization2Features {
    VkStructureType sType;
    void* pNext;
    VkBool32 synchronization2;
} VkPhysicalDeviceSynchronization2Features;

or the equivalent

// Provided by VK_KHR_synchronization2
typedef VkPhysicalDeviceSynchronization2Features VkPhysicalDeviceSynchronization2FeaturesKHR;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **synchronization2** indicates whether the implementation supports the new set of synchronization commands introduced in VK_KHR_synchronization2.

If the VkPhysicalDeviceSynchronization2Features structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceSynchronization2Features can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceSynchronization2Features-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SYNCHRONIZATION_2_FEATURES

The VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT structure is defined as:

// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 vertexInputDynamicState;
} VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- `vertexInputDynamicState` indicates that the implementation supports the following dynamic states:
  - `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT`

If the `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceVertexInputDynamicStateFeaturesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_INPUT_DYNAMIC_STATE_FEATURES_EXT`.

The `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT` structure is defined as:

```c
typedef struct VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 primitivesGeneratedQuery;
    VkBool32 primitivesGeneratedQueryWithRasterizerDiscard;
    VkBool32 primitivesGeneratedQueryWithNonZeroStreams;
} VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `primitivesGeneratedQuery` indicates whether the implementation supports the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query type.
- `primitivesGeneratedQueryWithRasterizerDiscard` indicates whether the implementation supports this query when rasterization discard is enabled.
- `primitivesGeneratedQueryWithNonZeroStreams` indicates whether the implementation supports this query with a non-zero index in `vkCmdBeginQueryIndexedEXT`.

If the `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

• VUID-VkPhysicalDevicePrimitivesGeneratedQueryFeaturesEXT-sType-sType

The VkPhysicalDeviceFragmentShadingRateFeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineFragmentShadingRate;
    VkBool32 primitiveFragmentShadingRate;
    VkBool32 attachmentFragmentShadingRate;
} VkPhysicalDeviceFragmentShadingRateFeaturesKHR;
```

This structure describes the following features:

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `pipelineFragmentShadingRate` indicates that the implementation supports the pipeline fragment shading rate.
• `primitiveFragmentShadingRate` indicates that the implementation supports the primitive fragment shading rate.
• `attachmentFragmentShadingRate` indicates that the implementation supports the attachment fragment shading rate.

If the `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceFragmentShadingRateFeaturesKHR-sType-sType

The VkPhysicalDeviceLegacyDitheringFeaturesEXT structure is defined as:

3862
typedef struct VkPhysicalDeviceLegacyDitheringFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 legacyDithering;
} VkPhysicalDeviceLegacyDitheringFeaturesEXT;

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `legacyDithering` indicates whether the implementation supports Legacy Dithering.

If the `VkPhysicalDeviceLegacyDitheringFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceLegacyDitheringFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLegacyDitheringFeaturesEXT-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_DITHERING_FEATURES_EXT`

The `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` structure is defined as:

typedef struct VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 fragmentShadingRateEnums;
    VkBool32 supersampleFragmentShadingRates;
    VkBool32 noInvocationFragmentShadingRates;
} VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV;

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentShadingRate Enums` indicates that the implementation supports specifying fragment shading rates using the `VkFragmentShadingRateNV` enumerated type.
- `supersampleFragmentShadingRates` indicates that the implementation supports fragment shading rate enum values indicating more than one invocation per fragment.
- `noInvocationFragmentShadingRates` indicates that the implementation supports a fragment
shading rate enum value indicating that no fragment shaders should be invoked when that shading rate is used.

If the `VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFragmentShadingRate EnumsFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE Enums_FEATURES_NV`

The `VkPhysicalDeviceInheritedViewportScissorFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_inherited_viewport_scissor
typedef struct VkPhysicalDeviceInheritedViewportScissorFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 inheritedViewportScissor2D;
} VkPhysicalDeviceInheritedViewportScissorFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `inheritedViewportScissor2D` indicates whether secondary command buffers can inherit most of the dynamic state affected by `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT`, `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT`, `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT`, `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_ENABLE_EXT`, `VK_DYNAMIC_STATE_DISCARD_RECTANGLE_MODE_EXT`, `VK_DYNAMIC_STATE_VIEWPORT` or `VK_DYNAMIC_STATE_SCISSOR`, from a primary command buffer.

If the `VkPhysicalDeviceInheritedViewportScissorFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceInheritedViewportScissorFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceInheritedViewportScissorFeaturesNV-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_Inherited_VIEWPORT_SCISSOR_FEATURES_NV`
The `VkPhysicalDevicePipelineProtectedAccessFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_protected_access
typedef struct VkPhysicalDevicePipelineProtectedAccessFeaturesEXT {
    VkStructureType     sType;
    void*                pNext;
    VkBool32             pipelineProtectedAccess;
} VkPhysicalDevicePipelineProtectedAccessFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pipelineProtectedAccess` indicates whether the implementation supports specifying protected access on individual pipelines.

If the `VkPhysicalDevicePipelineProtectedAccessFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineProtectedAccessFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDevicePipelineProtectedAccessFeaturesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_PROTECTED_ACCESS_FEATURES_EXT`.

The `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_ycbcr_2plane_444_formats
typedef struct VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT {
    VkStructureType     sType;
    void*                pNext;
    VkBool32             ycbcr2plane444Formats;
} VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `ycbcr2plane444Formats` indicates that the implementation supports the following 2-plane 444 Y’C_B_C_R formats:
  - `VK_FORMAT_G8_B8R8_2PLANE_444_UNORM`
VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16
VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16
VK_FORMAT_G16_B16R16_2PLANE_444_UNORM

If the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

• [VUID-VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT-sType-sType] **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_2_PLANE_444_FORMATS_FEATURES_EXT`

Note

Although the formats defined by the `VK_EXT_ycbcr_2plane_444_formats` were promoted to Vulkan 1.3 as optional formats, the `VkPhysicalDeviceYcbcr2Plane444FormatsFeaturesEXT` structure was not promoted to Vulkan 1.3.

The `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_color_write_enable
typedef struct VkPhysicalDeviceColorWriteEnableFeaturesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            colorWriteEnable;
} VkPhysicalDeviceColorWriteEnableFeaturesEXT;
```

This structure describes the following feature:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **colorWriteEnable** indicates that the implementation supports the dynamic state `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT`.

If the `VkPhysicalDeviceColorWriteEnableFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceColorWriteEnableFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceColorWriteEnableFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COLOR_WRITE_ENABLE_FEATURES_EXT

The `VkPhysicalDevicePipelinePropertiesFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_properties
typedef struct VkPhysicalDevicePipelinePropertiesFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelinePropertiesIdentifier;
} VkPhysicalDevicePipelinePropertiesFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pipelinePropertiesIdentifier` indicates that the implementation supports querying a unique pipeline identifier.

If the `VkPhysicalDevicePipelinePropertiesFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelinePropertiesFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelinePropertiesFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_PROPERTIES_FEATURES_EXT

The `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPhysicalDeviceProvokingVertexFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 provokingVertexLast;
    VkBool32 transformFeedbackPreservesProvokingVertex;
} VkPhysicalDeviceProvokingVertexFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **provokingVertexLast** indicates whether the implementation supports the `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT` provoking vertex mode for flat shading.

• **transformFeedbackPreservesProvokingVertex** indicates that the order of vertices within each primitive written by transform feedback will preserve the provoking vertex. This does not apply to triangle fan primitives when `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`. `transformFeedbackPreservesProvokingVertex` must be `VK_FALSE` when the `VK_EXT_transform_feedback` extension is not supported.

If the `VkPhysicalDeviceProvokingVertexFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceProvokingVertexFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

When `VkPhysicalDeviceProvokingVertexFeaturesEXT` is in the `pNext` chain of `VkDeviceCreateInfo` but the `transformFeedback` feature is not enabled, the value of `transformFeedbackPreservesProvokingVertex` is ignored.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceProvokingVertexFeaturesEXT-sType-sType**
  - `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROVOKING_VERTEX_FEATURES_EXT`

The `VkPhysicalDeviceDescriptorBufferFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkPhysicalDeviceDescriptorBufferFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 descriptorBuffer;
    VkBool32 descriptorBufferCaptureReplay;
    VkBool32 descriptorBufferImageLayoutIgnored;
    VkBool32 descriptorBufferPushDescriptors;
} VkPhysicalDeviceDescriptorBufferFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.

- **pNext** is NULL or a pointer to a structure extending this structure.

- **descriptorBuffer** indicates that the implementation supports putting shader-accessible descriptors directly in memory.

- **descriptorBufferCaptureReplay** indicates that the implementation supports capture and replay when using descriptor buffers. If this is `VK_TRUE`, all resources created with `VK_BUFFER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT`,

3868
VK_IMAGE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT,
VK_IMAGE_VIEW_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT,
VK_SAMPLER_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT,
VK_ACCELERATION_STRUCTURE_CREATE_DESCRIPTOR_BUFFER_CAPTURE_REPLAY_BIT_EXT or
must be created before resources of the same types without those flags.

- descriptorBufferImageLayoutIgnored indicates that the implementation will ignore imageLayout in
  VkDescriptorImageInfo when calling vkGetDescriptorEXT.

- descriptorBufferPushDescriptors indicates that the implementation supports using push
descriptors with descriptor buffers.

If the VkPhysicalDeviceDescriptorBufferFeaturesEXT structure is included in the pNext chain of the
VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceDescriptorBufferFeaturesEXT can also be used in the pNext chain of
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorBufferFeaturesEXT-sType-sType

  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_BUFFER_FEATURES_EXT

The VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_pageable_device_local_memory
typedef struct VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pageableDeviceLocalMemory;
} VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pageableDeviceLocalMemory indicates that the implementation supports pageable device-local
  memory and may transparently move device-local memory allocations to host-local memory to
  better share device-local memory with other applications.

If the VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT structure is included in the pNext
chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is
filled in to indicate whether each corresponding feature is supported.
VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT can also be used in the pNext chain of
VkDeviceCreateInfo to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDevicePageableDeviceLocalMemoryFeaturesEXT-sType-sType

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiDrawFeaturesEXT-sType-sType

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingMotionBlurFeaturesNV-sType-sType

The `VkPhysicalDeviceMultiDrawFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkPhysicalDeviceMultiDrawFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiDraw;
} VkPhysicalDeviceMultiDrawFeaturesEXT;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `multiDraw` indicates that the implementation supports `vkCmdDrawMultiEXT` and `vkCmdDrawMultiIndexedEXT`.

If the `VkPhysicalDeviceMultiDrawFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultiDrawFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

The `VkPhysicalDeviceRayTracingMotionBlurFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing.motion blur
typedef struct VkPhysicalDeviceRayTracingMotionBlurFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingMotionBlur;
    VkBool32 rayTracingMotionBlurPipelineTraceRaysIndirect;
} VkPhysicalDeviceRayTracingMotionBlurFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **rayTracingMotionBlur** indicates whether the implementation supports the motion blur feature.
• **rayTracingMotionBlurPipelineTraceRaysIndirect** indicates whether the implementation supports indirect ray tracing commands with the motion blur feature enabled.

If the **VkPhysicalDeviceRayTracingMotionBlurFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceRayTracingMotionBlurFeaturesNV** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingMotionBlurFeaturesNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICERAY_TRACING_MOTION_BLUR_FEATURES_NV**

The **VkPhysicalDeviceOpacityMicromapFeaturesEXT** structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkPhysicalDeviceOpacityMicromapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 micromap;
    VkBool32 micromapCaptureReplay;
    VkBool32 micromapHostCommands;
} VkPhysicalDeviceOpacityMicromapFeaturesEXT;
```

This structure describes the following feature:

• **sType** is a **VkStructureType** value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **micromap** indicates whether the implementation supports the micromap array feature.
• **micromapCaptureReplay** indicates whether the implementation supports capture and replay of addresses for micromap arrays.
• **micromapHostCommands** indicates whether the implementation supports host side micromap array commands.

If the **VkPhysicalDeviceOpacityMicromapFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceOpacityMicromapFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpacityMicromapFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPACITY_MICROMAP_FEATURES_EXT

The `VkPhysicalDeviceDisplacementMicromapFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
typedef struct VkPhysicalDeviceDisplacementMicromapFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 displacementMicromap;
} VkPhysicalDeviceDisplacementMicromapFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **displacementMicromap** indicates whether the implementation supports the displacement micromap feature.

If the `VkPhysicalDeviceDisplacementMicromapFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDisplacementMicromapFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDisplacementMicromapFeaturesNV-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISPLACEMENT_MICROMAP_FEATURES_NV

The `VkPhysicalDeviceRayTracingValidationFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing_validation
typedef struct VkPhysicalDeviceRayTracingValidationFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingValidation;
} VkPhysicalDeviceRayTracingValidationFeaturesNV;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.

• **rayTracingValidation** indicates whether the implementation supports the ray tracing validation feature.

If the **VkPhysicalDeviceRayTracingValidationFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceRayTracingValidationFeaturesNV** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRayTracingValidationFeaturesNV-sType-sType**

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_VALIDATION_FEATURES_NV**

---

The **VkPhysicalDeviceSubpassShadingFeaturesHUawei** structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading
typedef struct VkPhysicalDeviceSubpassShadingFeaturesHUawei {
    VkStructureType sType;
    void* pNext;
    VkBool32 subpassShading;
} VkPhysicalDeviceSubpassShadingFeaturesHUawei;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **subpassShading** specifies whether subpass shading is supported.

If the **VkPhysicalDeviceSubpassShadingFeaturesHUawei** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceSubpassShadingFeaturesHUawei** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceSubpassShadingFeaturesHUawei-sType-sType**

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_FEATURES_HUAWEI**

---

The **VkPhysicalDeviceExternalMemoryRDMAFeaturesNV** structure is defined as:

---

3873
typedef struct VkPhysicalDeviceExternalMemoryRDMAFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 externalMemoryRDMA;
} VkPhysicalDeviceExternalMemoryRDMAFeaturesNV;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **externalMemoryRDMA** indicates whether the implementation has support for the *VK_MEMORY_PROPERTY_RDMA_CAPABLE_BIT_NV* memory property and the *VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV* external memory handle type.

If the *VkPhysicalDeviceExternalMemoryRDMAFeaturesNV* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceExternalMemoryRDMAFeaturesNV* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

---

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryRDMAFeaturesNV-sType-sType
  
  **sType** must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_RDMA_FEATURES_NV*

The *VkPhysicalDevicePresentIdFeaturesKHR* structure is defined as:

typedef struct VkPhysicalDevicePresentIdFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentId;
} VkPhysicalDevicePresentIdFeaturesKHR;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **presentId** indicates that the implementation supports specifying present ID values in the *VkPresentIdKHR* extension to the *VkPresentInfoKHR* struct.

If the *VkPhysicalDevicePresentIdFeaturesKHR* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDevicePresentIdFeaturesKHR*
can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePresentIdFeaturesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_ID_FEATURES_KHR`  

The `VkPhysicalDevicePresentWaitFeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_present_wait
typedef struct VkPhysicalDevicePresentWaitFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentWait;
} VkPhysicalDevicePresentWaitFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `presentWait` indicates that the implementation supports `vkWaitForPresentKHR`.

If the `VkPhysicalDevicePresentWaitFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePresentWaitFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePresentWaitFeaturesKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_WAIT_FEATURES_KHR`  

The `VkPhysicalDeviceHostImageCopyFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkPhysicalDeviceHostImageCopyFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 hostImageCopy;
} VkPhysicalDeviceHostImageCopyFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **hostImageCopy** indicates that the implementation supports copying from host memory to images using the **vkCopyMemoryToImageEXT** command, copying from images to host memory using the **vkCopyImageToMemoryEXT** command, and copying between images using the **vkCopyImageToImageEXT** command.

If the **VkPhysicalDeviceHostImageCopyFeaturesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceHostImageCopyFeaturesEXT** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceHostImageCopyFeaturesEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_FEATURES_EXT**

The **VkPhysicalDevicePresentBarrierFeaturesNV** structure is defined as:

```c
// Provided by VK_NV_present_barrier
typedef struct VkPhysicalDevicePresentBarrierFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 presentBarrier;
} VkPhysicalDevicePresentBarrierFeaturesNV;
```

This structure describes the following feature:

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **presentBarrier** indicates that the implementation supports the present barrier feature.

If the **VkPhysicalDevicePresentBarrierFeaturesNV** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDevicePresentBarrierFeaturesNV** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

• VUID-VkPhysicalDevicePresentBarrierFeaturesNV-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PRESENT_BARRIER_FEATURES_NV**

The **VkPhysicalDeviceShaderIntegerDotProductFeatures** structure is defined as:
typedef struct VkPhysicalDeviceShaderIntegerDotProductFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderIntegerDotProduct;
} VkPhysicalDeviceShaderIntegerDotProductFeatures;

or the equivalent

typedef VkPhysicalDeviceShaderIntegerDotProductFeatures VkPhysicalDeviceShaderIntegerDotProductFeaturesKHR;

This structure describes the following feature:

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `shaderIntegerDotProduct` specifies whether shader modules can declare the `DotProductInputAllKHR`, `DotProductInput4x8BitKHR`, `DotProductInput4x8BitPackedKHR` and `DotProductKHR` capabilities.

If the `VkPhysicalDeviceShaderIntegerDotProductFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderIntegerDotProductFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderIntegerDotProductFeatures-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_INTEGER_DOT_PRODUCT_FEATURES`
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maintenance4** indicates that the implementation supports the following:
  - The application may destroy a `VkPipelineLayout` object immediately after using it to create another object.
  - `LocalSizeId` can be used as an alternative to `LocalSize` to specify the local workgroup size with specialization constants.
  - Images created with identical creation parameters will always have the same alignment requirements.
  - The size memory requirement of a buffer or image is never greater than that of another buffer or image created with a greater or equal size.
  - Push constants do not have to be initialized before they are dynamically accessed.
  - The interface matching rules allow a larger output vector to match with a smaller input vector, with additional values being discarded.

If the `VkPhysicalDeviceMaintenance4Features` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMaintenance4Features` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMaintenance4Features-sType-sType`  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_FEATURES`
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **maintenance5** indicates that the implementation supports the following:
  ◦ The ability to expose support for the optional format **VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR**.
  ◦ The ability to expose support for the optional format **VK_FORMAT_A8_UNORM_KHR**.
  ◦ A property to indicate that multisample coverage operations are performed after sample counting in EarlyFragmentTests mode.
  ◦ Creating a **VkBufferView** with a subset of the associated **VkBuffer** usage using **VkBufferUsageFlags2CreateInfoKHR**.
  ◦ A new function **vkCmdBindIndexBuffer2KHR**, allowing a range of memory to be bound as an index buffer.
  ◦ **vkGetDeviceProcAddr** will return **NULL** for function pointers of core functions for versions higher than the version requested by the application.
  ◦ **vkCmdBindVertexBuffer2** supports using **VK_WHOLE_SIZE** in the **pSizes** parameter.
  ◦ If **PointSize** is not written, a default value of **1.0** is used for the size of points.
  ◦ **VkShaderModuleCreateInfo** can be added as a chained structure to pipeline creation via **VkPipelineShaderStageCreateInfo**, rather than having to create a shader module.
  ◦ A function **vkGetRenderingAreaGranularityKHR** to query the optimal render area for a dynamic rendering instance.
  ◦ A property to indicate that depth/stencil texturing operations with **VK_COMPONENT_SWIZZLE_ONE** have defined behavior.
  ◦ **vkGetDeviceImageSubresourceLayoutKHR** allows an application to perform a **vkGetImageSubresourceLayout** query without having to create an image.
  ◦ **VK_REMAINING_ARRAY_LAYERS** as the **layerCount** member of **VkImageSubresourceLayers**.
  ◦ A property to indicate whether **PointSize** controls the final rasterization of polygons if **polygon mode** is **VK_POLYGON_MODE_POINT**.
  ◦ Two properties to indicate the non-strict line rasterization algorithm used.
  ◦ Two new flags words **VkPipelineCreateFlagBits2KHR** and **VkBufferUsageFlagBits2KHR**.
  ◦ Physical-device-level functions **can** now be called with any value in the valid range for a type beyond the defined enumerants, such that applications can avoid checking individual features, extensions, or versions before querying supported properties of a particular enumerant.
  ◦ Copies between images of any type are allowed, with 1D images treated as 2D images with a height of **1**.

If the ** VkPhysicalDeviceMaintenance5FeaturesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceMaintenance5FeaturesKHR** **can** also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.
The `VkPhysicalDeviceMaintenance6FeaturesKHR` structure is defined as:

```c
// Provided by VK_KHR_maintenance6
typedef struct VkPhysicalDeviceMaintenance6FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 maintenance6;
} VkPhysicalDeviceMaintenance6FeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maintenance6` indicates that the implementation supports the following:
  - `VK_NULL_HANDLE` can be used when binding an index buffer
  - `VkBindMemoryStatusKHR` can be included in the `pNext` chain of the `VkBindBufferMemoryInfo` and `VkBindImageMemoryInfo` structures, enabling applications to retrieve `VkResult` values for individual memory binding operations.
  - `VkPhysicalDeviceMaintenance6PropertiesKHR::blockTexelViewCompatibleMultipleLayers` property to indicate that the implementation supports creating image views with `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` where the `layerCount` member of `subresourceRange` is greater than 1.
  - `VkPhysicalDeviceMaintenance6PropertiesKHR::maxCombinedImageSamplerDescriptorCount` property which indicates the maximum descriptor size required for any format that requires a sampler `Y'CbCr` conversion supported by the implementation.
  - A `VkPhysicalDeviceMaintenance6PropertiesKHR::fragmentShadingRateClampCombinerInputs` property which indicates whether the implementation clamps the inputs to fragment shading rate combiner operations.

If the `VkPhysicalDeviceMaintenance6FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMaintenance6FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMaintenance6FeaturesKHR-sType-sType

\[3880\]
The `VkPhysicalDeviceDynamicRenderingFeatures` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceDynamicRenderingFeatures {
    VkStructureType sType;
    void* pNext;
    VkBool32 dynamicRendering;
} VkPhysicalDeviceDynamicRenderingFeatures;
```

or the equivalent

```c
// Provided by VK_KHR_dynamic_rendering
typedef VkPhysicalDeviceDynamicRenderingFeatures
    VkPhysicalDeviceDynamicRenderingFeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dynamicRendering` specifies that the implementation supports dynamic render pass instances using the `vkCmdBeginRendering` command.

If the `VkPhysicalDeviceDynamicRenderingFeatures` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceDynamicRenderingFeatures` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDynamicRenderingFeatures-sType-sType
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_FEATURES`

The `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_rgba10x6_formats
typedef struct VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 formatRgba10x6WithoutYCbCrSampler;
} VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT;
```
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **formatRgba10x6WithoutYCbCrSampler** indicates that `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16` can be used with a `VkImageView` with `subresourceRange.aspectMask` equal to `VK_IMAGE_ASPECT_COLOR_BIT` without a sampler Y′C′B′R conversion enabled.

If the `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT-sType-sType**  
  sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RGBA10X6_FORMATS_FEATURES_EXT`.

The `VkPhysicalDevicePipelineRobustnessFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPhysicalDevicePipelineRobustnessFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineRobustness;
} VkPhysicalDevicePipelineRobustnessFeaturesEXT;
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pipelineRobustness** indicates that robustness can be requested on a per-pipeline-stage granularity.

**Note**

Enabling `pipelineRobustness` may, on some platforms, incur a minor performance cost when `robustBufferAccess` is disabled, even for pipelines which do not make use of any robustness features. If robustness is not needed, `pipelineRobustness` should not be enabled by an application.

If the `VkPhysicalDevicePipelineRobustnessFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineRobustnessFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelineRobustnessFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINEROBUSTNESS_FEATURES_EXT

The VkPhysicalDeviceImageViewMinLodFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_image_view_min_lod
typedef struct VkPhysicalDeviceImageViewMinLodFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 minLod;
} VkPhysicalDeviceImageViewMinLodFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- minLod indicates whether the implementation supports clamping the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations with a given VkImageView by VkImageViewMinLodCreateInfoEXT::minLod.

If the VkPhysicalDeviceImageViewMinLodFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageViewMinLodFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewMinLodFeaturesEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_MIN_LOD_FEATURES_EXT

The VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT structure is defined as:
typedef struct VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT {
    VkStructureType sType;
    void*pNext;
    VkBool32 rasterizationOrderColorAttachmentAccess;
    VkBool32 rasterizationOrderDepthAttachmentAccess;
    VkBool32 rasterizationOrderStencilAttachmentAccess;
} VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT;

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `rasterizationOrderColorAttachmentAccess` indicates that rasterization order access to color and input attachments is supported by the implementation.
- `rasterizationOrderDepthAttachmentAccess` indicates that rasterization order access to the depth aspect of depth/stencil and input attachments is supported by the implementation.
- `rasterizationOrderStencilAttachmentAccess` indicates that rasterization order access to the stencil aspect of depth/stencil and input attachments is supported by the implementation.

If the `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceRasterizationOrderAttachmentAccessFeaturesEXT-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RASTERIZATION_ORDER_ATTACHMENT_ACCESS_FEATURES_EXT`.

The `VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT` structure is defined as:
typedef struct VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 subpassMergeFeedback;
} VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **subpassMergeFeedback** indicates whether the implementation supports feedback of subpass merging.

If the VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubpassMergeFeedbackFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_MERGE_FEEDBACK_FEATURES_EXT

The VkPhysicalDeviceLinearColorAttachmentFeaturesNV structure is defined as:

typedef struct VkPhysicalDeviceLinearColorAttachmentFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 linearColorAttachment;
} VkPhysicalDeviceLinearColorAttachmentFeaturesNV;

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **linearColorAttachment** indicates whether the implementation supports renderable Linear Color Attachment

If the VkPhysicalDeviceLinearColorAttachmentFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceLinearColorAttachmentFeaturesNV can also be used in the pNext chain of
VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLinearColorAttachmentFeaturesNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINEAR_COLOR_ATTACHMENT_FEATURES_NV

The VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_attachment_feedback_loop_layout
typedef struct VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 attachmentFeedbackLoopLayout;
} VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- attachmentFeedbackLoopLayout indicates whether the implementation supports using
  VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT image layout for images created with
  VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceAttachmentFeedbackLoopLayoutFeaturesEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ATTACHMENT_FEEDBACK_LOOP_LAYOUT_FEATURES_EXT

The VkPhysicalDeviceNestedCommandBufferFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_nested_command_buffer
typedef struct VkPhysicalDeviceNestedCommandBufferFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 nestedCommandBuffer;
    VkBool32 nestedCommandBufferRendering;
    VkBool32 nestedCommandBufferSimultaneousUse;
} VkPhysicalDeviceNestedCommandBufferFeaturesEXT;
```

This structure describes the following features:

- nestedCommandBuffer indicates the implementation supports nested command buffers, which
  allows Secondary Command Buffers to execute other Secondary Command Buffers.
• `nestedCommandBufferRendering` indicates that it is valid to call `vkCmdExecuteCommands` inside a Secondary Command Buffer recorded with `VK_COMMAND_BUFFER_USAGE_RENDER_PASS_CONTINUE_BIT`.

• `nestedCommandBufferSimultaneousUse` indicates that the implementation supports nested command buffers with command buffers that are recorded with `VK_COMMAND_BUFFER_USAGE_SIMULTANEOUS_USE_BIT`.

If the `VkPhysicalDeviceNestedCommandBufferFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceNestedCommandBufferFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceNestedCommandBufferFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_FEATURES_EXT`

The `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 graphicsPipelineLibrary;
} VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `graphicsPipelineLibrary` indicates that the implementation supports graphics pipeline libraries.

If the `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGraphicsPipelineLibraryFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_FEATURES_EXT`

The `VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT` structure is defined as:
This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `multisampledRenderToSingleSampled` indicates that the implementation supports multisampled rendering to single-sampled render pass attachments.

If the `VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceMultisampledRenderToSingleSampledFeaturesEXT-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_FEATURES_EXT`

The `VkPhysicalDeviceImage2DViewOf3DFeaturesEXT` structure is defined as:

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `image2DViewOf3D` indicates that the implementation supports using a 2D view of a 3D image in a descriptor of type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` if the image is created using `VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT`.
- `sampler2DViewOf3D` indicates that the implementation supports using a 2D view of a 3D image in
a descriptor of type VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the image is created using VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT.

If the VkPhysicalDeviceImage2DViewOf3DFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImage2DViewOf3DFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceImage2DViewOf3DFeaturesEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_2D_VIEW_OF_3D_FEATURES_EXT

The VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_image_sliced_view_of_3d
typedef struct VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageSlicedViewOf3D;
} VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT;
```

The members of the VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT structure describe the following features:

- imageSlicedViewOf3D indicates that the implementation supports using a sliced view of a 3D image in a descriptor of type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE by using a VkImageViewSlicedCreateInfoEXT structure when creating the view.

If the VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceImageSlicedViewOf3DFeaturesEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_SLICED_VIEW_OF_3D_FEATURES_EXT

The VkPhysicalDeviceImageCompressionControlFeaturesEXT structure is defined as:
This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageCompressionControl** indicates that the implementation supports providing controls for image compression at image creation time.

If the `VkPhysicalDeviceImageCompressionControlFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceImageCompressionControlFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageCompressionControlFeaturesEXT-sType-sType

> sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_COMPRESSION_CONTROL_FEATURES_EXT`

The `VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT` structure is defined as:

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **imageCompressionControlSwapchain** indicates that the implementation supports controlling image controls per swapchain and querying image compression properties per surface.

If the `VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported.
VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceImageCompressionControlSwapchainFeaturesEXT-sType-sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_COMPRESSION_CONTROL_SWAPCHAIN_FEATURES_EXT**

The VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR structure is defined as:

```
// Provided by VK_KHR_ray_tracing_position_fetch
typedef struct VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingPositionFetch;
} VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR;
```

This structure describes the following feature:

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **rayTracingPositionFetch** indicates that the implementation supports fetching the object space vertex positions of a hit triangle.

If the VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceRayTracingPositionFetchFeaturesKHR-sType-sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_POSITION_FETCH_FEATURES_KHR**

The VkPhysicalDeviceShaderFloatControls2FeaturesKHR structure is defined as:
```c
// Provided by VK_KHR_shader_float Controls2
typedef struct VkPhysicalDeviceShaderFloatControls2FeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderFloatControls2;
} VkPhysicalDeviceShaderFloatControls2FeaturesKHR;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderFloatControls2` specifies whether shader modules can declare the `FloatControls2` capability.

If the `VkPhysicalDeviceShaderFloatControls2FeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderFloatControls2FeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceShaderFloatControls2FeaturesKHR-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_FLOAT_CONTROLS_2_FEATURES_KHR`

The `VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD` structure is defined as:

```c
// Provided by VK_AMD_shader_early_and_late_fragment_tests
typedef struct VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderEarlyAndLateFragmentTests;
} VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderEarlyAndLateFragmentTests` indicates whether the implementation supports the `EarlyAndLateFragmentTestsAMD` Execution Mode.

If the `VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderEarlyAndLateFragmentTestsFeaturesAMD-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_EARLY_AND_LATE_FRAGMENT_TESTS_FEATURES_AMD.

The `VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_non_seamless_cube_map
typedef struct VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 nonSeamlessCubeMap;
} VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `nonSeamlessCubeMap` indicates that the implementation supports VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT.

If the `VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceNonSeamlessCubeMapFeaturesEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NON_SEAMLESS_CUBE_MAP_FEATURES_EXT.

The `VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_module_identifier
typedef struct VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderModuleIdentifier;
} VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT;
```

This structure describes the following feature:
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **shaderModuleIdentifier** indicates whether the implementation supports querying an identifier of a `VkShaderModule` or `VkShaderModuleCreateInfo` structure, and creating pipelines from identifiers only.

If the `VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderModuleIdentifierFeaturesEXT-sType-sType` sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_MODULE_IDENTIFIER_FEATURES_EXT`.

The `VkPhysicalDeviceTilePropertiesFeaturesQCOM` structure is defined as:

```c
typedef struct VkPhysicalDeviceTilePropertiesFeaturesQCOM {
    VkStructureType  sType;
    void*            pNext;
    VkBool32         tileProperties;
} VkPhysicalDeviceTilePropertiesFeaturesQCOM;
```

This structure describes the following features:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **tileProperties** indicates that the implementation supports queries for returning tile properties.

If the `VkPhysicalDeviceTilePropertiesFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceTilePropertiesFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceTilePropertiesFeaturesQCOM-sType-sType` sType **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TILE_PROPERTIES_FEATURES_QCOM`.

The `VkPhysicalDeviceImageProcessingFeaturesQCOM` structure is defined as:

```c
// Provided by VK_QCOM_tile_properties
typedef struct VkPhysicalDeviceTilePropertiesFeaturesQCOM {
    VkStructureType  sType;
    void*            pNext;
    VkBool32         tileProperties;
} VkPhysicalDeviceTilePropertiesFeaturesQCOM;
```
typedef struct VkPhysicalDeviceImageProcessingFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureSampleWeighted;
    VkBool32 textureBoxFilter;
    VkBool32 textureBlockMatch;
} VkPhysicalDeviceImageProcessingFeaturesQCOM;

This structure describes the following features:

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **textureSampleWeighted** indicates that the implementation supports shader modules that declare the *TextureSampleWeightedQCOM* capability.
• **textureBoxFilter** indicates that the implementation supports shader modules that declare the *TextureBoxFilterQCOM* capability.
• **textureBlockMatch** indicates that the implementation supports shader modules that declare the *TextureBlockMatchQCOM* capability.

If the *VkPhysicalDeviceImageProcessingFeaturesQCOM* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceImageProcessingFeaturesQCOM* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

**Valid Usage (Implicit)**

• VUID-VkPhysicalDeviceImageProcessingFeaturesQCOM-sType-sType
  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_FEATURES_QCOM*

The *VkPhysicalDeviceImageProcessing2FeaturesQCOM* structure is defined as:

// Provided by VK_QCOM_image_processing2
typedef struct VkPhysicalDeviceImageProcessing2FeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 textureBlockMatch2;
} VkPhysicalDeviceImageProcessing2FeaturesQCOM;

This structure describes the following features:

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• textureBlockMatch2 indicates that the implementation supports shader modules that declare the TextureBlockMatch2QCOM capability.

If the VkPhysicalDeviceImageProcessing2FeaturesQCOM structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageProcessing2FeaturesQCOM can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageProcessing2FeaturesQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_PROCESSING_2_FEATURES_QCOM

The VkPhysicalDeviceDepthClampZeroOneFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_depth_clamp_zero_one
typedef struct VkPhysicalDeviceDepthClampZeroOneFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 depthClampZeroOne;
} VkPhysicalDeviceDepthClampZeroOneFeaturesEXT;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• depthClampZeroOne indicates that the implementation supports clamping the depth to a range of 0 to 1.

If the VkPhysicalDeviceDepthClampZeroOneFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDepthClampZeroOneFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceDepthClampZeroOneFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_CLAMP_ZERO_ONE_FEATURES_EXT

The VkPhysicalDeviceShaderTileImageFeaturesEXT structure is defined as:
typedef struct VkPhysicalDeviceShaderTileImageFeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          shaderTileImageColorReadAccess;
    VkBool32          shaderTileImageDepthReadAccess;
    VkBool32          shaderTileImageStencilReadAccess;
} VkPhysicalDeviceShaderTileImageFeaturesEXT;

The members of the VkPhysicalDeviceShaderTileImageFeaturesEXT structure describe the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderTileImageColorReadAccess** indicates that the implementation supports the TileImageColorReadAccessEXT SPIR-V capability.
- **shaderTileImageDepthReadAccess** indicates that the implementation supports the TileImageDepthReadAccessEXT SPIR-V capability.
- **shaderTileImageStencilReadAccess** indicates that the implementation supports the TileImageStencilReadAccessEXT SPIR-V capability.

If the VkPhysicalDeviceShaderTileImageFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderTileImageFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderTileImageFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_TILE_IMAGE_FEATURES_EXT

The VkPhysicalDeviceDepthBiasControlFeaturesEXT structure is defined as:

typedef struct VkPhysicalDeviceDepthBiasControlFeaturesEXT {
    VkStructureType   sType;
    void*             pNext;
    VkBool32          depthBiasControl;
    VkBool32          leastRepresentableValueForceUnormRepresentation;
    VkBool32          floatRepresentation;
    VkBool32          depthBiasExact;
} VkPhysicalDeviceDepthBiasControlFeaturesEXT;

This structure describes the following feature:
• **sType** is a 

  `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **depthBiasControl** indicates whether the implementation supports the `vkCmdSetDepthBias2EXT` command and the `VkDepthBiasRepresentationInfoEXT` structure.

• **leastRepresentableValueForceUnormRepresentation** indicates whether the implementation supports using the `VK_DEPTH_BIAS_REPRESENTATION_LEAST_REPRESENTABLE_VALUE_FORCE_UNORM_EXT` depth bias representation.

• **floatRepresentation** indicates whether the implementation supports using the `VK_DEPTH_BIAS_REPRESENTATION_FLOAT_EXT` depth bias representation.

• **depthBiasExact** indicates whether the implementation supports forcing depth bias to not be scaled to ensure a minimum resolvable difference using `VkDepthBiasRepresentationInfoEXT::depthBiasExact`.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDepthBiasControlFeaturesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_BIAS_CONTROL_FEATURES_EXT`.

The `VkPhysicalDeviceAddressBindingReportFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_device_address_binding_report
typedef struct VkPhysicalDeviceAddressBindingReportFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 reportAddressBinding;
} VkPhysicalDeviceAddressBindingReportFeaturesEXT;
```

This structure describes the following feature:

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **reportAddressBinding** indicates whether this implementation supports reporting the binding of GPU virtual address ranges to Vulkan objects.

If the `VkPhysicalDeviceAddressBindingReportFeaturesEXT` structure is included in the **pNext** chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceAddressBindingReportFeaturesEXT` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceAddressBindingReportFeaturesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ADDRESS_BINDING_REPORT_FEATURES_EXT`. 

3898
The `VkPhysicalDeviceOpticalFlowFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_optical_flow
typedef struct VkPhysicalDeviceOpticalFlowFeaturesNV {
    VkStructureType  sType;
    void*             pNext;
    VkBool32          opticalFlow;
} VkPhysicalDeviceOpticalFlowFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `opticalFlow` indicates whether the implementation supports optical flow.

If the `VkPhysicalDeviceOpticalFlowFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceOpticalFlowFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpticalFlowFeaturesNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPTICAL_FLOW_FEATURES_NV`

The `VkPhysicalDeviceFaultFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_device_fault
typedef struct VkPhysicalDeviceFaultFeaturesEXT {
    VkStructureType  sType;
    void*             pNext;
    VkBool32          deviceFault;
    VkBool32          deviceFaultVendorBinary;
} VkPhysicalDeviceFaultFeaturesEXT;
```

The members of the `VkPhysicalDeviceFaultFeaturesEXT` structure describe the following features:

- `deviceFault` indicates that the implementation supports the reporting of device fault information.
- `deviceFaultVendorBinary` indicates that the implementation supports the generation of vendor-specific binary crash dumps. These may provide additional information when imported into vendor-specific external tools.

If the `VkPhysicalDeviceFaultFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFaultFeaturesEXT` can
also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFaultFeaturesEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FAULT_FEATURES_EXT`

The `VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_pipeline_library_group_handles
typedef struct VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 pipelineLibraryGroupHandles;
} VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT;
```

This structure describes the following features:

- `pipelineLibraryGroupHandles` indicates whether the implementation supports querying group handles directly from a ray tracing pipeline library, and guarantees bitwise identical group handles for such libraries when linked into other pipelines.

If the `VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDevicePipelineLibraryGroupHandlesFeaturesEXT-sType-sType `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_LIBRARY_GROUP_HANDLES_FEATURES_EXT`

The `VkPhysicalDeviceShaderObjectFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_shader_object
typedef struct VkPhysicalDeviceShaderObjectFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderObject;
} VkPhysicalDeviceShaderObjectFeaturesEXT;
```

This structure describes the following feature:

- `shaderObject` indicates whether the implementation supports shader objects.
If the `VkPhysicalDeviceShaderObjectFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderObjectFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderObjectFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_OBJECT_FEATURES_EXT`

The `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM` structure is defined as:

```c
// Provided by VK_ARM_shader_core_builtins
typedef struct VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderCoreBuiltins;
} VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCoreBuiltins` indicates whether the implementation supports the SPIR-V `CoreBuiltinsARM` capability.

If the `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderCoreBuiltinsFeaturesARM-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_BUILTINS_FEATURES_ARM`

The `VkPhysicalDeviceFrameBoundaryFeaturesEXT` structure is defined as:
typedef struct VkPhysicalDeviceFrameBoundaryFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 frameBoundary;
} VkPhysicalDeviceFrameBoundaryFeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **frameBoundary** indicates whether the implementation supports frame boundary information.

If the `VkPhysicalDeviceFrameBoundaryFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceFrameBoundaryFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceFrameBoundaryFeaturesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAME_BOUNDARY_FEATURES_EXT`

The `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` structure is defined as:

typedef struct VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 swapchainMaintenance1;
} VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT;

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **swapchainMaintenance1** indicates that the implementation supports the following:
  - `VkSwapchainPresentFenceInfoEXT`, specifying a fence that is signaled when the resources associated with a present operation can be safely destroyed.
  - `VkSwapchainPresentModesCreateInfoEXT` and `VkSwapchainPresentModeInfoEXT`, allowing the swapchain to switch present modes without a need for recreation.
  - `VkSwapchainPresentScalingCreateInfoEXT`, specifying the scaling behavior of the swapchain
in presence of window resizing.

- The `VK_SWAPCHAIN_CREATE_DEFERRED_MEMORY_ALLOCATION_BIT_EXT` flag, allowing the implementation to defer the allocation of swapchain image memory until first acquisition.
- `vkReleaseSwapchainImagesEXT`, allowing acquired swapchain images to be released without presenting them.

If the `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSwapchainMaintenance1FeaturesEXT-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SWAPCHAIN_MAINTENANCE_1_FEATURES_EXT`.

The `VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT` structure is defined as:

```c
// Provided by VK_EXT_dynamic_rendering_unused_attachments
typedef struct VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 dynamicRenderingUnusedAttachments;
} VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dynamicRenderingUnusedAttachments` indicates that the implementation supports binding graphics pipelines within a render pass instance where any pipeline `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` element with a format other than `VK_FORMAT_UNDEFINED` is allowed with a corresponding `VkRenderingInfo::pColorAttachments` element with an `imageView` equal to `VK_NULL_HANDLE`, or any pipeline `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` element with a `VK_FORMAT_UNDEFINED` format is allowed with a corresponding `VkRenderingInfo::pColorAttachments` element with a non-`VK_NULL_HANDLE` `imageView`. Also a `VkPipelineRenderingCreateInfo::depthAttachmentFormat` other than `VK_FORMAT_UNDEFINED` is allowed with a `VK_NULL_HANDLE` `VkRenderingInfo::pDepthAttachment`, or a `VkPipelineRenderingCreateInfo::depthAttachmentFormat` of `VK_FORMAT_UNDEFINED` is allowed with a non-`VK_NULL_HANDLE` `VkRenderingInfo::pDepthAttachment`. Also a `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` other than `VK_FORMAT_UNDEFINED` is allowed with a `VK_NULL_HANDLE` `VkRenderingInfo::pStencilAttachment`, or a `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` of `VK_FORMAT_UNDEFINED` is allowed with a non-`VK_NULL_HANDLE` `VkRenderingInfo::pStencilAttachment`. Any writes to a
VkRenderingInfo::pColorAttachments, VkRenderingInfo::pDepthAttachment, or VkRenderingInfo::pStencilAttachment with VK_NULL_HANDLE are discarded.

If the VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDynamicRenderingUnusedAttachmentsFeaturesEXT-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_UNUSED_ATTACHMENTS_FEATURES_EXT

The VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_invocation_reorder
typedef struct VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 rayTracingInvocationReorder;
} VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- rayTracingInvocationReorder indicates that the implementation supports SPV_NV_shader_invocation_reorder.

If the VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingInvocationReorderFeaturesNV-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_FEATURES_NV

The VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV structure is defined as:

3904
typedef struct VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 extendedSparseAddressSpace;
} VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **extendedSparseAddressSpace** indicates that the implementation supports allowing certain usages of sparse memory resources to exceed *VkPhysicalDeviceLimits::sparseAddressSpaceSize*. See *VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV*.

If the *VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.

Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceExtendedSparseAddressSpaceFeaturesNV-sType-sType**

The *VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM* structure is defined as:

```c
// Provided by VK_QCOM_multiview_per_view_viewports
typedef struct VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiviewPerViewViewports;
} VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM;
```

This structure describes the following features:

- **multiviewPerViewViewports** indicates that the implementation supports multiview per-view viewports.

If the *VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM* structure is included in the *pNext* chain of the *VkPhysicalDeviceFeatures2* structure passed to *vkGetPhysicalDeviceFeatures2*, it is filled in to indicate whether each corresponding feature is supported. *VkPhysicalDeviceMultiviewPerViewViewportsFeaturesQCOM* can also be used in the *pNext* chain of *VkDeviceCreateInfo* to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER_VIEW_RENDER AREAS FEATURES_QCOM

The VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM structure is defined as:

```c
// Provided by VK_QCOM_multiview_per_view_render_areas
typedef struct VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 multiviewPerViewRenderAreas;
} VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM;
```

This structure describes the following features:

- multiviewPerViewRenderAreas indicates that the implementation supports multiview per-view render areas.

If the VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewPerViewRenderAreasFeaturesQCOM-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PER VIEW_RENDER AREAS FEATURES_QCOM

The VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI structure is defined as:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
typedef struct VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI {
    VkStructureType sType;
    void* pNext;
    VkBool32 clustercullingShader;
    VkBool32 multiviewClusterCullingShader;
} VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
• `clustercullingShader` specifies whether cluster culling shader is supported.
• `multiviewClusterCullingShader` specifies whether multiview is supported.

If the `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

```
• VUID-VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CLUSTER_CULLING_SHADER_FEATURES_HUAWEI
```

To query whether a Cluster Culling Shader supports the per-cluster shading rate feature, include a `VkPhysicalDeviceClusterCullingShaderVrsFeaturesHUAWEI` structure in the `pNext` chain of the `VkPhysicalDeviceClusterCullingShaderFeaturesHUAWEI` structure. This structure is defined as:

```c
// Provided by VK_HUAWEI_cluster_culling_shader
typedef struct VkPhysicalDeviceClusterCullingShaderVrsFeaturesHUAWEI {
  VkStructureType sType;
  void* pNext;
  VkBool32 clusterShadingRate;
} VkPhysicalDeviceClusterCullingShaderVrsFeaturesHUAWEI;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `clusterShadingRate` specifies whether per-cluster shading rates is supported.

---

**Valid Usage (Implicit)**

```
• VUID-VkPhysicalDeviceClusterCullingShaderVrsFeaturesHUAWEI-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CLUSTER_CULLING_SHADER_VRS_FEATURES_HUAWEI
```

The `VkPhysicalDeviceShaderEnqueueFeaturesAMDX` structure is defined as:

```c
// Provided by VK_AMDX_shader_enqueue
typedef struct VkPhysicalDeviceShaderEnqueueFeaturesAMDX {
  VkStructureType sType;
  void* pNext;
  VkBool32 shaderEnqueue;
} VkPhysicalDeviceShaderEnqueueFeaturesAMDX;
```
This structure describes the following feature:

- `shaderEnqueue` indicates whether the implementation supports execution graphs.

If the `VkPhysicalDeviceShaderEnqueueFeaturesAMDX` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderEnqueueFeaturesAMDX` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderEnqueueFeaturesAMDX-sType-sType
  
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER.Enqueue.Features.AMDX`

The `VkPhysicalDeviceCubicClampFeaturesQCOM` structure is defined as:

```c
// Provided by VK_QCOM.filter_cubic_clamp
typedef struct VkPhysicalDeviceCubicClampFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 cubicRangeClamp;
} VkPhysicalDeviceCubicClampFeaturesQCOM;
```

This structure describes the following features:

- `cubicRangeClamp` indicates that the implementation supports cubic filtering in combination with a texel range clamp.

If the `VkPhysicalDeviceCubicClampFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCubicClampFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCubicClampFeaturesQCOM-sType-sType
  
  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUBIC_CLAMP_FEATURES_QCOM`

The `VkPhysicalDeviceYcbcrDegammaFeaturesQCOM` structure is defined as:
typedef struct VkPhysicalDeviceYcbcrDegammaFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 ycbcrDegamma;
} VkPhysicalDeviceYcbcrDegammaFeaturesQCOM;

This structure describes the following features:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **ycbcrDegamma** indicates whether the implementation supports \( Y'C_bC_r \) degamma.

If the `VkPhysicalDeviceYcbcrDegammaFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceYcbcrDegammaFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceYcbcrDegammaFeaturesQCOM-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_YCBCR_DEGAMMA_FEATURES_QCOM`

The `VkPhysicalDeviceCubicWeightsFeaturesQCOM` structure is defined as:

// Provided by VK_QCOM_filter_cubic_weights
typedef struct VkPhysicalDeviceCubicWeightsFeaturesQCOM {
    VkStructureType sType;
    void* pNext;
    VkBool32 selectableCubicWeights;
} VkPhysicalDeviceCubicWeightsFeaturesQCOM;

This structure describes the following feature:

- **selectableCubicWeights** indicates that the implementation supports the selection of filter cubic weights.

If the `VkPhysicalDeviceCubicWeightsFeaturesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCubicWeightsFeaturesQCOM` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCubicWeightsFeaturesQCOM-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUBIC_WEIGHTS_FEATURES_QCOM

The VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV structure is defined as:

```c
// Provided by VK_NV_descriptor_pool_overallocation
typedef struct VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 descriptorPoolOverallocation;
} VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV;
```

This structure describes the following feature:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **descriptorPoolOverallocation** indicates that the implementation allows the application to opt into descriptor pool overallocation by creating the descriptor pool with VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_SETS_BIT_NV and/or VK_DESCRIPTOR_POOL_CREATE_ALLOW_OVERALLOCATION_POOLS_BIT_NV flags.

If the VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceDescriptorPoolOverallocationFeaturesNV-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_POOL_OVERALLOCATION_FEATURES_NV

The VkPhysicalDevicePerStageDescriptorSetFeaturesNV structure is defined as:

```c
// Provided by VK_NV_per_stage_descriptor_set
typedef struct VkPhysicalDevicePerStageDescriptorSetFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 perStageDescriptorSet;
    VkBool32 dynamicPipelineLayout;
} VkPhysicalDevicePerStageDescriptorSetFeaturesNV;
```
This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.

  - **perStageDescriptorSet** indicates that the implementation allows the
    `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PER_STAGE_BIT_NV` descriptor set layout creation flag to be used
    so the bindings are specified per-stage rather than across all stages.

  - **dynamicPipelineLayout** indicates the implementation allows the **layout** member of
    `VkBindDescriptorSetsInfoKHR`, `VkPushConstantsInfoKHR`, `VkPushDescriptorSetInfoKHR`,
    `VkPushDescriptorSetWithTemplateInfoKHR`, `VkSetDescriptorBufferOffsetsInfoEXT` and
    `VkBindDescriptorBufferEmbeddedSamplersInfoEXT` to be **VK_NULL_HANDLE** and
    `VkPipelineLayoutCreateInfo` can be chained off those structures' **pNext** instead.

If the `VkPhysicalDevicePerStageDescriptorSetFeaturesNV` structure is included in the **pNext** chain of the
`VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePerStageDescriptorSetFeaturesNV` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDevicePerStageDescriptorSetFeaturesNV-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PER_STAGE_DESCRIPTOR_SET_FEATURES_NV**

The `VkPhysicalDeviceCudaKernelLaunchFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_cudakernel_launch
typedef struct VkPhysicalDeviceCudaKernelLaunchFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 cudaKernelLaunchFeatures;
} VkPhysicalDeviceCudaKernelLaunchFeaturesNV;
```

This structure describes the following features:

- **cudaKernelLaunchFeatures** is non-zero if cuda kernel launch is supported.

If the `VkPhysicalDeviceCudaKernelLaunchFeaturesNV` structure is included in the **pNext** chain of the
`VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceCudaKernelLaunchFeaturesNV` can also be used in the **pNext** chain of `VkDeviceCreateInfo` to selectively enable these features.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceCudaKernelLaunchFeaturesNV-sType-sType
The `VkPhysicalDeviceShaderMaximalReconvergenceFeaturesKHR` structure is defined as:

```c
struct VkPhysicalDeviceShaderMaximalReconvergenceFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderMaximalReconvergence;
};
```

This structure describes the following feature:

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **shaderMaximalReconvergence** specifies whether the implementation supports the shader execution mode `MaximallyReconvergesKHR`.

If the `VkPhysicalDevicePrivateDataFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDevicePrivateDataFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceShaderMaximalReconvergenceFeaturesKHR-sType-sType` be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_MAXIMAL_RECONVERGENCE_FEATURES_KHR`

The `VkPhysicalDeviceExternalFormatResolveFeaturesANDROID` structure is defined as:

```c
struct VkPhysicalDeviceExternalFormatResolveFeaturesANDROID {
    VkStructureType sType;
    void* pNext;
    VkBool32 externalFormatResolve;
};
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **externalFormatResolve** specifies whether external format resolves are supported.

If the `VkPhysicalDeviceExternalFormatResolveFeaturesANDROID` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is...
filled in to indicate whether each corresponding feature is supported. 

VkPhysicalDeviceExternalFormatResolveFeaturesANDROID can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFormatResolveFeaturesANDROID-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FORMAT_RESOLVE_FEATURES_ANDROID

The VkPhysicalDeviceSchedulingControlsFeaturesARM structure is defined as:

```c
typedef struct VkPhysicalDeviceSchedulingControlsFeaturesARM {
    VkStructureType sType;
    void* pNext;
    VkBool32 schedulingControls;
} VkPhysicalDeviceSchedulingControlsFeaturesARM;
```

This structure describes the following features:

- `schedulingControls` indicates that the implementation supports scheduling controls.

If the VkPhysicalDeviceSchedulingControlsFeaturesARM structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. 

VkPhysicalDeviceSchedulingControlsFeaturesARM can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSchedulingControlsFeaturesARM-sType-sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SCHEDULING_CONTROLS_FEATURES_ARM

The VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG structure is defined as:

```c
typedef struct VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG {
    VkStructureType sType;
    void* pNext;
    VkBool32 relaxedLineRasterization;
} VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG;
```

This structure describes the following feature:

- `sType` is a VkStructureType value identifying this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **relaxedLineRasterization** indicates that the implementation supports relaxed line rasterization control.

If the **VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceRelaxedLineRasterizationFeaturesIMG-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RELAXED_LINE_RASTERIZATION_FEATURES_IMG**

The **VkPhysicalDeviceRenderPassStripedFeaturesARM** structure is defined as:

```c
// Provided by VK_ARM_render_pass_striped
typedef struct VkPhysicalDeviceRenderPassStripedFeaturesARM {
    VkStructureType sType;
    void* pNext;
    VkBool32 renderPassStriped;
} VkPhysicalDeviceRenderPassStripedFeaturesARM;
```

The members of the **VkPhysicalDeviceRenderPassStripedFeaturesARM** structure describe the following features:

• **sType** is a **VkStructureType** value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **renderPassStriped** indicates that striped rendering is supported by the implementation.

If the **VkPhysicalDeviceRenderPassStripedFeaturesARM** structure is included in the **pNext** chain of the **VkPhysicalDeviceFeatures2** structure passed to **vkGetPhysicalDeviceFeatures2**, it is filled in to indicate whether each corresponding feature is supported. **VkPhysicalDeviceRenderPassStripedFeaturesARM** can also be used in the **pNext** chain of **VkDeviceCreateInfo** to selectively enable these features.

### Valid Usage (Implicit)

• VUID-VkPhysicalDeviceRenderPassStripedFeaturesARM-sType-sType

  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RENDER_PASS_STRIPED_FEATURES_ARM**

The **VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR** structure is defined as:

```c
...
// Provided by VK_KHR_shader_subgroup_rotate

typedef struct VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderSubgroupRotate;
    VkBool32 shaderSubgroupRotateClustered;
} VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR;

• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **shaderSubgroupRotate** specifies whether shader modules can declare the `GroupNonUniformRotateKHR` capability.

• **shaderSubgroupRotateClustered** specifies whether shader modules can use the `ClusterSize` operand to `OpGroupNonUniformRotateKHR`.

If the `VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceShaderSubgroupRotateFeaturesKHR-sType-sType**

  `sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SUBGROUP_ROTATE_FEATURES_KHR`
VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderExpectAssumeFeaturesKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_EXPECT_ASSUME_FEATURES_KHR

The VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_dynamic_rendering_local_read
typedef struct VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkBool32             dynamicRenderingLocalRead;
} VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR;
```

This structure describes the following feature:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- dynamicRenderingLocalRead specifies that the implementation supports local reads inside dynamic render pass instances using the vkCmdBeginRendering command.

If the VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDynamicRenderingLocalReadFeaturesKHR-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DYNAMIC_RENDERING_LOCAL_READ_FEATURES_KHR

The VkPhysicalDeviceShaderQuadControlFeaturesKHR structure is defined as:

```c
// Provided by VK_KHR_shader_quad_control
typedef struct VkPhysicalDeviceShaderQuadControlFeaturesKHR {
    VkStructureType      sType;
    void*                pNext;
    VkBool32             shaderQuadControl;
} VkPhysicalDeviceShaderQuadControlFeaturesKHR;
```

This structure describes the following features:
• shaderQuadControl indicates whether the implementation supports shaders with the QuadControlKHR capability.

If the VkPhysicalDeviceShaderQuadControlFeaturesKHR structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceShaderQuadControlFeaturesKHR can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderQuadControlFeaturesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_QUAD_CONTROL_FEATURES_KHR

The VkPhysicalDeviceMapMemoryPlacedFeaturesEXT structure is defined as:

```c
// Provided by VK_EXT_map_memory_placed
typedef struct VkPhysicalDeviceMapMemoryPlacedFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 memoryMapPlaced;
    VkBool32 memoryMapRangePlaced;
    VkBool32 memoryUnmapReserve;
} VkPhysicalDeviceMapMemoryPlacedFeaturesEXT;
```

This structure describes the following features:

• memoryMapPlaced indicates that the implementation supports placing memory maps at application-specified virtual addresses.

• memoryMapRangePlaced indicates that the implementation supports placing memory maps of a subrange of a memory object at application-specified virtual addresses.

• memoryUnmapReserve indicates that the implementation supports leaving the memory range reserved when unmapping a memory object.

If the VkPhysicalDeviceMapMemoryPlacedFeaturesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceMapMemoryPlacedFeaturesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMapMemoryPlacedFeaturesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAP_MEMORY_PLACED_FEATURES_EXT
The `VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_shader_atomic_float16_vector
typedef struct VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderFloat16VectorAtomics;
} VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV;
```

This structure describes the following features:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderFloat16VectorAtomics` indicates whether shaders can perform 16-bit floating-point, 2- and 4-component vector atomic operations.

If the `VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderAtomicFloat16VectorFeaturesNV-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ATOMIC_FLOAT16_VECTOR_FEATURES_NV`

The `VkPhysicalDeviceRawAccessChainsFeaturesNV` structure is defined as:

```c
// Provided by VK_NV_raw_access_chains
typedef struct VkPhysicalDeviceRawAccessChainsFeaturesNV {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderRawAccessChains;
} VkPhysicalDeviceRawAccessChainsFeaturesNV;
```

This structure describes the following feature:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderRawAccessChains` specifies whether shader modules can declare the `RawAccessChainsNV` capability.

If the `VkPhysicalDeviceRawAccessChainsFeaturesNV` structure is included in the `pNext` chain of the
VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceRawAccessChainsFeaturesNV can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceRawAccessChainsFeaturesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAW_ACCESS_CHAINS_FEATURES_NV

The VkPhysicalDeviceImageAlignmentControlFeaturesMESA structure is defined as:

```c
// Provided by VK_MESA_image_alignment_control
typedef struct VkPhysicalDeviceImageAlignmentControlFeaturesMESA {
    VkStructureType sType;
    void* pNext;
    VkBool32 imageAlignmentControl;
} VkPhysicalDeviceImageAlignmentControlFeaturesMESA;
```

This structure describes the following feature:

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• imageAlignmentControl specifies that VkImageAlignmentControlCreateInfoMESA can be chained in VkImageCreateInfo

If the VkPhysicalDeviceImageAlignmentControlFeaturesMESA structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceImageAlignmentControlFeaturesMESA can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceImageAlignmentControlFeaturesMESA-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_ALIGNMENT_CONTROL_FEATURES_MESA

The VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT structure is defined as:
// Provided by VK_EXT_shader_replicated_composites

typedef struct VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderReplicatedComposites;
} VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT;

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderReplicatedComposites** specifies whether shader modules can declare the ReplicatedCompositesEXT capability.

If the `VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderReplicatedCompositesFeaturesEXT-sType-sType *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_REPLICATED_COMPOSITES_FEATURES_EXT`

The `VkPhysicalDeviceShaderRelaxedExtendedInstructionFeaturesKHR` structure is defined as:

// Provided by VK_KHR_shader_relaxed_extended_instruction
typedef struct VkPhysicalDeviceShaderRelaxedExtendedInstructionFeaturesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 shaderRelaxedExtendedInstruction;
} VkPhysicalDeviceShaderRelaxedExtendedInstructionFeaturesKHR;

This structure describes the following feature:

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderRelaxedExtendedInstruction** specifies whether the implementation supports SPIR-V modules that use the SPV_KHR_relaxed_extended_instruction extension.

If the `VkPhysicalDeviceShaderRelaxedExtendedInstructionFeaturesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceFeatures2` structure passed to `vkGetPhysicalDeviceFeatures2`, it is filled in to indicate whether each corresponding feature is supported. `VkPhysicalDeviceShaderRelaxedExtendedInstructionFeaturesKHR` can also be used in the `pNext` chain of `VkDeviceCreateInfo` to selectively enable these features.
47.1. Feature Requirements

All Vulkan graphics implementations **must** support the following features:

- **robustBufferAccess**, unless the **VK_KHR_portability_subset** extension is enabled.
- **multiview**, if Vulkan 1.1 is supported.
- **shaderDrawParameters**, if the **VK_KHR_shader_draw_parameters** extension is supported.
- **uniformBufferStandardLayout**, if Vulkan 1.2 or the **VK_KHR_uniform_buffer_standard_layout** extension is supported.
- **variablePointersStorageBuffer**, if the **VK_KHR_variable_pointers** extension is supported.
- **storageBuffer8BitAccess**, if the **VK_KHR_8bit_storage** extension is supported.
- **storageBuffer8BitAccess**, if **uniformAndStorageBuffer8BitAccess** is enabled.
- If the **descriptorIndexing** feature is supported, or if the **VK_EXT_descriptor_indexing** extension is supported:
  - **shaderSampledImageArrayDynamicIndexing**
  - **shaderStorageBufferArrayDynamicIndexing**
  - **shaderUniformTexelBufferArrayDynamicIndexing**
  - **shaderStorageTexelBufferArrayDynamicIndexing**
  - **shaderSampledImageArrayNonUniformIndexing**
  - **shaderStorageBufferArrayNonUniformIndexing**
  - **shaderUniformTexelBufferArrayNonUniformIndexing**
  - **descriptorBindingSampledImageUpdateAfterBind**
  - **descriptorBindingStorageImageUpdateAfterBind**
  - **descriptorBindingStorageBufferUpdateAfterBind** (see also **robustBufferAccessUpdateAfterBind**)
  - **descriptorBindingUniformTexelBufferUpdateAfterBind** (see also **robustBufferAccessUpdateAfterBind**)
  - **descriptorBindingStorageTexelBufferUpdateAfterBind** (see also **robustBufferAccessUpdateAfterBind**)
  - **descriptorBindingUpdateUnusedWhilePending**
  - **descriptorBindingPartiallyBound**
  - **runtimeDescriptorArray**
• If Vulkan 1.3 is supported:
  ◦ vulkanMemoryModel
  ◦ vulkanMemoryModelDeviceScope
• inlineUniformBlock, if Vulkan 1.3 or the VK_EXT_inline_uniform_block extension is supported.
• descriptorBindingInlineUniformBlockUpdateAfterBind, if Vulkan 1.3 or the VK_EXT_inline_uniform_block extension is supported; and if the descriptorIndexing feature is supported, or the VK_EXT_descriptor_indexing extension is supported.
• scalarBlockLayout, if the VK_EXT_scalar_block_layout extension is supported.
• subgroupBroadcastDynamicId, if Vulkan 1.2 is supported.
• samplerMirrorClampToEdge, if the VK_KHR_sampler_mirror_clamp_to_edge extension is supported.
• drawIndirectCount, if the VK_KHR_draw_indirect_count extension is supported.
• samplerFilterMinmax, if the VK_KHR_sampler_filter_minmax extension is supported.
• shaderOutputViewportIndex, if the VK_EXT_shader_viewport_index_layer extension is supported.
• shaderOutputLayer, if the VK_KHR_subgroup_size_control extension is supported.
• computeFullSubgroups, if Vulkan 1.3 or the VK_KHR_subgroup_size_control extension is supported.
• deviceMemoryReport, if the VK_EXT_device_memory_report extension is supported.
• globalPriorityQuery, if the VK_EXT_global_priority_query extension is supported.
• globalPriorityQuery, if the VK_KHR_global_priority extension is supported.
• imagelessFramebuffer, if Vulkan 1.2 or the VK_KHR_imageless_framebuffer extension is supported.
• separateDepthStencilLayouts, if Vulkan 1.2 or the VK_KHR_separate_depthStencil_layouts extension is supported.
• hostQueryReset, if Vulkan 1.2 or the VK_EXT_host_query_reset extension is supported.
• timelineSemaphore, if Vulkan 1.2 or the VK_KHR_timeline_semaphore extension is supported.
• If the VK_KHR_acceleration_structure extension is supported:
  ◦ accelerationStructure
  ◦ All the features required by the descriptorIndexing feature if Vulkan 1.2 is supported, or the VK_EXT_descriptor_indexing extension.
  ◦ descriptorBindingAccelerationStructureUpdateAfterBind
  ◦ bufferDeviceAddress from Vulkan 1.2 or the VK_KHR_buffer_device_address extension.
• If the VK_KHR_ray_tracing_pipeline extension is supported:
  ◦ rayTracingPipeline
  ◦ rayTracingPipelineTraceRaysIndirect
  ◦ rayTraversalPrimitiveCulling, if rayQuery is supported
  ◦ the VK_KHR_pipeline_library extension must be supported.
• rayQuery, if the VK_KHR_ray_query extension is supported.
pipelineCreationCacheControl, if Vulkan 1.3 or the VK_EXT_pipeline_creation_cache_control extension is supported.

shaderSubgroupExtendedTypes, if Vulkan 1.2 or the VK_KHR_shader_subgroup_extended_types extension is supported.

samplerYcbcrConversion, if the VK_KHR_sampler_ycbcr_conversion extension is supported.

pipelineExecutableInfo, if the VK_KHR_pipeline_executable_properties extension is supported.

textureCompressionASTC_HDR, if the VK_EXT_texture_compression_astc_hdr extension is supported.

depthClipEnable, if the VK_EXT_depth_clip_enable extension is supported.

memoryPriority, if the VK_EXT_memory_priority extension is supported.

ycbcrImageArrays, if the VK_EXT_ycbcr_image_arrays extension is supported.

indexTypeUint8, if the VK_KHR_index_type_uint8 or VK_EXT_index_type_uint8 extension is supported.

indexTypeUint8, if the VK_KHR_index_type_uint8 extension is supported.

primitiveTopologyListRestart, if the VK_EXT_primitive_topology_list_restart extension is supported.

shaderDemoteToHelperInvocation, if Vulkan 1.3 or the VK_EXT_shader_demote_to_helper_invocation extension is supported.

texelBufferAlignment, if Vulkan 1.3 or the VK_EXT_texel_buffer_alignment extension is supported.

vulkanMemoryModel, if the VK_KHR_vulkan_memory_model extension is supported.

bufferDeviceAddress, if Vulkan 1.3 or the VK_KHR_buffer_device_address extension is supported.

performanceCounterQueryPools, if the VK_KHR_performance_query extension is supported.

transformFeedback, if the VK_EXT_transform_feedback extension is supported.

conditionalRendering, if the VK_EXT_conditional_rendering extension is supported.

vertexAttributeInstanceRateDivisor, if the VK_EXT_vertex_attribute_divisor extension or the VK_KHR_vertex_attribute_divisor extension is supported.

fragmentDensityMap, if the VK_EXT_fragment_density_map extension is supported.

shaderSubgroupClock, if the VK_KHR_shader_clock extension is supported.

shaderBufferInt64Atomics, if the VK_KHR_shader_atomic_int64 extension is supported.

shaderInt64, if the shaderSharedInt64Atomics or shaderBufferInt64Atomics features are supported.

shaderFloat16 or shaderInt8, if the shaderSharedInt64Atomics or shaderBufferInt64Atomics features are supported.

fragmentShaderSampleInterlock or fragmentShaderPixelInterlock or fragmentShaderShadingRateInterlock, if the VK_EXT_fragment_shader_interlock extension is supported.

rectangularLines or bresenhamLines or smoothLines or stippledRectangularLines or stippledBresenhamLines or stippledSmoothLines, if the VK_KHR_line_rasterization extension is supported.

rectangularLines or bresenhamLines or smoothLines or stippledRectangularLines or stippledBresenhamLines or stippledSmoothLines, if the VK_EXT_line_rasterization extension is supported.
• storageBuffer16BitAccess, if the VK_KHR_16bit_storage extension is supported.

• storageBuffer16BitAccess, if uniformAndStorageBuffer16BitAccess is enabled.

• robustImageAccess, if Vulkan 1.3 or the VK_EXT_image_robustness extension is supported.

• formatA4R4G4B4, if the VK_EXT_4444_formats extension is supported.

• mutableDescriptorType, if the VK_EXT_mutable_descriptor_type or VK_VALVE_mutable_descriptor_type extension is supported.

• shaderInt64 and shaderImageInt64Atomics, if the VK_EXT_shader_image_atomic_int64 extension is supported.

• shaderImageInt64Atomics, if the sparseImageInt64Atomics feature is supported.

• shaderImageFloat32Atomics, if the sparseImageFloat32Atomics feature is supported.

• shaderImageFloat32AtomicAdd, if the sparseImageFloat32AtomicAdd feature is supported.

• primitivesGeneratedQuery, if the VK_EXT_primitives_generated_query extension is supported.

• pipelineFragmentShadingRate, if the VK_KHR_fragment_shading_rate extension is supported.

• pipelineProtectedAccess, if the VK_EXT_pipeline_protected_access extension is supported.

• legacyDithering, if the VK_EXT_legacy_dithering extension is supported.

• shaderTerminateInvocation if Vulkan 1.3 or the VK_KHR_shader_terminate_invocation extension is supported.

• shaderZeroInitializeWorkgroupMemory, if Vulkan 1.3 or the VK_KHR_zero_initialize_workgroup_memory extension is supported.

• workgroupMemoryExplicitLayout, if the VK_KHR_workgroup_memory_explicit_layout extension is supported.

• vertexInputDynamicState, if the VK_EXT_vertex_input_dynamic_state extension is supported.

• synchronization2 if Vulkan 1.3 or the VK_KHR_synchronization2 extension is supported.

• provokingVertexLast, if the VK_EXT_provoking_vertex extension is supported.

• descriptorBuffer, if the VK_EXT_descriptor_buffer extension is supported.

• shaderSubgroupUniformControlFlow, if the VK_KHR_shader_subgroup_uniform_control_flow extension is supported.

• borderColorSwizzle if the VK_KHR_border_color_swizzle extension is supported.

• multiDraw, if the VK_EXT_multi_draw extension is supported.

• shaderImageFloat32AtomicMinMax, if the sparseImageFloat32AtomicMinMax feature is supported.

• presentId, if the VK_KHR_present_id extension is supported.

• presentWait, if the VK_KHR_present_wait extension is supported.

• hostImageCopy, if the VK_EXT_host_image_copy extension is supported.

• shaderIntegerDotProduct if Vulkan 1.3 or the VK_KHR_shader_integer_dot_product extension is supported.

• maintenance4, if Vulkan 1.3 or the VK_KHR_maintenance4 extension is supported.
• `maintenance5`, if the `VK_KHR_maintenance5` extension is supported.
• `maintenance6`, if the `VK_KHR_maintenance6` extension is supported.
• `image2DViewOf3D`, if the `VK_EXT_image_2d_view_of_3d` extension is supported.
• `imageSlicedViewOf3D`, if the `VK_EXT_image_sliced_view_of_3d` extension is supported.
• `privateData`, if Vulkan 1.3 or the `VK_EXT_private_data` extension is supported.
• `extendedDynamicState`, if the `VK_EXT_extended_dynamic_state` extension is supported.
• `extendedDynamicState2`, if the `VK_EXT_extended_dynamic_state2` extension is supported.
• `depthClipControl`, if the `VK_EXT_depth_clip_control` extension is supported.
• `minLod`, if the `VK_EXT_image_view_min_lod` extension is supported.
• `linearColorAttachment`, if the `VK_NV_linear_color_attachment` extension is supported.
• `presentBarrier`, if the `VK_NV_present_barrier` extension is supported.
• `graphicsPipelineLibrary`, if the `VK_EXT_graphics_pipeline_library` extension is supported.
• `dynamicRendering`, if Vulkan 1.3 or the `VK_KHR_dynamic_rendering` extension is supported.
• `nestedCommandBuffer`, if the `VK_EXT_nested_command_buffer` extension is supported.
• `taskShader` and `meshShader`, if the `VK_EXT_mesh_shader` extension is supported.
• `primitiveFragmentShadingRate` if `primitiveFragmentShadingRateMeshShader` feature is supported.
• `subpassMergeFeedback`, if the `VK_EXT_subpass_merge_feedback` extension is supported.
• `rayTracingMaintenance1`, if the `VK_KHR_ray_tracing_maintenance1` extension is supported.
• `videoMaintenance1`, if the `VK_KHR_video_maintenance1` extension is supported.
• `colorWriteEnable`, if the `VK_EXT_color_write_enable` extension is supported.
• `multisampledRenderToSingleSampled`, if the `VK_EXT_multisampled_render_to_single_sampled` extension is supported.
• `imageCompressionControl`, if the `VK_EXT_image_compression_control` extension is supported.
• `imageCompressionControlSwapchain`, if the `VK_EXT_image_compression_control_swapchain` extension is supported.
• `shaderEarlyAndLateFragmentTests`, if the `VK_AMD_shader_early_and_late_fragment_tests` extension is supported.
• `nonSeamlessCubeMap`, if the `VK_EXT_non_seamless_cube_map` extension is supported.
• `shaderModuleIdentifier`, if `VK_EXT_shader_module_identifier` extension is supported.
• `pipelineRobustness`, if the `VK_EXT_pipeline_robustness` extension is supported.
• `textureSampleWeighted`, `TextureBlockMatch`, and `TextureBoxFilter` if `VK_QCOM_image_processing` extension is supported.
• `TextureBlockMatch2` if `VK_QCOM_image_processing2` extension is supported.
• `tileProperties` if `VK_QCOM_tile_properties` extension is supported.
• `attachmentFeedbackLoopLayout`, if the `VK_EXT_attachment_feedback_loop_layout` extension is supported.
• `depthClampZeroOne`, if the `VK_EXT_depth_clamp_zero_one` extension is supported.
• `deviceFault`, if the `VK_EXT_device_fault` extension is supported.
• `reportAddressBinding`, if the `VK_EXT_device_address_binding_report` extension is supported.
• `micromap`, if the `VK_EXT_opacitMicromap` extension is supported.
• `frameBoundary`, if the `VK_EXT_frame_boundary` extension is supported.
• `displacementMicromap`, if the `VK_NV_displacement_micromap` extension is supported.
• `pipelineLibraryGroupHandles`, if the `VK_EXT_pipeline_library_group_handles` extension is supported.
• `swapchainMaintenance1`, if the `VK_EXT_swapchain_maintenance1` extension is supported.
• `tessellationShader`, if the `extendedDynamicState3TessellationDomainOrigin` feature is supported.
• `depthClamp`, if the `extendedDynamicState3DepthClampEnable` feature is supported.
• `fillModeNonSolid`, if the `extendedDynamicState3PolygonMode` feature is supported.
• `alphaToOne`, if the `extendedDynamicState3AlphaToOneEnable` feature is supported.
• `logicOp`, if the `extendedDynamicState3LogicOpEnable` feature is supported.
• `geometryStreams`, if the `extendedDynamicState3RasterizationStream` feature is supported.
• `VK_EXT_conservative_rasterization` extension, if the `extendedDynamicState3ConservativeRasterizationMode` feature is supported.
• `VK_EXT_conservative_rasterization` extension, if the `extendedDynamicState3ExtraPrimitiveOverestimationSize` feature is supported.
• `VK_EXT_sample_locations` extension, if the `extendedDynamicState3SampleLocationsEnable` feature is supported.
• `VK_EXT_blend_operation_advanced` extension, if the `extendedDynamicState3ColorBlendAdvanced` feature is supported.
• `provokingVertexLast`, if the `extendedDynamicState3ProvokingVertexMode` feature is supported.
• `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension, if the `extendedDynamicState3LineRasterizationMode` feature is supported.
• `VK_KHR_line_rasterization` or `VK_EXT_line_rasterization` extension, if the `extendedDynamicState3LineStippleEnable` feature is supported.
• `depthClipControl`, if the `extendedDynamicState3DepthClipNegativeOneToOne` feature is supported.
• `VK_NV_clip_space_w_scaling` extension, if the `extendedDynamicState3ViewportWScalingEnable` feature is supported.
• `VK_NV_viewport_swizzle` extension, if the `extendedDynamicState3ViewportSwizzle` feature is supported.
• `VK_NV_fragment_coverage_to_color` extension, if the `extendedDynamicState3CoverageToColorEnable` feature is supported.
• `VK_NV_fragment_coverage_to_color` extension, if the `extendedDynamicState3CoverageToColorLocation` feature is supported.
• `VK_NV_framebuffer_mixed_samples` extension, if the `extendedDynamicState3CoverageModulationMode` feature is supported.
feature is supported.

- **VK_NV_framebuffer_mixed_samples** extension, if the `extendedDynamicState3CoverageModulationTableEnable` feature is supported.
- **VK_NV_framebuffer_mixed_samples** extension, if the `extendedDynamicState3CoverageModulationTable` feature is supported.
- `coverageReductionMode`, if the `extendedDynamicState3CoverageReductionMode` feature is supported.
- `representativeFragmentTest`, if the `extendedDynamicState3RepresentativeFragmentTestEnable` feature is supported.
- `shadingRateImage`, if the `extendedDynamicState3ShadingRateImageEnable` feature is supported.
- `multiviewPerViewViewports`, if the `VK_QCOM_multiview_per_view_viewports` extension is supported.
- `attachmentFeedbackLoopDynamicState`, if the `VK_EXT_attachment_feedback_loop_dynamic_state` extension is supported.
- `legacyVertexAttributes`, if the `VK_EXT_legacy_vertex_attributes` extension is supported.
- `rayTracingPositionFetch`, if the `VK_KHR_ray_tracing_position_fetch` extension is supported.
- `shaderObject`, if the `VK_EXT_shader_object` extension is supported.
- `shaderTileImageColorReadAccess`, if the `VK_EXT_shader_tile_image` extension is supported.
- `depthBiasControl`, if the `VK_EXT_depth_bias_control` extension is supported.
- `deviceGeneratedCompute`, if the `VK_NV_device_generated_commands_compute` extension is supported.
- `shaderEnqueue`, if the `VK_AMDQ_shader_enqueue` extension is supported.
- `cooperativeMatrix`, if the `VK_KHR_cooperative_matrix` extension is supported.
- `ycbcrDegamma`, if the `VK_QCOM_qc_hcr_degamma` extension is supported.
- `descriptorPoolOverallocation`, if the `VK_NV_descriptor_pool_overallocation` extension is supported.
- `externalFormatResolve`, if the `VK_ANDROID_external_format_resolve` extension is supported.
- `extendedSparseAddressSpace`, if the `VK_NV_extended_sparse_address_space` extension is supported.
- `schedulingControls`, if the `VK_ARM_scheduling_controls` extension is supported.
- `relaxedLineRasterization`, if the `VK_IMG_relaxed_line_rasterization` extension is supported.
- `renderPassStriped`, if the `VK_ARM_render_pass_striped` extension is supported.
- `perStageDescriptorSet`, if the `VK_NV_per_stage_descriptor_set` extension is supported.
- `shaderMaximalReconvergence`, if the `VK_KHR_shade_maximal_reconvergence` extension is supported.
- `shaderSubgroupRotate`, if the `VK_KHR_shader_subgroup_rotate` extension is supported.
- `shaderExpectAssume`, if the `VK_KHR_shader_expect_assume` extension is supported.
- `shaderFloatControls2`, if the `VK_KHR_shader_float_controls2` extension is supported.
- `dynamicRenderingLocalRead`, if the `VK_KHR_dynamic_rendering_local_read` extension is supported.
- `shaderQuadControl`, if the `VK_KHR_shader_quad_control` extension is supported.
- `shaderFloat16VectorAtomics`, if the `VK_NV_shader_atomic_float16_vector` extension is supported.
• memoryMapPlaced if the VK_EXT_map_memory_placed extension is supported.
• shaderRawAccessChains, if the VK_NV_raw_access_chains extension is supported.
• customBorderColorColors, if the VK_EXT_custom_border_color extension is supported.
• imageAlignmentControl, if the VK_MESA_image_alignment_control extension is supported.
• shaderReplicatedComposites, if the VK_EXT_shader_replicated_composites extension is supported.
• shaderRelaxedExtendedInstruction if the VK_KHR_shader_relaxed_extended_instruction extension is supported.

All other features defined in the Specification are optional.

47.2. Profile Features

47.2.1. Roadmap 2022

Implementations that claim support for the Roadmap 2022 profile must support the following features:

• fullDrawIndexUint32
• imageCubeArray
• independentBlend
• sampleRateShading
• drawIndirectFirstInstance
• depthClamp
• depthBiasClamp
• samplerAnisotropy
• occlusionQueryPrecise
• fragmentStoresAndAtomics
• shaderStorageImageExtendedFormats
• shaderUniformBufferArrayDynamicIndexing
• shaderSampledImageArrayDynamicIndexing
• shaderStorageBufferArrayDynamicIndexing
• shaderStorageImageArrayDynamicIndexing
• samplerYcbcrConversion
• samplerMirrorClampToEdge
• descriptorIndexing
• shaderUniformTexelBufferArrayDynamicIndexing
• shaderStorageTexelBufferArrayDynamicIndexing
• shaderUniformBufferArrayNonUniformIndexing
47.2.2. Roadmap 2024

Implementations that claim support for the Roadmap 2024 profile must support the following features:

- multiDrawIndirect
- shaderImageGatherExtended
- shaderDrawParameters
- shaderInt8
- shaderInt16
- shaderFloat16
- storageBuffer16BitAccess
- storageBuffer8BitAccess
Chapter 48. Limits

Limits are implementation-dependent minimums, maximums, and other device characteristics that an application may need to be aware of.

Note
Limits are reported via the basic VkPhysicalDeviceLimits structure as well as the extensible structure VkPhysicalDeviceProperties2, which was added in VK_KHR_get_physical_device_properties2 and included in Vulkan 1.1. When limits are added in future Vulkan versions or extensions, each extension should introduce one new limit structure, if needed. This structure can be added to the pNext chain of the VkPhysicalDeviceProperties2 structure.

The VkPhysicalDeviceLimits structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPhysicalDeviceLimits {
    uint32_t maxImageDimension1D;
    uint32_t maxImageDimension2D;
    uint32_t maxImageDimension3D;
    uint32_t maxImageDimensionCube;
    uint32_t maxImageArrayLayers;
    uint32_t maxTexelBufferElements;
    uint32_t maxUniformBufferRange;
    uint32_t maxStorageBufferRange;
    uint32_t maxPushConstantsSize;
    uint32_t maxMemoryAllocationCount;
    uint32_t maxSamplerAllocationCount;
    VkDeviceSize bufferImageGranularity;
    VkDeviceSize sparseAddressSpaceSize;
    uint32_t maxBoundDescriptorSets;
    uint32_t maxPerStageDescriptorSamplers;
    uint32_t maxPerStageDescriptorUniformBuffers;
    uint32_t maxPerStageDescriptorStorageBuffers;
    uint32_t maxPerStageDescriptorSampledImages;
    uint32_t maxPerStageDescriptorStorageImages;
    uint32_t maxPerStageDescriptorInputAttachments;

The VkPhysicalDeviceLimits are properties of the physical device. These are available in the limits member of the VkPhysicalDeviceProperties structure which is returned from vkGetPhysicalDeviceProperties.

- **maxImageDimension1D** is the largest dimension (width) that is guaranteed to be supported for all images created with an `imageType` of VK_IMAGE_TYPE_1D. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension2D** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of VK_IMAGE_TYPE_2D and without VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT set in flags. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimension3D** is the largest dimension (width, height, or depth) that is guaranteed to be supported for all images created with an `imageType` of VK_IMAGE_TYPE_3D. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.

- **maxImageDimensionCube** is the largest dimension (width or height) that is guaranteed to be supported for all images created with an `imageType` of VK_IMAGE_TYPE_2D and with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT set in flags. Some combinations of image parameters (format, usage, etc.) may allow support for larger dimensions, which can be queried using `vkGetPhysicalDeviceImageFormatProperties`.
• **maxImageArrayLayers** is the maximum number of layers (arrayLayers) for an image.

• **maxTexelBufferElements** is the maximum number of addressable texels for a buffer view created on a buffer which was created with the `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT` set in the usage member of the `VkBufferCreateInfo` structure.

• **maxUniformBufferRange** is the maximum value that can be specified in the range member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`.

• **maxStorageBufferRange** is the maximum value that can be specified in the range member of a `VkDescriptorBufferInfo` structure passed to `vkUpdateDescriptorSets` for descriptors of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

• **maxPushConstantsSize** is the maximum size, in bytes, of the pool of push constant memory. For each of the push constant ranges indicated by the `pPushConstantRanges` member of the `VkPipelineLayoutCreateInfo` structure, \((\text{offset} + \text{size})\) must be less than or equal to this limit.

• **maxMemoryAllocationCount** is the maximum number of device memory allocations, as created by `vkAllocateMemory`, which can simultaneously exist.

• **maxSamplerAllocationCount** is the maximum number of sampler objects, as created by `vkCreateSampler`, which can simultaneously exist on a device.

• **bufferImageGranularity** is the granularity, in bytes, at which buffer or linear image resources, and optimal image resources can be bound to adjacent offsets in the same `VkDeviceMemory` object without aliasing. See Buffer-Image Granularity for more details.

• **sparseAddressSpaceSize** is the total amount of address space available, in bytes, for sparse memory resources. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them. If the `extendedSparseAddressSpace` feature is enabled, then the difference between `extendedSparseAddressSpaceSize` and `sparseAddressSpaceSize` can also be used, by `VkImage` created with the usage member of `VkImageCreateInfo` only containing bits in `extendedSparseImageUsageFlags` and `VkBuffer` created with the usage member of `VkBufferCreateInfo` only containing bits in `extendedSparseBufferUsageFlags`.

• **maxBoundDescriptorSets** is the maximum number of descriptor sets that can be simultaneously used by a pipeline. All `DescriptorSet` decorations in shader modules must have a value less than `maxBoundDescriptorSets`. See Descriptor Sets.

• **maxPerStageDescriptorSamplers** is the maximum number of samplers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. A descriptor is accessible to a shader stage when the stageFlags member of the `VkDescriptorSetLayoutBinding` structure has the bit for that shader stage set. See Sampler and Combined Image Sampler.

• **maxPerStageDescriptorUniformBuffers** is the maximum number of uniform buffers that can be accessible to a single shader stage in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against...
this limit. Only descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A
descriptor is accessible to a shader stage when the stageFlags member of the
VkDescriptorSetLayoutBinding structure has the bit for that shader stage set. See Uniform Buffer
and Dynamic Uniform Buffer.

- **maxPerStageDescriptorStorageBuffers** is the maximum number of storage buffers that can be
accessible to a single shader stage in a pipeline layout. Descriptors with a type of
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC count against
this limit. Only descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A
descriptor is accessible to a pipeline shader stage when the stageFlags member of the
VkDescriptorSetLayoutBinding structure has the bit for that shader stage set. See Storage Buffer
and Dynamic Storage Buffer.

- **maxPerStageDescriptorSampledImages** is the maximum number of sampled images that can be
accessible to a single shader stage in a pipeline layout. Descriptors with a type of
VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or
VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER count against this limit. Only descriptors in descriptor set
layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the
stageFlags member of the VkDescriptorSetLayoutBinding structure has the bit for that shader stage set. See Combined Image Sampler, Sampled Image, and Uniform Texel Buffer.

- **maxPerStageDescriptorStorageImages** is the maximum number of storage images that can be
accessible to a single shader stage in a pipeline layout. Descriptors with a type of
VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER count against this limit. Only descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A
descriptor is accessible to a pipeline shader stage when the stageFlags member of the
VkDescriptorSetLayoutBinding structure has the bit for that shader stage set. See Storage Image,
and Storage Texel Buffer.

- **maxPerStageDescriptorInputAttachments** is the maximum number of input attachments that can be
accessible to a single shader stage in a pipeline layout. Descriptors with a type of
VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT count against this limit. Only descriptors in descriptor set
layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. A descriptor is accessible to a pipeline shader stage when the
stageFlags member of the VkDescriptorSetLayoutBinding structure has the bit for that shader stage set. These are only supported for the fragment stage. See Input Attachment.

- **maxPerStageResources** is the maximum number of resources that can be accessible to a single
shader stage in a pipeline layout. Descriptors with a type of
VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,
VK_DESCRIPTOR_TYPE_STORAGE_IMAGE,
VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER,
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC,
count against this limit. Only descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set count against this limit. For
the fragment shader stage the framebuffer color attachments also count against this limit.
• **maxDescriptorSetSamplers** is the maximum number of samplers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Sampler and Combined Image Sampler.

• **maxDescriptorSetUniformBuffers** is the maximum number of uniform buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Uniform Buffer and Dynamic Uniform Buffer.

• **maxDescriptorSetUniformBuffersDynamic** is the maximum number of dynamic uniform buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Dynamic Uniform Buffer.

• **maxDescriptorSetStorageBuffers** is the maximum number of storage buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Storage Buffer and Dynamic Storage Buffer.

• **maxDescriptorSetStorageBuffersDynamic** is the maximum number of dynamic storage buffers that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Dynamic Storage Buffer.

• **maxDescriptorSetSampledImages** is the maximum number of sampled images that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Combined Image Sampler, Sampled Image, and Uniform Texel Buffer.

• **maxDescriptorSetStorageImages** is the maximum number of storage images that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See Storage Image, and Storage Texel Buffer.

• **maxDescriptorSetInputAttachments** is the maximum number of input attachments that can be included in a pipeline layout. Descriptors with a type of `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` count against this limit. Only descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit. See
maxVertexInputAttributes is the maximum number of vertex input attributes that can be specified for a graphics pipeline. These are described in the array of VkVertexInputAttributeDescription structures that are provided at graphics pipeline creation time via the pVertexAttributeDescriptions member of the VkPipelineVertexInputStateCreateInfo structure. See Vertex Attributes and Vertex Input Description.

maxVertexInputBindings is the maximum number of vertex buffers that can be specified for providing vertex attributes to a graphics pipeline. These are described in the array of VkVertexInputBindingDescription structures that are provided at graphics pipeline creation time via the pVertexBindingDescriptions member of the VkPipelineVertexInputStateCreateInfo structure. The binding member of VkVertexInputBindingDescription must be less than this limit. See Vertex Input Description.

maxVertexInputAttributeOffset is the maximum vertex input attribute offset that can be added to the vertex input binding stride. The offset member of the VkVertexInputAttributeDescription structure must be less than or equal to this limit. See Vertex Input Description.

maxVertexInputBindingStride is the maximum vertex input binding stride that can be specified in a vertex input binding. The stride member of the VkVertexInputBindingDescription structure must be less than or equal to this limit. See Vertex Input Description.

maxVertexOutputComponents is the maximum number of components of output variables which can be output by a vertex shader. See Vertex Shaders.

maxTessellationGenerationLevel is the maximum tessellation generation level supported by the fixed-function tessellation primitive generator. See Tessellation.

maxTessellationPatchSize is the maximum patch size, in vertices, of patches that can be processed by the tessellation control shader and tessellation primitive generator. The patchControlPoints member of the VkPipelineTessellationStateCreateInfo structure specified at pipeline creation time and the value provided in the OutputVertices execution mode of shader modules must be less than or equal to this limit. See Tessellation.

maxTessellationControlPerVertexInputComponents is the maximum number of components of input variables which can be provided as per-vertex inputs to the tessellation control shader stage.

maxTessellationControlPerVertexOutputComponents is the maximum number of components of per-vertex output variables which can be output from the tessellation control shader stage.

maxTessellationControlPerPatchOutputComponents is the maximum number of components of per-patch output variables which can be output from the tessellation control shader stage.

maxTessellationControlTotalOutputComponents is the maximum total number of components of per-vertex and per-patch output variables which can be output from the tessellation control shader stage.

maxTessellationEvaluationInputComponents is the maximum number of components of input variables which can be provided as per-vertex inputs to the tessellation evaluation shader stage.

maxTessellationEvaluationOutputComponents is the maximum number of components of per-vertex output variables which can be output from the tessellation evaluation shader stage.
• maxGeometryShaderInvocations is the maximum invocation count supported for instanced geometry shaders. The value provided in the Invocations execution mode of shader modules must be less than or equal to this limit. See Geometry Shading.

• maxGeometryInputComponents is the maximum number of components of input variables which can be provided as inputs to the geometry shader stage.

• maxGeometryOutputComponents is the maximum number of components of output variables which can be output from the geometry shader stage.

• maxGeometryOutputVertices is the maximum number of vertices which can be emitted by any geometry shader.

• maxGeometryTotalOutputComponents is the maximum total number of components of output variables, across all emitted vertices, which can be output from the geometry shader stage.

• maxFragmentInputComponents is the maximum number of components of input variables which can be provided as inputs to the fragment shader stage.

• maxFragmentOutputAttachments is the maximum number of output attachments which can be written to by the fragment shader stage.

• maxFragmentDualSrcAttachments is the maximum number of output attachments which can be written to by the fragment shader stage when blending is enabled and one of the dual source blend modes is in use. See Dual-Source Blending and dualSrcBlend.

• maxFragmentCombinedOutputResources is the total number of storage buffers, storage images, and output Location decorated color attachments (described in Fragment Output Interface) which can be used in the fragment shader stage.

• maxComputeSharedMemorySize is the maximum total storage size, in bytes, available for variables declared with the Workgroup storage class in shader modules (or with the shared storage qualifier in GLSL) in the compute shader stage.

• maxComputeWorkGroupCount[3] is the maximum number of local workgroups that can be dispatched by a single dispatching command. These three values represent the maximum number of local workgroups for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the dispatching commands must be less than or equal to the corresponding limit. See Dispatching Commands.

• maxComputeWorkGroupInvocations is the maximum total number of compute shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the LocalSize or LocalSizeId execution mode in shader modules or by the object decorated by the WorkgroupSize decoration, must be less than or equal to this limit.

• maxComputeWorkGroupSize[3] is the maximum size of a local compute workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the LocalSize or LocalSizeId execution mode or by the object decorated by the WorkgroupSize decoration in shader modules, must be less than or equal to the corresponding limit.

• subPixelPrecisionBits is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f. See Rasterization.

• subTexelPrecisionBits is the number of bits of precision in the division along an axis of an image used for minification and magnification filters. 2^{subTexelPrecisionBits} is the actual number of
divisions along each axis of the image represented. Sub-texel values calculated during image sampling will snap to these locations when generating the filtered results.

- **mipmapPrecisionBits** is the number of bits of division that the LOD calculation for mipmap fetching get snapped to when determining the contribution from each mip level to the mip filtered results. \(2^\text{mipmapPrecisionBits}\) is the actual number of divisions.

- **maxDrawIndexedIndexValue** is the maximum index value that can be used for indexed draw calls when using 32-bit indices. This excludes the primitive restart index value of 0xFFFFFFFF. See fullDrawIndexUint32.

- **maxDrawIndirectCount** is the maximum draw count that is supported for indirect drawing calls. See multiDrawIndirect.

- **maxSamplerLodBias** is the maximum absolute sampler LOD bias. The sum of the mipLodBias member of the VkSamplerCreateInfo structure and the Bias operand of image sampling operations in shader modules (or 0 if no Bias operand is provided to an image sampling operation) are clamped to the range \([-\text{maxSamplerLodBias}, +\text{maxSamplerLodBias}]\). See [samplers-mipLodBias].

- **maxSamplerAnisotropy** is the maximum degree of sampler anisotropy. The maximum degree of anisotropic filtering used for an image sampling operation is the minimum of the maxAnisotropy member of the VkSamplerCreateInfo structure and this limit. See [samplers-maxAnisotropy].

- **maxViewports** is the maximum number of active viewports. The viewportCount member of the VkPipelineViewportStateCreateInfo structure that is provided at pipeline creation must be less than or equal to this limit.

- **maxViewportDimensions[2]** are the maximum viewport dimensions in the X (width) and Y (height) dimensions, respectively. The maximum viewport dimensions must be greater than or equal to the largest image which can be created and used as a framebuffer attachment. See Controlling the Viewport.

- **viewportBoundsRange[2]** is the \([\text{minimum}, \text{maximum}]\) range that the corners of a viewport must be contained in. This range must be at least \([-2 \times \text{size}, 2 \times \text{size} - 1]\), where \(\text{size} = \max(\text{maxViewportDimensions}[0], \text{maxViewportDimensions}[1])\). See Controlling the Viewport.

**Note**

The intent of the viewportBoundsRange limit is to allow a maximum sized viewport to be arbitrarily shifted relative to the output target as long as at least some portion intersects. This would give a bounds limit of \([-\text{size} + 1, 2 \times \text{size} - 1]\) which would allow all possible non-empty-set intersections of the output target and the viewport. Since these numbers are typically powers of two, picking the signed number range using the smallest possible number of bits ends up with the specified range.

- **viewportSubPixelBits** is the number of bits of subpixel precision for viewport bounds. The subpixel precision that floating-point viewport bounds are interpreted at is given by this limit.

- **minMemoryMapAlignment** is the minimum required alignment, in bytes, of host visible memory allocations within the host address space. When mapping a memory allocation with vkMapMemory, subtracting offset bytes from the returned pointer will always produce an integer multiple of this limit. See Host Access to Device Memory Objects. The value must be a
power of two.

- **minTexelBufferOffsetAlignment** is the minimum **required** alignment, in bytes, for the offset member of the `VkBufferViewCreateInfo` structure for texel buffers. The value **must** be a power of two. If `texelBufferAlignment` is enabled, this limit is equivalent to the maximum of the `uniformTexelBufferOffsetAlignmentBytes` and `storageTexelBufferOffsetAlignmentBytes` members of `VkPhysicalDeviceTexelBufferAlignmentProperties`, but smaller alignment is **optionally** allowed by `storageTexelBufferOffsetSingleTexelAlignment` and `uniformTexelBufferOffsetSingleTexelAlignment`. If `texelBufferAlignment` is not enabled, `VkBufferViewCreateInfo::offset` **must** be a multiple of this value.

- **minUniformBufferOffsetAlignment** is the minimum **required** alignment, in bytes, for the offset member of the `VkDescriptorBufferInfo` structure for uniform buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` is updated, the offset **must** be an integer multiple of this limit. Similarly, dynamic offsets for uniform buffers **must** be multiples of this limit. The value **must** be a power of two.

- **minStorageBufferOffsetAlignment** is the minimum **required** alignment, in bytes, for the offset member of the `VkDescriptorBufferInfo` structure for storage buffers. When a descriptor of type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` is updated, the offset **must** be an integer multiple of this limit. Similarly, dynamic offsets for storage buffers **must** be multiples of this limit. The value **must** be a power of two.

- **minTexelOffset** is the minimum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.

- **maxTexelOffset** is the maximum offset value for the `ConstOffset` image operand of any of the `OpImageSample*` or `OpImageFetch*` image instructions.

- **minTexelGatherOffset** is the minimum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.

- **maxTexelGatherOffset** is the maximum offset value for the `Offset`, `ConstOffset`, or `ConstOffsets` image operands of any of the `OpImage*Gather` image instructions.

- **minInterpolationOffset** is the base minimum (inclusive) negative offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.

- **maxInterpolationOffset** is the base maximum (inclusive) positive offset value for the `Offset` operand of the `InterpolateAtOffset` extended instruction.

- **subPixelInterpolationOffsetBits** is the number of fractional bits that the x and y offsets to the `InterpolateAtOffset` extended instruction **may** be rounded to as fixed-point values.

- **maxFramebufferWidth** is the maximum width for a framebuffer. The width member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.

- **maxFramebufferHeight** is the maximum height for a framebuffer. The height member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.

- **maxFramebufferLayers** is the maximum layer count for a layered framebuffer. The layers member of the `VkFramebufferCreateInfo` structure **must** be less than or equal to this limit.

- **framebufferColorSampleCounts** is a bitmask\(^1\) of `VkSampleCountFlagBits` indicating the color sample counts that are supported for all framebuffer color attachments with floating- or fixed-point formats. For color attachments with integer formats, see

\(^1\) A bitmask is a way of encoding multiple pieces of information in a single value, where each bit represents a different piece of information.
framebufferIntegerColorSampleCounts.

- framebufferDepthSampleCounts is a bitmask of VkSampleCountFlagBits indicating the supported depth sample counts for all framebuffer depth/stencil attachments, when the format includes a depth component.

- framebufferStencilSampleCounts is a bitmask of VkSampleCountFlagBits indicating the supported stencil sample counts for all framebuffer depth/stencil attachments, when the format includes a stencil component.

- framebufferNoAttachmentsSampleCounts is a bitmask of VkSampleCountFlagBits indicating the supported sample counts for a subpass which uses no attachments.

- maxColorAttachments is the maximum number of color attachments that can be used by a subpass in a render pass. The colorAttachmentCount member of the VkSubpassDescription or VkSubpassDescription2 structure must be less than or equal to this limit.

- sampledImageColorSampleCounts is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a non-integer color format.

- sampledImageIntegerSampleCounts is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and an integer color format.

- sampledImageDepthSampleCounts is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a depth format.

- sampledImageStencilSampleCounts is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, usage containing VK_IMAGE_USAGE_SAMPLED_BIT, and a stencil format.

- storageImageSampleCounts is a bitmask of VkSampleCountFlagBits indicating the sample counts supported for all 2D images created with VK_IMAGE_TILING_OPTIMAL, and usage containing VK_IMAGE_USAGE_STORAGE_BIT.

- maxSampleMaskWords is the maximum number of array elements of a variable decorated with the SampleMask built-in decoration.

- timestampComputeAndGraphics specifies support for timestamps on all graphics and compute queues. If this limit is set to VK_TRUE, all queues that advertise the VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT in the VkQueueFamilyProperties::queueFlags support VkQueueFamilyProperties::timestampValidBits of at least 36. See Timestamp Queries.

- timestampPeriod is the number of nanoseconds required for a timestamp query to be incremented by 1. See Timestamp Queries.

- maxClipDistances is the maximum number of clip distances that can be used in a single shader stage. The size of any array declared with the ClipDistance built-in decoration in a shader module must be less than or equal to this limit.

- maxCullDistances is the maximum number of cull distances that can be used in a single shader stage. The size of any array declared with the CullDistance built-in decoration in a shader module must be less than or equal to this limit.

- maxCombinedClipAndCullDistances is the maximum combined number of clip and cull distances...
that can be used in a single shader stage. The sum of the sizes of all arrays declared with the ClipDistance and CullDistance built-in decoration used by a single shader stage in a shader module must be less than or equal to this limit.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- discreteQueuePriorities is the number of discrete priorities that can be assigned to a queue based on the value of each member of VkDeviceQueueCreateInfo::pQueuePriorities. This must be at least 2, and levels must be spread evenly over the range, with at least one level at 1.0, and another at 0.0. See Queue Priority.

- pointSizeRange[2] is the range [minimum,maximum] of supported sizes for points. Values written to variables decorated with the PointSize built-in decoration are clamped to this range.

- lineWidthRange[2] is the range [minimum,maximum] of supported widths for lines. Values specified by the lineWidth member of the VkPipelineRasterizationStateCreateInfo or the lineWidth parameter to vkCmdSetLineWidth are clamped to this range.

- pointSizeGranularity is the granularity of supported point sizes. Not all point sizes in the range defined by pointSizeRange are supported. This limit specifies the granularity (or increment) between successive supported point sizes.

- lineWidthGranularity is the granularity of supported line widths. Not all line widths in the range defined by lineWidthRange are supported. This limit specifies the granularity (or increment) between successive supported line widths.

- strictLines specifies whether lines are rasterized according to the preferred method of rasterization. If set to VK_FALSE, lines may be rasterized under a relaxed set of rules. If set to VK_TRUE, lines are rasterized as per the strict definition. See Basic Line Segment Rasterization.

- standardSampleLocations specifies whether rasterization uses the standard sample locations as documented in Multisampling. If set to VK_TRUE, the implementation uses the documented sample locations. If set to VK_FALSE, the implementation may use different sample locations.

- optimalBufferCopyOffsetAlignment is the optimal buffer offset alignment in bytes for vkCmdCopyBufferToImage2, vkCmdCopyBufferToImage, vkCmdCopyImageToBuffer2, and vkCmdCopyImageToBuffer. This value is also the optimal host memory offset alignment in bytes for vkCopyMemoryToImageEXT and vkCopyImageToMemoryEXT. The per texel alignment requirements are enforced, but applications should use the optimal alignment for optimal performance and power use. The value must be a power of two.

- optimalBufferCopyRowPitchAlignment is the optimal buffer row pitch alignment in bytes for vkCmdCopyBufferToImage2, vkCmdCopyBufferToImage, vkCmdCopyImageToBuffer2, and vkCmdCopyImageToBuffer. This value is also the optimal host memory row pitch alignment in bytes for vkCopyMemoryToImageEXT and vkCopyImageToMemoryEXT. Row pitch is the number of bytes between texels with the same X coordinate in adjacent rows (Y coordinates differ by one). The per texel alignment requirements are enforced, but applications should use the optimal alignment for optimal performance and power use. The value must be a power of two.

- nonCoherentAtomSize is the size and alignment in bytes that bounds concurrent access to host-mapped device memory. The value must be a power of two.

1 For all bitmasks of VkSampleCountFlagBits, the sample count limits defined above represent the minimum supported sample counts for each image type. Individual images may support
additional sample counts, which are queried using \texttt{vkGetPhysicalDeviceImageFormatProperties} as described in \textit{Supported Sample Counts}.

Bits which \textbf{may} be set in the sample count limits returned by \texttt{VkPhysicalDeviceLimits}, as well as in other queries and structures representing image sample counts, are:

\begin{verbatim}
// Provided by VK_VERSION_1_0
typedef enum VkSampleCountFlagBits {
    VK_SAMPLE_COUNT_1_BIT = 0x00000001,
    VK_SAMPLE_COUNT_2_BIT = 0x00000002,
    VK_SAMPLE_COUNT_4_BIT = 0x00000004,
    VK_SAMPLE_COUNT_8_BIT = 0x00000008,
    VK_SAMPLE_COUNT_16_BIT = 0x00000010,
    VK_SAMPLE_COUNT_32_BIT = 0x00000020,
    VK_SAMPLE_COUNT_64_BIT = 0x00000040,
} VkSampleCountFlagBits;
\end{verbatim}

- \textbf{VK\_SAMPLE\_COUNT\_1\_BIT} specifies an image with one sample per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_2\_BIT} specifies an image with 2 samples per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_4\_BIT} specifies an image with 4 samples per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_8\_BIT} specifies an image with 8 samples per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_16\_BIT} specifies an image with 16 samples per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_32\_BIT} specifies an image with 32 samples per pixel.
- \textbf{VK\_SAMPLE\_COUNT\_64\_BIT} specifies an image with 64 samples per pixel.

\begin{verbatim}
// Provided by VK\_VERSION\_1\_0
typedef VkFlags VkSampleCountFlags;
\end{verbatim}

\texttt{VkSampleCountFlags} is a bitmask type for setting a mask of zero or more \texttt{VkSampleCountFlagBits}.

The \texttt{VkPhysicalDevicePushDescriptorPropertiesKHR} structure is defined as:

\begin{verbatim}
// Provided by VK\_KHR\_push\_descriptor
typedef struct VkPhysicalDevicePushDescriptorPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t maxPushDescriptors;
} VkPhysicalDevicePushDescriptorPropertiesKHR;
\end{verbatim}

- \texttt{sType} is a \texttt{VkStructureType} value identifying this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{maxPushDescriptors} is the maximum number of descriptors that \textbf{can} be used in a descriptor set layout created with \texttt{VK\_DESCRIPTOR\_SET\_LAYOUT\_CREATE\_PUSH\_DESCRIPTOR\_BIT\_KHR} set.
If the `VkPhysicalDevicePushDescriptorPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePushDescriptorPropertiesKHR-sType-sType**
- `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PUSH_DESCRIPTOR_PROPERTIES_KHR`

The `VkPhysicalDeviceMultiviewProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMultiviewProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxMultiviewViewCount;
    uint32_t maxMultiviewInstanceIndex;
} VkPhysicalDeviceMultiviewProperties;
```

or the equivalent

```c
// Provided by VK_KHR_multiview
typedef VkPhysicalDeviceMultiviewProperties VkPhysicalDeviceMultiviewPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxMultiviewViewCount` is one greater than the maximum view index that can be used in a subpass.
- `maxMultiviewInstanceIndex` is the maximum valid value of instance index allowed to be generated by a drawing command recorded within a subpass of a multiview render pass instance.

If the `VkPhysicalDeviceMultiviewProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMultiviewProperties-sType-sType**
- `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTIVIEW_PROPERTIES`

The `VkPhysicalDeviceFloatControlsProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceFloatControlsProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxFloatControls
```
typedef struct VkPhysicalDeviceFloatControlsProperties {
    VkStructureType sType;
    void* pNext;
    VkShaderFloatControlsIndependence denormBehaviorIndependence;
    VkShaderFloatControlsIndependence roundingModeIndependence;
    VkBool32 shaderSignedZeroInfNanPreserveFloat16;
    VkBool32 shaderSignedZeroInfNanPreserveFloat32;
    VkBool32 shaderSignedZeroInfNanPreserveFloat64;
    VkBool32 shaderDenormPreserveFloat16;
    VkBool32 shaderDenormPreserveFloat32;
    VkBool32 shaderDenormPreserveFloat64;
    VkBool32 shaderDenormFlushToZeroFloat16;
    VkBool32 shaderDenormFlushToZeroFloat32;
    VkBool32 shaderDenormFlushToZeroFloat64;
    VkBool32 shaderRoundingModeRTEFloat16;
    VkBool32 shaderRoundingModeRTEFloat32;
    VkBool32 shaderRoundingModeRTEFloat64;
    VkBool32 shaderRoundingModeRTZFloat16;
    VkBool32 shaderRoundingModeRTZFloat32;
    VkBool32 shaderRoundingModeRTZFloat64;
} VkPhysicalDeviceFloatControlsProperties;

or the equivalent

// Provided by VK_KHR_shader_float_controls
typedef VkPhysicalDeviceFloatControlsProperties VkPhysicalDeviceFloatControlsPropertiesKHR;

• sType is a VkStructureType value identifying this structure.
  
• pNext is NULL or a pointer to a structure extending this structure.
  
• denormBehaviorIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, denorm behavior can be set independently for different bit widths.
  
• roundingModeIndependence is a VkShaderFloatControlsIndependence value indicating whether, and how, rounding modes can be set independently for different bit widths.
  
• shaderSignedZeroInfNanPreserveFloat16 is a boolean value indicating whether sign of a zero, Nans and \( \pm \) can be preserved in 16-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 16-bit floating-point types.

• shaderSignedZeroInfNanPreserveFloat32 is a boolean value indicating whether sign of a zero, Nans and \( \pm \) can be preserved in 32-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 32-bit floating-point types.

• shaderSignedZeroInfNanPreserveFloat64 is a boolean value indicating whether sign of a zero, Nans and \( \pm \) can be preserved in 64-bit floating-point computations. It also indicates whether the SignedZeroInfNanPreserve execution mode can be used for 64-bit floating-point types.
• `shaderDenormPreserveFloat16` is a boolean value indicating whether denormals can be preserved in 16-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 16-bit floating-point types.

• `shaderDenormPreserveFloat32` is a boolean value indicating whether denormals can be preserved in 32-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 32-bit floating-point types.

• `shaderDenormPreserveFloat64` is a boolean value indicating whether denormals can be preserved in 64-bit floating-point computations. It also indicates whether the `DenormPreserve` execution mode can be used for 64-bit floating-point types.

• `shaderDenormFlushToZeroFloat16` is a boolean value indicating whether denormals can be flushed to zero in 16-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 16-bit floating-point types.

• `shaderDenormFlushToZeroFloat32` is a boolean value indicating whether denormals can be flushed to zero in 32-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 32-bit floating-point types.

• `shaderDenormFlushToZeroFloat64` is a boolean value indicating whether denormals can be flushed to zero in 64-bit floating-point computations. It also indicates whether the `DenormFlushToZero` execution mode can be used for 64-bit floating-point types.

• `shaderRoundingModeRTEFloat16` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 16-bit floating-point types.

• `shaderRoundingModeRTEFloat32` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 32-bit floating-point types.

• `shaderRoundingModeRTEFloat64` is a boolean value indicating whether an implementation supports the round-to-nearest-even rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTE` execution mode can be used for 64-bit floating-point types.

• `shaderRoundingModeRTZFloat16` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 16-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 16-bit floating-point types.

• `shaderRoundingModeRTZFloat32` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 32-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 32-bit floating-point types.

• `shaderRoundingModeRTZFloat64` is a boolean value indicating whether an implementation supports the round-towards-zero rounding mode for 64-bit floating-point arithmetic and conversion instructions. It also indicates whether the `RoundingModeRTZ` execution mode can be used for 64-bit floating-point types.

If the `VkPhysicalDeviceFloatControlsProperties` structure is included in the `pNext` chain of the
**VkPhysicalDeviceProperties2** structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceFloatControlsProperties-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICALDEVICEFLOATCONTROLS_PROPERTIES`

Values which **may** be returned in the `denormBehaviorIndependence` and `roundingModeIndependence` fields of `VkPhysicalDeviceFloatControlsProperties` are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkShaderFloatControlsIndependence {
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY = 0,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL = 1,
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE = 2,
    // Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY_KHR =
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY,
    // Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL_KHR =
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL,
    // Provided by VK_KHR_shader_float_controls
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE_KHR =
    VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE,
} VkShaderFloatControlsIndependence;
```

or the equivalent

```c
// Provided by VK_KHR_shader_float_controls
typedef VkShaderFloatControlsIndependence VkShaderFloatControlsIndependenceKHR;
```

- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_32_BIT_ONLY** specifies that shader float controls for 32-bit floating-point **can** be set independently; other bit widths **must** be set identically to each other.

- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_ALL** specifies that shader float controls for all bit widths **can** be set independently.

- **VK_SHADER_FLOAT_CONTROLS_INDEPENDENCE_NONE** specifies that shader float controls for all bit widths **must** be set identically.

The `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is defined as:
typedef struct VkPhysicalDeviceDiscardRectanglePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxDiscardRectangles;
} VkPhysicalDeviceDiscardRectanglePropertiesEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxDiscardRectangles** is the maximum number of active discard rectangles that can be specified.

If the `VkPhysicalDeviceDiscardRectanglePropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDiscardRectanglePropertiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISCARD_RECTANGLE_PROPERTIES_EXT`

The `VkPhysicalDeviceSampleLocationsPropertiesEXT` structure is defined as:

typedef struct VkPhysicalDeviceSampleLocationsPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleLocationSampleCounts;
    VkExtent2D maxSampleLocationGridSize;
    float sampleLocationCoordinateRange[2];
    uint32_t sampleLocationSubPixelBits;
    VkBool32 variableSampleLocations;
} VkPhysicalDeviceSampleLocationsPropertiesEXT;

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationSampleCounts** is a bitmask of `VkSampleCountFlagBits` indicating the sample counts supporting custom sample locations.
- **maxSampleLocationGridSize** is the maximum size of the pixel grid in which sample locations can vary that is supported for all sample counts in `sampleLocationSampleCounts`.
- **sampleLocationCoordinateRange[2]** is the range of supported sample location coordinates.
- **sampleLocationSubPixelBits** is the number of bits of subpixel precision for sample locations.
- **variableSampleLocations** specifies whether the sample locations used by all pipelines that will be bound to a command buffer during a subpass must match. If set to `VK_TRUE`, the implementation
supports variable sample locations in a subpass. If set to VK_FALSE, then the sample locations must stay constant in each subpass.

If the VkPhysicalDeviceSampleLocationsPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSampleLocationsPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLE_LOCATIONS_PROPERTIES_EXT

The VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT structure is defined as:

```c
typedef struct VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 nativeUnalignedPerformance;
} VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT;
```

This structure describes the following features:

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **nativeUnalignedPerformance** specifies whether unaligned vertex fetches do not incur significant performance penalties as compared to aligned fetches.

If the VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceFeatures2 structure passed to vkGetPhysicalDeviceFeatures2, it is filled in to indicate whether each corresponding feature is supported. VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT can also be used in the pNext chain of VkDeviceCreateInfo to selectively enable these features.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLegacyVertexAttributesPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LEGACY_VERTEX_ATTRIBUTES_PROPERTIES_EXT

The VkPhysicalDeviceExternalMemoryHostPropertiesEXT structure is defined as:
typedef struct VkPhysicalDeviceExternalMemoryHostPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize minImportedHostPointerAlignment;
} VkPhysicalDeviceExternalMemoryHostPropertiesEXT;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **minImportedHostPointerAlignment** is the minimum required alignment, in bytes, for the base address and size of host pointers that can be imported to a Vulkan memory object. The value must be a power of two.

If the VkPhysicalDeviceExternalMemoryHostPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalMemoryHostPropertiesEXT-sType-sType
  
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_MEMORY_HOST_PROPERTIES_EXT

The VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX structure is defined as:

```c
// Provided by VK_NVX_multiview_per_view_attributes
typedef struct VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX {
    VkStructureType sType;
    void* pNext;
    VkBool32 perViewPositionAllComponents;
} VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **perViewPositionAllComponents** is VK_TRUE if the implementation supports per-view position values that differ in components other than the X component.

If the VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiviewPerViewAttributesPropertiesNVX-sType-sType
  
  sType must be
The `VkPhysicalDevicePointClippingProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDevicePointClippingProperties {
    VkStructureType sType;
    void* pNext;
    VkPointClippingBehavior pointClippingBehavior;
} VkPhysicalDevicePointClippingProperties;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPhysicalDevicePointClippingProperties
    VkPhysicalDevicePointClippingPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pointClippingBehavior` is a `VkPointClippingBehavior` value specifying the point clipping behavior supported by the implementation.

If the `VkPhysicalDevicePointClippingProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDevicePointClippingProperties-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_POINT_CLIPPING_PROPERTIES`

The `VkPhysicalDeviceSubgroupProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceSubgroupProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t subgroupSize;
    VkShaderStageFlags supportedStages;
    VkSubgroupFeatureFlags supportedOperations;
    VkBool32 quadOperationsInAllStages;
} VkPhysicalDeviceSubgroupProperties;
```

- `sType` is a `VkStructureType` value identifying this structure.
• \textit{pNext} is NULL or a pointer to a structure extending this structure.

• \texttt{subgroupSize} is the default number of invocations in each subgroup. \texttt{subgroupSize} is at least 1 if any of the physical device’s queues support \texttt{VK_QUEUE_GRAPHICS_BIT} or \texttt{VK_QUEUE.Compute_BIT}. \texttt{subgroupSize} is a power-of-two.

• \texttt{supportedStages} is a bitfield of \texttt{VkShaderStageFlagBits} describing the shader stages that \textit{group operations} with \textit{subgroup scope} are supported in. \texttt{supportedStages} will have the \texttt{VK_SHADER_STAGE_COMPUTE_BIT} bit set if any of the physical device’s queues support \texttt{VK_QUEUE.Compute_BIT}.

• \texttt{supportedOperations} is a bitmask of \texttt{VkSubgroupFeatureFlagBits} specifying the sets of \textit{group operations} with \textit{subgroup scope} supported on this device. \texttt{supportedOperations} will have the \texttt{VK_SUBGROUP_FEATURE_BASIC_BIT} bit set if any of the physical device’s queues support \texttt{VK_QUEUE_GRAPHICS_BIT} or \texttt{VK_QUEUE.Compute_BIT}.

• \texttt{quadOperationsInAllStages} is a boolean specifying whether \textit{quad group operations} are available in all stages, or are restricted to fragment and compute stages.

If the \texttt{VkPhysicalDeviceSubgroupProperties} structure is included in the \texttt{pNext} chain of the \texttt{VkPhysicalDeviceProperties2} structure passed to \texttt{vkGetPhysicalDeviceProperties2}, it is filled in with each corresponding implementation-dependent property.

If \texttt{supportedOperations} includes \texttt{VK_SUBGROUP_FEATURE_QUAD_BIT}, or \texttt{shaderSubgroupUniformControlFlow} is enabled, \texttt{subgroupSize} must be greater than or equal to 4.

If the \texttt{shaderQuadControl} feature is supported, \texttt{supportedOperations} must include \texttt{VK_SUBGROUP_FEATURE_QUAD_BIT}.

If \texttt{VK_KHR.shader_subgroup_rotate} is supported, and the implementation advertises support with a \texttt{VkExtensionProperties::specVersion} greater than or equal to 2, and \texttt{shaderSubgroupRotate} is supported, \texttt{VK_SUBGROUP_FEATURE_ROTATE_BIT_KHR} must be returned in \texttt{supportedOperations}. If \texttt{VK_KHR.shader_subgroup_rotate} is supported, and the implementation advertises support with a \texttt{VkExtensionProperties::specVersion} greater than or equal to 2, and \texttt{shaderSubgroupRotateClustered} is supported, \texttt{VK_SUBGROUP_FEATURE_ROTATE_CLUSTERED_BIT_KHR} must be returned in \texttt{supportedOperations}.

\begin{quote}
\textbf{Note}
\texttt{VK_SUBGROUP_FEATURE_ROTATE_BIT_KHR} and \texttt{VK_SUBGROUP_FEATURE_ROTATE_CLUSTERED_BIT_KHR} were added in version 2 of the \texttt{VK_KHR.shader_subgroup_rotate} extension, after the initial release, so there are implementations that do not advertise these bits. Applications should use the \texttt{shaderSubgroupRotate} and \texttt{shaderSubgroupRotateClustered} features to determine and enable support. These bits are advertised here for consistency and for future dependencies.
\end{quote}

\begin{quote}
\textbf{Valid Usage (Implicit)}
\begin{itemize}
\item \texttt{VUID-VkPhysicalDeviceSubgroupProperties-sType-sType} \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_PROPERTIES}
\end{itemize}
\end{quote}
Bits which can be set in `VkPhysicalDeviceSubgroupProperties::supportedOperations` and `VkPhysicalDeviceVulkan11Properties::subgroupSupportedOperations` to specify supported group operations with subgroup scope are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSubgroupFeatureFlagBits {
    VK_SUBGROUP_FEATURE_BASIC_BIT = 0x00000001,
    VK_SUBGROUP_FEATURE_VOTE_BIT = 0x00000002,
    VK_SUBGROUP_FEATURE_ARITHMETIC_BIT = 0x00000004,
    VK_SUBGROUP_FEATURE_BALLOT_BIT = 0x00000008,
    VK_SUBGROUP_FEATURE_SHUFFLE_BIT = 0x00000010,
    VK_SUBGROUP_FEATURE_SHUFFLE.Relative_BIT = 0x00000020,
    VK_SUBGROUP_FEATURE_CLUSTERS_BIT = 0x00000040,
    VK_SUBGROUP_FEATURE_QUAD_BIT = 0x00000080,
    // Provided by VK_NVShaderSubgroupPartitioned
    VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV = 0x00000100,
    // Provided by VK_KHRShaderSubgroupRotate
    VK_SUBGROUP_FEATURE_ROTATE_BIT_KHR = 0x00000200,
    // Provided by VK_KHRShaderSubgroupRotate
    VK_SUBGROUP_FEATURE_ROTATE_CLUSTERED_BIT_KHR = 0x00000400,
} VkSubgroupFeatureFlagBits;
```

- **VK_SUBGROUP_FEATURE_BASIC_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniform` capability.
- **VK_SUBGROUP_FEATURE_VOTE_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformVote` capability.
- **VK_SUBGROUP_FEATURE_ARITHMETIC_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformArithmetic` capability.
- **VK_SUBGROUP_FEATURE_BALLOT_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformBallot` capability.
- **VK_SUBGROUP_FEATURE_SHUFFLE_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformShuffle` capability.
- **VK_SUBGROUP_FEATURE_SHUFFLE.Relative_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformShuffleRelative` capability.
- **VK_SUBGROUP_FEATURE_CLUSTERS_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformClustered` capability.
- **VK_SUBGROUP_FEATURE_QUAD_BIT** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformQuad` capability.
- **VK_SUBGROUP_FEATURE_PARTITIONED_BIT_NV** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformPartitionedNV` capability.
- **VK_SUBGROUP_FEATURE_ROTATE_BIT_KHR** specifies the device will accept SPIR-V shader modules containing the `GroupNonUniformRotateKHR` capability.
- **VK_SUBGROUP_FEATURE_ROTATE_CLUSTERED_BIT_KHR** specifies the device will accept SPIR-V shader modules that use the `ClusterSize` operand to `OpGroupNonUniformRotateKHR`.
```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkSubgroupFeatureFlags;
```

`VkSubgroupFeatureFlags` is a bitmask type for setting a mask of zero or more `VkSubgroupFeatureFlagBits`.

The `VkPhysicalDeviceSubgroupSizeControlProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceSubgroupSizeControlProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t minSubgroupSize;
    uint32_t maxSubgroupSize;
    uint32_t maxComputeWorkgroupSubgroups;
    VkShaderStageFlags requiredSubgroupSizeStages;
} VkPhysicalDeviceSubgroupSizeControlProperties;
```

or the equivalent

```c
// Provided by VK_EXT_subgroup_size_control
typedef VkPhysicalDeviceSubgroupSizeControlProperties
    VkPhysicalDeviceSubgroupSizeControlPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minSubgroupSize` is the minimum subgroup size supported by this device. `minSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `minSubgroupSize` is a power-of-two. `minSubgroupSize` is less than or equal to `maxSubgroupSize`. `minSubgroupSize` is less than or equal to `subgroupSize`.
- `maxSubgroupSize` is the maximum subgroup size supported by this device. `maxSubgroupSize` is at least one if any of the physical device's queues support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`. `maxSubgroupSize` is a power-of-two. `maxSubgroupSize` is greater than or equal to `minSubgroupSize`. `maxSubgroupSize` is greater than or equal to `subgroupSize`.
- `maxComputeWorkgroupSubgroups` is the maximum number of subgroups supported by the implementation within a workgroup.
- `requiredSubgroupSizeStages` is a bitfield of what shader stages support having a required subgroup size specified.

If the `VkPhysicalDeviceSubgroupSizeControlProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `VkPhysicalDeviceSubgroupProperties::supportedOperations` includes
VK_SUBGROUP_FEATURE_QUAD_BIT, minSubgroupSize must be greater than or equal to 4.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubgroupSizeControlProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBGROUP_SIZE_CONTROL_PROPERTIES

The VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_blend_operation_advanced
typedef struct VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t advancedBlendMaxColorAttachments;
    VkBool32 advancedBlendIndependentBlend;
    VkBool32 advancedBlendNonPremultipliedSrcColor;
    VkBool32 advancedBlendNonPremultipliedDstColor;
    VkBool32 advancedBlendCorrelatedOverlap;
    VkBool32 advancedBlendAllOperations;
} VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- advancedBlendMaxColorAttachments is one greater than the highest color attachment index that can be used in a subpass, for a pipeline that uses an advanced blend operation.
- advancedBlendIndependentBlend specifies whether advanced blend operations can vary per-attachment.
- advancedBlendNonPremultipliedSrcColor specifies whether the source color can be treated as non-premultiplied. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::srcPremultiplied must be VK_TRUE.
- advancedBlendNonPremultipliedDstColor specifies whether the destination color can be treated as non-premultiplied. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::dstPremultiplied must be VK_TRUE.
- advancedBlendCorrelatedOverlap specifies whether the overlap mode can be treated as correlated. If this is VK_FALSE, then VkPipelineColorBlendAdvancedStateCreateInfoEXT::blendOverlap must be VK_BLEND_OVERLAP_UNCORRELATED_EXT.
- advancedBlendAllOperations specifies whether all advanced blend operation enums are supported. See the valid usage of VkPipelineColorBlendAttachmentState.

If the VkPhysicalDeviceBlendOperationAdvancedPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.
The `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVertexAttribDivisor;
} VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVertexAttribDivisor` is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.

If the `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

The `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_vertex_attribute_divisor
typedef struct VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVertexAttribDivisor;
    VkBool32 supportsNonZeroFirstInstance;
} VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVertexAttribDivisor` is the maximum value of the number of instances that will repeat the value of vertex attribute data when instanced rendering is enabled.

- `supportsNonZeroFirstInstance` is a `VkBool32` value indicating whether non-zero first instance indices are supported.
value of vertex attribute data when instanced rendering is enabled.

- `supportsNonZeroFirstInstance` specifies whether a non-zero value for the `firstInstance` parameter of drawing commands is supported when `VkVertexInputBindingDivisorDescriptionKHR::divisor` is not 1.

If the `VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceVertexAttributeDivisorPropertiesKHR-sType-sType

```
 sType must be
 VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_VERTEX_ATTRIBUTE_DIVISOR_PROPERTIES_KHR
```

The `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceSamplerFilterMinmaxProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 filterMinmaxSingleComponentFormats;
    VkBool32 filterMinmaxImageComponentMapping;
} VkPhysicalDeviceSamplerFilterMinmaxProperties;
```

or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkPhysicalDeviceSamplerFilterMinmaxProperties
VkPhysicalDeviceSamplerFilterMinmaxPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `filterMinmaxSingleComponentFormats` is a boolean value indicating whether a minimum set of required formats support min/max filtering.
- `filterMinmaxImageComponentMapping` is a boolean value indicating whether the implementation supports non-identity component mapping of the image when doing min/max filtering.

If the `VkPhysicalDeviceSamplerFilterMinmaxProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If `filterMinmaxSingleComponentFormats` is `VK_TRUE`, the following formats must support the `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT` feature with `VK_IMAGE_TILING_OPTIMAL`, if they
support VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT:

• VK_FORMAT_R8_UNORM
• VK_FORMAT_R8_SNORM
• VK_FORMAT_R16_UNORM
• VK_FORMAT_R16_SNORM
• VK_FORMAT_R16_SFLOAT
• VK_FORMAT_R32_SFLOAT
• VK_FORMAT_D16_UNORM
• VK_FORMAT_X8_D24_UNORM_PACK32
• VK_FORMAT_D32_SFLOAT
• VK_FORMAT_D16_UNORM_S8_UINT
• VK_FORMAT_D24_UNORM_S8_UINT
• VK_FORMAT_D32_SFLOAT_S8_UINT

If the format is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports min/max filtering, and that min/max filtering of the depth aspect is supported when depth compare is disabled in the sampler.

If filterMinmaxImageComponentMapping is VK_FALSE the component mapping of the image view used with min/max filtering must have been created with the r component set to the identity swizzle. Only the r component of the sampled image value is defined and the other component values are undefined. If filterMinmaxImageComponentMapping is VK_TRUE this restriction does not apply and image component mapping works as normal.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceSamplerFilterMinmaxProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SAMPLER_FILTER_MINMAX_PROPERTIES

The VkPhysicalDeviceProtectedMemoryProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceProtectedMemoryProperties {
    VkStructureType sType;
    void* pNext;
    VkBool32 protectedNoFault;
} VkPhysicalDeviceProtectedMemoryProperties;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• protectedNoFault specifies how an implementation behaves when an application attempts to
write to unprotected memory in a protected queue operation, read from protected memory in
an unprotected queue operation, or perform a query in a protected queue operation. If this limit
is VK_TRUE, such writes will be discarded or have undefined values written, reads and queries
will return undefined values. If this limit is VK_FALSE, applications must not perform these
operations. See Protected Memory Access Rules for more information.

If the VkPhysicalDeviceProtectedMemoryProperties structure is included in the pNext chain of the
VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with
each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceProtectedMemoryProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PROTECTED_MEMORY_PROPERTIES

The VkPhysicalDeviceMaintenance3Properties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceMaintenance3Properties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxPerSetDescriptors;
    VkDeviceSize maxMemoryAllocationSize;
} VkPhysicalDeviceMaintenance3Properties;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance3
typedef VkPhysicalDeviceMaintenance3Properties
VkPhysicalDeviceMaintenance3PropertiesKHR;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxPerSetDescriptors** is a maximum number of descriptors (summed over all descriptor types)
in a single descriptor set that is guaranteed to satisfy any implementation-dependent
constraints on the size of a descriptor set itself. Applications can query whether a descriptor set
that goes beyond this limit is supported using vkGetDescriptorSetLayoutSupport.
- **maxMemoryAllocationSize** is the maximum size of a memory allocation that can be created, even
if there is more space available in the heap.

If the VkPhysicalDeviceMaintenance3Properties structure is included in the pNext chain of the
VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with
each corresponding implementation-dependent property.
Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMaintenance3Properties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_3_PROPERTIES

The `VkPhysicalDeviceMaintenance4Properties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceMaintenance4Properties {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize maxBufferSize;
} VkPhysicalDeviceMaintenance4Properties;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkPhysicalDeviceMaintenance4Properties
    VkPhysicalDeviceMaintenance4PropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **maxBufferSize** is the maximum size `VkBuffer` that can be created.

If the `VkPhysicalDeviceMaintenance4Properties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMaintenance4Properties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_4_PROPERTIES

The `VkPhysicalDeviceMaintenance5PropertiesKHR` structure is defined as:
// Provided by VK_KHR_maintenance5
typedef struct VkPhysicalDeviceMaintenance5PropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 earlyFragmentMultisampleCoverageAfterSampleCounting;
    VkBool32 earlyFragmentSampleMaskTestBeforeSampleCounting;
    VkBool32 depthStencilSwizzleOneSupport;
    VkBool32 polygonModePointSize;
    VkBool32 nonStrictSinglePixelWideLinesUseParallelogram;
    VkBool32 nonStrictWideLinesUseParallelogram;
} VkPhysicalDeviceMaintenance5PropertiesKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **earlyFragmentMultisampleCoverageAfterSampleCounting** is a boolean value indicating whether the fragment shading and multisample coverage operations are performed after sample counting for fragment shaders with `EarlyFragmentTests` execution mode.
• **earlyFragmentSampleMaskTestBeforeSampleCounting** is a boolean value indicating whether the sample mask test operation is performed before sample counting for fragment shaders using the `EarlyFragmentTests` execution mode.
• **depthStencilSwizzleOneSupport** is a boolean indicating that depth/stencil texturing operations with `VK_COMPONENT_SWIZZLE_ONE` have defined behavior.
• **polygonModePointSize** is a boolean value indicating whether the point size of the final rasterization of polygons with `VK_POLYGON_MODE_POINT` is controlled by `PointSize`.
• **nonStrictSinglePixelWideLinesUseParallelogram** is a boolean value indicating whether non-strict lines with a width of 1.0 are rasterized as parallelograms or using Bresenham’s algorithm.
• **nonStrictWideLinesUseParallelogram** is a boolean value indicating whether non-strict lines with a width greater than 1.0 are rasterized as parallelograms or using Bresenham’s algorithm.

If the `VkPhysicalDeviceMaintenance5PropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceMaintenance5PropertiesKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_5_PROPERTIES_KHR`

The `VkPhysicalDeviceMaintenance6PropertiesKHR` structure is defined as:
typedef struct VkPhysicalDeviceMaintenance6PropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 blockTexelViewCompatibleMultipleLayers;
    uint32_t maxCombinedImageSamplerDescriptorCount;
    VkBool32 fragmentShadingRateClampCombinerInputs;
} VkPhysicalDeviceMaintenance6PropertiesKHR;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **blockTexelViewCompatibleMultipleLayers** is a boolean value indicating that an implementation supports creating image views with `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` where the `layerCount` member of `subresourceRange` is greater than 1.
• **maxCombinedImageSamplerDescriptorCount** is the maximum number of combined image sampler descriptors that the implementation uses to access any of the formats that require a sampler Y’CbCr conversion supported by the implementation.
• **fragmentShadingRateClampCombinerInputs** is a boolean value indicating that an implementation clamps the inputs to combiner operations.

If the `VkPhysicalDeviceMaintenance6PropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceMaintenance6PropertiesKHR-sType-sType
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAINTENANCE_6_PROPERTIES_KHR`

The `VkPhysicalDeviceMeshShaderPropertiesNV` structure is defined as:
typedef struct VkPhysicalDeviceMeshShaderPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t maxDrawMeshTasksCount;
    uint32_t maxTaskWorkGroupInvocations;
    uint32_t maxTaskWorkGroupSize[3];
    uint32_t maxTaskTotalMemorySize;
    uint32_t maxTaskOutputCount;
    uint32_t maxMeshWorkGroupInvocations;
    uint32_t maxMeshWorkGroupSize[3];
    uint32_t maxMeshTotalMemorySize;
    uint32_t maxMeshOutputVertices;
    uint32_t maxMeshOutputPrimitives;
    uint32_t maxMeshMultiviewViewCount;
    uint32_t meshOutputPerVertexGranularity;
    uint32_t meshOutputPerPrimitiveGranularity;
} VkPhysicalDeviceMeshShaderPropertiesNV;

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxDrawMeshTasksCount` is the maximum number of local workgroups that can be launched by a single draw mesh tasks command. See Programmable Mesh Shading.
- `maxTaskWorkGroupInvocations` is the maximum total number of task shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode in shader modules or by the object decorated by the `WorkgroupSize` decoration, must be less than or equal to this limit.
- `maxTaskWorkGroupSize[3]` is the maximum size of a local task workgroup. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object decorated by the `WorkgroupSize` decoration in shader modules, must be less than or equal to the corresponding limit.
- `maxTaskTotalMemorySize` is the maximum number of bytes that the task shader can use in total for shared and output memory combined.
- `maxTaskOutputCount` is the maximum number of output tasks a single task shader workgroup can emit.
- `maxMeshWorkGroupInvocations` is the maximum total number of mesh shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode in shader modules or by the object decorated by the `WorkgroupSize` decoration, must be less than or equal to this limit.
- `maxMeshWorkGroupSize[3]` is the maximum size of a local mesh workgroup. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object decorated by the `WorkgroupSize` decoration in shader modules, must be less than or equal to the corresponding limit.
- `maxMeshTotalMemorySize` is the maximum number of bytes that the mesh shader can use in total for shared and output memory combined.
- `maxMeshOutputVertices` is the maximum number of vertices a mesh shader output can store.
- `maxMeshOutputPrimitives` is the maximum number of primitives a mesh shader output can store.
- `maxMeshMultiviewViewCount` is the maximum number of multiview views a mesh shader can use.
- `meshOutputPerVertexGranularity` is the granularity with which mesh vertex outputs are allocated. The value can be used to compute the memory size used by the mesh shader, which must be less than or equal to `maxMeshTotalMemorySize`.
- `meshOutputPerPrimitiveGranularity` is the granularity with which mesh outputs qualified as per-primitive are allocated. The value can be used to compute the memory size used by the mesh shader, which must be less than or equal to `maxMeshTotalMemorySize`.

If the `VkPhysicalDeviceMeshShaderPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceMeshShaderPropertiesNV-sType-sType`
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MESH_SHADER_PROPERTIES_NV`

The `VkPhysicalDeviceMeshShaderPropertiesEXT` structure is defined as:
typedef struct VkPhysicalDeviceMeshShaderPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxTaskWorkGroupTotalCount;
    uint32_t maxTaskWorkGroupCount[3];
    uint32_t maxTaskWorkGroupInvocations;
    uint32_t maxTaskWorkGroupSize[3];
    uint32_t maxTaskPayloadSize;
    uint32_t maxTaskSharedMemorySize;
    uint32_t maxTaskPayloadAndSharedMemorySize;
    uint32_t maxMeshWorkGroupTotalCount;
    uint32_t maxMeshWorkGroupCount[3];
    uint32_t maxMeshWorkGroupInvocations;
    uint32_t maxMeshWorkGroupSize[3];
    uint32_t maxMeshSharedMemorySize;
    uint32_t maxMeshPayloadAndSharedMemorySize;
    uint32_t maxMeshOutputMemorySize;
    uint32_t maxMeshPayloadAndOutputMemorySize;
    uint32_t maxMeshPayloadComponents;
    uint32_t maxMeshOutputVertices;
    uint32_t maxMeshOutputPrimitives;
    uint32_t maxMeshOutputLayers;
    uint32_t maxMeshMultiviewViewCount;
    uint32_t meshOutputPerVertexGranularity;
    uint32_t meshOutputPerPrimitiveGranularity;
    uint32_t maxPreferredTaskWorkGroupInvocations;
    uint32_t maxPreferredMeshWorkGroupInvocations;
    VkBool32 prefersLocalInvocationVertexOutput;
    VkBool32 prefersLocalInvocationPrimitiveOutput;
    VkBool32 prefersCompactVertexOutput;
    VkBool32 prefersCompactPrimitiveOutput;
} VkPhysicalDeviceMeshShaderPropertiesEXT;

The members of the VkPhysicalDeviceMeshShaderPropertiesEXT structure describe the following implementation-dependent limits:

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxTaskWorkGroupTotalCount is the maximum number of total local workgroups that can be launched by a single mesh tasks drawing command. See Programmable Mesh Shading.
- maxTaskWorkGroupCount[3] is the maximum number of local workgroups that can be launched by a single mesh tasks drawing command. These three values represent the maximum number of local workgroups for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the drawing commands must be less than or equal to the corresponding limit. The product of these dimensions must be less than or equal to maxTaskWorkGroupTotalCount.
- maxTaskWorkGroupInvocations is the maximum total number of task shader invocations in a
single local workgroup. The product of the X, Y, and Z sizes, as specified by the LocalSize or LocalSizeId execution mode in shader modules or by the object decorated by the WorkgroupSize decoration, must be less than or equal to this limit.

- **maxTaskWorkGroupSize[3]** is the maximum size of a local task workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the LocalSize or LocalSizeId execution mode or by the object decorated by the WorkgroupSize decoration in shader modules, must be less than or equal to the corresponding limit.

- **maxTaskPayloadSize** is the maximum total storage size, in bytes, available for variables declared with the TaskPayloadWorkgroupEXT storage class in shader modules in the task shader stage.

- **maxTaskSharedMemorySize** is the maximum total storage size, in bytes, available for variables declared with the Workgroup storage class in shader modules in the task shader stage.

- **maxTaskPayloadAndSharedMemorySize** is the maximum total storage size, in bytes, available for variables that are declared with the TaskPayloadWorkgroupEXT or Workgroup storage class, in shader modules in the task shader stage.

- **maxMeshWorkGroupTotalCount** is the maximum number of local output tasks a single task shader workgroup can emit.

- **maxMeshWorkGroupCount[3]** is the maximum number of local output tasks a single task shader workgroup can emit, per dimension. These three values represent the maximum number of local output tasks for the X, Y, and Z dimensions, respectively. The workgroup count parameters to the OpEmitMeshTasksEXT must be less than or equal to the corresponding limit. The product of these dimensions must be less than or equal to maxMeshWorkGroupTotalCount.

- **maxMeshWorkGroupInvocations** is the maximum total number of mesh shader invocations in a single local workgroup. The product of the X, Y, and Z sizes, as specified by the LocalSize or LocalSizeId execution mode in shader modules or by the object decorated by the WorkgroupSize decoration, must be less than or equal to this limit.

- **maxMeshWorkGroupSize[3]** is the maximum size of a local mesh workgroup, per dimension. These three values represent the maximum local workgroup size in the X, Y, and Z dimensions, respectively. The x, y, and z sizes, as specified by the LocalSize or LocalSizeId execution mode or by the object decorated by the WorkgroupSize decoration in shader modules, must be less than or equal to the corresponding limit.

- **maxMeshSharedMemorySize** is the maximum total storage size, in bytes, available for variables declared with the Workgroup storage class in shader modules in the mesh shader stage.

- **maxMeshPayloadAndSharedMemorySize** is the maximum total storage size, in bytes, available for variables that are declared with the TaskPayloadWorkgroupEXT or Workgroup storage class, in shader modules in the mesh shader stage.

- **maxMeshOutputMemorySize** is the maximum total storage size, in bytes, available for output variables in shader modules in the mesh shader stage, according to the formula in Mesh Shader Output.

- **maxMeshPayloadAndOutputMemorySize** is the maximum total storage size, in bytes, available for output variables that are declared with the TaskPayloadWorkgroupEXT storage class, or output variables in shader modules in the mesh shader stage, according to the formula in Mesh Shader Output.

- **maxMeshOutputComponents** is the maximum number of components of output variables which can
be output from the mesh shader stage.

- `maxMeshOutputVertices` is the maximum number of vertices which can be emitted by a single mesh shader workgroup.

- `maxMeshOutputPrimitives` is the maximum number of primitives which can be emitted by a single mesh shader workgroup.

- `maxMeshOutputLayers` is one greater than the maximum layer index that can be output from the mesh shader stage.

- `maxMeshMultiviewViewCount` is one greater than the maximum view index that can be used by any mesh shader.

- `meshOutputPerVertexGranularity` is the granularity of vertex allocation. The number of output vertices allocated for the mesh shader stage is padded to a multiple of this number. The value can be used to calculate the required storage size for output variables in shader modules in the mesh shader stage, which must be less than or equal to `maxMeshOutputMemorySize`.

- `meshOutputPerPrimitiveGranularity` is the granularity of primitive allocation. The number of output primitives allocated for the mesh shader stage is padded to a multiple of this number. The value can be used to calculate the required storage size for output variables in shader modules in the mesh shader stage, which must be less than or equal to `maxMeshOutputMemorySize`.

- `maxPreferredTaskWorkGroupInvocations` is the maximum number of task shader invocations in a single workgroup that is preferred by the implementation for optimal performance. The value is guaranteed to be a multiple of a supported subgroup size for the task shader stage.

- `maxPreferredMeshWorkGroupInvocations` is the maximum number of mesh shader invocations in a single workgroup that is preferred by the implementation for optimal performance. The value is guaranteed to be a multiple of a supported subgroup size for the mesh shader stage.

- `prefersLocalInvocationVertexOutput` specifies whether writes to the vertex output array in a mesh shader yield best performance when the array index matches `LocalInvocationIndex`.

- `prefersLocalInvocationPrimitiveOutput` specifies whether writes to the primitive output array in a mesh shader yield best performance when the array index matches `LocalInvocationIndex`.

- `prefersCompactVertexOutput` specifies whether output vertices should be compacted after custom culling in the mesh shader for best performance, otherwise keeping the vertices at their original location may be better.

- `prefersCompactPrimitiveOutput` specifies whether output primitives should be compacted after custom culling in the mesh shader for best performance, otherwise the use of `CullPrimitiveEXT` may be better.

If the `VkPhysicalDeviceMeshShaderPropertiesEXT` structure is included in the `pNext` chain of `VkPhysicalDeviceProperties2`, it is filled with the implementation-dependent limits.

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkPhysicalDeviceDescriptorIndexingProperties
    VkPhysicalDeviceDescriptorIndexingPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxUpdateAfterBindDescriptorsInAllPools` is the maximum number of descriptors (summed over all descriptor types) that can be created across all pools that are created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` bit set. Pool creation may fail when this limit is exceeded, or when the space this limit represents is unable to satisfy a pool creation due to fragmentation.
- `shaderUniformBufferArrayNonUniformIndexingNative` is a boolean value indicating whether uniform buffer descriptors natively support nonuniform indexing. If this is `VK_FALSE`, then a
single dynamic instance of an instruction that nonuniformly indexes an array of uniform buffers **may** execute multiple times in order to access all the descriptors.

- **shaderSampledImageArrayNonUniformIndexingNative** is a boolean value indicating whether sampler and image descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of samplers or images **may** execute multiple times in order to access all the descriptors.

- **shaderStorageBufferArrayNonUniformIndexingNative** is a boolean value indicating whether storage buffer descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage buffers may execute multiple times in order to access all the descriptors.

- **shaderStorageImageArrayNonUniformIndexingNative** is a boolean value indicating whether storage image descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of storage images may execute multiple times in order to access all the descriptors.

- **shaderInputAttachmentArrayNonUniformIndexingNative** is a boolean value indicating whether input attachment descriptors natively support nonuniform indexing. If this is **VK_FALSE**, then a single dynamic instance of an instruction that nonuniformly indexes an array of input attachments may execute multiple times in order to access all the descriptors.

- **robustBufferAccessUpdateAfterBind** is a boolean value indicating whether **robustBufferAccess** can be enabled on a device simultaneously with **descriptorBindingUniformBufferUpdateAfterBind**, **descriptorBindingStorageBufferUpdateAfterBind**, **descriptorBindingUniformTexelBufferUpdateAfterBind**, and/or **descriptorBindingStorageTexelBufferUpdateAfterBind**. If this is **VK_FALSE**, then either **robustBufferAccess** must be disabled or all of these update-after-bind features must be disabled.

- **quadDivergentImplicitLod** is a boolean value indicating whether implicit LOD calculations for image operations have well-defined results when the image and/or sampler objects used for the instruction are not uniform within a quad. See [Derivative Image Operations](#).

- **maxPerStageDescriptorUpdateAfterBindSamplers** is similar to **maxPerStageDescriptorSamplers** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxPerStageDescriptorUpdateAfterBindUniformBuffers** is similar to **maxPerStageDescriptorUniformBuffers** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageBuffers** is similar to **maxPerStageDescriptorStorageBuffers** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxPerStageDescriptorUpdateAfterBindSampledImages** is similar to **maxPerStageDescriptorSampledImages** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxPerStageDescriptorUpdateAfterBindStorageImages** is similar to **maxPerStageDescriptorStorageImages** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.

- **maxPerStageDescriptorUpdateAfterBindInputAttachments** is similar to **maxPerStageDescriptorInputAttachments** but counts descriptors from descriptor sets created with or without the **VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT** bit set.
maxPerStageDescriptorInputAttachments but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxPerStageUpdateAfterBindResources is similar to maxPerStageResources but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetUpdateAfterBindSamplers is similar to maxDescriptorSetSamplers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetUpdateAfterBindUniformBuffers is similar to maxDescriptorSetUniformBuffers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- maxDescriptorSetUpdateAfterBindUniformBuffersDynamic is similar to maxDescriptorSetUniformBuffersDynamic but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set. While an application can allocate dynamic uniform buffer descriptors from a pool created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- maxDescriptorSetUpdateAfterBindStorageBuffers is similar to maxDescriptorSetStorageBuffers but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetUpdateAfterBindStorageBuffersDynamic is similar to maxDescriptorSetStorageBuffersDynamic but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set. While an application can allocate dynamic storage buffer descriptors from a pool created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, bindings for these descriptors must not be present in any descriptor set layout that includes bindings created with VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT.

- maxDescriptorSetUpdateAfterBindSampledImages is similar to maxDescriptorSetSampledImages but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetUpdateAfterBindStorageImages is similar to maxDescriptorSetStorageImages but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

- maxDescriptorSetUpdateAfterBindInputAttachments is similar to maxDescriptorSetInputAttachments but counts descriptors from descriptor sets created with or without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set.

If the VkPhysicalDeviceDescriptorIndexingProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.
Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDescriptorIndexingProperties-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_INDEXING_PROPERTIES`.

The `VkPhysicalDeviceInlineUniformBlockProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceInlineUniformBlockProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t maxInlineUniformBlockSize;
    uint32_t maxPerStageDescriptorInlineUniformBlocks;
    uint32_t maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks;
    uint32_t maxDescriptorSetInlineUniformBlocks;
    uint32_t maxDescriptorSetUpdateAfterBindInlineUniformBlocks;
} VkPhysicalDeviceInlineUniformBlockProperties;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
typedef VkPhysicalDeviceInlineUniformBlockProperties
    VkPhysicalDeviceInlineUniformBlockPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockSize` is the maximum size in bytes of an `inline uniform block` binding.
- `maxPerStageDescriptorInlineUniformBlocks` is the maximum number of inline uniform block bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks` is similar to `maxPerStageDescriptorInlineUniformBlocks` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.
- `maxDescriptorSetInlineUniformBlocks` is the maximum number of inline uniform block bindings that can be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxDescriptorSetUpdateAfterBindInlineUniformBlocks` is similar to `maxDescriptorSetInlineUniformBlocks` but counts descriptor bindings from descriptor sets...
created with or without the VkDescriptorSetLayoutCreateUpdateAfterBindPoolBit bit set.

If the VkPhysicalDeviceInlineUniformBlockProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceInlineUniformBlockProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_INLINE_UNIFORM_BLOCK_PROPERTIES

The VkPhysicalDeviceConservativeRasterizationPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPhysicalDeviceConservativeRasterizationPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    float primitiveOverestimationSize;
    float maxExtraPrimitiveOverestimationSize;
    float extraPrimitiveOverestimationSizeGranularity;
    VkBool32 primitiveUnderestimation;
    VkBool32 conservativePointAndLineRasterization;
    VkBool32 degenerateTrianglesRasterized;
    VkBool32 degenerateLinesRasterized;
    VkBool32 fullyCoveredFragmentShaderInputVariable;
    VkBool32 conservativeRasterizationPostDepthCoverage;
} VkPhysicalDeviceConservativeRasterizationPropertiesEXT;
```

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• primitiveOverestimationSize is the size in pixels the generating primitive is increased at each of its edges during conservative rasterization overestimation mode. Even with a size of 0.0, conservative rasterization overestimation rules still apply and if any part of the pixel rectangle is covered by the generating primitive, fragments are generated for the entire pixel. However implementations may make the pixel coverage area even more conservative by increasing the size of the generating primitive.
• maxExtraPrimitiveOverestimationSize is the maximum size in pixels of extra overestimation the implementation supports in the pipeline state. A value of 0.0 means the implementation does not support any additional overestimation of the generating primitive during conservative rasterization. A value above 0.0 allows the application to further increase the size of the generating primitive during conservative rasterization overestimation.
• extraPrimitiveOverestimationSizeGranularity is the granularity of extra overestimation that can be specified in the pipeline state between 0.0 and maxExtraPrimitiveOverestimationSize inclusive. A value of 0.0 means the implementation can use the smallest representable non-zero value in the screen space pixel fixed-point grid.
• **primitiveUnderestimation** is **VK_TRUE** if the implementation supports the **VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT** conservative rasterization mode in addition to **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT**. Otherwise the implementation only supports **VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT**.

• **conservativePointAndLineRasterization** is **VK_TRUE** if the implementation supports conservative rasterization of point and line primitives as well as triangle primitives. Otherwise the implementation only supports triangle primitives.

• **degenerateTrianglesRasterized** is **VK_FALSE** if the implementation culls primitives generated from triangles that become zero area after they are quantized to the fixed-point rasterization pixel grid. **degenerateTrianglesRasterized** is **VK_TRUE** if these primitives are not culled and the provoking vertex attributes and depth value are used for the fragments. The primitive area calculation is done on the primitive generated from the clipped triangle if applicable. Zero area primitives are backfacing and the application can enable backface culling if desired.

• **degenerateLinesRasterized** is **VK_FALSE** if the implementation culls lines that become zero length after they are quantized to the fixed-point rasterization pixel grid. **degenerateLinesRasterized** is **VK_TRUE** if zero length lines are not culled and the provoking vertex attributes and depth value are used for the fragments.

• **fullyCoveredFragmentShaderInputVariable** is **VK_TRUE** if the implementation supports the SPIR-V built-in fragment shader input variable **FullyCoveredEXT** specifying that conservative rasterization is enabled and the fragment area is fully covered by the generating primitive.

• **conservativeRasterizationPostDepthCoverage** is **VK_TRUE** if the implementation supports conservative rasterization with the **PostDepthCoverage** execution mode enabled. Otherwise the **PostDepthCoverage** execution mode must not be used when conservative rasterization is enabled.

If the **VkPhysicalDeviceConservativeRasterizationPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

---

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceConservativeRasterizationPropertiesEXT-sType-sType**
  - **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CONSERVATIVE_RASTERIZATION_PROPERTIES_EXT**

The **VkPhysicalDeviceFragmentDensityMapPropertiesEXT** structure is defined as:
// Provided by VK_EXT_fragment_density_map

typedef struct VkPhysicalDeviceFragmentDensityMapPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkExtent2D minFragmentDensityTexelSize;
    VkExtent2D maxFragmentDensityTexelSize;
    VkBool32 fragmentDensityInvocations;
} VkPhysicalDeviceFragmentDensityMapPropertiesEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• minFragmentDensityTexelSize is the minimum fragment density texel size.
• maxFragmentDensityTexelSize is the maximum fragment density texel size.
• fragmentDensityInvocations specifies whether the implementation may invoke additional fragment shader invocations for each covered sample.

If the VkPhysicalDeviceFragmentDensityMapPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceFragmentDensityMapPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_PROPERTIES_EXT

The VkPhysicalDeviceFragmentDensityMap2PropertiesEXT structure is defined as:

// Provided by VK_EXT_fragment_density_map2

typedef struct VkPhysicalDeviceFragmentDensityMap2PropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 subsampledLoads;
    VkBool32 subsampledCoarseReconstructionEarlyAccess;
    uint32_t maxSubsampledArrayLayers;
    uint32_t maxDescriptorSetSubsampledSamplers;
} VkPhysicalDeviceFragmentDensityMap2PropertiesEXT;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• subsampledLoads specifies if performing image data read with load operations on subsampled attachments will be resampled to the fragment density of the render pass.
• subsampledCoarseReconstructionEarlyAccess specifies if performing image data read with samplers created with flags containing
VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT in fragment shader will trigger additional reads during VK_PIPELINE_STAGE_VERTEX_SHADER_BIT.

- `maxSubsampledArrayLayers` is the maximum number of `VkImageView` array layers for usages supporting subsampled samplers.
- `maxDescriptorSetSubsampledSamplers` is the maximum number of subsampled samplers that can be included in a `VkPipelineLayout`.

If the `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentDensityMap2PropertiesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_2_PROPERTIES_EXT`.

The `VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM` structure is defined as:

```c
typedef struct VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM {
    VkStructureType sType;
    void* pNext;
    VkExtent2D fragmentDensityOffsetGranularity;
} VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentDensityOffsetGranularity` is the granularity for fragment density offsets.

If the `VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceFragmentDensityMapOffsetPropertiesQCOM-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_DENSITY_MAP_OFFSET_PROPERTIES_QCOM`.

The `VkPhysicalDeviceShaderCorePropertiesAMD` structure is defined as:
// Provided by VK_AMD_shader_core_properties

typedef struct VkPhysicalDeviceShaderCorePropertiesAMD {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderEngineCount;
    uint32_t shaderArraysPerEngineCount;
    uint32_t computeUnitsPerShaderArray;
    uint32_t simdPerComputeUnit;
    uint32_t wavefrontsPerSimd;
    uint32_t wavefrontSize;
    uint32_t sgprsPerSimd;
    uint32_t minSgprAllocation;
    uint32_t maxSgprAllocation;
    uint32_t sgprAllocationGranularity;
    uint32_t vgprsPerSimd;
    uint32_t minVgprAllocation;
    uint32_t maxVgprAllocation;
    uint32_t vgprAllocationGranularity;
} VkPhysicalDeviceShaderCorePropertiesAMD;

• sType is a VkStructureType value identifying this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• shaderEngineCount is an unsigned integer value indicating the number of shader engines found inside the shader core of the physical device.
• shaderArraysPerEngineCount is an unsigned integer value indicating the number of shader arrays inside a shader engine. Each shader array has its own scan converter, set of compute units, and a render back end (color and depth attachments). Shader arrays within a shader engine share shader processor input (wave launcher) and shader export (export buffer) units. Currently, a shader engine can have one or two shader arrays.
• computeUnitsPerShaderArray is an unsigned integer value indicating the physical number of compute units within a shader array. The active number of compute units in a shader array may be lower. A compute unit houses a set of SIMIDs along with a sequencer module and a local data store.
• simdPerComputeUnit is an unsigned integer value indicating the number of SIMIDs inside a compute unit. Each SIMD processes a single instruction at a time.
• wavefrontSize is an unsigned integer value indicating the maximum size of a subgroup.
• sgprsPerSimd is an unsigned integer value indicating the number of physical Scalar General-Purpose Registers (SGPRs) per SIMD.
• minSgprAllocation is an unsigned integer value indicating the minimum number of SGPRs allocated for a wave.
• maxSgprAllocation is an unsigned integer value indicating the maximum number of SGPRs allocated for a wave.
• sgprAllocationGranularity is an unsigned integer value indicating the granularity of SGPR allocation for a wave.
• `vgprsPerSimd` is an unsigned integer value indicating the number of physical Vector General-Purpose Registers (VGPRs) per SIMD.

• `minVgprAllocation` is an unsigned integer value indicating the minimum number of VGPRs allocated for a wave.

• `maxVgprAllocation` is an unsigned integer value indicating the maximum number of VGPRs allocated for a wave.

• `vgprAllocationGranularity` is an unsigned integer value indicating the granularity of VGPR allocation for a wave.

If the `VkPhysicalDeviceShaderCorePropertiesAMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderCorePropertiesAMD-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_AMD`

The `VkPhysicalDeviceShaderCoreProperties2AMD` structure is defined as:

```c
// Provided by VK_AMD_shader_core_properties2
typedef struct VkPhysicalDeviceShaderCoreProperties2AMD {
    VkStructureType sType;
    void* pNext;
    VkShaderCorePropertiesFlagsAMD shaderCoreFeatures;
    uint32_t activeComputeUnitCount;
} VkPhysicalDeviceShaderCoreProperties2AMD;
```

• `sType` is a `VkStructureType` value identifying this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `shaderCoreFeatures` is a bitmask of `VkShaderCorePropertiesFlagBitsAMD` indicating the set of features supported by the shader core.

• `activeComputeUnitCount` is an unsigned integer value indicating the number of compute units that have been enabled.

If the `VkPhysicalDeviceShaderCoreProperties2AMD` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderCoreProperties2AMD-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_2_AMD`

3976
Bits for this type **may** be defined by future extensions, or new versions of the `VK_AMD_shader_core_properties2` extension. Possible values of the `flags` member of `VkShaderCorePropertiesFlagsAMD` are:

```c
// Provided by VK_AMD_shader_core_properties2
typedef enum VkShaderCorePropertiesFlagBitsAMD {
} VkShaderCorePropertiesFlagBitsAMD;
```

```c
// Provided by VK_AMD_shader_core_properties2
typedef VkFlags VkShaderCorePropertiesFlagsAMD;
```

`VkShaderCorePropertiesFlagsAMD` is a bitmask type for providing zero or more `VkShaderCorePropertiesFlagBitsAMD`.

The `VkPhysicalDeviceDepthStencilResolveProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceDepthStencilResolveProperties {
    VkStructureType sType;
    void* pNext;
    VkResolveModeFlags supportedDepthResolveModes;
    VkResolveModeFlags supportedStencilResolveModes;
    VkBool32 independentResolveNone;
    VkBool32 independentResolve;
} VkPhysicalDeviceDepthStencilResolveProperties;
```

or the equivalent

```c
// Provided by VK_KHR_depth_stencil_resolve
typedef VkPhysicalDeviceDepthStencilResolveProperties
    VkPhysicalDeviceDepthStencilResolvePropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **supportedDepthResolveModes** is a bitmask of `VkResolveModeFlagBits` indicating the set of supported depth resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations **may** support additional modes.
- **supportedStencilResolveModes** is a bitmask of `VkResolveModeFlagBits` indicating the set of supported stencil resolve modes. `VK_RESOLVE_MODE_SAMPLE_ZERO_BIT` must be included in the set but implementations **may** support additional modes. `VK.Resolve_MODE.AVERAGE_BIT` must not be included in the set.
- **independentResolveNone** is `VK_TRUE` if the implementation supports setting the depth and stencil resolve modes to different values when one of those modes is `VK_RESOLVE_MODE_NONE`. Otherwise
the implementation only supports setting both modes to the same value.

- **independentResolve** is **VK_TRUE** if the implementation supports all combinations of the supported depth and stencil resolve modes, including setting either depth or stencil resolve mode to **VK_RESOLVE_MODE_NONE**. An implementation that supports **independentResolve** must also support **independentResolveNone**.

If the **VkPhysicalDeviceDepthStencilResolveProperties** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDepthStencilResolveProperties-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEPTH_STENCIL_RESOLVE_PROPERTIES**

The **VkPhysicalDevicePerformanceQueryPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkPhysicalDevicePerformanceQueryPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 allowCommandBufferQueryCopies;
} VkPhysicalDevicePerformanceQueryPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **allowCommandBufferQueryCopies** is **VK_TRUE** if the performance query pools are allowed to be used with **vkCmdCopyQueryPoolResults**.

If the **VkPhysicalDevicePerformanceQueryPropertiesKHR** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDevicePerformanceQueryPropertiesKHR-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PERFORMANCE_QUERY_PROPERTIES_KHR**

The **VkPhysicalDeviceShadingRateImagePropertiesNV** structure is defined as:
// Provided by VK_NV_shading_rate_image

typedef struct VkPhysicalDeviceShadingRateImagePropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkExtent2D shadingRateTexelSize;
    uint32_t shadingRatePaletteSize;
    uint32_t shadingRateMaxCoarseSamples;
} VkPhysicalDeviceShadingRateImagePropertiesNV;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **shadingRateTexelSize** indicates the width and height of the portion of the framebuffer corresponding to each texel in the shading rate image.
• **shadingRatePaletteSize** indicates the maximum number of palette entries supported for the shading rate image.
• **shadingRateMaxCoarseSamples** specifies the maximum number of coverage samples supported in a single fragment. If the product of the fragment size derived from the base shading rate and the number of coverage samples per pixel exceeds this limit, the final shading rate will be adjusted so that its product does not exceed the limit.

If the `VkPhysicalDeviceShadingRateImagePropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to the shading rate image feature.

---

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShadingRateImagePropertiesNV-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADING_RATE_IMAGE_PROPERTIES_NV`

The `VkPhysicalDeviceMemoryDecompressionPropertiesNV` structure is defined as:

// Provided by VK_NV_memory_decompression
typedef struct VkPhysicalDeviceMemoryDecompressionPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkMemoryDecompressionMethodFlagsNV decompressionMethods;
    uint64_t maxDecompressionIndirectCount;
} VkPhysicalDeviceMemoryDecompressionPropertiesNV;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **decompressionMethods** is a bitmask of `VkMemoryDecompressionMethodFlagBitsNV` specifying
memory decompression methods supported by the implementation.

- `maxDecompressionIndirectCount` specifies the maximum supported count value in the `countBuffer` of `vkCmdDecompressMemoryIndirectCountNV`.

If the `VkPhysicalDeviceMemoryDecompressionPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- `VUID-VkPhysicalDeviceMemoryDecompressionPropertiesNV-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MEMORY_DECOMPRESSION_PROPERTIES_NV`.

The `VkPhysicalDeviceTransformFeedbackPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPhysicalDeviceTransformFeedbackPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxTransformFeedbackStreams;
    uint32_t maxTransformFeedbackBuffers;
    VkDeviceSize maxTransformFeedbackBufferSize;
    uint32_t maxTransformFeedbackStreamDataSize;
    uint32_t maxTransformFeedbackBufferDataSize;
    uint32_t maxTransformFeedbackBufferDataStride;
    VkBool32 transformFeedbackQueries;
    VkBool32 transformFeedbackStreamsLinesTriangles;
    VkBool32 transformFeedbackRasterizationStreamSelect;
    VkBool32 transformFeedbackDraw;
} VkPhysicalDeviceTransformFeedbackPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxTransformFeedbackStreams` is the maximum number of vertex streams that can be output from geometry shaders declared with the `GeometryStreams` capability. If the implementation does not support `VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams` then `maxTransformFeedbackStreams` must be set to 1.
- `maxTransformFeedbackBuffers` is the maximum number of transform feedback buffers that can be bound for capturing shader outputs from the last pre-rasterization shader stage.
- `maxTransformFeedbackBufferSize` is the maximum size that can be specified when binding a buffer for transform feedback in `vkCmdBindTransformFeedbackBuffersEXT`.
- `maxTransformFeedbackStreamDataSize` is the maximum amount of data in bytes for each vertex that captured to one or more transform feedback buffers associated with a specific vertex stream.
• maxTransformFeedbackBufferDataSize is the maximum amount of data in bytes for each vertex that can be captured to a specific transform feedback buffer.

• maxTransformFeedbackBufferDataStride is the maximum stride between each capture of vertex data to the buffer.

• transformFeedbackQueries is VK_TRUE if the implementation supports the VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT query type. transformFeedbackQueries is VK_FALSE if queries of this type cannot be created.

• transformFeedbackStreamsLinesTriangles is VK_TRUE if the implementation supports the geometry shader OpExecutionMode of OutputLineStrip and OutputTriangleStrip in addition to OutputPoints when more than one vertex stream is output. If transformFeedbackStreamsLinesTriangles is VK_FALSE the implementation only supports an OpExecutionMode of OutputPoints when more than one vertex stream is output from the geometry shader.

• transformFeedbackRasterizationStreamSelect is VK_TRUE if the implementation supports the GeometryStreams SPIR-V capability and the application can use VkPipelineRasterizationStateStreamCreateInfoEXT to modify which vertex stream output is used for rasterization. Otherwise vertex stream 0 must always be used for rasterization.

• transformFeedbackDraw is VK_TRUE if the implementation supports the vkCmdDrawIndirectByteCountEXT function otherwise the function must not be called.

If the VkPhysicalDeviceTransformFeedbackPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceTransformFeedbackPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TRANSFORM_FEEDBACK_PROPERTIES_EXT

The VkPhysicalDeviceCopyMemoryIndirectPropertiesNV structure is defined as:

```c
typedef struct VkPhysicalDeviceCopyMemoryIndirectPropertiesNV {
  VkStructureType sType;
  void* pNext;
  VkQueueFlags supportedQueues;
} VkPhysicalDeviceCopyMemoryIndirectPropertiesNV;
```

• sType is a VkStructureType value identifying this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• supportedQueues is a bitmask of VkQueueFlagBits indicating the queues on which indirect copy commands are supported.

If the indirectCopy feature is supported, supportedQueues must return at least one supported queue.
If the `VkPhysicalDeviceCopyMemoryIndirectPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceCopyMemoryIndirectPropertiesNV-sType-sType`  
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COPY_MEMORY_INDIRECT_PROPERTIES_NV`  

The `VkPhysicalDeviceRayTracingPropertiesNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing

typedef struct VkPhysicalDeviceRayTracingPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderGroupHandleSize;
    uint32_t maxRecursionDepth;
    uint32_t maxShaderGroupStride;
    uint32_t shaderGroupBaseAlignment;
    uint64_t maxGeometryCount;
    uint64_t maxInstanceCount;
    uint64_t maxTriangleCount;
    uint32_t maxDescriptorSetAccelerationStructures;
} VkPhysicalDeviceRayTracingPropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderGroupHandleSize` is the size in bytes of the shader header.
- `maxRecursionDepth` is the maximum number of levels of recursion allowed in a trace command.
- `maxShaderGroupStride` is the maximum stride in bytes allowed between shader groups in the shader binding table.
- `shaderGroupBaseAlignment` is the **required** alignment in bytes for the base of the shader binding table.
- `maxGeometryCount` is the maximum number of geometries in the bottom level acceleration structure.
- `maxInstanceCount` is the maximum number of instances in the top level acceleration structure.
- `maxTriangleCount` is the maximum number of triangles in all geometries in the bottom level acceleration structure.
- `maxDescriptorSetAccelerationStructures` is the maximum number of acceleration structure descriptors that are allowed in a descriptor set.

Due to the fact that the geometry, instance, and triangle counts are specified at acceleration structure creation as 32-bit values, `maxGeometryCount`, `maxInstanceCount`, and `maxTriangleCount` **must**
If the `VkPhysicalDeviceRayTracingPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure **must** match those specified with the same name in `VkPhysicalDeviceAccelerationStructurePropertiesKHR` and `VkPhysicalDeviceRayTracingPipelinePropertiesKHR`.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceRayTracingPropertiesNV-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PROPERTIES_NV`

---

The `VkPhysicalDeviceAccelerationStructurePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkPhysicalDeviceAccelerationStructurePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint64_t maxGeometryCount;
    uint64_t maxInstanceCount;
    uint64_t maxPrimitiveCount;
    uint32_t maxPerStageDescriptorAccelerationStructures;
    uint32_t maxPerStageDescriptorUpdateAfterBindAccelerationStructures;
    uint32_t maxDescriptorSetAccelerationStructures;
    uint32_t maxDescriptorSetUpdateAfterBindAccelerationStructures;
    uint32_t minAccelerationStructureScratchOffsetAlignment;
} VkPhysicalDeviceAccelerationStructurePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxGeometryCount` is the maximum number of geometries in the bottom level acceleration structure.
- `maxInstanceCount` is the maximum number of instances in the top level acceleration structure.
- `maxPrimitiveCount` is the maximum number of triangles or AABBs in all geometries in the bottom level acceleration structure.
- `maxPerStageDescriptorAccelerationStructures` is the maximum number of acceleration structure bindings that can be accessible to a single shader stage in a pipeline layout. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.
- `maxPerStageDescriptorUpdateAfterBindAccelerationStructures` is similar to `maxPerStageDescriptorAccelerationStructures` but counts descriptor bindings from descriptor
sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **maxDescriptorSetAccelerationStructures** is the maximum number of acceleration structure descriptors that *can* be included in descriptor bindings in a pipeline layout across all pipeline shader stages and descriptor set numbers. Descriptor bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` count against this limit. Only descriptor bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set count against this limit.

- **maxDescriptorSetUpdateAfterBindAccelerationStructures** is similar to `maxDescriptorSetAccelerationStructures` but counts descriptor bindings from descriptor sets created with or without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set.

- **minAccelerationStructureScratchOffsetAlignment** is the minimum required alignment, in bytes, for scratch data passed in to an acceleration structure build command. The value *must* be a power of two.

Due to the fact that the geometry, instance, and primitive counts are specified at acceleration structure creation as 32-bit values, `maxGeometryCount`, `maxInstanceCount`, and `maxPrimitiveCount` *must* not exceed $2^{32} - 1$.

If the `VkPhysicalDeviceAccelerationStructurePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure *must* match those specified with the same name in `VkPhysicalDeviceRayTracingPropertiesNV`.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceAccelerationStructurePropertiesKHR-sType-sType**
  
sType *must* be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ACCELERATION_STRUCTURE_PROPERTIES_KHR`

The `VkPhysicalDeviceRayTracingPipelinePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_ray_tracing_pipeline
typedef struct VkPhysicalDeviceRayTracingPipelinePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderGroupHandleSize;
    uint32_t maxRayRecursionDepth;
    uint32_t maxShaderGroupStride;
    uint32_t shaderGroupBaseAlignment;
    uint32_t shaderGroupHandleCaptureReplaySize;
    uint32_t maxRayDispatchInvocationCount;
    uint32_t shaderGroupHandleAlignment;
    uint32_t maxRayHitAttributeSize;
} VkPhysicalDeviceRayTracingPipelinePropertiesKHR;
```
• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **shaderGroupHandleSize** is the size in bytes of the shader header.
• **maxRayRecursionDepth** is the maximum number of levels of ray recursion allowed in a trace command.
• **maxShaderGroupStride** is the maximum stride in bytes allowed between shader groups in the shader binding table.
• **shaderGroupBaseAlignment** is the required alignment in bytes for the base of the shader binding table.
• **shaderGroupHandleCaptureReplaySize** is the number of bytes for the information required to do capture and replay for shader group handles.
• **maxRayDispatchInvocationCount** is the maximum number of ray generation shader invocations which may be produced by a single `vkCmdTraceRaysIndirectKHR` or `vkCmdTraceRaysKHR` command.
• **shaderGroupHandleAlignment** is the required alignment in bytes for each entry in a shader binding table. The value **must** be a power of two.
• **maxRayHitAttributeSize** is the maximum size in bytes for a ray attribute structure.

If the `VkPhysicalDeviceRayTracingPipelinePropertiesKHR` structure is included in the **pNext** chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

Limits specified by this structure **must** match those specified with the same name in `VkPhysicalDeviceRayTracingPropertiesNV`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRayTracingPipelinePropertiesKHR-sType-sType
  `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_PIPELINE_PROPERTIES_KHR`

The `VkPhysicalDeviceCooperativeMatrixPropertiesNV` structure is defined as:

```c
// Provided by VK_NV_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags cooperativeMatrixSupportedStages;
} VkPhysicalDeviceCooperativeMatrixPropertiesNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **cooperativeMatrixSupportedStages** is a bitfield of `VkShaderStageFlagBits` describing the shader
stages that cooperative matrix instructions are supported in. `cooperativeMatrixSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.

If the `VkPhysicalDeviceCooperativeMatrixPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixPropertiesNV-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_PROPERTIES_NV`

---

The `VkPhysicalDeviceCooperativeMatrixPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_cooperative_matrix
typedef struct VkPhysicalDeviceCooperativeMatrixPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkShaderStageFlags cooperativeMatrixSupportedStages;
} VkPhysicalDeviceCooperativeMatrixPropertiesKHR;
```

- *sType* is a `VkStructureType` value identifying this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *cooperativeMatrixSupportedStages* is a bitfield of `VkShaderStageFlagBits` describing the shader stages that cooperative matrix instructions are supported in. `cooperativeMatrixSupportedStages` will have the `VK_SHADER_STAGE_COMPUTE_BIT` bit set if any of the physical device's queues support `VK_QUEUE_COMPUTE_BIT`.

`cooperativeMatrixSupportedStages` must not have any bits other than `VK_SHADER_STAGE_COMPUTE_BIT` set.

If the `VkPhysicalDeviceCooperativeMatrixPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceCooperativeMatrixPropertiesKHR-sType-sType
  
  *sType* must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_COOPERATIVE_MATRIX_PROPERTIES_KHR`

---

The `VkPhysicalDeviceShaderSMBuiltinsPropertiesNV` structure is defined as:

---

3986
typedef struct VkPhysicalDeviceShaderSMBuiltinsPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t shaderSMCount;
    uint32_t shaderWarpsPerSM;
} VkPhysicalDeviceShaderSMBuiltinsPropertiesNV;

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **shaderSMCount** is the number of SMs on the device.
- **shaderWarpsPerSM** is the maximum number of simultaneously executing warps on an SM.

If the VkPhysicalDeviceShaderSMBuiltinsPropertiesNV structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderSMBuiltinsPropertiesNV-sType-sType
  
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_SM_BUILTINS_PROPERTIES_NV

The VkPhysicalDeviceTexelBufferAlignmentProperties structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkPhysicalDeviceTexelBufferAlignmentProperties {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize storageTexelBufferOffsetAlignmentBytes;
    VkBool32 storageTexelBufferOffsetSingleTexelAlignment;
    VkDeviceSize uniformTexelBufferOffsetAlignmentBytes;
    VkBool32 uniformTexelBufferOffsetSingleTexelAlignment;
} VkPhysicalDeviceTexelBufferAlignmentProperties;
```

or the equivalent

```c
// Provided by VK_EXT_texel_buffer_alignment
typedef VkPhysicalDeviceTexelBufferAlignmentProperties
    VkPhysicalDeviceTexelBufferAlignmentPropertiesEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **storageTexelBufferOffsetAlignmentBytes** is a byte alignment that is sufficient for a storage texel
buffer of any format. The value **must** be a power of two.

- `storageTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a storage texel buffer of any format.
- `uniformTexelBufferOffsetAlignmentBytes` is a byte alignment that is sufficient for a uniform texel buffer of any format. The value **must** be a power of two.
- `uniformTexelBufferOffsetSingleTexelAlignment` indicates whether single texel alignment is sufficient for a uniform texel buffer of any format.

If the `VkPhysicalDeviceTexelBufferAlignmentProperties` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

If the single texel alignment property is `VK_FALSE`, then the buffer view's offset **must** be aligned to the corresponding byte alignment value. If the single texel alignment property is `VK_TRUE`, then the buffer view's offset **must** be aligned to the lesser of the corresponding byte alignment value or the size of a single texel, based on `VkBufferViewCreateInfo::format`. If the size of a single texel is a multiple of three bytes, then the size of a single component of the format is used instead.

These limits **must** not advertise a larger alignment than the required maximum minimum value of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`, for any format that supports use as a texel buffer.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceTexelBufferAlignmentProperties-sType-sType
  
  **sType** **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TEXEL_BUFFER_ALIGNMENT_PROPERTIES`

The `VkPhysicalDeviceTimelineSemaphoreProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkPhysicalDeviceTimelineSemaphoreProperties {
    VkStructureType sType;
    void* pNext;
    uint64_t maxTimelineSemaphoreValueDifference;
} VkPhysicalDeviceTimelineSemaphoreProperties;
```

or the equivalent

```c
// Provided by VK_KHR_timeline_semaphore
typedef VkPhysicalDeviceTimelineSemaphoreProperties
    VkPhysicalDeviceTimelineSemaphorePropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
maxTimelineSemaphoreValueDifference indicates the maximum difference allowed by the implementation between the current value of a timeline semaphore and any pending signal or wait operations.

If the VkPhysicalDeviceTimelineSemaphoreProperties structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceTimelineSemaphoreProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_TIMELINE_SEMAPHORE_PROPERTIES

The VkPhysicalDeviceLineRasterizationPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_line_rasterization
typedef struct VkPhysicalDeviceLineRasterizationPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    uint32_t lineSubPixelPrecisionBits;
} VkPhysicalDeviceLineRasterizationPropertiesKHR;
```

or the equivalent

```c
// Provided by VK_EXT_line_rasterization
typedef VkPhysicalDeviceLineRasterizationPropertiesKHR
VkPhysicalDeviceLineRasterizationPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- lineSubPixelPrecisionBits is the number of bits of subpixel precision in framebuffer coordinates x_f and y_f when rasterizing line segments.

If the VkPhysicalDeviceLineRasterizationPropertiesKHR structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceLineRasterizationPropertiesKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_LINE_RASTERIZATION_PROPERTIES_KHR

The VkPhysicalDeviceRobustness2PropertiesEXT structure is defined as:
typedef struct VkPhysicalDeviceRobustness2PropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize robustStorageBufferAccessSizeAlignment;
    VkDeviceSize robustUniformBufferAccessSizeAlignment;
} VkPhysicalDeviceRobustness2PropertiesEXT;

• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **robustStorageBufferAccessSizeAlignment** is the number of bytes that the range of a storage buffer descriptor is rounded up to when used for bounds-checking when the [robustBufferAccess2](#) feature is enabled. This value **must** be either 1 or 4.
• **robustUniformBufferAccessSizeAlignment** is the number of bytes that the range of a uniform buffer descriptor is rounded up to when used for bounds-checking when the [robustBufferAccess2](#) feature is enabled. This value **must** be a power of two in the range [1, 256].

If the [VkPhysicalDeviceRobustness2PropertiesEXT](#) structure is included in the `pNext` chain of the [VkPhysicalDeviceProperties2](#) structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceRobustness2PropertiesEXT-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_ROBUSTNESS_2_PROPERTIES_EXT

The [VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV](#) structure is defined as:

typedef struct VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t maxGraphicsShaderGroupCount;
    uint32_t maxIndirectSequenceCount;
    uint32_t maxIndirectCommandsTokenCount;
    uint32_t maxIndirectCommandsStreamCount;
    uint32_t maxIndirectCommandsTokenOffset;
    uint32_t maxIndirectCommandsStreamStride;
    uint32_t minSequencesCountBufferOffsetAlignment;
    uint32_t minSequencesIndexBufferOffsetAlignment;
    uint32_t minIndirectCommandsBufferOffsetAlignment;
} VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV;

• **sType** is a [VkStructureType](#) value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• `maxGraphicsShaderGroupCount` is the maximum number of shader groups in `VkGraphicsPipelineShaderGroupsCreateInfoNV`.

• `maxIndirectSequenceCount` is the maximum number of sequences in `VkGeneratedCommandsInfoNV` and in `VkGeneratedCommandsMemoryRequirementsInfoNV`.

• `maxIndirectCommandsTokenCount` is the maximum number of tokens in `VkIndirectCommandsLayoutCreateInfoNV`.

• `maxIndirectCommandsStreamCount` is the maximum number of streams in `VkIndirectCommandsLayoutCreateInfoNV`.

• `maxIndirectCommandsTokenOffset` is the maximum offset in `VkIndirectCommandsLayoutTokenNV`.

• `maxIndirectCommandsStreamStride` is the maximum stream stride in `VkIndirectCommandsLayoutCreateInfoNV`.

• `minSequencesCountBufferOffsetAlignment` is the minimum alignment for memory addresses which can be used in `VkGeneratedCommandsInfoNV`.

• `minSequencesIndexBufferOffsetAlignment` is the minimum alignment for memory addresses which can be used in `VkGeneratedCommandsInfoNV`.

• `minIndirectCommandsBufferOffsetAlignment` is the minimum alignment for memory addresses used in `VkIndirectCommandsStreamNV`, and as preprocess buffer in `VkGeneratedCommandsInfoNV`.

If the `VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDeviceGeneratedCommandsPropertiesNV-sType-sType must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DEVICE_GENERATED_COMMANDS_PROPERTIES_NV`.

---

The `VkPhysicalDevicePortabilitySubsetPropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_portability_subset
typedef struct VkPhysicalDevicePortabilitySubsetPropertiesKHR {
    VkStructureType       sType;
    void*                 pNext;
    uint32_t              minVertexInputBindingStrideAlignment;
} VkPhysicalDevicePortabilitySubsetPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minVertexInputBindingStrideAlignment` indicates the minimum alignment for vertex input strides. `VkVertexInputBindingDescription::stride` must be a multiple of, and at least as large as, this value. The value must be a power of two.
If the `VkPhysicalDevicePortabilitySubsetPropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDevicePortabilitySubsetPropertiesKHR-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PORTABILITY_SUBSET_PROPERTIES_KHR`

The `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRatePropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkExtent2D minFragmentShadingRateAttachmentTexelSize;
    VkExtent2D maxFragmentShadingRateAttachmentTexelSize;
    uint32_t maxFragmentShadingRateAttachmentTexelSizeAspectRatio;
    VkBool32 primitiveFragmentShadingRateWithMultipleViewports;
    VkBool32 layeredShadingRateAttachments;
    VkBool32 fragmentShadingRateNonTrivialCombinerOps;
    VkBool32 maxFragmentSize;
    uint32_t maxFragmentSizeAspectRatio;
    uint32_t maxFragmentShadingRateCoverageSamples;
    VkSampleCountFlagBits maxFragmentShadingRateRasterizationSamples;
    VkBool32 fragmentShadingRateWithShaderDepthStencilWrites;
    VkBool32 fragmentShadingRateWithSampleMask;
    VkBool32 fragmentShadingRateWithShaderSampleMask;
    VkBool32 fragmentShadingRateWithConservativeRasterization;
    VkBool32 fragmentShadingRateWithFragmentShaderInterlock;
    VkBool32 fragmentShadingRateWithCustomSampleLocations;
    VkBool32 fragmentShadingRateStrictMultiplyCombiner;
} VkPhysicalDeviceFragmentShadingRatePropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minFragmentShadingRateAttachmentTexelSize` indicates minimum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value must be less than or equal to the values in `maxFragmentShadingRateAttachmentTexelSize`. Each value must be a power-of-two. It must be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.
- `maxFragmentShadingRateAttachmentTexelSize` indicates maximum supported width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. Each value must be greater than or equal to the values in `minFragmentShadingRateAttachmentTexelSize`. Each value must be a power-of-two. It must be (0,0) if the `attachmentFragmentShadingRate` feature is not supported.
• `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` indicates the maximum ratio between the width and height of the portion of the framebuffer corresponding to each texel in a fragment shading rate attachment. `maxFragmentShadingRateAttachmentTexelSizeAspectRatio` must be a power-of-two value, and must be less than or equal to \[
\min(\frac{\text{maxFragmentShadingRateAttachmentTexelSize.width}}{\text{minFragmentShadingRateAttachmentTexelSize.height}}, \frac{\text{maxFragmentShadingRateAttachmentTexelSize.height}}{\text{minFragmentShadingRateAttachmentTexelSize.width}}). \]
It must be 0 if the `attachmentFragmentShadingRate` feature is not supported.

• `primitiveFragmentShadingRateWithMultipleViewports` specifies whether the primitive fragment shading rate can be used when multiple viewports are used. If this value is `VK_FALSE`, only a single viewport must be used, and applications must not write to the `ViewportMaskNV` or `ViewportIndex` built-in when setting `PrimitiveShadingRateKHR`. It must be `VK_FALSE` if the `shaderOutputViewportIndex` feature, the `VK_EXT_shader_viewport_index_layer` extension, or the `geometryShader` feature is not supported, or if the `primitiveFragmentShadingRate` feature is not supported.

• `layeredShadingRateAttachments` specifies whether a shading rate attachment image view can be created with multiple layers. If this value is `VK_FALSE`, when creating an image view with a usage that includes `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, `layerCount` must be 1. It must be `VK_FALSE` if the multiview feature, the `shaderOutputViewportIndex` feature, the `VK_EXT_shader_viewport_index_layer` extension, or the `geometryShader` feature is not supported, or if the `attachmentFragmentShadingRate` feature is not supported.

• `fragmentShadingRateNonTrivialCombinerOps` specifies whether `VkFragmentShadingRateCombinerOpKHR` enums other than `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` can be used. It must be `VK_FALSE` unless either the `primitiveFragmentShadingRate` or `attachmentFragmentShadingRate` feature is supported.

• `maxFragmentSize` indicates the maximum supported width and height of a fragment. Its `width` and `height` members must both be power-of-two values. This limit is purely informational, and is not validated.

• `maxFragmentSizeAspectRatio` indicates the maximum ratio between the width and height of a fragment. `maxFragmentSizeAspectRatio` must be a power-of-two value, and must be less than or equal to the maximum of the `width` and `height` members of `maxFragmentSize`. This limit is purely informational, and is not validated.

• `maxFragmentShadingRateCoverageSamples` specifies the maximum number of coverage samples supported in a single fragment. `maxFragmentShadingRateCoverageSamples` must be less than or equal to the product of the `width` and `height` members of `maxFragmentSize`, and the sample count reported by `maxFragmentShadingRateRasterizationSamples`. `maxFragmentShadingRateCoverageSamples` must be less than or equal to `maxSampleMaskWords × 32` if `fragmentShadingRateWithShaderSampleMask` is supported. This limit is purely informational, and is not validated.

• `maxFragmentShadingRateRasterizationSamples` is a `VkSampleCountFlagBits` value specifying the maximum sample rate supported when a fragment covers multiple pixels. This limit is purely informational, and is not validated.

• `fragmentShadingRateWithShaderDepthStencilWrites` specifies whether the implementation
supports writing `FragDepth` or `FragStencilRefEXT` from a fragment shader for multi-pixel fragments. If this value is `VK_FALSE`, writing to those built-ins will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithSampleMask` specifies whether the implementation supports setting valid bits of `VkPipelineMultisampleStateCreateInfo::pSampleMask` to 0 for multi-pixel fragments. If this value is `VK_FALSE`, zeroing valid bits in the sample mask will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithShaderSampleMask` specifies whether the implementation supports reading or writing `SampleMask` for multi-pixel fragments. If this value is `VK_FALSE`, using that built-in will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithConservativeRasterization` specifies whether conservative rasterization is supported for multi-pixel fragments. It must be `VK_FALSE` if `VK_EXT_conservative_rasterization` is not supported. If this value is `VK_FALSE`, using conservative rasterization will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithFragmentShaderInterlock` specifies whether fragment shader interlock is supported for multi-pixel fragments. It must be `VK_FALSE` if `VK_EXT_fragment_shader_interlock` is not supported. If this value is `VK_FALSE`, using fragment shader interlock will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateWithCustomSampleLocations` specifies whether custom sample locations are supported for multi-pixel fragments. It must be `VK_FALSE` if `VK_EXT_sample_locations` is not supported. If this value is `VK_FALSE`, using custom sample locations will clamp the fragment shading rate to (1,1).

- `fragmentShadingRateStrictMultiplyCombiner` specifies whether `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` accurately performs a multiplication or not. Implementations where this value is `VK_FALSE` will instead combine rates with an addition. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_FALSE`, implementations must report this as `VK_FALSE`. If `fragmentShadingRateNonTrivialCombinerOps` is `VK_TRUE`, implementations should report this as `VK_TRUE`.

**Note**

Multiplication of the combiner rates using the fragment width/height in linear space is equivalent to an addition of those values in log2 space. Some implementations inadvertently implemented an addition in linear space due to unclear requirements originating outside of this specification. This resulted in `fragmentShadingRateStrictMultiplyCombiner` being added. Fortunately, this only affects situations where a rate of 1 in either dimension is combined with another rate of 1. All other combinations result in the exact same result as if multiplication was performed in linear space due to the clamping logic, and the fact that both the sum and product of 2 and 2 are equal. In many cases, this limit will not affect the correct operation of applications.

If the `VkPhysicalDeviceFragmentShadingRatePropertiesKHR` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
These properties are related to **fragment shading rates**.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceFragmentShadingRatePropertiesKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_PROPERTIES_KHR`.

The **VkPhysicalDeviceFragmentShadingRatePropertiesKHR** structure is defined as:

```c
typedef struct VkPhysicalDeviceFragmentShadingRatePropertiesKHR {
    VkStructureType sType;
    void* pNext;
} VkPhysicalDeviceFragmentShadingRatePropertiesKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxFragmentShadingRateInvocationCount** is a `VkSampleCountFlagBits` value indicating the maximum number of fragment shader invocations per fragment supported in pipeline, primitive, and attachment fragment shading rates.

If the **VkPhysicalDeviceFragmentShadingRatePropertiesKHR** structure is included in the `pNext` chain of the **VkPhysicalDeviceProperties2** structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to **fragment shading rates**.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_ENUMS_PROPERTIES_NV`.

- **VUID-VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV-maxFragmentShadingRateInvocationCount-parameter**
  
  `maxFragmentShadingRateInvocationCount` must be a valid `VkSampleCountFlagBits` value.

The **VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV** structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef struct VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlagBits maxFragmentShadingRateInvocationCount;
} VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **maxFragmentShadingRateInvocationCount** is a `VkSampleCountFlagBits` value indicating the maximum number of fragment shader invocations per fragment supported in pipeline, primitive, and attachment fragment shading rates.

If the **VkPhysicalDeviceFragmentShadingRateEnumsPropertiesNV** structure is included in the `pNext` chain of the **VkPhysicalDeviceProperties2** structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

These properties are related to **fragment shading rates**.

**Valid Usage (Implicit)**

- **VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUSTOM_BORDER_COLOR_PROPERTIES_EXT`.

- **VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-maxBorderColorCoverage-parameter**
  
  `maxBorderColorCoverage` must be a valid `VkSampleCountFlagBits` value.

The **VkPhysicalDeviceCustomBorderColorPropertiesEXT** structure is defined as:
```c
typedef struct VkPhysicalDeviceCustomBorderColorPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxCustomBorderColorSamplers;
} VkPhysicalDeviceCustomBorderColorPropertiesEXT;
```

- `maxCustomBorderColorSamplers` indicates the maximum number of samplers with custom border colors which can simultaneously exist on a device.

If the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceCustomBorderColorPropertiesEXT-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICALDEVICECUSTOMBORDERCOLORPROPERTIES_EXT`

The `VkPhysicalDeviceProvokingVertexPropertiesEXT` structure is defined as:

```c
typedef struct VkPhysicalDeviceProvokingVertexPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 provokingVertexModePerPipeline;
    VkBool32 transformFeedbackPreservesTriangleFanProvokingVertex;
} VkPhysicalDeviceProvokingVertexPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexModePerPipeline` indicates whether the implementation supports graphics pipelines with different provoking vertex modes within the same render pass instance.
- `transformFeedbackPreservesTriangleFanProvokingVertex` indicates whether the implementation can preserve the provoking vertex order when writing triangle fan vertices to transform feedback.

If the `VkPhysicalDeviceProvokingVertexPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceProvokingVertexPropertiesEXT-sType-sType` 
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICALDEVICEPROVOKINGVERTEXPROPERTIES_EXT`
The `VkPhysicalDeviceDescriptorBufferPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkPhysicalDeviceDescriptorBufferPropertiesEXT {
    VkStructureType sType;
    void*pNext;
    VkBool32 combinedImageSamplerDescriptorSingleArray;
    VkBool32 bufferlessPushDescriptors;
    VkBool32 allowSamplerImageViewPostSubmitCreation;
    VkDeviceSize descriptorBufferOffsetAlignment;
    uint32_t maxDescriptorBufferBindings;
    uint32_t maxResourceDescriptorBufferBindings;
    uint32_t maxSamplerDescriptorBufferBindings;
    uint32_t maxEmbeddedImmutableSamplerBindings;
    uint32_t maxEmbeddedImmutableSamplers;
    size_t bufferCaptureReplayDescriptorDataSize;
    size_t imageCaptureReplayDescriptorDataSize;
    size_t imageViewCaptureReplayDescriptorDataSize;
    size_t accelerationStructureCaptureReplayDescriptorDataSize;
    size_t samplerDescriptorSize;
    size_t combinedImageSamplerDescriptorSize;
    size_t sampledImageDescriptorSize;
    size_t storageImageDescriptorSize;
    size_t uniformTexelBufferDescriptorSize;
    size_t robustUniformTexelBufferDescriptorSize;
    size_t storageTexelBufferDescriptorSize;
    size_t robustStorageTexelBufferDescriptorSize;
    size_t uniformBufferDescriptorSize;
    size_t robustUniformBufferDescriptorSize;
    size_t storageBufferDescriptorSize;
    size_t robustStorageBufferDescriptorSize;
    size_t inputAttachmentDescriptorSize;
    size_t accelerationStructureDescriptorSize;
    VkDeviceSize maxSamplerDescriptorBufferRange;
    VkDeviceSize maxResourceDescriptorBufferRange;
    VkDeviceSize samplerDescriptorBufferAddressSpaceSize;
    VkDeviceSize resourceDescriptorBufferAddressSpaceSize;
    VkDeviceSize descriptorBufferAddressSpaceSize;
} VkPhysicalDeviceDescriptorBufferPropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `combinedImageSamplerDescriptorSingleArray` indicates that the implementation does not require an array of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` descriptors to be written into a descriptor buffer as an array of image descriptors, immediately followed by an array of sampler descriptors.
- `bufferlessPushDescriptors` indicates that the implementation does not require a buffer created...
with VK_BUFFER_USAGE_PUSH_DESCRIPTORs_DESCRIPTOR_BUFFER_BIT_EXT to be bound when using push descriptors.

- **allowSamplerImageViewPostSubmitCreation** indicates that the implementation does not restrict when the VkSampler or VkImageView objects used to retrieve descriptor data can be created in relation to command buffer submission. If this value is VK_FALSE, then the application must create any VkSampler or VkImageView objects whose descriptor data is accessed during the execution of a command buffer, before the vkQueueSubmit, or vkQueueSubmit2, call that submits that command buffer.

- **descriptorBufferOffsetAlignment** indicates the required alignment in bytes when setting offsets into the descriptor buffer.

- **maxDescriptorBufferBindings** indicates the maximum sum total number of descriptor buffers and embedded immutable sampler sets that can be bound.

- **maxResourceDescriptorBufferBindings** indicates the maximum number of resource descriptor buffers that can be bound.

- **maxSamplerDescriptorBufferBindings** indicates the maximum number of sampler descriptor buffers that can be bound.

- **maxEmbeddedImmutableSamplerBindings** indicates the maximum number of embedded immutable sampler sets that can be bound.

- **maxEmbeddedImmutableSamplers** indicates the maximum number of unique immutable samplers in descriptor set layouts created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_EMBEDDED_IMMUTABLE_SAMPLERS_BIT_EXT, and pipeline layouts created from them, which can simultaneously exist on a device.

- **bufferCaptureReplayDescriptorDataSize** indicates the maximum size in bytes of the opaque data used for capture and replay with buffers.

- **imageCaptureReplayDescriptorDataSize** indicates the maximum size in bytes of the opaque data used for capture and replay with images.

- **imageViewCaptureReplayDescriptorDataSize** indicates the maximum size in bytes of the opaque data used for capture and replay with image views.

- **samplerCaptureReplayDescriptorDataSize** indicates the maximum size in bytes of the opaque data used for capture and replay with samplers.

- **accelerationStructureCaptureReplayDescriptorDataSize** indicates the maximum size in bytes of the opaque data used for capture and replay with acceleration structures.

- **samplerDescriptorSize** indicates the size in bytes of a VK_DESCRIPTOR_TYPE_SAMPLER descriptor.

- **combinedImageSamplerDescriptorSize** indicates the size in bytes of a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptor.

- **sampledImageDescriptorSize** indicates the size in bytes of a VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE descriptor.

- **storageImageDescriptorSize** indicates the size in bytes of a VK_DESCRIPTOR_TYPE_STORAGE_IMAGE descriptor.

- **uniformTexelBufferDescriptorSize** indicates the size in bytes of a VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER descriptor if the robustBufferAccess feature is not
enabled.

- **robustUniformTexelBufferDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor if the `robustBufferAccess` feature is enabled.

- **storageTexelBufferDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor if the `robustBufferAccess` feature is not enabled.

- **robustStorageTexelBufferDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor if the `robustBufferAccess` feature is enabled.

- **uniformBufferDescriptorSize** indicates the size in bytes of a `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` descriptor.

- **robustUniformBufferDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` descriptor if the `robustBufferAccess` feature is enabled.

- **storageBufferDescriptorSize** indicates the size in bytes of a `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` descriptor.

- **robustStorageBufferDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` descriptor if the `robustBufferAccess` feature is enabled.

- **inputAttachmentDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` descriptor.

- **accelerationStructureDescriptorSize** indicates the size in bytes of a 
  `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` or 
  `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` descriptor.

- **maxSamplerDescriptorBufferRange** indicates the maximum range in bytes from the address of a 
  sampler descriptor buffer binding that is accessible to a shader.

- **maxResourceDescriptorBufferRange** indicates the maximum range in bytes from the address of a 
  resource descriptor buffer binding that is accessible to a shader.

- **samplerDescriptorBufferAddressSpaceSize** indicates the total size in bytes of the address space available for descriptor buffers created with 
  `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT`.

- **resourceDescriptorBufferAddressSpaceSize** indicates the total size in bytes of the address space available for descriptor buffers created with 
  `VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT`.

- **descriptorBufferAddressSpaceSize** indicates the total size in bytes of the address space available for descriptor buffers created with both 
  `VK_BUFFER_USAGE_SAMPLER_DESCRIPTOR_BUFFER_BIT_EXT` and 
  `VK_BUFFER_USAGE_RESOURCE_DESCRIPTOR_BUFFER_BIT_EXT`.

A descriptor binding with type `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE` has a descriptor size which is implied by the descriptor types included in the `VkMutableDescriptorTypeCreateInfoVALVE`::pDescriptorTypes list. The descriptor size is equal to the maximum size of any descriptor type included in the pDescriptorTypes list.

As there is no way to request robust and non-robust descriptors separately, or specify robust/non-robust descriptors in the set layout, if `robustBufferAccess` is enabled then robust descriptors are always used.
If the *VkPhysicalDeviceDescriptorBufferPropertiesEXT* structure is included in the *pNext* chain of the *VkPhysicalDeviceProperties2* structure passed to *vkGetPhysicalDeviceProperties2*, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDescriptorBufferPropertiesEXT-sType-sType**

  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_BUFFER_PROPERTIES_EXT*

The *VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT* structure is defined as:

```c
// Provided by VK_EXT_descriptor_buffer
typedef struct VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    size_t combinedImageSamplerDensityMapDescriptorSize;
} VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT;
```

- **sType** is a *VkStructureType* value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **combinedImageSamplerDensityMapDescriptorSize** indicates the size in bytes of a *VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER* descriptor when creating the descriptor with *VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT* set.

If the *VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT* structure is included in the *pNext* chain of the *VkPhysicalDeviceProperties2* structure passed to *vkGetPhysicalDeviceProperties2*, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceDescriptorBufferDensityMapPropertiesEXT-sType-sType**

  *sType* must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DESCRIPTOR_BUFFER_DENSITY_MAP_PROPERTIES_EXT*

The *VkPhysicalDeviceHostImageCopyPropertiesEXT* structure is defined as:

```c
4000
```
typedef struct VkPhysicalDeviceHostImageCopyPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t copySrcLayoutCount;
    VkImageLayout* pCopySrcLayouts;
    uint32_t copyDstLayoutCount;
    VkImageLayout* pCopyDstLayouts;
    uint8_t optimalTilingLayoutUUID[VK_UUID_SIZE];
    VkBool32 identicalMemoryTypeRequirements;
} VkPhysicalDeviceHostImageCopyPropertiesEXT;

• **sType** is a VkStructureType value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **copySrcLayoutCount** is an integer related to the number of image layouts for host copies from images available or queried, as described below.
• **pCopySrcLayouts** is a pointer to an array of VkImageLayout in which supported image layouts for use with host copy operations from images are returned.
• **copyDstLayoutCount** is an integer related to the number of image layouts for host copies to images available or queried, as described below.
• **pCopyDstLayouts** is a pointer to an array of VkImageLayout in which supported image layouts for use with host copy operations to images are returned.
• **optimalTilingLayoutUUID** is an array of VK_UUID_SIZE uint8_t values representing a universally unique identifier for the implementation's swizzling layout of images created with VK_IMAGE_TILING_OPTIMAL.
• **identicalMemoryTypeRequirements** indicates that specifying the VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT flag in VkImageCreateInfo::usage does not affect the memory type requirements of the image.

If the VkPhysicalDeviceHostImageCopyPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

If **pCopyDstLayouts** is NULL, then the number of image layouts that are supported in VkCopyMemoryToImageInfoEXT::dstImageLayout and VkCopyImageToImageInfoEXT::dstImageLayout is returned in copyDstLayoutCount. Otherwise, copyDstLayoutCount must be set by the application to the number of elements in the pCopyDstLayouts array, and on return the variable is overwritten with the number of values actually written to pCopyDstLayouts. If the value of copyDstLayoutCount is less than the number of image layouts that are supported, at most copyDstLayoutCount values will be written to pCopyDstLayouts. The implementation must include the VK_IMAGE_LAYOUT_GENERAL image layout in pCopyDstLayouts.

If **pCopySrcLayouts** is NULL, then the number of image layouts that are supported in VkCopyImageToMemoryInfoEXT::srcImageLayout and VkCopyImageToImageInfoEXT::srcImageLayout is returned in copySrcLayoutCount. Otherwise, copySrcLayoutCount must be set by
the application to the number of elements in the `pCopySrcLayouts` array, and on return the variable is overwritten with the number of values actually written to `pCopySrcLayouts`. If the value of `copySrcLayoutCount` is less than the number of image layouts that are supported, at most `copySrcLayoutCount` values will be written to `pCopySrcLayouts`. The implementation must include the `VK_IMAGE_LAYOUT_GENERAL` image layout in `pCopySrcLayouts`.

The `optimalTilingLayoutUUID` value can be used to ensure compatible data layouts when using the `VK_HOST_IMAGE_COPY_MEMCPY_EXT` flag in `vkCopyMemoryToImageEXT` and `vkCopyImageToMemoryEXT`.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceHostImageCopyPropertiesEXT-sType-sType  
  *sType must be* `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_HOST_IMAGE_COPY_PROPERTIES_EXT`  
- VUID-VkPhysicalDeviceHostImageCopyPropertiesEXT-pCopySrcLayouts-parameter  
  If `copySrcLayoutCount` is not 0, and `pCopySrcLayouts` is not NULL, `pCopySrcLayouts` must be a valid pointer to an array of `copySrcLayoutCount` `VkImageLayout` values  
- VUID-VkPhysicalDeviceHostImageCopyPropertiesEXT-pCopyDstLayouts-parameter  
  If `copyDstLayoutCount` is not 0, and `pCopyDstLayouts` is not NULL, `pCopyDstLayouts` must be a valid pointer to an array of `copyDstLayoutCount` `VkImageLayout` values.

The `VkPhysicalDeviceSubpassShadingPropertiesHUAWEI` structure is defined as:

```c
// Provided by VK_HUAWEI_subpass_shading  
typedef struct VkPhysicalDeviceSubpassShadingPropertiesHUAWEI {  
    VkStructureType sType;  
    void* pNext;  
    uint32_t maxSubpassShadingWorkgroupSizeAspectRatio;  
} VkPhysicalDeviceSubpassShadingPropertiesHUAWEI;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `maxSubpassShadingWorkgroupSizeAspectRatio` indicates the maximum ratio between the width and height of the portion of the subpass shading shader workgroup size. `maxSubpassShadingWorkgroupSizeAspectRatio` must be a power-of-two value, and must be less than or equal to max(WorkgroupSize.x/WorkgroupSize.y, WorkgroupSize.y/WorkgroupSize.x).

If the `VkPhysicalDeviceSubpassShadingPropertiesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceSubpassShadingPropertiesHUAWEI-sType-sType  
  *`sType` must be* `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SUBPASS_SHADING_PROPERTIES_HUAWEI`
The VkPhysicalDeviceMultiDrawPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkPhysicalDeviceMultiDrawPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxMultiDrawCount;
} VkPhysicalDeviceMultiDrawPropertiesEXT;
```

The members of the VkPhysicalDeviceMultiDrawPropertiesEXT structure describe the following features:

- `maxMultiDrawCount` indicates the maximum number of draw calls which can be batched into a single multidraw.

If the VkPhysicalDeviceMultiDrawPropertiesEXT structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMultiDrawPropertiesEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MULTI_DRAW_PROPERTIES_EXT`

The VkPhysicalDeviceNestedCommandBufferPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_nested_command_buffer
typedef struct VkPhysicalDeviceNestedCommandBufferPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxCommandBufferNestingLevel;
} VkPhysicalDeviceNestedCommandBufferPropertiesEXT;
```

The members of the VkPhysicalDeviceNestedCommandBufferPropertiesEXT structure describe the following features:

- `maxCommandBufferNestingLevel` indicates the maximum nesting level of calls to `vkCmdExecuteCommands` from Secondary Command Buffers. A `maxCommandBufferNestingLevel` of `UINT32_MAX` means there is no limit to the nesting level.

If the VkPhysicalDeviceNestedCommandBufferPropertiesEXT structure is included in the `pNext` chain of the VkPhysicalDeviceProperties2 structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceNestedCommandBufferPropertiesEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_NESTED_COMMAND_BUFFER_PROPERTIES_EXT**

The **VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT** structure is defined as:

```c
// Provided by VK_EXT_graphics_pipeline_library
typedef struct VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            graphicsPipelineLibraryFastLinking;
    VkBool32            graphicsPipelineLibraryIndependentInterpolationDecoration;
} VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT;
```

- **graphicsPipelineLibraryFastLinking** indicates whether fast linking of graphics pipelines is supported. If it is **VK_TRUE**, creating a graphics pipeline entirely from pipeline libraries without **VK_PIPELINE_CREATE_LATE_LINK_TIME_OPTIMIZATION_BIT_EXT** is comparable in cost to recording a command in a command buffer.

- **graphicsPipelineLibraryIndependentInterpolationDecoration** indicates whether **NoPerspective** and **Flat** interpolation decorations in the last vertex processing stage and the fragment shader are required to match when using graphics pipeline libraries. If it is **VK_TRUE**, the interpolation decorations do not need to match. If it is **VK_FALSE**, these decorations must either be present in both stages or neither stage in order for a given interface variable to match.

If the **VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT** structure is included in the **pNext** chain of the **VkPhysicalDeviceProperties2** structure passed to **vkGetPhysicalDeviceProperties2**, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceGraphicsPipelineLibraryPropertiesEXT-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_GRAPHICS_PIPELINE_LIBRARY_PROPERTIES_EXT**

The **VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR** structure is defined as:

```c
// Provided by VK_KHR_fragment_shader_barycentric
typedef struct VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR {
    VkStructureType     sType;
    void*               pNext;
    VkBool32            triStripVertexOrderIndependentOfProvokingVertex;
} VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR;
```

- When the **provoking vertex mode** is **VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT**, and the
primitive order is odd in a triangle strip, the ordering of vertices is defined in last vertex table. triStripVertexOrderIndependentOfProvokingVertex equal to VK_TRUE indicates that the implementation ignores this and uses the vertex order defined by VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT instead.

If the VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShaderBarycentricPropertiesKHR-sType-sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADER_BARYCENTRIC_PROPERTIES_KHR

The VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint8_t shaderModuleIdentifierAlgorithmUUID[VK_UUID_SIZE];
} VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT;
```

The members of the VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT structure describe the following:

- shaderModuleIdentifierAlgorithmUUID is an array of VK_UUID_SIZE uint8_t values which uniquely represents the algorithm used to compute an identifier in vkGetShaderModuleIdentifierEXT and vkGetShaderModuleCreateInfoIdentifierEXT. Implementations should not change this value in different driver versions if the algorithm used to compute an identifier is the same.

Note

The algorithm UUID may be the same in different ICDs if the algorithms are guaranteed to produce the same results. This may happen in driver stacks which support different kinds of hardware with shared code.

Khronos’ conformance testing can not guarantee that shaderModuleIdentifierAlgorithmUUID values are actually unique, so implementors should make their own best efforts to ensure that their UUID is unlikely to conflict with other implementations which may use a different algorithm. In particular, hard-coded values which easily conflict, such as all-0 bits, should never be used. Hard-coded values are acceptable if best effort is ensured that the value will not accidentally conflict.

If the VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled...
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceShaderModuleIdentifierPropertiesEXT-sType-sType
  sType must be
  VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_MODULE_IDENTIFIER_PROPERTIES_EXT

The VkPhysicalDevicePipelineRobustnessPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_pipeline_robustness
typedef struct VkPhysicalDevicePipelineRobustnessPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkPipelineRobustnessBufferBehaviorEXT defaultRobustnessStorageBuffers;
    VkPipelineRobustnessBufferBehaviorEXT defaultRobustnessUniformBuffers;
    VkPipelineRobustnessBufferBehaviorEXT defaultRobustnessVertexInputs;
    VkPipelineRobustnessImageBehaviorEXT defaultRobustnessImages;
} VkPhysicalDevicePipelineRobustnessPropertiesEXT;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **defaultRobustnessStorageBuffers** describes the behavior of out of bounds accesses made to
  storage buffers when no robustness features are enabled
- **defaultRobustnessUniformBuffers** describes the behavior of out of bounds accesses made to
  uniform buffers when no robustness features are enabled
- **defaultRobustnessVertexInputs** describes the behavior of out of bounds accesses made to vertex
  input attributes when no robustness features are enabled
- **defaultRobustnessImages** describes the behavior of out of bounds accesses made to images when
  no robustness features are enabled

Some implementations of Vulkan may be able to guarantee that certain types of accesses are always
performed with robustness even when the Vulkan API's robustness features are not explicitly
enabled.

Even when an implementation reports that accesses to a given resource type are robust by default,
it remains invalid to make an out of bounds access without requesting the appropriate robustness
feature.

If the VkPhysicalDevicePipelineRobustnessPropertiesEXT structure is included in the pNext chain of
the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in
with each corresponding implementation-dependent property.
Valid Usage (Implicit)

• VUID-VkPhysicalDevicePipelineRobustnessPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_PIPELINE_ROBUSTNESS_PROPERTIES_EXT

The VkPhysicalDeviceExtendedDynamicState3PropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_extended_dynamic_state3
typedef struct VkPhysicalDeviceExtendedDynamicState3PropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 dynamicPrimitiveTopologyUnrestricted;
} VkPhysicalDeviceExtendedDynamicState3PropertiesEXT;
```

• dynamicPrimitiveTopologyUnrestricted indicates that the implementation allows
  vkCmdSetPrimitiveTopology to use a different primitive topology class to the one specified in the
  active graphics pipeline.

If the VkPhysicalDeviceExtendedDynamicState3PropertiesEXT structure is included in the pNext chain
of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled
in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceExtendedDynamicState3PropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_DYNAMIC_STATE_3_PROPERTIES_EXT

The VkPhysicalDeviceOpticalFlowPropertiesNV structure is defined as:
// Provided by VK_NV_optical_flow

typedef struct VkPhysicalDeviceOpticalFlowPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkOpticalFlowGridSizeFlagsNV supportedOutputGridSizes;
    VkOpticalFlowGridSizeFlagsNV supportedHintGridSizes;
    VkBool32 hintSupported;
    VkBool32 costSupported;
    VkBool32 bidirectionalFlowSupported;
    VkBool32 globalFlowSupported;
    uint32_t minWidth;
    uint32_t minHeight;
    uint32_t maxWidth;
    uint32_t maxHeight;
    uint32_t maxNumRegionsOfInterest;
} VkPhysicalDeviceOpticalFlowPropertiesNV;

• **sType** is a VkStructureType value identifying this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **supportedOutputGridSizes** are the supported VkOpticalFlowGridSizeFlagsNV which can be specified in VkOpticalFlowSessionCreateInfoNV::outputGridSize.

• **supportedHintGridSizes** are the supported VkOpticalFlowGridSizeFlagsNV which can be specified in VkOpticalFlowSessionCreateInfoNV::hintGridSize.

• **hintSupported** is a boolean describing whether using hint flow vector map is supported in an optical flow session.

• **costSupported** is a boolean describing whether cost map generation is supported in an optical flow session.

• **bidirectionalFlowSupported** is a boolean describing whether bi-directional flow generation is supported in an optical flow session.

• **globalFlowSupported** is a boolean describing whether global flow vector map generation is supported in an optical flow session.

• **minWidth** is the minimum width in pixels for images used in an optical flow session.

• **minHeight** is the minimum height in pixels for images used in an optical flow session.

• **maxWidth** is the maximum width in pixels for images used in an optical flow session.

• **maxHeight** is the maximum height in pixels for images used in an optical flow session.

• **maxNumRegionsOfInterest** is the maximum number of regions of interest which can be used in an optical flow session. If this maxNumRegionsOfInterest is 0, regions of interest are not supported in an optical flow session.

If the VkPhysicalDeviceOpticalFlowPropertiesNV structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpticalFlowPropertiesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPTICAL_FLOWPERTIES_NV

The VkPhysicalDeviceOpacityMicromapPropertiesEXT structure is defined as:

```c
// Provided by VK_EXT_opacity_micromap
typedef struct VkPhysicalDeviceOpacityMicromapPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t maxOpacity2StateSubdivisionLevel;
    uint32_t maxOpacity4StateSubdivisionLevel;
} VkPhysicalDeviceOpacityMicromapPropertiesEXT;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxOpacity2StateSubdivisionLevel is the maximum allowed subdivisionLevel when format is VK_OPACITY_MICROMAP_FORMAT_2_STATE_EXT
- maxOpacity4StateSubdivisionLevel is the maximum allowed subdivisionLevel when format is VK_OPACITY_MICROMAP_FORMAT_4_STATE_EXT

If the VkPhysicalDeviceOpacityMicromapPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceOpacityMicromapPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_OPACITY_MICROMAP_PROPERTIES_EXT

The VkPhysicalDeviceDisplacementMicromapPropertiesNV structure is defined as:

```c
// Provided by VK_NV_displacement_micromap
typedef struct VkPhysicalDeviceDisplacementMicromapPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t maxDisplacementMicromapSubdivisionLevel;
} VkPhysicalDeviceDisplacementMicromapPropertiesNV;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxDisplacementMicromapSubdivisionLevel is the maximum allowed subdivisionLevel for...
displacement micromaps.

If the `VkPhysicalDeviceDisplacementMicromapPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceDisplacementMicromapPropertiesNV-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_DISPLACEMENT_MICROMAP_PROPERTIES_NV`

The `VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM` structure is defined as:

```c
// Provided by VK_ARM_shader_core_builtins
typedef struct VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM {
    VkStructureType sType;
    void* pNext;
    uint64_t shaderCoreMask;
    uint32_t shaderCoreCount;
    uint32_t shaderWarpsPerCore;
} VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shaderCoreMask` is a bitfield where each bit set represents the presence of a shader core whose ID is the bit position. The highest ID for any shader core on the device is the position of the most significant bit set.
- `shaderCoreCount` is the number of shader cores on the device.
- `shaderWarpsPerCore` is the maximum number of simultaneously executing warps on a shader core.

If the `VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderCoreBuiltinsPropertiesARM-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_BUILTINS_PROPERTIES_ARM`

Values which **may** be returned in the `rayTracingInvocationReorderReorderingHint` field of `VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV` are:
typedef enum VkRayTracingInvocationReorderModeNV {
    VK_RAY_TRACING_INVOCATION_REORDER_MODE_NONE_NV = 0,
    VK_RAY_TRACING_INVOCATION_REORDER_MODE_REORDER_NV = 1,
} VkRayTracingInvocationReorderModeNV;

- **VK_RAY_TRACING_INVOCATION_REORDER_MODE_NONE_NV** indicates that the implementation is likely to not reorder at reorder calls.

- **VK_RAY_TRACING_INVOCATION_REORDER_MODE_REORDER_NV** indicates that the implementation is likely to reorder at reorder calls.

The `VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV {
    VkStructureType sType;
    void* pNext;
    VkRayTracingInvocationReorderModeNV rayTracingInvocationReorderReorderingHint;
} VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV;
```

- `rayTracingInvocationReorderReorderingHint` is a hint indicating if the implementation will actually reorder at the reorder calls.

**Note**

Because the extension changes how hits are managed there is a compatibility reason to expose the extension even when an implementation does not have sorting active.

If the `VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceRayTracingInvocationReorderPropertiesNV-sType-sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RAY_TRACING_INVOCATION_REORDER_PROPERTIES_NV`
```c
typedef struct VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI {
    VkStructureType sType;
    void* pNext;
    uint32_t maxWorkGroupCount[3];
    uint32_t maxWorkGroupSize[3];
    uint32_t maxOutputClusterCount;
    VkDeviceSize indirectBufferOffsetAlignment;
} VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxWorkGroupCount[3]` is the maximum number of local workgroups that can be launched by a single command. These three values represent the maximum local workgroup count in the X, Y and Z dimensions, respectively. In the current implementation, the values of Y and Z are both implicitly set as one. `groupCountX` of `DrawCluster` command must be less than or equal to `maxWorkGroupCount[0]`.
- `maxWorkGroupSize[3]` is the maximum size of a local workgroup. These three values represent the maximum local workgroup size in the X, Y and Z dimensions, respectively. The x, y and z sizes, as specified by the `LocalSize` or `LocalSizeId` execution mode or by the object decorated by the `WorkgroupSize` decoration in shader modules, must be less than or equal to the corresponding limit. In the current implementation, the maximum workgroup size of the X dimension is 32, the others are 1.
- `maxOutputClusterCount` is the maximum number of output cluster a single cluster culling shader workgroup can emit.
- `indirectBufferOffsetAlignment` indicates the alignment for cluster drawing command buffer stride. `vkCmdDrawClusterIndirectHUAWEI::offset` must be a multiple of this value.

If the `VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceClusterCullingShaderPropertiesHUAWEI-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CLUSTER_CULLING_SHADER_PROPERTIES_HUAWEI`

The `VkPhysicalDeviceShaderCorePropertiesARM` structure is defined as:
// Provided by VK_ARM_shader_core_properties

typedef struct VkPhysicalDeviceShaderCorePropertiesARM {
    VkStructureType sType;
    void* pNext;
    uint32_t pixelRate;
    uint32_t texelRate;
    uint32_t fmaRate;
} VkPhysicalDeviceShaderCorePropertiesARM;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **pixelRate** is an unsigned integer value indicating the maximum number of pixels output per clock per shader core.
• **texelRate** is an unsigned integer value indicating the maximum number of texels per clock per shader core.
• **fmaRate** is an unsigned integer value indicating the maximum number of single-precision fused multiply-add operations per clock per shader core.

If a throughput rate cannot be determined on the physical device, the value 0 will be returned for that rate.

If the *VkPhysicalDeviceShaderCorePropertiesARM* structure is included in the *pNext* chain of the *VkPhysicalDeviceProperties2* structure passed to *vkGetPhysicalDeviceProperties2*, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

• VUID-VkPhysicalDeviceShaderCorePropertiesARM-sType-sType
  
  **sType** must be *VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_CORE_PROPERTIES_ARM*

The *VkPhysicalDeviceShaderObjectPropertiesEXT* structure is defined as:

// Provided by VK_EXT_shader_object

typedef struct VkPhysicalDeviceShaderObjectPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint8_t shaderBinaryUUID[VK_UUID_SIZE];
    uint32_t shaderBinaryVersion;
} VkPhysicalDeviceShaderObjectPropertiesEXT;

• **sType** is a *VkStructureType* value identifying this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **shaderBinaryUUID** is an array of *VK_UUID_SIZE uint8_t* values representing a universally unique identifier for one or more implementations whose shader binaries are guaranteed to be
The purpose and usage of the values of this structure are described in greater detail in Binary Shader Compatibility.

If the `VkPhysicalDeviceShaderObjectPropertiesEXT` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceShaderObjectPropertiesEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_OBJECT_PROPERTIES_EXT`

The `VkPhysicalDeviceShaderEnqueuePropertiesAMDX` structure is defined as:

```c
typedef struct VkPhysicalDeviceShaderEnqueuePropertiesAMDX {
    VkStructureType sType;
    void* pNext;
    uint32_t maxExecutionGraphDepth;
    uint32_t maxExecutionGraphShaderOutputNodes;
    uint32_t maxExecutionGraphShaderPayloadSize;
    uint32_t maxExecutionGraphShaderPayloadCount;
    uint32_t executionGraphDispatchAddressAlignment;
} VkPhysicalDeviceShaderEnqueuePropertiesAMDX;
```

The members of the `VkPhysicalDeviceShaderEnqueuePropertiesAMDX` structure describe the following limits:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxExecutionGraphDepth` defines the maximum node chain depth in the graph. The dispatched node is at depth 1 and the node enqueued by it is at depth 2, and so on. If a node enqueues itself, each recursive enqueue increases the depth by 1 as well.
- `maxExecutionGraphShaderOutputNodes` specifies the maximum number of unique nodes that can be dispatched from a single shader, and must be at least 256.
- `maxExecutionGraphShaderPayloadSize` specifies the maximum total size of payload declarations in a shader. For any payload declarations that share resources, indicated by `NodeSharesPayloadLimitsWithAMDX` decorations, the maximum size of each set of shared payload declarations is taken. The sum of each shared set’s maximum size and the size of each unshared payload is counted against this limit.
- `maxExecutionGraphShaderPayloadCount` specifies the maximum number of output payloads that...
can be initialized in a single workgroup.

- `executionGraphDispatchAddressAlignment` specifies the alignment of non-scratch `VkDeviceAddress` arguments consumed by graph dispatch commands.

If the `VkPhysicalDeviceShaderEnqueuePropertiesAMDX` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceShaderEnqueuePropertiesAMDX-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_SHADER_ENQUEUE_PROPERTIES_AMDX`.

The `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV` structure is defined as:

```c
typedef struct VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV {
    VkStructureType     sType;
    void*                pNext;
    VkDeviceSize         extendedSparseAddressSpaceSize;
    VkImageUsageFlags    extendedSparseImageUsageFlags;
    VkBufferUsageFlags   extendedSparseBufferUsageFlags;
} VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `extendedSparseAddressSpaceSize` is the total amount of address space available, in bytes, for sparse memory resources of all usages if the `extendedSparseAddressSpace` feature is enabled. This must be greater than or equal to `VkPhysicalDeviceLimits::sparseAddressSpaceSize`, and the difference in space must only be used with usages allowed below. This is an upper bound on the sum of the sizes of all sparse resources, regardless of whether any memory is bound to them.
- `extendedSparseImageUsageFlags` is a bitmask of `VkImageUsageFlagBits` of usages which may allow an implementation to use the full `extendedSparseAddressSpaceSize` space.
- `extendedSparseBufferUsageFlags` is a bitmask of `VkBufferUsageFlagBits` of usages which may allow an implementation to use the full `extendedSparseAddressSpaceSize` space.

If the `VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

---

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceExtendedSparseAddressSpacePropertiesNV-sType-sType

  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTENDED_SPARSE_ADDRESS_SPACE_PROPERTIES_NV`.
The `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure is defined as:

```c
// Provided by VK_NV_cuda_kernel_launch
typedef struct VkPhysicalDeviceCudaKernelLaunchPropertiesNV {
    VkStructureType sType;
    void* pNext;
    uint32_t computeCapabilityMinor;
    uint32_t computeCapabilityMajor;
} VkPhysicalDeviceCudaKernelLaunchPropertiesNV;
```

The members of the `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure describe the following features:

- `computeCapabilityMinor` indicates the minor version number of the compute code.
- `computeCapabilityMajor` indicates the major version number of the compute code.

If the `VkPhysicalDeviceCudaKernelLaunchPropertiesNV` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceCudaKernelLaunchPropertiesNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_CUDA_KERNEL_LAUNCH_PROPERTIES_NV`.

The `VkPhysicalDeviceExternalFormatResolvePropertiesANDROID` structure is defined as:

```c
// Provided by VK_ANDROID_external_format_resolve
typedef struct VkPhysicalDeviceExternalFormatResolvePropertiesANDROID {
    VkStructureType sType;
    void* pNext;
    VkBool32 nullColorAttachmentWithExternalFormatResolve;
    VkChromaLocation externalFormatResolveChromaOffsetX;
    VkChromaLocation externalFormatResolveChromaOffsetY;
} VkPhysicalDeviceExternalFormatResolvePropertiesANDROID;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `nullColorAttachmentWithExternalFormatResolve` indicates that there must be no color attachment image when performing external format resolves if it is `VK_TRUE`.
- `externalFormatResolveChromaOffsetX` indicates the `VkChromaLocation` that an implementation uses in the X axis for accesses to an external format image as a resolve attachment. This must be consistent between external format resolves and load operations from external format resolve attachments to color attachments when `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`.
• `externalFormatResolveChromaOffsetY` indicates the `VkChromaLocation` that an implementation uses in the Y axis for accesses to an external format image as a resolve attachment. This must be consistent between external format resolves and load operations from external format resolve attachments to color attachments when `nullColorAttachmentWithExternalFormatResolve` is `VK_TRUE`.

If the `VkPhysicalDeviceExternalFormatResolvePropertiesANDROID` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalFormatResolvePropertiesANDROID-sType-sType
  
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FORMAT_RESOLVE_PROPERTIES_ANDROID`.

The members of the `VkPhysicalDeviceRenderPassStripedPropertiesARM` structure describe the following limits:

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `renderPassStripeGranularity` indicates the minimum supported granularity of striped render pass regions.
- `maxRenderPassStripes` indicates the maximum number of stripes supported in striped rendering.

If the `VkPhysicalDeviceRenderPassStripedPropertiesARM` structure is included in the `pNext` chain of the `VkPhysicalDeviceProperties2` structure passed to `vkGetPhysicalDeviceProperties2`, it is filled in with each corresponding implementation-dependent property.

### Valid Usage (Implicit)

- VUID-VkPhysicalDeviceRenderPassStripedPropertiesARM-sType-sType
  
  - `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_RENDER_PASS_STRIPED_PROPERTIES_ARM`.

The `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT` structure is defined as:

```c
// Provided by VK_ARM_render_pass_striped
typedef struct VkPhysicalDeviceRenderPassStripedPropertiesARM {
    VkStructureType sType;
    void* pNext;
    VkExtent2D renderPassStripeGranularity;
    uint32_t maxRenderPassStripes;
} VkPhysicalDeviceRenderPassStripedPropertiesARM;
```

The `VkPhysicalDeviceMapMemoryPlacedPropertiesEXT` structure is defined as:
typedef struct VkPhysicalDeviceMapMemoryPlacedPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkDeviceSize minPlacedMemoryMapAlignment;
} VkPhysicalDeviceMapMemoryPlacedPropertiesEXT;

The members of the VkPhysicalDeviceMapMemoryPlacedPropertiesEXT structure describe the following:

- **minPlacedMemoryMapAlignment** is the minimum alignment required for memory object offsets and virtual address ranges when using placed memory mapping.

If the VkPhysicalDeviceMapMemoryPlacedPropertiesEXT structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceMapMemoryPlacedPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_MAP_MEMORY_PLACED_PROPERTIES_EXT

The VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure is defined as:

```c
typedef struct VkPhysicalDeviceImageAlignmentControlPropertiesMESA {
    VkStructureType sType;
    void* pNext;
    uint32_t supportedImageAlignmentMask;
} VkPhysicalDeviceImageAlignmentControlPropertiesMESA;
```

The members of the VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure describe the following:

- **supportedImageAlignmentMask** is a bitwise-or of all potentially supported image alignments for a given physical device when using VK_IMAGE_TILING_OPTIMAL. If a given alignment is supported, the application can request an image to have that alignment. A given set of image creation parameters may support a subset of these alignments. To determine if a particular alignment is supported for a given set of image creation parameters, check VkMemoryRequirements::alignment after chaining in VkImageAlignmentControlCreateInfoMESA.

If the VkPhysicalDeviceImageAlignmentControlPropertiesMESA structure is included in the pNext chain of the VkPhysicalDeviceProperties2 structure passed to vkGetPhysicalDeviceProperties2, it is filled in with each corresponding implementation-dependent property.
48.1. Limit Requirements

The following table specifies the **required** minimum/maximum for all Vulkan graphics implementations. Where a limit corresponds to a fine-grained device feature which is **optional**, the feature name is listed with two **required** limits, one when the feature is supported and one when it is not supported. If an implementation supports a feature, the limits reported are the same whether or not the feature is enabled.

1 The Limit Type column specifies the limit is either the minimum limit all implementations must support, the maximum limit all implementations must support, or the exact value all implementations must support. For bitmasks a minimum limit is the least bits all implementations must set, but they may have additional bits set beyond this minimum.

2 The maxPerStageResources must be at least the smallest of the following:

- the sum of the maxPerStageDescriptorUniformBuffers, maxPerStageDescriptorStorageBuffers, maxPerStageDescriptorSampledImages, maxPerStageDescriptorStorageImages, maxPerStageDescriptorInputAttachments, maxColorAttachments limits, or
- 128.

It may not be possible to reach this limit in every stage.
See `maxViewportDimensions` for the **required** relationship to other limits.

See `viewportBoundsRange` for the **required** relationship to other limits.

The values `minInterpolationOffset` and `maxInterpolationOffset` describe the closed interval of supported interpolation offsets: `minInterpolationOffset`, `maxInterpolationOffset`. The ULP is determined by `subPixelInterpolationOffsetBits`. If `subPixelInterpolationOffsetBits` is 4, this provides increments of \( (1/2^4) = 0.0625 \), and thus the range of supported interpolation offsets would be \([-0.5, 0.4375]\).

The point size ULP is determined by `pointSizeGranularity`. If the `pointSizeGranularity` is 0.125, the range of supported point sizes **must** be at least \([1.0, 63.875]\).

The line width ULP is determined by `lineWidthGranularity`. If the `lineWidthGranularity` is 0.0625, the range of supported line widths **must** be at least \([1.0, 7.9375]\).

The minimum `maxDescriptorSet*` limit is \( n \) times the corresponding `specification` minimum `maxPerStageDescriptor*` limit, where \( n \) is the number of shader stages supported by the `VkPhysicalDevice`. If all shader stages are supported, \( n = 6 \) (vertex, tessellation control, tessellation evaluation, geometry, fragment, compute).

The `UpdateAfterBind` descriptor limits **must** each be greater than or equal to the corresponding non-`UpdateAfterBind` limit.

If the `VK_KHR_portability_subset` extension is enabled, the required minimum value of `maxVertexInputBindings` is 8.

`maxResourceDescriptorSize` is defined as the maximum value of `storageImageDescriptorSize`, `sampledImageDescriptorSize`, `robustUniformTexelBufferDescriptorSize`, `robustStorageTexelBufferDescriptorSize`, `robustUniformBufferDescriptorSize`, `robustStorageBufferDescriptorSize`, `inputAttachmentDescriptorSize`, and `accelerationStructureDescriptorSize`.

**48.2. Additional Multisampling Capabilities**

To query additional multisampling capabilities which **may** be supported for a specific sample count, beyond the minimum capabilities described for `Limits` above, call:
void vkGetPhysicalDeviceMultisamplePropertiesEXT(
    VkPhysicalDevice physicalDevice,
    VkSampleCountFlagBits samples,
    VkMultisamplePropertiesEXT* pMultisampleProperties);

- `physicalDevice` is the physical device from which to query the additional multisampling capabilities.
- `samples` is a `VkSampleCountFlagBits` value specifying the sample count to query capabilities for.
- `pMultisampleProperties` is a pointer to a `VkMultisamplePropertiesEXT` structure in which information about additional multisampling capabilities specific to the sample count is returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-physicalDevice-parameter
  `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-samples-parameter
  `samples` must be a valid `VkSampleCountFlagBits` value
- VUID-vkGetPhysicalDeviceMultisamplePropertiesEXT-pMultisampleProperties-parameter
  `pMultisampleProperties` must be a valid pointer to a `VkMultisamplePropertiesEXT` structure

The `VkMultisamplePropertiesEXT` structure is defined as

```c
// Provided by VK_EXT_sample_locations
typedef struct VkMultisamplePropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkExtent2D maxSampleLocationGridSize;
} VkMultisamplePropertiesEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxSampleLocationGridSize` is the maximum size of the pixel grid in which sample locations can vary.

Valid Usage (Implicit)

- VUID-VkMultisamplePropertiesEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MULTISAMPLE_PROPERTIES_EXT`
- VUID-VkMultisamplePropertiesEXT-pNext-pNext

4045
pNext must be NULL

If the sample count for which additional multisampling capabilities are requested using `vkGetPhysicalDeviceMultisamplePropertiesEXT` is set in `sampleLocationSampleCounts` the width and height members of `VkMultisamplePropertiesEXT::maxSampleLocationGridSize` must be greater than or equal to the corresponding members of `maxSampleLocationGridSize`, respectively, otherwise both members must be 0.

## 48.3. Profile Limits

### 48.3.1. Roadmap 2022

Implementations that claim support for the Roadmap 2022 profile must satisfy the following additional limit requirements:

<table>

<td>min</td>
</tr>
</tbody>
</table>
Chapter 49. Formats

Supported buffer and image formats may vary across implementations. A minimum set of format features are guaranteed, but others must be explicitly queried before use to ensure they are supported by the implementation.

The features for the set of formats (VkFormat) supported by the implementation are queried individually using the vkGetPhysicalDeviceFormatProperties command.

49.1. Format Definition

The following image formats can be passed to, and may be returned from Vulkan commands. The memory required to store each format is discussed with that format, and also summarized in the Representation and Texel Block Size section and the Compatible formats table.

```c
// Provided by VK_VERSION_1_0
typedef enum VkFormat {
    VK_FORMAT_UNDEFINED = 0,
    VK_FORMAT_R4G4_UNORM_PACK8 = 1,
    VK_FORMAT_R4G4B4A4_UNORM_PACK16 = 2,
    VK_FORMAT_B4G4R4A4_UNORM_PACK16 = 3,
    VK_FORMAT_R5G6B5_UNORM_PACK16 = 4,
    VK_FORMAT_B5G6R5_UNORM_PACK16 = 5,

VK_FORMAT_UNDEFINED specifies that the format is not specified.

VK_FORMAT_R4G4_UNORM_PACK8 specifies a two-component, 8-bit packed unsigned normalized format that has a 4-bit R component in bits 4..7, and a 4-bit G component in bits 0..3.

VK_FORMAT_R4G4B4A4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit R component in bits 12..15, a 4-bit G component in bits 8..11, a 4-bit B component in bits 4..7, and a 4-bit A component in bits 0..3.

VK_FORMAT_A4R4G4B4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit R component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit B component in bits 0..3.

VK_FORMAT_A4B4G4R4_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 4-bit A component in bits 12..15, a 4-bit B component in bits 8..11, a 4-bit G component in bits 4..7, and a 4-bit R component in bits 0..3.

VK_FORMAT_R5G6B5_UNORM_PACK16 specifies a three-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit B component in bits 0..4.

VK_FORMAT_B5G5R5A1_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 6-bit G component in bits 5..10, and a 5-bit R component in bits 0..4.

VK_FORMAT_R5G5B5A1_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit R component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit B component in bits 1..5, and a 1-bit A component in bit 0.

VK_FORMAT_B5G5R5A1_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 5-bit B component in bits 11..15, a 5-bit G component in bits 6..10, a 5-bit R component in bits 1..5, and a 1-bit A component in bit 0.

VK_FORMAT_A1R5G5B5_UNORM_PACK16 specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit R component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit B component in bits 0..4.

VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR specifies a four-component, 16-bit packed unsigned normalized format that has a 1-bit A component in bit 15, a 5-bit B component in bits 10..14, a 5-bit G component in bits 5..9, and a 5-bit R component in bits 0..4.

VK_FORMAT_A8_UNORM_KHR specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit A component.
• **VK_FORMAT_R8_UNORM** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component.

• **VK_FORMAT_R8_SNORM** specifies a one-component, 8-bit signed normalized format that has a single 8-bit R component.

• **VK_FORMAT_R8_USCALED** specifies a one-component, 8-bit unsigned scaled integer format that has a single 8-bit R component.

• **VK_FORMAT_R8_SSCALED** specifies a one-component, 8-bit signed scaled integer format that has a single 8-bit R component.

• **VK_FORMAT_R8_UINT** specifies a one-component, 8-bit unsigned integer format that has a single 8-bit R component.

• **VK_FORMAT_R8_SINT** specifies a one-component, 8-bit signed integer format that has a single 8-bit R component.

• **VK_FORMAT_R8_SRGB** specifies a one-component, 8-bit unsigned normalized format that has a single 8-bit R component stored with sRGB nonlinear encoding.

• **VK_FORMAT_R8G8_UNORM** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_SNORM** specifies a two-component, 16-bit signed normalized format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_USCALED** specifies a two-component, 16-bit unsigned scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_SSCALED** specifies a two-component, 16-bit signed scaled integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_UINT** specifies a two-component, 16-bit unsigned integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_SINT** specifies a two-component, 16-bit signed integer format that has an 8-bit R component in byte 0, and an 8-bit G component in byte 1.

• **VK_FORMAT_R8G8_SRGB** specifies a two-component, 16-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, and an 8-bit G component stored with sRGB nonlinear encoding in byte 1.

• **VK_FORMAT_R8G8B8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_USCALED** specifies a three-component, 24-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

• **VK_FORMAT_R8G8B8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.
- **VK_FORMAT_R8G8B8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, and an 8-bit B component in byte 2.

- **VK_FORMAT_R8G8B8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit B component stored with sRGB nonlinear encoding in byte 2.

- **VK_FORMAT_B8G8R8_UNORM** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- **VK_FORMAT_B8G8R8_SNORM** specifies a three-component, 24-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- **VK_FORMAT_B8G8R8_SSCALED** specifies a three-component, 24-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- **VK_FORMAT_B8G8R8_UINT** specifies a three-component, 24-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- **VK_FORMAT_B8G8R8_SINT** specifies a three-component, 24-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, and an 8-bit R component in byte 2.

- **VK_FORMAT_B8G8R8_SRGB** specifies a three-component, 24-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, and an 8-bit R component stored with sRGB nonlinear encoding in byte 2.

- **VK_FORMAT_R8G8B8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.

- **VK_FORMAT_R8G8B8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit R component in byte 0, an 8-bit G component in byte 1, an 8-bit B component in byte 2, and an 8-bit A component in byte 3.
• **VK_FORMAT_R8G8B8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit R component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit B component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_UNORM** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_SNORM** specifies a four-component, 32-bit signed normalized format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_USCALED** specifies a four-component, 32-bit unsigned scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_SSCALED** specifies a four-component, 32-bit signed scaled format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_UINT** specifies a four-component, 32-bit unsigned integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_SINT** specifies a four-component, 32-bit signed integer format that has an 8-bit B component in byte 0, an 8-bit G component in byte 1, an 8-bit R component in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_B8G8R8A8_SRGB** specifies a four-component, 32-bit unsigned normalized format that has an 8-bit B component stored with sRGB nonlinear encoding in byte 0, an 8-bit G component stored with sRGB nonlinear encoding in byte 1, an 8-bit R component stored with sRGB nonlinear encoding in byte 2, and an 8-bit A component in byte 3.

• **VK_FORMAT_A8B8G8R8_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.

• **VK_FORMAT_A8B8G8R8_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has an 8-bit A component in bits 24..31, an 8-bit B component in bits 16..23, an 8-bit G component in bits 8..15, and an 8-bit R component in bits 0..7.
component in bits 8..15, and an 8-bit R component in bits 0..7.

- **VK_FORMAT_A8B8G8R8_SRGB_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has an 8-bit A component in bits 24..31, an 8-bit B component stored with sRGB nonlinear encoding in bits 16..23, an 8-bit G component stored with sRGB nonlinear encoding in bits 8..15, and an 8-bit R component stored with sRGB nonlinear encoding in bits 0..7.

- **VK_FORMAT_A2R10G10B10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2R10G10B10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2R10G10B10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2R10G10B10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2R10G10B10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2R10G10B10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit R component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit B component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_UNORM_PACK32** specifies a four-component, 32-bit packed unsigned normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_SNORM_PACK32** specifies a four-component, 32-bit packed signed normalized format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_USCALED_PACK32** specifies a four-component, 32-bit packed unsigned scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_SSCALED_PACK32** specifies a four-component, 32-bit packed signed scaled integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_UINT_PACK32** specifies a four-component, 32-bit packed unsigned integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_A2B10G10R10_SINT_PACK32** specifies a four-component, 32-bit packed signed integer format that has a 2-bit A component in bits 30..31, a 10-bit B component in bits 20..29, a 10-bit G component in bits 10..19, and a 10-bit R component in bits 0..9.

- **VK_FORMAT_R16_UNORM** specifies a one-component, 16-bit unsigned normalized format that has a
single 16-bit R component.

- **VK_FORMAT_R16_SNORM** specifies a one-component, 16-bit signed normalized format that has a single 16-bit R component.
- **VK_FORMAT_R16_USCALED** specifies a one-component, 16-bit unsigned scaled integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SSCALED** specifies a one-component, 16-bit signed scaled integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_UINT** specifies a one-component, 16-bit unsigned integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SINT** specifies a one-component, 16-bit signed integer format that has a single 16-bit R component.
- **VK_FORMAT_R16_SFLOAT** specifies a one-component, 16-bit signed floating-point format that has a single 16-bit R component.
- **VK_FORMAT_R16G16_UNORM** specifies a two-component, 32-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SNORM** specifies a two-component, 32-bit signed normalized format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_USCALED** specifies a two-component, 32-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SSCALED** specifies a two-component, 32-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_UINT** specifies a two-component, 32-bit unsigned integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SINT** specifies a two-component, 32-bit signed integer format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16_SFLOAT** specifies a two-component, 32-bit signed floating-point format that has a 16-bit R component in bytes 0..1, and a 16-bit G component in bytes 2..3.
- **VK_FORMAT_R16G16B16_UNORM** specifies a three-component, 48-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SNORM** specifies a three-component, 48-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_USCALED** specifies a three-component, 48-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_SSCALED** specifies a three-component, 48-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
- **VK_FORMAT_R16G16B16_UINT** specifies a three-component, 48-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.
VK_FORMAT_R16G16B16_SINT specifies a three-component, 48-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.

VK_FORMAT_R16G16B16_SFLOAT specifies a three-component, 48-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, and a 16-bit B component in bytes 4..5.

VK_FORMAT_R16G16B16A16_UNORM specifies a four-component, 64-bit unsigned normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_SNORM specifies a four-component, 64-bit signed normalized format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_USCALED specifies a four-component, 64-bit unsigned scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_SSCALED specifies a four-component, 64-bit signed scaled integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_UINT specifies a four-component, 64-bit unsigned integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_SINT specifies a four-component, 64-bit signed integer format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R16G16B16A16_SFLOAT specifies a four-component, 64-bit signed floating-point format that has a 16-bit R component in bytes 0..1, a 16-bit G component in bytes 2..3, a 16-bit B component in bytes 4..5, and a 16-bit A component in bytes 6..7.

VK_FORMAT_R32_UINT specifies a one-component, 32-bit unsigned integer format that has a single 32-bit R component.

VK_FORMAT_R32_SINT specifies a one-component, 32-bit signed integer format that has a single 32-bit R component.

VK_FORMAT_R32_SFLOAT specifies a one-component, 32-bit signed floating-point format that has a single 32-bit R component.

VK_FORMAT_R32G32_UINT specifies a two-component, 64-bit unsigned integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

VK_FORMAT_R32G32_SINT specifies a two-component, 64-bit signed integer format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

VK_FORMAT_R32G32_SFLOAT specifies a two-component, 64-bit signed floating-point format that has a 32-bit R component in bytes 0..3, and a 32-bit G component in bytes 4..7.

VK_FORMAT_R32G32B32_UINT specifies a three-component, 96-bit unsigned integer format that has a
32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32_SINT** specifies a three-component, 96-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32_SFLOAT** specifies a three-component, 96-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, and a 32-bit B component in bytes 8..11.

- **VK_FORMAT_R32G32B32A32_UINT** specifies a four-component, 128-bit unsigned integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R32G32B32A32_SINT** specifies a four-component, 128-bit signed integer format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R32G32B32A32_SFLOAT** specifies a four-component, 128-bit signed floating-point format that has a 32-bit R component in bytes 0..3, a 32-bit G component in bytes 4..7, a 32-bit B component in bytes 8..11, and a 32-bit A component in bytes 12..15.

- **VK_FORMAT_R64_UINT** specifies a one-component, 64-bit unsigned integer format that has a single 64-bit R component.

- **VK_FORMAT_R64_SINT** specifies a one-component, 64-bit signed integer format that has a single 64-bit R component.

- **VK_FORMAT_R64_SFLOAT** specifies a one-component, 64-bit signed floating-point format that has a single 64-bit R component.

- **VK_FORMAT_R64G64_UINT** specifies a two-component, 128-bit unsigned integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64_SINT** specifies a two-component, 128-bit signed integer format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64_SFLOAT** specifies a two-component, 128-bit signed floating-point format that has a 64-bit R component in bytes 0..7, and a 64-bit G component in bytes 8..15.

- **VK_FORMAT_R64G64B64_UINT** specifies a three-component, 192-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

- **VK_FORMAT_R64G64B64_SINT** specifies a three-component, 192-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

- **VK_FORMAT_R64G64B64_SFLOAT** specifies a three-component, 192-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, and a 64-bit B component in bytes 16..23.

- **VK_FORMAT_R64G64B64A64_UINT** specifies a four-component, 256-bit unsigned integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.
• **VK_FORMAT_R64G64B64A64_SINT** specifies a four-component, 256-bit signed integer format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.

• **VK_FORMAT_R64G64B64A64_SFLOAT** specifies a four-component, 256-bit signed floating-point format that has a 64-bit R component in bytes 0..7, a 64-bit G component in bytes 8..15, a 64-bit B component in bytes 16..23, and a 64-bit A component in bytes 24..31.

• **VK_FORMAT_B10G11R11_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 10-bit B component in bits 22..31, an 11-bit G component in bits 11..21, and an 11-bit R component in bits 0..10. See **Unsigned 10-Bit Floating-Point Numbers** and **Unsigned 11-Bit Floating-Point Numbers**.

• **VK_FORMAT_E5B9G9R9_UFLOAT_PACK32** specifies a three-component, 32-bit packed unsigned floating-point format that has a 5-bit shared exponent in bits 27..31, a 9-bit B component mantissa in bits 18..26, a 9-bit G component mantissa in bits 9..17, and a 9-bit R component mantissa in bits 0..8.

• **VK_FORMAT_D16_UNORM** specifies a one-component, 16-bit unsigned normalized format that has a single 16-bit depth component.

• **VK_FORMAT_X8_D24_UNORM_PACK32** specifies a two-component, 32-bit format that has 24 unsigned normalized bits in the depth component and, optionally, 8 bits that are unused.

• **VK_FORMAT_D32_SFLOAT** specifies a one-component, 32-bit signed floating-point format that has 32 bits in the depth component.

• **VK_FORMAT_S8_UINT** specifies a one-component, 8-bit unsigned integer format that has 8 bits in the stencil component.

• **VK_FORMAT_D16_UNORM_S8_UINT** specifies a two-component, 24-bit format that has 16 unsigned normalized bits in the depth component and 8 unsigned integer bits in the stencil component.

• **VK_FORMAT_D24_UNORM_S8_UINT** specifies a two-component, 32-bit packed format that has 8 unsigned integer bits in the stencil component, and 24 unsigned normalized bits in the depth component.

• **VK_FORMAT_D32_SFLOAT_S8_UINT** specifies a two-component format that has 32 signed float bits in the depth component and 8 unsigned integer bits in the stencil component. There are optionally 24 bits that are unused.

• **VK_FORMAT_BC1_RGB_UNORM_BLOCK** specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.

• **VK_FORMAT_BC1_RGB_SRGB_BLOCK** specifies a three-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.

• **VK_FORMAT_BC1_RGBA_UNORM_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data, and provides 1 bit of alpha.

• **VK_FORMAT_BC1_RGBA_SRGB_BLOCK** specifies a four-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.

• **VK_FORMAT_BC2_UNORM_BLOCK** specifies a four-component, block-compressed format where each
128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- **VK_FORMAT_BC2_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.

- **VK_FORMAT_BC3_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- **VK_FORMAT_BC3_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding.

- **VK_FORMAT_BC4_UNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- **VK_FORMAT_BC4_SNORM_BLOCK** specifies a one-component, block-compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.

- **VK_FORMAT_BC5_UNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_BC5_SNORM_BLOCK** specifies a two-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- **VK_FORMAT_BC6H_UFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned floating-point RGB texel data.

- **VK_FORMAT_BC6H_SFLOAT_BLOCK** specifies a three-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGB texel data.

- **VK_FORMAT_BC7_UNORM_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_BC7_SRGB_BLOCK** specifies a four-component, block-compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data. This format has no alpha and is considered opaque.

- **VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK** specifies a three-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding. This format has no alpha and is considered opaque.

- **VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK** specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA...
texel data, and provides 1 bit of alpha.

- `VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK` specifies a four-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGB texel data with sRGB nonlinear encoding, and provides 1 bit of alpha.

- `VK_FORMAT_ETC2_R8G8B8AB_UNORM_BLOCK` specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values.

- `VK_FORMAT_ETC2_R8G8B8AB_SRGB_BLOCK` specifies a four-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with the first 64 bits encoding alpha values followed by 64 bits encoding RGB values with sRGB nonlinear encoding applied.

- `VK_FORMAT_EAC_R11_UNORM_BLOCK` specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized red texel data.

- `VK_FORMAT_EAC_R11_SNORM_BLOCK` specifies a one-component, ETC2 compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of signed normalized red texel data.

- `VK_FORMAT_EAC_R11G11_UNORM_BLOCK` specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- `VK_FORMAT_EAC_R11G11_SNORM_BLOCK` specifies a two-component, ETC2 compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed normalized RG texel data with the first 64 bits encoding red values followed by 64 bits encoding green values.

- `VK_FORMAT_ASTC_4x4_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.

- `VK_FORMAT_ASTC_4x4_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- `VK_FORMAT_ASTC_4x4_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 4×4 rectangle of signed floating-point RGBA texel data.

- `VK_FORMAT_ASTC_5x4_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data.

- `VK_FORMAT_ASTC_5x4_SRGB_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- `VK_FORMAT_ASTC_5x4_SFLOAT_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×4 rectangle of signed floating-point RGBA texel data.

- `VK_FORMAT_ASTC_5x5_UNORM_BLOCK` specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5×5 rectangle of unsigned normalized RGBA texel data.
data.

- **VK_FORMAT_ASTC_5x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5x5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_5x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 5x5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_6x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_6x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_6x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_6x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x6 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_6x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_6x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 6x6 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_8x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8x5 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_8x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8x5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8x5 rectangle of signed floating-point RGBA texel data.

- **VK_FORMAT_ASTC_8x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8x6 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_ASTC_8x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8x6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

- **VK_FORMAT_ASTC_8x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 8x6 rectangle of signed floating-point RGBA texel data.
• **VK_FORMAT_ASTC_8x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_8x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_8x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes an 8×8 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_10x5_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_10x5_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_10x5_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×5 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_10x6_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_10x6_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_10x6_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×6 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_10x8_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_10x8_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_10x8_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×8 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_10x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_10x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of unsigned normalized RGBA data.
texel data with sRGB nonlinear encoding applied to the RGB components.
• **VK_FORMAT_ASTC_10x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 10×10 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_12x10_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_12x10_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_12x10_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×10 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_ASTC_12x12_UNORM_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data.

• **VK_FORMAT_ASTC_12x12_SRGB_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of unsigned normalized RGBA texel data with sRGB nonlinear encoding applied to the RGB components.

• **VK_FORMAT_ASTC_12x12_SFLOAT_BLOCK** specifies a four-component, ASTC compressed format where each 128-bit compressed texel block encodes a 12×12 rectangle of signed floating-point RGBA texel data.

• **VK_FORMAT_G8B8G8R8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit G component for the even i coordinate in byte 0, an 8-bit B component in byte 1, an 8-bit G component for the odd i coordinate in byte 2, and an 8-bit R component in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

• **VK_FORMAT_B8G8R8G8_422_UNORM** specifies a four-component, 32-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has an 8-bit B component in byte 0, an 8-bit G component for the even i coordinate in byte 1, an 8-bit R component in byte 2, and an 8-bit G component for the odd i coordinate in byte 3. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

• **VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which
The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G8_B8R8_2PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which \(|i_G \times 0.5| = i_B = i_R\) and \(|j_G \times 0.5| = j_B = j_R\). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G8_B8_R8_3PLANE_422_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \(|i_G \times 0.5| = i_B = i_R\). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G8_B8R8_2PLANE_422_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \(|i_G \times 0.5| = i_B = i_R\). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- **VK_FORMAT_G8_B8_R8_3PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has an 8-bit G component in plane 0, an 8-bit B component in plane 1, and an 8-bit R component in plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- **VK_FORMAT_R10X6_UNORM_PACK16** specifies a one-component, 16-bit unsigned normalized format that has a single 10-bit R component in the top 10 bits of a 16-bit word, with the bottom 6 bits unused.

- **VK_FORMAT_R10X6G10X6_UNORM_2PACK16** specifies a two-component, 32-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, and a 10-bit G component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused.

- **VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 10-bit R component in the top 10 bits of the word in bytes 0..1, a
10-bit G component in the top 10 bits of the word in bytes 2..3, a 10-bit B component in the top 10 bits of the word in bytes 4..5, and a 10-bit A component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused.

- **VK_FORMAT_G10X6B10X6G10X6R10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 0..1, a 10-bit B component in the top 10 bits of the word in bytes 2..3, a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 4..5, and a 10-bit R component in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 10-bit B component in the top 10 bits of the word in bytes 0..1, a 10-bit G component for the even i coordinate in the top 10 bits of the word in bytes 2..3, a 10-bit R component in the top 10 bits of the word in bytes 4..5, and a 10-bit G component for the odd i coordinate in the top 10 bits of the word in bytes 6..7, with the bottom 6 bits of each word unused. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multiplanar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which l_g × 0.5 = i_r = i_b and |l_g × 0.5| = j_b = j_r. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized multiplanar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which l_g × 0.5 = i_r = i_b and |l_g × 0.5| = j_b = j_r. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width and height that is a multiple of two.
**VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \times 0.5 \times i_B = i_B \times i_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

**VK_FORMAT_G10X6_B10X6_R10X6_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, with the bottom 6 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \times 0.5 \times i_B = i_B \times i_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.

**VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, a 10-bit B component in the top 10 bits of each 16-bit word of plane 1, and a 10-bit R component in the top 10 bits of each 16-bit word of plane 2, with the bottom 6 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

**VK_FORMAT_R12X4_UNORM_PACK16** specifies a one-component, 16-bit unsigned normalized format that has a single 12-bit R component in the top 12 bits of a 16-bit word, with the bottom 4 bits unused.

**VK_FORMAT_R12X4G12X4_UNORM_2PACK16** specifies a two-component, 32-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, and a 12-bit G component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused.

**VK_FORMAT_R12X4G12X4B12X4A12X4_UNORM_4PACK16** specifies a four-component, 64-bit unsigned normalized format that has a 12-bit R component in the top 12 bits of the word in bytes 0..1, a 12-bit G component in the top 12 bits of the word in bytes 2..3, a 12-bit B component in the top 12 bits of the word in bytes 4..5, and a 12-bit A component in the top 12 bits of the word in bytes 6..7, with the bottom 4 bits of each word unused.

**VK_FORMAT_G12X4B12X4G12X4R12X4_422_UNORM_4PACK16** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each \( i \) coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 12-bit G component for the even \( i \)
coordinate in the top 12 bits of the word in bytes 0..1, a 12-bit B component in the top 12 bits of
the word in bytes 2..3, a 12-bit G component for the odd \(i\) coordinate in the top 12 bits of the
word in bytes 4..5, and a 12-bit R component in the top 12 bits of the word in bytes 6..7, with the
bottom 4 bits of each word unused. This format only supports images with a width that is a
multiple of two. For the purposes of the constraints on copy extents, this format is treated as a
compressed format with a 2\(\times\)1 compressed texel block.

- **VK_FORMAT_B12X4G12X4R12X4_422_UNORM_4PACK16** specifies a four-component, 64-bit format
  containing a pair of G components, an R component, and a B component, collectively encoding a
  2\(\times\)1 rectangle of unsigned normalized RGB texel data. One G value is present at each \(i\)
  coordinate, with the B and R values shared across both G values and thus recorded at half the
  horizontal resolution of the image. This format has a 12-bit B component in the top 12 bits of the
  word in bytes 0..1, a 12-bit G component for the even \(i\) coordinate in the top 12 bits of the word
  in bytes 2..3, a 12-bit R component in the top 12 bits of the word in bytes 4..5, and a 12-bit G
  component for the odd \(i\) coordinate in the top 12 bits of the word in bytes 6..7, with the bottom 4
  bits of each word unused. This format only supports images with a width that is a multiple of
  two. For the purposes of the constraints on copy extents, this format is treated as a compressed
  format with a 2\(\times\)1 compressed texel block.

- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_420_UNORM_3PACK16** specifies an unsigned normalized
  multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a
  12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in
  the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The
  horizontal and vertical dimensions of the R and B planes are halved relative to the image
  dimensions, and each R and B component is shared with the G components for which
  \(\lceil G \times 0.5\rceil = i_B = i_R\) and \(\lceil G \times 0.5\rceil = j_B = j_R\). The location of each plane when this image is in linear
  layout can be determined via `vkGetImageSubresourceLayout`, using
  `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and
  `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width and
  height that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_420_UNORM_3PACK16** specifies an unsigned normalized
  multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0,
  and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of
  the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with
  the bottom 4 bits of each word unused. The horizontal and vertical dimensions of the BR plane
  are halved relative to the image dimensions, and each R and B value is shared with the G
  components for which \(\lceil G \times 0.5\rceil = i_B = i_R\) and \(\lceil G \times 0.5\rceil = j_B = j_R\). The location of each plane when
  this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using
  `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.
  This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4R12X4_3PLANE_422_UNORM_3PACK16** specifies an unsigned normalized
  multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a
  12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in
  the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. The
  horizontal dimension of the R and B plane is halved relative to the image dimensions, and each
  R and B value is shared with the G components for which \(\lceil G \times 0.5\rceil = i_B = i_R\). The location of each plane when
  this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using
  `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the R plane, and
  `VK_IMAGE_ASPECT_PLANE_2_BIT` for the BR plane.
and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_422_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, with the bottom 4 bits of each word unused. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \( \lfloor i_G \times 0.5 \rfloor = j_B = j_R \). The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, and VK_IMAGE_ASPECT_PLANE_1_BIT for the BR plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G12X4_B12X4_R12X4_3PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, a 12-bit B component in the top 12 bits of each 16-bit word of plane 1, and a 12-bit R component in the top 12 bits of each 16-bit word of plane 2, with the bottom 4 bits of each word unused. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.

- **VK_FORMAT_G16B16G16R16_422_UNORM** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit G component for the even i coordinate in the word in bytes 0..1, a 16-bit B component in the word in bytes 2..3, a 16-bit G component for the odd i coordinate in the word in bytes 4..5, and a 16-bit R component in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_B16G16R16G16_422_UNORM** specifies a four-component, 64-bit format containing a pair of G components, an R component, and a B component, collectively encoding a 2×1 rectangle of unsigned normalized RGB texel data. One G value is present at each i coordinate, with the B and R values shared across both G values and thus recorded at half the horizontal resolution of the image. This format has a 16-bit B component in the word in bytes 0..1, a 16-bit G component for the even i coordinate in the word in bytes 2..3, a 16-bit R component in the word in bytes 4..5, and a 16-bit G component for the odd i coordinate in the word in bytes 6..7. This format only supports images with a width that is a multiple of two. For the purposes of the constraints on copy extents, this format is treated as a compressed format with a 2×1 compressed texel block.

- **VK_FORMAT_G16_B16_R16_3PLANE_420_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal and vertical dimensions of the R and B planes are halved relative to the image dimensions, and each R and B component is shared with the G components for which \( \lfloor i_G \times 0.5 \rfloor = j_B = j_R \) and \( \lfloor j_G \times 0.5 \rfloor = i_B = i_R \). The location of each plane when this image is in linear layout can be determined via vkGetImageSubresourceLayout, using VK_IMAGE_ASPECT_PLANE_0_BIT for the G plane, VK_IMAGE_ASPECT_PLANE_1_BIT for the B plane, and VK_IMAGE_ASPECT_PLANE_2_BIT for the R plane.
plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G16_B16R16_2PLANE_420_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal and vertical dimensions of the BR plane are halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \times 0.5 = i_B = i_R \) and \( j_G \times 0.5 = j_B = j_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width and height that is a multiple of two.

- **VK_FORMAT_G16_B16_R16_3PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. The horizontal dimension of the R and B plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \times 0.5 = i_B = i_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G16_B16R16_2PLANE_422_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. The horizontal dimension of the BR plane is halved relative to the image dimensions, and each R and B value is shared with the G components for which \( i_G \times 0.5 = i_B = i_R \). The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane. This format only supports images with a width that is a multiple of two.

- **VK_FORMAT_G16_B16R16_3PLANE_444_UNORM** specifies an unsigned normalized *multi-planar format* that has a 16-bit G component in each 16-bit word of plane 0, a 16-bit B component in each 16-bit word of plane 1, and a 16-bit R component in each 16-bit word of plane 2. Each plane has the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, `VK_IMAGE_ASPECT_PLANE_1_BIT` for the B plane, and `VK_IMAGE_ASPECT_PLANE_2_BIT` for the R plane.

- **VK_FORMAT_G8_BBR8_2PLANE_444_UNORM** specifies an unsigned normalized *multi-planar format* that has an 8-bit G component in plane 0, and a two-component, 16-bit BR plane 1 consisting of an 8-bit B component in byte 0 and an 8-bit R component in byte 1. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- **VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16** specifies an unsigned normalized *multi-planar format* that has a 10-bit G component in the top 10 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 10-bit B component in the top 10 bits of
the word in bytes 0..1, and a 10-bit R component in the top 10 bits of the word in bytes 2..3, the bottom 6 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- **VK_FORMAT_G12X4_B12X4R12X4_2PLANE_444_UNORM_3PACK16** specifies an unsigned normalized multi-planar format that has a 12-bit G component in the top 12 bits of each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 12-bit B component in the top 12 bits of the word in bytes 0..1, and a 12-bit R component in the top 12 bits of the word in bytes 2..3, the bottom 4 bits of each word unused. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- **VK_FORMAT_G16_B16R16_2PLANE_444_UNORM** specifies an unsigned normalized multi-planar format that has a 16-bit G component in each 16-bit word of plane 0, and a two-component, 32-bit BR plane 1 consisting of a 16-bit B component in the word in bytes 0..1, and a 16-bit R component in the word in bytes 2..3. Both planes have the same dimensions and each R, G and B component contributes to a single texel. The location of each plane when this image is in linear layout can be determined via `vkGetImageSubresourceLayout`, using `VK_IMAGE_ASPECT_PLANE_0_BIT` for the G plane, and `VK_IMAGE_ASPECT_PLANE_1_BIT` for the BR plane.

- **VK_FORMAT_PVRTC1_2BPP_UNORM_BLOCK_IMG** specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_PVRTC1_4BPP_UNORM_BLOCK_IMG** specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_PVRTC2_2BPP_UNORM_BLOCK_IMG** specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes an 8×4 rectangle of unsigned normalized RGBA texel data.

- **VK_FORMAT_PVRTC2_4BPP_UNORM_BLOCK_IMG** specifies a four-component, PVRTC compressed format where each 64-bit compressed texel block encodes a 4×4 rectangle of unsigned normalized RGBA texel data.
VK_FORMAT_R16G16_SFIXED5_NV specifies a two-component, 16-bit signed fixed-point format with linear encoding. The components are signed two's-complement integers where the most significant bit specifies the sign bit, the next 10 bits specify the integer value, and the last 5 bits represent the fractional value. The signed 16-bit values can be converted to floats in the range \([-1024, 1023.96875]\) by dividing the value by 32 (2^5).

### 49.1.1. Compatible Formats of Planes of Multi-Planar Formats

Individual planes of multi-planar formats are size-compatible with single-plane color formats if they occupy the same number of bits per texel block, and are compatible with those formats if they have the same block extent.

In the following table, individual planes of a multi-planar format are compatible with the format listed against the relevant plane index for that multi-planar format, and any format compatible with the listed single-plane format according to Format Compatibility Classes. These planes are also size-compatible with any format that is size-compatible with the listed single-plane format.

### 49.1.2. Multi-planar Format Image Aspect

When using `VkImageAspectFlagBits` to select a plane of a multi-planar format, the following are the valid options:

- **Two planes**
  - `VK_IMAGE_ASPECT_PLANE_0_BIT`
  - `VK_IMAGE_ASPECT_PLANE_1_BIT`

- **Three planes**
  - `VK_IMAGE_ASPECT_PLANE_0_BIT`
  - `VK_IMAGE_ASPECT_PLANE_1_BIT`
  - `VK_IMAGE_ASPECT_PLANE_2_BIT`

### 49.1.3. Packed Formats

For the purposes of address alignment when accessing buffer memory containing vertex attribute or texel data, the following formats are considered *packed* - components of the texels or attributes are stored in bitfields packed into one or more 8-, 16-, or 32-bit fundamental data type.

- **Packed into 8-bit data types:**
  - `VK_FORMAT_R4G4_UNORM_PACK8`

- **Packed into 16-bit data types:**
  - `VK_FORMAT_R4G4B4A4_UNORM_PACK16`
  - `VK_FORMAT_B4G4R4A4_UNORM_PACK16`
  - `VK_FORMAT_R5G6B5_UNORM_PACK16`
  - `VK_FORMAT_B5G6R5_UNORM_PACK16`
  - `VK_FORMAT_R5G5B5A1_UNORM_PACK16`
  - `VK_FORMAT_B5G5R5A1_UNORM_PACK16`
  - `VK_FORMAT_A1R5G5B5_UNORM_PACK16`
  - `VK_FORMAT_A1B5G5R5_UNORM_PACK16_KHR`
  - `VK_FORMAT_R10X6_UNORM_PACK16`
  - `VK_FORMAT_R10X6G10X6_UNORM_2PACK16`
  - `VK_FORMAT_R10X6G10X6B10X6A10X6_UNORM_4PACK16`
  - `VK_FORMAT_610X6B10X6G10X6R10X6_422_UNORM_4PACK16`
- VK_FORMAT_B10X6G10X6R10X6G10X6_422_UNORM_4PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_420_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_422_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_422_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_444_UNORM_3PACK16
- VK_FORMAT_B10X6G10X6R10X6_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_G10X6_B10X6R10X6_2PLANE_444_UNORM_3PACK16
- VK_FORMAT_A4R4G4B4_UNORM_PACK16
- VK_FORMAT_A4B4G4R4_UNORM_PACK16
  - Packed into 32-bit data types:
    - VK_FORMAT_A8B8G8R8_UNORM_PACK32
    - VK_FORMAT_A8B8G8R8_SNORM_PACK32
    - VK_FORMAT_A8B8G8R8_USCALED_PACK32
    - VK_FORMAT_A8B8G8R8_SSCALED_PACK32
    - VK_FORMAT_A8B8G8R8_UINT_PACK32
    - VK_FORMAT_A8B8G8R8_SINT_PACK32
    - VK_FORMAT_A2R10G10B10_UNORM_PACK32
    - VK_FORMAT_A2R10G10B10_SNORM_PACK32
    - VK_FORMAT_A2R10G10B10_USCALED_PACK32
    - VK_FORMAT_A2R10G10B10_SSCALED_PACK32
    - VK_FORMAT_A2R10G10B10_UINT_PACK32
    - VK_FORMAT_A2R10G10B10_SINT_PACK32
    - VK_FORMAT_A2B10G10R10_UNORM_PACK32
49.1.4. Identification of Formats

A “format” is represented by a single enum value. The name of a format is usually built up by using the following pattern:

\[
\text{VK_FORMAT}_{\text{component-format|compression-scheme}}_{\text{numeric-format}}
\]

The component-format indicates either the size of the R, G, B, and A components (if they are present) in the case of a color format, or the size of the depth (D) and stencil (S) components (if they are present) in the case of a depth/stencil format (see below). An X indicates a component that is unused, but may be present for padding.
<table>
<thead>
<tr>
<th>Numeric format</th>
<th>Type-Declaration instructions</th>

<td>OpTypeInt</td>
<td>scaled signed integer</td>
<td>The components are signed fractional integer values that get converted to floating-point in the range [-1024,1023.96875]</td>
</tr>
</tbody>
</table>

\(n\) is the number of bits in the component.

The suffix \(_{\text{PACK}}\text{nn}\) indicates that the format is packed into an underlying type with \(\text{nn}\) bits. The suffix \(_{\text{mPACK}}\text{nn}\) is a short-hand that indicates that the format has \(m\) groups of components (which may or may not be stored in separate planes) that are each packed into an underlying type with \(\text{nn}\) bits.

The suffix \(_{\text{BLOCK}}\) indicates that the format is a block-compressed format, with the representation of multiple pixels encoded interdependently within a region.

For multi-planar images, the components in separate planes are separated by underscores, and the number of planes is indicated by the addition of a _2PLANE or _3PLANE suffix. Similarly, the separate aspects of depth-stencil formats are separated by underscores, although these are not considered separate planes. Formats are suffixed by _422 to indicate that planes other than the first are reduced in size by a factor of two horizontally or that the R and B values appear at half the horizontal frequency of the G values, _420 to indicate that planes other than the first are reduced in size by a factor of two both horizontally and vertically, and _444 for consistency to indicate that all three planes of a three-planar image are the same size.

**Note**

No common format has a single plane containing both R and B components but does not store these components at reduced horizontal resolution.

### 49.1.5. Representation and Texel Block Size

Color formats must be represented in memory in exactly the form indicated by the format’s name. This means that promoting one format to another with more bits per component and/or additional components must not occur for color formats. Depth/stencil formats have more relaxed requirements as discussed below.

Each format has a texel block size, the number of bytes used to store one texel block (a single addressable element of an uncompressed image, or a single compressed block of a compressed image). The texel block size for each format is shown in the Compatible formats table.

The representation of non-packed formats is that the first component specified in the name of the format is in the lowest memory addresses and the last component specified is in the highest memory addresses. See Byte mappings for non-packed/compressed color formats. The in-memory ordering of bytes within a component is determined by the host endianness.

</tbody>
</table>
Packed formats store multiple components within one underlying type. The bit representation is that the first component specified in the name of the format is in the most-significant bits and the last component specified is in the least-significant bits of the underlying type. The in-memory ordering of bytes comprising the underlying type is determined by the host endianness.

VK_FORMAT_A1R5G5B5_UNORM_PACK16

Table 72. Bit mappings for packed 32-bit formats
49.1.6. Depth/Stencil Formats

Depth/stencil formats are considered opaque and need not be stored in the exact number of bits per
texel or component ordering indicated by the format enum. However, implementations must not
substitute a different depth or stencil precision than is described in the format (e.g. D16 must not
be implemented as D24 or D32).

49.1.7. Format Compatibility Classes

Uncompressed color formats are compatible with each other if they occupy the same number of bits per
texel block as long as neither or both are alpha formats (e.g., VK_FORMAT_A8_UNORM_KHR).
Compressed color formats are compatible with each other if the only difference between them is
the numeric format of the uncompressed pixels. Each depth/stencil format is only compatible with
itself. In the following table, all the formats in the same row are compatible. Each format has a
defined texel block extent specifying how many texels each texel block represents in each
dimension.

**Size Compatibility**

Color formats with the same texel block size are considered *size-compatible* as long as neither or both are alpha formats (e.g., `VK_FORMAT_A8_UNORM_KHR`). If two size-compatible formats have different block extents (i.e., for compressed formats), then an image with size $A \times B \times C$ in one format with a block extent of $a \times b \times c$ can be represented as an image with size $X \times Y \times Z$ in the other format with block extent $x \times y \times z$ at the ratio between the block extents for each format, where:

$$\lceil \frac{A}{a} \rceil = \lceil \frac{X}{x} \rceil$$

$$\lceil \frac{B}{b} \rceil = \lceil \frac{Y}{y} \rceil$$

$$\lceil \frac{C}{c} \rceil = \lceil \frac{Z}{z} \rceil$$

**Note**

For example, a 7x3 image in the `VK_FORMAT_ASTC_8x5_UNORM_BLOCK` format can be represented as a 1x1 `VK_FORMAT_R64G64_UINT` image.

Images created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag can have size-compatible views created from them to enable access via different size-compatible formats. Image views created in this way will be sized to match the expectations of the block extents noted above.

Copy operations are able to copy between size-compatible formats in different resources to enable manipulation of data in different formats. The extent used in these copy operations always matches the source image, and is resized to the expectations of the block extents noted above for the destination image.

### 49.2. Format Properties

To query supported format features which are properties of the physical device, call:
```c
void vkGetPhysicalDeviceFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkFormatProperties* pFormatProperties);
```

- `physicalDevice` is the physical device from which to query the format properties.
- `format` is the format whose properties are queried.
- `pFormatProperties` is a pointer to a `VkFormatProperties` structure in which physical device properties for `format` are returned.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties-physicalDevice-parameter: `physicalDevice` must be a valid `VkPhysicalDevice` handle.
- VUID-vkGetPhysicalDeviceFormatProperties-format-parameter: `format` must be a valid `VkFormat` value.

The `VkFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkFormatProperties {
    VkFormatFeatureFlags linearTilingFeatures;
    VkFormatFeatureFlags optimalTilingFeatures;
    VkFormatFeatureFlags bufferFeatures;
} VkFormatProperties;
```

- `linearTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_LINEAR`.
- `optimalTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by images created with a `tiling` parameter of `VK_IMAGE_TILING_OPTIMAL`.
- `bufferFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying features supported by buffers.

**Note**

If no format feature flags are supported, the format itself is not supported, and images of that format cannot be created.

If `format` is a block-compressed format, then `bufferFeatures` must not support any features for the format.
If format is not a multi-plane format then linearTilingFeatures and optimalTilingFeatures must not contain VK_FORMAT_FEATURE_DISJOINT_BIT.

Bits which can be set in the VkFormatProperties features linearTilingFeatures, optimalTilingFeatures, VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures, and bufferFeatures are:

```
// Provided by VK_VERSION_1_0
typedef enum VkFormatFeatureFlagBits {
    VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT = 0x00000001,
    VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT = 0x00000002,

// Provided by VK_KHR_sampler_ycbcr_conversion
VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT_KHR = VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_FORMAT_FEATURE_DISJOINT_BIT_KHR = VK_FORMAT_FEATURE_DISJOINT_BIT,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT_KHR = VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT,
These values all have the same meaning as the equivalently named values for 
 VkFormatFeatureFlags2 and may be set in linearTilingFeatures, optimalTilingFeatures, and 
 VkDrmFormatModifierPropertiesEXT::drmFormatModifierTilingFeatures, specifying that the features 
 are supported by images or image views or sampler Y’CbCr conversion objects created with the 
 queried vkGetPhysicalDeviceFormatProperties::format:

- VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT specifies that an image view can be sampled from.
- VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT specifies that an image view can be used as a storage image.
- VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT specifies that an image view can be used as storage image that supports atomic operations.
- VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT specifies that an image view can be used as a framebuffer color attachment and as an input attachment.
- VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT specifies that an image view can be used as a framebuffer color attachment that supports blending.
- VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT specifies that an image view can be used as a framebuffer depth/stencil attachment and as an input attachment.
- VK_FORMAT_FEATURE_BLIT_SRC_BIT specifies that an image can be used as srcImage for the vkCmdBlitImage2 and vkCmdBlitImage commands.
- VK_FORMAT_FEATURE_BLIT_DST_BIT specifies that an image can be used as dstImage for the vkCmdBlitImage2 and vkCmdBlitImage commands.
- VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT specifies that if VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT is also set, an image view can be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_LINEAR, or mipmapMode set to VK_SAMPLER_MIPMAP_MODE_LINEAR. If VK_FORMAT_FEATURE_BLIT_SRC_BIT is also set, an image can be used as the srcImage to vkCmdBlitImage2 and vkCmdBlitImage with a filter of VK_FILTER_LINEAR. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT or VK_FORMAT_FEATURE_BLIT_SRC_BIT.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering, and that linear filtering of the depth aspect is supported whether depth compare is enabled in the sampler or not. Where depth comparison is supported it may be linear filtered whether this bit is present or not, but where this bit is not present the filtered value may be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value must be in the range [0,1] and should be proportional to, or a weighted average of, the number of comparison passes or failures.

- VK_FORMAT_FEATURE_TRANSFER_SRC_BIT specifies that an image can be used as a source image for copy commands. If the application apiVersion is Vulkan 1.0 and VK_KHR_maintenance1 is not supported, VK_FORMAT_FEATURE_TRANSFER_SRC_BIT is implied to be set when the format feature flag is not 0.
• **VK_FORMAT_FEATURE_TRANSFER_DST_BIT** specifies that an image **can** be used as a destination image for copy commands and clear commands. If the application apiVersion is Vulkan 1.0 and VK_KHR_maintenance1 is not supported, **VK_FORMAT_FEATURE_TRANSFER_DST_BIT** is implied to be set when the format feature flag is not 0.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_MINMAX_BIT** specifies **VkImage** **can** be used as a sampled image with a min or max VkSamplerReductionMode. This bit **must** only be exposed for formats that also support the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT** specifies that **VkImage** **can** be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_CUBIC_EXT, or be the source image for a blit with filter set to VK_FILTER_CUBIC_EXT. This bit **must** only be exposed for formats that also support the **VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT**. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.

• **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT** specifies that an application **can** define a sampler Y′C_bC_r conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CROMA_LOCATION_MIDPOINT. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CROMA_LOCATION_COSITED_EVEN. If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler Y′C_bC_r conversion for this format, the implementation **must** set **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT**.

• **VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT** specifies that an application **can** define a sampler Y′C_bC_r conversion using this format as a source, and that an image of this format **can** be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CROMA_LOCATION_COSITED_EVEN. Otherwise both xChromaOffset and yChromaOffset **must** be VK_CROMA_LOCATION_MIDPOINT. If neither **VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT** nor **VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT** is set, the application **must** not define a sampler Y′C_bC_r conversion using this format as a source.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT** specifies that an application **can** define a sampler Y′C_bC_r conversion using this format as a source with chromaFilter set to VK_FILTER_LINEAR.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT** specifies that the format can have different chroma, min, and mag filters.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT** specifies that reconstruction is explicit, as described in Chroma Reconstruction. If this bit is not present, reconstruction is implicit by default.

• **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT** specifies that reconstruction **can** be forcibly made explicit by setting VkSamplerYcbcrConversionCreateInfo::forceExplicitReconstruction to VK_TRUE. If the format being queried supports **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT** it **must** also support **VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT**.

• **VK_FORMAT_FEATURE_DISJOINT_BIT** specifies that a multi-planar image **can** have the VK_IMAGE_CREATE_DISJOINT_BIT set during image creation. An implementation **must** not set
VK_FORMAT_FEATURE_DISJOINT_BIT for single-plane formats.

- VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT specifies that an image view can be used as a fragment density map attachment.
- VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR specifies that an image view can be used as a fragment shading rate attachment. An implementation must not set this feature for formats with a numeric format other than UINT, or set it as a buffer feature.
- VK_FORMAT_FEATURE_VIDEO_DECODE_OUTPUT_BIT_KHR specifies that an image view with this format can be used as a decode output picture in video decode operations.
- VK_FORMAT_FEATURE_VIDEO_DECODER_DPB_BIT_KHR specifies that an image view with this format can be used as an output reconstructed picture or an input reference picture in video decode operations.
- VK_FORMAT_FEATURE_VIDEO_ENCODE_INPUT_BIT_KHR specifies that an image view with this format can be used as an encode input picture in video encode operations.
- VK_FORMAT_FEATURE_VIDEO_ENCODE_DPB_BIT_KHR specifies that an image view with this format can be used as an output reconstructed picture or an input reference picture in video encode operations.

Note
Specific video profiles may have additional restrictions on the format and other image creation parameters corresponding to image views used by video coding operations that can be enumerated using the vkGetPhysicalDeviceVideoFormatPropertiesKHR command.

The following bits may be set in bufferFeatures, specifying that the features are supported by buffers or buffer views created with the queried vkGetPhysicalDeviceFormatProperties::format:

- VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT specifies that the format can be used to create a buffer view that can be bound to a VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER descriptor.
- VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT specifies that the format can be used to create a buffer view that can be bound to a VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER descriptor.
- VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT specifies that atomic operations are supported on VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER with this format.
- VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT specifies that the format can be used as a vertex attribute format (VkVertexInputAttributeDescription::format).
- VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR specifies that the format can be used as the vertex format when creating an acceleration structure (VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat). This format can also be used as the vertex format in host memory when doing host acceleration structure builds.

Note
VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT and VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT are only intended to be advertised for single-component formats, since SPIR-V atomic operations require a
typedef VkFlags VkFormatFeatureFlags;

VkFormatFeatureFlags is a bitmask type for setting a mask of zero or more VkFormatFeatureFlagBits.

To query supported format features which are properties of the physical device, call:

void vkGetPhysicalDeviceFormatProperties2(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkFormatProperties2* pFormatProperties);

or the equivalent command

void vkGetPhysicalDeviceFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkFormatProperties2* pFormatProperties);

- **physicalDevice** is the physical device from which to query the format properties.
- **format** is the format whose properties are queried.
- **pFormatProperties** is a pointer to a VkFormatProperties2 structure in which physical device properties for format are returned.

vkGetPhysicalDeviceFormatProperties2 behaves similarly to vkGetPhysicalDeviceFormatProperties, with the ability to return extended information in a pNext chain of output structures.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceFormatProperties2-physicalDevice-parameter **physicalDevice** must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceFormatProperties2-format-parameter **format** must be a valid VkFormat value
- VUID-vkGetPhysicalDeviceFormatProperties2-pFormatProperties-parameter **pFormatProperties** must be a valid pointer to a VkFormatProperties2 structure

The VkFormatProperties2 structure is defined as:
```c
// Provided by VK_VERSION_1_1
typedef struct VkFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkFormatProperties formatProperties;
} VkFormatProperties2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkFormatProperties2 VkFormatProperties2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `formatProperties` is a `VkFormatProperties` structure describing features supported by the requested format.

### Valid Usage (Implicit)

- VUID-VkFormatProperties2-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_2`
- VUID-VkFormatProperties2-pNext-pNext
  - Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDrmFormatModifierPropertiesList2EXT`, `VkDrmFormatModifierPropertiesListEXT`, `VkFormatProperties3`, or `VkSubpassResolvePerformanceQueryEXT`
- VUID-VkFormatProperties2-sType-unique
  - The `sType` value of each struct in the `pNext` chain must be unique

To obtain the list of Linux DRM format modifiers compatible with a `VkFormat`, add a `VkDrmFormatModifierPropertiesListEXT` structure to the `pNext` chain of `VkFormatProperties2`.

The `VkDrmFormatModifierPropertiesListEXT` structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesListEXT {
    VkStructureType sType;
    void* pNext;
    uint32_t drmFormatModifierCount;
    VkDrmFormatModifierPropertiesEXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesListEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `drmFormatModifierCount` is an inout parameter related to the number of modifiers compatible with the `format`, as described below.

• `pDrmFormatModifierProperties` is either `NULL` or a pointer to an array of `VkDrmFormatModifierPropertiesEXT` structures.

If `pDrmFormatModifierProperties` is `NULL`, then the function returns in `drmFormatModifierCount` the number of modifiers compatible with the queried `format`. Otherwise, the application **must** set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will write at most `drmFormatModifierCount` elements to the array, and will return in `drmFormatModifierCount` the number of elements written.

Among the elements in array `pDrmFormatModifierProperties`, each returned `drmFormatModifier` must be unique.

**Valid Usage (Implicit)**

- VUID-VkDrmFormatModifierPropertiesListEXT-sType-sType `sType` **must be** `VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_EXT`

The `VkDrmFormatModifierPropertiesEXT` structure describes properties of a `VkFormat` when that format is combined with a Linux DRM format modifier. These properties, like those of `VkFormatProperties2`, are independent of any particular image.

The `VkDrmFormatModifierPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkDrmFormatModifierPropertiesEXT {
    uint64_t    drmFormatModifier;
    uint32_t    drmFormatModifierPlaneCount;
    VkFormatFeatureFlags drmFormatModifierTilingFeatures;
} VkDrmFormatModifierPropertiesEXT;
```

- `drmFormatModifier` is a *Linux DRM format modifier*.

- `drmFormatModifierPlaneCount` is the number of *memory planes* in any image created with `format` and `drmFormatModifier`. An image's *memory planecount* is distinct from its *format planecount*, as explained below.

- `drmFormatModifierTilingFeatures` is a bitmask of `VkFormatFeatureFlagBits` that are supported by any image created with `format` and `drmFormatModifier`.

The returned `drmFormatModifierTilingFeatures` **must** contain at least one bit.

The implementation **must not** return `DRM_FORMAT_MOD_INVALID` in `drmFormatModifier`.

An image’s *memory planecount* (as returned by `drmFormatModifierPlaneCount`) is distinct from its *format planecount* (in the sense of multi-planar Y’CₙCₙ formats). In `VkImageAspectFlags`, each
VK_IMAGE_ASPECT_MEMORY_PLANE_\_\_BIT_EXT represents a memory plane and each VK_IMAGE_ASPECT_PLANE_\_\_BIT a format plane.

An image's set of format planes is an ordered partition of the image's content into separable groups of format components. The ordered partition is encoded in the name of each VkFormat. For example, VK_FORMAT_G8_B8R8_2PLANE_420_UNORM contains two format planes; the first plane contains the green component and the second plane contains the blue component and red component. If the format name does not contain PLANE, then the format contains a single plane; for example, VK_FORMAT_R8G8B8A8_UNORM. Some commands, such as vkCmdCopyBufferToImage, do not operate on all format components in the image, but instead operate only on the format planes explicitly chosen by the application and operate on each format plane independently.

An image's set of memory planes is an ordered partition of the image's memory rather than the image's content. Each memory plane is a contiguous range of memory. The union of an image's memory planes is not necessarily contiguous.

If an image is linear, then the partition is the same for memory planes and for format planes. Therefore, if the returned drmFormatModifier is DRM_FORMAT_MOD_LINEAR, then drmFormatModifierPlaneCount must equal the format planecount, and drmFormatModifierTilingFeatures must be identical to the VkFormatProperties2::linearTilingFeatures returned in the same pNext chain.

If an image is non-linear, then the partition of the image's memory into memory planes is implementation-specific and may be unrelated to the partition of the image's content into format planes. For example, consider an image whose format is VK_FORMAT_G8_B8_R8_3PLANE_420_UNORM, tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, whose drmFormatModifier is not DRM_FORMAT_MOD_LINEAR, and flags lacks VK_IMAGE_CREATE_DISJOINT_BIT. The image has 3 format planes, and commands such as vkCmdCopyBufferToImage act on each format plane independently as if the data of each format plane were separable from the data of the other planes. In a straightforward implementation, the implementation may store the image's content in 3 adjacent memory planes where each memory plane corresponds exactly to a format plane. However, the implementation may also store the image's content in a single memory plane where all format components are combined using an implementation-private block-compressed format; or the implementation may store the image's content in a collection of 7 adjacent memory planes using an implementation-private sharding technique. Because the image is non-linear and non-disjoint, the implementation has much freedom when choosing the image's placement in memory.

The memory planecount applies to function parameters and structures only when the API specifies an explicit requirement on drmFormatModifierPlaneCount. In all other cases, the memory planecount is ignored.

The list of Linux DRM format modifiers compatible with a VkFormat can be obtained by adding a VkDrmFormatModifierPropertiesList2EXT structure to the pNext chain of VkFormatProperties2.

The VkDrmFormatModifierPropertiesList2EXT structure is defined as:
typedef struct VkDrmFormatModifierPropertiesList2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t drmFormatModifierCount;
    VkDrmFormatModifierProperties2EXT* pDrmFormatModifierProperties;
} VkDrmFormatModifierPropertiesList2EXT;

• **sType** is a `VkStructureType` value identifying this structure.
• **pNext** is `NULL` or a pointer to a structure extending this structure.
• **drmFormatModifierCount** is an inout parameter related to the number of modifiers compatible with the format, as described below.
• **pDrmFormatModifierProperties** is either `NULL` or a pointer to an array of `VkDrmFormatModifierProperties2EXT` structures.

If `pDrmFormatModifierProperties` is `NULL`, the number of modifiers compatible with the queried format is returned in `drmFormatModifierCount`. Otherwise, the application **must** set `drmFormatModifierCount` to the length of the array `pDrmFormatModifierProperties`; the function will write at most `drmFormatModifierCount` elements to the array, and will return in `drmFormatModifierCount` the number of elements written.

Among the elements in array `pDrmFormatModifierProperties`, each returned `drmFormatModifier` must be unique.

Among the elements in array `pDrmFormatModifierProperties`, the bits reported in `drmFormatModifierTilingFeatures` must include the bits reported in the corresponding element of `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties`.

### Valid Usage (Implicit)

- **VUID-VkDrmFormatModifierPropertiesList2EXT-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_DRM_FORMAT_MODIFIER_PROPERTIES_LIST_2_EXT`

The `VkDrmFormatModifierProperties2EXT` structure describes properties of a `VkFormat` when that format is combined with a Linux DRM format modifier. These properties, like those of `VkFormatProperties2`, are independent of any particular image.

The `VkDrmFormatModifierPropertiesEXT` structure is defined as:
typedef struct VkDrmFormatModifierProperties2EXT {
    uint64_t drmFormatModifier;
    uint32_t drmFormatModifierPlaneCount;
    VkFormatFeatureFlags2 drmFormatModifierTilingFeatures;
} VkDrmFormatModifierProperties2EXT;

- **drmFormatModifier** is a Linux DRM format modifier.
- **drmFormatModifierPlaneCount** is the number of memory planes in any image created with format and drmFormatModifier. An image's memory plane count is distinct from its format plane count, as explained below.
- **drmFormatModifierTilingFeatures** is a bitmask of VkFormatFeatureFlagBits2 that are supported by any image created with format and drmFormatModifier.

To query supported format extended features which are properties of the physical device, add VkFormatProperties3 structure to the pNext chain of VkFormatProperties2.

The VkFormatProperties3 structure is defined as:

```c
typedef struct VkFormatProperties3 {
    VkStructureType sType;
    void* pNext;
    VkFormatFeatureFlags2 linearTilingFeatures;
    VkFormatFeatureFlags2 optimalTilingFeatures;
    VkFormatFeatureFlags2 bufferFeatures;
} VkFormatProperties3;
```

or the equivalent

```c
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatProperties3 VkFormatProperties3KHR;
```

- **linearTilingFeatures** is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by images created with a tiling parameter of VK_IMAGE_TILING_LINEAR.
- **optimalTilingFeatures** is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by images created with a tiling parameter of VK_IMAGE_TILING_OPTIMAL.
- **bufferFeatures** is a bitmask of VkFormatFeatureFlagBits2 specifying features supported by buffers.

The bits reported in linearTilingFeatures, optimalTilingFeatures and bufferFeatures must include the bits reported in the corresponding fields of VkFormatProperties2::formatProperties.
Valid Usage (Implicit)

- VUID-VkFormatProperties3-sType-sType
  sType must be VK_STRUCTURE_TYPE_FORMAT_PROPERTIES_3

Bits which can be set in the VkFormatProperties3 features linearTilingFeatures, optimalTilingFeatures, and bufferFeatures are:

```c
typedef VkFlags64 VkFormatFeatureFlagBits2;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT = 0x00000001ULL;
static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT_KHR = 0x00000001ULL;

static const VkFormatFeatureFlagBits2 VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR =
0x20000000ULL;
// Provided by VK_KHR_format_feature_flags2 or
// VK_VERSION_1_3
4115
The following bits may be set in `linearTilingFeatures` and `optimalTilingFeatures`, specifying that the features are supported by images or image views or sampler Y’C’bC’r conversion objects created with the queried `vkGetPhysicalDeviceFormatProperties2::format`:

- `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT` specifies that an image view can be sampled from.
- `VK_FORMAT_FEATURE_2_STORAGE_IMAGE_BIT` specifies that an image view can be used as a storage image.
• **VK_FORMAT_FEATURE_2_STORAGE_IMAGE_ATOMIC_BIT** specifies that an image view can be used as storage image that supports atomic operations.

• **VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BIT** specifies that an image view can be used as a framebuffer color attachment and as an input attachment.

• **VK_FORMAT_FEATURE_2_COLOR_ATTACHMENT_BLEND_BIT** specifies that an image view can be used as a framebuffer color attachment that supports blending.

• **VK_FORMAT_FEATURE_2_DEPTH_STENCIL_ATTACHMENT_BIT** specifies that an image view can be used as a framebuffer depth/stencil attachment and as an input attachment.

• **VK_FORMAT_FEATURE_2_BLIT_SRC_BIT** specifies that an image can be used as the srcImage for vkCmdBlitImage2 and vkCmdBlitImage.

• **VK_FORMAT_FEATURE_2_BLIT_DST_BIT** specifies that an image can be used as the dstImage for vkCmdBlitImage2 and vkCmdBlitImage.

• **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_LINEAR_BIT** specifies that if VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT is also set, an image view can be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_LINEAR, or mipmapMode set to VK_SAMPLER_MIPMAP_MODE_LINEAR. If VK_FORMAT_FEATURE_2_BLIT_SRC_BIT is also set, an image can be used as the srcImage for vkCmdBlitImage2 and vkCmdBlitImage with a filter of VK_FILTER_LINEAR. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT or VK_FORMAT_FEATURE_2_BLIT_SRC_BIT.

If the format being queried is a depth/stencil format, this bit only specifies that the depth aspect (not the stencil aspect) of an image of this format supports linear filtering. Where depth comparison is supported it may be linear filtered whether this bit is present or not, but where this bit is not present the filtered value may be computed in an implementation-dependent manner which differs from the normal rules of linear filtering. The resulting value must be in the range [0,1] and should be proportional to, or a weighted average of, the number of comparison passes or failures.

• **VK_FORMAT_FEATURE_2_TRANSFER_SRC_BIT** specifies that an image can be used as a source image for copy commands.

• **VK_FORMAT_FEATURE_2_TRANSFER_DST_BIT** specifies that an image can be used as a destination image for copy commands and clear commands.

• **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_MINMAX_BIT** specifiesVkImage can be used as a sampled image with a min or max VkSamplerReductionMode. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.

• **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_FILTER_CUBIC_BIT** specifies that VkImage can be used with a sampler that has either of magFilter or minFilter set to VK_FILTER_CUBIC_EXT, or be the source image for a blit with filter set to VK_FILTER_CUBIC_EXT. This bit must only be exposed for formats that also support the VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT. If the format being queried is a depth/stencil format, this only specifies that the depth aspect is cubic filterable.

• **VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT** specifies that an application can define a sampler Y'CbCr conversion using this format as a source, and that an image of this format can be used with a VkSamplerYcbcrConversionCreateInfo xChromaOffset and/or yChromaOffset of VK_CHROMA_LOCATION_MIDPOINT. Otherwise both xChromaOffset and yChromaOffset must be
If a format does not incorporate chroma downsampling (it is not a “422” or “420” format) but the implementation supports sampler \( Y'C_B C_R \) conversion for this format, the implementation must set \( \text{VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT} \).

- \( \text{VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT} \) specifies that an application can define a sampler \( Y'C_B C_R \) conversion using this format as a source, and that an image of this format can be used with a \( \text{VkSamplerYcbcrConversionCreateInfo} \) \( xChromaOffset \) and/or \( yChromaOffset \) of \( \text{VK_CHROMA_LOCATION_COSITED_EVEN} \). Otherwise both \( xChromaOffset \) and \( yChromaOffset \) must be \( \text{VK_CHROMA_LOCATION_MIDPOINT} \). If neither \( \text{VK_FORMAT_FEATURE_2_COSITED_CHROMA_SAMPLES_BIT} \) nor \( \text{VK_FORMAT_FEATURE_2_MIDPOINT_CHROMA_SAMPLES_BIT} \) is set, the application must not define a sampler \( Y'C_B C_R \) conversion using this format as a source.

- \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT} \) specifies that an application can define a sampler \( Y'C_B C_R \) conversion using this format as a source with \( \text{chromaFilter} \) set to \( \text{VK_FILTER_LINEAR} \).

- \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT} \) specifies that the format can have different chroma, min, and mag filters.

- \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT} \) specifies that reconstruction is explicit, as described in Chroma Reconstruction. If this bit is not present, reconstruction is implicit by default.

- \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT} \) specifies that reconstruction can be forcibly made explicit by setting \( \text{VkSamplerYcbcrConversionCreateInfo}::\text{forceExplicitReconstruction} \) to \( \text{VK_TRUE} \). If the format being queried supports \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT} \) it must also support \( \text{VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCEABLE_BIT} \).

- \( \text{VK_FORMAT_FEATURE_2_DISJOINT_BIT} \) specifies that a multi-planar image can have the \( \text{VK_IMAGE_CREATE_DISJOINT_BIT} \) set during image creation. An implementation must not set \( \text{VK_FORMAT_FEATURE_2_DISJOINT_BIT} \) for single-plane formats.

- \( \text{VK_FORMAT_FEATURE_2_FRAGMENT_DENSITY_MAP_BIT_EXT} \) specifies that an image view can be used as a fragment density map attachment.

- \( \text{VK_FORMAT_FEATURE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR} \) specifies that an image view can be used as a fragment shading rate attachment. An implementation must not set this feature for formats with a numeric format other than \( \text{UINT} \), or set it as a buffer feature.

- \( \text{VK_FORMAT_FEATURE_2_VIDEO_DECODE_OUTPUT_BIT_KHR} \) specifies that an image view with this format can be used as a decode output picture in video decode operations.

- \( \text{VK_FORMAT_FEATURE_2_VIDEO_DECODE_DPB_BIT_KHR} \) specifies that an image view with this format can be used as an output reconstructed picture or an input reference picture in video decode operations.

- \( \text{VK_FORMAT_FEATURE_2_VIDEO_ENCODE_INPUT_BIT_KHR} \) specifies that an image view with this format can be used as an encode input picture in video encode operations.

- \( \text{VK_FORMAT_FEATURE_2_VIDEO_ENCODE_DPB_BIT_KHR} \) specifies that an image view with this format can be used as an output reconstructed picture or an input reference picture in video encode operations.
operations.

Note
Specific video profiles may have additional restrictions on the format and other image creation parameters corresponding to image views used by video coding operations that can be enumerated using the `vkGetPhysicalDeviceVideoFormatPropertiesKHR` command.

- **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT** specifies that image views or buffer views created with this format can be used as storage images or storage texel buffers respectively for read operations without specifying a format.

- **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT** specifies that image views or buffer views created with this format can be used as storage images or storage texel buffers respectively for write operations without specifying a format.

- **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT** specifies that image views created with this format can be used for depth comparison performed by OpImage*Dref* instructions.

- **VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV** specifies that the format is supported as a renderable Linear Color Attachment. This bit will be set for renderable color formats in the linearTilingFeatures. This must not be set in the optimalTilingFeatures or bufferFeatures members.

- **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM** specifies that image views created with this format can be used as the weight image input to weight image sampling operations.

- **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM** specifies that image views created with this format can be sampled in weight image sampling operations.

- **VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM** specifies that image views created with this format can be used in block matching operations.

- **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM** specifies that image views created with this format can be sampled in box filter sampling operations.

- **VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT** specifies that an image can be created with `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT`.

The following bits may be set in bufferFeatures, specifying that the features are supported by buffers or buffer views created with the queried `vkGetPhysicalDeviceFormatProperties2::format`:

- **VK_FORMAT_FEATURE_2_UNIFORM_TEXEL_BUFFER_BIT** specifies that the format can be used to create a buffer view that can be bound to a `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` descriptor.

- **VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_BIT** specifies that the format can be used to create a buffer view that can be bound to a `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` descriptor.

- **VK_FORMAT_FEATURE_2_STORAGE_TEXEL_BUFFER_ATOMIC_BIT** specifies that atomic operations are supported on `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` with this format.

- **VK_FORMAT_FEATURE_2_VERTEX_BUFFER_BIT** specifies that the format can be used as a vertex attribute format (`VkVertexInputAttributeDescription::format`).

- **VK_FORMAT_FEATURE_2_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR** specifies that the format
can be used as the vertex format when creating an acceleration structure (VkAccelerationStructureGeometryTrianglesDataKHR::vertexFormat). This format can also be used as the vertex format in host memory when doing host acceleration structure builds.

- **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT** specifies that buffer views created with this format can be used as storage texel buffers for read operations without specifying a format.
- **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT** specifies that buffer views created with this format can be used as storage texel buffers for write operations without specifying a format.
- **VK_FORMAT_FEATURE_2_OPTICAL_FLOW_IMAGE_BIT_NV** specifies that an image view with this format can be used as an input or reference to optical flow operations.
- **VK_FORMAT_FEATURE_2_OPTICAL_FLOW_VECTOR_BIT_NV** specifies that an image view with this format can be used as a flow vector map (either as hint, output or global flow) for optical flow operations.
- **VK_FORMAT_FEATURE_2_OPTICAL_FLOW_COST_BIT_NV** specifies that an image view with this format can be used as an output cost map for optical flow operations.

```c
// Provided by VK_VERSION_1_3
typedef VkFlags64 VkFormatFeatureFlags2;
```

or the equivalent

```c
// Provided by VK_KHR_format_feature_flags2
typedef VkFormatFeatureFlags2 VkFormatFeatureFlags2KHR;
```

**VkFormatFeatureFlags2** is a bitmask type for setting a mask of zero or more **VkFormatFeatureFlagBits2**.

To query the performance characteristics of a subpass resolve operation for an attachment with a **VkFormat**, add a **VkSubpassResolvePerformanceQueryEXT** structure to the **pNext** chain of **VkFormatProperties2**.

The **VkSubpassResolvePerformanceQueryEXT** structure is defined as:

```c
// Provided by VK_EXT_multisampled_render_to_single_sampled
typedef struct VkSubpassResolvePerformanceQueryEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 optimal;
} VkSubpassResolvePerformanceQueryEXT;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **optimal** specifies that a subpass resolve operation is optimally performed.
If `optimal` is `VK_FALSE` for a `VkFormat`, using a subpass resolve operation on a multisampled attachment with this format can incur additional costs, including additional memory bandwidth usage and a higher memory footprint. If an attachment with such a format is used in a multisampled-render-to-single-sampled subpass, the additional memory and memory bandwidth usage can nullify the benefits of using the `VK_EXT_multisampled_render_to_single_sampled` extension.

**Valid Usage (Implicit)**

- VUID-VkSubpassResolvePerformanceQueryEXT-sType-sType
  sType must be `VK_STRUCTURE_TYPE_SUBPASS_RESOLVE_PERFORMANCE_QUERY_EXT`

### 49.2.1. Potential Format Features

Some valid usage conditions depend on the format features supported by a `VkImage` whose `VkImageTiling` is unknown. In such cases the exact `VkFormatFeatureFlagBits` supported by the `VkImage` cannot be determined, so the valid usage conditions are expressed in terms of the potential format features of the `VkImage` format.

The potential format features of a `VkFormat` are defined as follows:

- The union of `VkFormatFeatureFlagBits` and `VkFormatFeatureFlagBits2`, supported when the `VkImageTiling` is `VK_IMAGE_TILING_OPTIMAL`, `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, or `VK_IMAGE_TILING_LINEAR` if `VkFormat` is not `VK_FORMAT_UNDEFINED`

- `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` and `VkAndroidHardwareBufferFormatProperties2ANDROID::formatFeatures` of a valid external format if `VkFormat` is `VK_FORMAT_UNDEFINED`

- `VkScreenBufferFormatPropertiesQNX::formatFeatures` of a valid external format if `VkFormat` is `VK_FORMAT_UNDEFINED`

### 49.3. Required Format Support

Implementations must support at least the following set of features on the listed formats. For images, these features must be supported for every `VkImageType` (including arrayed and cube variants) unless otherwise noted. These features are supported on existing formats without needing to advertise an extension or needing to explicitly enable them. Support for additional functionality beyond the requirements listed here is queried using the `vkGetPhysicalDeviceFormatProperties` command.

**Note**

Unless otherwise excluded below, the required formats are supported for all `VkImageCreateFlags` values as long as those flag values are otherwise allowed.

The following tables show which feature bits must be supported for each format. Formats that are required to support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` must also support `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT` and `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

• VK_FORMAT_A8B8G8R8_SNORM_PACK32
• VK_FORMAT_A8B8G8R8_SRGB_PACK32

If ETC compressed formats are supported, **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT** must be supported for the following image view types:

• VK_IMAGE_VIEW_TYPE_2D
• VK_IMAGE_VIEW_TYPE_2D_ARRAY

for the following additional formats:

• VK_FORMAT_ETC2_R8G8B8_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8_SRGB_BLOCK
• VK_FORMAT_ETC2_R8G8B8A1_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8A1_SRGB_BLOCK
• VK_FORMAT_ETC2_R8G8B8A8_UNORM_BLOCK
• VK_FORMAT_ETC2_R8G8B8A8_SRGB_BLOCK

If cubic filtering is supported for any other formats, the following image view types must be supported for those formats:

• VK_IMAGE_VIEW_TYPE_2D
• VK_IMAGE_VIEW_TYPE_2D_ARRAY

To be used with VkImageView with subresourceRange.aspectMask equal to VK_IMAGE_ASPECT_COLOR_BIT, sampler Y’C₆C₉ conversion must be enabled for the following formats:
Table 88. Formats requiring sampler Y’CnCn conversion for VK_IMAGE_ASPECT_COLOR_BIT image views

</tbody>
</table>
Format features marked † must be supported for optimalTilingFeatures with VkImageType VK_IMAGE_TYPE_2D if the VkPhysicalDevice supports the VkPhysicalDeviceSamplerYcbcrConversionFeatures feature.

Formats marked ‡ do not require a sampler Y′C_bC_r conversion for VK_IMAGE_AsPECT_COLOR_BIT image views if the VkPhysicalDeviceRGBA10X6FormatsFeaturesEXT::formatRgba10x6WithoutYCbCrSampler feature is enabled.

Implementations are not required to support the VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, or VK_IMAGE_CREATE_SPARSE_ALIASED_BIT VkImageCreateFlags for the above formats that require sampler Y′C_bC_r conversion. To determine whether the implementation supports sparse image creation flags with these formats use vkGetPhysicalDeviceImageFormatProperties or vkGetPhysicalDeviceImageFormatProperties2.

VK_FORMAT_FEATURE_FRAGMENT_DENSITY_MAP_BIT_EXT must be supported for the following formats if the fragmentDensityMap feature is enabled:

- VK_FORMAT_R8G8_UNORM

VK_FORMAT_FEATURE_ACCELERATION_STRUCTURE_VERTEX_BUFFER_BIT_KHR must be supported in bufferFeatures for the following formats if the accelerationStructure feature is supported:

- VK_FORMAT_R32G32_SFLOAT
- VK_FORMAT_R32G32B32_SFLOAT
- VK_FORMAT_R16G16_SFLOAT
- VK_FORMAT_R16G16B16A16_SFLOAT
- VK_FORMAT_R16G16_SNORM
- VK_FORMAT_R16G16B16A16_SNORM

VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR must be supported for the following formats if the attachmentFragmentShadingRate feature is supported:

- VK_FORMAT_R8_UINT
If `VK_EXT_host_image_copy` is supported and `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` is supported in `optimalTilingFeatures` or `linearTilingFeatures` for a color format, `VK_FORMAT_FEATURE_2_HOST_IMAGE_TRANSFER_BIT_EXT` must also be supported in `optimalTilingFeatures` or `linearTilingFeatures` respectively.

### 49.3.1. Formats Without Shader Storage Format

The device-level features for using a storage image or a storage texel buffer with an image format of `Unknown`, `shaderStorageImageReadWithoutFormat` and `shaderStorageImageWriteWithoutFormat`, only apply to the following formats:

- `VK_FORMAT_R8G8B8A8_UNORM`
- `VK_FORMAT_R8G8B8A8_SNORM`
- `VK_FORMAT_R8G8B8A8_UINT`
- `VK_FORMAT_R8G8B8A8_SINT`

• VK_FORMAT_R8_UINT
• VK_FORMAT_A8_UNORM_KHR

Note
This list of formats is the union of required storage formats from Required Format Support section and formats listed in shaderStorageImageExtendedFormats.

An implementation that supports VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT for any format from the given list of formats and supports shaderStorageImageReadWithoutFormat must support VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT for that same format if Vulkan 1.3 or the VK_KHR_format_feature_flags2 extension is supported.

An implementation that supports VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT for any format from the given list of formats and supports shaderStorageImageWriteWithoutFormat must support VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT for that same format if Vulkan 1.3 or the VK_KHR_format_feature_flags2 extension is supported.

An implementation that does not support either of VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT or VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT for a format must not report support for VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT or VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT for that format if it is not listed in the SPIR-V and Vulkan Image Format Compatibility table.

Note
Some older implementations do not follow this restriction. They report support for formats as storage images even though they do not support access without the Format qualifier and there is no matching Format token. Such images cannot be either read from or written to.

Drivers which pass Vulkan conformance test suite version 1.3.9.0, or any subsequent version will conform to the requirement above.
49.3.2. Depth Comparison Format Support

If Vulkan 1.3 or the `VK_KHR_format_feature_flags2` extension is supported, a depth/stencil format with a depth component supporting `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT` must support `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

49.3.3. Format Feature Dependent Usage Flags

Certain resource usage flags depend on support for the corresponding format feature flag for the format in question. The following tables list the `VkBufferUsageFlagBits` and `VkImageUsageFlagBits` that have such dependencies, and the format feature flags they depend on. Additional restrictions, including, but not limited to, further required format feature flags specific to the particular use of the resource may apply, as described in the respective sections of this specification.

Chapter 50. Additional Capabilities

This chapter describes additional capabilities beyond the minimum capabilities described in the Limits and Formats chapters, including:

- Additional Image Capabilities
- Additional Buffer Capabilities
- Optional Semaphore Capabilities
- Optional Fence Capabilities
- Timestamp Calibration Capabilities

50.1. Additional Image Capabilities

Additional image capabilities, such as larger dimensions or additional sample counts for certain image types, or additional capabilities for linear tiling format images, are described in this section.

To query additional capabilities specific to image types, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetPhysicalDeviceImageFormatProperties(
    VkPhysicalDevice physicalDevice,
    VkFormat format,
    VkImageType type,
    VkImageTiling tiling,
    VkImageUsageFlags usage,
    VkImageCreateFlags flags,
    VkImageFormatProperties* pImageFormatProperties);
```

- `physicalDevice` is the physical device from which to query the image capabilities.
- `format` is a `VkFormat` value specifying the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is a `VkImageType` value specifying the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is a `VkImageTiling` value specifying the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- `flags` is a bitmask of `VkImageCreateFlagBits` specifying additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.
- `pImageFormatProperties` is a pointer to a `VkImageFormatProperties` structure in which capabilities are returned.

The `format`, `type`, `tiling`, `usage`, and `flags` parameters correspond to parameters that would be
consumed by \texttt{vkCreateImage} (as members of \texttt{VkImageCreateInfo}).

If \textit{format} is not a supported image format, or if the combination of \textit{format}, \textit{type}, \textit{tiling}, \textit{usage}, and \textit{flags} is not supported for images, then \texttt{vkGetPhysicalDeviceImageFormatProperties} returns \texttt{VK_ERROR_FORMAT_NOT_SUPPORTED}.

The limitations on an image format that are reported by \texttt{vkGetPhysicalDeviceImageFormatProperties} have the following property: if \textit{usage1} and \textit{usage2} of type \texttt{VkImageUsageFlags} are such that the bits set in \textit{usage1} are a subset of the bits set in \textit{usage2}, and \textit{flags1} and \textit{flags2} of type \texttt{VkImageCreateFlags} are such that the bits set in \textit{flags1} are a subset of the bits set in \textit{flags2}, then the limitations for \textit{usage1} and \textit{flags1} must be no more strict than the limitations for \textit{usage2} and \textit{flags2}, for all values of \textit{format}, \textit{type}, and \textit{tiling}.

If \texttt{VK_EXT_host_image_copy} is supported, \textit{usage} includes \texttt{VK_IMAGE_USAGE_SAMPLED_BIT}, and \textit{flags} does not include either of \texttt{VK_IMAGE_CREATE_SPARSE_BINDING_BIT}, \texttt{VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT}, or \texttt{VK_IMAGE_CREATE_SPARSE_ALIASED_BIT}, then the result of calls to \texttt{vkGetPhysicalDeviceImageFormatProperties} with identical parameters except for the inclusion of \texttt{VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT} in \textit{usage} must be identical.

### Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-02248
  \texttt{tiling} must not be \texttt{VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT}. (Use \texttt{vkGetPhysicalDeviceImageFormatProperties2} instead)

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties-physicalDevice-parameter
  \texttt{physicalDevice} must be a valid \texttt{VkPhysicalDevice} handle
- VUID-vkGetPhysicalDeviceImageFormatProperties-format-parameter
  \texttt{format} must be a valid \texttt{VkFormat} value
- VUID-vkGetPhysicalDeviceImageFormatProperties-type-parameter
  \texttt{type} must be a valid \texttt{VkImageType} value
- VUID-vkGetPhysicalDeviceImageFormatProperties-tiling-parameter
  \texttt{tiling} must be a valid \texttt{VkImageTiling} value
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-parameter
  \texttt{usage} must be a valid combination of \texttt{VkImageUsageFlagBits} values
- VUID-vkGetPhysicalDeviceImageFormatProperties-usage-required bitmask
  \texttt{usage} must not be 0
- VUID-vkGetPhysicalDeviceImageFormatProperties-flags-parameter
  \texttt{flags} must be a valid combination of \texttt{VkImageCreateFlagBits} values
  \texttt{pImageFormatProperties} must be a valid pointer to a \texttt{VkImageFormatProperties} structure
Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The `VkImageFormatProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageFormatProperties {
    VkExtent3D       maxExtent;
    uint32_t         maxMipLevels;
    uint32_t         maxArrayLayers;
    VkSampleCountFlags sampleCounts;
    VkDeviceSize     maxResourceSize;
} VkImageFormatProperties;
```

- `maxExtent` are the maximum image dimensions. See the Allowed Extent Values section below for how these values are constrained by `type`.

- `maxMipLevels` is the maximum number of mipmap levels. `maxMipLevels` must be equal to the number of levels in the complete mipmap chain based on the `maxExtent.width`, `maxExtent.height`, and `maxExtent.depth`, except when one of the following conditions is true, in which case it may instead be 1:
  - `vkGetPhysicalDeviceImageFormatProperties::tiling` was `VK_IMAGE_TILING_LINEAR`
  - `VkPhysicalDeviceImageFormatInfo2::tiling` was `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`
  - the `VkPhysicalDeviceImageFormatInfo2::pNext` chain included a `VkPhysicalDeviceExternalImageFormatInfo` structure with a handle type included in the `handleTypes` member for which mipmap image support is not required
  - image format is one of the formats that require a sampler Y’C_bC_r conversion
  - `flags` contains `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- `maxArrayLayers` is the maximum number of array layers. `maxArrayLayers` must be no less than `VkPhysicalDeviceLimits::maxImageArrayLayers`, except when one of the following conditions is true, in which case it may instead be 1:
  - `tiling` is `VK_IMAGE_TILING_LINEAR`
  - `tiling` is `VK_IMAGE_TILING_OPTIMAL` and `type` is `VK_IMAGE_TYPE_3D`
  - `format` is one of the formats that require a sampler Y’C_bC_r conversion

- If `tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `maxArrayLayers` must not be 0.
• **sampleCounts** is a bitmask of **VkSampleCountFlagBits** specifying all the supported sample counts for this image as described below.

• **maxResourceSize** is an upper bound on the total image size in bytes, inclusive of all image subresources. Implementations **may** have an address space limit on total size of a resource, which is advertised by this property. **maxResourceSize must** be at least $2^{31}$.

**Note**

There is no mechanism to query the size of an image before creating it, to compare that size against maxResourceSize. If an application attempts to create an image that exceeds this limit, the creation will fail and **vkCreateImage** will return **VK_ERROR_OUT_OF_DEVICE_MEMORY**. While the advertised limit **must** be at least $2^{31}$, it **may** not be possible to create an image that approaches that size, particularly for **VK_IMAGE_TYPE_1D**.

If the combination of parameters to **vkGetPhysicalDeviceImageFormatProperties** is not supported by the implementation for use in **vkCreateImage**, then all members of **VkImageFormatProperties** will be filled with zero.

**Note**

Filling **VkImageFormatProperties** with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility.

To determine the image capabilities compatible with an external memory handle type, call:

```c
// Provided by VK_NV_external_memory_capabilities
VkResult vkGetPhysicalDeviceExternalImageFormatPropertiesNV(
    VkPhysicalDevice physicalDevice,  
    VkFormat format,  
    VkImageType type,  
    VkImageTiling tiling,  
    VkImageUsageFlags usage,  
    VkImageCreateFlags flags,  
    VkExternalMemoryHandleTypeFlagsNV externalHandleType,  
    VkExternalImageFormatPropertiesNV* pExternalImageFormatProperties);
```

• **physicalDevice** is the physical device from which to query the image capabilities

• **format** is the image format, corresponding to **VkImageCreateInfo::format**.

• **type** is the image type, corresponding to **VkImageCreateInfo::imageType**.

• **tiling** is the image tiling, corresponding to **VkImageCreateInfo::tiling**.

• **usage** is the intended usage of the image, corresponding to **VkImageCreateInfo::usage**.

• **flags** is a bitmask describing additional parameters of the image, corresponding to **VkImageCreateInfo::flags**.

• **externalHandleType** is either one of the bits from **VkExternalMemoryHandleTypeFlagBitsNV**, or
• `pExternalImageFormatProperties` is a pointer to a `VkExternalImageFormatPropertiesNV` structure in which capabilities are returned.

If `externalHandleType` is 0, `pExternalImageFormatProperties->imageFormatProperties` will return the same values as a call to `vkGetPhysicalDeviceImageFormatProperties`, and the other members of `pExternalImageFormatProperties` will all be 0. Otherwise, they are filled in as described for `VkExternalImageFormatPropertiesNV`.

### Valid Usage

- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-externalHandleType-07721**
  - `externalHandleType` must not have more than one bit set

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-physicalDevice-parameter**
  - `physicalDevice` must be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-format-parameter**
  - `format` must be a valid `VkFormat` value
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-type-parameter**
  - `type` must be a valid `VkImageType` value
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-tiling-parameter**
  - `tiling` must be a valid `VkImageTiling` value
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-parameter**
  - `usage` must be a valid combination of `VkImageUsageFlagBits` values
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-usage-requiredbitmask**
  - `usage` must not be 0
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-flags-parameter**
  - `flags` must be a valid combination of `VkImageCreateFlagBits` values
- **VUID-vkGetPhysicalDeviceExternalImageFormatPropertiesNV-externalHandleType-parameter**
  - `externalHandleType` must be a valid combination of `VkExternalMemoryHandleTypeFlagBitsNV` values
  - `pExternalImageFormatProperties` must be a valid pointer to a `VkExternalImageFormatPropertiesNV` structure
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY
• VK_ERROR_FORMAT_NOT_SUPPORTED

The VkExternalImageFormatPropertiesNV structure is defined as:

```c
// Provided by VK_NV_external_memory_capabilities
typedef struct VkExternalImageFormatPropertiesNV {
    VkImageFormatProperties imageFormatProperties;
    VkExternalMemoryFeatureFlagsNV externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlagsNV exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlagsNV compatibleHandleTypes;
} VkExternalImageFormatPropertiesNV;
```

• `imageFormatProperties` will be filled in as when calling `vkGetPhysicalDeviceImageFormatProperties`, but the values returned may vary depending on the external handle type requested.

• `externalMemoryFeatures` is a bitmask of `VkExternalMemoryFeatureFlagBitsNV`, indicating properties of the external memory handle type (`vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType`) being queried, or 0 if the external memory handle type is 0.

• `exportFromImportedHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` containing a bit set for every external handle type that may be used to create memory from which the handles of the type specified in `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType` can be exported, or 0 if the external memory handle type is 0.

• `compatibleHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBitsNV` containing a bit set for every external handle type that may be specified simultaneously with the handle type specified by `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType` when calling `vkAllocateMemory`, or 0 if the external memory handle type is 0. `compatibleHandleTypes` will always contain `vkGetPhysicalDeviceExternalImageFormatPropertiesNV::externalHandleType`.

Bits which can be set in `VkExternalImageFormatPropertiesNV::externalMemoryFeatures`, indicating properties of the external memory handle type, are:
typedef enum VkExternalMemoryFeatureFlagBitsNV {
    VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV = 0x00000001,
    VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV = 0x00000002,
    VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV = 0x00000004,
} VkExternalMemoryFeatureFlagBitsNV;

• VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_NV specifies that external memory of the specified type must be created as a dedicated allocation when used in the manner specified.
• VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_NV specifies that the implementation supports exporting handles of the specified type.
• VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_NV specifies that the implementation supports importing handles of the specified type.

typedef VkFlags VkExternalMemoryFeatureFlagsNV;

VkExternalMemoryFeatureFlagsNV is a bitmask type for setting a mask of zero or more VkExternalMemoryFeatureFlagBitsNV.

To query additional capabilities specific to image types, call:

// Provided by VK_VERSION_1_1
VkResult vkGetPhysicalDeviceImageFormatProperties2(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceImageFormatInfo2* pImageFormatInfo,
    VkImageFormatProperties2* pImageFormatProperties);

or the equivalent command

// Provided by VK_KHR_get_physical_device_properties2
VkResult vkGetPhysicalDeviceImageFormatProperties2KHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceImageFormatInfo2* pImageFormatInfo,
    VkImageFormatProperties2* pImageFormatProperties);

• physicalDevice is the physical device from which to query the image capabilities.
• pImageFormatInfo is a pointer to a VkPhysicalDeviceImageFormatInfo2 structure describing the parameters that would be consumed by vkCreateImage.
• pImageFormatProperties is a pointer to a VkImageFormatProperties2 structure in which capabilities are returned.

vkGetPhysicalDeviceImageFormatProperties2 behaves similarly to vkGetPhysicalDeviceImageFormatProperties, with the ability to return extended information in a
pNext chain of output structures.

If the pNext chain of pImageFormatInfo includes a VkVideoProfileListInfoKHR structure with a profileCount member greater than 0, then this command returns format capabilities specific to image types used in conjunction with the specified video profiles. In this case, this command will return one of the video-profile-specific error codes if any of the profiles specified via VkVideoProfileListInfoKHR:pProfiles are not supported. Furthermore, if VkPhysicalDeviceImageFormatInfo2:usage includes any image usage flag not supported by the specified video profiles, then this command returns VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR.

Valid Usage

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pNext-01868
  If the pNext chain of pImageFormatProperties includes a VkAndroidHardwareBufferUsageANDROID structure, the pNext chain of pImageFormatInfo must include a VkPhysicalDeviceExternalImageFormatInfo structure with handleType set to VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID.

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pNext-09004
  If the pNext chain of pImageFormatProperties includes a VkHostImageCopyDevicePerformanceQueryEXT structure, pImageFormatInfo->usage must contain VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceImageFormatProperties2-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle.

- VUID-vkGetPhysicalDeviceImageFormatProperties2-pImageFormatInfo-parameter
  pImageFormatInfo must be a valid pointer to a valid VkPhysicalDeviceImageFormatInfo2 structure.

  pImageFormatProperties must be a valid pointer to a VkImageFormatProperties2 structure.

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED
- VK_ERROR_IMAGE_USAGE_NOT_SUPPORTED_KHR
- VK_ERROR_VIDEO_PROFILE_OPERATION_NOT_SUPPORTED_KHR
The `VkPhysicalDeviceImageFormatInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceImageFormatInfo2 {
    VkStructureType   sType;
    const void*       pNext;
    VkFormat          format;
    VkImageType       type;
    VkImageTiling     tiling;
    VkImageUsageFlags usage;
    VkImageCreateFlags flags;
} VkPhysicalDeviceImageFormatInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkPhysicalDeviceImageFormatInfo2 VkPhysicalDeviceImageFormatInfo2KHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkPhysicalDeviceImageFormatInfo2` is used to provide additional image parameters to `vkGetPhysicalDeviceImageFormatProperties2`.
- `format` is a `VkFormat` value indicating the image format, corresponding to `VkImageCreateInfo::format`.
- `type` is a `VkImageType` value indicating the image type, corresponding to `VkImageCreateInfo::imageType`.
- `tiling` is a `VkImageTiling` value indicating the image tiling, corresponding to `VkImageCreateInfo::tiling`.
- `usage` is a bitmask of `VkImageUsageFlagBits` indicating the intended usage of the image, corresponding to `VkImageCreateInfo::usage`.
- `flags` is a bitmask of `VkImageCreateFlagBits` indicating additional parameters of the image, corresponding to `VkImageCreateInfo::flags`.

The members of `VkPhysicalDeviceImageFormatInfo2` correspond to the arguments to `vkGetPhysicalDeviceImageFormatProperties`, with `sType` and `pNext` added for extensibility.

**Valid Usage**

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-02249
**Valid Usage (Implicit)**

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_FORMAT_INFO_2

- VUID-VkPhysicalDeviceImageFormatInfo2-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkImageCompressionControlEXT, VkImageFormatListCreateInfo, VkImageStencilUsageCreateInfo, VkOpticalFlowImageFormatInfoNV, VkPhysicalDeviceExternalImageFormatInfo, VkPhysicalDeviceImageDrmFormatModifierInfoEXT, VkPhysicalDeviceImageViewImageFormatInfoEXT, or VkVideoProfileListInfoKHR

- VUID-VkPhysicalDeviceImageFormatInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPhysicalDeviceImageFormatInfo2-format-parameter
  format must be a valid VkFormat value

- VUID-VkPhysicalDeviceImageFormatInfo2-type-parameter
  type must be a valid VkImageType value

- VUID-VkPhysicalDeviceImageFormatInfo2-tiling-parameter
  tiling must be a valid VkImageTiling value

- VUID-VkPhysicalDeviceImageFormatInfo2-usage-parameter
  usage must be a valid combination of VkImageUsageFlagBits values

- VUID-VkPhysicalDeviceImageFormatInfo2-usage-requiredbitmask
  usage must not be 0

- VUID-VkPhysicalDeviceImageFormatInfo2-flags-parameter
  flags must be a valid combination of VkImageCreateFlagBits values

The VkImageFormatProperties2 structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageFormatProperties2 {
    VkStructureType sType;
    void* pNext;
    VkImageFormatProperties imageFormatProperties;
} VkImageFormatProperties2;
```
or the equivalent

```c
// Provided by VK_KHR_get_physical_device_properties2
typedef VkImageFormatProperties2 VkImageFormatProperties2KHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure. The `pNext` chain of `VkImageFormatProperties2` is used to allow the specification of additional capabilities to be returned from `vkGetPhysicalDeviceImageFormatProperties2`.
- **imageFormatProperties** is a `VkImageFormatProperties` structure in which capabilities are returned.

If the combination of parameters to `vkGetPhysicalDeviceImageFormatProperties2` is not supported by the implementation for use in `vkCreateImage`, then all members of `imageFormatProperties` will be filled with zero.

**Note**
Filling `imageFormatProperties` with zero for unsupported formats is an exception to the usual rule that output structures have undefined contents on error. This exception was unintentional, but is preserved for backwards compatibility. This exception only applies to `imageFormatProperties`, not `sType`, `pNext`, or any structures chained from `pNext`.

**Valid Usage (Implicit)**

- **VUID-VkImageFormatProperties2-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_PROPERTIES_2`

- **VUID-VkImageFormatProperties2-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain **must** be either `NULL` or a pointer to a valid instance of `VkAndroidHardwareBufferUsageANDROID`, `VkExternalImageFormatProperties`, `VkFilterCubicImageViewImageFormatPropertiesEXT`, `VkHostImageCopyDevicePerformanceQueryEXT`, `VkImageCompressionPropertiesEXT`, `VkSamplerYcbcrConversionImageFormatProperties`, or `VkTextureLODGatherFormatPropertiesAMD`

- **VUID-VkImageFormatProperties2-sType-unique**
  The `sType` value of each struct in the `pNext` chain **must** be unique

To determine if texture gather functions that take explicit LOD and/or bias argument values can be used with a given image format, add a `VkTextureLODGatherFormatPropertiesAMD` structure to the `pNext` chain of the `VkImageFormatProperties2` structure in a call to `vkGetPhysicalDeviceImageFormatProperties2`.

The `VkTextureLODGatherFormatPropertiesAMD` structure is defined as:
```c
// Provided by VK_AMD_texture_gather_bias_lod
typedef struct VkTextureLODGatherFormatPropertiesAMD {
    VkStructureType sType;
    void* pNext;
    VkBool32 supportsTextureGatherLODBiasAMD;
} VkTextureLODGatherFormatPropertiesAMD;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **supportsTextureGatherLODBiasAMD** tells if the image format can be used with texture gather bias/LOD functions, as introduced by the `VK_AMD_texture_gather_bias_lod` extension. This field is set by the implementation. An application-specified value is ignored.

### Valid Usage (Implicit)

- `VUID-VkTextureLODGatherFormatPropertiesAMD-sType-sType`
  - **sType** must be `VK_STRUCTURE_TYPE_TEXTURE_LOD_GATHER_FORMAT_PROPERTIES_AMD`

To determine the image capabilities compatible with an external memory handle type, add a `VkPhysicalDeviceExternalImageFormatInfo` structure to the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure and a `VkExternalImageFormatProperties` structure to the `pNext` chain of the `VkImageFormatProperties2` structure.

The `VkPhysicalDeviceExternalImageFormatInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalImageFormatInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalImageFormatInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalImageFormatInfo
    VkPhysicalDeviceExternalImageFormatInfoKHR;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **handleType** is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the image.

If **handleType** is 0, `vkGetPhysicalDeviceExternalImageFormatProperties2` will behave as if
VkPhysicalDeviceExternalImageFormatInfo was not present, and VkExternalImageFormatProperties will be ignored.

If `handleType` is not compatible with the format, type, tiling, usage, and flags specified in VkPhysicalDeviceImageFormatInfo2, then `vkGetPhysicalDeviceImageFormatProperties2` returns VK_ERROR_FORMAT_NOT_SUPPORTED.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalImageFormatInfo-sType-sType
  
  `sType` must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_IMAGE_FORMAT_INFO

- VUID-VkPhysicalDeviceExternalImageFormatInfo-handleType-parameter
  
  If `handleType` is not 0, `handleType` must be a valid VkExternalMemoryHandleTypeFlagBits value

Possible values of `VkPhysicalDeviceExternalImageFormatInfo::handleType`, specifying an external memory handle type, are:
// Provided by VK_VERSION_1_1
typedef enum VkExternalMemoryHandleTypeFlagBits {
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT = 0x00000008,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT = 0x00000010,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT = 0x00000020,
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT = 0x00000040,
    // Provided by VK_EXT_external_memory_dma_buf
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT = 0x00000200,
    // Provided by VK_ANDROID_external_memory_android_hardware_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID = 0x00000400,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_external_memory_host
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT = 0x00000100,
    // Provided by VK_FUCHSIA_external_memory
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA = 0x00000800,
    // Provided by VK_NV_external_memory_rdma
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV = 0x00001000,
    // Provided by VK_QNX_external_memory_screen_buffer
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX = 0x00004000,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT,
    // Provided by VK_KHR_external_memory_capabilities
    VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT_KHR = VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT,
} VkExternalMemoryHandleTypeFlagBits;

or the equivalent
// Provided by VK_KHR_external_memory_capabilities

typedef VkExternalMemoryHandleTypeFlagBits VkExternalMemoryHandleTypeFlagBitsKHR;

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it must be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying memory resource represented by its Vulkan memory object, and will therefore become invalid when all Vulkan memory objects associated with it are destroyed.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT** specifies an NT handle returned by `IDXGIResource1::CreateSharedHandle` referring to a Direct3D 10 or 11 texture resource. It owns a reference to the memory used by the Direct3D resource.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT** specifies a global share handle returned by `IDXGIResource::GetSharedHandle` referring to a Direct3D 10 or 11 texture resource. It does not own a reference to the underlying Direct3D resource, and will therefore become invalid when all Vulkan memory objects and Direct3D resources associated with it are destroyed.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_HEAP_BIT** specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 heap resource. It owns a reference to the resources used by the Direct3D heap.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT** specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 committed resource. It owns a reference to the memory used by the Direct3D resource.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT** specifies a host pointer returned by a host memory allocation command. It does not own a reference to the underlying memory resource, and will therefore become invalid if the host memory is freed.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT** specifies a host pointer to host mapped foreign memory. It does not own a reference to the underlying memory resource, and will therefore become invalid if the foreign memory is unmapped or otherwise becomes no longer available.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT** is a file descriptor for a Linux dma_buf. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

- **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID** specifies an `AHardwareBuffer` object defined by the Android NDK. See Android Hardware Buffers for more details of this handle type.
• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ZIRCON_VMO_BIT_FUCHSIA** is a Zircon handle to a virtual memory object.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_RDMA_ADDRESS_BIT_NV** is a handle to an allocation accessible by remote devices. It owns a reference to the underlying memory resource represented by its Vulkan memory object.

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX** specifies a _screen_buffer_ object defined by the QNX SDP. See QNX Screen Buffer for more details of this handle type.
Some external memory handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

**Table 91. External memory handle types compatibility**

<table>
<thead>
<tr>
<th>Handle type</th>

</tbody>
</table>

**Note**

The above table does not restrict the drivers and devices with which VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT and VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT may be shared, as these handle types inherently mean memory that does not come from the same device, as they import memory from the host or a foreign device, respectively.

**Note**

Even though the above table does not restrict the drivers and devices with which
VK_EXTERNAL_MEMORY_HANDLE_TYPE_DMA_BUF_BIT_EXT may be shared, query mechanisms exist in the Vulkan API that prevent the import of incompatible dma-bufs (such as vkGetMemoryFdPropertiesKHR) and that prevent incompatible usage of dma-bufs (such as VkPhysicalDeviceExternalBufferInfo and VkPhysicalDeviceExternalImageFormatInfo).

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryHandleTypeFlags;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryHandleTypeFlags VkExternalMemoryHandleTypeFlagsKHR;
```

**VkExternalMemoryHandleTypeFlags** is a bitmask type for setting a mask of zero or more **VkExternalMemoryHandleTypeFlagBits**.

The **VkExternalImageFormatProperties** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalImageFormatProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalMemoryProperties externalMemoryProperties;
} VkExternalImageFormatProperties;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalImageFormatProperties VkExternalImageFormatPropertiesKHR;
```

- **sType** is a **VkStructureType** value identifying this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **externalMemoryProperties** is a **VkExternalMemoryProperties** structure specifying various capabilities of the external handle type when used with the specified image creation parameters.

**Valid Usage (Implicit)**

- **VUID-VkExternalImageFormatProperties-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_EXTERNAL_IMAGE_FORMAT_PROPERTIES**

The **VkExternalMemoryProperties** structure is defined as:
typedef struct VkExternalMemoryProperties {
    VkExternalMemoryFeatureFlags externalMemoryFeatures;
    VkExternalMemoryHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalMemoryHandleTypeFlags compatibleHandleTypes;
} VkExternalMemoryProperties;

or the equivalent

typedef VkExternalMemoryProperties VkExternalMemoryPropertiesKHR;

- `externalMemoryFeatures` is a bitmask of `VkExternalMemoryFeatureFlagBits` specifying the features of `handleType`.
- `exportFromImportedHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying which types of imported handle `handleType` can be exported from.
- `compatibleHandleTypes` is a bitmask of `VkExternalMemoryHandleTypeFlagBits` specifying handle types which can be specified at the same time as `handleType` when creating an image compatible with external memory.

`compatibleHandleTypes` must include at least `handleType`. Inclusion of a handle type in `compatibleHandleTypes` does not imply the values returned in `VkImageFormatProperties2` will be the same when `VkPhysicalDeviceExternalImageFormatInfo::handleType` is set to that type. The application is responsible for querying the capabilities of all handle types intended for concurrent use in a single image and intersecting them to obtain the compatible set of capabilities.

Bits which `may` be set in `VkExternalMemoryProperties::externalMemoryFeatures`, specifying features of an external memory handle type, are:

typedef enum VK_VERSION_1_1
    VkExternalMemoryFeatureFlagBits {
        VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT = 0x00000001,
        VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT = 0x00000002,
        VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT = 0x00000004,
        // Provided by VK_KHR_external_memory_capabilities
        VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT_KHR =
        VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT_KHR =
        VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT_KHR =
        // Provided by VK_KHR_external_memory_capabilities
    } VkExternalMemoryFeatureFlagBits;

or the equivalent
• **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** specifies that images or buffers created with the specified parameters and handle type **must** use the mechanisms defined by `VkMemoryDedicatedRequirements` and `VkMemoryDedicatedAllocateInfo` to create (or import) a dedicated allocation for the image or buffer.

• **VK_EXTERNAL_MEMORY_FEATURE_EXPORTABLE_BIT** specifies that handles of this type **can** be exported from Vulkan memory objects.

• **VK_EXTERNAL_MEMORY_FEATURE_IMPORTABLE_BIT** specifies that handles of this type **can** be imported as Vulkan memory objects.

Because their semantics in external APIs roughly align with that of an image or buffer with a dedicated allocation in Vulkan, implementations are **required** to report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for the following external handle types:

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT**

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT**

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT**

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID** for images only

• **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX** for images only

Implementations **must** not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID**. Implementations **must** not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_SCREEN_BUFFER_BIT_QNX**. Implementations **must** not report **VK_EXTERNAL_MEMORY_FEATURE_DEDICATED_ONLY_BIT** for images or buffers with external handle type **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_ALLOCATION_BIT_EXT**, or **VK_EXTERNAL_MEMORY_HANDLE_TYPE_HOST_MAPPED_FOREIGN_MEMORY_BIT_EXT**.

// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalMemoryFeatureFlags;

or the equivalent

// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalMemoryFeatureFlags VkExternalMemoryFeatureFlagsKHR;

**VkExternalMemoryFeatureFlags** is a bitmask type for setting a mask of zero or more **VkExternalMemoryFeatureFlagBits**.

To query the image capabilities that are compatible with a **Linux DRM format modifier**, set `VkPhysicalDeviceImageFormatInfo2::tiling` to `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and add a `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure to the `pNext` chain of
The `VkPhysicalDeviceImageDrmFormatModifierInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkPhysicalDeviceImageDrmFormatModifierInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint64_t drmFormatModifier;
    VkSharingMode sharingMode;
    uint32_t queueFamilyIndexCount;
    const uint32_t* pQueueFamilyIndices;
} VkPhysicalDeviceImageDrmFormatModifierInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `drmFormatModifier` is the image's Linux DRM format modifier, corresponding to `VkImageDrmFormatModifierExplicitCreateInfoEXT::modifier` or to `VkImageDrmFormatModifierListCreateInfoEXT::pModifiers`.
- `sharingMode` specifies how the image will be accessed by multiple queue families.
- `queueFamilyIndexCount` is the number of entries in the `pQueueFamilyIndices` array.
- `pQueueFamilyIndices` is a pointer to an array of `queueFamilyIndexCount` `uint32_t` values.

If the `drmFormatModifier` is incompatible with the parameters specified in `VkPhysicalDeviceImageFormatInfo2` and its `pNext` chain, then `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_ERROR_FORMAT_NOT_SUPPORTED`. The implementation must support the query of any `drmFormatModifier`, including unknown and invalid modifier values.

### Valid Usage

- **VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02314**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `pQueueFamilyIndices` must be a valid pointer to an array of `queueFamilyIndexCount uint32_t` values.

- **VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02315**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, then `queueFamilyIndexCount` must be greater than 1.

- **VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-02316**
  If `sharingMode` is `VK_SHARING_MODE_CONCURRENT`, each element of `pQueueFamilyIndices` must be unique and must be less than the `pQueueFamilyPropertyCount` returned by `vkGetPhysicalDeviceQueueFamilyProperties2` for the `physicalDevice` that was used to create device.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_DRM_FORMAT_MODIFIER_INFO_EXT

- VUID-VkPhysicalDeviceImageDrmFormatModifierInfoEXT-sharingMode-parameter
  
sharingMode must be a valid VkSharingMode value

To determine the number of combined image samplers required to support a multi-planar format, add VkSamplerYcbcrConversionImageFormatProperties to the pNext chain of the VkImageFormatProperties2 structure in a call to vkGetPhysicalDeviceImageFormatProperties2.

The VkSamplerYcbcrConversionImageFormatProperties structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionImageFormatProperties {
    VkStructureType sType;
    void* pNext;
    uint32_t combinedImageSamplerDescriptorCount;
} VkSamplerYcbcrConversionImageFormatProperties;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionImageFormatProperties
VkSamplerYcbcrConversionImageFormatPropertiesKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- combinedImageSamplerDescriptorCount is the number of combined image sampler descriptors that the implementation uses to access the format.

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionImageFormatProperties-sType-sType
  
sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_IMAGE_FORMAT_PROPERTIES

combinedImageSamplerDescriptorCount is a number between 1 and the number of planes in the format. A descriptor set layout binding with immutable Y’CbCr conversion samplers will have a maximum combinedImageSamplerDescriptorCount which is the maximum across all formats supported by its samplers of the combinedImageSamplerDescriptorCount for each format. Descriptor sets with that layout will internally use that maximum combinedImageSamplerDescriptorCount descriptors for each descriptor in the binding. This expanded number of descriptors will be consumed from the descriptor pool when a descriptor set is allocated, and counts towards the
maxDescriptorSetSamplers, maxDescriptorSetSampledImages, maxPerStageDescriptorSamplers, and maxPerStageDescriptorSampledImages limits.

*Note*

All descriptors in a binding use the same maximum combinedImageSamplerDescriptorCount descriptors to allow implementations to use a uniform stride for dynamic indexing of the descriptors in the binding.

For example, consider a descriptor set layout binding with two descriptors and immutable samplers for multi-planar formats that have VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount values of 2 and 3 respectively. There are two descriptors in the binding and the maximum combinedImageSamplerDescriptorCount is 3, so descriptor sets with this layout consume 6 descriptors from the descriptor pool. To create a descriptor pool that allows allocating four descriptor sets with this layout, descriptorCount must be at least 24.

Instead of querying all the potential formats that the application might use in the descriptor layout, the application can use the VkPhysicalDeviceMaintenance6PropertiesKHR::maxCombinedImageSamplerDescriptorCount property to determine the maximum descriptor size that will accommodate any and all formats that require a sampler Y'CbCr conversion supported by the implementation.

To obtain optimal Android hardware buffer usage flags for specific image creation parameters, add a VkAndroidHardwareBufferUsageANDROID structure to the pNext chain of a VkImageFormatProperties2 structure passed to vkGetPhysicalDeviceImageFormatProperties2. This structure is defined as:

```c
// Provided by VK_ANDROID_external_memory_android_hardware_buffer
typedef struct VkAndroidHardwareBufferUsageANDROID {
    VkStructureType sType;
    void* pNext;
    uint64_t androidHardwareBufferUsage;
} VkAndroidHardwareBufferUsageANDROID;
```

- **sType** is a VkStructureType value identifying this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **androidHardwareBufferUsage** returns the Android hardware buffer usage flags.

The androidHardwareBufferUsage field must include Android hardware buffer usage flags listed in the AHardwareBuffer Usage Equivalence table when the corresponding Vulkan image usage or image creation flags are included in the usage or flags fields of VkPhysicalDeviceImageFormatInfo2. It must include at least one GPU usage flag (AHARDWAREBUFFER_USAGE_GPU_*), even if none of the corresponding Vulkan usages or flags are requested.

*Note*

Requiring at least one GPU usage flag ensures that Android hardware buffer
memory will be allocated in a memory pool accessible to the Vulkan implementation, and that specializing the memory layout based on usage flags does not prevent it from being compatible with Vulkan. Implementations may avoid unnecessary restrictions caused by this requirement by using vendor usage flags to indicate that only the Vulkan uses indicated in `VkImageFormatProperties2` are required.

### Valid Usage (Implicit)

- **VUID-VkAndroidHardwareBufferUsageANDROID-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_ANDROID_HARDWARE_BUFFER_USAGE_ANDROID`

To query if using `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` has a negative impact on device performance when accessing an image, add `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` to `VkPhysicalDeviceImageFormatInfo2::usage`, and add a `VkHostImageCopyDevicePerformanceQueryEXT` structure to the `pNext` chain of a `VkImageFormatProperties2` structure passed to `vkGetPhysicalDeviceImageFormatProperties2`. This structure is defined as:

```c
// Provided by VK_EXT_host_image_copy
typedef struct VkHostImageCopyDevicePerformanceQueryEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 optimalDeviceAccess;
    VkBool32 identicalMemoryLayout;
} VkHostImageCopyDevicePerformanceQueryEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **optimalDeviceAccess** returns `VK_TRUE` if use of host image copy has no adverse effect on device access performance, compared to an image that is created with exact same creation parameters, and bound to the same `VkDeviceMemory`, except that `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` is replaced with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.
- **identicalMemoryLayout** returns `VK_TRUE` if use of host image copy has no impact on memory layout compared to an image that is created with exact same creation parameters, and bound to the same `VkDeviceMemory`, except that `VK_IMAGE_USAGE_HOST_TRANSFER_BIT_EXT` is replaced with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` and `VK_IMAGE_USAGE_TRANSFER_DST_BIT`.

The implementation may return `VK_FALSE` in `optimalDeviceAccess` if `identicalMemoryLayout` is `VK_FALSE`. If `identicalMemoryLayout` is `VK_TRUE`, `optimalDeviceAccess` must be `VK_TRUE`.

The implementation may return `VK_TRUE` in `optimalDeviceAccess` while `identicalMemoryLayout` is `VK_FALSE`. In this situation, any device performance impact should not be measurable.

If `VkPhysicalDeviceImageFormatInfo2::format` is a block-compressed format and `vkGetPhysicalDeviceImageFormatProperties2` returns `VK_SUCCESS`, the implementation must return `VK_TRUE` in `optimalDeviceAccess`. 

4166
Applications can make use of `optimalDeviceAccess` to determine their resource copying strategy. If a resource is expected to be accessed more on device than on the host, and the implementation considers the resource sub-optimally accessed, it is likely better to use device copies instead.

Layout not being identical yet still considered optimal for device access could happen if the implementation has different memory layout patterns, some of which are easier to access on the host.

The most practical reason for `optimalDeviceAccess` to be `VK_FALSE` is that host image access may disable framebuffer compression where it would otherwise have been enabled. This represents far more efficient host image access since no compression algorithm is required to read or write to the image, but it would impact device access performance. Some implementations may only set `optimalDeviceAccess` to `VK_FALSE` if certain conditions are met, such as specific image usage flags or creation flags.

Valid Usage (Implicit)

- `VUID-VkHostImageCopyDevicePerformanceQueryEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_HOST_IMAGE_COPY_DEVICE_PERFORMANCE_QUERY_EXT`  
  To determine if cubic filtering can be used with a given image format and a given image view type add a `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure to the `pNext` chain of the `VkPhysicalDeviceImageFormatInfo2` structure, and a `VkFilterCubicImageViewImageFormatPropertiesEXT` structure to the `pNext` chain of the `VkImageFormatProperties2` structure.  
  The `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_filter_cubic
typedef struct VkPhysicalDeviceImageViewImageFormatInfoEXT {
    VkStructureType sType;
    void* pNext;
    VkImageViewType imageViewType;
} VkPhysicalDeviceImageViewImageFormatInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageViewType` is a `VkImageViewType` value specifying the type of the image view.
Valid Usage (Implicit)

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_IMAGE_VIEW_IMAGE_FORMAT_INFO_EXT`

- VUID-VkPhysicalDeviceImageViewImageFormatInfoEXT-imageViewType-parameter
  
  **imageViewType** must be a valid `VkImageViewType` value

The `VkFilterCubicImageViewImageFormatPropertiesEXT` structure is defined as:

```c
// Provided by VK_EXT_filter_cubic
typedef struct VkFilterCubicImageViewImageFormatPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    VkBool32 filterCubic;
    VkBool32 filterCubicMinmax;
} VkFilterCubicImageViewImageFormatPropertiesEXT;
```

- **sType** is a `VkStructureType` value identifying this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **filterCubic** tells if image format, image type and image view type can be used with cubic filtering. This field is set by the implementation. An application-specified value is ignored.
- **filterCubicMinmax** tells if image format, image type and image view type can be used with cubic filtering and minmax filtering. This field is set by the implementation. An application-specified value is ignored.

Valid Usage (Implicit)

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_FILTER_CUBIC_IMAGE_VIEW_IMAGE_FORMAT_PROPERTIES_EXT`

Valid Usage

- VUID-VkFilterCubicImageViewImageFormatPropertiesEXT-pNext-02627
  
  If the **pNext** chain of the `VkImageFormatProperties2` structure includes a `VkFilterCubicImageViewImageFormatPropertiesEXT` structure, the **pNext** chain of the `VkPhysicalDeviceImageFormatInfo2` structure must include a `VkPhysicalDeviceImageViewImageFormatInfoEXT` structure with an **imageViewType** that is compatible with **imageType**

50.1.1. Supported Sample Counts

`vkGetPhysicalDeviceImageFormatProperties` returns a bitmask of `VkSampleCountFlagBits` in
sampleCounts specifying the supported sample counts for the image parameters.

sampleCounts will be set to VK_SAMPLE_COUNT_1_BIT if at least one of the following conditions is true:

- tiling is VK_IMAGE_TILING_LINEAR
- type is not VK_IMAGE_TYPE_2D
- flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT
- Neither the VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT flag nor the VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT flag in VkFormatProperties::optimalTilingFeatures returned by vkGetPhysicalDeviceFormatProperties is set
- VkPhysicalDeviceExternalImageFormatInfo::handleType is an external handle type for which multisampled image support is not required.
- format is one of the formats that require a sampler Y’CbCr conversion
- usage contains VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR
- usage contains VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT

Otherwise, the bits set in sampleCounts will be the sample counts supported for the specified values of usage and format. For each bit set in usage, the supported sample counts relate to the limits in VkPhysicalDeviceLimits as follows:

- If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT and format is a floating- or fixed-point color format, a superset of VkPhysicalDeviceLimits::framebufferColorSampleCounts
- If usage includes VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT and format is an integer format, a superset of VkPhysicalDeviceVulkan12Properties::framebufferIntegerColorSampleCounts
- If usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and format includes a depth component, a superset of VkPhysicalDeviceLimits::framebufferDepthSampleCounts
- If usage includes VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, and format includes a stencil component, a superset of VkPhysicalDeviceLimits::framebufferStencilSampleCounts
- If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format includes a color component, a superset of VkPhysicalDeviceLimits::sampledImageColorSampleCounts
- If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format includes a depth component, a superset of VkPhysicalDeviceLimits::sampledImageDepthSampleCounts
- If usage includes VK_IMAGE_USAGE_SAMPLED_BIT, and format is an integer format, a superset of VkPhysicalDeviceLimits::sampledImageIntegerSampleCounts
- If usage includes VK_IMAGE_USAGE_STORAGE_BIT, a superset of VkPhysicalDeviceLimits::storageImageSampleCounts

If multiple bits are set in usage, sampleCounts will be the intersection of the per-usage values described above.

If none of the bits described above are set in usage, then there is no corresponding limit in VkPhysicalDeviceLimits. In this case, sampleCounts must include at least VK_SAMPLE_COUNT_1_BIT.
50.1.2. Allowed Extent Values Based on Image Type

Implementations may support extent values larger than the required minimum/maximum values for certain types of images. VkImageFormatProperties::maxExtent for each type is subject to the constraints below.

Note
Implementations must support images with dimensions up to the required minimum/maximum values for all types of images. It follows that the query for additional capabilities must return extent values that are at least as large as the required values.

For VK_IMAGE_TYPE_1D:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension1D
- maxExtent.height = 1
- maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags does not contain VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension2D
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension2D
- maxExtent.depth = 1

For VK_IMAGE_TYPE_2D when flags contains VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimensionCube
- maxExtent.depth = 1

For VK_IMAGE_TYPE_3D:

- maxExtent.width ≥ VkPhysicalDeviceLimits::maxImageDimension3D
- maxExtent.height ≥ VkPhysicalDeviceLimits::maxImageDimension3D
- maxExtent.depth ≥ VkPhysicalDeviceLimits::maxImageDimension3D

50.2. Additional Buffer Capabilities

To query the external handle types supported by buffers, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalBufferProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalBufferInfo* pExternalBufferInfo,
    VkExternalBufferProperties* pExternalBufferProperties);
```
or the equivalent command

```c
// Provided by VK_KHR_external_memory_capabilities
void vkGetPhysicalDeviceExternalBufferPropertiesKHR(  
    VkPhysicalDevice physicalDevice,  
    const VkPhysicalDeviceExternalBufferInfo* pExternalBufferInfo,  
    VkExternalBufferProperties* pExternalBufferProperties);
```

- `physicalDevice` is the physical device from which to query the buffer capabilities.
- `pExternalBufferInfo` is a pointer to a `VkPhysicalDeviceExternalBufferInfo` structure describing the parameters that would be consumed by `vkCreateBuffer`.
- `pExternalBufferProperties` is a pointer to a `VkExternalBufferProperties` structure in which capabilities are returned.

### Valid Usage (Implicit)

- **VUID-vkGetPhysicalDeviceExternalBufferProperties-physicalDevice-parameter**
  - `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
- **VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferInfo-parameter**
  - `pExternalBufferInfo` **must** be a valid pointer to a valid `VkPhysicalDeviceExternalBufferInfo` structure
- **VUID-vkGetPhysicalDeviceExternalBufferProperties-pExternalBufferProperties-parameter**
  - `pExternalBufferProperties` **must** be a valid pointer to a `VkExternalBufferProperties` structure

The `VkPhysicalDeviceExternalBufferInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalBufferInfo {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateFlags flags;
    VkBufferUsageFlags usage;
    VkExternalMemoryHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalBufferInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_memory_capabilities
typedef VkPhysicalDeviceExternalBufferInfo VkPhysicalDeviceExternalBufferInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `flags` is a bitmask of `VkBufferCreateFlagBits` describing additional parameters of the buffer, corresponding to `VkBufferCreateInfo::flags`.

• `usage` is a bitmask of `VkBufferUsageFlagBits` describing the intended usage of the buffer, corresponding to `VkBufferCreateInfo::usage`.

• `handleType` is a `VkExternalMemoryHandleTypeFlagBits` value specifying the memory handle type that will be used with the memory associated with the buffer.

Only usage flags representable in `VkBufferUsageFlagBits` are returned in this structure’s `usage`. If a `VkBufferUsageFlags2CreateInfoKHR` structure is present in the `pNext` chain, all usage flags of the buffer are returned in `VkBufferUsageFlags2CreateInfoKHR::usage`.

### Valid Usage

- **VUID-VkPhysicalDeviceExternalBufferInfo-None-09499**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must be a valid combination of `VkBufferUsageFlagBits` values.

- **VUID-VkPhysicalDeviceExternalBufferInfo-None-09500**
  If the `pNext` chain does not include a `VkBufferUsageFlags2CreateInfoKHR` structure, `usage` must not be 0.

### Valid Usage (Implicit)

- **VUID-VkPhysicalDeviceExternalBufferInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_BUFFER_INFO`.

- **VUID-VkPhysicalDeviceExternalBufferInfo-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkBufferUsageFlags2CreateInfoKHR`.

- **VUID-VkPhysicalDeviceExternalBufferInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPhysicalDeviceExternalBufferInfo-flags-parameter**
  `flags` must be a valid combination of `VkBufferCreateFlagBits` values.

- **VUID-VkPhysicalDeviceExternalBufferInfo-handleType-parameter**
  `handleType` must be a valid `VkExternalMemoryHandleTypeFlagBits` value.

The `VkExternalBufferProperties` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkExternalBufferProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalMemoryProperties externalMemoryProperties;
}VkExternalBufferProperties;
```
or the equivalent

```c
// Provided by VK_KHR_external_memory_capabilities
typedef VkExternalBufferProperties VkExternalBufferPropertiesKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `externalMemoryProperties` is a `VkExternalMemoryProperties` structure specifying various capabilities of the external handle type when used with the specified buffer creation parameters.

### Valid Usage (Implicit)

- VUID-VkExternalBufferProperties-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_EXTERNAL_BUFFER_PROPERTIES`

- VUID-VkExternalBufferProperties-pNext-pNext
  - `pNext` must be `NULL`

## 50.3. Optional Semaphore Capabilities

Semaphores may support import and export of their payload to external handles. To query the external handle types supported by semaphores, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalSemaphoreProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties* pExternalSemaphoreProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_external_semaphore_capabilities
void vkGetPhysicalDeviceExternalSemaphorePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalSemaphoreInfo* pExternalSemaphoreInfo,
    VkExternalSemaphoreProperties* pExternalSemaphoreProperties);
```

- `physicalDevice` is the physical device from which to query the semaphore capabilities.
- `pExternalSemaphoreInfo` is a pointer to a `VkPhysicalDeviceExternalSemaphoreInfo` structure describing the parameters that would be consumed by `vkCreateSemaphore`.
- `pExternalSemaphoreProperties` is a pointer to a `VkExternalSemaphoreProperties` structure in which capabilities are returned.
Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreInfo-parameter
  pExternalSemaphoreInfo must be a valid pointer to a valid VkPhysicalDeviceExternalSemaphoreInfo structure

- VUID-vkGetPhysicalDeviceExternalSemaphoreProperties-pExternalSemaphoreProperties-parameter
  pExternalSemaphoreProperties must be a valid pointer to a valid VkExternalSemaphoreProperties structure

The VkPhysicalDeviceExternalSemaphoreInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalSemaphoreInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalSemaphoreHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalSemaphoreInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkPhysicalDeviceExternalSemaphoreInfo
VkPhysicalDeviceExternalSemaphoreInfoKHR;
```

- sType is a VkStructureType value identifying this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- handleType is a VkExternalSemaphoreHandleTypeFlagBits value specifying the external semaphore handle type for which capabilities will be returned.

Valid Usage (Implicit)

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_SEMAPHORE_INFO

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkSemaphoreTypeCreateInfo

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkPhysicalDeviceExternalSemaphoreInfo-handleType-parameter
**handleType** must be a valid *VkExternalSemaphoreHandleTypeFlagBits* value

Bits which may be set in *VkPhysicalDeviceExternalSemaphoreInfo::handleType*, specifying an external semaphore handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreHandleTypeFlagBits {
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT = 0x00000008,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT = 0x00000010,
    // Provided by VK_FUCHSIA_external_semaphore
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA = 0x00000080,

    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT_KHR = VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR = VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR = VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT_KHR = VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT,
    VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT_KHR = VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT,
} VkExternalSemaphoreHandleTypeFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreHandleTypeFlagBits
    VkExternalSemaphoreHandleTypeFlagBitsKHR;
```

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_FD_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the POSIX system calls *dup*, *dup2*, *close*, and the non-standard system call *dup3*. Additionally, it must be transportable over a socket using an *SCM_RIGHTS* control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the functions *DuplicateHandle*, *CloseHandle*, *CompareObjectHandles*, *GetHandleInformation*, and
SetHandleInformation. It owns a reference to the underlying synchronization primitive represented by its Vulkan semaphore object.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan semaphore object, and will therefore become invalid when all Vulkan semaphore objects associated with it are destroyed.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT** specifies an NT handle returned by `ID3D12Device::CreateSharedHandle` referring to a Direct3D 12 fence, or `ID3D11Device5::CreateFence` referring to a Direct3D 11 fence. It owns a reference to the underlying synchronization primitive associated with the Direct3D fence.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D11_FENCE_BIT** is an alias of **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_D3D12_FENCE_BIT** with the same meaning. It is provided for convenience and code clarity when interacting with D3D11 fences.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT** specifies a POSIX file descriptor handle to a Linux Sync File or Android Fence object. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type must accept any type of sync or fence FD supported by the native system they are running on.

- **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_ZIRCON_EVENT_BIT_FUCHSIA** specifies a handle to a Zircon event object. It can be used with any native API that accepts a Zircon event handle. Zircon event handles are created with `ZX_RIGHTS_BASIC` and `ZX_RIGHTS_SIGNAL` rights. Vulkan on Fuchsia uses only the `ZX_EVENT_SIGNALED` bit when signaling or waiting.

**Note**

Handles of type **VK_EXTERNAL_SEMAPHORE_HANDLE_TYPE_SYNC_FD_BIT** generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation’s discretion. Applications should only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.
Some external semaphore handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

**Table 92. External semaphore handle types compatibility**

<table>
<thead>
<tr>

// Provided by VK_VERSION_1_1

typedef VkFlags VkExternalSemaphoreHandleTypeFlags;

or the equivalent

// Provided by VK_KHR_external_semaphore_capabilities

typedef VkExternalSemaphoreHandleTypeFlags VkExternalSemaphoreHandleTypeFlagsKHR;

VkExternalSemaphoreHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalSemaphoreHandleTypeFlagBits.

The VkExternalSemaphoreProperties structure is defined as:

// Provided by VK_VERSION_1_1

typedef struct VkExternalSemaphoreProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalSemaphoreHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalSemaphoreHandleTypeFlags compatibleHandleTypes;
    VkExternalSemaphoreFeatureFlags externalSemaphoreFeatures;
} VkExternalSemaphoreProperties;

or the equivalent

// Provided by VK_KHR_external_semaphore_capabilities

typedef VkExternalSemaphoreProperties VkExternalSemaphorePropertiesKHR;
• **sType** is a `VkStructureType` value identifying this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **exportFromImportedHandleTypes** is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying which types of imported handle `handleType` can be exported from.

• **compatibleHandleTypes** is a bitmask of `VkExternalSemaphoreHandleTypeFlagBits` specifying handle types which can be specified at the same time as `handleType` when creating a semaphore.

• **externalSemaphoreFeatures** is a bitmask of `VkExternalSemaphoreFeatureFlagBits` describing the features of `handleType`.

If **handleType** is not supported by the implementation, then `VkExternalSemaphoreProperties::externalSemaphoreFeatures` will be set to zero.

### Valid Usage (Implicit)

• **VUID-VkExternalSemaphoreProperties-sType-sType**
  
  **sType** must be `VK_STRUCTURE_TYPE_EXTERNAL_SEMAPHORE_PROPERTIES`

• **VUID-VkExternalSemaphoreProperties-pNext-pNext**
  
  **pNext** must be **NULL**

Bits which **may** be set in `VkExternalSemaphoreProperties::externalSemaphoreFeatures`, specifying the features of an external semaphore handle type, are:

```cpp
// Provided by VK_VERSION_1_1
typedef enum VkExternalSemaphoreFeatureFlagBits {
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT = 0x00000002,

    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT_KHR =
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT_KHR =

    // Provided by VK_KHR_external_semaphore_capabilities
    VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT_KHR,
    VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT_KHR =
} VkExternalSemaphoreFeatureFlagBits;
```

or the equivalent

```cpp
// Provided by VK_KHR_external_semaphore_capabilities
typedef VkExternalSemaphoreFeatureFlagBits VkExternalSemaphoreFeatureFlagBitsKHR;
```

• **VK_EXTERNAL_SEMAPHORE_FEATURE_EXPORTABLE_BIT** specifies that handles of this type can be exported from Vulkan semaphore objects.

• **VK_EXTERNAL_SEMAPHORE_FEATURE_IMPORTABLE_BIT** specifies that handles of this type can be imported as Vulkan semaphore objects.
50.4. Optional Fence Capabilities

Fences may support import and export of their payload to external handles. To query the external handle types supported by fences, call:

```c
// Provided by VK_VERSION_1_1
void vkGetPhysicalDeviceExternalFenceProperties(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

or the equivalent command

```c
// Provided by VK_KHR_external_fence_capabilities
void vkGetPhysicalDeviceExternalFencePropertiesKHR(
    VkPhysicalDevice physicalDevice,
    const VkPhysicalDeviceExternalFenceInfo* pExternalFenceInfo,
    VkExternalFenceProperties* pExternalFenceProperties);
```

- `physicalDevice` is the physical device from which to query the fence capabilities.
- `pExternalFenceInfo` is a pointer to a `VkPhysicalDeviceExternalFenceInfo` structure describing the parameters that would be consumed by `vkCreateFence`.
- `pExternalFenceProperties` is a pointer to a `VkExternalFenceProperties` structure in which capabilities are returned.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceExternalFenceProperties-physicalDevice-parameter `physicalDevice` must be a valid `VkPhysicalDevice` handle
- VUID-vkGetPhysicalDeviceExternalFenceProperties-pExternalFenceInfo-parameter `pExternalFenceInfo` must be a valid pointer to a valid `VkPhysicalDeviceExternalFenceInfo` structure
The `VkPhysicalDeviceExternalFenceInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPhysicalDeviceExternalFenceInfo {
    VkStructureType sType;
    const void* pNext;
    VkExternalFenceHandleTypeFlagBits handleType;
} VkPhysicalDeviceExternalFenceInfo;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities
typedef VkPhysicalDeviceExternalFenceInfo VkPhysicalDeviceExternalFenceInfoKHR;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `handleType` is a `VkExternalFenceHandleTypeFlagBits` value specifying an external fence handle type for which capabilities will be returned.

**Note**
Handles of type `VK_EXTERNAL_FENCE_HANDLE_TYPE_SYNC_FD_BIT` generated by the implementation may represent either Linux Sync Files or Android Fences at the implementation's discretion. Applications **should** only use operations defined for both types of file descriptors, unless they know via means external to Vulkan the type of the file descriptor, or are prepared to deal with the system-defined operation failures resulting from using the wrong type.

**Valid Usage (Implicit)**

- `VUID-VkPhysicalDeviceExternalFenceInfo-sType-sType` `sType` **must** be `VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_EXTERNAL_FENCE_INFO`
- `VUID-VkPhysicalDeviceExternalFenceInfo-pNext-pNext` `pNext` **must** be `NULL`
- `VUID-VkPhysicalDeviceExternalFenceInfo-handleType-parameter` `handleType` **must** be a valid `VkExternalFenceHandleTypeFlagBits` value

Bits which **may** be set in

- `VkPhysicalDeviceExternalFenceInfo::handleType`
• **VkExternalFenceProperties::exportFromImportedHandleTypes**

• **VkExternalFenceProperties::compatibleHandleTypes**

indicate external fence handle types, and are:

```c
typedef enum VkExternalFenceHandleTypeFlagBits {
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_fd_BIT = 0x00000001,
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_BIT = 0x00000002,
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT = 0x00000004,
    VK_EXTERNAL_fence_HANDLE_TYPE_SYNC_fd_BIT = 0x00000008,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_fd_BIT_KHR = VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_fd_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_BIT_KHR = VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT_KHR = VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT,
    // Provided by VK_KHR_external_fence_capabilities
    VK_EXTERNAL_fence_HANDLE_TYPE_SYNC_fd_BIT_KHR = VK_EXTERNAL_fence_HANDLE_TYPE_SYNC_fd_BIT,
} VkExternalFenceHandleTypeFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlagBits VkExternalFenceHandleTypeFlagBitsKHR;
```

• **VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_fd_BIT** specifies a POSIX file descriptor handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the POSIX system calls `dup`, `dup2`, `close`, and the non-standard system call `dup3`. Additionally, it must be transportable over a socket using an `SCM_RIGHTS` control message. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.

• **VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_BIT** specifies an NT handle that has only limited valid usage outside of Vulkan and other compatible APIs. It must be compatible with the functions `DuplicateHandle`, `CloseHandle`, `CompareObjectHandles`, `GetHandleInformation`, and `SetHandleInformation`. It owns a reference to the underlying synchronization primitive represented by its Vulkan fence object.

• **VK_EXTERNAL_fence_HANDLE_TYPE_OPAQUE_WIN32_KMT_BIT** specifies a global share handle that has only limited valid usage outside of Vulkan and other compatible APIs. It is not compatible with any native APIs. It does not own a reference to the underlying synchronization primitive represented by its Vulkan fence object, and will therefore become invalid when all Vulkan fence objects associated with it are destroyed.

• **VK_EXTERNAL_fence_HANDLE_TYPE_SYNC_fd_BIT** specifies a POSIX file descriptor handle to a Linux
Sync File or Android Fence. It can be used with any native API accepting a valid sync file or fence as input. It owns a reference to the underlying synchronization primitive associated with the file descriptor. Implementations which support importing this handle type **must** accept any type of sync or fence FD supported by the native system they are running on.
Some external fence handle types can only be shared within the same underlying physical device and/or the same driver version, as defined in the following table:

<table>
<thead>
<tr>
<th>Handle type</th>

// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceHandleTypeFlags;

or the equivalent

// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceHandleTypeFlags VkExternalFenceHandleTypeFlagsKHR;

VkExternalFenceHandleTypeFlags is a bitmask type for setting a mask of zero or more VkExternalFenceHandleTypeFlagBits.

The VkExternalFenceProperties structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VKExternalFenceProperties {
    VkStructureType sType;
    void* pNext;
    VkExternalFenceHandleTypeFlags exportFromImportedHandleTypes;
    VkExternalFenceHandleTypeFlags compatibleHandleTypes;
    VkExternalFenceFeatureFlags externalFenceFeatures;
} VkExternalFenceProperties;

or the equivalent

// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceProperties VkExternalFencePropertiesKHR;

- exportFromImportedHandleTypes is a bitmask of VkExternalFenceHandleTypeFlagBits indicating which types of imported handle handleType can be exported from.
• compatibleHandleTypes is a bitmask of VkExternalFenceHandleTypeFlagBits specifying handle types which can be specified at the same time as handleType when creating a fence.

• externalFenceFeatures is a bitmask of VkExternalFenceFeatureFlagBits indicating the features of handleType.

If handleType is not supported by the implementation, then VkExternalFenceProperties::externalFenceFeatures will be set to zero.

Valid Usage (Implicit)

• VUID-VkExternalFenceProperties-sType-sType
  sType must be VK_STRUCTURE_TYPE_EXTERNAL_FENCE_PROPERTIES

• VUID-VkExternalFenceProperties-pNext-pNext
  pNext must be NULL

Bits which may be set in VkExternalFenceProperties::externalFenceFeatures, indicating features of a fence external handle type, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkExternalFenceFeatureFlagBits {
    VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT = 0x00000001,
    VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT = 0x00000002,
} VkExternalFenceFeatureFlagBits;
```

or the equivalent

```c
// Provided by VK_KHR_external_fence_capabilities
typedef VkExternalFenceFeatureFlagBits VkExternalFenceFeatureFlagBitsKHR;
```

• VK_EXTERNAL_FENCE_FEATURE_EXPORTABLE_BIT specifies handles of this type can be exported from Vulkan fence objects.

• VK_EXTERNAL_FENCE_FEATURE_IMPORTABLE_BIT specifies handles of this type can be imported to Vulkan fence objects.

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkExternalFenceFeatureFlags;
```

or the equivalent

4184
VkExternalFenceFeatureFlags is a bitmask type for setting a mask of zero or more VkExternalFenceFeatureFlagBits.

50.5. Timestamp Calibration Capabilities

To query the set of time domains for which a physical device supports timestamp calibration, call:

```c
// Provided by VK_KHR_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pTimeDomainCount,
    VkTimeDomainKHR* pTimeDomains);
```

or the equivalent command

```c
// Provided by VK_EXT_calibrated_timestamps
VkResult vkGetPhysicalDeviceCalibrateableTimeDomainsEXT(
    VkPhysicalDevice physicalDevice,
    uint32_t* pTimeDomainCount,
    VkTimeDomainKHR* pTimeDomains);
```

- `physicalDevice` is the physical device from which to query the set of calibrateable time domains.
- `pTimeDomainCount` is a pointer to an integer related to the number of calibrateable time domains available or queried, as described below.
- `pTimeDomains` is either `NULL` or a pointer to an array of VkTimeDomainKHR values, indicating the supported calibrateable time domains.

If `pTimeDomains` is `NULL`, then the number of calibrateable time domains supported for the given `physicalDevice` is returned in `pTimeDomainCount`. Otherwise, `pTimeDomainCount` must point to a variable set by the application to the number of elements in the `pTimeDomains` array, and on return the variable is overwritten with the number of values actually written to `pTimeDomains`. If the value of `pTimeDomainCount` is less than the number of calibrateable time domains supported, at most `pTimeDomainCount` values will be written to `pTimeDomains`, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available time domains were returned.

Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-physicalDevice-parameter `physicalDevice` must be a valid VkPhysicalDevice handle
- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomainCount-parameter
pTimeDomainCount must be a valid pointer to a uint32_t value

- VUID-vkGetPhysicalDeviceCalibrateableTimeDomainsKHR-pTimeDomains-parameter
  If the value referenced by pTimeDomainCount is not 0, and pTimeDomains is not NULL, pTimeDomains must be a valid pointer to an array of pTimeDomainCount VkTimeDomainKHR values

## Return Codes

**Success**

- VK_SUCCESS
- VK_INCOMPLETE

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
Chapter 51. Debugging

To aid developers in tracking down errors in the application’s use of Vulkan, particularly in combination with an external debugger or profiler, debugging extensions may be available.

The `VkObjectType` enumeration defines values, each of which corresponds to a specific Vulkan handle type. These values can be used to associate debug information with a particular type of object through one or more extensions.

```c
// Provided by VK_VERSION_1_0
typedef enum VkObjectType {
    VK_OBJECT_TYPE_UNKNOWN = 0,
    VK_OBJECT_TYPE_INSTANCE = 1,
    VK_OBJECT_TYPE_PHYSICAL_DEVICE = 2,
    VK_OBJECT_TYPE_DEVICE = 3,
    VK_OBJECT_TYPE_QUEUE = 4,
    VK_OBJECT_TYPE_SEMAPHORE = 5,
    VK_OBJECT_TYPE_COMMAND_BUFFER = 6,
    VK_OBJECT_TYPE_FENCE = 7,
    VK_OBJECT_TYPE_DEVICE_MEMORY = 8,
    VK_OBJECT_TYPE_BUFFER = 9,
    VK_OBJECT_TYPE_IMAGE = 10,
    VK_OBJECT_TYPE_IMAGE_VIEW = 11,
    VK_OBJECT_TYPE_QUERY_POOL = 12,
    VK_OBJECT_TYPE_TRANSLATION_TABLE = 13,
    VK_OBJECT_TYPE_SHADER_STAGE_PIPELINE_NAMESPACE_KHR = 14,
    VK_OBJECT_TYPE_SHADER_MODULE = 15,
    VK_OBJECT_TYPE_PIPELINE_CACHE = 16,
    VK_OBJECT_TYPE_PIPELINE_LAYOUT = 17,
    VK_OBJECT_TYPE_RENDER_PASS = 18,
    VK_OBJECT_TYPE_PIPELINE = 19,
    VK_OBJECT_TYPE_DESCRIPTOR_SET_LAYOUT = 20,
    VK_OBJECT_TYPE_SAMPLER = 21,
    VK_OBJECT_TYPE_DESCRIPTOR_POOL = 22,
    VK_OBJECT_TYPE_DESCRIPTOR_SET = 23,
    VK_OBJECT_TYPE_FRAMEBUFFER = 24,
    VK_OBJECT_TYPE_COMMAND_POOL = 25,
    // Provided by VK_VERSION_1_1
    VK_OBJECT_TYPE_PIPELINE_LAYOUT_CREATE_INFO = 1000028000,
    // Provided by VK_KHR_surface
    VK_OBJECT_TYPE_SURFACE_KHR = 1000000000,
    // Provided by VK_KHR_swapchain
    VK_OBJECT_TYPE_SWAPCHAIN_KHR = 1000001000,
    // Provided by VK_KHR_display
    VK_OBJECT_TYPE_DISPLAY_KHR = 1000002000,
} VkObjectType;
```

If this Specification was generated with any such extensions included, they will be described in the remainder of this chapter.

51.1. Debug Utilities

Vulkan provides flexible debugging utilities for debugging an application.

The Object Debug Annotation section describes how to associate either a name or binary data with a specific Vulkan object.

The Queue Labels section describes how to annotate and group the work submitted to a queue.

The Command Buffer Labels section describes how to associate logical elements of the scene with commands in a VkCommandBuffer.

The Debug Messengers section describes how to create debug messenger objects associated with an application supplied callback to capture debug messages from a variety of Vulkan components.

51.1.1. Object Debug Annotation

It can be useful for an application to provide its own content relative to a specific Vulkan object.

The following commands allow application developers to associate application-defined information with Vulkan objects. These commands are device-level commands but they may reference instance-
level objects (such as `VkInstance`) and physical device-level objects (such as `VkPhysicalDevice`) with a few restrictions: * The data for the corresponding object may still be available after the `VkDevice` used in the corresponding API call to set it is destroyed, but access to this data is not guaranteed and should be avoided. * Subsequent calls to change the data of the same object across multiple `VkDevice` objects, may result in the data being changed to the most recent version for all `VkDevice` objects and not just the `VkDevice` used in the most recent API call.

**Object Naming**

An object can be given an application-defined name by calling:

```c
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectNameEXT(
    VkDevice device,
    const VkDebugUtilsObjectNameInfoEXT* pNameInfo);
```

- `device` is the device that is associated with the named object passed in via `objectHandle`.
- `pNameInfo` is a pointer to a `VkDebugUtilsObjectNameInfoEXT` structure specifying parameters of the name to set on the object.

**Valid Usage**

- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02587 `pNameInfo->objectType` must not be `VK_OBJECT_TYPE_UNKNOWN`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-02588 `pNameInfo->objectHandle` must not be `VK_NULL_HANDLE`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07872 If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the `VkDevice` identified by `device` must be a descendant of the same `VkInstance` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07873 If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the `VkDevice` identified by `device` must be a descendant of the same `VkPhysicalDevice` as the object identified by `pNameInfo->objectHandle`
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-07874 If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object must be a descendant of the `VkDevice` identified by `device`

**Valid Usage (Implicit)**

- VUID-vkSetDebugUtilsObjectNameEXT-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkSetDebugUtilsObjectNameEXT-pNameInfo-parameter `pNameInfo` must be a valid pointer to a valid `VkDebugUtilsObjectNameInfoEXT` structure
Host Synchronization

• Host access to `pNameInfo->objectHandle` must be externally synchronized

Return Codes

Success
• `VK_SUCCESS`

Failure
• `VK_ERROR_OUT_OF_HOST_MEMORY`
• `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectNameInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectNameInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkObjectType objectType;
    uint64_t objectHandle;
    const char* pObjectName;
} VkDebugUtilsObjectNameInfoEXT;
```

• `sType` is a `VkStructureType` value identifying this structure.
• `pNext` is NULL or a pointer to a structure extending this structure.
• `objectType` is a `VkObjectType` specifying the type of the object to be named.
• `objectHandle` is the object to be named.
• `pObjectName` is either NULL or a null-terminated UTF-8 string specifying the name to apply to `objectHandle`.

Applications may change the name associated with an object simply by calling `vkSetDebugUtilsObjectNameEXT` again with a new string. If `pObjectName` is either NULL or an empty string, then any previously set name is removed.

The `graphicsPipelineLibrary` feature allows the specification of pipelines without the creation of `VkShaderModule` objects beforehand. In order to continue to allow naming these shaders independently, `VkDebugUtilsObjectNameInfoEXT` can be included in the `pNext` chain of `VkPipelineShaderStageCreateInfo`, which associates a static name with that particular shader.

Valid Usage

• VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02589
If `objectType` is `VK_OBJECT_TYPE_UNKNOWN`, `objectHandle` must not be `VK_NULL_HANDLE`.

- **VUID-VkDebugUtilsObjectNameInfoEXT-objectType-02590**
  If `objectType` is not `VK_OBJECT_TYPE_UNKNOWN`, `objectHandle` must be `VK_NULL_HANDLE` or a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType and Vulkan Handle Relationship` table.

## Valid Usage (Implicit)

- **VUID-VkDebugUtilsObjectNameInfoEXT-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_NAME_INFO_EXT`

- **VUID-VkDebugUtilsObjectNameInfoEXT-objectType-parameter**
  `objectType` must be a valid `VkObjectType` value.

- **VUID-VkDebugUtilsObjectNameInfoEXT-pObjectName-parameter**
  If `pObjectName` is not NULL, `pObjectName` must be a null-terminated UTF-8 string.

### Object Data Association

In addition to setting a name for an object, debugging and validation layers may have uses for additional binary data on a per-object basis that have no other place in the Vulkan API.

For example, a `VkShaderModule` could have additional debugging data attached to it to aid in offline shader tracing.

Additional data can be attached to an object by calling `vkSetDebugUtilsObjectTagEXT` as defined below.

```c
// Provided by VK_EXT_debug_utils
VkResult vkSetDebugUtilsObjectTagEXT(
    VkDevice device,
    const VkDebugUtilsObjectTagInfoEXT* pTagInfo);
```

- **device** is the device that created the object.

- **pTagInfo** is a pointer to a `VkDebugUtilsObjectTagInfoEXT` structure specifying parameters of the tag to attach to the object.

### Valid Usage

- **VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07875**
  If `pNameInfo->objectHandle` is the valid handle of an instance-level object, the `VkDevice` identified by `device` must be a descendent of the same `VkInstance` as the object identified by `pNameInfo->objectHandle`.

- **VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07876**
  If `pNameInfo->objectHandle` is the valid handle of a physical-device-level object, the `VkDevice` identified by `device` must be a descendent of the same `VkPhysicalDevice` as the
object identified by `pNameInfo->objectHandle`

- VUID-vkSetDebugUtilsObjectTagEXT-pNameInfo-07877
  If `pNameInfo->objectHandle` is the valid handle of a device-level object, that object must be a descendent of the `VkDevice` identified by `device`.

### Valid Usage (Implicit)

- VUID-vkSetDebugUtilsObjectTagEXT-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkSetDebugUtilsObjectTagEXT-pTagInfo-parameter
  `pTagInfo` must be a valid pointer to a valid `VkDebugUtilsObjectTagInfoEXT` structure.

### Host Synchronization

- Host access to `pTagInfo->objectHandle` must be externally synchronized.

### Return Codes

#### Success

- `VK_SUCCESS`

#### Failure

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkDebugUtilsObjectTagInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsObjectTagInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkObjectType objectType;
    uint64_t objectHandle;
    uint64_t tagName;
    size_t tagSize;
    const void* pTag;
} VkDebugUtilsObjectTagInfoEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `objectType` is a `VkObjectType` specifying the type of the object to be named.
• `objectHandle` is the object to be tagged.
• `tagName` is a numerical identifier of the tag.
• `tagSize` is the number of bytes of data to attach to the object.
• `pTag` is a pointer to an array of `tagSize` bytes containing the data to be associated with the object.

The `tagName` parameter gives a name or identifier to the type of data being tagged. This can be used by debugging layers to easily filter for only data that can be used by that implementation.

**Valid Usage**

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-01908
  
  `objectType` must not be `VK_OBJECT_TYPE_UNKNOWN`

- VUID-VkDebugUtilsObjectTagInfoEXT-objectHandle-01910
  
  `objectHandle` must be a valid Vulkan handle of the type associated with `objectType` as defined in the `VkObjectType` and `Vulkan Handle Relationship` table

**Valid Usage (Implicit)**

- VUID-VkDebugUtilsObjectTagInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEBUG_UTILS_OBJECT_TAG_INFO_EXT`

- VUID-VkDebugUtilsObjectTagInfoEXT-pNext-pNext
  
  `pNext` must be `NULL`

- VUID-VkDebugUtilsObjectTagInfoEXT-objectType-parameter
  
  `objectType` must be a valid `VkObjectType` value

- VUID-VkDebugUtilsObjectTagInfoEXT-pTag-parameter
  
  `pTag` must be a valid pointer to an array of `tagSize` bytes

- VUID-VkDebugUtilsObjectTagInfoEXT-tagSize-arraylength
  
  `tagSize` must be greater than `0`

**51.1.2. Queue Labels**

All Vulkan work must be submitted using queues. It is possible for an application to use multiple queues, each containing multiple command buffers, when performing work. It can be useful to identify which queue, or even where in a queue, something has occurred.

To begin identifying a region using a debug label inside a queue, you may use the `vkQueueBeginDebugUtilsLabelEXT` command.

Then, when the region of interest has passed, you may end the label region using `vkQueueEndDebugUtilsLabelEXT`.

Additionally, a single debug label may be inserted at any time using `vkQueueInsertDebugUtilsLabelEXT`.
A queue debug label region is opened by calling:

```c
// Provided by VK_EXT_debug_utils
void vkQueueBeginDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `queue` is the queue in which to start a debug label region.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label region to open.

### Valid Usage (Implicit)

- `VUID-vkQueueBeginDebugUtilsLabelEXT-queue-parameter`  
  `queue` must be a valid `VkQueue` handle

- `VUID-vkQueueBeginDebugUtilsLabelEXT-pLabelInfo-parameter`  
  `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

The `VkDebugUtilsLabelEXT` structure is defined as:

```c
// Provided by VK_EXT_debug_utils
typedef struct VkDebugUtilsLabelEXT {
    VkStructureType sType;
    const void* pNext;
    const char* pLabelName;
    float color[4];
} VkDebugUtilsLabelEXT;
```

- `sType` is a `VkStructureType` value identifying this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pLabelName` is a pointer to a null-terminated UTF-8 string containing the name of the label.
- `color` is an optional RGBA color value that can be associated with the label. A particular implementation may choose to ignore this color value. The values contain RGBA values in order, in the range 0.0 to 1.0. If all elements in `color` are set to 0.0 then it is ignored.
Valid Usage (Implicit)

- VUID-VkDebugUtilsLabelEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_DEBUG_UTILS_LABEL_EXT

- VUID-VkDebugUtilsLabelEXT-pNext-pNext
  pNext must be NULL

- VUID-VkDebugUtilsLabelEXT-pLabelName-parameter
  pLabelName must be a null-terminated UTF-8 string

A queue debug label region is closed by calling:

```c
// Provided by VK_EXT_debug_utils
void vkQueueEndDebugUtilsLabelEXT(
  VkQueue queue);
```

- `queue` is the queue in which a debug label region should be closed.

The calls to `vkQueueBeginDebugUtilsLabelEXT` and `vkQueueEndDebugUtilsLabelEXT` must be matched and balanced.

Valid Usage

- VUID-vkQueueEndDebugUtilsLabelEXT-None-01911
  There must be an outstanding `vkQueueBeginDebugUtilsLabelEXT` command prior to the `vkQueueEndDebugUtilsLabelEXT` on the queue

Valid Usage (Implicit)

- VUID-vkQueueEndDebugUtilsLabelEXT-queue-parameter
  queue must be a valid VkQueue handle

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>-</td>
<td>-</td>
<td>Any</td>
<td>-</td>
</tr>
</tbody>
</table>

A single label can be inserted into a queue by calling:
void vkQueueInsertDebugUtilsLabelEXT(
    VkQueue queue,
    const VkDebugUtilsLabelEXT* pLabelInfo);

- `queue` is the queue into which a debug label will be inserted.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label to insert.

**Valid Usage (Implicit)**

- VUID-vkQueueInsertDebugUtilsLabelEXT-queue-parameter
  `queue` must be a valid `VkQueue` handle
- VUID-vkQueueInsertDebugUtilsLabelEXT-pLabelInfo-parameter
  `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure

---

</table>

### 51.1.3. Command Buffer Labels

Typical Vulkan applications will submit many command buffers in each frame, with each command buffer containing a large number of individual commands. Being able to logically annotate regions of command buffers that belong together as well as hierarchically subdivide the frame is important to a developer’s ability to navigate the commands viewed holistically.

To identify the beginning of a debug label region in a command buffer, `vkCmdBeginDebugUtilsLabelEXT` can be used as defined below.

To indicate the end of a debug label region in a command buffer, `vkCmdEndDebugUtilsLabelEXT` can be used.

To insert a single command buffer debug label inside of a command buffer, `vkCmdInsertDebugUtilsLabelEXT` can be used as defined below.

A command buffer debug label region can be opened by calling:
// Provided by VK_EXT_debug_utils

```c
void vkCmdBeginDebugUtilsLabelEXT(
    VkCommandBuffer commandBuffer,
    const VkDebugUtilsLabelEXT* pLabelInfo);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `pLabelInfo` is a pointer to a `VkDebugUtilsLabelEXT` structure specifying parameters of the label region to open.

### Valid Usage (Implicit)

- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginDebugUtilsLabelEXT-pLabelInfo-parameter `pLabelInfo` must be a valid pointer to a valid `VkDebugUtilsLabelEXT` structure
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdBeginDebugUtilsLabelEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations
- VUID-vkCmdBeginDebugUtilsLabelEXT-videocoding This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>Action State</td>
</tr>
</tbody>
</table>

A command buffer label region can be closed by calling:
void vkCmdEndDebugUtilsLabelEXT(VkCommandBuffer commandBuffer);

- `commandBuffer` is the command buffer into which the command is recorded.

An application may open a debug label region in one command buffer and close it in another, or otherwise split debug label regions across multiple command buffers or multiple queue submissions. When viewed from the linear series of submissions to a single queue, the calls to `vkCmdBeginDebugUtilsLabelEXT` and `vkCmdEndDebugUtilsLabelEXT` must be matched and balanced.

There can be problems reporting command buffer debug labels during the recording process because command buffers may be recorded out of sequence with the resulting execution order. Since the recording order may be different, a solitary command buffer may have an inconsistent view of the debug label regions by itself. Therefore, if an issue occurs during the recording of a command buffer, and the environment requires returning debug labels, the implementation may return only those labels it is aware of. This is true even if the implementation is aware of only the debug labels within the command buffer being actively recorded.

**Valid Usage**

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01912
  There must be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command prior to the `vkCmdEndDebugUtilsLabelEXT` on the queue that `commandBuffer` is submitted to

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-01913
  If `commandBuffer` is a secondary command buffer, there must be an outstanding `vkCmdBeginDebugUtilsLabelEXT` command recorded to `commandBuffer` that has not previously been ended by a call to `vkCmdEndDebugUtilsLabelEXT`

**Valid Usage (Implicit)**

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdEndDebugUtilsLabelEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdEndDebugUtilsLabelEXT-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

A single debug label can be inserted into a command buffer by calling:

```c
// Provided by VK_EXT_debug_utils
def void vkCmdInsertDebugUtilsLabelEXT(VkCommandBuffer commandBuffer, const VkDebugUtilsLabelEXT* pLabelInfo);
```

- commandBuffer is the command buffer into which the command is recorded.
- pInfo is a pointer to a VkDebugUtilsLabelEXT structure specifying parameters of the label to insert.

Valid Usage (Implicit)

- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-parameter commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdInsertDebugUtilsLabelEXT-pLabelInfo-parameter pInfo must be a valid pointer to a valid VkDebugUtilsLabelEXT structure
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-recording commandBuffer must be in the recording state
- VUID-vkCmdInsertDebugUtilsLabelEXT-commandBuffer-cmdpool The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations
- VUID-vkCmdInsertDebugUtilsLabelEXT-videocoding This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>

51.1.4. Debug Messengers

Vulkan allows an application to register multiple callbacks with any Vulkan component wishing to report debug information. Some callbacks may log the information to a file, others may cause a debug break point or other application-defined behavior. A primary producer of callback messages are the validation layers. An application can register callbacks even when no validation layers are enabled, but they will only be called for the Vulkan loader and, if implemented, other layer and driver events.

A `VkDebugUtilsMessengerEXT` is a messenger object which handles passing along debug messages to a provided debug callback.

```c
// Provided by VK_EXT_debug_utils
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDebugUtilsMessengerEXT)
```

The debug messenger will provide detailed feedback on the application’s use of Vulkan when events of interest occur. When an event of interest does occur, the debug messenger will submit a debug message to the debug callback that was provided during its creation. Additionally, the debug messenger is responsible with filtering out debug messages that the callback is not interested in and will only provide desired debug messages.

A debug messenger triggers a debug callback with a debug message when an event of interest occurs. To create a debug messenger which will trigger a debug callback, call:

```c
// Provided by VK_EXT_debug_utils
VkResult vkCreateDebugUtilsMessengerEXT(  
    VkInstance instance,  
    const VkDebugUtilsMessengerCreateInfoEXT* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkDebugUtilsMessengerEXT* pMessenger);
```
• **instance** is the instance the messenger will be used with.

• **pCreateInfo** is a pointer to a `VkDebugUtilsMessengerCreateInfoEXT` structure containing the callback pointer, as well as defining conditions under which this messenger will trigger the callback.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

• **pMessenger** is a pointer to a `VkDebugUtilsMessengerEXT` handle in which the created object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDebugUtilsMessengerEXT-instance-parameter
  
  **instance** must be a valid `VkInstance` handle

- VUID-vkCreateDebugUtilsMessengerEXT-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid `VkDebugUtilsMessengerCreateInfoEXT` structure

- VUID-vkCreateDebugUtilsMessengerEXT-pAllocator-parameter
  
  If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDebugUtilsMessengerEXT-pMessenger-parameter
  
  **pMessenger** must be a valid pointer to a `VkDebugUtilsMessengerEXT` handle

### Return Codes

**Success**

- **VK_SUCCESS**

**Failure**

- **VK_ERROR_OUT_OF_HOST_MEMORY**
