image as a **DPB Video Picture Resource**, representing a **reference picture**. If an implementation requires separate allocations for DPB and decode output, indicating this by returning **VK_ERROR_FORMAT_NOT_SUPPORTED** to any **vkGetPhysicalDeviceVideoFormatPropertiesKHR** call with both **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** and **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** usage bits, then **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** must not be combined with any other **VK_IMAGE_USAGE_*** flags. Otherwise, **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR** must be combined with **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**, if the DPB image is required to coincide with the decoded output picture. In the case where DPB coincides with the decoded output picture, image resources **can** be used as **reference pictures** only after acting as targets for video decode operations, where its image view **must** be set to both **VkVideoDecodeInfoKHR::pSetupReferenceSlot->pPictureResource->imageViewBinding** and **VkVideoDecodeInfoKHR::dstPictureResource.imageViewBinding**.

- **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR** specifies that the image **can** be used as an **input picture** for **video encode operations**.
- **VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR** is reserved for future use.
- **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR** specifies that **video encode operations** **can** use the image as an output to hold a **reconstructed picture** that **can** subsequently act as an input **reference picture**.
- **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** specifies that the image **can** be transitioned to the **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** layout to be used as a color or depth/stencil attachment in a **VkFramebuffer** and/or as a read-only input resource in a shader (sampled image, combined image sampler or input attachment) in the same render pass.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageUsageFlags;
```

**VkImageUsageFlags** is a bitmask type for setting a mask of zero or more **VkImageUsageFlagBits**.

When creating a **VkImageView** one of the following **VkImageUsageFlagBits** **must** be set:

- **VK_IMAGE_USAGE_SAMPLED_BIT**
- **VK_IMAGE_USAGE_STORAGE_BIT**
- **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT**
- **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**
- **VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT**
- **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR**
- **VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR**
• VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM
• VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM

Bits which can be set in VkImageCreateInfo::flags, specifying additional parameters of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageCreateFlagBits {
    VK_IMAGE_CREATE_SPARSE_BINDING_BIT = 0x00000001,
    VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT = 0x00000002,
    VK_IMAGE_CREATE_SPARSE_ALIASED_BIT = 0x00000004,
    VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT = 0x00000008,
    VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT = 0x00000010,
// Provided by VK_VERSION_1_1
    VK_IMAGE_CREATE_ALIAS_BIT = 0x00000400,
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT = 0x00000040,
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT = 0x00000020,
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT = 0x00000080,
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT = 0x00000100,
    VK_IMAGE_CREATE_PROTECTED_BIT = 0x00000800,
    VK_IMAGE_CREATE_DISJOINT_BIT = 0x00000200,
// Provided by VK_NV_corner_sampled_image
    VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV = 0x00002000,
// Provided by VK_EXT_sample_locations
    VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT = 0x00001000,
// Provided by VK_EXT_fragment_density_map
    VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT = 0x00004000,
// Provided by VK_EXT_multisampled_render_to_single_sampled
    VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT = 0x00040000,
// Provided by VK_EXT_image_2d_view_of_3d
    VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT = 0x00002000,
// Provided by VK_QCOM_fragment_density_map_offset
    VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM = 0x00008000,
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
    VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT_KHR = VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT,
// Provided by VK_KHR_maintenance1
    VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT,
// Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT_KHR = VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT,
// Provided by VK_KHR_maintenance2
    VK_IMAGE_CREATE_EXTENDED_USAGE_BIT_KHR = VK_IMAGE_CREATE_EXTENDED_USAGE_BIT,
};
```

• **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** specifies that the image will be backed using sparse memory binding.

• **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** specifies that the image can be partially backed using sparse memory binding. Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_SPARSE_ALIASED_BIT** specifies that the image will be backed using sparse memory binding with memory ranges that might also simultaneously be backing another image (or another portion of the same image). Images created with this flag must also be created with the **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** flag.

• **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that the image can be used to create a `VkImageView` with a different format from the image. For multi-planar formats, **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** specifies that a `VkImageView` can be created of a plane of the image.

• **VK_IMAGE_CREATE_CUBES_COMPATIBLE_BIT** specifies that the image can be used to create a `VkImageView` of type `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`.

• **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT** specifies that the image can be used to create a `VkImageView` of type `VK_IMAGE_VIEW_TYPE_2D` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

• **VK_IMAGE_CREATE_PROTECTED_BIT** specifies that the image is a protected image.

• **VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT** specifies that the image can be used with a non-zero value of the `splitInstanceBindRegionCount` member of a `VkBindImageMemoryDeviceGroupInfo` structure passed into `vkBindImageMemory2`. This flag also has the effect of making the image use the standard sparse image block dimensions.

• **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** specifies that the image having a compressed format can be used to create a `VkImageView` with an uncompressed format where each texel in the image view corresponds to a compressed texel block of the image.

• **VK_IMAGE_CREATE_EXTENDED_USAGE_BIT** specifies that the image can be created with usage flags that are not supported for the format the image is created with but are supported for at least one format a `VkImageView` created from the image can have.

• **VK_IMAGE_CREATE_DISJOINT_BIT** specifies that an image with a multi-planar format must have each plane separately bound to memory, rather than having a single memory binding for the whole image; the presence of this bit distinguishes a disjoint image from an image without this bit set.

• **VK_IMAGE_CREATE_ALIAS_BIT** specifies that two images created with the same creation parameters and aliased to the same memory can interpret the contents of the memory consistently with each other, subject to the rules described in the Memory Aliasing section. This flag further specifies that each plane of a disjoint image can share an in-memory non-linear representation with single-plane images, and that a single-plane image can share an in-memory non-linear
representation with a plane of a multi-planar disjoint image, according to the rules in Compatible formats of planes of multi-planar formats. If the pNext chain includes a VkExternalMemoryImageCreateInfo or VkExternalMemoryImageCreateInfoNV structure whose handleTypes member is not 0, it is as if VK_IMAGE_CREATE_ALIAS_BIT is set.

- VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT specifies that an image with a depth or depth/stencil format can be used with custom sample locations when used as a depth/stencil attachment.

- VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV specifies that the image is a corner-sampled image.

- VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT specifies that an image can be in a subsampled format which may be more optimal when written as an attachment by a render pass that has a fragment density map attachment. Accessing a subsampled image has additional considerations:
  - Image data read as an image sampler will have undefined values if the sampler was not created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or was not sampled through the use of a combined image sampler with an immutable sampler in VkDescriptorSetLayoutBinding.
  - Image data read with an input attachment will have undefined values if the contents were not written as an attachment in an earlier subpass of the same render pass.
  - Image data read as an image sampler in the fragment shader will be additionally be read by the device during VK_PIPELINE_STAGE_VERTEX_SHADER_BIT if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledCoarseReconstructionEarlyAccess is VK_TRUE and the sampler was created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT.
  - Image data read with load operations are resampled to the fragment density of the render pass if VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::subsampledLoads is VK_TRUE. Otherwise, values of image data are undefined.
  - Image contents outside of the render area take on undefined values if the image is stored as a render pass attachment.

- VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM specifies that an image can be used in a render pass with non-zero fragment density map offsets. In a renderpass with non-zero offsets, fragment density map attachments, input attachments, color attachments, depth/stencil attachment, resolve attachments, and preserve attachments must be created with VK_IMAGE_CREATE_FRAGMENT_DENSITY_MAP_OFFSET_BIT_QCOM.

- VK_IMAGE_CREATE_MULTISAMPLED_RENDER_TO_SINGLE_SAMPLED_BIT_EXT specifies that an image can be used with multisampled rendering as a single-sampled framebuffer attachment

See Sparse Resource Features and Sparse Physical Device Features for more details.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageCreateFlags;
```

VkImageCreateFlags is a bitmask type for setting a mask of zero or more VkImageCreateFlagBits.
Possible values of `VkImageCreateInfo::imageType`, specifying the basic dimensionality of an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageType {
    VK_IMAGE_TYPE_1D = 0,
    VK_IMAGE_TYPE_2D = 1,
    VK_IMAGE_TYPE_3D = 2,
} VkImageType;
```

- `VK_IMAGE_TYPE_1D` specifies a one-dimensional image.
- `VK_IMAGE_TYPE_2D` specifies a two-dimensional image.
- `VK_IMAGE_TYPE_3D` specifies a three-dimensional image.

Possible values of `VkImageCreateInfo::tiling`, specifying the tiling arrangement of texel blocks in an image, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageTiling {
    VK_IMAGE_TILING_OPTIMAL = 0,
    VK_IMAGE_TILING_LINEAR = 1,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT = 1000158000,
} VkImageTiling;
```

- `VK_IMAGE_TILING_OPTIMAL` specifies optimal tiling (texels are laid out in an implementation-dependent arrangement, for more efficient memory access).
- `VK_IMAGE_TILING_LINEAR` specifies linear tiling (texels are laid out in memory in row-major order, possibly with some padding on each row).
- `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` indicates that the image's tiling is defined by a Linux DRM format modifier. The modifier is specified at image creation with `VkImageDrmFormatModifierListCreateInfoEXT` or `VkImageDrmFormatModifierExplicitCreateInfoEXT`, and can be queried with `vkGetImageDrmFormatModifierPropertiesEXT`.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageSubresourceLayout(
    VkDevice device,
    VkImage image,
    const VkImageSubresource* pSubresource,
    VkSubresourceLayout* pLayout);
```

- `device` is the logical device that owns the image.
• **image** is the image whose layout is being queried.

• **pSubresource** is a pointer to a `VkImageSubresource` structure selecting a specific image subresource from the image.

• **pLayout** is a pointer to a `VkSubresourceLayout` structure in which the layout is returned.

If the image is linear, then the returned layout is valid for host access.

If the image's tiling is `VK_IMAGE_TILING_LINEAR` and its format is a multi-planar format, then `vkGetImageSubresourceLayout` describes one *format plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `vkGetImageSubresourceLayout` describes one *memory plane* of the image. If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT` and the image is non-linear, then the returned layout has an implementation-dependent meaning; the vendor of the image’s DRM format modifier may provide documentation that explains how to interpret the returned layout.

`vkGetImageSubresourceLayout` is invariant for the lifetime of a single image. However, the subresource layout of images in Android hardware buffer external memory is not known until the image has been bound to memory, so applications must not call `vkGetImageSubresourceLayout` for such an image before it has been bound.

---

### Valid Usage

- **VUID-vkGetImageSubresourceLayout-image-02270**
  image **must** have been created with tiling equal to `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`

- **VUID-vkGetImageSubresourceLayout-aspectMask-00997**
  The `aspectMask` member of **pSubresource** **must** only have a single bit set

- **VUID-vkGetImageSubresourceLayout-mipLevel-01716**
  The `mipLevel` member of **pSubresource** **must** be less than the `mipLevels` specified in `VkImageCreateInfo` when image was created

- **VUID-vkGetImageSubresourceLayout-arrayLayer-01717**
  The `arrayLayer` member of **pSubresource** **must** be less than the `arrayLayers` specified in `VkImageCreateInfo` when image was created

- **VUID-vkGetImageSubresourceLayout-format-04461**
  If `format` is a color format, the `aspectMask` member of **pSubresource** **must** be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-vkGetImageSubresourceLayout-format-04462**
  If `format` has a depth component, the `aspectMask` member of **pSubresource** **must** contain `VK_IMAGE_ASPECT_DEPTH_BIT`

- **VUID-vkGetImageSubresourceLayout-format-04463**
  If `format` has a stencil component, the `aspectMask` member of **pSubresource** **must** contain `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-vkGetImageSubresourceLayout-format-04464**
  If `format` does not contain a stencil or depth component, the `aspectMask` member of **pSubresource** **must** not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`
If the tiling of the image is VK_IMAGE_TILING_LINEAR and its format is a multi-planar format with two planes, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

If the tiling of the image is VK_IMAGE_TILING_LINEAR and its format is a multi-planar format with three planes, the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT

If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory

If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image’s format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier

Valid Usage (Implicit)

device must be a valid VkDevice handle

image must be a valid VkImage handle

pSubresource must be a valid pointer to a valid VkImageSubresource structure

pLayout must be a valid pointer to a VkSubresourceLayout structure

image must have been created, allocated, or retrieved from device

The VkImageSubresource structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresource {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t arrayLayer;
} VkImageSubresource;
```

• aspectMask is a VkImageAspectFlags value selecting the image aspect.
• **mipLevel** selects the mipmap level.
• **arrayLayer** selects the array layer.

## Valid Usage (Implicit)

- **VUID-VkImageSubresource-aspectMask-parameter**
  
  *aspectMask* **must** be a valid combination of *VkImageAspectFlagBits* values

- **VUID-VkImageSubresource-aspectMask-requiredbitmask**
  
  *aspectMask* **must** not be 0

Information about the layout of the image subresource is returned in a *VkSubresourceLayout* structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSubresourceLayout {
    VkDeviceSize offset;
    VkDeviceSize size;
    VkDeviceSize rowPitch;
    VkDeviceSize arrayPitch;
    VkDeviceSize depthPitch;
} VkSubresourceLayout;
```

- **offset** is the byte offset from the start of the image or the plane where the image subresource begins.
- **size** is the size in bytes of the image subresource. *size* includes any extra memory that is required based on *rowPitch*.
- **rowPitch** describes the number of bytes between each row of texels in an image.
- **arrayPitch** describes the number of bytes between each array layer of an image.
- **depthPitch** describes the number of bytes between each slice of 3D image.

If the image is linear, then **rowPitch**, **arrayPitch** and **depthPitch** describe the layout of the image subresource in linear memory. For uncompressed formats, **rowPitch** is the number of bytes between texels with the same x coordinate in adjacent rows (y coordinates differ by one). **arrayPitch** is the number of bytes between texels with the same x and y coordinate in adjacent array layers of the image (array layer values differ by one). **depthPitch** is the number of bytes between texels with the same x and y coordinate in adjacent slices of a 3D image (z coordinates differ by one). Expressed as an addressing formula, the starting byte of a texel in the image subresource has address:

```c
// (x,y,z,layer) are in texel coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x*elementSize + offset
```

For compressed formats, the **rowPitch** is the number of bytes between compressed texel blocks in adjacent rows. **arrayPitch** is the number of bytes between compressed texel blocks in adjacent rows.
array layers. `depthPitch` is the number of bytes between compressed texel blocks in adjacent slices of a 3D image.

```c
// (x,y,z,layer) are in compressed texel block coordinates
address(x,y,z,layer) = layer*arrayPitch + z*depthPitch + y*rowPitch + x
*compressedTexelBlockByteSize + offset;
```

The value of `arrayPitch` is undefined for images that were not created as arrays. `depthPitch` is defined only for 3D images.

If the image has a `single-plane` color format and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` must be `VK_IMAGE_ASPECT_COLOR_BIT`.

If the image has a depth/stencil format and its tiling is `VK_IMAGE_TILING_LINEAR`, then `aspectMask` must be either `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`. On implementations that store depth and stencil aspects separately, querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that aspect. On implementations that store depth and stencil aspects interleaved, the same `offset` and `size` are returned and represent the interleaved memory allocation.

If the image has a `multi-planar format` and its tiling is `VK_IMAGE_TILING_LINEAR`, then the `aspectMask` member of `VkImageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or (for 3-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`. Querying each of these image subresource layouts will return a different `offset` and `size` representing the region of memory used for that plane. If the image is `disjoint`, then the `offset` is relative to the base address of the plane. If the image is `non-disjoint`, then the `offset` is relative to the base address of the image.

If the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the `aspectMask` member of `VkImageSubresource` must be one of `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT`, where the maximum allowed plane index `i` is defined by the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image’s `VkImageCreateInfo::format` and `modifier`. The memory range used by the subresource is described by `offset` and `size`. If the image is `disjoint`, then the `offset` is relative to the base address of the `memory plane`. If the image is `non-disjoint`, then the `offset` is relative to the base address of the image. If the image is `non-linear`, then `rowPitch`, `arrayPitch`, and `depthPitch` have an implementation-dependent meaning.

To query the memory layout of an image subresource, call:

```c
// Provided by VK_EXT_image_compression_control
void vkGetImageSubresourceLayout2EXT(
    VkDevice device, 
    VkImage image, 
    const VkImageSubresource2EXT* pSubresource, 
    VkSubresourceLayout2EXT* pLayout);
```

- `device` is the logical device that owns the image.
- `image` is the image whose layout is being queried.
- **pSubresource** is a pointer to a `VkImageSubresource2EXT` structure selecting a specific image for the image subresource.

- **pLayout** is a pointer to a `VkSubresourceLayout2EXT` structure in which the layout is returned.

`vkGetImageSubresourceLayout2EXT` behaves similarly to `vkGetImageSubresourceLayout`, with the ability to specify extended inputs via chained input structures, and to return extended information via chained output structures.

### Valid Usage

- **VUID-vkGetImageSubresourceLayout2EXT-image-02270**
  image must have been created with tiling equal to `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`

- **VUID-vkGetImageSubresourceLayout2EXT-aspectMask-00997**
  The aspectMask member of pSubresource must only have a single bit set

- **VUID-vkGetImageSubresourceLayout2EXT-mipLevel-01716**
  The mipLevel member of pSubresource must be less than the mipLevels specified in `VkImageCreateInfo` when image was created

- **VUID-vkGetImageSubresourceLayout2EXT-arrayLayer-01717**
  The arrayLayer member of pSubresource must be less than the arrayLayers specified in `VkImageCreateInfo` when image was created

- **VUID-vkGetImageSubresourceLayout2EXT-format-04461**
  If format is a color format, the aspectMask member of pSubresource must be `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-format-04462**
  If format has a depth component, the aspectMask member of pSubresource must contain `VK_IMAGE_ASPECT_DEPTH_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-format-04463**
  If format has a stencil component, the aspectMask member of pSubresource must contain `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-format-04464**
  If format does not contain a stencil or depth component, the aspectMask member of pSubresource must not contain `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-format-01581**
  If the tiling of the image is `VK_IMAGE_TILING_LINEAR` and its format is a multi-planar format with two planes, the aspectMask member of pSubresource must be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-format-01582**
  If the tiling of the image is `VK_IMAGE_TILING_LINEAR` and its format is a multi-planar format with three planes, the aspectMask member of pSubresource must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`

- **VUID-vkGetImageSubresourceLayout2EXT-image-01895**
  If image was created with the
VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BITANDROID  external memory handle type, then **image must** be bound to memory

- **VUID-vkGetImageSubresourceLayout2EXT-tiling-02271**
  If the tiling of the image is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then the aspectMask member of pSubresource must be VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT and the index i must be less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier

### Valid Usage (Implicit)

- **VUID-vkGetImageSubresourceLayout2EXT-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkGetImageSubresourceLayout2EXT-image-parameter**
  image must be a valid VkImage handle

- **VUID-vkGetImageSubresourceLayout2EXT-pSubresource-parameter**
  pSubresource must be a valid pointer to a valid VkImageSubresource2EXT structure

- **VUID-vkGetImageSubresourceLayout2EXT-pLayout-parameter**
  pLayout must be a valid pointer to a VkSubresourceLayout2EXT structure

- **VUID-vkGetImageSubresourceLayout2EXT-image-parent**
  image must have been created, allocated, or retrieved from device

The **VkImageSubresource2EXT** structure is defined as:

```c
// Provided by VK_EXT_image_compression_control
typedef struct VkImageSubresource2EXT {
    VkStructureType sType;
    void* pNext;
    VkImageSubresource imageSubresource;
} VkImageSubresource2EXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **imageSubresource** is a VkImageSubresource structure.

### Valid Usage (Implicit)

- **VUID-VkImageSubresource2EXT-sType-sType**
  sType must be VK_STRUCTURE_TYPE_IMAGE_SUBRESOURCE_2_EXT

- **VUID-VkImageSubresource2EXT-pNext-pNext**
  pNext must be NULL

- **VUID-VkImageSubresource2EXT-imageSubresource-parameter**
Information about the layout of the image subresource is returned in a `VkSubresourceLayout2EXT` structure:

```c
typedef struct VkSubresourceLayout2EXT {
    VkStructureType sType;
    void* pNext;
    VkSubresourceLayout subresourceLayout;
} VkSubresourceLayout2EXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `subresourceLayout` is a `VkSubresourceLayout` structure.

### Valid Usage (Implicit)

- **VUID-VkSubresourceLayout2EXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SUBRESOURCE_LAYOUT_2_EXT`
- **VUID-VkSubresourceLayout2EXT-pNext-pNext**
  - `pNext` must be `NULL` or a pointer to a valid instance of `VkImageCompressionPropertiesEXT`
- **VUID-VkSubresourceLayout2EXT-sType-unique**
  - The `sType` value of each struct in the `pNext` chain must be unique

If an image was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then the image has a Linux DRM format modifier. To query the modifier, call:

```c
VkResult vkGetImageDrmFormatModifierPropertiesEXT(
    VkDevice device,
    VkImage image,
    VkImageDrmFormatModifierPropertiesEXT* pProperties);
```

- `device` is the logical device that owns the image.
- `image` is the queried image.
- `pProperties` is a pointer to a `VkImageDrmFormatModifierPropertiesEXT` structure in which properties of the image's DRM format modifier are returned.

### Valid Usage

- **VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-02272**
image must have been created with tiling equal to VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT

Valid Usage (Implicit)

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-device-parameter
device must be a valid VkDevice handle

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parameter
image must be a valid VkImage handle

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-pProperties-parameter
pNext must be a valid pointer to a VkImageDrmFormatModifierPropertiesEXT structure

• VUID-vkGetImageDrmFormatModifierPropertiesEXT-image-parent
image must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkImageDrmFormatModifierPropertiesEXT structure is defined as:

```
// Provided by VK_EXT_image_drm_format_modifier
typedef struct VkImageDrmFormatModifierPropertiesEXT {
    VkStructureType sType;
    void* pNext;
    uint64_t drmFormatModifier;
} VkImageDrmFormatModifierPropertiesEXT;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• drmFormatModifier returns the image's Linux DRM format modifier.

If the image was created with VkImageDrmFormatModifierListCreateInfoEXT, then the returned
drmFormatModifier must belong to the list of modifiers provided at time of image creation in
VkImageDrmFormatModifierListCreateInfoEXT::pDrmFormatModifiers. If the image was created with
VkImageDrmFormatModifierExplicitCreateInfoEXT, then the returned drmFormatModifier must be
the modifier provided at time of image creation in VkImageDrmFormatModifierExplicitCreateInfoEXT::drmFormatModifier.
Valid Usage (Implicit)

- VUID-VkImageDrmFormatModifierPropertiesEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_DRM_FORMAT_MODIFIER_PROPERTIES_EXT

- VUID-VkImageDrmFormatModifierPropertiesEXT-pNext-pNext
  pNext must be NULL

To destroy an image, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImage(
    VkDevice device,
    VkImage image,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the image.
- image is the image to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage

- VUID-vkDestroyImage-image-01000
  All submitted commands that refer to image, either directly or via a VkImageView, must have completed execution

- VUID-vkDestroyImage-image-01001
  If VkAllocationCallbacks were provided when image was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyImage-image-01002
  If no VkAllocationCallbacks were provided when image was created, pAllocator must be NULL

- VUID-vkDestroyImage-image-04882
  image must not have been acquired from vkGetSwapchainImagesKHR

Valid Usage (Implicit)

- VUID-vkDestroyImage-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyImage-image-parameter
  If image is not VK_NULL_HANDLE, image must be a valid VkImage handle

- VUID-vkDestroyImage-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid
12.3.1. Image Format Features

Valid uses of a VkImage may depend on the image's format features, defined below. Such constraints are documented in the affected valid usage statement.

- If the image was created with VK_IMAGE_TILING_LINEAR, then its set of format features is the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageCreateInfo::format.
- If the image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, or an VkBufferCollectionImageCreateInfoFUCHSIA, then its set of format features is the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageCreateInfo::format.
- If the image was created with an Android hardware buffer external format, then its set of format features is the value of VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures found by calling vkGetAndroidHardwareBufferPropertiesANDROID on the Android hardware buffer that was imported to the VkDeviceMemory to which the image is bound.
- If the image was created with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then:
  - The image's DRM format modifier is the value of VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier found by calling vkGetImageDrmFormatModifierPropertiesEXT.
  - Let VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties be the array found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageCreateInfo::format.
  - Let VkDrmFormatModifierPropertiesEXT prop be the array element whose drmFormatModifier member is the value of the image's DRM format modifier.
  - Then the image's set of format features is the value of prop::drmFormatModifierTilingFeatures.

12.3.2. Corner-Sampled Images

A corner-sampled image is an image where unnormalized texel coordinates are centered on integer values rather than half-integer values.

A corner-sampled image has a number of differences compared to conventional texture image:

- Texels are centered on integer coordinates. See Unnormalized Texel Coordinate Operations
• Normalized coordinates are scaled using \( \text{coord} \times (\text{dim} - 1) \) rather than \( \text{coord} \times \text{dim} \), where \( \text{dim} \) is the size of one dimension of the image. See normalized texel coordinate transform.

• Partial derivatives are scaled using \( \text{coord} \times (\text{dim} - 1) \) rather than \( \text{coord} \times \text{dim} \). See Scale Factor Operation.

• Calculation of the next higher lod size goes according to \( \lceil \text{dim} / 2 \rceil \) rather than \( \lfloor \text{dim} / 2 \rfloor \). See Image Mipmap Sizing.

• The minimum level size is 2x2 for 2D images and 2x2x2 for 3D images. See Image Mipmap Sizing.

Corner-sampling is only supported for 2D and 3D images. When sampling a corner-sampled image, the sampler addressing mode must be VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Corner-sampled images are not supported as cube maps or depth/stencil images.

### 12.3.3. Image Mipmap Sizing

A complete mipmap chain is the full set of miplevels, from the largest mipmap provided, down to the minimum mipmap size.

#### Conventional Images

For conventional images, the dimensions of each successive mipmap level, \( n+1 \), are:

\[
\begin{align*}
\text{width}_{n+1} &= \max(\text{width}_n/2, 1) \\
\text{height}_{n+1} &= \max(\text{height}_n/2, 1) \\
\text{depth}_{n+1} &= \max(\text{depth}_n/2, 1)
\end{align*}
\]

where \( \text{width}_n \), \( \text{height}_n \), and \( \text{depth}_n \) are the dimensions of the next larger mipmap level, \( n \).

The minimum mipmap size is:

• 1 for one-dimensional images,
• 1x1 for two-dimensional images, and
• 1x1x1 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[
\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil + 1
\]

where \( \text{width}_0 \), \( \text{height}_0 \), and \( \text{depth}_0 \) are the dimensions of the largest (most detailed) mipmap level, \( 0 \).
Corner-Sampled Images

For corner-sampled images, the dimensions of each successive mipmap level, \( n+1 \), are:

\[
\text{width}_{n+1} = \max(\lceil \text{width}_n/2 \rceil, 2)
\]

\[
\text{height}_{n+1} = \max(\lceil \text{height}_n/2 \rceil, 2)
\]

\[
\text{depth}_{n+1} = \max(\lceil \text{depth}_n/2 \rceil, 2)
\]

where \( \text{width}_n \), \( \text{height}_n \), and \( \text{depth}_n \) are the dimensions of the next larger mipmap level, \( n \).

The minimum mipmap level size is:

- 2x2 for two-dimensional images, and
- 2x2x2 for three-dimensional images.

The number of levels in a complete mipmap chain is:

\[
\lceil \log_2(\max(\text{width}_0, \text{height}_0, \text{depth}_0)) \rceil
\]

where \( \text{width}_0 \), \( \text{height}_0 \), and \( \text{depth}_0 \) are the dimensions of the largest (most detailed) mipmap level, \( 0 \).

12.4. Image Layouts

Images are stored in implementation-dependent opaque layouts in memory. Each layout has limitations on what kinds of operations are supported for image subresources using the layout. At any given time, the data representing an image subresource in memory exists in a particular layout which is determined by the most recent layout transition that was performed on that image subresource. Applications have control over which layout each image subresource uses, and can transition an image subresource from one layout to another. Transitions can happen with an image memory barrier, included as part of a \text{vkCmdPipelineBarrier} or a \text{vkCmdWaitEvents} command buffer command (see Image Memory Barriers), or as part of a subpass dependency within a render pass (see VkSubpassDependency).

Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the separateDepthStencilLayouts feature is enabled.

Note

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of \text{VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL} may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image
subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the VkImageCreateInfo::initialLayout member. The initialLayout must be either VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED. If it is VK_IMAGE_LAYOUT_PREINITIALIZED, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is VK_IMAGE_LAYOUT_UNDEFINED, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layout. Calling vkGetImageSubresourceLayout for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
};
```
// Provided by VK_KHR_swapchain
    VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_decode_queue
    VK_IMAGE_LAYOUT_VIDEO_DECODE_DPB_KHR = 1000024002,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_shared_presentable_image
    VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR = 1000111000,
// Provided by VK_EXT_fragment_density_map
    VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT = 1000218000,
// Provided by VK_KHR_fragment_shading_rate
    VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR = 1000164003,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DST_KHR = 1000299000,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_SRC_KHR = 1000299001,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_KHR_video_encode_queue
    VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR = 1000299002,
#endif VK_ENABLE_BETA_EXTENSIONS
// Provided by VK_EXT_attachment_feedback_loop_layout
    VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT = 1000339000,
// Provided by VK_KHR_maintenance2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,
// Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,
// Provided by VK_KHR_separate_depth_stencil_layouts
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR,
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout can be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image's memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image's memory is in a defined layout and can be populated by data, but that it has not yet been initialized by the driver. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data can be written to memory immediately, without first executing a layout transition. Currently, VK_IMAGE_LAYOUT_PREINITIALIZED is only useful with linear images because there is not a standard layout defined for VK_IMAGE_TILING_OPTIMAL images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that must only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a VkFramebuffer. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to
• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.

• **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_SAMPLED_BIT** or **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** usage bits enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**). This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display. A swapchain's image must be transitioned to this layout before calling **vkQueuePresentKHR**, and must be transitioned away from this layout after calling **vkAcquireNextImageKHR**.

• **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be used for any usage the image supports.

• **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or shading rate image. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT** must only be used as a fragment density map attachment in a **VkRenderPass**. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** must only be used as a decode output image of a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** usage bit enabled.
• **VK_IMAGE_LAYOUT_VIDEO_DECODER_SRC_KHR** is reserved for future use.

• **VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR** must only be used as a decode source or destination image of a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODER_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_DST_KHR** is reserved for future use.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_SRC_KHR** must only be used as a encode source image of a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODER_SRC_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_DPB_KHR** must only be used as a encode source or destination image of a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODER_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** must only be used as either a color attachment or depth/stencil attachment in a **VkFramebuffer** and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** usage bit enabled and either the **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** and either the **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_SAMPLED_BIT** usage bits enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see **Clear Commands** and **Copy Commands**). For use as a framebuffer attachment, this is a member in the substructures of the **VkRenderPassCreateInfo** (see **Render Pass**). For use in a descriptor set, this is a member in the **VkDescriptorImageInfo** structure (see **Descriptor Set Updates**).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

• Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.

• Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** are considered to match.

When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else be **VK_IMAGE_LAYOUT_UNDEFINED** (implying that the contents of the image subresource need not be
preserved). The new layout used in a transition must not be `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED`.

The image layout of each image subresource of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications must provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

### 12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, image views representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by `VkImageView` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

`VK_REMAINING_ARRAY_LAYERS` is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS (~0U)
```

`VK_REMAINING_MIP_LEVELS` is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS (~0U)
```

The types of image views that can be created are:
To create an image view, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice device,
    const VkImageViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImageView* pView);
```

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

**Valid Usage (Implicit)**

- VUID-vkCreateImageView-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImageView-pView-parameter
  `pView` must be a valid pointer to a `VkImageView` handle

**Return Codes**

**Success**
- `VK_SUCCESS`
The `VkImageViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageViewCreateFlagBits` specifying additional parameters of the image view.
- `image` is a `VkImage` on which the view will be created.
- `viewType` is a `VkImageViewType` value specifying the type of the image view.
- `format` is a `VkFormat` specifying the format and type used to interpret texel blocks of the image.
- `components` is a `VkComponentMapping` structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- `subresourceRange` is a `VkImageSubresourceRange` structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the `image` creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter `usage` specifying the allowed usages of the image view that, by default, takes the value of the corresponding `usage` parameter specified in `VkImageCreateInfo` at image creation time. The implicit `usage` can be overridden by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain, but the view usage must be a subset of the image usage. If `image` has a depth-stencil format and was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, the usage is calculated based on the `subresource.aspectMask` provided:

- If `aspectMask` includes only `VK_IMAGE_ASPECT_STENCIL_BIT`, the implicit `usage` is equal to `VkImageStencilUsageCreateInfo::stencilUsage`.
- If `aspectMask` includes only `VK_IMAGE_ASPECT_DEPTH_BIT`, the implicit `usage` is equal to `VkImageCreateInfo::usage`. 
If both aspects are included in \texttt{aspectMask}, the implicit \texttt{usage} is equal to the intersection of \texttt{VkImageCreateInfo::usage} and \texttt{VkImageStencilUsageCreateInfo::stencilUsage}.

If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT} flag, and if the \texttt{format} of the image is not multi-planar, \texttt{format} can be different from the image's format, but if \texttt{image} was created without the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag and they are not equal they \textbf{must} be compatible. Image format compatibility is defined in the \texttt{Format Compatibility Classes} section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the \texttt{format}, with only the interpretation of the bit pattern changing.

\begin{itemize}
  \item If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag, and if the \texttt{format} of the image is \textbf{not} multi-planar, \texttt{format} \textbf{can} be different from the image’s format, but if \texttt{image} was created without the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag and they are not equal \textbf{they must} be compatible. Image format compatibility is defined in the \texttt{Format Compatibility Classes} section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the \texttt{format}, with only the interpretation of the bit pattern changing.
\end{itemize}

\begin{itemize}
  \item If \texttt{image} was created with the \texttt{VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT} flag, \texttt{format} \textbf{must} be compatible with the image’s format as described above, or \textbf{must} be an uncompressed format in which case it \textbf{must} be size-compatible with the image’s format, as defined for \texttt{copying data between images}. In this case, the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.
\end{itemize}

The \texttt{VkComponentMapping components} member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping \textbf{must} be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any \texttt{VkImageView} used with a combined image sampler that enables \texttt{sampler Y’C_bC_r conversion}.

If the image view is to be used with a sampler which supports \texttt{sampler Y’C_bC_r conversion}, an \textit{identically defined object} of type \texttt{VkSamplerYcbcrConversion} to that used to create the sampler \textbf{must} be passed to \texttt{vkCreateImageView} in a \texttt{VkSamplerYcbcrConversionInfo} included in the \texttt{pNext} chain of \texttt{VkImageViewCreateInfo}. Conversely, if a \texttt{VkSamplerYcbcrConversion} object is passed to \texttt{vkCreateImageView}, an \textit{identically defined} \texttt{VkSamplerYcbcrConversion} object \textbf{must} be used when sampling the image.

If the image has a \texttt{multi-planar format} and \texttt{subresourceRange.aspectMask} is \texttt{VK_IMAGE_ASPECT_COLOR_BIT}, and it was created with \texttt{usage} value containing flags other than \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR}, \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR}, \texttt{VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR}, \texttt{VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR}, then the \texttt{format} \textbf{must} be identical to the image \texttt{format}, and the sampler to be used with the image view \textbf{must} enable \texttt{sampler Y’C_bC_r conversion}.

If the image has a \texttt{multi-planar format} and the \texttt{image} has been created with a \texttt{usage} value containing any of the \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR}, \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR}, and \texttt{VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR} flags, then all of the video decode operations would ignore the \texttt{VkSamplerYcbcrConversionInfo} structure and/or \texttt{sampler Y’C_bC_r conversion object},...
associated with the image view. If the image has a multi-planar format and the image has been created with a usage value containing any of the VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, and VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR flags, then all of the video encode operations would ignore the VkSamplerYcbcrConversionInfo structure and/or sampler Y’CbCr conversion object, associated with the image view.

If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT and the image has a multi-planar format, and if subresourceRange.aspectMask is VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y’CbCr conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the (u_{plane}, v_{plane}) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the (u_{color}, v_{color}) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same (u_{plane}, v_{plane}) or (i_{plane}, j_{plane}) coordinates.

Valid Usage

- VUID-VkImageViewCreateInfo-image-01003
  If image was not created with VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT then viewType must not be VK_IMAGE_VIEW_TYPE_CUBE or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-VkImageViewCreateInfo-viewType-01004
  If the imageCubeArray feature is not enabled, viewType must not be VK_IMAGE_VIEW_TYPE_CUBE_ARRAY

- VUID-VkImageViewCreateInfo-image-06723
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set then viewType must not be VK_IMAGE_VIEW_TYPE_2D_ARRAY
• VUID-VkImageViewCreateInfo-image-06728
  If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, then viewType must not be VK_IMAGE_VIEW_TYPE_2D

• VUID-VkImageViewCreateInfo-image-04970
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1

• VUID-VkImageViewCreateInfo-image-04971
  If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then VkImageCreateInfo::flags must not contain any of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT

• VUID-VkImageViewCreateInfo-image-04972
  If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then viewType must be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

• VUID-VkImageViewCreateInfo-image-04441
  image must have been created with a usage value containing at least one of the usages defined in the valid image usage list for image views

• VUID-VkImageViewCreateInfo-None-02273
  The format features of the resultant image view must contain at least one bit

• VUID-VkImageViewCreateInfo-image-02274
  If usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT

• VUID-VkImageViewCreateInfo-image-02275
  If usage contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT

• VUID-VkImageViewCreateInfo-image-02276
  If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

• VUID-VkImageViewCreateInfo-image-02277
  If usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

• VUID-VkImageViewCreateInfo-image-06516
  If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV, if the image is created with VK_IMAGE_TILING_LINEAR and the linearColorAttachment feature is enabled

• VUID-VkImageViewCreateInfo-image-06517
  If usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV, if the image is created with VK_IMAGE_TILING_LINEAR and the linearColorAttachment feature is enabled

• VUID-VkImageViewCreateInfo-image-02652
  If usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then the image view's format features must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or
• VUID-VkImageViewCreateInfo-subresourceRange-01478
  subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageViewCreateInfo-subresourceRange-01718
  If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

• VUID-VkImageViewCreateInfo-image-02571
  If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, subresourceRange.levelCount must be 1

• VUID-VkImageViewCreateInfo-image-06724
  If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageViewCreateInfo-subresourceRange-06725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

• VUID-VkImageViewCreateInfo-image-02724
  If image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing

• VUID-VkImageViewCreateInfo-subresourceRange-02725
  If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing

• VUID-VkImageViewCreateInfo-image-01761
  If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, but without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, and if the format of the image is not a multi-planar format, format must be compatible with the format used to create image, as defined in Format Compatibility Classes

• VUID-VkImageViewCreateInfo-image-01583
  If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag,
**format must** be compatible with, or **must** be an uncompressed format that is size-compatible with, the **format** used to create **image**

- **VUID-VkImageViewCreateInfo-image-07072**
  If **image** was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag and **format** is a non-compressed format, the **levelCount** and **layerCount** members of **subresourceRange** must both be 1

- **VUID-VkImageViewCreateInfo-pNext-01585**
  If a VkImageFormatListCreateInfo structure was included in the **pNext** chain of the VkImageCreateInfo structure used when creating **image** and VkImageFormatListCreateInfo::viewFormatCount is not zero then **format must** be one of the formats in VkImageFormatListCreateInfo::pViewFormats

- **VUID-VkImageViewCreateInfo-image-01586**
  If **image** was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, if the **format** of the **image** is a multi-planar format, and if **subresourceRange.aspectMask** is one of VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT, then **format must** be compatible with the VkFormat for the plane of the **image format** indicated by **subresourceRange.aspectMask**, as defined in Compatible formats of planes of multi-planar formats

- **VUID-VkImageViewCreateInfo-image-01762**
  If **image** was not created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, or if the **format** of the **image** is a multi-planar format and if **subresourceRange.aspectMask** is VK_IMAGE_ASPECT_COLOR_BIT, **format must** be identical to the **format used to create image**

- **VUID-VkImageViewCreateInfo-format-06415**
  If the **image view** requires a sampler Y'C_b'C_r conversion and **usage** contains VK_IMAGE_USAGE_SAMPLED_BIT, then the **pNext** chain must include a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE

- **VUID-VkImageViewCreateInfo-format-04714**
  If **format** has a _422 or _420 suffix then **image must** have been created with a width that is a multiple of 2

- **VUID-VkImageViewCreateInfo-format-04715**
  If **format** has a _420 suffix then **image must** have been created with a height that is a multiple of 2

- **VUID-VkImageViewCreateInfo-pNext-01970**
  If the **pNext** chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, all members of **components must** have the identity swizzle

- **VUID-VkImageViewCreateInfo-pNext-06658**
  If the **pNext** chain includes a VkSamplerYcbcrConversionInfo structure with a conversion value other than VK_NULL_HANDLE, **format must** be the same used in VkSamplerYcbcrConversionCreateInfo::format

- **VUID-VkImageViewCreateInfo-image-01020**
  If **image** is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object
• VUID-VkImageViewCreateInfo-subResourceRange-01021
  viewType must be compatible with the type of image as shown in the view type compatibility table

• VUID-VkImageViewCreateInfo-image-02399
  If image has an external format, format must be VK_FORMAT_UNDEFINED

• VUID-VkImageViewCreateInfo-image-02400
  If image has an external format, the pNext chain must include a VkSamplerYcbcrConversionInfo structure with a conversion object created with the same external format as image

• VUID-VkImageViewCreateInfo-image-02401
  If image has an external format, all members of components must be the identity swizzle

• VUID-VkImageViewCreateInfo-image-02086
  If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

• VUID-VkImageViewCreateInfo-image-02087
  If the shadingRateImage feature is enabled, and If image was created with usage containing VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, format must be VK_FORMAT_R8_UINT

• VUID-VkImageViewCreateInfo-usage-04550
  If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-VkImageViewCreateInfo-usage-04551
  If the attachmentFragmentShadingRate feature is enabled, the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, and layeredShadingRateAttachments is VK_FALSE, subresourceRange.layerCount must be 1

• VUID-VkImageViewCreateInfo-flags-02572
  If the fragmentDensityMapDynamic feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

• VUID-VkImageViewCreateInfo-flags-03567
  If the fragmentDensityMapDeferred feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT

• VUID-VkImageViewCreateInfo-flags-03568
  If flags contains VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT

• VUID-VkImageViewCreateInfo-image-03569
  If image was created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT and usage containing VK_IMAGE_USAGE_SAMPLED_BIT, subresourceRange.layerCount must be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxSubsampledArrayLayers

• VUID-VkImageViewCreateInfo-invocationMask-04993
  If the invocationMask feature is enabled, and if image was created with usage containing VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI, format must be VK_FORMAT_R8_UINT
• VUID-VkImageViewCreateInfo-flags-04116
  If `flags` does not contain `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` and `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, its `flags` must not contain any of `VK_IMAGE_CREATE_PROTECTED_BIT`, `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`.

• VUID-VkImageViewCreateInfo-pNext-02662
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

• VUID-VkImageViewCreateInfo-pNext-02663
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageStencilUsageCreateInfo` structure used to create `image`.

• VUID-VkImageViewCreateInfo-pNext-02664
  If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageStencilUsageCreateInfo` structure used to create `image`.

• VUID-VkImageViewCreateInfo-imageViewType-04973
  If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then `subresourceRange.layerCount` must be 1.

• VUID-VkImageViewCreateInfo-imageViewType-04974
  If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, then the remaining number of layers must be 1.

• VUID-VkImageViewCreateInfo-viewType-02960
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be 6.

• VUID-VkImageViewCreateInfo-viewType-02961
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be a multiple of 6.

• VUID-VkImageViewCreateInfo-viewType-02962
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, the remaining number of layers must be 6.

• VUID-VkImageViewCreateInfo-viewType-02963
  If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is
VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be a multiple of 6

- VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image

- VUID-VkImageViewCreateInfo-image-04817
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_DECODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY and all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-image-04818
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY and all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-pNext-06787
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT.

- VUID-VkImageViewCreateInfo-pNext-06944
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then textureSampleWeighted feature must be enabled

- VUID-VkImageViewCreateInfo-pNext-06945
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then image must have been created with usage containing VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM

- VUID-VkImageViewCreateInfo-pNext-06946
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then components must be VK_COMPONENT_SWIZZLE_IDENTITY for all components

- VUID-VkImageViewCreateInfo-pNext-06947
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageViewCreateInfo-pNext-06948
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.levelCount must be 1

- VUID-VkImageViewCreateInfo-pNext-06949
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then viewType must be VK_IMAGE_VIEW_TYPE_1D_ARRAY or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-VkImageViewCreateInfo-pNext-06950
If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and if `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `imageType` `VK_IMAGE_TYPE_1D`.

- VUID-VkImageViewCreateInfo-pNext-06951
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `width` equal to or greater than `(numPhases × max(align(filterSize.width, 4), filterSize.height))`.

- VUID-VkImageViewCreateInfo-pNext-06952
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `imageType` `VK_IMAGE_TYPE_2D`.

- VUID-VkImageViewCreateInfo-pNext-06953
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `width` equal to or greater than `filterSize.width`.

- VUID-VkImageViewCreateInfo-pNext-06954
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `height` equal to or greater than `filterSize.height`.

- VUID-VkImageViewCreateInfo-pNext-06955
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure then `VkImageViewSampleWeightCreateInfoQCOM::filterSize.height` must be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height`.

### Valid Usage (Implicit)

- VUID-VkImageViewCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`.

- VUID-VkImageViewCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkImageViewASTCDecodeModeEXT`, `VkImageViewMinLodCreateInfoEXT`, `VkImageViewSampleWeightCreateInfoQCOM`, `VkImageViewUsageCreateInfo`, or `VkSamplerYcbcrConversionInfo`.
The `sType` value of each struct in the `pNext` chain must be unique, with the exception of structures of type `VkExportMetalObjectCreateInfoEXT`.

Flags must be a valid combination of `VkImageViewCreateFlagBits` values.

Image must be a valid `VkImage` handle.

View type must be a valid `VkImageViewType` value.

Format must be a valid `VkFormat` value.

Components must be a valid `VkComponentMapping` structure.

Subresource range must be a valid `VkImageSubresourceRange` structure.

Bits which can be set in `VkImageViewCreateInfo::flags`, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map2
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT = 0x00000002,
} VkImageViewCreateFlagBits;
```

- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` specifies that the fragment density map will be read by device during `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.
- `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT` specifies that the fragment density map will be read by the host during `vkEndCommandBuffer` for the primary command buffer that the render pass is recorded into.

`VkImageViewCreateFlags` is a bitmask type for setting a mask of zero or more `VkImageViewCreateFlagBits`.

The set of usages for the created image view can be restricted compared to the parent image's usage flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType       sType;
    const void*            pNext;
    VkImageUsageFlags     usage;
} VkImageViewUsageCreateInfo;

or the equivalent

typedef VkImageViewUsageCreateInfo     VkImageViewUsageCreateInfoKHR;

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **usage** is a bitmask of **VkImageUsageFlagBits** specifying allowed usages of the image view.

When this structure is chained to **VkImageViewCreateInfo** the **usage** field overrides the implicit **usage** parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of **VkImageViewCreateInfo**.

Valid Usage (Implicit)

- [VUID-VkImageViewUsageCreateInfo-sType-sType](#) **sType** **must** be **VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO**
- [VUID-VkImageViewUsageCreateInfo-usage-parameter](#) **usage** **must** be a valid combination of **VkImageUsageFlagBits** values
- [VUID-VkImageViewUsageCreateInfo-usage-requiredbitmask](#) **usage** **must** not be 0

The **VkImageSubresourceRange** structure is defined as:

typedef struct VkImageSubresourceRange {
    VkImageAspectFlags    aspectMask;
    uint32_t               baseMipLevel;
    uint32_t               levelCount;
    uint32_t               baseArrayLayer;
    uint32_t               layerCount;
} VkImageSubresourceRange;

- **aspectMask** is a bitmask of **VkImageAspectFlagBits** specifying which aspect(s) of the image are included in the view.
- **baseMipLevel** is the first mipmap level accessible to the view.
• **levelCount** is the number of mipmap levels (starting from **baseMipLevel**) accessible to the view.

• **baseArrayLayer** is the first array layer accessible to the view.

• **layerCount** is the number of array layers (starting from **baseArrayLayer**) accessible to the view.

The number of mipmap levels and array layers **must** be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the **baseMipLevel** or **baseArrayLayer**, it **can** set **levelCount** and **layerCount** to the special values **VK_REMAINING_MIP_LEVELS** and **VK_REMAINING_ARRAY_LAYERS** without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at **baseArrayLayer** correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is **layerCount / 6**, and image array layer (**baseArrayLayer + i**) is face index (**i mod 6**) of cube (**i / 6**). If the number of layers in the view, whether set explicitly in **layerCount** or implied by **VK_REMAINING_ARRAY_LAYERS**, is not a multiple of 6, the last cube map in the array **must not** be accessed.

**aspectMask** **must** be only **VK_IMAGE_ASPECT_COLOR_BIT**, **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT** if **format** is a color, depth-only or stencil-only format, respectively, except if **format** is a multi-planar format. If using a depth/stencil format with both depth and stencil components, **aspectMask** **must** include at least one of **VK_IMAGE_ASPECT_DEPTH_BIT** and **VK_IMAGE_ASPECT_STENCIL_BIT**, and **can** include both.

When the **VkImageSubresourceRange** structure is used to select a subset of the slices of a 3D image’s mip level in order to create a 2D or 2D array image view of a 3D image created with **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT**, **baseArrayLayer** and **layerCount** specify the first slice index and the number of slices to include in the created image view. Such an image view **can** be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the **aspectMask** **must** only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the **aspectMask** is ignored and both depth and stencil image subresources are used.

When creating a **VkImageView**, if **sampler Y’CbCr conversion** is enabled in the sampler, the **aspectMask** of a **subresourceRange** used by the **VkImageView** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**.

When creating a **VkImageView**, if **sampler Y’CbCr conversion** is not enabled in the sampler and the image **format** is multi-planar, the image **must** have been created with **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT**, and the **aspectMask** of the **VkImageView**’s **subresourceRange** **must** be **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT** or **VK_IMAGE_ASPECT_PLANE_2_BIT**.
Valid Usage

- **VUID-VkImageSubresourceRange-levelCount-01720**
  If `levelCount` is not `VK_REMAINING_MIP_LEVELS`, it **must** be greater than 0.

- **VUID-VkImageSubresourceRange-layerCount-01721**
  If `layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, it **must** be greater than 0.

- **VUID-VkImageSubresourceRange-aspectMask-01670**
  If `aspectMask` includes `VK_IMAGE_ASPECT_COLOR_BIT`, then it **must** not include any of `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

- **VUID-VkImageSubresourceRange-aspectMask-02278**
  `aspectMask` **must** not include `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`.

Valid Usage (Implicit)

- **VUID-VkImageSubresourceRange-aspectMask-parameter**
  `aspectMask` **must** be a valid combination of `VkImageAspectFlagBits` values.

- **VUID-VkImageSubresourceRange-aspectMask-required bitmask**
  `aspectMask` **must** not be 0.

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    ...}
```
VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,

VK_IMAGE_ASPECT_COLOR_BIT

VK_IMAGE_ASPECT_DEPTH_BIT

VK_IMAGE_ASPECT_STENCIL_BIT

VK_IMAGE_ASPECT_METADATA_BIT specifies the metadata aspect used for sparse resource operations.

VK_IMAGE_ASPECT_PLANE_0_BIT specifies plane 0 of a multi-planar image format.

VK_IMAGE_ASPECT_PLANE_1_BIT specifies plane 1 of a multi-planar image format.

VK_IMAGE_ASPECT_PLANE_2_BIT specifies plane 2 of a multi-planar image format.

VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT specifies memory plane 0.

VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT specifies memory plane 1.

VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT specifies memory plane 2.

VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT specifies memory plane 3.

VkImageAspectFlags is a bitmask type for setting a mask of zero or more VkImageAspectFlagBits.

The VkComponentMapping structure is defined as:

```c
typedef VkFlags VkImageAspectFlags;
```

```c
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;
```

- `r` is a `VkComponentSwizzle` specifying the component value placed in the R component of the output vector.
- `g` is a `VkComponentSwizzle` specifying the component value placed in the G component of the output vector.
- `b` is a `VkComponentSwizzle` specifying the component value placed in the B component of the output vector.
output vector.

- \( a \) is a \texttt{VkComponentSwizzle} specifying the component value placed in the A component of the output vector.

### Valid Usage (Implicit)

- \texttt{VUID-VkComponentMapping-r-parameter}
  
  \( r \) must be a valid \texttt{VkComponentSwizzle} value

- \texttt{VUID-VkComponentMapping-g-parameter}
  
  \( g \) must be a valid \texttt{VkComponentSwizzle} value

- \texttt{VUID-VkComponentMapping-b-parameter}
  
  \( b \) must be a valid \texttt{VkComponentSwizzle} value

- \texttt{VUID-VkComponentMapping-a-parameter}
  
  \( a \) must be a valid \texttt{VkComponentSwizzle} value

Possible values of the members of \texttt{VkComponentMapping}, specifying the component values placed in each component of the output vector, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
```

- \texttt{VK_COMPONENT_SWIZZLE_IDENTITY} specifies that the component is set to the identity swizzle.

- \texttt{VK_COMPONENT_SWIZZLE_ZERO} specifies that the component is set to zero.

- \texttt{VK_COMPONENT_SWIZZLE_ONE} specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the Format Definition section for each \texttt{VkFormat}.

- \texttt{VK_COMPONENT_SWIZZLE_R} specifies that the component is set to the value of the R component of the image.

- \texttt{VK_COMPONENT_SWIZZLE_G} specifies that the component is set to the value of the G component of the image.

- \texttt{VK_COMPONENT_SWIZZLE_B} specifies that the component is set to the value of the B component of the image.

- \texttt{VK_COMPONENT_SWIZZLE_A} specifies that the component is set to the value of the A component of the image.
Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

Table 16. Component Mappings Equivalent To VK_COMPONENT_SWIZZLE_IDENTITY

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

If the pNext chain includes a VkImageViewASTCDecodeModeEXT structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The VkImageViewASTCDecodeModeEXT structure is defined as:

```c
// Provided by VK_EXT_astc_decode_mode
typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType sType;
    const void* pNext;
    VkFormat decodeMode;
} VkImageViewASTCDecodeModeEXT;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `decodeMode` is the intermediate format used to decode ASTC compressed formats.

### Valid Usage

- **VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230**
  
  *decodeMode* must be one of VK_FORMAT_R16G16B16A16_SFLOAT, VK_FORMAT_R8G8B8A8_UNORM, or VK_FORMAT_E5B9G9R9_UFLOAT_PACK32

- **VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231**
  
  If the *decodeModeSharedExponent* feature is not enabled, *decodeMode* must not be VK_FORMAT_E5B9G9R9_UFLOAT_PACK32

- **VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02232**
  
  If *decodeMode* is VK_FORMAT_R8G8B8A8_UNORM the image view must not include blocks using any of the ASTC HDR modes

- **VUID-VkImageViewASTCDecodeModeEXT-format-04084**
  
  *format* of the image view must be one of the ASTC Compressed Image Formats

If *format* uses sRGB encoding then the *decodeMode* has no effect.
Valid Usage (Implicit)

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
  decodeMode must be a valid VkFormat value

If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then that structure includes a parameter specifying the parameters for weight image views used in weight image sampling.

The VkImageViewSampleWeightCreateInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_image_processing
typedef struct VkImageViewSampleWeightCreateInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D filterCenter;
    VkExtent2D filterSize;
    uint32_t numPhases;
} VkImageViewSampleWeightCreateInfoQCOM;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- filterCenter is a VkOffset2D describing the location of the weight filter origin.
- filterSize is a VkExtent2D specifying weight filter dimensions.
- numPhases is number of sub-pixel filter phases.

The filterCenter specifies the origin or center of the filter kernel, as described in Weight Sampling Operation. The numPhases describes the number of sub-pixel filter phases as described in Weight Sampling Phases.

Valid Usage

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06958
  filterSize.width must be less than or equal to
  VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.width

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06959
  filterSize.height must be less than or equal to
  VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06960
  filterCenter.x must be less than or equal to (filterSize.width - 1)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06961
filterCenter.y must be less than or equal to (filterSize.height - 1)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06962
  numPhases must be a power of two squared value (i.e., 1, 4, 16, 64, 256, etc.)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06963
  numPhases must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases

**Valid Usage (Implicit)**

- VUID-VkImageViewSampleWeightCreateInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_SAMPLE_WEIGHT_CREATE_INFO_QCOM

To destroy an image view, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyImageView(
    VkDevice device,
    VkImageView imageView,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the image view.
- imageView is the image view to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to imageView must have completed execution

- VUID-vkDestroyImageView-imageView-01027
  If VkAllocationCallbacks were provided when imageView was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyImageView-imageView-01028
  If no VkAllocationCallbacks were provided when imageView was created, pAllocator must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyImageView-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyImageView-imageView-parameter
  If imageView is not VK_NULL_HANDLE, imageView must be a valid VkImageView handle
If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

If `imageView` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

Host access to `imageView` must be externally synchronized.

To get the handle for an image view, call:

```c
uint32_t vkGetImageViewHandleNVX(
    VkDevice device,
    const VkImageViewHandleInfoNVX* pInfo);
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

### Valid Usage (Implicit)

- `device` must be a valid `VkDevice` handle
- `pInfo` must be a valid pointer to a valid `VkImageViewHandleInfoNVX` structure

The `VkImageViewHandleInfoNVX` structure is defined as:

```c
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkDescriptorType descriptorType;
    VkSampler sampler;
} VkImageViewHandleInfoNVX;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `imageView` is the image view to query.
- `descriptorType` is the type of descriptor for which to query a handle.
- `sampler` is the sampler to combine with the image view when generating the handle.

### Valid Usage

- **VUID-VkImageViewHandleInfoNVX-descriptorType-02654**
  - `descriptorType` **must** be `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`.

- **VUID-VkImageViewHandleInfoNVX-sampler-02655**
  - `sampler` **must** be a valid `VkSampler` if `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`.

- **VUID-VkImageViewHandleInfoNVX-imageView-02656**
  - If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the image that `imageView` was created from **must** have been created with the `VK_IMAGE_USAGE_SAMPLED_BIT` usage bit set.

- **VUID-VkImageViewHandleInfoNVX-imageView-02657**
  - If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the image that `imageView` was created from **must** have been created with the `VK_IMAGE_USAGE_STORAGE_BIT` usage bit set.

### Valid Usage (Implicit)

- **VUID-VkImageViewHandleInfoNVX-sType-sType**
  - `sType` **must** be `VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX`.

- **VUID-VkImageViewHandleInfoNVX-pNext-pNext**
  - `pNext` **must** be `NULL`.

- **VUID-VkImageViewHandleInfoNVX-imageView-parameter**
  - `imageView` **must** be a valid `VkImageView` handle.

- **VUID-VkImageViewHandleInfoNVX-descriptorType-parameter**
  - `descriptorType` **must** be a valid `VkDescriptorType` value.

- **VUID-VkImageViewHandleInfoNVX-sampler-parameter**
  - If `sampler` is not `VK_NULL_HANDLE`, `sampler` **must** be a valid `VkSampler` handle.

- **VUID-VkImageViewHandleInfoNVX-commonparent**
  - Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`.

To get the device address for an image view, call:

```c
// Provided by VK_NVX_image_view_handle
VkResult vkGetImageViewAddressNVX(
    VkDevice device,
    VkImageView imageView
);
```
• **device** is the logical device that owns the image view.
• **imageView** is a handle to the image view.
• **pProperties** contains the device address and size when the call returns.

### Valid Usage (Implicit)

- VUID-vkGetImageViewAddressNVX-device-parameter
  
  **device** must be a valid `VkDevice` handle

- VUID-vkGetImageViewAddressNVX-imageView-parameter
  
  **imageView** must be a valid `VkImageView` handle

- VUID-vkGetImageViewAddressNVX-pProperties-parameter
  
  **pProperties** must be a valid pointer to a `VkImageViewAddressPropertiesNVX` structure

- VUID-vkGetImageViewAddressNVX-imageView-parent
  
  **imageView** must have been created, allocated, or retrieved from **device**

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_UNKNOWN`

The `VkImageViewAddressPropertiesNVX` structure is defined as:

```c
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewAddressPropertiesNVX {
    VkStructureType sType;
    void* pNext;
    VkDeviceAddress deviceAddress;
    VkDeviceSize size;
} VkImageViewAddressPropertiesNVX;
```

• **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.
• **deviceAddress** is the device address of the image view.
• **size** is the size in bytes of the image view device memory.
Valid Usage (Implicit)

- VUID-VkImageViewAddressPropertiesNVX-sType-sType
  sType **must** be VK_STRUCTURE_TYPE_IMAGE_VIEW_ADDRESS_PROPERTIES_NVX

- VUID-VkImageViewAddressPropertiesNVX-pNext-pNext
  pNext **must** be NULL

### 12.5.1. Image View Format Features

Valid uses of a VkImageView may depend on the image view’s format features, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is enabled, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view’s set of format features is the value of VkFormatProperties3::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties2 on the same format as VkImageViewCreateInfo::format.

- If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not enabled, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_LINEAR, then the image view’s set of format features is the union of the value of VkFormatProperties::linearTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:
  - VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
  - VK_FORMAT_FEATURE_2_STORAGE_READWITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageReadWithoutFormat is enabled on the device.
  - VK_FORMAT_FEATURE_2_STORAGE_WRITEWITHOUT_FORMAT_BIT if the format is one of the extended storage formats and shaderStorageImageWriteWithoutFormat is enabled on the device.

- If Vulkan 1.3 is supported or the VK_KHR_format_feature_flags2 extension is enabled, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, then the image view’s set of format features is the value of VkFormatProperties::optimalTilingFeatures or VkFormatProperties3::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties or vkGetPhysicalDeviceImageFormatProperties2 on the same format as VkImageViewCreateInfo::format.

- If Vulkan 1.3 is not supported and the VK_KHR_format_feature_flags2 extension is not enabled, and VkImageViewCreateInfo::image was created with VK_IMAGE_TILING_OPTIMAL, but without an Android hardware buffer external format, then the image view’s set of format features is the union of the value of VkFormatProperties::optimalTilingFeatures found by calling vkGetPhysicalDeviceFormatProperties on the same format as VkImageViewCreateInfo::format, with:
  - VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT if the format is a depth/stencil format and the image view features also contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT.
◦ **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT** if the format is one of the extended storage formats and `shaderStorageImageReadWithoutFormat` is enabled on the device.

◦ **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT** if the format is one of the extended storage formats and `shaderStorageImageWriteWithoutFormat` is enabled on the device.

- If `VkImageViewCreateInfo::image` was created with an Android hardware buffer external format, then the image view’s set of format features is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` found by calling `vkGetAndroidHardwareBufferPropertiesANDROID` on the Android hardware buffer that was imported to the `VkDeviceMemory` to which the `VkImageViewCreateInfo::image` is bound.

- If `VkImageViewCreateInfo::image` was created with a chained `VkBufferCollectionImageCreateInfoFUCHSIA`, then the image view’s set of format features is the value of `VkBufferCollectionPropertiesFUCHSIA::formatFeatures` found by calling `vkGetBufferCollectionPropertiesFUCHSIA` on the buffer collection passed as `VkBufferCollectionImageCreateInfoFUCHSIA::collection` when the image was created.

- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:

  ◦ The image’s DRM format modifier is the value of `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.

  ◦ Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`.

  ◦ Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image’s DRM format modifier.

  ◦ Then the image view’s set of format features is `prop::drmFormatModifierTilingFeatures`.

The `VkImageViewMinLodCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_image_view_min_lod
typedef struct VkImageViewMinLodCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float minLod;
} VkImageViewMinLodCreateInfoEXT;
```

- `sType` is the type of this structure.

- `pNext` is `NULL` or a pointer to a structure extending this structure.

- `minLod` is the value to clamp the minimum LOD accessible by this `VkImageView`.

If the `pNext` chain includes a `VkImageViewMinLodCreateInfoEXT` structure, then that structure includes a parameter specifying a value to clamp the minimum LOD value during Image Level(s) Selection, Texel Gathering and Integer Texel Coordinate Operations.

If the image view contains `VkImageViewMinLodCreateInfoEXT` and it is used as part of a sampling
operation:
\[ \text{minLodFloat}_{\text{imageView}} = \text{minLod} \]

otherwise:
\[ \text{minLodFloat}_{\text{imageView}} = 0.0 \]

An integer variant of this parameter is also defined for sampling operations which access integer mipmap levels:
\[ \text{minLodInteger}_{\text{imageView}} = \lfloor \text{minLodFloat}_{\text{imageView}} \rfloor \]

### Valid Usage

- **VUID-VkImageViewMinLodCreateInfoEXT-minLod-06455**
  If the \textit{minLod} feature is not enabled, \textit{minLod} must be 0.0.

- **VUID-VkImageViewMinLodCreateInfoEXT-minLod-06456**
  \textit{minLod} must be less or equal to the index of the last mipmap level accessible to the view.

### Valid Usage (Implicit)

- **VUID-VkImageViewMinLodCreateInfoEXT-sType-sType**
  \textit{sType} must be \textit{VK_STRUCTURE_TYPE_IMAGE_VIEW_MIN_LOD_CREATE_INFO_EXT}

### 12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by \textit{VkAccelerationStructureKHR} handles:

```c
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

Acceleration structures for the \textit{VK_NV_ray_tracing} extension are represented by the similar \textit{VkAccelerationStructureNV} handles:
To create acceleration structures, call:

```c
VKResult vkCreateAccelerationStructureNV(
    VkDevice                       device,
    const VkAccelerationStructureCreateInfoNV* pCreateInfo,
    constVkAllocationCallbacks* pAllocator,
    VkAccelerationStructureNV* pAccelerationStructure);
```

- `device` is the logical device that creates the buffer object.
- `pCreateInfo` is a pointer to a `VkAccelerationStructureCreateInfoNV` structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureNV` handle in which the resulting acceleration structure object is returned.

Similarly to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape” as specified by the information in `VkAccelerationStructureCreateInfoNV` and `compactedSize` in `pCreateInfo`. Populating the data in the object after allocating and binding memory is done with `vkCmdBuildAccelerationStructureNV` and `vkCmdCopyAccelerationStructureNV`.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.

### Valid Usage (Implicit)

- **VUID-vkCreateAccelerationStructureNV-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateAccelerationStructureNV-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkAccelerationStructureCreateInfoNV` structure

- **VUID-vkCreateAccelerationStructureNV-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateAccelerationStructureNV-pAccelerationStructure-parameter**
  
  `pAccelerationStructure` must be a valid pointer to a `VkAccelerationStructureNV` handle
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY

The VkAccelerationStructureCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize compactedSize;
    VkAccelerationStructureInfoNV info;
} VkAccelerationStructureCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `compactedSize` is the size from the result of `vkCmdWriteAccelerationStructuresPropertiesNV` if this acceleration structure is going to be the target of a compacting copy.
- `info` is the `VkAccelerationStructureInfoNV` structure specifying further parameters of the created acceleration structure.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoNV-compactedSize-02421
  If `compactedSize` is not 0 then both `info.geometryCount` and `info.instanceCount` must be 0

Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV`
- VUID-VkAccelerationStructureCreateInfoNV-pNext-pNext
  `pNext` must be NULL
- VUID-VkAccelerationStructureCreateInfoNV-info-parameter
  `info` must be a valid `VkAccelerationStructureInfoNV` structure

The VkAccelerationStructureInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
```
typedef structVkAccelerationStructureInfoNV {
  VkStructureType sType;
  const void* pNext;
  VkAccelerationStructureTypeNV type;
  VkBuildAccelerationStructureFlagsNV flags;
  uint32_t instanceCount;
  uint32_t geometryCount;
  const VkGeometryNV* pGeometries;
} VkAccelerationStructureInfoNV;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **type** is a `VkAccelerationStructureTypeNV` value specifying the type of acceleration structure that will be created.
- **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsNV` specifying additional parameters of the acceleration structure.
- **instanceCount** specifies the number of instances that will be in the new acceleration structure.
- **geometryCount** specifies the number of geometries that will be in the new acceleration structure.
- **pGeometries** is a pointer to an array of `geometryCount` `VkGeometryNV` structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureInfoNV` contains information that is used both for acceleration structure creation with `vkCreateAccelerationStructureNV` and in combination with the actual geometric data to build the acceleration structure with `vkCmdBuildAccelerationStructureNV`.

### Valid Usage

- **VUID-VkAccelerationStructureInfoNV-geometryCount-02422**
  
  `geometryCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- **VUID-VkAccelerationStructureInfoNV-instanceCount-02423**
  
  `instanceCount` **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxInstanceCount`

- **VUID-VkAccelerationStructureInfoNV-maxTriangleCount-02424**
  
  The total number of triangles in all geometries **must** be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxTriangleCount`

- **VUID-VkAccelerationStructureInfoNV-type-02425**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` then `geometryCount` **must** be 0

- **VUID-VkAccelerationStructureInfoNV-type-02426**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then `instanceCount` **must** be 0

- **VUID-VkAccelerationStructureInfoNV-type-02786**
  
  If `type` is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then the `geometryType` member of each geometry in `pGeometries` **must** be the same
- **VUID-VkAccelerationStructureInfoNV-type-04623**
  The `type` must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

- **VUID-VkAccelerationStructureInfoNV-flags-02592**
  If `flags` has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV` bit set, then it must not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV` bit set.

- **VUID-VkAccelerationStructureInfoNV-scratch-02781**
  The `scratch` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

- **VUID-VkAccelerationStructureInfoNV-instanceData-02782**
  If `instanceData` is not `VK_NULL_HANDLE`, `instanceData` must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag.

**Valid Usage (Implicit)**

- **VUID-VkAccelerationStructureInfoNV-sType-sType**
  The `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV`.

- **VUID-VkAccelerationStructureInfoNV-pNext-pNext**
  The `pNext` must be `NULL`.

- **VUID-VkAccelerationStructureInfoNV-type-parameter**
  The `type` must be a valid `VkAccelerationStructureTypeNV` value.

- **VUID-VkAccelerationStructureInfoNV-flags-parameter**
  The `flags` must be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values.

- **VUID-VkAccelerationStructureInfoNV-pGeometries-parameter**
  If `geometryCount` is not 0, `pGeometries` must be a valid pointer to an array of `geometryCount` valid `VkGeometryNV` structures.

To create an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureKHR* pAccelerationStructure);
```

- `device` is the logical device that creates the acceleration structure object.
- `pCreateInfo` is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pAccelerationStructure` is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with...
a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

Populating the data in the object after allocating and binding memory is done with commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure may hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures must be fully self-contained. The application may re-use or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.

### Valid Usage

- **VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611**
  The accelerationStructure feature must be enabled

- **VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488**
  If `VkAccelerationStructureCreateInfoKHR::deviceAddress` is not zero, the accelerationStructureCaptureReplay feature must be enabled

- **VUID-vkCreateAccelerationStructureKHR-device-03489**
  If `device` was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

### Valid Usage (Implicit)

- **VUID-vkCreateAccelerationStructureKHR-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkAccelerationStructureCreateInfoKHR` structure

- **VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter**
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter**
  `pAccelerationStructure` must be a valid pointer to a `VkAccelerationStructureKHR` handle

### Return Codes

**Success**
- `VK_SUCCESS`
The `VkAccelerationStructureCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureCreateFlagsKHR createFlags;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize size;
    VkAccelerationStructureTypeKHR type;
    VkDeviceAddress deviceAddress;
} VkAccelerationStructureCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **createFlags** is a bitmask of `VkAccelerationStructureCreateFlagBitsKHR` specifying additional creation parameters of the acceleration structure.
- **buffer** is the buffer on which the acceleration structure will be stored.
- **offset** is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of 256.
- **size** is the size required for the acceleration structure.
- **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure that will be created.
- **deviceAddress** is the device address requested for the acceleration structure if the `accelerationStructureCaptureReplay` feature is being used.

If `deviceAddress` is zero, no specific address is requested.

If `deviceAddress` is not zero, `deviceAddress` **must** be an address retrieved from an identically created acceleration structure on the same implementation. The acceleration structure **must** also be placed on an identically created `buffer` and at the same `offset`.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use
VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT, and will add VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT to all buffers used as storage for an acceleration structure where deviceAddress is not zero. This also means that the tool will need to add VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT, to avoid address space allocation conflicts.

Applications should create an acceleration structure with a specific VkAccelerationStructureTypeKHR other than VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR.

Note
VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR is intended to be used by API translation layers. This can be used at acceleration structure creation time in cases where the actual acceleration structure type (top or bottom) is not yet known. The actual acceleration structure type must be specified as VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR when the build is performed.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure can be queried with vkGetAccelerationStructureBuildSizesKHR. If the acceleration structure is going to be the target of a compacting copy, vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR can be used to obtain the compacted size required.

If the acceleration structure will be the target of a build operation with VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV it must include VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV in flags and include VkAccelerationStructureMotionInfoNV as an extension structure in pNext with the number of instances as metadata for the object.

Valid Usage

- VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612
  If deviceAddress is not zero, createFlags must include VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613
  If createFlags includes VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR, VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay
must be **VK_TRUE**

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614**
  
  buffer **must** have been created with a usage value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615**
  
  buffer **must** not have been created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03616**
  
  The sum of `offset` and `size` **must** be less than the size of `buffer`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03734**
  
  `offset` **must** be a multiple of 256 bytes

- **VUID-VkAccelerationStructureCreateInfoKHR-flags-04954**
  
  If `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` is set in `flags` and `type` is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, one member of the `pNext` chain **must** be a pointer to a valid instance of `VkAccelerationStructureMotionInfoNV`

- **VUID-VkAccelerationStructureCreateInfoKHR-flags-04955**
  
  If any geometry includes `VkAccelerationStructureGeometryMotionTrianglesDataNV` then `flags` **must** contain `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV`

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureCreateInfoKHR-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext**
  
  `pNext` **must** be `NULL` or a pointer to a valid instance of `VkAccelerationStructureMotionInfoNV`

- **VUID-VkAccelerationStructureCreateInfoKHR-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain **must** be unique

- **VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter**
  
  `createFlags` **must** be a valid combination of `VkAccelerationStructureCreateFlagBitsKHR` values

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter**
  
  `buffer` **must** be a valid `VkBuffer` handle

- **VUID-VkAccelerationStructureCreateInfoKHR-type-parameter**
  
  `type` **must** be a valid `VkAccelerationStructureTypeKHR` value

The `VkAccelerationStructureMotionInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInstances;
} VkAccelerationStructureMotionInfoNV;
```
VkAccelerationStructureMotionInfoFlagsNV flags;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `maxInstances` is the maximum number of instances that may be used in the motion top-level acceleration structure.
- `flags` is 0 and reserved for future use.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInfoNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MOTION_INFO_NV`
- VUID-VkAccelerationStructureMotionInfoNV-flags-zerobitmask
  `flags` must be 0

```c
typedef VkFlags VkAccelerationStructureMotionInfoFlagsNV;
```

`VkAccelerationStructureMotionInfoFlagsNV` is a bitmask type for setting a mask, but is currently reserved for future use.

To get the build sizes for an acceleration structure, call:

```c
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.
- `pMaxPrimitiveCounts` is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values defining the number of primitives built into each geometry.
- `pSizeInfo` is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.
The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- For `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `geometryType` member is equal to `pBuildInfo->geometryType`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, its `flags` member is equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `vertexFormat` and `indexType` members of `geometry.triangles` are equal to the corresponding members of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, the `maxVertex` member of `geometry.triangles` is less than or equal to the corresponding member of the same element in `pBuildInfo`.
  - For each element of either `pGeometries` or `ppGeometries` at a given index, with a `geometryType` member equal to `VK_GEOMETRY_TYPE_TRIANGLES_KHR`, if the applicable address in the `transformData` member of `geometry.triangles` is not `NULL`, the corresponding `transformData.hostAddress` parameter in `pBuildInfo` is not `NULL`.
- For each `VkAccelerationStructureBuildRangeInfoKHR` corresponding to the `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `primitiveCount` member is less than or equal to the corresponding element of `pMaxPrimitiveCounts`.

Similarly, the `updateScratchSize` value will support any build command specifying the `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` mode under the above conditions, and the `buildScratchSize` value will support any build command specifying the `VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR` mode under the above conditions.
Valid Usage

- VUID-vkGetAccelerationStructureBuildSizesKHR-rayTracingPipeline-03617
  The `rayTracingPipeline` or `rayQuery` feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If `pBuildInfo->geometryCount` is not 0, `pMaxPrimitiveCounts` must be a valid pointer to an array of `pBuildInfo->geometryCount uint32_t` values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If `pBuildInfo->pGeometries` or `pBuildInfo->ppGeometries` has a `geometryType` of `VK_GEOMETRY_TYPE_INSTANCES_KHR`, each `pMaxPrimitiveCounts[i]` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount`

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
  `buildType` must be a valid `VkAccelerationStructureBuildTypeKHR` value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
  `pBuildInfo` must be a valid pointer to a valid `VkAccelerationStructureBuildGeometryInfoKHR` structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
  If `pMaxPrimitiveCounts` is not NULL, `pMaxPrimitiveCounts` must be a valid pointer to an array of `pBuildInfo->geometryCount uint32_t` values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
  `pSizeInfo` must be a valid pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure

The `VkAccelerationStructureBuildSizesInfoKHR` structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **accelerationStructureSize** is the size in bytes required in a `VkAccelerationStructureKHR` for a build or update operation.
• **updateScratchSize** is the size in bytes required in a scratch buffer for an update operation.
• **buildScratchSize** is the size in bytes required in a scratch buffer for a build operation.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR`
- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext
  - `pNext` must be NULL

Values which can be set in `VkAccelerationStructureCreateInfoKHR::type` or `VkAccelerationStructureInfoNV::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,

    // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV =
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR,

    // Provided by VK_NV_ray_tracing
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV =
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR,
} VkAccelerationStructureTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureTypeKHR VkAccelerationStructureTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR** is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- **VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR** is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- **VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR** is an acceleration structure whose type is determined at build time used for special circumstances. In these cases, the acceleration structure type is not known at creation time, but **must** be specified at build time as either top or bottom.
Bits which can be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
    // Provided by VK_NV_ray_tracing_motion_blur
    VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV = 0x00000004,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR` specifies that the acceleration structure's address can be saved and reused on a subsequent run.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```

`VkAccelerationStructureCreateFlagsKHR` is a bitmask type for setting a mask of zero or more `VkAccelerationStructureCreateFlagBitsKHR`.

Bits which can be set in `VkAccelerationStructureBuildGeometryInfoKHR::flags` or `VkAccelerationStructureInfoNV::flags` specifying additional parameters for acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
    // Provided by VK_NV_ray_tracing_motion_blur
    VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV = 0x00000020,
    // Provided by VK_NV_ray_tracing
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_NV = VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR,
} VkBuildAccelerationStructureFlagBitsKHR;
```
} VkBuildAccelerationStructureFlagBitsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagBitsKHR VkBuildAccelerationStructureFlagBitsNV;

- **VK_BUILD_ACCELERATION_STRUCTURE.AllowUpdateBitKHR** indicates that the specified acceleration structure can be updated with a mode of **VK_BUILD_ACCELERATION_STRUCTURE.ModeUpdateKHR** in `VkAccelerationStructureBuildGeometryInfoKHR` or an update of **VK_TRUE** in `vkCmdBuildAccelerationStructureNV`.

- **VK_BUILD_ACCELERATION_STRUCTURE.AllowCompactionBitKHR** indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of **VK_COPY_ACCELERATION_STRUCTURE.ModeCompactKHR** to produce a compacted acceleration structure.

- **VK_BUILD_ACCELERATION_STRUCTURE.PrefetchFastTraceBitKHR** indicates that the given acceleration structure build should prioritize trace performance over build time.

- **VK_BUILD_ACCELERATION_STRUCTURE.PrefetchFastBuildBit_KHR** indicates that the given acceleration structure build should prioritize build time over trace performance.

- **VK_BUILD_ACCELERATION_STRUCTURE.LowMemoryBit_KHR** indicates that this acceleration structure should minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

    Note
    **VK_BUILD_ACCELERATION_STRUCTURE.AllowUpdateBit_KHR** and **VK_BUILD_ACCELERATION_STRUCTURE.AllowCompactionBit_KHR** may take more time and memory than a normal build, and so should only be used when those features are needed.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagsKHR VkBuildAccelerationStructureFlagsNV;

`VkBuildAccelerationStructureFlagsKHR` is a bitmask type for setting a mask of zero or more `VkBuildAccelerationStructureFlagBitsKHR`.

The `VkGeometryNV` structure describes geometry in a bottom-level acceleration structure and is defined as:
typedef struct VkGeometryNV {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkGeometryDataNV geometry;
    VkGeometryFlagsKHR flags;
} VkGeometryNV;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **geometryType** specifies the **VkGeometryTypeKHR** which this geometry refers to.
- **geometry** contains the geometry data as described in **VkGeometryDataNV**.
- **flags** has **VkGeometryFlagBitsKHR** describing options for this geometry.

**Valid Usage**

- **VUID-VkGeometryNV-geometryType-03503**
  
  **geometryType** must be **VK_GEOMETRY_TYPE_TRIANGLES_NV** or **VK_GEOMETRY_TYPE_AABBS_NV**

**Valid Usage (Implicit)**

- **VUID-VkGeometryNV-sType-sType**
  
  **sType** must be **VK_STRUCTURE_TYPE_GEOMETRY_NV**

- **VUID-VkGeometryNV-pNext-pNext**
  
  **pNext** must be **NULL**

- **VUID-VkGeometryNV-geometryType-parameter**
  
  **geometryType** must be a valid **VkGeometryTypeKHR** value

- **VUID-VkGeometryNV-geometry-parameter**
  
  **geometry** must be a valid **VkGeometryDataNV** structure

- **VUID-VkGeometryNV-flags-parameter**
  
  **flags** must be a valid combination of **VkGeometryFlagBitsKHR** values

Geometry types are specified by **VkGeometryTypeKHR**, which takes values:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
    // Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_TRIANGLES_NV = VK_GEOMETRY_TYPE_TRIANGLES_KHR,
```
• **VK_GEOMETRY_TYPE_TRIANGLES_KHR** specifies a geometry type consisting of triangles.

• **VK_GEOMETRY_TYPE_AABBS_KHR** specifies a geometry type consisting of axis-aligned bounding boxes.

• **VK_GEOMETRY_TYPE_INSTANCES_KHR** specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:

• **VK_GEOMETRY_OPAQUE_BIT_KHR** indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.

• **VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR** indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation may invoke the any-hit shader more than once for this geometry.
typedef VkGeometryFlagsKHR VkGeometryFlagsNV;

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

The VkGeometryDataNV structure specifies geometry in a bottom-level acceleration structure and is defined as:

typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV triangles;
    VkGeometryAABBNV aabbs;
} VkGeometryDataNV;

- triangles contains triangle data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_TRIANGLES_NV.
- aabbs contains axis-aligned bounding box data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_AABBS_NV.

Valid Usage (Implicit)

- VUID-VkGeometryDataNV-triangles-parameter triangles must be a valid VkGeometryTrianglesNV structure
- VUID-VkGeometryDataNV-aabbs-parameter aabbs must be a valid VkGeometryAABBNV structure

The VkGeometryTrianglesNV structure specifies triangle geometry in a bottom-level acceleration structure and is defined as:

typedef struct VkGeometryTrianglesNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer vertexData;
    VkDeviceSize vertexOffset;
    uint32_t vertexCount;
    VkDeviceSize vertexStride;
    VkFormat vertexFormat;
    VkBuffer indexData;
    VkDeviceSize indexOffset;
    uint32_t indexCount;
    VkIndexType indexType;
    VkBuffer transformData;
    VkDeviceSize transformOffset;
} VkGeometryTrianglesNV;
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **vertexData** is the buffer containing vertex data for this geometry.
• **vertexOffset** is the offset in bytes within **vertexData** containing vertex data for this geometry.
• **vertexCount** is the number of valid vertices.
• **vertexStride** is the stride in bytes between each vertex.
• **vertexFormat** is a *VkFormat* describing the format of each vertex element.
• **indexData** is the buffer containing index data for this geometry.
• **indexOffset** is the offset in bytes within **indexData** containing index data for this geometry.
• **indexCount** is the number of indices to include in this geometry.
• **indexType** is a *VkIndexType* describing the format of each index.
• **transformData** is an optional buffer containing an *VkTransformMatrixNV* structure defining a transformation to be applied to this geometry.
• **transformOffset** is the offset in bytes in **transformData** of the transform information described above.

If **indexType** is *VK_INDEX_TYPE_NONE_NV*, then this structure describes a set of triangles determined by **vertexCount**. Otherwise, this structure describes a set of indexed triangles determined by **indexCount**.

### Valid Usage

- **VUID-VkGeometryTrianglesNV-vertexOffset-02428**
  vertexOffset must be less than the size of vertexData

- **VUID-VkGeometryTrianglesNV-vertexOffset-02429**
  vertexOffset must be a multiple of the component size of vertexFormat

- **VUID-VkGeometryTrianglesNV-vertexFormat-02430**
  vertexFormat must be one of VK_FORMAT_R32G32B32_SFLOAT, VK_FORMAT_R32G32_SFLOAT, VK_FORMAT_R16G16B16_SFLOAT, VK_FORMAT_R16G16_SFLOAT, VK_FORMAT_R16G16_SNORM, or VK_FORMAT_R16G16B16_SNORM

- **VUID-VkGeometryTrianglesNV-vertexStride-03818**
  vertexStride must be less than or equal to $2^{32}-1$

- **VUID-VkGeometryTrianglesNV-indexOffset-02431**
  indexOffset must be less than the size of indexData

- **VUID-VkGeometryTrianglesNV-indexOffset-02432**
  indexOffset must be a multiple of the element size of indexType

- **VUID-VkGeometryTrianglesNV-indexType-02433**
  indexType must be VK_INDEX_TYPE_UINT16, VK_INDEX_TYPE_UINT32, or VK_INDEX_TYPE_NONE_NV

- **VUID-VkGeometryTrianglesNV-indexData-02434**
  indexData must be VK_NULL_HANDLE if indexType is VK_INDEX_TYPE_NONE_NV

- **VUID-VkGeometryTrianglesNV-indexData-02435**
indexData must be a valid VkBuffer handle if indexType is not VK_INDEX_TYPE_NONE_NV

- VUID-VkGeometryTrianglesNV-indexCount-02436
  indexCount must be 0 if indexType is VK_INDEX_TYPE_NONE_NV

- VUID-VkGeometryTrianglesNV-transformOffset-02437
  transformOffset must be less than the size of transformData

- VUID-VkGeometryTrianglesNV-transformOffset-02438
  transformOffset must be a multiple of 16

### Valid Usage (Implicit)

- VUID-VkGeometryTrianglesNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV

- VUID-VkGeometryTrianglesNV-pNext-pNext
  pNext must be NULL

- VUID-VkGeometryTrianglesNV-vertexData-parameter
  If vertexData is not VK_NULL_HANDLE, vertexData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-vertexFormat-parameter
  vertexFormat must be a valid VkFormat value

- VUID-VkGeometryTrianglesNV-indexData-parameter
  If indexData is not VK_NULL_HANDLE, indexData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-indexType-parameter
  indexType must be a valid VkIndexType value

- VUID-VkGeometryTrianglesNV-transformData-parameter
  If transformData is not VK_NULL_HANDLE, transformData must be a valid VkBuffer handle

- VUID-VkGeometryTrianglesNV-commonparent
  Each of indexData, transformData, and vertexData that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The VkGeometryAABBNV structure specifies axis-aligned bounding box geometry in a bottom-level acceleration structure, and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryAABBNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer aabbData;
    uint32_t numAABBs;
    uint32_t stride;
    VkDeviceSize offset;
} VkGeometryAABBNV;
```

- sType is the type of this structure.
• \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
• \texttt{aabbData} is the buffer containing axis-aligned bounding box data.
• \texttt{numAABBs} is the number of AABBs in this geometry.
• \texttt{stride} is the stride in bytes between AABBs in \texttt{aabbData}.
• \texttt{offset} is the offset in bytes of the first AABB in \texttt{aabbData}.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.

### Valid Usage

- VUID-VkGeometryAABBNV-offset-02439
  \textit{offset} must be less than the size of \texttt{aabbData}

- VUID-VkGeometryAABBNV-offset-02440
  \textit{offset} must be a multiple of 8

- VUID-VkGeometryAABBNV-stride-02441
  \textit{stride} must be a multiple of 8

### Valid Usage (Implicit)

- VUID-VkGeometryAABBNV-sType-sType
  \textit{sType} must be \texttt{VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV}

- VUID-VkGeometryAABBNV-pNext-pNext
  \textit{pNext} must be \texttt{NULL}

- VUID-VkGeometryAABBNV-aabbData-parameter
  If \texttt{aabbData} is not \texttt{VK_NULL_HANDLE}, \texttt{aabbData} must be a valid \texttt{VkBuffer} handle

To destroy an acceleration structure, call:

```c
void vkDestroyAccelerationStructureKHR(
    VkDevice device,
    VkAccelerationStructureKHR accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- \texttt{device} is the logical device that destroys the acceleration structure.
- \texttt{accelerationStructure} is the acceleration structure to destroy.
- \texttt{pAllocator} controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442
  All submitted commands that refer to accelerationStructure must have completed execution

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443
  If VkAllocationCallbacks were provided when accelerationStructure was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444
  If no VkAllocationCallbacks were provided when accelerationStructure was created, pAllocator must be NULL

Valid Usage (Implicit)

- VUID-vkDestroyAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parameter
  If accelerationStructure is not VK_NULL_HANDLE, accelerationStructure must be a valid VkAccelerationStructureKHR handle

- VUID-vkDestroyAccelerationStructureKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-parent
  If accelerationStructure is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to accelerationStructure must be externally synchronized

To destroy an acceleration structure, call:

```c
// Provided by VK_NV_ray_tracing
void vkDestroyAccelerationStructureNV(
    VkDevice device,
    VkAccelerationStructureNV accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the buffer.
- accelerationStructure is the acceleration structure to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03752
  All submitted commands that refer to `accelerationStructure` must have completed execution

• VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03753
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03754
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

• VUID-vkDestroyAccelerationStructureNV-device-parameter
device must be a valid `VkDevice` handle

• VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parameter
  If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle

• VUID-vkDestroyAccelerationStructureNV-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkDestroyAccelerationStructureNV-accelerationStructure-parent
  If `accelerationStructure` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

• Host access to `accelerationStructure` must be externally synchronized

An acceleration structure has memory requirements for the structure object itself, scratch space for the build, and scratch space for the update.

Scratch space is allocated as a `VkBuffer`, so for `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` and `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` the `pMemoryRequirements->alignment` and `pMemoryRequirements->memoryTypeBits` values returned by this call must be filled with zero, and should be ignored by the application.

To query the memory requirements, call:

```c
// Provided by VK_NV_ray_tracing
go void vkGetAccelerationStructureMemoryRequirementsNV
```
VkDevice

const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo,
VkMemoryRequirements2KHR* pMemoryRequirements);

• **device** is the logical device on which the acceleration structure was created.

• **pInfo** is a pointer to a *VkAccelerationStructureMemoryRequirementsInfoNV* structure specifying the acceleration structure to get memory requirements for.

• **pMemoryRequirements** is a pointer to a *VkMemoryRequirements2KHR* structure in which the requested acceleration structure memory requirements are returned.

---

The *VkAccelerationStructureMemoryRequirementsInfoNV* structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType               sType;
    const void*                   pNext;
    VkAccelerationStructureMemoryRequirementsTypeNV type;
    VkAccelerationStructureNV    accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **type** selects the type of memory requirement being queried.
  *VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV* returns the memory requirements for the object itself.
  *VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV* returns the memory requirements for the scratch memory when doing a build.
  *VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV* returns the memory requirements for the scratch memory when doing an update.

• **accelerationStructure** is the acceleration structure to be queried for memory requirements.
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureMemoryRequirementsInfoNV-sType-sType** must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_INFO_NV`
- **VUID-VkAccelerationStructureMemoryRequirementsInfoNV-pNext-pNext** must be NULL
- **VUID-VkAccelerationStructureMemoryRequirementsInfoNV-type-parameter** type must be a valid `VkAccelerationStructureMemoryRequirementsTypeNV` value
- **VUID-VkAccelerationStructureMemoryRequirementsInfoNV-accelerationStructure-parameter** accelerationStructure must be a valid `VkAccelerationStructureNV` handle

Possible values of **type** in `VkAccelerationStructureMemoryRequirementsInfoNV` are:

```c
// Provided by VK_NV_ray_tracing
typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
} VkAccelerationStructureMemoryRequirementsTypeNV;
```

- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV** requests the memory requirement for the `VkAccelerationStructureNV` backing store.
- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV** requests the memory requirement for scratch space during the initial build.
- **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV** requests the memory requirement for scratch space during an update.

Possible values of **buildType** in `vkGetAccelerationStructureBuildSizesKHR` are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;
```

- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR** requests the memory requirement for operations performed by the host.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR** requests the memory requirement for operations performed by the device.
- **VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR** requests the memory requirement for operations performed by either the host, or the device.
To attach memory to one or more acceleration structures at a time, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkBindAccelerationStructureMemoryNV(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);
```

- `device` is the logical device that owns the acceleration structures and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `VkBindAccelerationStructureMemoryInfoNV` structures describing acceleration structures and memory to bind.

### Valid Usage (Implicit)

- VUID-vkBindAccelerationStructureMemoryNV-device-parameter
  `device` must be a valid `VkDevice` handle
- VUID-vkBindAccelerationStructureMemoryNV-pBindInfos-parameter
  `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindAccelerationStructureMemoryInfoNV` structures
- VUID-vkBindAccelerationStructureMemoryNV-bindInfoCount-arraylength
  `bindInfoCount` must be greater than 0

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkBindAccelerationStructureMemoryInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkBindAccelerationStructureMemoryInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureNV accelerationStructure;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindAccelerationStructureMemoryInfoNV;
```
VkBindAccelerationStructureMemoryInfoNV;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructure` is the acceleration structure to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified acceleration structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

## Valid Usage

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-03620
  
  `accelerationStructure` **must** not already be backed by a memory object

- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03621
  
  `memoryOffset` **must** be less than the size of `memory`

- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-03622
  
  `memory` **must** have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and type of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV`

- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03623
  
  `memoryOffset` **must** be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and type of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV`

- VUID-VkBindAccelerationStructureMemoryInfoNV-size-03624
  
  The `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetAccelerationStructureMemoryRequirementsNV` with `accelerationStructure` and type of `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV` **must** be less than or equal to the size of `memory` minus `memoryOffset`

## Valid Usage (Implicit)

- VUID-VkBindAccelerationStructureMemoryInfoNV-sType-sType
  
  `sType` **must** be `VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV`

- VUID-VkBindAccelerationStructureMemoryInfoNV-pNext-pNext
  
  `pNext` **must** be `NULL`

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-parameter...
accelerationStructure must be a valid VkAccelerationStructureNV handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-pDeviceIndices-parameter
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

- VUID-VkBindAccelerationStructureMemoryInfoNV-commonparent
  Both of accelerationStructure, and memory must have been created, allocated, or retrieved from the same VkDevice

To allow constructing geometry instances with device code if desired, we need to be able to query a opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetAccelerationStructureHandleNV(
    VkDevice device,
    VkAccelerationStructureNV accelerationStructure,
    size_t dataSize,
    void* pData);
```

- device is the logical device that owns the acceleration structures.
- accelerationStructure is the acceleration structure.
- dataSize is the size in bytes of the buffer pointed to by pData.
- pData is a pointer to a user-allocated buffer where the results will be written.

**Valid Usage**

- VUID-vkGetAccelerationStructureHandleNV-dataSize-02240
  dataSize must be large enough to contain the result of the query, as described above

- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-02787
  accelerationStructure must be bound completely and contiguously to a single VkDeviceMemory object via vkBindAccelerationStructureMemoryNV

**Valid Usage (Implicit)**

- VUID-vkGetAccelerationStructureHandleNV-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parameter
  accelerationStructure must be a valid VkAccelerationStructureNV handle

- VUID-vkGetAccelerationStructureHandleNV-pData-parameter
  pData must be a valid pointer to an array of dataSize bytes
• VUID-vkGetAccelerationStructureHandleNV-dataSize-arraylength
dataSize must be greater than 0
• VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parent
accelerationStructure must have been created, allocated, or retrieved from device

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
  VkDevice device,
  const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);
```

• `device` is the logical device that the acceleration structure was created on.
• `pInfo` is a pointer to a `VkAccelerationStructureDeviceAddressInfoKHR` structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of `VkAccelerationStructureCreateInfoKHR::deviceAddress`, the return value will be the same address.

If the acceleration structure was created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`, the returned address must be consistent with the relative offset to other acceleration structures with type `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` allocated with the same `VkBuffer`. That is, the difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

The returned address must be aligned to 256 bytes.

`Note`
The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure’s start offset in its storage buffer for acceleration structure types other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

960
Valid Usage

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled.

Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter
  `pInfo` must be a valid pointer to a valid `VkAccelerationStructureDeviceAddressInfoKHR` structure

The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `accelerationStructure` specifies the acceleration structure whose address is being queried.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR`

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
  `pNext` must be NULL

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
  `accelerationStructure` must be a valid `VkAccelerationStructureKHR` handle

12.7. Resource Memory Association

Resources are initially created as virtual allocations with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.
Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources **must** be bound completely and contiguously to a single VkDeviceMemory object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an *instance* of the resource. For sparse resources, each instance **can** be bound to memory arbitrarily differently. For non-sparse resources, each instance **can** either be bound to the local or a peer instance of the memory, or for images **can** be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.

**Note**

There are no new copy commands to transfer data between physical devices. Instead, an application **can** create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- **device** is the logical device that owns the buffer.
- **buffer** is the buffer to query.
- **pMemoryRequirements** is a pointer to a VkMemoryRequirements structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- VUID-vkGetBufferMemoryRequirements-device-parameter
  - **device** must be a valid VkDevice handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter
buffer must be a valid VkBuffer handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent
  buffer must have been created, allocated, or retrieved from device

To determine the memory requirements for an image resource which is not created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set, call:

```c
// Provided by VK_VERSION_1_0
def void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
    VkMemoryRequirements* pMemoryRequirements);
```

- device is the logical device that owns the image.
- image is the image to query.
- pMemoryRequirements is a pointer to a VkMemoryRequirements structure in which the memory requirements of the image object are returned.

Valid Usage

- VUID-vkGetImageMemoryRequirements-image-01588
  image must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag set

- VUID-vkGetImageMemoryRequirements-image-04004
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetImageMemoryRequirements-image-parameter
  image must be a valid VkImage handle
- VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements structure
- VUID-vkGetImageMemoryRequirements-image-parent
  image must have been created, allocated, or retrieved from device

The VkMemoryRequirements structure is defined as:
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;

• **size** is the size, in bytes, of the memory allocation **required** for the resource.

• **alignment** is the alignment, in bytes, of the offset within the allocation **required** for the resource.

• **memoryTypeBits** is a bitmask and contains one bit set for every supported memory type for the resource. Bit _i_ is set if and only if the memory type _i_ in the VkPhysicalDeviceMemoryProperties structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications **must** not call vkGetImageMemoryRequirements or vkGetImageMemoryRequirements2 with such an VkImage before it has been bound to memory. For this reason, applications also **must** not call vkGetDeviceImageMemoryRequirements with a VkImageCreateInfo describing an external Android hardware buffer. When importing Android hardware buffer memory, the **allocationSize** can be determined by calling vkGetAndroidHardwareBufferPropertiesANDROID. When allocating new memory for a VkImage that **can** be exported to an Android hardware buffer, the memory's **allocationSize** **must** be zero; the actual size will be determined by the dedicated image's parameters. After the memory has been allocated, the amount of space allocated from the memory's heap **can** be obtained by getting the image's memory requirements or by calling vkGetAndroidHardwareBufferPropertiesANDROID with the Android hardware buffer exported from the memory.

When allocating new memory for a VkBuffer that **can** be exported to an Android hardware buffer an application **may** still call vkGetBufferMemoryRequirements or vkGetBufferMemoryRequirements2 with VkBuffer before it has been bound to memory.

If the resource being queried was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT, VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT, or VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT external memory handle type, the value of **size** has no meaning and **should** be ignored.

The implementation guarantees certain properties about the memory requirements returned by vkGetBufferMemoryRequirements2, vkGetImageMemoryRequirements2, vkGetDeviceBufferMemoryRequirements, vkGetDeviceImageMemoryRequirements, vkGetBufferMemoryRequirements and vkGetImageMemoryRequirements:

• The **memoryTypeBits** member always contains at least one bit set.

• If **buffer** is a VkBuffer not created with the VK_BUFFER_CREATE_SPARSE_BINDING_BIT bit set, or if **image** is linear image, then the **memoryTypeBits** member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has both the
VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT bit and the VK_MEMORY_PROPERTY_HOST_COHERENT_BIT bit set. In other words, mappable coherent memory can always be attached to these objects.

- If buffer was created with VkExternalMemoryBufferCreateInfo::handleTypes set to 0 or image was created with VkExternalMemoryImageCreateInfo::handleTypes set to 0, the memoryTypeBits member always contains at least one bit set corresponding to a VkMemoryType with a propertyFlags that has the VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT bit set.

- The memoryTypeBits member is identical for all VkBuffer objects created with the same value for the flags and usage members in the VkBufferCreateInfo structure and the handleTypes member of the VkExternalMemoryBufferCreateInfo structure passed to vkCreateBuffer. Further, if usage1 and usage2 of type VkBufferUsageFlags are such that the bits set in usage2 are a subset of the bits set in usage1, and they have the same flags and VkExternalMemoryBufferCreateInfo::handleTypes, then the bits set in memoryTypeBits returned for usage1 must be a subset of the bits set in memoryTypeBits returned for usage2, for all values of flags.

- The alignment member is a power of two.

- The alignment member is identical for all VkBuffer objects created with the same combination of values for the usage and flags members in the VkBufferCreateInfo structure passed to vkCreateBuffer.

- If the maintenance4 feature is enabled, then the alignment member is identical for all VkImage objects created with the same combination of values for the flags, imageType, format, extent, mipLevels, arrayLayers, samples, tiling and usage members in the VkImageCreateInfo structure passed to vkCreateImage.

- The alignment member satisfies the buffer descriptor offset alignment requirements associated with the VkBuffer’s usage:
  - If usage included VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT or VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment.
  - If usage included VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment.
  - If usage included VK_BUFFER_USAGE_STORAGE_BUFFER_BIT, alignment must be an integer multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment.

- For images created with a color format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

- For images created with a depth/stencil format, the memoryTypeBits member is identical for all VkImage objects created with the same combination of values for the format member, the tiling member, the VK_IMAGE_CREATE_SPARSE_BINDING_BIT bit of the flags member, the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit of the flags member, handleTypes member of VkExternalMemoryImageCreateInfo, and the VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT of the usage member in the VkImageCreateInfo structure passed to vkCreateImage.

- If the memory requirements are for a VkImage, the memoryTypeBits member must not refer to a
**VkMemoryType** with a **propertyFlags** that has the **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit set if the image did not have **VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT** bit set in the **usage** member of the **VkImageCreateInfo** structure passed to **vkCreateImage**.

- If the memory requirements are for a **VkBuffer**, the **memoryTypeBits** member **must** not refer to a **VkMemoryType** with a **propertyFlags** that has the **VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT** bit set.

**Note**
The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The **size** member is identical for all **VkBuffer** objects created with the same combination of creation parameters specified in **VkBufferCreateInfo** and its **pNext** chain.

- The **size** member is identical for all **VkImage** objects created with the same combination of creation parameters specified in **VkImageCreateInfo** and its **pNext** chain.

**Note**
This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, **can** be explicitly requested using **VK_IMAGE_CREATE_ALIAS_BIT**.

- If the **maintenance4** feature is enabled, these additional guarantees apply:
  - For a **VkBuffer**, the **size** memory requirement is never greater than that of another **VkBuffer** created with a greater or equal **size** specified in **VkBufferCreateInfo**, all other creation parameters being identical.
  - For a **VkBuffer**, the **size** memory requirement is never greater than the result of aligning **VkBufferCreateInfo::size** with the **alignment** memory requirement.
  - For a **VkImage**, the **size** memory requirement is never greater than that of another **VkImage** created with a greater or equal value in each of **extent.width**, **extent.height**, and **extent.depth**; all other creation parameters being identical.
  - The memory requirements returned by **vkGetDeviceBufferMemoryRequirements** are identical to those that would be returned by **vkGetBufferMemoryRequirements2** if it were called with a **VkBuffer** created with the same **VkBufferCreateInfo** values.
  - The memory requirements returned by **vkGetDeviceImageMemoryRequirements** are identical to those that would be returned by **vkGetImageMemoryRequirements2** if it were called with a **VkImage** created with the same **VkImageCreateInfo** values.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```
or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a `VkBufferMemoryRequirementsInfo2` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  - `device` **must** be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  - `pInfo` **must** be a valid pointer to a valid `VkBufferMemoryRequirementsInfo2` structure
- VUID-vkGetBufferMemoryRequirements2-pMemoryRequirements-parameter
  - `pMemoryRequirements` **must** be a valid pointer to a `VkMemoryRequirements2` structure

To determine the memory requirements for a buffer resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device intended to own the buffer.
- `pInfo` is a pointer to a `VkDeviceBufferMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory
requirements of the buffer object are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceBufferMemoryRequirements-device-parameter 
  `device` must be a valid `VkDevice` handle

- VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter 
  `pInfo` must be a valid pointer to a valid `VkDeviceBufferMemoryRequirements` structure

- VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter 
  `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is the buffer to query.

Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType 
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`

- VUID-VkBufferMemory RequirementsInfo2-pNext-pNext 
  `pNext` must be `NULL`

- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter 
  `buffer` must be a valid `VkBuffer` handle

The `VkDeviceBufferMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
```
VkStructureType sType;
const void* pNext;
const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;

or the equivalent

// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements KvDeviceBufferMemoryRequirementsKHR;

- \textit{sType} is the type of this structure.
- \textit{pNext} is NULL or a pointer to a structure extending this structure.
- \textit{pCreateInfo} is a pointer to a \textit{VkBufferCreateInfo} structure containing parameters affecting creation of the buffer to query.

**Valid Usage (Implicit)**

- VUID-VkDeviceBufferMemoryRequirements-sType-sType
  \textit{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS}
- VUID-VkDeviceBufferMemoryRequirements-pNext-pNext
  \textit{pNext} \textbf{must} be NULL
- VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter
  \textit{pCreateInfo} \textbf{must} be a valid pointer to a valid \textit{VkBufferCreateInfo} structure

To determine the memory requirements for an image resource, call:

// Provided by VK_VERSION_1_1

\begin{verbatim}
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
\end{verbatim}

or the equivalent command

// Provided by VK_KHR_get_memory_requirements2

\begin{verbatim}
void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
\end{verbatim}

- \textit{device} is the logical device that owns the image.
- \textit{pInfo} is a pointer to a \textit{VkImageMemoryRequirementsInfo2} structure containing parameters required for the memory requirements query.
MemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements2-device-parameter  
  device must be a valid VkDevice handle
- VUID-vkGetImageMemoryRequirements2-pInfo-parameter  
  pInfo must be a valid pointer to a valid VkImageMemoryRequirementsInfo2 structure
- VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter  
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure

To determine the memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- device is the logical device intended to own the image.
- pInfo is a pointer to a VkDeviceImageMemoryRequirements structure containing parameters required for the memory requirements query.
- pMemoryRequirements is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the image object are returned.

Valid Usage (Implicit)

- VUID-vkGetDeviceImageMemoryRequirements-device-parameter  
  device must be a valid VkDevice handle
- VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter  
  pInfo must be a valid pointer to a valid VkDeviceImageMemoryRequirements structure
- VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter  
  pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2 structure
The `VkImageMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.

**Valid Usage**

- **VUID-VkImageMemoryRequirementsInfo2-image-01589**
  If `image` was created with a `multi-planar` format and the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-02279**
  If `image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` and with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there must be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-01590**
  If `image` was not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag, there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-02280**
  If `image` was created with a single-plane format and with any `tiling` other than `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then there must not be a `VkImagePlaneMemoryRequirementsInfo` included in the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure

- **VUID-VkImageMemoryRequirementsInfo2-image-01897**
  If `image` was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` external memory handle type, then `image` must be bound to memory
Valid Usage (Implicit)

- VUID-VkImageMemoryRequirementsInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2

- VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkImagePlaneMemoryRequirementsInfo

- VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkImageMemoryRequirementsInfo2-image-parameter
  image must be a valid VkImage handle

The VkDeviceImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
  VkStructureType sType;
  const void* pNext;
  const VkImageCreateInfo* pCreateInfo;
  VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.
- planeAspect is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless pCreateInfo::tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, or pCreateInfo::flags has VK_IMAGE_CREATE_DISJOINT_BIT set.

Valid Usage

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06416
  The pCreateInfo::pNext chain must not contain a VkImageSwapchainCreateInfoKHR structure

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06776

972
The `pNext` chain must not contain a `VkImageDrmFormatModifierExplicitCreateInfoEXT` structure

- **VUID-VkDeviceImageMemoryRequirements-pNext-06996**
  Applications also must not call `vkGetDeviceImageMemoryRequirements` with a `VkImageCreateInfo` whose `pNext` chain includes a `VkExternalFormatANDROID` structure with non-zero `externalFormat`.

- **VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06417**
  If `pCreateInfo::format` specifies a multi-planar format and `pCreateInfo::flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set then `planeAspect` must not be `VK_IMAGE_ASPECT_NONE_KHR`.

- **VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06419**
  If `pCreateInfo::flags` has `VK_IMAGE_CREATE_DISJOINT_BIT` set and if the `pCreateInfo::tiling` is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then `planeAspect` must be a single valid format plane for the image (that is, for a two-plane image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`, and for a three-plane image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`).

- **VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06420**
  If `pCreateInfo::tiling` is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image’s format and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`).

---

**Valid Usage (Implicit)**

- **VUID-VkDeviceImageMemoryRequirements-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS`.

- **VUID-VkDeviceImageMemoryRequirements-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkImageCreateInfo` structure.

- **VUID-VkDeviceImageMemoryRequirements-planeAspect-parameter**
  If `planeAspect` is not 0, `planeAspect` must be a valid `VkImageAspectFlagBits` value.

To determine the memory requirements for a plane of a disjoint image, add a `VkImagePlaneMemoryRequirementsInfo` structure to the `pNext` chain of the `VkImageMemoryRequirementsInfo2` structure.

The `VkImagePlaneMemoryRequirementsInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImagePlaneMemoryRequirementsInfo {
    VkStructureType sType;
} VkImagePlaneMemoryRequirementsInfo;
```
```c
const void* pNext;
VkImageAspectFlagBits planeAspect;
} VkImagePlaneMemoryRequirementsInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkImagePlaneMemoryRequirementsInfo VkImagePlaneMemoryRequirementsInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **planeAspect** is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query.

### Valid Usage

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281**
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid format plane for the image (that is, for a two-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT, and for a three-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT).

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282**
  If the image's tiling is VK_IMAGE_TILING_OPAQUE_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier).

### Valid Usage (Implicit)

- **VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter**
  planeAspect must be a valid VkImageAspectFlagBits value

The **VkMemoryRequirements2** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType         sType;
    void*                   pNext;
    VkMemoryRequirements    memoryRequirements;
} VkMemoryRequirements2;
```
or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2, VK_NV_ray_tracing
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkMemoryRequirements` structure describing the memory requirements of the resource.

Valid Usage (Implicit)

- VUID-VkMemoryRequirements2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2`
- VUID-VkMemoryRequirements2-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkMemoryDedicatedRequirements`
- VUID-VkMemoryRequirements2-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

The `VkMemoryDedicatedRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType sType;
    void* pNext;
    VkBool32 prefersDedicatedAllocation;
    VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.
To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`, respectively.

Constraints on the values returned for buffer resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried included a `VkExternalMemoryBufferCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`. Otherwise, `requiresDedicatedAllocation` will be `VK_FALSE`.

- When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it must also set `prefersDedicatedAllocation` to `VK_TRUE`.

- If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when buffer was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkImageCreateInfo` for the call to `vkCreateImage` used to create the image being queried included a `VkExternalMemoryImageCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryImageCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceImageFormatProperties2` in `VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures`.

- `requiresDedicatedAllocation` may be `VK_TRUE` if the image’s tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`.

- `requiresDedicatedAllocation` will otherwise be `VK_FALSE`.

- If `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` was set in `VkImageCreateInfo::flags` when image was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

### Valid Usage (Implicit)

- `VUID-VkMemoryDedicatedRequirements-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS`  

To attach memory to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device,  
    VkBuffer buffer,  
    VkDeviceMemory memory,
```
• **device** is the logical device that owns the buffer and memory.

• **buffer** is the buffer to be attached to memory.

• **memory** is a [VkDeviceMemory](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/html/vkDeviceMemory.html) object describing the device memory to attach.

• **memoryOffset** is the start offset of the region of **memory** which is to be bound to the buffer. The number of bytes returned in the **VkMemoryRequirements::size** member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified buffer.

`vkBindBufferMemory` is equivalent to passing the same parameters through `VkBindBufferMemoryInfo` to `vkBindBufferMemory2`.

### Valid Usage

- **VUID-vkBindBufferMemory-buffer-01029**
  
  buffer **must** not already be backed by a memory object

- **VUID-vkBindBufferMemory-buffer-01030**
  
  buffer **must** not have been created with any sparse memory binding flags

- **VUID-vkBindBufferMemory-memoryOffset-01031**
  
  memoryOffset **must** be less than the size of **memory**

- **VUID-vkBindBufferMemory-memory-01035**
  
  memory **must** have been allocated using one of the memory types allowed in the **memoryTypeBits** member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with **buffer**

- **VUID-vkBindBufferMemory-memoryOffset-01036**
  
  memoryOffset **must** be an integer multiple of the **alignment** member of the `VkMemoryRequirements` structure returned from a call to `vkGetBufferMemoryRequirements` with **buffer**

- **VUID-vkBindBufferMemory-size-01037**
  
  The **size** member of the **VkMemoryRequirements** structure returned from a call to `vkGetBufferMemoryRequirements` with **buffer** **must** be less than or equal to the size of **memory** minus **memoryOffset**

- **VUID-vkBindBufferMemory-buffer-01444**
  
  If **buffer** requires a dedicated allocation (as reported by `vkGetBufferMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for **buffer**), **memory** **must** have been allocated with `VkMemoryDedicatedAllocateInfo::buffer` equal to **buffer**

- **VUID-vkBindBufferMemory-memory-01508**
  
  If the `VkMemoryAllocateInfo` provided when **memory** was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::buffer` was not `VK_NULL_HANDLE`, then **buffer** **must** equal `VkMemoryDedicatedAllocateInfo::buffer`, and **memoryOffset** **must** be zero

- **VUID-vkBindBufferMemory-None-01898**
If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindBufferMemory-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

- VUID-vkBindBufferMemory-buffer-01038
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero

- VUID-vkBindBufferMemory-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

- VUID-vkBindBufferMemory-memory-02985
  If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

- VUID-vkBindBufferMemory-memory-02986
  If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

- VUID-vkBindBufferMemory-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

- VUID-vkBindBufferMemory-memory-bufferDeviceAddress-06408
  If buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext

Valid Usage (Implicit)

- VUID-vkBindBufferMemory-device-parameter
  device must be a valid VkDevice handle

- VUID-vkBindBufferMemory-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-vkBindBufferMemory-memory-parameter
memory must be a valid VkDeviceMemory handle

- VUID-vkBindBufferMemory-buffer-parent
  buffer must have been created, allocated, or retrieved from device
- VUID-vkBindBufferMemory-memory-parent
  memory must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to buffer must be externally synchronized

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
  VkDevice device,
  uint32_t bindInfoCount,
  const VkBindBufferMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindBufferMemory2KHR(
  VkDevice device,
  uint32_t bindInfoCount,
  const VkBindBufferMemoryInfo* pBindInfos);
```

- device is the logical device that owns the buffers and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of bindInfoCount VkBindBufferMemoryInfo structures describing buffers and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single
Valid Usage (Implicit)

- VUID-vkBindBufferMemory2-device-parameter
  device **must** be a valid VkDevice handle

- VUID-vkBindBufferMemory2-pBindInfos-parameter
  pBindInfos **must** be a valid pointer to an array of bindInfoCount valid
  VkBindBufferMemoryInfo structures

- VUID-vkBindBufferMemory2-bindInfoCount-arraylength
  bindInfoCount **must** be greater than 0

Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

VkBindBufferMemoryInfo contains members corresponding to the parameters of
vkBindBufferMemory.

The VkBindBufferMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkBuffer            buffer;
    VkDeviceMemory      memory;
    VkDeviceSize        memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
• **buffer** is the buffer to be attached to memory.

• **memory** is a **VkDeviceMemory** object describing the device memory to attach.

• **memoryOffset** is the start offset of the region of **memory** which is to be bound to the buffer. The number of bytes returned in the **VkMemoryRequirements::size** member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified buffer.

---

**Valid Usage**

• VUID-VkBindBufferMemoryInfo-buffer-01029  
  **buffer** must not already be backed by a memory object

• VUID-VkBindBufferMemoryInfo-buffer-01030  
  **buffer** must not have been created with any sparse memory binding flags

• VUID-VkBindBufferMemoryInfo-memoryOffset-01031  
  **memoryOffset** must be less than the size of **memory**

• VUID-VkBindBufferMemoryInfo-memoryOffset-01035  
  **memory** must have been allocated using one of the memory types allowed in the **memoryTypeBits** member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer**

• VUID-VkBindBufferMemoryInfo-memoryOffset-01036  
  **memoryOffset** must be an integer multiple of the **alignment** member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer**

• VUID-VkBindBufferMemoryInfo-size-01037  
  The **size** member of the **VkMemoryRequirements** structure returned from a call to **vkGetBufferMemoryRequirements** with **buffer** must be less than or equal to the size of **memory** minus **memoryOffset**

• VUID-VkBindBufferMemoryInfo-buffer-01444  
  If **buffer** requires a dedicated allocation (as reported by **vkGetBufferMemoryRequirements2** in **VkMemoryDedicatedRequirements** ::**requiresDedicatedAllocation** for **buffer**), **memory** must have been allocated with **VkMemoryDedicatedAllocateInfo::buffer** equal to **buffer**

• VUID-VkBindBufferMemoryInfo-memory-01508  
  If the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, and **VkMemoryDedicatedAllocateInfo::buffer** was not **VK_NULL_HANDLE**, then **buffer** must equal **VkMemoryDedicatedAllocateInfo::buffer**, and **memoryOffset** must be zero

• VUID-VkBindBufferMemoryInfo-None-01898  
  If **buffer** was created with the **VK_BUFFER_CREATE_PROTECTED_BIT** bit set, the buffer must be bound to a memory object allocated with a memory type that reports **VK_MEMORY_PROPERTY_PROTECTED_BIT**

• VUID-VkBindBufferMemoryInfo-None-01899  
  If **buffer** was created with the **VK_BUFFER_CREATE_PROTECTED_BIT** bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports **VK_MEMORY_PROPERTY_PROTECTED_BIT**
• VUID-VkBindBufferMemoryInfo-buffer-01038
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero

• VUID-VkBindBufferMemoryInfo-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-VkBindBufferMemoryInfo-memory-02985
  If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-VkBindBufferMemoryInfo-memory-02986
  If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created

• VUID-VkBindBufferMemoryInfo-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set

• VUID-VkBindBufferMemoryInfo-pNext-01605
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

### Valid Usage (Implicit)

• VUID-VkBindBufferMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO

• VUID-VkBindBufferMemoryInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo

• VUID-VkBindBufferMemoryInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique
- VUID-VkBindBufferMemoryInfo-buffer-parameter
  buffer must be a valid VkBuffer handle
- VUID-VkBindBufferMemoryInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle
- VUID-VkBindBufferMemoryInfo-commonparent
  Both of buffer, and memory must have been created, allocated, or retrieved from the same VkDevice

The VkBindBufferMemoryDeviceGroupInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfoKHR VkBindBufferMemoryDeviceGroupInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- deviceIndexCount is the number of elements in pDeviceIndices.
- pDeviceIndices is a pointer to an array of device indices.

If the pNext chain of VkBindBufferMemoryInfo includes a VkBindBufferMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i the buffer is attached to the instance of memory on the physical device with device index pDeviceIndices[i].

If deviceIndexCount is zero and memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of memory.

If deviceIndexCount is zero and memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.
Valid Usage

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
  \texttt{deviceIndexCount} must either be zero or equal to the number of physical devices in the logical device

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
  All elements of \texttt{pDeviceIndices} must be valid device indices

Valid Usage (Implicit)

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO}

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If \texttt{deviceIndexCount} is not 0, \texttt{pDeviceIndices} must be a valid pointer to an array of \texttt{deviceIndexCount uint32_t} values

To attach memory to a \texttt{VkImage} object created without the \texttt{VK_IMAGE_CREATE_DISJOINT_BIT} set, call:

\begin{verbatim}
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice device,                    // Logical device that owns the image and memory.
    VkImage image,                      // Image.
    VkDeviceMemory memory,              // Device memory object describing the device memory to attach.
    VkDeviceSize memoryOffset);         // Start offset of the region of memory which is to be bound to the image.

vkBindImageMemory is equivalent to passing the same parameters through \texttt{VkBindImageMemoryInfo} to \texttt{vkBindImageMemory2}.

Valid Usage

- VUID-vkBindImageMemory-image-01044
  \texttt{image} must not already be backed by a memory object

- VUID-vkBindImageMemory-image-01045
  \texttt{image} must not have been created with any sparse memory binding flags

- VUID-vkBindImageMemory-memoryOffset-01046

984
memoryOffset must be less than the size of memory

- **VUID-vkBindImageMemory-image-01445**  
  If image requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for image), memory must have been created with `VkMemoryDedicatedAllocateInfo::image` equal to image

- **VUID-vkBindImageMemory-memory-02628**  
  If the `dedicatedAllocationImageAliasing` feature is not enabled, and the `VkMemoryAllocateInfo` provided when memory was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then image must equal `VkMemoryDedicatedAllocateInfo::image` and memoryOffset must be zero

- **VUID-vkBindImageMemory-memory-02629**  
  If the `dedicatedAllocationImageAliasing` feature is enabled, and the `VkMemoryAllocateInfo` provided when memory was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then memoryOffset must be zero, and image must be either equal to `VkMemoryDedicatedAllocateInfo::image` or an image that was created using the same parameters in `VkImageCreateInfo`, with the exception that `extent` and `arrayLayers` may differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

- **VUID-vkBindImageMemory-None-01901**  
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`

- **VUID-vkBindImageMemory-None-01902**  
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`

- **VUID-vkBindImageMemory-image-01050**  
  If image was created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, memory must have been created with `VkDedicatedAllocationMemoryAllocateInfoNV::image` equal to an image handle created with identical creation parameters to image and memoryOffset must be zero

- **VUID-vkBindImageMemory-memory-02728**  
  If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate memory is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created

- **VUID-vkBindImageMemory-memory-02989**  
  If memory was created by a memory import operation, that is not `VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL buffer value, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when image was created
- VUID-vkBindImageMemory-memory-02990
  If `memory` was created with the `VkImportAndroidHardwareBufferInfoANDROID` memory import operation with a non-NULL `buffer` value, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- VUID-vkBindImageMemory-image-01608
  `image` must not have been created with the `VK_IMAGE_CREATE_DISJOINT_BIT` set.

- VUID-vkBindImageMemory-memory-01047
  `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`.

- VUID-vkBindImageMemory-memoryOffset-01048
  `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with `image`.

- VUID-vkBindImageMemory-size-01049
  The difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements` with the same `image`.

- VUID-vkBindImageMemory-image-06392
  If `image` was created with `VkBufferCollectionImageCreateInfoFUCHSIA` chained to `VkImageCreateInfo::pNext`, `memory` must be allocated with a `VkImportMemoryBufferCollectionFUCHSIA` chained to `VkMemoryAllocateInfo::pNext`.

**Valid Usage (Implicit)**

- VUID-vkBindImageMemory-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkBindImageMemory-image-parameter
  `image` must be a valid `VkImage` handle.

- VUID-vkBindImageMemory-memory-parameter
  `memory` must be a valid `VkDeviceMemory` handle.

- VUID-vkBindImageMemory-image-parent
  `image` must have been created, allocated, or retrieved from `device`.

- VUID-vkBindImageMemory-memory-parent
  `memory` must have been created, allocated, or retrieved from `device`.

**Host Synchronization**

- Host access to `image` must be externally synchronized.
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_OUT_OF_DEVICE_MEMORY

To attach memory to image objects for one or more images at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
```

• `device` is the logical device that owns the images and memory.
• `bindInfoCount` is the number of elements in `pBindInfos`.
• `pBindInfos` is a pointer to an array of `VkBindImageMemoryInfo` structures, describing images and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

Valid Usage

• VUID-vkBindImageMemory2-pBindInfos-02858
  If any `VkBindImageMemoryInfo::image` was created with `VK_IMAGE_CREATE_DISJOINT_BIT` then all planes of `VkBindImageMemoryInfo::image` **must** be bound individually in separate `pBindInfos`

• VUID-vkBindImageMemory2-pBindInfos-04006
  `pBindInfos` **must** not refer to the same image subresource more than once
Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
device must be a valid VkDevice handle

- VUID-vkBindImageMemory2-pBindInfos-parameter
pBindInfos must be a valid pointer to an array of bindInfoCount valid VkBindImageMemoryInfo structures

- VUID-vkBindImageMemory2-bindInfoCount-arraylength
bindInfoCount must be greater than 0

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

VkBindImageMemoryInfo contains members corresponding to the parameters of vkBindImageMemory.

The VkBindImageMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
    VkStructureType     sType;
    const void*          pNext;
    VkImage              image;
    VkDeviceMemory       memory;
    VkDeviceSize         memoryOffset;
} VkBindImageMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- image is the image to be attached to memory.
- memory is a VkDeviceMemory object describing the device memory to attach.
• `memoryOffset` is the start offset of the region of `memory` which is to be bound to the image. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified image.

### Valid Usage

- **VUID-VkBindImageMemoryInfo-image-01044**
  - `image` must not already be backed by a memory object

- **VUID-VkBindImageMemoryInfo-image-01045**
  - `image` must not have been created with any sparse memory binding flags

- **VUID-VkBindImageMemoryInfo-memoryOffset-01046**
  - `memoryOffset` must be less than the size of `memory`

- **VUID-VkBindImageMemoryInfo-image-01445**
  - If `image` requires a dedicated allocation (as reported by `vkGetImageMemoryRequirements2` in `VkMemoryDedicatedRequirements::requiresDedicatedAllocation` for `image`), `memory` must have been created with `VkMemoryDedicatedAllocateInfo::image` equal to `image`

- **VUID-VkBindImageMemoryInfo-memory-02628**
  - If the `dedicatedAllocationImageAliasing` feature is not enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `image` must equal `VkMemoryDedicatedAllocateInfo::image` and `memoryOffset` must be zero

- **VUID-VkBindImageMemoryInfo-memory-02629**
  - If the `dedicatedAllocationImageAliasing` feature is enabled, and the `VkMemoryAllocateInfo` provided when `memory` was allocated included a `VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and `VkMemoryDedicatedAllocateInfo::image` was not `VK_NULL_HANDLE`, then `memoryOffset` must be zero, and `image` must be either equal to `VkMemoryDedicatedAllocateInfo::image` or an image that was created using the same parameters in `VkImageCreateInfo`, with the exception that `extent` and `arrayLayers` may differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

- **VUID-VkBindImageMemoryInfo-None-01901**
  - If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORYPROPERTY_PROTECTED_BIT`

- **VUID-VkBindImageMemoryInfo-None-01902**
  - If `image` was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORYPROPERTY_PROTECTED_BIT`

- **VUID-VkBindImageMemoryInfo-image-01050**
  - If `image` was created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation...`
equal to VK_TRUE, memory must have been created with VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created with identical creation parameters to image and memoryOffset must be zero

• VUID-VkBindImageMemoryInfo-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-VkBindImageMemoryInfo-memory-02989
  If memory was created by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-VkBindImageMemoryInfo-memory-02990
  If memory was created with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-VkBindImageMemoryInfo-pNext-01615
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

• VUID-VkBindImageMemoryInfo-pNext-01616
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image

• VUID-VkBindImageMemoryInfo-pNext-01617
  If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, the difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image

• VUID-VkBindImageMemoryInfo-pNext-01618
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, image must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set

• VUID-VkBindImageMemoryInfo-pNext-01619
  If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with image and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the VkImagePlaneMemoryRequirementsInfo::planeAspect in the VkImageMemoryRequirementsInfo2 structure’s pNext chain

• VUID-VkBindImageMemoryInfo-pNext-01620
If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

- **VUID-VkBindImageMemoryInfo-pNext-01621**
  If the `pNext` chain includes a `VkBindImagePlaneMemoryInfo` structure, the difference of the size of `memory` and `memoryOffset` must be greater than or equal to the `size` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with the same `image` and where `VkBindImagePlaneMemoryInfo::planeAspect` corresponds to the `VkImagePlaneMemoryRequirementsInfo::planeAspect` in the `VkImageMemoryRequirementsInfo2` structure's `pNext` chain.

- **VUID-VkBindImageMemoryInfo-pNext-01626**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all instances of `memory` specified by `VkBindImageMemoryDeviceGroupInfo::pDeviceIndices` must have been allocated.

- **VUID-VkBindImageMemoryInfo-pNext-01627**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, and `VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount` is not zero, then `image` must have been created with the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit set.

- **VUID-VkBindImageMemoryInfo-pNext-01628**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` must be valid rectangles contained within the dimensions of `image`.

- **VUID-VkBindImageMemoryInfo-pNext-01629**
  If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` must cover the entire `image`.

- **VUID-VkBindImageMemoryInfo-image-01630**
  If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain must include a `VkBindImageMemorySwapchainInfoKHR` structure containing the same swapchain handle.

- **VUID-VkBindImageMemoryInfo-pNext-01631**
  If the `pNext` chain includes a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be `VK_NULL_HANDLE`.

- **VUID-VkBindImageMemoryInfo-pNext-01632**
  If the `pNext` chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be a valid `VkDeviceMemory` handle.
Valid Usage (Implicit)

- **VUID-VkBindImageMemoryInfo-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, or `VkBindImagePlaneMemoryInfo`

- **VUID-VkBindImageMemoryInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkBindImageMemoryInfo-image-parameter**
  image must be a valid VkImage handle

- **VUID-VkBindImageMemoryInfo-commonparent**
  Both of image, and memory that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType  sType;
    const void*      pNext;
    uint32_t         deviceIndexCount;
    const uint32_t*  pDeviceIndices;
    uint32_t         splitInstanceBindRegionCount;
    const VkRect2D*  pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceIndexCount** is the number of elements in pDeviceIndices.
- **pDeviceIndices** is a pointer to an array of device indices.
- **splitInstanceBindRegionCount** is the number of elements in pSplitInstanceBindRegions.
- **pSplitInstanceBindRegions** is a pointer to an array of VkRect2D structures describing which regions of the image are attached to each instance of memory.

If the pNext chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo`
structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` image is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.

Let N be the number of physical devices in the logical device. If `splitInstanceBindRegionCount` is greater than zero, then `pSplitInstanceBindRegions` is a pointer to an array of N² rectangles, where the image region specified by the rectangle at element `i*N+j` in resource instance `i` is bound to the memory instance `j`. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to `memoryOffset`, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of image, and the block at (0,0) corresponds to memory starting at `memoryOffset`.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

---

**Valid Usage**

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633**
  At least one of `deviceIndexCount` and `splitInstanceBindRegionCount` must be zero

- **VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634**
  `deviceIndexCount` must either be zero or equal to the number of physical devices in the logical device

- **VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635**
  All elements of `pDeviceIndices` must be valid device indices

- **VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636**
  `splitInstanceBindRegionCount` must either be zero or equal to the number of physical devices in the logical device squared

- **VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637**
  Elements of `pSplitInstanceBindRegions` that correspond to the same instance of an image must not overlap

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638**
  The `offset.x` member of any element of `pSplitInstanceBindRegions` must be a multiple of the sparse image block width (`VkSparseImageFormatProperties::imageGranularity.width`) of all non-metadata aspects of the image

- **VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639**
The offset.y member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of all non-metadata aspects of the image.

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
  The extent.width member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else extent.width + offset.x must equal the width of the image subresource.

- VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The extent.height member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else extent.height + offset.y must equal the height of the image subresource.

Valid Usage (Implicit)

- VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO

- VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

- VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  If splitInstanceBindRegionCount is not 0, pSplitInstanceBindRegions must be a valid pointer to an array of splitInstanceBindRegionCount VkRect2D structures

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemorySwapchainInfoKHR structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The VkBindImageMemorySwapchainInfoKHR structure is defined as:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_swapchain, VK_KHR_device_group with VK_KHR_swapchain
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType     sType;
    const void*         pNext;
    VkSwapchainKHR      swapchain;
    uint32_t            imageIndex;
} VkBindImageMemorySwapchainInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- swapchain is VK_NULL_HANDLE or a swapchain handle.
- imageIndex is an image index within swapchain.
If `swapchain` is not `NULL`, the `swapchain` and `imageIndex` are used to determine the memory that the image is bound to, instead of `memory` and `memoryOffset`.

Memory can be bound to a swapchain and use the `pDeviceIndices` or `pSplitInstanceBindRegions` members of `VkBindImageMemoryDeviceGroupInfo`.

---

**Valid Usage**

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  
  `imageIndex` must be less than the number of images in `swapchain`

---

**Valid Usage (Implicit)**

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGEMEMORY_SWAPCHAIN_INFO_KHR`

- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
  
  `swapchain` must be a valid `VkSwapchainKHR` handle

---

**Host Synchronization**

- Host access to `swapchain` must be externally synchronized

In order to bind planes of a disjoint image, add a `VkBindImagePlaneMemoryInfo` structure to the `pNext` chain of `VkBindImageMemoryInfo`.

The `VkBindImagePlaneMemoryInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {
    VkStructureType    sType;
    const void*        pNext;
    VkImageAspectFlagBits  planeAspect;
} VkBindImagePlaneMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `planeAspect` is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.
Valid Usage

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283
  If the image's tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid format plane for the image (that is, for a two-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT, and for a three-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT)

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284
  If the image's tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane index that is less than the VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount associated with the image's format and VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier)

Valid Usage (Implicit)

• VUID-VkBindImagePlaneMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO

• VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter
  planeAspect must be a valid VkImageAspectFlagBits value

Buffer-Image Granularity

The implementation-dependent limit bufferImageGranularity specifies a page-like granularity at which linear and non-linear resources must be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. bufferImageGranularity is specified in bytes, and must be a power of two. Implementations which do not impose a granularity restriction may report a bufferImageGranularity value of one.

Note

Despite its name, bufferImageGranularity is really a granularity between “linear” and “non-linear” resources.

Given resourceA at the lower memory offset and resourceB at the higher memory offset in the same VkDeviceMemory object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end & ~(bufferImageGranularity-1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start & ~(bufferImageGranularity-1)

The following property must hold:
resourceA.endPage < resourceB.startPage

That is, the end of the first resource (A) and the beginning of the second resource (B) **must** be on separate “pages” of size `bufferImageGranularity`. `bufferImageGranularity` **may** be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources **can** be closer than `bufferImageGranularity`, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments **must** all be multiples of the `bufferImageGranularity`. Therefore, memory bound to sparse resources naturally satisfies the `bufferImageGranularity`.

### 12.8. Resource Sharing Mode

Buffer and image objects are created with a _sharing mode_ controlling how they **can** be accessed from queues. The supported sharing modes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- **VK_SHARING_MODE_EXCLUSIVE** specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- **VK_SHARING_MODE_CONCURRENT** specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.

**Note**

`VK_SHARING_MODE_CONCURRENT` **may** result in lower performance access to the buffer or image than `VK_SHARING_MODE_EXCLUSIVE`.

Ranges of buffers and image subresources of image objects created using `VK_SHARING_MODE_EXCLUSIVE` **must** only be accessed by queues in the queue family that has _ownership_ of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using `VK_SHARING_MODE_EXCLUSIVE` is owned by some queue family, the application **must** perform a _queue family ownership transfer_ to make the memory contents of a range or image subresource accessible to a different queue family.

**Note**

Images still require a _layout transition_ from `VK_IMAGE_LAYOUT_UNDEFINED` or `VK_IMAGE_LAYOUT_PREINITIALIZED` before being used on the first queue.

A queue family **can** take ownership of an image subresource or buffer range of a resource created
with \texttt{VK\_SHARING\_MODE\_EXCLUSIVE}, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using \texttt{VK\_SHARING\_MODE\_CONCURRENT} must only be accessed by queues from the queue families specified through the \texttt{queueFamilyIndexCount} and \texttt{pQueueFamilyIndices} members of the corresponding create info structures.

\section*{12.8.1. External Resource Sharing}

Resources \textbf{should} only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource's underlying memory at a given time, regardless of whether the resource was created using \texttt{VK\_SHARING\_MODE\_EXCLUSIVE} or \texttt{VK\_SHARING\_MODE\_CONCURRENT}. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of \texttt{VK\_SHARING\_MODE\_EXCLUSIVE} resources between queues, and is also accomplished using \texttt{VkBufferMemoryBarrier} or \texttt{VkImageMemoryBarrier} operations. To make the contents of the underlying memory accessible in the destination instance or API, applications \textbf{must}

\begin{enumerate}
\item Release exclusive ownership from the source instance or API.
\item Ensure the release operation has completed using semaphores or fences.
\item Acquire exclusive ownership in the destination instance or API
\end{enumerate}

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's \texttt{dstQueueFamilyIndex} or \texttt{srcQueueFamilyIndex} parameters are set to the reserved queue family index \texttt{VK\_QUEUE\_FAMILY\_EXTERNAL} or \texttt{VK\_QUEUE\_FAMILY\_FOREIGN\_EXT} to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity \textbf{can} also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a \texttt{VK\_SHARING\_MODE\_EXCLUSIVE} resource, with one exception: Implementations \textbf{must} ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set \textbf{must} not make the contents of memory used by other subresources in the set undefined. An application \textbf{can} define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications \textbf{may}
also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout `VK_IMAGE_LAYOUT_UNDEFINED` and binding it to the same region of external memory as the existing images.

**Note**
Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

### 12.9. Memory Aliasing

A range of a `VkDeviceMemory` allocation is *aliased* if it is bound to multiple resources simultaneously, as described below, via `vkBindImageMemory`, `vkBindBufferMemory`, `vkBindAccelerationStructureMemoryNV`, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource\textsubscript{A} and resource\textsubscript{B}, bound respectively to memory range\textsubscript{A} and range\textsubscript{B}. Let paddedRange\textsubscript{A} and paddedRange\textsubscript{B} be, respectively, range\textsubscript{A} and range\textsubscript{B} aligned to `bufferImageGranularity`. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources alias the memory in the intersection of range\textsubscript{A} and range\textsubscript{B}. If one resource is linear and the other is non-linear, then the resources alias the memory in the intersection of paddedRange\textsubscript{A} and paddedRange\textsubscript{B}.

Applications *can* alias memory, but use of multiple aliases is subject to several constraints.

**Note**
Memory aliasing *can* be useful to reduce the total device memory footprint of an application, if some large resources are used for disjoint periods of time.

When a non-linear, non-VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image’s advertised layout) include bytes from the aliased range overlap the range. When a VK\_IMAGE\_CREATE\_SPARSE\_RESIDENCY\_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the VK\_IMAGE\_LAYOUT\_PREINITIALIZED or VK\_IMAGE\_LAYOUT\_GENERAL layouts, are *host-accessible subresources*. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory can be consistently interpreted across aliases if each of those aliases is a host-accessible subresource.
Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the VK_IMAGE_CREATE_ALIAS_BIT flag set, and both are bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag.
- The single-plane image must have a VkFormat that is equivalent to that of the multi-planar image’s individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.
- The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then both images must be linear.
- All other creation parameters must be identical

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources must have its layout transitioned from VK_IMAGE_LAYOUT_UNDEFINED to a valid layout before it is used, or from VK_IMAGE_LAYOUT_PREINITIALIZED if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them must be transitioned.

Use of an overlapping range by two aliases must be separated by a memory dependency using the
appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier must contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass must declare the attachments using the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, and follow the other rules listed in that section.

Note

Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.

12.10. Buffer Collections

Fuchsia's FIDL-based Sysmem service interoperates with Vulkan via the `VK_FUCHSIA_buffer_collection` extension.

A buffer collection is a set of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers' internal representation, such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design.

Buffer collections are represented by `VkBufferCollectionFUCHSIA` handles:

```c
// Provided by VK_FUCHSIA_buffer_collection
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferCollectionFUCHSIA)
```

12.10.1. Definitions

- **FIDL** - Fuchsia Interface Definition Language. The declarative language used to define FIDL interprocess communication interfaces on Fuchsia. FIDL files use the `fidl` extension. FIDL is also used to refer to the services defined by interfaces declared in the FIDL language
- **Sysmem** - The FIDL service that facilitates optimal buffer sharing and reuse on Fuchsia
- **client** - Any participant of the buffer collection e.g. the Vulkan application
- **token** - A `zx_handle_t` Zircon channel object that allows participation in the buffer collection

12.10.2. Platform initialization for buffer collections

To initialize a buffer collection on Fuchsia:
• Connect to the Sysmem service to initialize a Sysmem allocator
• Create an initial buffer collection token using the Sysmem allocator
• Duplicate the token for each participant beyond the initiator
• See the Sysmem Overview and fuchsia.sysmem FIDL documentation on fuchsia.dev for more detailed information

12.10.3. Create the buffer collection

To create an VkBufferCollectionFUCHSIA for Vulkan to participate in the buffer collection:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkCreateBufferCollectionFUCHSIA(
    VkDevice device,
    const VkBufferCollectionCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkBufferCollectionFUCHSIA* pCollection);
```

• `device` is the logical device that creates the `VkBufferCollectionFUCHSIA`

• `pCreateInfo` is a pointer to a `VkBufferCollectionCreateInfoFUCHSIA` structure containing parameters affecting creation of the buffer collection

• `pAllocator` is a pointer to a `VkAllocationCallbacks` structure controlling host memory allocation as described in the Memory Allocation chapter

• `pBufferCollection` is a pointer to a `VkBufferCollectionFUCHSIA` handle in which the resulting buffer collection object is returned

**Valid Usage (Implicit)**

• VUID-vkCreateBufferCollectionFUCHSIA-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkCreateBufferCollectionFUCHSIA-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkBufferCollectionCreateInfoFUCHSIA` structure

• VUID-vkCreateBufferCollectionFUCHSIA-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

• VUID-vkCreateBufferCollectionFUCHSIA-pCollection-parameter
  `pCollection` must be a valid pointer to a `VkBufferCollectionFUCHSIA` handle

**Return Codes**

- **Success**
  • `VK_SUCCESS`
**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_INVALID_EXTERNAL_HANDLE
- VK_ERROR_INITIALIZATION_FAILED

**Host Access**

All functions referencing a `VkBufferCollectionFUCHSIA` must be externally synchronized with the exception of `vkCreateBufferCollectionFUCHSIA`.

The `VkBufferCollectionCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    zx_handle_t collectionToken;
} VkBufferCollectionCreateInfoFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is NULL or a pointer to a structure extending this structure
- `collectionToken` is a `zx_handle_t` containing the Sysmem client's buffer collection token

**Valid Usage**

- VUID-VkBufferCollectionCreateInfoFUCHSIA-collectionToken-06393
  `collectionToken` must be a valid `zx_handle_t` to a Zircon channel allocated from Sysmem (`fuchsia.sysmem.Allocator/AllocateSharedCollection`) with `ZX_DEFAULT_CHANNEL_RIGHTS` rights

**Valid Usage (Implicit)**

- VUID-VkBufferCollectionCreateInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CREATE_INFO_FUCHSIA`
- VUID-VkBufferCollectionCreateInfoFUCHSIA-pNext-pNext
  `pNext` must be NULL

**12.10.4. Set the constraints**

Buffer collections can be established for `VkImage` allocations or `VkBuffer` allocations.
Set image-based buffer collection constraints

Setting the constraints on the buffer collection initiates the format negotiation and allocation of the buffer collection. To set the constraints on a `VkImage` buffer collection, call:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionImageConstraintsFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkImageConstraintsInfoFUCHSIA* pImageConstraintsInfo);
```

- `device` is the logical device
- `collection` is the `VkBufferCollectionFUCHSIA` handle
- `pImageConstraintsInfo` is a pointer to a `VkImageConstraintsInfoFUCHSIA` structure

`vkSetBufferCollectionImageConstraintsFUCHSIA` may fail if `pImageConstraintsInfo::formatConstraintsCount` is larger than the implementation-defined limit. If that occurs, `vkSetBufferCollectionImageConstraintsFUCHSIA` will return `VK_ERROR_INITIALIZATION_FAILED`.

`vkSetBufferCollectionImageConstraintsFUCHSIA` may fail if the implementation does not support any of the formats described by the `pImageConstraintsInfo` structure. If that occurs, `vkSetBufferCollectionImageConstraintsFUCHSIA` will return `VK_ERROR_FORMAT_NOT_SUPPORTED`.

Valid Usage

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-06394
  - `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` must not have already been called on `collection`

Valid Usage (Implicit)

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parameter
  - `collection` must be a valid `VkBufferCollectionFUCHSIA` handle
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-pImageConstraintsInfo-parameter
  - `pImageConstraintsInfo` must be a valid pointer to a valid `VkImageConstraintsInfoFUCHSIA` structure
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parent
  - `collection` must have been created, allocated, or retrieved from `device`
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The VkImageConstraintsInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    uint32_t formatConstraintsCount;
    const VkImageFormatConstraintsInfoFUCHSIA* pFormatConstraints;
    VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
    VkImageConstraintsInfoFlagsFUCHSIA flags;
} VkImageConstraintsInfoFUCHSIA;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `formatConstraintsCount` is the number of elements in `pFormatConstraints`.
- `pFormatConstraints` is a pointer to an array of `VkImageFormatConstraintsInfoFUCHSIA` structures of size `formatConstraintsCount` that is used to further constrain buffer collection format selection for image-based buffer collections.
- `bufferCollectionConstraints` is a `VkBufferCollectionConstraintsInfoFUCHSIA` structure used to supply parameters for the negotiation and allocation for buffer-based buffer collections.
- `flags` is a `VkImageConstraintsInfoFlagBitsFUCHSIA` value specifying hints about the type of memory Sysmem should allocate for the buffer collection.

Valid Usage

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06395
  All elements of `pFormatConstraints` must have at least one bit set in its `VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures`

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06396
  If `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_SAMPLED_BIT`, then `pFormatConstraints::requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT`

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06397
If `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_STORAGE_BIT`, then `pFormatConstraints::requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT`.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06398
  If `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT`, then `pFormatConstraints::requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT`.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06399
  If `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT`, then `pFormatConstraints::requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06400
  If `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT`, then `pFormatConstraints::requiredFormatFeatures` must contain at least one of `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT` or `VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT`.

- VUID-VkImageConstraintsInfoFUCHSIA-attachmentFragmentShadingRate-06401
  If the `attachmentFragmentShadingRate` feature is enabled, and `pFormatConstraints::imageCreateInfo::usage` contains `VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`, then `pFormatConstraints::requiredFormatFeatures` must contain `VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

---

**Valid Usage (Implicit)**

- VUID-VkImageConstraintsInfoFUCHSIA-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA`.

- VUID-VkImageConstraintsInfoFUCHSIA-pNext-pNext
  `pNext` must be `NULL`.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-parameter
  `pFormatConstraints` must be a valid pointer to an array of `formatConstraintsCount` valid `VkImageFormatConstraintsInfoFUCHSIA` structures.

- VUID-VkImageConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter
  `bufferCollectionConstraints` must be a valid `VkBufferCollectionConstraintsInfoFUCHSIA` structure.

- VUID-VkImageConstraintsInfoFUCHSIA-flags-parameter
  `flags` must be a valid combination of `VkImageConstraintsInfoFlagBitsFUCHSIA` values.

- VUID-VkImageConstraintsInfoFUCHSIA-formatConstraintsCount-arraylength
  `formatConstraintsCount` must be greater than 0.

---

// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageConstraintsInfoFlagsFUCHSIA;

VkImageConstraintsInfoFlagsFUCHSIA is a bitmask type for setting a mask of zero or moreVkImageConstraintsInfoFlagBitsFUCHSIA bits.

Bits which can be set in VkImageConstraintsInfoFlagBitsFUCHSIA::flags include:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef enum VkImageConstraintsInfoFlagBitsFUCHSIA {
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA = 0x00000001,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA = 0x00000002,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA = 0x00000004,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA = 0x00000008,
    VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA = 0x00000010,
} VkImageConstraintsInfoFlagBitsFUCHSIA;
```

General hints about the type of memory that should be allocated by Sysmem based on the expected usage of the images in the buffer collection include:

- VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA
- VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA

For protected memory:

- VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA specifies that protected memory is optional for the buffer collection.

Note that if all participants in the buffer collection (Vulkan or otherwise) specify that protected memory is optional, Sysmem will not allocate protected memory.

The VkImageFormatConstraintsInfoFUCHSIA structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageFormatConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkImageCreateInfo imageCreateInfo;
    VkFormatFeatureFlags requiredFormatFeatures;
    VkImageFormatConstraintsFlagsFUCHSIA flags;
    uint64_t sysmemPixelFormat;
    uint32_t colorSpaceCount;
    const VkSysmemColorSpaceFUCHSIA* pColorSpaces;
} VkImageFormatConstraintsInfoFUCHSIA;
```

- sType is the type of this structure

```c
```
- **pNext** is NULL or a pointer to a structure extending this structure
- **imageCreateInfo** is the VkImageCreateInfo used to create a VkImage that is to use memory from the VkBufferCollectionFUCHSIA
- **requiredFormatFeatures** is a bitmask of VkFormatFeatureFlagBits specifying required features of the buffers in the buffer collection
- **flags** is reserved for future use
- **sysmemPixelFormat** is a PixelFormatType value from the fuchsia.sysmem/image_formats.fidl FIDL interface
- **colorSpaceCount** the element count of pColorSpaces
- **pColorSpaces** is a pointer to an array of VkSysmemColorSpaceFUCHSIA structs of size colorSpaceCount

## Valid Usage (Implicit)

- **VUID-VkImageFormatConstraintsInfoFUCHSIA-sType-sType**
  - sType **must** be VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-pNext-pNext**
  - pNext **must** be NULL
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-imageCreateInfo-parameter**
  - imageCreateInfo **must** be a valid VkImageCreateInfo structure
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter**
  - requiredFormatFeatures **must** be a valid combination of VkFormatFeatureFlagBits values
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-requiredbitmask**
  - requiredFormatFeatures **must** not be 0
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-flags-zerobitmask**
  - flags **must** be 0
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-pColorSpaces-parameter**
  - pColorSpaces **must** be a valid pointer to an array of colorSpaceCount valid VkSysmemColorSpaceFUCHSIA structures
- **VUID-VkImageFormatConstraintsInfoFUCHSIA-colorSpaceCount-arraylength**
  - colorSpaceCount **must** be greater than 0

// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageFormatConstraintsFlagsFUCHSIA;

VkImageFormatConstraintsFlagsFUCHSIA is a bitmask type for setting a mask, but is currently reserved for future use.

The VkBufferCollectionConstraintsInfoFUCHSIA structure is defined as:

// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    uint32_t minBufferCount;
    uint32_t maxBufferCount;
    uint32_t minBufferCountForCamping;
    uint32_t minBufferCountForDedicatedSlack;
    uint32_t minBufferCountForSharedSlack;
} VkBufferCollectionConstraintsInfoFUCHSIA;

• **sType** is the type of this structure
• **pNext** is NULL or a pointer to a structure extending this structure
• **minBufferCount** is the minimum number of buffers available in the collection
• **maxBufferCount** is the maximum number of buffers allowed in the collection
• **minBufferCountForCamping** is the per-participant minimum buffers for camping
• **minBufferCountForDedicatedSlack** is the per-participant minimum buffers for dedicated slack
• **minBufferCountForSharedSlack** is the per-participant minimum buffers for shared slack

Sysmem uses all buffer count parameters in combination to determine the number of buffers it will allocate. Sysmem defines buffer count constraints in `fuchsia.sysmem/constraints.fidl`.

_Camping_ as referred to by `minBufferCountForCamping`, is the number of buffers that should be available for the participant that are not for transient use. This number of buffers is required for the participant to logically operate.

_Slack_ as referred to by `minBufferCountForDedicatedSlack` and `minBufferCountForSharedSlack`, refers to the number of buffers desired by participants for optimal performance. `minBufferCountForDedicatedSlack` refers to the current participant. `minBufferCountForSharedSlack` refers to buffer slack for all participants in the collection.

### Valid Usage (Implicit)

- **VUID-VkBufferCollectionConstraintsInfoFUCHSIA-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CONSTRAINTS_INFO_FUCHSIA`
- **VUID-VkBufferCollectionConstraintsInfoFUCHSIA-pNext-pNext**
  `pNext` **must** be `NULL`

The `VkSysmemColorSpaceFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkSysmemColorSpaceFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorSpace;
} VkSysmemColorSpaceFUCHSIA;
```
VkSysmemColorSpaceFUCHSIA;

- **sType** is the type of this structure
- **pNext** is NULL or a pointer to a structure extending this structure
- **colorSpace** value of the Sysmem ColorSpaceType

## Valid Usage

- VUID-VkSysmemColorSpaceFUCHSIA-colorSpace-06402  
  `colorSpace` must be a `ColorSpaceType` as defined in `fuchsia.sysmem/image_formats.fidl`

## Valid Usage (Implicit)

- VUID-VkSysmemColorSpaceFUCHSIA-sType-sType  
  `sType` must be `VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA`

- VUID-VkSysmemColorSpaceFUCHSIA-pNext-pNext  
  `pNext` must be `NULL`

---

### Set buffer-based buffer collection constraints

To set the constraints on a `VkBuffer` buffer collection, call:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionBufferConstraintsFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkBufferConstraintsInfoFUCHSIA* pBufferConstraintsInfo);
```

- **device** is the logical device
- **collection** is the `VkBufferCollectionFUCHSIA` handle
- **pBufferConstraintsInfo** is a pointer to a `VkBufferConstraintsInfoFUCHSIA` structure

`vkSetBufferCollectionBufferConstraintsFUCHSIA` may fail if the implementation does not support the constraints specified in the `bufferCollectionConstraints` structure. If that occurs, `vkSetBufferCollectionBufferConstraintsFUCHSIA` will return `VK_ERROR_FORMAT_NOT_SUPPORTED`.

## Valid Usage

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-06403  
  `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` must not have already been called on `collection`
Valid Usage (Implicit)

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parameter
  
  `collection` must be a valid `VkBufferCollectionFUCHSIA` handle

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-pBufferConstraintsInfo-parameter
  
  `pBufferConstraintsInfo` must be a valid pointer to a valid `VkBufferConstraintsInfoFUCHSIA` structure

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parent
  
  `collection` must have been created, allocated, or retrieved from `device`

Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_INITIALIZATION_FAILED
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_FORMAT_NOT_SUPPORTED

The `VkBufferConstraintsInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateInfo createInfo;
    VkFormatFeatureFlags requiredFormatFeatures;
    VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
} VkBufferConstraintsInfoFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is NULL or a pointer to a structure extending this structure
- `pBufferCreateInfo` a pointer to a `VkBufferCreateInfo` struct describing the buffer attributes for the buffer collection
- `requiredFormatFeatures` bitmask of `VkFormatFeatureFlagBits` required features of the buffers in the buffer collection
- `bufferCollectionConstraints` is used to supply parameters for the negotiation and allocation of the buffer collection
Valid Usage

- VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-06404
  The requiredFormatFeatures bitmask of VkFormatFeatureFlagBits must be chosen from among the buffer compatible format features listed in buffer compatible format features

Valid Usage (Implicit)

- VUID-VkBufferConstraintsInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA

- VUID-VkBufferConstraintsInfoFUCHSIA-pNext-pNext
  pNext must be NULL

- VUID-VkBufferConstraintsInfoFUCHSIA-createInfo-parameter
  createInfo must be a valid VkBufferCreateInfo structure

- VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter
  requiredFormatFeatures must be a valid combination of VkFormatFeatureFlagBits values

- VUID-VkBufferConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter
  bufferCollectionConstraints must be a valid VkBufferCollectionConstraintsInfoFUCHSIA structure

12.10.5. Retrieve buffer collection properties

After constraints have been set on the buffer collection by calling vkSetBufferCollectionImageConstraintsFUCHSIA or vkSetBufferCollectionBufferConstraintsFUCHSIA, call vkGetBufferCollectionPropertiesFUCHSIA to retrieve the negotiated and finalized properties of the buffer collection.

The call to vkGetBufferCollectionPropertiesFUCHSIA is synchronous. It waits for the Sysmem format negotiation and buffer collection allocation to complete before returning.

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkGetBufferCollectionPropertiesFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    VkBufferCollectionPropertiesFUCHSIA* pProperties);
```

- device is the logical device handle
- collection is the VkBufferCollectionFUCHSIA handle
- pProperties is a pointer to the retrieved VkBufferCollectionPropertiesFUCHSIA struct

For image-based buffer collections, upon calling vkGetBufferCollectionPropertiesFUCHSIA, Sysmem will choose an element of the VkImageConstraintsInfoFUCHSIA::pImageCreateInfos established by the preceding call to vkSetBufferCollectionImageConstraintsFUCHSIA. The index of the element
chosen is stored in and can be retrieved from `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex`.

For buffer-based buffer collections, a single `VkBufferCreateInfo` is specified as `VkBufferConstraintsInfoFUCHSIA::createInfo`. `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex` will therefore always be zero.

`vkGetBufferCollectionPropertiesFUCHSIA` may fail if Sysmem is unable to resolve the constraints of all of the participants in the buffer collection. If that occurs, `vkGetBufferCollectionPropertiesFUCHSIA` will return `VK_ERROR_INITIALIZATION_FAILED`.

### Valid Usage

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-None-06405**
  Prior to calling `vkGetBufferCollectionPropertiesFUCHSIA`, the constraints on the buffer collection must have been set by either `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA`.

### Valid Usage (Implicit)

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-device-parameter**
  device must be a valid `VkDevice` handle

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parameter**
  collection must be a valid `VkBufferCollectionFUCHSIA` handle

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-pProperties-parameter**
  pProperties must be a valid pointer to a `VkBufferCollectionPropertiesFUCHSIA` structure

- **VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parent**
  collection must have been created, allocated, or retrieved from device

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INITIALIZATION_FAILED`

The `VkBufferCollectionPropertiesFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionPropertiesFUCHSIA {
  VkStructureType sType;
  void* pNext;
} VkBufferCollectionPropertiesFUCHSIA;
```
uint32_t memoryTypeBits;
uint32_t bufferCount;
uint32_t createInfoIndex;
uint64_t sysmemPixelFormat;
VkFormatFeatureFlags formatFeatures;
VkSysmemColorSpaceFUCHSIA sysmemColorSpaceIndex;
VkComponentMapping samplerYcbcrConversionComponents;
VkSamplerYcbcrModelConversion suggestedYcbcrModel;
VkSamplerYcbcrRange suggestedYcbcrRange;
VkChromaLocation suggestedXChromaOffset;
VkChromaLocation suggestedYChromaOffset;

} VkBufferCollectionPropertiesFUCHSIA;

• sType is the type of this structure
• pNext is NULL or a pointer to a structure extending this structure
• memoryTypeBits is a bitmask containing one bit set for every memory type which the buffer collection can be imported as buffer collection
• bufferCount is the number of buffers in the collection
• createInfoIndex as described in Sysmem chosen create infos
• sysmemPixelFormat is the Sysmem PixelFormatType as defined in fuchsia.sysmem/image_formats.fidl
• formatFeatures is a bitmask of VkFormatFeatureFlagBits shared by the buffer collection
• sysmemColorSpaceIndex is a VkSysmemColorSpaceFUCHSIA struct specifying the color space
• samplerYcbcrConversionComponents is a VkComponentMapping struct specifying the component mapping
• suggestedYcbcrModel is a VkSamplerYcbcrModelConversion value specifying the suggested Y C_a C_R model
• suggestedYcbcrRange is a VkSamplerYcbcrRange value specifying the suggested Y C_a C_R range
• suggestedXChromaOffset is a VkChromaLocation value specifying the suggested X chroma offset
• suggestedYChromaOffset is a VkChromaLocation value specifying the suggested Y chroma offset

sysmemColorSpace is only set for image-based buffer collections where the constraints were specified using VkImageConstraintsInfoFUCHSIA in a call to vkSetBufferCollectionImageConstraintsFUCHSIA. For image-based buffer collections, createInfoIndex will identify both the VkImageConstraintsInfoFUCHSIA::pImageCreateInfos element and the VkImageConstraintsInfoFUCHSIA::pFormatConstraints element chosen by Sysmem when vkSetBufferCollectionImageConstraintsFUCHSIA was called. The value of sysmemColorSpaceIndex will be an index to one of the color spaces provided in the VkImageFormatConstraintsInfoFUCHSIA::pColorSpaces array.

The implementation must have formatFeatures with all bits set that were set in VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures, by the call to vkSetBufferCollectionImageConstraintsFUCHSIA, at createInfoIndex (other bits could be set as well).
Valid Usage (Implicit)

- **VUID-VkBufferCollectionPropertiesFUCHSIA-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-formatFeatures-parameter**
  - `formatFeatures` must be a valid combination of `VkFormatFeatureFlagBits` values

- **VUID-VkBufferCollectionPropertiesFUCHSIA-formatFeatures-requiredbitmask**
  - `formatFeatures` must not be `0`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-sysmemColorSpaceIndex-parameter**
  - `sysmemColorSpaceIndex` must be a valid `VkSysmemColorSpaceFUCHSIA` structure

- **VUID-VkBufferCollectionPropertiesFUCHSIA-samplerYcbcrConversionComponents-parameter**
  - `samplerYcbcrConversionComponents` must be a valid `VkComponentMapping` structure

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYcbcrModel-parameter**
  - `suggestedYcbcrModel` must be a valid `VkSamplerYcbcrModelConversion` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYcbcrRange-parameter**
  - `suggestedYcbcrRange` must be a valid `VkSamplerYcbcrRange` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedXChromaOffset-parameter**
  - `suggestedXChromaOffset` must be a valid `VkChromaLocation` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYChromaOffset-parameter**
  - `suggestedYChromaOffset` must be a valid `VkChromaLocation` value

12.10.6. Memory allocation

To import memory from a buffer collection into a `VkImage` or a `VkBuffer`, chain a `VkImportMemoryBufferCollectionFUCHSIA` structure to the `pNext` member of the `VkMemoryAllocateInfo` in the call to `vkAllocateMemory`.

The `VkImportMemoryBufferCollectionFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImportMemoryBufferCollectionFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkImportMemoryBufferCollectionFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
• **collection** is the `VkBufferCollectionFUCHSIA` handle

• **index** the index of the buffer to import from **collection**

---

**Valid Usage**

- `VUID-VkImportMemoryBufferCollectionFUCHSIA-index-06406`
  
  `index` **must** be less than the value retrieved as `VkBufferCollectionPropertiesFUCHSIA:bufferCount`

---

**Valid Usage (Implicit)**

- `VUID-VkImportMemoryBufferCollectionFUCHSIA-sType-sType`
  
  `sType` **must** be `VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA`

- `VUID-VkImportMemoryBufferCollectionFUCHSIA-collection-parameter`
  
  `collection` **must** be a valid `VkBufferCollectionFUCHSIA` handle

---

To release a `VkBufferCollectionFUCHSIA`:

```c
// Provided by VK_FUCHSIA_buffer_collection
void vkDestroyBufferCollectionFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that creates the `VkBufferCollectionFUCHSIA`

• **collection** is the `VkBufferCollectionFUCHSIA` handle

• **pAllocator** is a pointer to a `VkAllocationCallbacks` structure controlling host memory allocation as described in the Memory Allocation chapter

---

**Valid Usage**

- `VUID-vkDestroyBufferCollectionFUCHSIA-collection-06407`

  `VkImage` and `VkBuffer` objects that referenced **collection** upon creation by inclusion of a `VkBufferCollectionImageCreateInfoFUCHSIA` or `VkBufferCollectionBufferCreateInfoFUCHSIA` chained to their `VkImageCreateInfo` or `VkBufferCreateInfo` structures respectively, **may** outlive **collection**.

---

**Valid Usage (Implicit)**

- `VUID-vkDestroyBufferCollectionFUCHSIA-device-parameter`

  `device` **must** be a valid `VkDevice` handle

- `VUID-vkDestroyBufferCollectionFUCHSIA-collection-parameter`
**collection** must be a valid **VkBufferCollectionFUCHSIA** handle

- **VUID-vkDestroyBufferCollectionFUCHSIA-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyBufferCollectionFUCHSIA-collection-parent**
  **collection** must have been created, allocated, or retrieved from **device**
Chapter 13. Samplers

`VkSampler` objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by `VkSampler` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(  
    VkDevice device,  
    const VkSamplerCreateInfo* pCreateInfo,  
    const VkAllocationCallbacks* pAllocator,  
    VkSampler* pSampler);
```

- `device` is the logical device that creates the sampler.
- `pCreateInfo` is a pointer to a `VkSamplerCreateInfo` structure specifying the state of the sampler object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSampler` is a pointer to a `VkSampler` handle in which the resulting sampler object is returned.

### Valid Usage

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There **must** be less than `VkPhysicalDeviceLimits::maxSamplerAllocationCount` `VkSampler` objects currently created on the device

### Valid Usage (Implicit)

- VUID-vkCreateSampler-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkCreateSampler-pCreateInfo-parameter
  `pCreateInfo` **must** be a valid pointer to a valid `VkSamplerCreateInfo` structure

- VUID-vkCreateSampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateSampler-pSampler-parameter
  `pSampler` **must** be a valid pointer to a `VkSampler` handle
Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSamplerCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerCreateFlags flags;
    VkFilter magFilter;
    VkFilter minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float mipLodBias;
    VkBool32 anisotropyEnable;
    float maxAnisotropy;
    VkBool32 compareEnable;
    VkCompareOp compareOp;
    float minLod;
    float maxLod;
    VkBorderColor borderColor;
    VkBool32 unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is a bitmask of `VkSamplerCreateFlagBits` describing additional parameters of the sampler.
• `magFilter` is a `VkFilter` value specifying the magnification filter to apply to lookups.
• `minFilter` is a `VkFilter` value specifying the minification filter to apply to lookups.
• `mipmapMode` is a `VkSamplerMipmapMode` value specifying the mipmap filter to apply to lookups.
• `addressModeU` is a `VkSamplerAddressMode` value specifying the addressing mode for U coordinates outside [0,1).
• `addressModeV` is a `VkSamplerAddressMode` value specifying the addressing mode for V coordinates outside [0,1).
• `addressModeW` is a `VkSamplerAddressMode` value specifying the addressing mode for W
coordinates outside \([0,1)\).

- **mipLodBias** is the bias to be added to mipmap LOD (level-of-detail) calculation and bias provided by image sampling functions in SPIR-V, as described in the Level-of-Detail Operation section.

- **anisotropyEnable** is **VK_TRUE** to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or **VK_FALSE** otherwise.

- **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is **VK_TRUE**. If **anisotropyEnable** is **VK_FALSE**, **maxAnisotropy** is ignored.

- **compareEnable** is **VK_TRUE** to enable comparison against a reference value during lookups, or **VK_FALSE** otherwise.
  
  ◦ Note: Some implementations will default to shader state if this member does not match.

- **compareOp** is a **VkCompareOp** value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.

- **minLod** is used to clamp the minimum of the computed LOD value.

- **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set **maxLod** to the constant **VK_LOD_CLAMP_NONE**.

- **borderColor** is a **VkBorderColor** value specifying the predefined border color to use.

- **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to **VK_TRUE**, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When set to **VK_FALSE** the range of image coordinates is zero to one.

When **unnormalizedCoordinates** is **VK_TRUE**, images the sampler is used with in the shader have the following requirements:

- The **viewType** **must** be either **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**.
- The image view **must** have a single layer and a single mip level.

When **unnormalizedCoordinates** is **VK_TRUE**, image built-in functions in the shader that use the sampler have the following requirements:

- The functions **must** not use projection.
- The functions **must** not use offsets.

---

**Mapping of OpenGL to Vulkan filter modes**

- **magFilter** values of **VK_FILTER_NEAREST** and **VK_FILTER_LINEAR** directly correspond to **GL_NEAREST** and **GL_LINEAR** magnification filters. **minFilter** and **mipmapMode** combine to correspond to the similarly named OpenGL minification filter of **GL_minFilter_MIPMAP_mipmapMode** (e.g., **minFilter** of **VK_FILTER_LINEAR** and **mipmapMode** of **VK_SAMPLER_MIPMAP_MODE_NEAREST** correspond to **GL_LINEAR_MIPMAP_NEAREST**).

There are no Vulkan filter modes that directly correspond to OpenGL minification filters of **GL_LINEAR** or **GL_NEAREST**, but they can be emulated using **VK_SAMPLER_MIPMAP_MODE_NEAREST**, **minLod = 0**, and **maxLod = 0.25**, and using **minFilter = VK_FILTER_LINEAR** or **minFilter = VK_FILTER_NEAREST**, respectively.
Note that using a `maxLod` of zero would cause magnification to always be performed, and the `magfilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the λ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

Note

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations may return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

Valid Usage

- **VUID-VkSamplerCreateInfo-mipLodBias-01069**
  The absolute value of `mipLodBias` must be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`

- **VUID-VkSamplerCreateInfo-samplerMipLodBias-04467**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias` is `VK_FALSE`, `mipLodBias` must be zero

- **VUID-VkSamplerCreateInfo-maxLod-01973**
  `maxLod` must be greater than or equal to `minLod`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01070**
  If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01071**
  If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` must be between 1.0 and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive

- **VUID-VkSamplerCreateInfo-minFilter-01645**
  If `sampler Y′C_bC_R conversion` is enabled and the potential format features of the sampler `Y′C_bC_R conversion` do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` must be equal to the sampler `Y′C_bC_R conversion`'s `chromaFilter`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072**
  If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` must be equal
If `unnormalizedCoordinates` is `VK_TRUE`, `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`

If `unnormalizedCoordinates` is `VK_TRUE`, `minLod` and `maxLod` must be zero

If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`

If `unnormalizedCoordinates` is `VK_TRUE`, `unnormalizedCoordinates` must be `VK_FALSE`

If `unnormalizedCoordinates` is `VK_TRUE`, `anisotropyEnable` must be `VK_FALSE`

If `unnormalizedCoordinates` is `VK_TRUE`, `compareEnable` must be `VK_FALSE`

If `unnormalizedCoordinates` is `VK_TRUE`, `addressModeU` must be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

If `samplerY_CB_CbR_conversion` is enabled, `addressModeU`, `addressModeV`, and `addressModeW` must be `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`, `anisotropyEnable` must be `VK_FALSE`, and `unnormalizedCoordinates` must be `VK_FALSE`

If `samplerFilterMinmax` is not enabled and the `pNext` chain includes a `VkSamplerReductionModeCreateInfo` structure, then the sampler reduction mode must be set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`

If `samplerMirrorClampToEdge` is not enabled, and if the `VK_KHR_sampler_mirror_clamp_to_edge` extension is not enabled, `addressModeU`, `addressModeV`, and `addressModeW` must not be `VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE`

If `compareEnable` is `VK_TRUE`, the `reductionMode` member of `VkSamplerReductionModeCreateInfo` must be `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minFilter` and `magFilter` must be equal
If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`.

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `minLod` and `maxLod` must be zero.

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `anisotropyEnable` must be `VK_FALSE`.

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `compareEnable` must be `VK_FALSE`.

If `flags` includes `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT`, then `unnormalizedCoordinates` must be `VK_FALSE`.

If the `nonSeamlessCubeMap` feature is not enabled, `flags` must not include `VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT`.

If `borderColor` is one of `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`, then a `VkSamplerCustomBorderColorCreateInfoEXT` must be included in the `pNext` chain.

If the `customBorderColors` feature is not enabled, `borderColor` must not be `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`.

If `borderColor` is one of `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`, and `VkSamplerCustomBorderColorCreateInfoEXT::format` is not `VK_FORMAT_UNDEFINED`, `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` must be within the range of values representable in `format`.

The maximum number of samplers with custom border colors which can be simultaneously created on a device is implementation-dependent and specified by the `maxCustomBorderColorSamplers` member of the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure.

If `flags` includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `minFilter` and `magFilter` must be `VK_FILTER_NEAREST`.

The maximum number of samplers with custom border colors which can be simultaneously created on a device is implementation-dependent and specified by the `maxCustomBorderColorSamplers` member of the `VkPhysicalDeviceCustomBorderColorPropertiesEXT` structure.
If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST

- VUID-VkSamplerCreateInfo-flags-06966
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then minLod and maxLod must be zero

- VUID-VkSamplerCreateInfo-flags-06967
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then addressModeU and addressModeV must each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER

- VUID-VkSamplerCreateInfo-flags-06968
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, and if addressModeU or addressModeV is VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, then borderColor must be VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK.

- VUID-VkSamplerCreateInfo-flags-06969
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then anisotropyEnable must be VK_FALSE

- VUID-VkSamplerCreateInfo-flags-06970
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then compareEnable must be VK_FALSE

## Valid Usage (Implicit)

- VUID-VkSamplerCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO

- VUID-VkSamplerCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkSamplerBorderColorComponentMappingCreateInfoEXT, VkSamplerCustomBorderColorCreateInfoEXT, VkSamplerReductionModeCreateInfo, or VkSamplerYcbcrConversionInfo

- VUID-VkSamplerCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSamplerCreateInfo-flags-parameter
  flags must be a valid combination of VkSamplerCreateFlagBits values

- VUID-VkSamplerCreateInfo-magFilter-parameter
  magFilter must be a valid VkFilter value

- VUID-VkSamplerCreateInfo-minFilter-parameter
  minFilter must be a valid VkFilter value

- VUID-VkSamplerCreateInfo-mipmapMode-parameter
  mipmapMode must be a valid VkSamplerMipmapMode value

- VUID-VkSamplerCreateInfo-addressModeU-parameter
  addressModeU must be a valid VkSamplerAddressMode value
VK_LOD_CLAMP_NONE is a special constant value used for VkSamplerCreateInfo::maxLod to indicate that maximum LOD clamping should not be performed.

#define VK_LOD_CLAMP_NONE 1000.0F

Bits which can be set in VkSamplerCreateInfo::flags, specifying additional parameters of a sampler, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_non_seamless_cube_map
    VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT = 0x00000004,
    // Provided by VK_QCOM_image_processing
    VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM = 0x00000010,
} VkSamplerCreateFlagBits;
```

- **VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT** specifies that the sampler will read from an image created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

- **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** specifies that the implementation may use approximations when reconstructing a full color value for texture access from a subsampled image.

- **VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT** specifies that cube map edge handling is not performed.

- **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM** specifies that the sampler will read from images using only OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM.

**Note**
The approximations used when VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT is specified are implementation defined. Some implementations may interpolate between fragment density levels in a subsampled image. In that case, this bit may be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.
typedef VkFlags VkSamplerCreateFlags;

VkSamplerCreateFlags is a bitmask type for setting a mask of zero or more VkSamplerCreateFlagBits.

The VkSamplerReductionModeCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionModeCreateInfo VkSamplerReductionModeCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **reductionMode** is a VkSamplerReductionMode value controlling how texture filtering combines texel values.

If the **pNext** chain of VkSamplerCreateInfo includes a VkSamplerReductionModeCreateInfo structure, then that structure includes a mode controlling how texture filtering combines texel values.

If this structure is not present, **reductionMode** is considered to be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

### Valid Usage (Implicit)

- **VUID-VkSamplerReductionModeCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO
- **VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter**
  reductionMode must be a valid VkSamplerReductionMode value

Reduction modes are specified by VkSamplerReductionMode, which takes values:

```c
// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
} VkSamplerReductionMode;
```
or the equivalent

```c
// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionMode VkSamplerReductionModeEXT;
```

- **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE** specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.

- **VK_SAMPLER_REDUCTION_MODE_MIN** specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.

- **VK_SAMPLER_REDUCTION_MODE_MAX** specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the `VkSamplerCreateInfo::magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = 1000015000,
    // Provided by VK_IMG_filter_cubic
    VK_FILTER_CUBIC_IMG = VK_FILTER_CUBIC_EXT,
} VkFilter;
```

- **VK_FILTER_NEAREST** specifies nearest filtering.

- **VK_FILTER_LINEAR** specifies linear filtering.

- **VK_FILTER_CUBIC_EXT** specifies cubic filtering.

These filters are described in detail in Texel Filtering.

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
```
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;

- **VK_SAMPLER_MIPMAP_MODE_NEAREST** specifies nearest filtering.
- **VK_SAMPLER_MIPMAP_MODE_LINEAR** specifies linear filtering.

These modes are described in detail in **Texel Filtering**.

Possible values of the **VkSamplerCreateInfo::addressMode** parameters, specifying the behavior of sampling with coordinates outside the range [0,1] for the respective u, v, or w coordinate as defined in the **Wrapping Operation** section, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2, VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
    // Provided by VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
```

- **VK_SAMPLER_ADDRESS_MODE_REPEAT** specifies that the repeat wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT** specifies that the mirrored repeat wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE** specifies that the clamp to edge wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER** specifies that the clamp to border wrap mode will be used.
- **VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE** specifies that the mirror clamp to edge wrap mode will be used. This is only valid if **samplerMirrorClampToEdge** is enabled, or if the **VK_KHR_sampler_mirror_clamp_to_edge** extension is enabled.

**Comparison operators** compare a *reference* and a *test* value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
};
```
VK_COMPARE_OP_GREATER = 4,
VK_COMPARE_OP_NOT_EQUAL = 5,
VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;

• **VK_COMPARE_OP_NEVER** specifies that the comparison always evaluates false.
• **VK_COMPARE_OP_LESS** specifies that the comparison evaluates reference < test.
• **VK_COMPARE_OP_EQUAL** specifies that the comparison evaluates reference = test.
• **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the comparison evaluates reference ≤ test.
• **VK_COMPARE_OP_GREATER** specifies that the comparison evaluates reference > test.
• **VK_COMPARE_OP_NOT_EQUAL** specifies that the comparison evaluates reference ≠ test.
• **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the comparison evaluates reference ≥ test.
• **VK_COMPARE_OP_ALWAYS** specifies that the comparison always evaluates true.

Comparison operators are used for:

• The **Depth Compare Operation** operator for a sampler, specified by VkSamplerCreateInfo::compareOp.

• The stencil comparison operator for the **stencil test**, specified by vkCmdSetStencilOp::compareOp or VkStencilOpState::compareOp.

• The **Depth Comparison** operator for the **depth test**, specified by vkCmdSetDepthCompareOp::depthCompareOp or VkPipelineDepthStencilStateCreateInfo::depthCompareOp.

Each such use describes how the **reference** and **test** values for that comparison are determined.

Possible values of VkSamplerCreateInfo:borderColor, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

• **VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK** specifies a transparent, floating-point format, black color.
• **VK_BORDER_COLOR_INT_TRANSPARENT_BLACK** specifies a transparent, integer format, black color.

• **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK** specifies an opaque, floating-point format, black color.

• **VK_BORDER_COLOR_INT_OPAQUE_BLACK** specifies an opaque, integer format, black color.

• **VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE** specifies an opaque, floating-point format, white color.

• **VK_BORDER_COLOR_INT_OPAQUE_WHITE** specifies an opaque, integer format, white color.

• **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in floating-point format.

• **VK_BORDER_COLOR_INT_CUSTOM_EXT** indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in integer format.

These colors are described in detail in *Texel Replacement*.

To destroy a sampler, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice device,
    VkSampler sampler,
    const VkAllocationCallbacks* pAllocator);
```

• `device` is the logical device that destroys the sampler.

• `sampler` is the sampler to destroy.

• `pAllocate` controls host memory allocation as described in the *Memory Allocation* chapter.

**Valid Usage**

• **VUID-vkDestroySampler-sampler-01082**
  All submitted commands that refer to `sampler` must have completed execution.

• **VUID-vkDestroySampler-sampler-01083**
  If `VkAllocationCallbacks` were provided when `sampler` was created, a compatible set of callbacks must be provided here.

• **VUID-vkDestroySampler-sampler-01084**
  If no `VkAllocationCallbacks` were provided when `sampler` was created, `pAllocate` must be `NULL`.

**Valid Usage (Implicit)**

• **VUID-vkDestroySampler-device-parameter**
  `device` must be a valid `VkDevice` handle.

• **VUID-vkDestroySampler-sampler-parameter**
If `sampler` is not `VK_NULL_HANDLE`, `sampler` must be a valid `VkSampler` handle.

- VUID-vkDestroySampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroySampler-sampler-parent
  If `sampler` is a valid handle, it must have been created, allocated, or retrieved from `device`.

### Host Synchronization

- Host access to `sampler` must be externally synchronized.

### 13.1. Sampler Y'CbCr conversion

To create a sampler with Y'CbCr conversion enabled, add a `VkSamplerYcbcrConversionInfo` structure to the `pNext` chain of the `VkSamplerCreateInfo` structure. To create a sampler Y'CbCr conversion, the `samplerYcbcrConversion` feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.

A `VkSamplerYcbcrConversionInfo` must be provided for samplers to be used with image views that access `VK_IMAGE_ASPECT_COLOR_BIT` if the format is one of the formats that require a sampler Y'CbCr conversion, or if the image view has an external format.

The `VkSamplerYcbcrConversionInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.
Valid Usage (Implicit)

- **VUID-VkSamplerYcbcrConversionInfo-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_INFO`

- **VUID-VkSamplerYcbcrConversionInfo-conversion-parameter**
  - `conversion` must be a valid `VkSamplerYcbcrConversion` handle

A sampler $Y'CbCr$ conversion is an opaque representation of a device-specific sampler $Y'CbCr$ conversion description, represented as a `VkSamplerYcbcrConversion` handle:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a `VkSamplerYcbcrConversion`, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- `device` is the logical device that creates the sampler $Y'CbCr$ conversion.
- `pCreateInfo` is a pointer to a `VkSamplerYcbcrConversionCreateInfo` structure specifying the requested sampler $Y'CbCr$ conversion.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.
- `pYcbcrConversion` is a pointer to a `VkSamplerYcbcrConversion` handle in which the resulting sampler $Y'CbCr$ conversion is returned.
The interpretation of the configured sampler Y’C_bC_r conversion is described in more detail in the description of sampler Y’C_bC_r conversion in the Image Operations chapter.

Valid Usage

- VUID-vkCreateSamplerYcbcrConversion-None-01648
  The samplerYcbcrConversion feature must be enabled

Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle
- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSamplerYcbcrConversionCreateInfo structure
- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  pYcbcrConversion must be a valid pointer to a VkSamplerYcbcrConversion handle

Return Codes

Success

- VK_SUCCESS

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSamplerYcbcrConversionCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange ycbcrRange;
    VkComponentMapping components;
    VkChromaLocation xChromaOffset;
    VkChromaLocation yChromaOffset;
    VkFilter chromaFilter;
    VkBool32 forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```
or the equivalent

```cpp
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **format** is the format of the image from which color information will be retrieved.
- **ycbcrModel** describes the color matrix for conversion between color models.
- **ycbcrRange** describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- **components** applies a *swizzle* based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- **xChromaOffset** describes the sample location associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- **yChromaOffset** describes the sample location associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- **chromaFilter** is the filter for chroma reconstruction.
- **forceExplicitReconstruction** can be used to ensure that reconstruction is done explicitly, if supported.

**Note**

Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.

If `format` supports `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` the `forceExplicitReconstruction` value behaves as if it was set to `VK_TRUE`.

If the `pNext` chain includes a `VkExternalFormatANDROID` structure with non-zero `externalFormat` member, the sampler Y’C₆C₆ conversion object represents an *external format conversion*, and `format` must be `VK_FORMAT_UNDEFINED`. Such conversions must only be used to sample image views with a matching *external format*. When creating an external format conversion, the value of `components` is ignored.

**Valid Usage**

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01904
If an external format conversion is being created, format must be \texttt{VK\_FORMAT\_UNDEFINED}.

- VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  If an external format conversion is not being created, format must represent unsigned normalized values (i.e. the format must be a \texttt{UNORM} format).

- VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler Y’CbCr conversion must support \texttt{VK\_FORMAT\_FEATURE\_MIDPOINT\_CHROMA\_SAMPLES\_BIT} or \texttt{VK\_FORMAT\_FEATURE\_COSITED\_CHROMA\_SAMPLES\_BIT}.

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler Y’CbCr conversion do not support \texttt{VK\_FORMAT\_FEATURE\_COSITED\_CHROMA\_SAMPLES\_BIT}, \texttt{xChromaOffset} and \texttt{yChromaOffset} must not be \texttt{VK\_CHROMA\_LOCATION\_COSITED\_EVEN} if the corresponding components are downsampling.

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler Y’CbCr conversion do not support \texttt{VK\_FORMAT\_FEATURE\_MIDPOINT\_CHROMA\_SAMPLES\_BIT}, \texttt{xChromaOffset} and \texttt{yChromaOffset} must not be \texttt{VK\_CHROMA\_LOCATION\_MIDPOINT} if the corresponding components are downsampling.

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then \texttt{components.g} must be the identity swizzle.

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then \texttt{components.a} must be the identity swizzle, \texttt{VK\_COMPONENT\_SWIZZLE\_ONE}, or \texttt{VK\_COMPONENT\_SWIZZLE\_ZERO}.

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then \texttt{components.r} must be the identity swizzle or \texttt{VK\_COMPONENT\_SWIZZLE\_B}.

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then \texttt{components.b} must be the identity swizzle or \texttt{VK\_COMPONENT\_SWIZZLE\_R}.

- VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  If the format has a _422 or _420 suffix, and if either \texttt{components.r} or \texttt{components.b} is the identity swizzle, both values must be the identity swizzle.

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  If \texttt{ycbcrModel} is not \texttt{VK\_SAMPLER\_YCBCR\_MODEL\_CONVERSION\_RGB\_IDENTITY}, then \texttt{components.r}, \texttt{components.g}, and \texttt{components.b} must correspond to components of the format; that is, \texttt{components.r}, \texttt{components.g}, and \texttt{components.b} must not be \texttt{VK\_COMPONENT\_SWIZZLE\_ZERO} or \texttt{VK\_COMPONENT\_SWIZZLE\_ONE}, and must not correspond to a component containing zero or one as a consequence of conversion to RGBA.

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  If \texttt{ycbcrRange} is \texttt{VK\_SAMPLER\_YCBCR\_RANGE\_ITU\_NARROW} then the R, G and B components obtained by applying the component swizzle to format must each have a bit-depth greater than or equal to 8.

- VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
  If the potential format features of the sampler Y’CbCr conversion do not support \texttt{VK\_FORMAT\_FEATURE\_SAMPLED\_IMAGE\_YCBCR\_CONVERSION\_CHROMA\_RECONSTRUCTION\_EXPLICIT\_FORCE}.
ABLE_BIT forceExplicitReconstruction must be VK_FALSE

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
  If the potential format features of the sampler Y\textsubscript{C_{\text{b}}}C_{\text{r}} conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, chromaFilter must not be VK_FILTER_LINEAR

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO

- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkExternalFormatANDROID

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
  ycbcrModel must be a valid VkSamplerYcbcrModelConversion value

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
  ycbcrRange must be a valid VkSamplerYcbcrRange value

- VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  xChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  yChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  chromaFilter must be a valid VkFilter value

If chromaFilter is VK_FILTER_NEAREST, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler Y\textsubscript{C_{\text{b}}}C_{\text{r}} conversion in the Image Operations chapter.

VkSamplerYcbcrModelConversion defines the conversion from the source color model to the shader color model. Possible values are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
};
```
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601 = 3,
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020 = 4,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601,
// Provided by VK_KHR_sampler_ycbcr_conversion
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020_KHR =
VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020,
} VkSamplerYcbcrModelConversion;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY** specifies that the input values to the conversion are unmodified.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY** specifies no model conversion but the inputs are range expanded as for Y’C_bC_r.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.709 and described in the “BT.709 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.601 and described in the “BT.601 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

• **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.2020 and described in the “BT.2020 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

In the **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*** color models, for the input to the sampler Y’C_bC_r range expansion and model conversion:

• the Y (Y’ luma) component corresponds to the G component of an RGB image.

• the CB (C_b or “U” blue color difference) component corresponds to the B component of an RGB image.

• the CR (C_r or “V” red color difference) component corresponds to the R component of an RGB image.
• the alpha component, if present, is not modified by color model conversion.

These rules reflect the mapping of components after the component swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

Note

For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```cpp
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```cpp
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the Sampler Y’C₉C₉ Range Expansion section of the Image Operations chapter.

No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma component samples.
relative to the luma samples, and is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_COSITED_EVEN_KHR = VK_CHROMA_LOCATION_COSITED_EVEN,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_CHROMA_LOCATION_MIDPOINT_KHR = VK_CHROMA_LOCATION_MIDPOINT,
} VkChromaLocation;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkChromaLocation VkChromaLocationKHR;
```

- **VK_CHROMA_LOCATION_COSITED_EVEN** specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- **VK_CHROMA_LOCATION_MIDPOINT** specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler Y’CₘCᵦ conversion, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
void vkDestroySamplerYcbcrConversionKHR(
    VkDevice device,
    VkSamplerYcbcrConversion ycbcrConversion,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the Y’CₘCᵦ conversion.
- **ycbcrConversion** is the conversion to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage (Implicit)

• VUID-vkDestroySamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
  If ycbcrConversion is not VK_NULL_HANDLE, ycbcrConversion must be a valid VkSamplerYcbcrConversion handle

• VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
  If ycbcrConversion is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to ycbcrConversion must be externally synchronized

In addition to the predefined border color values, applications can provide a custom border color value by including the VkSamplerCustomBorderColorCreateInfoEXT structure in the VkSamplerCreateInfo::pNext chain.

The VkSamplerCustomBorderColorCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_custom_border_color
typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkClearColorValue customBorderColor;
    VkFormat format;
} VkSamplerCustomBorderColorCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- customBorderColor is a VkClearColorValue representing the desired custom sampler border color.
- format is a VkFormat representing the format of the sampled image view(s). This field may be VK_FORMAT_UNDEFINED if the customBorderColorWithoutFormat feature is enabled.

Valid Usage

• VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04013
  If provided format is not VK_FORMAT_UNDEFINED then the VkSamplerCreateInfo::borderColor
type must match the sampled type of the provided format, as shown in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04014
  If the customBorderColorWithoutFormat feature is not enabled then format must not be VK_FORMAT_UNDEFINED.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04015
  If the sampler is used to sample an image view of VK_FORMAT_B4G4R4A4_UNORM_PACK16, VK_FORMAT_B5G6R5_UNORM_PACK16, or VK_FORMAT_B5G5R5A1_UNORM_PACK16 format then format must not be VK_FORMAT_UNDEFINED.

**Valid Usage (Implicit)**

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT.

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-parameter
  format must be a valid VkFormat value.

If the sampler is created with VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK, VK_BORDER_COLOR_INT_OPAQUE_BLACK, VK_BORDER_COLOR_FLOAT_CUSTOM_EXT, or VK_BORDER_COLOR_INT_CUSTOM_EXT borderColor, and that sampler will be combined with an image view that does not have an identity swizzle, and VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage is not enabled, then it is necessary to specify the component mapping of the border color, by including the VkSamplerBorderColorComponentMappingCreateInfoEXT structure in the VkSamplerCreateInfo::pNext chain, to get defined results.

The VkSamplerBorderColorComponentMappingCreateInfoEXT structure is defined as:

```c
typedef struct VkSamplerBorderColorComponentMappingCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkComponentMapping components;
    VkBool32 srgb;
} VkSamplerBorderColorComponentMappingCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- components is a VkComponentMapping structure specifying a remapping of the border color components.
- sRgb indicates that the sampler will be combined with an image view that has an image format which is SRGB encoded.

The VkComponentMapping components member describes a remapping from components of the border color to components of the vector returned by shader image instructions when the border
Valid Usage

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-borderColorSwizzle-06437
  The `borderColorSwizzle` feature **must** be enabled.

Valid Usage (Implicit)

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-sType-sType
  `sType` **must** be
  `VK_STRUCTURE_TYPE_SAMPLER_BORDER_COLOR_COMPONENT_MAPPING_CREATE_INFO_EXT`

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-components-parameter
  `components` **must** be a valid `VkComponentMapping` structure
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into descriptor sets, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in task, mesh and compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.
14.1.2. Sampler

A *sampler descriptor* (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a *sampler* object, used to control the behavior of *sampling operations* performed on a *sampled image*.

14.1.3. Sampled Image

A *sampled image* (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an *image resource* via an *image view* that *sampling operations* can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose *format features* contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

An image subresources for a sampled image *must* be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

14.1.4. Combined Image Sampler

A *combined image sampler* (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a *sampler* and an *image resource*, combining both a *sampler* and *sampled image* descriptor into a single descriptor.

If the descriptor refers to a sampler that performs YC₆C₈ conversion or samples a *subsampled image*, the sampler *must* only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor *can* be used freely with any other samplers and images.

An image subresources for a combined image sampler *must* be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
• VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
• VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

Note
On some implementations, it may be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

14.1.5. Uniform Texel Buffer

A uniform texel buffer (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that image sampling operations can be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as for an image.

Load operations from uniform texel buffers are supported in all shader stages for image formats which report support for the VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT feature bit via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.

14.1.6. Storage Texel Buffer

A storage texel buffer (VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER) is a descriptor type associated with a buffer resource via a buffer view that image load, store, and atomic operations can be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike uniform texel buffers, these buffers can also be written to in the same way as for storage images.

Storage texel buffer loads are supported in all shader stages for texel buffer formats which report support for the VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT feature bit via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.

Stores to storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report support for the VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT feature via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.

Atomic operations on storage texel buffers are supported in task, mesh and compute shaders for texel buffer formats which report support for the VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT feature via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.
When the `fragmentStoresAndAtomics` feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the `vertexPipelineStoresAndAtomics` feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

### 14.1.7. Storage Buffer

A *storage buffer* (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load, store, and atomic operations can be performed on.

**Note**

Atomic operations can only be performed on members of certain types as defined in the SPIR-V environment appendix.

### 14.1.8. Uniform Buffer

A *uniform buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER) is a descriptor type associated with a buffer resource directly, described in a shader as a structure with various members that load operations can be performed on.

### 14.1.9. Dynamic Uniform Buffer

A *dynamic uniform buffer* (VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC) is almost identical to a uniform buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

### 14.1.10. Dynamic Storage Buffer

A *dynamic storage buffer* (VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC) is almost identical to a storage buffer, and differs only in how the offset into the buffer is specified. The base offset calculated by the VkDescriptorBufferInfo when initially updating the descriptor set is added to a dynamic offset when binding the descriptor set.

### 14.1.11. Inline Uniform Block

An *inline uniform block* (VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK) is almost identical to a uniform buffer, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirect enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors cannot be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding’s capacity in bytes.
14.1.12. Sample Weight Image

A sample weight image (VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that can be used in weight image sampling. The image view must have been created with VkImageViewSampleWeightCreateInfoQCOM.

Shaders can combine a weight image variable, a sampled image variable, and a sampler variable to perform weight image sampling.

Weight image sampling is supported in all shader stages if the weight image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM and the sampled image view specifies a format that supports format feature VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

The image subresources for the weight image must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

14.1.13. Block Matching Image

A block matching image (VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM) is a descriptor type associated with an image resource via an image view that can be used in block matching.

Shaders can combine a target image variable, a reference image variable, and a sampler variable to perform block matching.

Block matching is supported in all shader stages for if both the target view and reference view specifies a format that supports format feature VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

The image subresources for block matching must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

An input attachment (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an image resource via an image view that can be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
14.1.15. Acceleration Structure

An acceleration structure (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

14.1.16. Mutable

A descriptor of mutable (VK_DESCRIPTOR_TYPE_MUTABLE_EXT) type indicates that this descriptor can mutate to any of the descriptor types given in the VkMutableDescriptorTypeCreateInfoEXT::pDescriptorTypes list of descriptor types in the pNext chain of VkDescriptorSetLayoutCreateInfo for this binding. At any point, each individual descriptor of mutable type has an active descriptor type. The active descriptor type can be any one of the declared types in pDescriptorTypes. Additionally, a mutable descriptor's active descriptor type can be of the VK_DESCRIPTOR_TYPE_MUTABLE_EXT type, which is the initial active descriptor type. The active descriptor type can change when the descriptor is updated. When a descriptor is consumed by binding a descriptor set, the active descriptor type is considered, not VK_DESCRIPTOR_TYPE_MUTABLE_EXT.

An active descriptor type of VK_DESCRIPTOR_TYPE_MUTABLE_EXT is considered an undefined descriptor. If a descriptor is consumed where the active descriptor type does not match what the shader expects, the descriptor is considered an undefined descriptor.

Note

To find which descriptor types are supported as VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the application can use vkGetDescriptorSetLayoutSupport with an VK_DESCRIPTOR_TYPE_MUTABLE_EXT binding, with the list of descriptor types to query in the VkMutableDescriptorTypeCreateInfoEXT::pDescriptorTypes array for that binding.

Note

The intention of a mutable descriptor type is that implementations allocate N bytes per descriptor, where N is determined by the maximum descriptor size for a given descriptor binding. Implementations are not expected to keep track of the active descriptor type, and it should be considered a C-like union type.

A mutable descriptor type is not considered as efficient in terms of runtime performance as using a non-mutable descriptor type, and applications are not encouraged to use them outside API layering efforts. Mutable descriptor types can be more efficient if the alternative is using many different descriptors to emulate
mutable descriptor types.

14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by VkDescriptorSetLayout handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorSetLayout* pSetLayout);
```

- `device` is the logical device that creates the descriptor set layout.
- `pCreateInfo` is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pSetLayout` is a pointer to a VkDescriptorSetLayout handle in which the resulting descriptor set layout object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
**pCreateInfo** must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure

- **VUID-vkCreateDescriptorSetLayout-pAllocator-parameter**
  If `pAllocator` is not **NULL**, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter**
  `pSetLayout` must be a valid pointer to a `VkDescriptorSetLayout` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

Information about the descriptor set layout is passed in a `VkDescriptorSetLayoutCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is **NULL** or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDescriptorSetLayoutCreateFlagBits` specifying options for descriptor set layout creation.
- `bindingCount` is the number of elements in `pBindings`.
- `pBindings` is a pointer to an array of `VkDescriptorSetLayoutBinding` structures.

### Valid Usage

- **VUID-VkDescriptorSetLayoutCreateInfo-binding-00279**
  The `VkDescriptorSetLayoutBinding::binding` members of the elements of the `pBindings` array must each have different values.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-00280**
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all
elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

- VUID-VkDescriptorSetLayoutCreateInfo-flags-02208
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

- VUID-VkDescriptorSetLayoutCreateInfo-flags-00281
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then the total number of elements of all bindings must be less than or equal to VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04590
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04591
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT

- VUID-VkDescriptorSetLayoutCreateInfo-flags-03000
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, flags must include VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-03001
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, then all bindings must not have descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04592
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT

- VUID-VkDescriptorSetLayoutCreateInfo-pBindings-07303
  If any element pBindings[i] has a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT, then a VkMutableDescriptorTypeCreateInfoEXT must be present in the pNext chain, and mutableDescriptorTypeListCount must be greater than i.

- VUID-VkDescriptorSetLayoutCreateInfo-descriptorType-04594
  If a binding has a descriptorType value of VK_DESCRIPTOR_TYPE_MUTABLE_EXT, then pImmutableSamplers must be NULL

- VUID-VkDescriptorSetLayoutCreateInfo-mutableDescriptorType-04595
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType is not enabled, pBindings must not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_EXT

- VUID-VkDescriptorSetLayoutCreateInfo-flags-04596
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT, VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType must be enabled
Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`.

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo` or `VkMutableDescriptorTypeCreateInfoEXT`.

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter**
  
  `flags` must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values.

- **VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter**
  
  If `bindingCount` is not 0, `pBindings` must be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures.

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` or `VkDescriptorPoolCreateInfo` structure includes a `VkMutableDescriptorTypeCreateInfoEXT` structure, then that structure specifies information about the possible descriptor types for mutable descriptor types.

The `VkMutableDescriptorTypeCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t mutableDescriptorTypeListCount;
    const VkMutableDescriptorTypeListEXT* pMutableDescriptorTypeLists;
} VkMutableDescriptorTypeCreateInfoEXT;
```

or the equivalent

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef VkMutableDescriptorTypeCreateInfoEXT VkMutableDescriptorTypeCreateInfoVALVE;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorTypeListCount` is the number of elements in `pMutableDescriptorTypeLists`.
- `pMutableDescriptorTypeLists` is a pointer to an array of `VkMutableDescriptorTypeListEXT` structures.

If `mutableDescriptorTypeListCount` is zero or if this structure is not included in the `pNext` chain, the `VkMutableDescriptorTypeListEXT` for each element is considered to be zero or `NULL` for each.
member. Otherwise, the descriptor set layout binding at \texttt{VkDescriptorSetLayoutCreateInfo::pBindings[i]} uses the descriptor type lists in \texttt{VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i]}.

### Valid Usage (Implicit)

- \texttt{VUID-VkMutableDescriptorTypeCreateInfoEXT-sType-sType}
  \texttt{sType must be VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO_EXT}

- \texttt{VUID-VkMutableDescriptorTypeCreateInfoEXT-pMutableDescriptorTypeLists-parameter}
  If \texttt{mutableDescriptorTypeListCount} is not \texttt{0}, \texttt{pMutableDescriptorTypeLists must be a valid pointer to an array of mutableDescriptorTypeListCount valid \texttt{VkMutableDescriptorTypeListEXT} structures}

The list of potential descriptor types a given mutable descriptor \textbf{can} mutate to is passed in a \texttt{VkMutableDescriptorTypeListEXT} structure.

The \texttt{VkMutableDescriptorTypeListEXT} structure is defined as:

```c
// Provided by VK_EXT_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeListEXT {
    uint32_t descriptorTypeCount;
    const VkDescriptorType* pDescriptorTypes;
} VkMutableDescriptorTypeListEXT;
```

or the equivalent

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef VkMutableDescriptorTypeListEXT VkMutableDescriptorTypeListVALVE;
```

- \texttt{descriptorTypeCount} is the number of elements in \texttt{pDescriptorTypes}.
- \texttt{pDescriptorTypes} is \texttt{NULL} or a pointer to an array of \texttt{descriptorTypeCount} \texttt{VkDescriptorType} values defining which descriptor types a given binding may mutate to.

### Valid Usage

- \texttt{VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04597}
  \texttt{descriptorTypeCount must not be 0 if the corresponding binding is of VK_DESCRIPTOR_TYPE_MUTABLE_EXT}

- \texttt{VUID-VkMutableDescriptorTypeListEXT-pDescriptorTypes-04598}
  \texttt{pDescriptorTypes must be a valid pointer to an array of descriptorTypeCount valid, unique VkDescriptorType values if the given binding is of VK_DESCRIPTOR_TYPE_MUTABLE_EXT type}

- \texttt{VUID-VkMutableDescriptorTypeListEXT-descriptorTypeCount-04599}
  \texttt{descriptorTypeCount must be 0 if the corresponding binding is not of VK_DESCRIPTOR_TYPE_MUTABLE_EXT}
pDescriptorTypes must not contain VK_DESCRIPTOR_TYPE_MUTABLE_EXT

pDescriptorTypes must not contain VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

pDescriptorTypes must not contain VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC

pDescriptorTypes must not contain VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

Valid Usage (Implicit)

If descriptorTypeCount is not 0, pDescriptorTypes must be a valid pointer to an array of descriptorTypeCount valid VkDescriptorType values

Bits which can be set in VkDescriptorsetLayoutCreateInfo::flags, specifying options for descriptor set layout, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
    // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT = VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE = VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT,
} VkDescriptorSetLayoutCreateFlagBits;
```

• VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR specifies that descriptor sets must not be allocated using this layout, and descriptors are instead pushed by vkCmdPushDescriptorSetKHR.

• VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits may be higher than the non-UpdateAfterBind limits.
VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT bit set. Descriptor set layouts created with this bit have no expressible limit for maximum number of descriptors per-stage. Host descriptor sets are limited only by available host memory, but may be limited for implementation specific reasons. Implementations may limit the number of supported descriptors to UpdateAfterBind limits or non-UpdateAfterBind limits, whichever is larger.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorSetLayoutCreateFlags;
```

VkDescriptorSetLayoutCreateFlags is a bitmask type for setting a mask of zero or more VkDescriptorSetLayoutCreateFlagBits.

The VkDescriptorSetLayoutBinding structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
    uint32_t binding;
    VkDescriptorType descriptorType;
    uint32_t descriptorCount;
    VkShaderStageFlags stageFlags;
    const VkSampler* pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.
- **descriptorType** is a VkDescriptorType specifying which type of resource descriptors are used for this binding.
- **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array, except if descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK in which case descriptorCount is the size in bytes of the inline uniform block. If descriptorCount is zero this binding entry is reserved and the resource must not be accessed from any stage via this binding within any pipeline using the set layout.
- **stageFlags** member is a bitmask of VkShaderStageFlagBits specifying which pipeline shader stages can access a resource for this binding. VK_SHADER_STAGE_ALL is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, can access the resource.

If a shader stage is not included in stageFlags, then a resource must not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages can use a descriptor binding, and in particular a binding can be used by both graphics stages and the compute stage.

- **pImmutableSamplers** affects initialization of samplers. If descriptorType specifies a
VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER type descriptor, then pImmutableSamplers can be used to initialize a set of immutable samplers. Immutable samplers are permanently bound into the set layout and must not be changed; updating a VK_DESCRIPTOR_TYPE_SAMPLER descriptor with immutable samplers is not allowed and updates to a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If pImmutableSamplers is not NULL, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects must not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If pImmutableSamplers is NULL, then the sampler slots are dynamic and sampler handles must be bound into descriptor sets using this layout. If descriptorType is not one of these descriptor types, then pImmutableSamplers is ignored.

The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the pBindings array. Bindings that are not specified have a descriptorCount and stageFlags of zero, and the value of descriptorType is undefined. However, all binding numbers between 0 and the maximum binding number in the VkDescriptorSetLayoutCreateInfo::pBindings array may consume memory in the descriptor set layout even if not all descriptor bindings are used, though it should not consume additional memory from the descriptor pool.

Note
The maximum binding number specified should be as compact as possible to avoid wasted memory.

Valid Usage

- VUID-VkDescriptorSetLayoutBinding-descriptorType-00282
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and descriptorCount is not 0 and pImmutableSamplers is not NULL, pImmutableSamplers must be a valid pointer to an array of descriptorCount valid VkSampler handles

- VUID-VkDescriptorSetLayoutBinding-descriptorType-04604
  If the inlineUniformBlock feature is not enabled, descriptorType must not be VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

- VUID-VkDescriptorSetLayoutBinding-descriptorType-02209
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount must be a multiple of 4

- VUID-VkDescriptorSetLayoutBinding-descriptorType-02210
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize

- VUID-VkDescriptorSetLayoutBinding-descriptorCount-00283
  If descriptorCount is not 0, stageFlags must be a valid combination of VkShaderStageFlagBits values
If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` must be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`.

If `descriptorType` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, then `pImmutableSamplers` must be `NULL`.

Valid Usage (Implicit)

If the `pNext` chain of a `VkDescriptorSetLayoutCreateInfo` structure includes a `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The `VkDescriptorSetLayoutBindingFlagsCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t bindingCount;
    const VkDescriptorBindingFlags* pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetLayoutBindingFlagsCreateInfo
    VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `bindingCount` is zero or the number of elements in `pBindingFlags`.
- `pBindingFlags` is a pointer to an array of `VkDescriptorBindingFlags` bitfields, one for each descriptor set layout binding.

If `bindingCount` is zero or if this structure is not included in the `pNext` chain, the `VkDescriptorBindingFlags` for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses...
the flags in `pBindingFlags[i].`

**Valid Usage**

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002**
  If `bindingCount` is not zero, `bindingCount` **must** equal `VkDescriptorSetLayoutCreateInfo::bindingCount`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003**
  If `VkDescriptorSetLayoutCreateInfo::flags` includes `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all elements of `pBindingFlags` **must** not include `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`, `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`, or `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004**
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, then all other elements of `VkDescriptorSetLayoutCreateInfo::pBindings` **must** have a smaller value of `binding`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_SAMPLER`, `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, or `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009**
  If `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` **must** not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`
::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingInlineUniformBlockUpdateAfterBind-02211
  If VkPhysicalDeviceInlineUniformBlockFeatures::descriptorBindingInlineUniformBlockUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570
  If VkPhysicalDeviceAccelerationStructureFeaturesKHR::descriptorBindingAccelerationStructureUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011
  All bindings with descriptor type VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUpdateUnusedWhilePending is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingPartiallyBound is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount is not enabled, all elements of pBindingFlags must not include VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015
  If an element of pBindingFlags includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, that element's descriptorType must not be VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or
Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType
  
  **sType** must be **VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO**

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter
  
  If bindingCount is not 0, pBindingFlags must be a valid pointer to an array of bindingCount valid combinations of **VkDescriptorBindingFlagBits** values

Bits which **can** be set in each element of **VkDescriptorSetLayoutBindingFlagsCreateInfo**::pBindingFlags, specifying options for the corresponding descriptor set layout binding, are:

```c
// Provided by VK_VERSION_1_2
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT =
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT =
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT =
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT =
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT,
} VkDescriptorBindingFlagBits;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlagBits VkDescriptorBindingFlagBitsEXT;
```

- **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in **vkUpdateDescriptorSetWithTemplateKHR** and **vkUpdateDescriptorSets**. Multiple descriptors with this flag set **can** be updated concurrently in different threads, though the same
descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not *dynamically used* need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets` in the same way as for **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT**. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- **VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT** indicates that this is a *variable-sized descriptor binding* whose size will be specified when a descriptor set is allocated using this layout. The value of `descriptorCount` is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of `binding`). For the purposes of counting against limits such as `maxDescriptorSet*` and `maxPerStageDescriptor*`, the full value of `descriptorCount` is counted, except for descriptor bindings with a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**. In this case, `descriptorCount` specifies the upper bound on the byte size of the binding; thus it counts against the `maxInlineUniformBlockSize` and `maxInlineUniformTotalSize` limits instead.

Note

Note that while **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** and **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** both involve updates to descriptor sets after they are bound, **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** is a weaker requirement since it is only about descriptors that are not used, whereas **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** requires the implementation to observe updates to descriptors that are used.

```c
// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
```
typedef VkDescriptorBindingFlags VkDescriptorBindingFlagsEXT;

VkDescriptorBindingFlags is a bitmask type for setting a mask of zero or more VkDescriptorBindingFlagBits.

To query information about whether a descriptor set layout can be created, call:

```c
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

or the equivalent command

```c
// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- **device** is the logical device that would create the descriptor set layout.
- **pCreateInfo** is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- **pSupport** is a pointer to a VkDescriptorSetLayoutSupport structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like maxDescriptorSet*, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, this command is guaranteed to return VK_TRUE in VkDescriptorSetLayoutSupport::supported. If the descriptor set layout exceeds the VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as maxPerStageDescriptor*, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as maxPerStageDescriptor* in order to be used in a pipeline layout.

**Note**

This is a VkDevice query rather than VkPhysicalDevice because the answer may depend on enabled features.
Valid Usage (Implicit)

- **VUID-vkGetDescriptorSetLayoutSupport-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure

- **VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter**
  
  `pSupport` must be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in a `VkDescriptorSetLayoutSupport` structure:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance3
typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supported` specifies whether the descriptor set layout can be created.

`supported` is set to `VK_TRUE` if the descriptor set can be created, or else is set to `VK_FALSE`.

Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutSupport-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`

- **VUID-VkDescriptorSetLayoutSupport-pNext-pNext**
  
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupport`

- **VUID-VkDescriptorSetLayoutSupport-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns
additional information about whether the descriptor set layout is supported.

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetVariableDescriptorCountLayoutSupport
    VkDescriptorSetVariableDescriptorCountLayoutSupportEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxVariableDescriptorCount` indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `maxVariableDescriptorCount` indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the `VkDescriptorSetLayoutCreateInfo` structure specified in `vkGetDescriptorSetLayoutSupport::pCreateInfo` includes a variable-sized descriptor, then `supported` is determined assuming the requested size of the variable-sized descriptor, and `maxVariableDescriptorCount` is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the `VkDescriptorSetLayoutCreateInfo` structure does not include a variable-sized descriptor, or if the `VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount` feature is not enabled, then `maxVariableDescriptorCount` is set to zero. For the purposes of this command, a variable-sized descriptor binding with a `descriptorCount` of zero is treated as if the `descriptorCount` is one, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to `maxVariableDescriptorCount` is undefined.

### Valid Usage (Implicit)

- `VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT`.

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.
GLSL example

```glsl
// binding to a single sampled image descriptor in set 0
layout (set=0, binding=0) uniform texture2D mySampledImage;

// binding to an array of sampled image descriptors in set 0
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

// binding to a single uniform buffer descriptor in set 1
layout (set=1, binding=0) uniform myUniformBuffer
{
    vec4 myElement[32];
};
```

SPIR-V example

```spirv
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "mySampledImage"
OpName %14 "myArrayOfSampledImages"
OpName %18 "myUniformBuffer"
OpMemberName %18 0 "myElement"
OpName %20 ""
OpDecorate %9 DescriptorSet 0
OpDecorate %9 Binding 0
OpDecorate %14 DescriptorSet 0
OpDecorate %14 Binding 1
OpDecorate %17 ArrayStride 16
OpMemberDecorate %18 0 Offset 0
OpDecorate %18 Block
OpDecorate %20 DescriptorSet 1
OpDecorate %20 Binding 0
%2 = OpTypeVoid
%3 = OpTypeFunction %2
%6 = OpTypeFloat 32
%7 = OpTypeImage %6 2D 0 0 0 1 Unknown
%8 = OpTypePointer UniformConstant %7
%9 = OpVariable %8 UniformConstant
%10 = OpTypeInt 32 0
%11 = OpConstant %10 12
%12 = OpTypeArray %7 %11
%13 = OpTypePointer UniformConstant %12
%14 = OpVariable %13 UniformConstant
```
API example

```c
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] = {
  // binding to a single image descriptor
  { 0, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, 1, VK_SHADER_STAGE_FRAGMENT_BIT, NULL },
  // binding to an array of image descriptors
  { 1, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, 12, VK_SHADER_STAGE_FRAGMENT_BIT, NULL },
  // binding to a single uniform buffer descriptor
  { 0, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, 1, VK_SHADER_STAGE_FRAGMENT_BIT, NULL }
};

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] = {
  // Information for first descriptor set with two descriptor bindings
  { VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO, 0, 2, 1066
```
To destroy a descriptor set layout, call:

```c
void vkDestroyDescriptorSetLayout(
    VkDevice device, 
    VkDescriptorSetLayout descriptorSetLayout, 
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor set layout.
- `descriptorSetLayout` is the descriptor set layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284
If `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285**

If no `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, `pAllocator` **must** be NULL

---

**Valid Usage (Implicit)**

- **VUID-vkDestroyDescriptorSetLayout-device-parameter**
  
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter**
  
  If `descriptorSetLayout` is not `VK_NULL_HANDLE`, `descriptorSetLayout` **must** be a valid `VkDescriptorSetLayout` handle

- **VUID-vkDestroyDescriptorSetLayout-pAllocator-parameter**
  
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parent**
  
  If `descriptorSetLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `descriptorSetLayout` **must** be externally synchronized

---

**14.2.2. Pipeline Layouts**

Access to descriptor sets from a pipeline is accomplished through a *pipeline layout*. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that **can** be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by `VkPipelineLayout` handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
```
VkDevice
const VkPipelineLayoutCreateInfo* pCreateInfo,
const VkAllocationCallbacks* pAllocator,
VkPipelineLayout* pPipelineLayout);

- **device** is the logical device that creates the pipeline layout.
- **pCreateInfo** is a pointer to a `VkPipelineLayoutCreateInfo` structure specifying the state of the pipeline layout object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pPipelineLayout** is a pointer to a `VkPipelineLayout` handle in which the resulting pipeline layout object is returned.

### Valid Usage (Implicit)

- **VUID-vkCreatePipelineLayout-device-parameter**
  - **device must** be a valid `VkDevice` handle
- **VUID-vkCreatePipelineLayout-pCreateInfo-parameter**
  - **pCreateInfo must** be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure
- **VUID-vkCreatePipelineLayout-pAllocator-parameter**
  - If **pAllocator** is not NULL, **pAllocator must** be a valid pointer to a valid `VkAllocationCallbacks` structure
- **VUID-vkCreatePipelineLayout-pPipelineLayout-parameter**
  - **pPipelineLayout must** be a valid pointer to a `VkPipelineLayout` handle

### Return Codes

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

The `VkPipelineLayoutCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
} VkPipelineLayoutCreateInfo;
```
```c
const VkPushConstantRange* pPushConstantRanges;
}
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineLayoutCreateFlagBits` specifying options for pipeline layout creation.
- `setLayoutCount` is the number of descriptor sets included in the pipeline layout.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects.
- `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

**Note**
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

### Valid Usage

- **VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286**
  
  `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03016**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03017**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03018**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-06939**

1070
The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, and VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03020
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
  The total number of bindings in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03022
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03023
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03024
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03025
  The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03026
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03027
  The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments

- VUID-VkPipelineLayoutCreateInfo-descriptorType-02215
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03028
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03029
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03030
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03031
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers
elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers}

- \textbf{VUID-VkPipelineLayoutCreateInfo-descriptorType-03032}
  The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic}

- \textbf{VUID-VkPipelineLayoutCreateInfo-descriptorType-03033}
  The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetSampledImages}

- \textbf{VUID-VkPipelineLayoutCreateInfo-descriptorType-03034}
  The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, and \texttt{VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxDescriptorSetInputAttachments}

- \textbf{VUID-VkPipelineLayoutCreateInfo-descriptorType-03035}
  The total number of descriptors in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks}

- \textbf{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03036}
  The total number of bindings in descriptor set layouts created without the \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT} bit set with a \texttt{descriptorType} of \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetInlineUniformBlocks}

- \textbf{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03037}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_SAMPLER} and \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers}

- \textbf{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03038}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers}

- \textbf{VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039}
  The total number of descriptors of the type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} accessible across all shader stages and across all elements of \texttt{pSetLayouts} must be less than or equal to \texttt{VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic}
accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03039**
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03040**
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03041**
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03042**
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-03043**
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-02217**
The total number of bindings with a descriptorType of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`

- **VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-00292**
Any two elements of `pPushConstantRanges` must not include the same stage in `stageFlags`

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-00293**
`pSetLayouts` must not contain more than one descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03571**
The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_KHR` bit set with a descriptorType
The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03572**
  The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures`.

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03573**
  The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures`.

- **VUID-VkPipelineLayoutCreateInfo-pImmutableSamplers-03566**
  The total number of `pImmutableSamplers` created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` or `VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT` across all shader stages and across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxDescriptorSetSubsampledSamplers`.

- **VUID-VkPipelineLayoutCreateInfo-pSetLayouts-04606**
  Any element of `pSetLayouts` must not have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` bit set.

- **VUID-VkPipelineLayoutCreateInfo-graphicsPipelineLibrary-06753**
  If `graphicsPipelineLibrary` is not enabled, elements of `pSetLayouts` must be valid `VkDescriptorSetLayout` objects.

## Valid Usage (Implicit)

- **VUID-VkPipelineLayoutCreateInfo-sType-sType**
sType must be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO

- VUID-VkPipelineLayoutCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineLayoutCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineLayoutCreateFlagBits values

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter
  If setLayoutCount is not 0, pSetLayouts must be a valid pointer to an array of setLayoutCount valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter
  If pushConstantRangeCount is not 0, pPushConstantRanges must be a valid pointer to an array of pushConstantRangeCount valid VkPushConstantRange structures

// Provided by VK_EXT_graphics_pipeline_library
typedef enum VkPipelineLayoutCreateFlagBits {

  // Provided by VK_EXT_graphics_pipeline_library
  VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT = 0x00000002,
} VkPipelineLayoutCreateFlagBits;

- VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT specifies that implementations must ensure that the properties and/or absence of a particular descriptor set do not influence any other properties of the pipeline layout. This allows pipelines libraries linked without VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT to be created with a subset of the total descriptor sets.

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineLayoutCreateFlags;

VkPipelineLayoutCreateFlags is a bitmask type for setting a mask of VkPipelineLayoutCreateFlagBits.

The VkPushConstantRange structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkPushConstantRange {

  VkShaderStageFlags stageFlags;
  uint32_t offset;
  uint32_t size;
} VkPushConstantRange;

- stageFlags is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.

- offset and size are the start offset and size, respectively, consumed by the range. Both offset and size are in units of bytes and must be a multiple of 4. The layout of the push constant
variables is specified in the shader.

Valid Usage

- VUID-VkPushConstantRange-offset-00294
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize

- VUID-VkPushConstantRange-offset-00295
  offset must be a multiple of 4

- VUID-VkPushConstantRange-size-00296
  size must be greater than 0

- VUID-VkPushConstantRange-size-00297
  size must be a multiple of 4

- VUID-VkPushConstantRange-size-00298
  size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

Valid Usage (Implicit)

- VUID-VkPushConstantRange-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-VkPushConstantRange-stageFlags-requiredbitmask
  stageFlags must not be 0

Once created, pipeline layouts are used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline must be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in stageFlags. The pipeline layout can include entries that are not used by a particular pipeline, or that are dead-code eliminated from any of the shaders. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with stageFlags including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline, or for which the variables have been dead-code eliminated from any of the shaders.
There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```
• **device** is the logical device that destroys the pipeline layout.
• **pipelineLayout** is the pipeline layout to destroy.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyPipelineLayout-pipelineLayout-00299**
  If **VkAllocationCallbacks** were provided when **pipelineLayout** was created, a compatible set of callbacks **must** be provided here.

- **VUID-vkDestroyPipelineLayout-pipelineLayout-00300**
  If no **VkAllocationCallbacks** were provided when **pipelineLayout** was created, **pAllocator** **must** be **NULL**.

- **VUID-vkDestroyPipelineLayout-pipelineLayout-02004**
  **pipelineLayout** **must** not have been passed to any **vkCmd*** command for any command buffers that are still in the **recording state** when **vkDestroyPipelineLayout** is called.

### Valid Usage (Implicit)

- **VUID-vkDestroyPipelineLayout-device-parameter**
  **device** **must** be a valid **VkDevice** handle.

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parameter**
  If **pipelineLayout** is not **VK_NULL_HANDLE**, **pipelineLayout** **must** be a valid **VkPipelineLayout** handle.

- **VUID-vkDestroyPipelineLayout-pAllocator-parameter**
  If **pAllocator** is not **NULL**, **pAllocator** **must** be a valid pointer to a valid **VkAllocationCallbacks** structure.

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parent**
  If **pipelineLayout** is a valid handle, it **must** have been created, allocated, or retrieved from **device**.

### Host Synchronization

- Host access to **pipelineLayout** **must** be externally synchronized.

### Pipeline Layout Compatibility

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with *identically defined* descriptor set layouts for sets zero through N, if both of them either were or were not created with **VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT**, and if they were created with identical push constant ranges.
When binding a descriptor set (see Descriptor Set Binding) to set number N, if the previously bound descriptor sets for sets zero through N-1 were all bound using compatible pipeline layouts, then performing this binding does not disturb any of the lower numbered sets. If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout compatible for set N, then the bindings in sets numbered greater than N are also not disturbed.

Similarly, when binding a pipeline, the pipeline can correctly access any previously bound descriptor sets which were bound with compatible pipeline layouts, as long as all lower numbered sets were also bound with compatible layouts.

Layout compatibility means that descriptor sets can be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets can remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

Implementor’s Note

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N should only be a function of sets [0..N].

Note

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see maxBoundDescriptorSets in Limits).

API example

```c
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };  
const VkPushConstantRange ranges[] =  
{  
   {  
      VK_SHADER_STAGE_VERTEX_BIT, // stageFlags  
      0, // offset  
      4 // size  
   },  

   {  
      VK_SHADER_STAGE_FRAGMENT_BIT, // stageFlags  
      4, // offset  
      4 // size  
   },
```
14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

To create a descriptor pool object, call:

```
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)

VkResult vkCreateDescriptorPool(
    VkDevice       device,           // device
    const VkDescriptorPoolCreateInfo* pCreateInfo, // pCreateInfo
    const VkAllocationCallbacks* pAllocator,   // pAllocator
    VkDescriptorPool* pDescriptorPool);      // pDescriptorPool
```

- **device** is the logical device that creates the descriptor pool.
- **pCreateInfo** is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pDescriptorPool** is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.
The created descriptor pool is returned in `pDescriptorPool`.

**Valid Usage (Implicit)**

- **VUID-vkCreateDescriptorPool-device-parameter**
  device must be a valid `VkDevice` handle

- **VUID-vkCreateDescriptorPool-pCreateInfo-parameter**
  `pCreateInfo` must be a valid pointer to a valid `VkDescriptorPoolCreateInfo` structure

- **VUID-vkCreateDescriptorPool-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreateDescriptorPool-pDescriptorPool-parameter**
  `pDescriptorPool` must be a valid pointer to a `VkDescriptorPool` handle

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`
- `VK_ERROR_FRAGMENTATION_EXT`

Additional information about the pool is passed in a `VkDescriptorPoolCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDescriptorPoolCreateFlagBits` specifying certain supported operations on the pool.
- `maxSets` is the maximum number of descriptor sets that can be allocated from the pool.
- `poolSizeCount` is the number of elements in `pPoolSizes`. 
• **pPoolSizes** is a pointer to an array of **VkDescriptorPoolSize** structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple **VkDescriptorPoolSize** structures containing the same descriptor type appear in the **pPoolSizes** array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and **may** lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation **must** not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation **must** not cause an allocation failure (note that this is always the case for a pool created without the **VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT** bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation **must** not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application **can** create an additional descriptor pool to perform further descriptor set allocations.

If **flags** has the **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** bit set, descriptor pool creation **may** fail with the error **VK_ERROR_FRAGMENTATION** if the total number of descriptors across all pools (including this one) created with this bit set exceeds maxUpdateAfterBindDescriptorsInAllPools, or if fragmentation of the underlying hardware resources occurs.

If a **pPoolSizes[i].:type** is **VK_DESCRIPTOR_TYPE_MUTABLE_EXT**, a **VkMutableDescriptorTypeCreateInfoEXT** struct in the **pNext** chain **can** be used to specify which mutable descriptor types **can** be allocated from the pool. If present in the **pNext** chain, **VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i]** specifies which kind of **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** descriptors **can** be allocated from this pool entry. If **VkMutableDescriptorTypeCreateInfoEXT** does not exist in the **pNext** chain, or **VkMutableDescriptorTypeCreateInfoEXT::pMutableDescriptorTypeLists[i]** is out of range, the descriptor pool allocates enough memory to be able to allocate a **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** descriptor with any supported **VkDescriptorType** as a mutable descriptor. A mutable descriptor **can** be allocated from a pool entry if the type list in **VkDescriptorSetLayoutCreateInfo** is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple **pPoolSizes** entries with **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** **can** be declared. When multiple such pool entries are present in **pPoolSizes**, they specify sets of supported descriptor types which either fully overlap, partially overlap, or are disjoint. Two sets fully overlap if the sets of supported descriptor types are equal. If the sets are not disjoint they partially overlap. A pool entry without a **VkMutableDescriptorTypeListEXT** assigned to it is considered to partially overlap any other pool entry which has a **VkMutableDescriptorTypeListEXT** assigned to it. The application **must** ensure that partial overlap does not exist in **pPoolSizes**.

---

**Note**

The requirement of no partial overlap is intended to resolve ambiguity for
validation as there is no confusion which \texttt{pPoolSizes} entries will be allocated from. An implementation is not expected to depend on this requirement.

**Valid Usage**

- **VUID-VkDescriptorPoolCreateInfo-maxSets-00301**
  \texttt{maxSets} must be greater than 0

- **VUID-VkDescriptorPoolCreateInfo-flags-04607**
  If flags has the \texttt{VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT} bit set, then the \texttt{VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT} bit must not be set

- **VUID-VkDescriptorPoolCreateInfo-mutableDescriptorType-04608**
  If \texttt{VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType} is not enabled, \texttt{pPoolSizes} must not contain a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}

- **VUID-VkDescriptorPoolCreateInfo-flags-04609**
  If flags has the \texttt{VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT} bit set, \texttt{VkPhysicalDeviceMutableDescriptorTypeFeaturesEXT::mutableDescriptorType} must be enabled

- **VUID-VkDescriptorPoolCreateInfo-pPoolSizes-04787**
  If \texttt{pPoolSizes} contains a descriptorType of \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT}, any other \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_EXT} element in \texttt{pPoolSizes} must not have sets of supported descriptor types which partially overlap

**Valid Usage (Implicit)**

- **VUID-VkDescriptorPoolCreateInfo-sType-sType**
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO}

- **VUID-VkDescriptorPoolCreateInfo-pNext-pNext**
  Each \texttt{pNext} member of any structure (including this one) in the \texttt{pNext} chain must be either \texttt{NULL} or a pointer to a valid instance of \texttt{VkDescriptorPoolInlineUniformBlockCreateInfo} or \texttt{VkMutableDescriptorTypeCreateInfoEXT}

- **VUID-VkDescriptorPoolCreateInfo-sType-unique**
  The \texttt{sType} value of each struct in the \texttt{pNext} chain must be unique

- **VUID-VkDescriptorPoolCreateInfo-flags-parameter**
  \texttt{flags} must be a valid combination of \texttt{VkDescriptorPoolCreateFlagBits} values

- **VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter**
  If \texttt{poolSizeCount} is not 0, \texttt{pPoolSizes} must be a valid pointer to an array of \texttt{poolSizeCount} valid \texttt{VkDescriptorPoolSize} structures

In order to be able to allocate descriptor sets having **inline uniform block** bindings the descriptor pool must be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a \texttt{VkDescriptorPoolSize} structure with a descriptorType value of
This can be done by adding a `VkDescriptorPoolInlineUniformBlockCreateInfo` structure to the `pNext` chain of `VkDescriptorPoolCreateInfo`.

The `VkDescriptorPoolInlineUniformBlockCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType       sType;
    const void*            pNext;
    uint32_t               maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
typedef VkDescriptorPoolInlineUniformBlockCreateInfo VkDescriptorPoolInlineUniformBlockCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `maxInlineUniformBlockBindings` is the number of inline uniform block bindings to allocate.

**Valid Usage (Implicit)**

- `VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO`.

Bits which can be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT   = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT    = 0x00000002,
    // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT        = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT = VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE      = VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT,
} VkDescriptorPoolCreateFlagBits;
```
• **VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT** specifies that descriptor sets can return their individual allocations to the pool, i.e. all of *vkAllocateDescriptorSets*, *vkFreeDescriptorSets*, and *vkResetDescriptorPool* are allowed. Otherwise, descriptor sets allocated from the pool must not be individually freed back to the pool, i.e. only *vkAllocateDescriptorSets* and *vkResetDescriptorPool* are allowed.

• **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** specifies that descriptor sets allocated from this pool can include bindings with the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit set. It is valid to allocate descriptor sets that have bindings that do not set the **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** bit from a pool that has **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** set.

• **VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT** specifies that this descriptor pool and the descriptor sets allocated from it reside entirely in host memory and cannot be bound. Similar to descriptor sets allocated without this flag, applications can copy-from and copy-to descriptors sets allocated from this descriptor pool. Descriptor sets allocated from this pool are partially exempt from the external synchronization requirement in *vkUpdateDescriptorSetWithTemplateKHR* and *vkUpdateDescriptorSets*. Descriptor sets and their descriptors can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;
```

**VkDescriptorPoolCreateFlags** is a bitmask type for setting a mask of zero or more **VkDescriptorPoolCreateFlagBits**.

The **VkDescriptorPoolSize** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType    type;
    uint32_t             descriptorCount;
} VkDescriptorPoolSize;
```

• **type** is the type of descriptor.

• **descriptorCount** is the number of descriptors of that type to allocate. If **type** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **descriptorCount** is the number of bytes to allocate for descriptors of this type.

**Note**

When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the **descriptorCount** value, as indicated by *VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount*. 

1086
Valid Usage

- VUID-VkDescriptorPoolSize-descriptorCount-00302
descriptorCount must be greater than 0

- VUID-VkDescriptorPoolSize-type-02218
  If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkDescriptorPoolSize-type-parameter
type must be a valid VkDescriptorType value

To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
  VkDevice device,
  VkDescriptorPool descriptorPool,
  const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the descriptor pool.
- descriptorPool is the descriptor pool to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

Valid Usage

- VUID-vkDestroyDescriptorPool-descriptorPool-00303
  All submitted commands that refer to descriptorPool (via any allocated descriptor sets) must have completed execution

- VUID-vkDestroyDescriptorPool-descriptorPool-00304
  If VkAllocationCallbacks were provided when descriptorPool was created, a compatible set of callbacks must be provided here

- VUID-vkDestroyDescriptorPool-descriptorPool-00305
  If no VkAllocationCallbacks were provided when descriptorPool was created, pAllocator must be NULL
Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorPool-device-parameter**
  - `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorPool-descriptorPool-parameter**
  - If `descriptorPool` is not `VK_NULL_HANDLE`, `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-vkDestroyDescriptorPool-pAllocator-parameter**
  - If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyDescriptorPool-descriptorPool-parent**
  - If `descriptorPool` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

- Host access to `descriptorPool` must be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by `VkDescriptorSet` handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device,
    const VkDescriptorSetAllocateInfo* pAllocateInfo,
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a `VkDescriptorSetAllocateInfo` structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of `VkDescriptorSet` handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined. Descriptors also become undefined if the underlying resource is destroyed. Descriptor sets containing undefined descriptors can still be bound and used, subject to the following
conditions:

• For descriptor set bindings created with the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are dynamically used must have been populated before the descriptor set is consumed.

• For descriptor set bindings created without the `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT` bit set, all descriptors in that binding that are statically used must have been populated before the descriptor set is consumed.

• Descriptor bindings with descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` can be undefined when the descriptor set is consumed; though values in that block will be undefined.

• Entries that are not used by a pipeline can have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation may fail due to lack of space in the descriptor pool. Similarly, the allocation may fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of `VkDescriptorPoolCreateInfo::pPoolSizes` with a type equal to that type.

Additionally, the allocation may also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of `VkDescriptorPoolInlineUniformBlockCreateInfo::maxInlineUniformBlockBindings` used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then `VK_ERROR_OUT_OF_POOL_MEMORY` must be returned.

`vkAllocateDescriptorSets` can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to `VK_NULL_HANDLE` and return the error.

---

**Valid Usage (Implicit)**

- **VUID-vkAllocateDescriptorSets-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter**
  `pAllocateInfo` **must** be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure

- **VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter**
  `pDescriptorSets` **must** be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` `VkDescriptorSet` handles

- **VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength**
  `pAllocateInfo->descriptorSetCount` **must** be greater than 0
Host Synchronization

- Host access to pAllocateInfo->descriptorPool must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OFDEVICE_MEMORY
- VK_ERROR_FRAGMENTED_POOL
- VK_ERROR_OUT_OF_POOL_MEMORY

The VkDescriptorSetAllocateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType            sType;
    const void*                pNext;
    VkDescriptorPool           descriptorPool;
    uint32_t                   descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

Valid Usage

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308
  Each element of pSetLayouts must not have been created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR set

- VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044
  If any element of pSetLayouts was created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set, descriptorPool must have been created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set
If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` flag set.

Valid Usage (Implicit)

- **VUID-VkDescriptorSetAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`

- **VUID-VkDescriptorSetAllocateInfo-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountAllocateInfo`

- **VUID-VkDescriptorSetAllocateInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter**
  `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter**
  `pSetLayouts` must be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles

- **VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength**
  `descriptorSetCount` must be greater than `0`

- **VUID-VkDescriptorSetAllocateInfo-commonparent**
  Both of `descriptorPool`, and the elements of `pSetLayouts` must have been created, allocated, or retrieved from the same `VkDevice`

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t descriptorSetCount;
    const uint32_t* pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
```
typedef VkDescriptorSetVariableDescriptorCountAllocateInfo
VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `descriptorSetCount` is zero or the number of elements in `pDescriptorCounts`.
- `pDescriptorCounts` is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.

If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable lengths are considered to be zero. Otherwise, `pDescriptorCounts[i]` is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `pDescriptorCounts[i]` specifies the binding's capacity in bytes. If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` does not include a variable-sized descriptor binding, then `pDescriptorCounts[i]` is ignored.

Valid Usage

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045
  If `descriptorSetCount` is not zero, `descriptorSetCount` must equal `VkDescriptorSetAllocateInfo::descriptorSetCount`

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pSetLayouts-03046
  If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` has a variable-sized descriptor binding, then `pDescriptorCounts[i]` must be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO`

- VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter
  If `descriptorSetCount` is not 0, `pDescriptorCounts` must be a valid pointer to an array of `descriptorSetCount uint32_t` values

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkFreeDescriptorSets(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    uint32_t descriptorSetCount,
);```

1092
const VkDescriptorSet* pDescriptorSets);

- **device** is the logical device that owns the descriptor pool.
- **descriptorPool** is the descriptor pool from which the descriptor sets were allocated.
- **descriptorSetCount** is the number of elements in the `pDescriptorSets` array.
- **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects.

After calling `vkFreeDescriptorSets`, all descriptor sets in `pDescriptorSets` are invalid.

### Valid Usage

- **VUID-vkFreeDescriptorSets-pDescriptorSets-00309**
  All submitted commands that refer to any element of `pDescriptorSets` must have completed execution

- **VUID-vkFreeDescriptorSets-pDescriptorSets-00310**
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` `VkDescriptorSet` handles, each element of which must either be a valid handle or `VK_NULL_HANDLE`

### Valid Usage (Implicit)

- **VUID-vkFreeDescriptorSets-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkFreeDescriptorSets-descriptorPool-parameter**
  `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength**
  `descriptorSetCount` must be greater than 0

- **VUID-vkFreeDescriptorSets-descriptorPool-parent**
  `descriptorPool` must have been created, allocated, or retrieved from `device`

- **VUID-vkFreeDescriptorSets-pDescriptorSets-parent**
  Each element of `pDescriptorSets` that is a valid handle must have been created, allocated, or retrieved from `descriptorPool`

### Host Synchronization

- Host access to `descriptorPool` must be externally synchronized
- Host access to each member of `pDescriptorSets` must be externally synchronized
To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool to be reset.
- `flags` is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

**Valid Usage**

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of `descriptorPool` (via any allocated descriptor sets) **must** have completed execution

**Valid Usage (Implicit)**

- VUID-vkResetDescriptorPool-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkResetDescriptorPool-descriptorPool-parameter
  `descriptorPool` **must** be a valid `VkDescriptorPool` handle

- VUID-vkResetDescriptorPool-flags-zerobitmask
  `flags` **must** be 0

- VUID-vkResetDescriptorPool-descriptorPool-parent
  `descriptorPool` **must** have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `descriptorPool` **must** be externally synchronized
Host access to any `VkDescriptorSet` objects allocated from `descriptorPool` must be externally synchronized.

## Return Codes

### Success
- `VK_SUCCESS`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolResetFlags;
```

`VkDescriptorPoolResetFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

### 14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice device,                     // Logical device to update descriptor sets.
    uint32_t descriptorWriteCount,       // Number of write operations in the `pDescriptorWrites` array.
    const VkWriteDescriptorSet* pDescriptorWrites,  // Array of `VkWriteDescriptorSet` structures describing the write operations.
    uint32_t descriptorCopyCount,        // Number of copy operations in the `pDescriptorCopies` array.
    const VkCopyDescriptorSet* pDescriptorCopies) ;  // Array of `VkCopyDescriptorSet` structures describing the copy operations.
```

- `device` is the logical device that updates the descriptor sets.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptor sets to write to.
- `descriptorCopyCount` is the number of elements in the `pDescriptorCopies` array.
- `pDescriptorCopies` is a pointer to an array of `VkCopyDescriptorSet` structures describing the descriptor sets to copy between.

The operations described by `pDescriptorWrites` are performed first, followed by the operations described by `pDescriptorCopies`. Within each array, the operations are performed in the order they appear in the array.

Each element in the `pDescriptorWrites` array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the `pDescriptorCopies` array is a `VkCopyDescriptorSet` structure describing an operation copying descriptors between sets.
If the dstSet member of any element of pDescriptorWrites or pDescriptorCopies is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set, that command buffer becomes invalid.

### Valid Usage

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, elements of the pTexelBufferView member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of any element of the pBufferInfo member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of any element of the pImageInfo member of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06239**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER the imageView member of any element of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06241**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, elements of the pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of pDescriptorWrites[i] must have been created on device.

- **VUID-vkUpdateDescriptorSets-pDescriptorWrites-06940**
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or...
VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the imageView member of any element of pDescriptorWrites[i] must have been created on device

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06941
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-None-03047
  Descriptor bindings updated by this command which were created without the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set must not be used by any command that was recorded to a command buffer which is in the pending state

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
  Host access to pDescriptorWrites[i].dstSet and pDescriptorCopies[i].dstSet must be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter
device must be a valid VkDevice handle

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
  If descriptorWriteCount is not 0, pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
  If descriptorCopyCount is not 0, pDescriptorCopies must be a valid pointer to an array of descriptorCopyCount valid VkCopyDescriptorSet structures

The VkWriteDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
  VkStructureType sType;
  const void* pNext;
  VkDescriptorSet dstSet;
  uint32_t dstBinding;
  uint32_t dstArrayElement;
} VkWriteDescriptorSet;
```
uint32_t descriptorCount;
VkDescriptorType descriptorType;
const VkDescriptorImageInfo* pImageInfo;
const VkDescriptorBufferInfo* pBufferInfo;
const VkBufferView* pTexelBufferView;
} VkWriteDescriptorSet;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• dstSet is the destination descriptor set to update.
• dstBinding is the descriptor binding within that set.
• dstArrayElement is the starting element in that array. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then dstArrayElement specifies the starting byte offset within the binding.
• descriptorCount is the number of descriptors to update. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, then descriptorCount specifies the number of bytes to update. Otherwise, descriptorCount is one of
  ◦ the number of elements in pImageInfo
  ◦ the number of elements in pBufferInfo
  ◦ the number of elements in pTexelBufferView
  ◦ a value matching the dataSize member of a VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain
  ◦ a value matching the accelerationStructureCount of a VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain
• descriptorType is a VkDescriptorType specifying the type of each descriptor in pImageInfo, pBufferInfo, or pTexelBufferView, as described below. If VkDescriptorSetLayoutBinding for dstSet at dstBinding is not equal to VK_DESCRIPTOR_TYPE_MUTABLE_EXT, descriptorType must be the same type as the descriptorType specified in VkDescriptorSetLayoutBinding for dstSet at dstBinding. The type of the descriptor also controls which array the descriptors are taken from.
• pImageInfo is a pointer to an array of VkDescriptorImageInfo structures or is ignored, as described below.
• pBufferInfo is a pointer to an array of VkDescriptorBufferInfo structures or is ignored, as described below.
• pTexelBufferView is a pointer to an array of VkBufferView handles as described in the Buffer Views section or is ignored, as described below.

Only one of pImageInfo, pBufferInfo, or pTexelBufferView members is used according to the descriptor type specified in the descriptorType member of the containing VkWriteDescriptorSet structure, or none of them in case descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, in which case the source data for the descriptor writes is taken from the VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet, or if descriptorType is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, in
which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetAccelerationStructureKHR` structure in the `pNext` chain of `VkWriteDescriptorSet`, or if `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, in which case the source data for the descriptor writes is taken from the `VkWriteDescriptorSetAccelerationStructureNV` structure in the `pNext` chain of `VkWriteDescriptorSet`, as specified below.

If the `nullDescriptor` feature is enabled, the buffer, acceleration structure, imageView, or `bufferView` can be `VK_NULL_HANDLE`. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded. A null acceleration structure descriptor results in the miss shader being invoked.

If the destination descriptor is a mutable descriptor, the active descriptor type for the destination descriptor becomes `descriptorType`.

If the `dstBinding` has fewer than `descriptorCount` array elements remaining starting from `dstArrayElement`, then the remainder will be used to update the subsequent binding - `dstBinding + 1` starting at array element zero. If a binding has a `descriptorCount` of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all `descriptorCount` descriptors. Consecutive bindings must have identical `VkDescriptorType`, `VkShaderStageFlags`, `VkDescriptorBindingFlagBits`, and immutable samplers references. In addition, if the `VkDescriptorType` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, the supported descriptor types in `VkMutableDescriptorTypeCreateInfoEXT` must be equally defined.

**Note**

The same behavior applies to bindings with a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` where `descriptorCount` specifies the number of bytes to update while `dstArrayElement` specifies the starting byte offset, thus in this case if the `dstBinding` has a smaller byte size than the sum of `dstArrayElement` and `descriptorCount`, then the remainder will be used to update the subsequent binding - `dstBinding + 1` starting at offset zero. This falls out as a special case of the above rule.

**Valid Usage**

- VUID-VkWriteDescriptorSet-dstBinding-00315
  `dstBinding` must be less than or equal to the maximum value of `binding` of all `VkDescriptorSetLayoutBinding` structures specified when `dstSet`'s descriptor set layout was created

- VUID-VkWriteDescriptorSet-dstBinding-00316
  `dstBinding` must be a binding with a non-zero `descriptorCount`

- VUID-VkWriteDescriptorSet-descriptorCount-00317
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those with a `descriptorCount` of zero, must have identical `descriptorType` and `stageFlags`

- VUID-VkWriteDescriptorSet-descriptorCount-00318
  All consecutive bindings updated via a single `VkWriteDescriptorSet` structure, except those
with a descriptorCount of zero, must all either use immutable samplers or must all not use immutable samplers

- VUID-VkWriteDescriptorSet-descriptorType-00319
descriptorType must match the type of dstBinding within dstSet

- VUID-VkWriteDescriptorSet-dstSet-00320
dstSet must be a valid VkDescriptorSet handle

- VUID-VkWriteDescriptorSet-dstArrayElement-00321
  The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkWriteDescriptorSet-descriptorType-02219
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02220
  If descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02994
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of pTexelBufferView must be either a valid VkBufferView handle or VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02995
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and the nullDescriptor feature is not enabled, each element of pTexelBufferView must not be VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-00324
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, pBufferInfo must be a valid pointer to an array of descriptorCount valid VkDescriptorBufferInfo structures

- VUID-VkWriteDescriptorSet-descriptorType-00325
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and dstSet was not allocated with a layout that included immutable samplers for dstBinding with descriptorType, the sampler member of each element of pImageInfo must be a valid VkSampler object

- VUID-VkWriteDescriptorSet-descriptorType-02996
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must be either a valid VkImageView handle or VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02997
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and the nullDescriptor feature is not enabled, the
member of each element of `pImageInfo` must not be `VK_NULL_HANDLE`.

- **VUID-VkWriteDescriptorSet-descriptorType-02221**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, the `pNext` chain must include a `VkWriteDescriptorSetInlineUniformBlock` structure whose `dataSize` member equals `descriptorCount`.

- **VUID-VkWriteDescriptorSet-descriptorType-02382**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureKHR` structure whose `accelerationStructureCount` member equals `descriptorCount`.

- **VUID-VkWriteDescriptorSet-descriptorType-03817**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, the `pNext` chain must include a `VkWriteDescriptorSetAccelerationStructureNV` structure whose `accelerationStructureCount` member equals `descriptorCount`.

- **VUID-VkWriteDescriptorSet-descriptorType-01946**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element must have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain.

- **VUID-VkWriteDescriptorSet-descriptorType-02738**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has a `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` must have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler must have been created with an identically defined `VkSamplerYcbcrConversionInfo` object.

- **VUID-VkWriteDescriptorSet-descriptorType-01948**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables sampler Y′CBCR conversion must have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an identically defined `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler.

- **VUID-VkWriteDescriptorSet-descriptorType-00327**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

- **VUID-VkWriteDescriptorSet-descriptorType-00328**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` must be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- **VUID-VkWriteDescriptorSet-descriptorType-00329**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of
** pBufferInfo** is the handle of a non-sparse buffer, then that buffer must be bound completely and contiguously to a single VkDeviceMemory object.

- **VUID-VkWriteDescriptorSet-descriptorType-00330**
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT set.

- **VUID-VkWriteDescriptorSet-descriptorType-00331**
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT set.

- **VUID-VkWriteDescriptorSet-descriptorType-00332**
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxUniformBufferRange.

- **VUID-VkWriteDescriptorSet-descriptorType-00333**
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxStorageBufferRange.

- **VUID-VkWriteDescriptorSet-descriptorType-00334**
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT set.

- **VUID-VkWriteDescriptorSet-descriptorType-00335**
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT set.

- **VUID-VkWriteDescriptorSet-descriptorType-00336**
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have been created with the identity swizzle.

- **VUID-VkWriteDescriptorSet-descriptorType-00337**
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_SAMPLED_BIT set.

- **VUID-VkWriteDescriptorSet-descriptorType-04149**
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE the imageLayout member of each element of pImageInfo must be a member of the list given in Sampled Image.

- **VUID-VkWriteDescriptorSet-descriptorType-04150**
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER the imageLayout member of each element of pImageInfo must be a member of the list given in Combined Image Sampler.
• VUID-VkWriteDescriptorSet-descriptorType-04151
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Input Attachment

• VUID-VkWriteDescriptorSet-descriptorType-04152
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` the `imageLayout` member of each element of `pImageInfo` must be a member of the list given in Storage Image

• VUID-VkWriteDescriptorSet-descriptorType-00338
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT` set

• VUID-VkWriteDescriptorSet-descriptorType-00339
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, the `imageView` member of each element of `pImageInfo` must have been created with `VK_IMAGE_USAGE_STORAGE_BIT` set

• VUID-VkWriteDescriptorSet-descriptorType-06710
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, each `imageView` member of each element of `pImageInfo` that is a 2D image view created from a 3D image must have been created from an image created with `VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT` set

• VUID-VkWriteDescriptorSet-descriptorType-02752
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` must not have been allocated with a layout that included immutable samplers for `dstBinding`

• VUID-VkWriteDescriptorSet-dstSet-04611
  If the `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, the new active descriptor type `descriptorType` must exist in the corresponding `pMutableDescriptorTypeLists` list for `dstBinding`

• VUID-VkWriteDescriptorSet-descriptorType-06450
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, the `imageView` member of each element of `pImageInfo` must have either been created without a `VkImageViewMinLodCreateInfoEXT` present in the `pNext` chain or with a `VkImageViewMinLodCreateInfoEXT::minLod` of 0.0

• VUID-VkWriteDescriptorSet-descriptorType-06942
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, the `imageView` member of each element of `pImageInfo` must have been created with a view created with an image created with `VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM`

• VUID-VkWriteDescriptorSet-descriptorType-06943
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM`, the `imageView` member of each element of `pImageInfo` must have been created with a view created with an image created with `VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM`

---

Valid Usage (Implicit)

• VUID-VkWriteDescriptorSet-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET`
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkWriteDescriptorSetAccelerationStructureKHR`, `VkWriteDescriptorSetAccelerationStructureNV`, or `VkWriteDescriptorSetInlineUniformBlock`.

The `sType` value of each struct in the `pNext` chain must be unique.

`descriptorType` must be a valid `VkDescriptorType` value.

`descriptorCount` must be greater than `0`.

Both of `dstSet`, and the elements of `pTexelBufferView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which must be one of the values:

```c
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR_acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
    // Provided by VK_NV_ray_tracing
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
    // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM = 1000440000,
    // Provided by VK_QCOM_image_processing
    VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM = 1000440001,
    // Provided by VK_EXT_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_EXT = 1000351000,
    // Provided by VK_EXT_inline_uniform_block
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT = VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_KHR = 1104
} VkDescriptorType;
```
VK_DESCRIPTOR_TYPE_MUTABLE_EXT = VK_DESCRIPTOR_TYPE_MUTABLE_EXT,
} VkDescriptorType;

- VK_DESCRIPTOR_TYPE_SAMPLER specifies a sampler descriptor.
- VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER specifies a combined image sampler descriptor.
- VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE specifies a sampled image descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_IMAGE specifies a storage image descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER specifies a uniform texel buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER specifies a storage texel buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER specifies a uniform buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER specifies a storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC specifies a dynamic uniform buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC specifies a dynamic storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT specifies an input attachment descriptor.
- VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK specifies an inline uniform block.
- VK_DESCRIPTOR_TYPE_MUTABLE_EXT specifies a descriptor of mutable type.
- VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM specifies a sampled weight image descriptor.
- VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM specifies a block matching image descriptor.

When a descriptor set is updated via elements of VkWriteDescriptorSet, members of pImageInfo, pBufferInfo and pTexelBufferView are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For VK_DESCRIPTOR_TYPE_SAMPLER, only the sampler member of each element of VkWriteDescriptorSet::pImageInfo is accessed.
- For VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, only the imageView and imageLayout members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
- For VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, all members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, all members of each element of VkWriteDescriptorSet::pBufferInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of VkWriteDescriptorSet::pTexelBufferView is accessed.

When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a
descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of VkWriteDescriptorSet.

The VkDescriptorBufferInfo structure is defined as:

```
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- **buffer** is VK_NULL_HANDLE or the buffer resource.
- **offset** is the offset in bytes from the start of buffer. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- **range** is the size in bytes that is used for this descriptor update, or VK_WHOLE_SIZE to use the range from offset to the end of the buffer.

When setting **range** to VK_WHOLE_SIZE, the **effective range** must not be larger than the maximum range for the descriptor type (maxUniformBufferRange or maxStorageBufferRange). This means that VK_WHOLE_SIZE is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than maxUniformBufferRange.

For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC descriptor types, **offset** is the base offset from which the dynamic offset is applied and **range** is the static size used for all dynamic offsets.

When **range** is VK_WHOLE_SIZE the effective range is calculated at vkUpdateDescriptorSets is by taking the size of buffer minus the offset.

### Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340  
  **offset** must be less than the size of buffer

- VUID-VkDescriptorBufferInfo-range-00341  
  If **range** is not equal to VK_WHOLE_SIZE, **range** must be greater than 0

- VUID-VkDescriptorBufferInfo-range-00342  
  If **range** is not equal to VK_WHOLE_SIZE, **range** must be less than or equal to the size of buffer minus offset
• VUID-VkDescriptorBufferInfo-buffer-02998
  If the nullDescriptor feature is not enabled, buffer must not be VK_NULL_HANDLE

• VUID-VkDescriptorBufferInfo-buffer-02999
  If buffer is VK_NULL_HANDLE, offset must be zero and range must be VK_WHOLE_SIZE

Valid Usage (Implicit)

• VUID-VkDescriptorBufferInfo-buffer-parameter
  If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
  VkSampler    sampler;
  VkImageView  imageView;
  VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

• sampler is a sampler handle, and is used in descriptor updates for types
  VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being
  updated does not use immutable samplers.

• imageView is VK_NULL_HANDLE or an image view handle, and is used in descriptor updates for
  types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, 
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

• imageLayout is the layout that the image subresources accessible from imageView will be in at the
  time this descriptor is accessed. imageLayout is used in descriptor updates for types
  VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, 
  VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.

Valid Usage

• VUID-VkDescriptorImageInfo-imageView-06712
  imageView must not be a 2D array image view created from a 3D image

• VUID-VkDescriptorImageInfo-descriptorType-06713
  If the image2DViewOf3D feature is not enabled and descriptorType is
  VK_DESCRIPTOR_TYPE_STORAGE_IMAGE then imageView must not be a 2D view created from a
  3D image

• VUID-VkDescriptorImageInfo-descriptorType-06714
  If the sampler2DViewOf3D feature is not enabled and descriptorType is
  VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER then
**imageView** must not be a 2D view created from a 3D image

- **VUID-VkDescriptorImageInfo-imageView-01976**
  If **imageView** is created from a depth/stencil image, the **aspectMask** used to create the **imageView** must include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

- **VUID-VkDescriptorImageInfo-imageLayout-00344**
  **imageLayout** must match the actual VkImageLayout of each subresource accessible from **imageView** at the time this descriptor is accessed as defined by the image layout matching rules

- **VUID-VkDescriptorImageInfo-sampler-01564**
  If **sampler** is used and the **VkFormat** of the image is a multi-planar format, the image must have been created with VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT, and the **aspectMask** of the **imageView** must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or (for three-plane formats only) VK_IMAGE_ASPECT_PLANE_2_BIT

- **VUID-VkDescriptorImageInfo-mutableComparisonSamplers-04450**
  If the **VK_KHR_portability_subset** extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers is VK_FALSE, then **sampler** must have been created with VkSamplerCreateInfo::compareEnable set to VK_FALSE

Valid Usage (Implicit)

- **VUID-VkDescriptorImageInfo-commonparent**
  Both of **imageView**, and **sampler** that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

If the **descriptorType** member of VkWriteDescriptorSet is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then the data to write to the descriptor set is specified through a VkWriteDescriptorSetInlineUniformBlock structure included in the pNext chain of VkWriteDescriptorSet.

The **VkWriteDescriptorSetInlineUniformBlock** structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType sType;
    const void* pNext;
    uint32_t dataSize;
    const void* pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
```
typedef VkWriteDescriptorSetInlineUniformBlock
VkWriteDescriptorSetInlineUniformBlockEXT;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dataSize` is the number of bytes of inline uniform block data pointed to by `pData`.
- `pData` is a pointer to `dataSize` number of bytes of data to write to the inline uniform block.

### Valid Usage

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
  `dataSize` must be an integer multiple of 4

### Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK`
- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
  `pData` must be a valid pointer to an array of `dataSize` bytes
- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
  `dataSize` must be greater than 0

The `VkWriteDescriptorSetAccelerationStructureKHR` structure is defined as:

```c
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `accelerationStructureCount` is the number of elements in `pAccelerationStructures`.
- `pAccelerationStructures` is a pointer to an array of `VkAccelerationStructureKHR` structures specifying the acceleration structures to update.

### Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236

// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
accelerationStructureCount must be equal to descriptorCount in the extended structure

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
  Each acceleration structure in pAccelerationStructures must have been created with a type of VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
  If the nullDescriptor feature is not enabled, each element of pAccelerationStructures must not be VK_NULL_HANDLE

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount valid or VK_NULL_HANDLE VkAccelerationStructureKHR handles

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

The VkWriteDescriptorSetAccelerationStructureNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureNV* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructureCount is the number of elements in pAccelerationStructures.
- pAccelerationStructures is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.

Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-03747
  accelerationStructureCount must be equal to descriptorCount in the extended structure
- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748
Each acceleration structure in `pAccelerationStructures` must have been created with `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749
  If the `nullDescriptor` feature is not enabled, each member of `pAccelerationStructures` must not be `VK_NULL_HANDLE`

### Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV`

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter
  `pAccelerationStructures` must be a valid pointer to an array of `accelerationStructureCount` valid or `VK_NULL_HANDLE` `VkAccelerationStructureNV` handles

- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength
  `accelerationStructureCount` must be greater than 0

The `VkCopyDescriptorSet` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {  
    VkStructureType          sType;  
    const void*              pNext;  
    VkDescriptorSet          srcSet;  
    uint32_t                 srcBinding;  
    uint32_t                 srcArrayElement;  
    VkDescriptorSet          dstSet;  
    uint32_t                 dstBinding;  
    uint32_t                 dstArrayElement;  
    uint32_t                 descriptorCount;  
} VkCopyDescriptorSet;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcSet`, `srcBinding`, and `srcArrayElement` are the source set, binding, and array element, respectively. If the descriptor binding identified by `srcSet` and `srcBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `srcArrayElement` specifies the starting byte offset within the binding to copy from.
- `dstSet`, `dstBinding`, and `dstArrayElement` are the destination set, binding, and array element, respectively. If the descriptor binding identified by `dstSet` and `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset within the binding to copy to.
- `descriptorCount` is the number of descriptors to copy from the source to destination. If
descriptorCount is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

If the VkDescriptorSetLayoutBinding for dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_EXT and srcBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the new active descriptor type becomes the descriptor type of srcBinding. If both VkDescriptorSetLayoutBinding for srcBinding and dstBinding are VK_DESCRIPTOR_TYPE_MUTABLE_EXT, the active descriptor type in each source descriptor is copied into the corresponding destination descriptor. The active descriptor type can be different for each source descriptor.

**Note**
The intention is that copies to and from mutable descriptors is a simple memcpy. Copies between non-mutable and mutable descriptors are expected to require one memcpy per descriptor to handle the difference in size, but this use case with more than one descriptorCount is considered rare.

---

**Valid Usage**

- VUID-VkCopyDescriptorSet-srcBinding-00345
  srcBinding must be a valid binding within srcSet

- VUID-VkCopyDescriptorSet-srcArrayElement-00346
  The sum of srcArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by srcBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-dstBinding-00347
  dstBinding must be a valid binding within dstSet

- VUID-VkCopyDescriptorSet-dstArrayElement-00348
  The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-dstBinding-02632
  The type of dstBinding within dstSet must be equal to the type of srcBinding within srcSet

- VUID-VkCopyDescriptorSet-srcSet-00349
  If srcSet is equal to dstSet, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

- VUID-VkCopyDescriptorSet-srcBinding-02223
  If the descriptor type of the descriptor set binding specified by srcBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, srcArrayElement must be an integer multiple of 4
• **VUID-VkCopyDescriptorSet-dstBinding-02224**
  If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `dstArrayElement` must be an integer multiple of 4.

• **VUID-VkCopyDescriptorSet-srcBinding-02225**
  If the descriptor type of the descriptor set binding specified by either `srcBinding` or `dstBinding` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`, `descriptorCount` must be an integer multiple of 4.

• **VUID-VkCopyDescriptorSet-srcSet-01918**
  If `srcSet`'s layout was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set, then `dstSet`'s layout must also have been created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-04885**
  If `srcSet`'s layout was created with neither `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` nor `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_EXT` flags set, then `dstSet`'s layout must have been created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-01920**
  If the descriptor pool from which `srcSet` was allocated was created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set, then the descriptor pool from which `dstSet` was allocated must also have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.

• **VUID-VkCopyDescriptorSet-srcSet-04887**
  If the descriptor pool from which `srcSet` was allocated was created with neither `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` nor `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT` flags set, then the descriptor pool from which `dstSet` was allocated must have been created without the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set.

• **VUID-VkCopyDescriptorSet-dstBinding-02753**
  If the descriptor type of the descriptor set binding specified by `dstBinding` is `VK_DESCRIPTOR_TYPE_SAMPLER`, then `dstSet` must not have been allocated with a layout that included immutable samplers for `dstBinding`.

• **VUID-VkCopyDescriptorSet-srcSet-04612**
  If `VkDescriptorSetLayoutBinding` for `srcSet` at `srcBinding` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, and the `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is not `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, the active descriptor type for the source descriptor must match the descriptor type of `dstBinding`.
If `VkDescriptorSetLayoutBinding` for `dstSet` at `dstBinding` is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, and the new active descriptor type is `VK_DESCRIPTOR_TYPE_MUTABLE_EXT`, the `pMutableDescriptorTypeLists` for `srcBinding` and `dstBinding` must match exactly.

### Valid Usage (Implicit)

- **VUID-VkCopyDescriptorSet-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET`

- **VUID-VkCopyDescriptorSet-pNext-pNext**  
  `pNext` must be `NULL`

- **VUID-VkCopyDescriptorSet-srcSet-parameter**  
  `srcSet` must be a valid `VkDescriptorSet` handle

- **VUID-VkCopyDescriptorSet-dstSet-parameter**  
  `dstSet` must be a valid `VkDescriptorSet` handle

- **VUID-VkCopyDescriptorSet-commonparent**  
  Both of `dstSet`, and `srcSet` must have been created, allocated, or retrieved from the same `VkDevice`

### 14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

### 14.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specifies the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`. 
VkDescriptorUpdateTemplate allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR, can be more efficient compared to calling vkUpdateDescriptorSets or vkCmdPushDescriptorSetKHR. The descriptors themselves are not specified in the VkDescriptorUpdateTemplate, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to vkUpdateDescriptorSetWithTemplate or vkCmdPushDescriptorSetWithTemplateKHR. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.

To create a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- device is the logical device that creates the descriptor update template.
- pCreateInfo is a pointer to a VkDescriptorUpdateTemplateCreateInfo structure specifying the set of descriptors to update with a single call to vkCmdPushDescriptorSetWithTemplateKHR or vkUpdateDescriptorSetWithTemplate.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pDescriptorUpdateTemplate is a pointer to a VkDescriptorUpdateTemplate handle in which the resulting descriptor update template object is returned.

Valid Usage (Implicit)

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter
  device must be a valid VkDevice handle

- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkDescriptorUpdateTemplateCreateInfo structure

- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid

---

1115
**VkAllocationCallbacks** structure

- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
  pDescriptorUpdateTemplate must be a valid pointer to a VkDescriptorUpdateTemplate handle.

---

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The **VkDescriptorUpdateTemplateCreateInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **descriptorUpdateEntryCount** is the number of elements in the **pDescriptorUpdateEntries** array.
- **pDescriptorUpdateEntries** is a pointer to an array of **VkDescriptorUpdateTemplateEntry** structures describing the descriptors to be updated by the descriptor update template.
- **templateType** specifies the type of the descriptor update template. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET it can only be used to update descriptor sets.
with a fixed descriptorSetLayout. If set to VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR it can only be used to push descriptor sets using the provided pipelineBindPoint, pipelineLayout, and set number.

- descriptorSetLayout is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update template must be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET.

- pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- pipelineLayout is a VkPipelineLayout object used to program the bindings. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- set is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

### Valid Usage

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350 If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout must be a valid VkDescriptorSetLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351 If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352 If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineLayout must be a valid VkPipelineLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353 If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-04615 If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout must not contain a binding with type VK_DESCRIPTOR_TYPE_MUTABLE_EXT

### Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO

- VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext pNext must be NULL
• **VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zerobitmask**
  
  `flags` **must** be 0

• **VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter**
  
  `pDescriptorUpdateEntries` **must** be a valid pointer to an array of `descriptorUpdateEntryCount` valid `VkDescriptorUpdateTemplateEntry` structures

• **VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter**
  
  `templateType` **must** be a valid `VkDescriptorUpdateTemplateType` value

• **VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength**
  
  `descriptorUpdateEntryCount` **must** be greater than 0

• **VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent**
  
  Both of `descriptorSetLayout`, and `pipelineLayout` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;
```

`VkDescriptorUpdateTemplateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the `VkDescriptorUpdateTemplateCreateInfo::templateType` property, which takes the following values:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {
  VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
  // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
  VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
  VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
  // Provided by VK_KHR_descriptor_update_template
  VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR =
  VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
} VkDescriptorUpdateTemplateType;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;
```
• **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET** specifies that the descriptor update template will be used for descriptor set updates only.

• **VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR** specifies that the descriptor update template will be used for push descriptor updates only.

The `VkDescriptorUpdateTemplateEntry` structure is defined as:

```c
typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;
```

or the equivalent

```c
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;
```

- `dstBinding` is the descriptor binding to update when using this descriptor update template.
- `dstArrayElement` is the starting element in the array belonging to `dstBinding`. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `dstArrayElement` specifies the starting byte offset to update.
- `descriptorCount` is the number of descriptors to update. If `descriptorCount` is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to `VkWriteDescriptorSet` above. If the descriptor binding identified by `dstBinding` has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.
- `descriptorType` is a `VkDescriptorType` specifying the type of the descriptor.
- `offset` is the offset in bytes of the first binding in the raw data structure.
- `stride` is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer `ptr` for each array element `j` of update entry `i` is computed using the following formula:

```c
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
```

The stride is useful in case the bindings are stored in structs along with other data. If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the value of `stride` is ignored.
and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.

### Valid Usage

- **VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354**
  
  *dstBinding* **must** be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors.

- **VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355**
  
  *dstArrayElement* and *descriptorCount* **must** be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates.

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226**
  
  If *descriptor* type is *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK*, *dstArrayElement* **must** be an integer multiple of 4.

- **VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227**
  
  If *descriptor* type is *VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK*, *descriptorCount* **must** be an integer multiple of 4.

### Valid Usage (Implicit)

- **VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter**
  
  *descriptorType* **must** be a valid *VkDescriptorType* value.

To destroy a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
    VkDevice device, 
    VkDescriptorUpdateTemplate descriptorUpdateTemplate, 
    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command:

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
    VkDevice device, 
    VkDescriptorUpdateTemplate descriptorUpdateTemplate, 
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that has been used to create the descriptor update template.
- **descriptorUpdateTemplate** is the descriptor update template to destroy.
• `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356
  If `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, a compatible set of callbacks **must** be provided here

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no `VkAllocationCallbacks` were provided when `descriptorUpdateTemplate` was created, `pAllocator` **must** be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
  If `descriptorUpdateTemplate` is not `VK_NULL_HANDLE`, `descriptorUpdateTemplate` **must** be a valid `VkDescriptorUpdateTemplate` handle

- VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
  If `descriptorUpdateTemplate` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

**Host Synchronization**

- Host access to `descriptorUpdateTemplate` **must** be externally synchronized

Once a `VkDescriptorUpdateTemplate` has been created, descriptor sets **can** be updated by calling:

```c
// Provided by VK_VERSION_1_1
void vkUpdateDescriptorSetWithTemplate(
    VkDevice device,
    VkDescriptorSet descriptorSet,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    const void* pData);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
```

---

1121
VkDevice device, VkDescriptorSet descriptorSet, VkDescriptorUpdateTemplate descriptorUpdateTemplate, const void* pData);

- **device** is the logical device that updates the descriptor set.
- **descriptorSet** is the descriptor set to update
- **descriptorUpdateTemplate** is a VkDescriptorUpdateTemplate object specifying the update mapping between pData and the descriptor set to update.
- **pData** is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR or VkAccelerationStructureNV handles used to write the descriptors.

### Valid Usage

- **VUID-vkUpdateDescriptorSetWithTemplate-pData-01685**
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995**
  Host access to descriptorSet must be externally synchronized unless explicitly denoted otherwise for specific flags

### Valid Usage (Implicit)

- **VUID-vkUpdateDescriptorSetWithTemplate-device-parameter**
  device must be a valid VkDevice handle

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter**
  descriptorSet must be a valid VkDescriptorSet handle

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter**
  descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- **VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent**
  descriptorUpdateTemplate must have been created, allocated, or retrieved from device

### API example

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t applicationRelatedInformation;
};

struct AppDataStructure {
```
VkDescriptorImageInfo imageInfo;  // a single image info
VkDescriptorBufferInfo bufferInfoArray[3];  // 3 buffer infos in an array
AppBufferView bufferView[2];  // An application defined structure

// ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] =
{
    // binding to a single image descriptor
    {
        0, 0, 1, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
        offsetof(AppDataStructure, imageInfo), 0
    },

    // binding to an array of buffer descriptors
    {
        1, 0, 3, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,
        offsetof(AppDataStructure, bufferInfoArray),
        sizeof(VkDescriptorBufferInfo)
    },

    // binding to an array of buffer views
    {
        2, 0, 2, VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
        offsetof(AppDataStructure, bufferView) +
        offsetof(AppBufferView, bufferView),
        sizeof(AppBufferView)
    },

    // create a descriptor update template for descriptor set updates
    const VkDescriptorUpdateTemplateCreateInfo createInfo =
    {
        VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO,  // sType
        NULL,  // pNext
        0,  // flags
        3,  //
```c
vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);
```

```c
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &createInfo,
    NULL,
    &myDescriptorUpdateTemplate);
```

```c
AppDataStructure appData;
```

14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(  
    VkCommandBuffer commandBuffer,  
    VkPipelineBindPoint pipelineBindPoint,  
    VkPipelineLayout layout,  
    uint32_t firstSet,  
    uint32_t descriptorSetCount,  
    const VkDescriptorSet* pDescriptorSets,  
    uint32_t dynamicOffsetCount,  
    const uint32_t* pDynamicOffsets);
```

- `commandBuffer` is the command buffer that the descriptor sets will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `firstSet` is the set number of the first descriptor set to be bound.
• **descriptorSetCount** is the number of elements in the `pDescriptorSets` array.
• **pDescriptorSets** is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.
• **dynamicOffsetCount** is the number of dynamic offsets in the `pDynamicOffsets` array.
• **pDynamicOffsets** is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets `pDescriptorSets[0..descriptorSetCount-1]` to set numbers `[firstSet..firstSet+descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in Pipeline Layout Compatibility.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. **dynamicOffsetCount** must equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

• For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,

• during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding **must** not be altered (overwritten by an update command, or freed) between the first point in time that it **may** be consumed, and when the
command completes executing on the queue.

The contents of \texttt{pDynamicOffsets} are consumed immediately during execution of \texttt{vkCmdBindDescriptorSets}. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

\begin{center}
\textbf{Valid Usage}
\end{center}

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358
  Each element of \texttt{pDescriptorSets} \textbf{must} have been allocated with a \texttt{VkDescriptorSetLayout} that matches (is the same as, or identically defined as) the \texttt{VkDescriptorSetLayout} at set \texttt{n} in \texttt{layout}, where \texttt{n} is the sum of \texttt{firstSet} and the index into \texttt{pDescriptorSets}

- VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359
  \texttt{dynamicOffsetCount} \textbf{must} be equal to the total number of dynamic descriptors in \texttt{pDescriptorSets}

- VUID-vkCmdBindDescriptorSets-firstSet-00360
  The sum of \texttt{firstSet} and \texttt{descriptorSetCount} \textbf{must} be less than or equal to \texttt{VkPipelineLayoutCreateInfo::setLayoutCount} provided when \texttt{layout} was created

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
  \texttt{pipelineBindPoint} \textbf{must} be supported by the \texttt{commandBuffer}'s parent \texttt{VkCommandPool}'s queue family

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971
  Each element of \texttt{pDynamicOffsets} which corresponds to a descriptor binding with type \texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment}

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972
  Each element of \texttt{pDynamicOffsets} which corresponds to a descriptor binding with type \texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC} \textbf{must} be a multiple of \texttt{VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment}

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979
  For each dynamic uniform or storage buffer binding in \texttt{pDescriptorSets}, the sum of the \textbf{effective offset} and the range of the binding \textbf{must} be less than or equal to the size of the buffer

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715
  For each dynamic uniform or storage buffer binding in \texttt{pDescriptorSets}, if the range was set with \texttt{VK_WHOLE_SIZE} then \texttt{pDynamicOffsets} which corresponds to the descriptor binding \textbf{must} be 0

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-04616
  Each element of \texttt{pDescriptorSets} \textbf{must} not have been allocated from a \texttt{VkDescriptorPool} with the \texttt{VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_EXT} flag set

- VUID-vkCmdBindDescriptorSets-graphicsPipelineLibrary-06754
  If \texttt{graphicsPipelineLibrary} is not enabled, each element of \texttt{pDescriptorSets} \textbf{must} be a valid \texttt{VkDescriptorSet}
Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
  pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-vkCmdBindDescriptorSets-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
  pDescriptorSets must be a valid pointer to an array of descriptorSetCount valid or VK_NULL_HANDLE VkDescriptorSet handles

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
  If dynamicOffsetCount is not 0, pDynamicOffsets must be a valid pointer to an array of dynamicOffsetCount uint32_t values

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdBindDescriptorSets-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
  descriptorSetCount must be greater than 0

- VUID-vkCmdBindDescriptorSets-commonparent
  Each of commandBuffer, layout, and the elements of pDescriptorSets that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
// Provided by VK_KHR_push_descriptor
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t set,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

Push descriptors are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the offset member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.
Each element of `pDescriptorWrites` is interpreted as in `VkWriteDescriptorSet`, except the `dstSet` member is ignored.

To push an immutable sampler, use a `VkWriteDescriptorSet` with `dstBinding` and `dstArrayElement` selecting the immutable sampler's binding. If the descriptor type is `VK_DESCRIPTOR_TYPE_SAMPLER`, the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, the `sampler` member of the `pImageInfo` parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

### Valid Usage

- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363**
  - `pipelineBindPoint` must be supported by the commandBuffer's parent `VkCommandPool`'s queue family
- **VUID-vkCmdPushDescriptorSetKHR-set-00364**
  - `set` must be less than `VkPipelineLayoutCreateInfo::setLayoutCount` provided when `layout` was created
- **VUID-vkCmdPushDescriptorSetKHR-set-00365**
  - `set` must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`
- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494**
  - For each element `i` where `pDescriptorWrites[i].descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, or `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `pDescriptorWrites[i].pImageInfo` must be a valid pointer to an array of `pDescriptorWrites[i].descriptorCount` valid `VkDescriptorImageInfo` structures

### Valid Usage (Implicit)

- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter**
  - `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value
- **VUID-vkCmdPushDescriptorSetKHR-layout-parameter**
  - `layout` must be a valid `VkPipelineLayout` handle
- **VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter**
  - `pDescriptorWrites` must be a valid pointer to an array of `descriptorWriteCount` valid `VkWriteDescriptorSet` structures
- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or
compute operations

- VUID-vkCmdPushDescriptorSetKHR-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength
  descriptorWriteCount **must** be greater than 0

- VUID-vkCmdPushDescriptorSetKHR-commonparent
  Both of commandBuffer, and layout **must** have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

### Command Properties

#### 14.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor, VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,
    VkPipelineLayout layout,
    uint32_t set,
    const void* pData);
```

- **commandBuffer** is the command buffer that the descriptors will be recorded in.
- **descriptorUpdateTemplate** is a descriptor update template defining how to interpret the descriptor information in pData.
- **layout** is a VkPipelineLayout object used to program the bindings. It **must** be compatible with the layout used to create the descriptorUpdateTemplate handle.
set is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the descriptorUpdateTemplate handle.

pData is a pointer to memory containing descriptors for the templated update.

Valid Usage

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366
  The pipelineBindPoint specified during the creation of the descriptor update template must be supported by the commandBuffer’s parent VkCommandPool’s queue family

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686
  pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07304
  set must be less than VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-set-07305
  set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

Valid Usage (Implicit)

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  layout must be a valid VkPipelineLayout handle

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of commandBuffer, descriptorUpdateTemplate, and layout must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td></td>
</tr>
</tbody>
</table>

API example

```c
struct AppDataStructure
{
    VkDescriptorImageInfo imageInfo;       // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    {
        0,                   // binding
        0,                   // dstArrayElement
        1,                   // descriptorCount
        VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, // descriptorType
        offsetof(AppDataStructure, imageInfo), // offset
        0                     // stride is not required if descriptorCount is 1
    }
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL, // pNext
    0,     // flags
    1,     // descriptorUpdateEntryCount
    descriptorUpdateTemplateEntries, // pDescriptorUpdateTemplateEntries
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, // templateType
};
```
14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

Note
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

To update push constants, call:

```
// Provided by VK_VERSION_1_0
void vkCmdPushConstants(
    VkCommandBuffer commandBuffer,
    VkPipelineLayout layout,
    VkShaderStageFlags stageFlags,
    uint32_t offset,
    uint32_t size,
    const void* pValues);
```

- `commandBuffer` is the command buffer in which the push constant update will be recorded.
- `layout` is the pipeline layout used to program the push constant updates.
- `stageFlags` is a bitmask of `VkShaderStageFlagBits` specifying the shader stages that will use the push constants in the updated range.
- `offset` is the start offset of the push constant range to update, in units of bytes.
- `size` is the size of the push constant range to update, in units of bytes.
- `pValues` is a pointer to an array of `size` bytes containing the new push constant values.
When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.

Push constant values can be updated incrementally, causing shader stages in stageFlags to read the new data from pValues for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline’s layout must be compatible with the layouts used to set the values of all push constants in the pipeline layout’s push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**
As stageFlags needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the VkCommandPool used to allocate commandBuffer was created on are ignored.

**Valid Usage**

- VUID-vkCmdPushConstants-offset-01795
  For each byte in the range specified by offset and size and for each shader stage in stageFlags, there must be a push constant range in layout that includes that byte and that stage
- VUID-vkCmdPushConstants-offset-01796
  For each byte in the range specified by offset and size and for each push constant range that overlaps that byte, stageFlags must include all stages in that push constant range’s VkPushConstantRange::stageFlags
- VUID-vkCmdPushConstants-offset-00368
  offset must be a multiple of 4
- VUID-vkCmdPushConstants-size-00369
  size must be a multiple of 4
- VUID-vkCmdPushConstants-offset-00370
  offset must be less than VkPhysicalDeviceLimits::maxPushConstantsSize
- VUID-vkCmdPushConstants-size-00371
  size must be less than or equal to VkPhysicalDeviceLimits::maxPushConstantsSize minus offset

**Valid Usage (Implicit)**

- VUID-vkCmdPushConstants-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdPushConstants-layout-parameter
  layout must be a valid VkPipelineLayout handle
- VUID-vkCmdPushConstants-stageFlags-parameter
stageFlags must be a valid combination of VkShaderStageFlagBits values

- VUID-vkCmdPushConstants-stageFlags-requiredbitmask
  stageFlags must not be 0

- VUID-vkCmdPushConstants-pValues-parameter
  pValues must be a valid pointer to an array of size bytes

- VUID-vkCmdPushConstants-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushConstants-vidcoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0

- VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

### 14.3. Physical Storage Buffer Access

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_EXT_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressEXT(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an address of the start of `pInfo->buffer`. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the `SPV_KHR_physical_storage_buffer` extension or the equivalent `SPV_EXT_physical_storage_buffer` extension and the `PhysicalStorageBuffer` storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a "null" pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through `PhysicalStorageBuffer` pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` or `VkBufferDeviceAddressCreateInfoEXT::deviceAddress`, the return value will be the same address that was returned at capture time.

The returned address must satisfy the alignment requirement specified by `VkMemoryRequirements::alignment` for the buffer in `VkBufferDeviceAddressInfo::buffer`.

### Valid Usage

- **VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324**
  The `bufferDeviceAddress` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress` feature must be enabled

- **VUID-vkGetBufferDeviceAddress-device-03325**
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` or `VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressMultiDevice` feature must be enabled
Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter
pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure

The VkBufferDeviceAddressInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- buffer specifies the buffer whose address is being queried.

Valid Usage

- VUID-VkBufferDeviceAddressInfo-buffer-02600
  If buffer is non-sparse and was not created with the VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT flag, then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkBufferDeviceAddressInfo-buffer-02601
  buffer must have been created with VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT

Valid Usage (Implicit)
To query a 64-bit buffer opaque capture address, call:

```c
// Provided by VK_VERSION_1_2
uint64_t vkGetBufferOpaqueCaptureAddress(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
uint64_t vkGetBufferOpaqueCaptureAddressKHR(
    VkDevice device,
    const VkBufferDeviceAddressInfo* pInfo);
```

- `device` is the logical device that the buffer was created on.
- `pInfo` is a pointer to a `VkBufferDeviceAddressInfo` structure specifying the buffer to retrieve an address for.

The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo`::`opaqueCaptureAddress` the return value must be the same address.

### Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The `bufferDeviceAddress` feature must be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

### Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
`pInfo` must be a valid pointer to a valid `VkBufferDeviceAddressInfo` structure
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `Vk*PipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface
- Geometry Shader Passthrough

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

---

**Note**

In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block.
They **must**

- be explicitly declared (there are no implicit built-ins),
- be identified with a `BuiltIn` decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There **must** be no more than one built-in interface block per shader per interface.

Built-ins **must** not have any `Location` or `Component` decorations.

### 15.1.2. User-defined Variable Interface

The non-built-in variables listed by `OpEntryPoint` with the `Input` or `Output` storage class form the **user-defined variable interface**. These **must** have SPIR-V numerical types or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports `storageInputOutput16`, components **can** also have a width of 16 bits. These variables **must** be identified with a `Location` decoration and **can** also be identified with a `Component` decoration.

### 15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - `XfbBuffer`, `XfbStride`, `Offset`, and `Stream`
  - one is not decorated with `Component` and the other is declared with a `Component` of 0
  - Interpolation decorations
  - `RelaxedPrecision` if one is an input variable and the other an output variable

- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an `OpTypeArray` with an `ElementType` equivalent to the `OpType*` declaration of the output, and neither is a structure member; or
  - if the `maintenance4` feature is enabled, they are declared as `OpTypeVector` variables, and the output has a `Component Count` value higher than that of the input but the same `Component Type`; or
  - if the output is declared in a mesh shader as an `OpTypeArray` with an `ElementType` equivalent to the `OpType*` declaration of the input, and neither the input nor the output is a structure member; or
  - if the input is decorated with `PerVertexKHR`, and is declared in a fragment shader as an `OpTypeArray` with an `ElementType` equivalent to the `OpType*` declaration of the output, and neither the input nor the output is a structure member; or
  - if in any other case they are declared with an equivalent `OpType*` declaration.
• If both are structures and every member has an interface match.

**Note**
The word “structure” above refers to both variables that have an `OpTypeStruct` type and interface blocks (which are also declared as `OpTypeStruct`).

If the pipeline is compiled as separate graphics pipeline libraries and the `graphicsPipelineLibraryIndependentInterpolationDecoration` limit is not supported, matches are not found if the interpolation decorations differ between the last pre-rasterization shader stage and the fragment shader stage.

All input variables and blocks **must** have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders **can** declare and write to output variables that are not declared or read by the subsequent stage.

Matching rules for *passthrough geometry shaders* are slightly different and are described in the *Passthrough Interface Matching* section.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

### 15.1.4. Location Assignment

This section describes location assignments for user-defined variables and how many locations are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many locations the type consumes.

The `Location` value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The `Component` specifies components within these vector locations. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive locations.

If a declared input or output is an array of size \( n \) and each element takes \( m \) locations, it will be assigned \( m \times n \) consecutive locations starting with the location specified.

If the declared input or output is an \( n \times m \) 16-, 32- or 64-bit matrix, it will be assigned multiple locations starting with the location specified. The number of locations assigned for each matrix will be the same as for an \( n \)-element array of \( m \)-component vectors.

An `OpVariable` with a structure type that is not a block **must** be decorated with a `Location`. 

1142
When an \texttt{OpVariable} with a structure type (either block or non-block) is decorated with a \texttt{Location}, the members in the structure type \textbf{must} not be decorated with a \texttt{Location}. The \texttt{OpVariable}'s members are assigned consecutive locations in declaration order, starting from the first member, which is assigned the location decoration from the \texttt{OpVariable}.

When a block-type \texttt{OpVariable} is declared without a \texttt{Location} decoration, each member in its structure type \textbf{must} be decorated with a \texttt{Location}. Types nested deeper than the top-level members \textbf{must} not have \texttt{Location} decorations.

The locations consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same \texttt{OpEntryPoint} \textbf{must} not be assigned the same location, either explicitly or implicitly. Any two outputs listed as operands on the same \texttt{OpEntryPoint} \textbf{must} not be assigned the same location, either explicitly or implicitly.

The number of input and output locations available for a shader input or output interface are limited, and dependent on the shader stage as described in \textit{Shader Input and Output Locations}. All variables in both the \texttt{built-in interface block} and the \texttt{user-defined variable interface} count against these limits. Each effective \texttt{Location} \textbf{must} have a value less than the number of locations available for the given interface, as specified in the “Locations Available” column in \textit{Shader Input and Output Locations}.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
\textbf{Shader Interface} & \textbf{Locations Available} \\
\hline
vertex input & \texttt{maxVertexInputAttributes} \\
vertex output & \texttt{maxVertexOutputComponents} / 4 \\
tessellation control input & \texttt{maxTessellationControlPerVertexInputComponents} / 4 \\
tessellation control output & \texttt{maxTessellationControlPerVertexOutputComponents} / 4 \\
tessellation evaluation input & \texttt{maxTessellationEvaluationInputComponents} / 4 \\
tessellation evaluation output & \texttt{maxTessellationEvaluationOutputComponents} / 4 \\

fragment input & \texttt{maxFragmentInputComponents} / 4 \\
fragment output & \texttt{maxFragmentOutputAttachments} \\
mesh output & \texttt{maxMeshOutputComponents} / 4 \\
\hline
\end{tabular}
\caption{Shader Input and Output Locations}
\end{table}

15.1.5. Component Assignment

The \texttt{Component} decoration allows the \texttt{Location} to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a
location are 0, 1, 2, and 3. A variable or block member starting at component N will consume components N, N+1, N+2, ... up through its size. For 16-, and 32-bit types, it is invalid if this sequence of components gets larger than 3. A scalar 64-bit type will consume two of these components in sequence, and a two-component 64-bit vector type will consume all four components available within a location. A three- or four-component 64-bit vector type must not specify a Component decoration. A three-component 64-bit vector type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A Component decoration must not be specified for any type that is not a scalar or vector.

15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input locations is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of i is associated with the element of VkRenderingInfo::pColorAttachments with a location equal to i. When using render pass objects, it is associated with the color attachment indicated by pColorAttachments[i]. Values are written to those attachments after passing through the blending unit as described in Blending, if
enabled. Locations are consumed as described in **Location Assignment**. The number of available fragment output locations is given by the `maxFragmentOutputAttachments` member of the `VkPhysicalDeviceLimits` structure.

Components of the output variables are assigned as described in **Component Assignment**. Output components identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same location, they **must** have the same underlying type (floating-point or integer). The input values to blending or color attachment writes are undefined for components which do not correspond to a fragment shader output.

Fragment outputs identified with an **Index** of zero are directed to the first input of the blending unit associated with the corresponding **Location**. Outputs identified with an **Index** of one are directed to the second input of the corresponding blending unit.

No **component aliasing** of output variables is allowed, that is there **must** not be two output variables which have the same location, component, and index, either explicitly declared or implied.

Output values written by a fragment shader **must** be declared with either `OpTypeFloat` or `OpTypeInt`, and a **Width** of 32. If `storageInputOutput16` is supported, output values written by a fragment shader **can** be also declared with either `OpTypeFloat` or `OpTypeInt` and a **Width** of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in [Conversion from Floating-Point to Normalized Fixed-Point](#); If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment’s format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

### 15.4. Legacy Dithering

The application **can** enable dithering to be applied to the color output of a subpass, by using the `VK_SUBPASS_DESCRIPTION_ENABLE_LEGACY_DITHERING_BIT_EXT` or the `VK_RENDERING_ENABLE_LEGACY_DITHERING_BIT_EXT` flags.

When dithering is enabled, the implementation **may** modify the output color value `c` by one ULP. This modification **must** only depend on the framebuffer coordinates `(x_f,y_f)` of the sample, as well as on the value of `c`.

The exact details of the dithering algorithm are unspecified, including the algorithm itself, the formats dithering is applied to, and the stage in which it is applied.

---

**Note**

This extension is intended only for use by OpenGL emulation layers, and as such the dithering algorithm applied to the subpass **should** be equivalent to the vendor’s OpenGL implementation, if any.
15.5. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by InputAttachmentIndex decorations to the input attachments specified in the pInputAttachments array of the VkSubpassDescription structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by OpEntryPoint form the fragment input attachment interface. These variables must be declared with a type of OpTypeImage, a Dim operand of SubpassData, an Arrayed operand of 0, and a Sampled operand of 2. The MS operand of the OpTypeImage must be 0 if the samples field of the corresponding VkAttachmentDescription is VK_SAMPLE_COUNT_1_BIT and 1 otherwise.

A subpass input variable identified with an InputAttachmentIndex decoration of i reads from the input attachment indicated by pInputAttachments[i] member of VkSubpassDescription. If the subpass input variable is declared as an array of size N, it consumes N consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same InputAttachmentIndex whether explicitly declared or implied by an array declaration. The number of available input attachment indices is given by the maxPerStageDescriptorInputAttachments member of the VkPhysicalDeviceLimits structure.

Variables identified with the InputAttachmentIndex must only be used by a fragment stage. The basic data type (floating-point, integer, unsigned integer) of the subpass input must match the basic format of the corresponding input attachment, or the values of subpass loads from these variables are undefined.

See Input Attachment for more details.

15.6. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as
the hit attribute structure written in the corresponding intersection shader in the same hit group.

- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

**Table 19. Ray Pipeline Shader Interface**

**15.7. Shader Resource Interface**

When a shader stage accesses buffer or image resources, as described in the Resource Descriptors section, the shader resource variables must be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the shader resource interface for a stage are the variables statically used by that stage’s OpEntryPoint with a storage class of Uniform, UniformConstant, StorageBuffer, or PushConstant. For the fragment shader, this includes the fragment input attachment interface.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

**15.7.1. Push Constant Interface**

The shader variables defined with a storage class of PushConstant that are statically used by the shader entry points for the pipeline define the push constant interface. They must be:

- typed as OpTypeStruct,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in
Offset and Stride Assignment.

There **must** be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block **must** be placed at an Offset such that the entire member is entirely contained within the VkPushConstantRange for each OpEntryPoint that uses it, and the stageFlags for that range **must** specify the appropriate VkShaderStageFlagBits for that stage. The Offset decoration for any member of a push constant block **must** not cause the space required for that member to extend outside the range [0, maxPushConstantsSize).

Any member of a push constant block that is declared as an array **must** only be accessed with dynamically uniform indices.

### 15.7.2. Descriptor Set Interface

The *descriptor set interface* is comprised of the shader variables with the storage class of StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables **must** have DescriptorSet and Binding decorations specified, which are assigned and matched with the VkDescriptorSetLayout objects in the pipeline layout as described in DescriptorSet and Binding Assignment.

The Image Format of an OpTypeImage declaration **must** not be Unknown, for variables which are used for OpImageRead, OpImageSparseRead, or OpImageWrite operations, except under the following conditions:

- For OpImageWrite, if the image format is listed in the storage without format list and if the shaderStorageImageWriteWithoutFormat feature is enabled and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageWrite, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format is listed in the storage without format list and if the shaderStorageImageReadWithoutFormat feature is enabled and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead, if Dim is SubpassData (indicating a read from an input attachment).

The Image Format of an OpTypeImage declaration **must** not be Unknown, for variables which are used for OpAtomic* operations.

Variables identified with the Uniform storage class are used to access transparent buffer backed resources. Such variables **must** be:

- typed as OpTypeStruct, or an array of this type,
• identified with a `Block` or `BufferBlock` decoration, and

• laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in `Offset and Stride Assignment`.

Variables identified with the `StorageBuffer` storage class are used to access transparent buffer backed resources. Such variables **must** be:

• typed as `OpTypeStruct`, or an array of this type,

• identified with a `Block` decoration, and

• laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in `Offset and Stride Assignment`.

The `Offset` decoration for any member of a `Block`-decorated variable in the `Uniform` storage class **must** not cause the space required for that variable to extend outside the range `[0, maxUniformBufferRange)`. The `Offset` decoration for any member of a `Block`-decorated variable in the `StorageBuffer` storage class **must** not cause the space required for that variable to extend outside the range `[0, maxStorageBufferRange)`. Variables identified with the `Uniform` storage class **can** also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. In this case the variable **must** be typed as `OpTypeStruct` and **cannot** be aggregated into arrays of that type. Further, the `Offset` decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range `[0, maxInlineUniformBlockSize)`. Variables identified with a storage class of `UniformConstant` and a decoration of `InputAttachmentIndex` **must** be declared as described in `Fragment Input Attachment Interface`.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor **can** have a type of `OpTypeImage`, `OpTypeSampler (Sampled=1)`, or `OpTypeSampledImage`. Arrays of any of these types **can** be indexed with *constant integral expressions*. The following features **must** be enabled and capabilities **must** be declared in order to index such arrays with dynamically uniform or non-uniform indices:

• Storage images (except storage texel buffers and input attachments):

  ◦ Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`

  ◦ Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexing`

• Storage texel buffers:

  ◦ Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexing`

  ◦ Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexing`

• Input attachments:
• Dynamically uniform: shaderInputAttachmentArrayDynamicIndexing and InputAttachmentArrayDynamicIndexing
• Non-uniform: shaderInputAttachmentArrayNonUniformIndexing and InputAttachmentArrayNonUniformIndexing

• Sampled images (except uniform texel buffers), samplers and combined image samplers:
  • Dynamically uniform: shaderSampledImageArrayDynamicIndexing and SampledImageArrayDynamicIndexing
  • Non-uniform: shaderSampledImageArrayNonUniformIndexing and SampledImageArrayNonUniformIndexing

• Uniform texel buffers:
  • Dynamically uniform: shaderUniformTexelBufferArrayDynamicIndexing and UniformTexelBufferArrayDynamicIndexing
  • Non-uniform: shaderUniformTexelBufferArrayNonUniformIndexing and UniformTexelBufferArrayNonUniformIndexing

• Uniform buffers:
  • Dynamically uniform: shaderUniformBufferArrayDynamicIndexing and UniformBufferArrayDynamicIndexing
  • Non-uniform: shaderUniformBufferArrayNonUniformIndexing and UniformBufferArrayNonUniformIndexing

• Storage buffers:
  • Dynamically uniform: shaderStorageBufferArrayDynamicIndexing and StorageBufferArrayDynamicIndexing
  • Non-uniform: shaderStorageBufferArrayNonUniformIndexing and StorageBufferArrayNonUniformIndexing

• Acceleration structures:
  • Dynamically uniform: Always supported.
  • Non-uniform: Always supported.

• weight image:
  • Dynamically uniform: Always supported.
  • Non-uniform: Never supported.

• Block matching image:
  • Dynamically uniform: Always supported.
  • Non-uniform: Never supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature must be enabled and the capability must be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the
corresponding dynamic or non-uniform indexing feature must be enabled and the capability must be declared.

If the combined image sampler enables sampler Y’CbCr conversion or samples a subsampled image, it must be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the shaderSampledImageArrayDynamicIndexing feature.

1

Where OpTypeImage is referenced, the Dim values Buffer and Subpassdata are only accepted where they are specifically referenced. They do not correspond to resource types where a generic OpTypeImage is specified.

2

In addition to DescriptorSet and Binding.

15.7.3. DescriptorSet and Binding Assignment

A variable decorated with a DescriptorSet decoration of s and a Binding decoration of b indicates that this variable is associated with the VkDescriptorSetLayoutBinding that has a binding equal to b in pSetLayouts[s] that was specified in VkPipelineLayoutCreateInfo.

DescriptorSet decoration values must be between zero and maxBoundDescriptorSets minus one, inclusive. Binding decoration values can be any 32-bit unsigned integer value, as described in Descriptor Set Layout. Each descriptor set has its own binding name space.

If the Binding decoration is used with an array, the entire array is assigned that binding value. The array must be a single-dimensional array and size of the array must be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set must not be used. If the array is runtime-sized, the runtimeDescriptorArray feature must be enabled and the RuntimeDescriptorArray
capability **must** be declared. The index of each element of the array is referred to as the **arrayElement**. For the purposes of interface matching and descriptor set operations, if a resource variable is not an array, it is treated as if it has an arrayElement of zero.

There is a limit on the number of resources of each type that **can** be accessed by a pipeline stage as shown in **Shader Resource Limits**. The “Resources Per Stage” column gives the limit on the number each type of resource that **can** be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits. The **VK_DESCRIPTOR_TYPE_MUTABLE_EXT** descriptor type counts as one individual resource and one for every unique resource limit per descriptor set type that is present in the associated binding’s **VkMutableDescriptorTypeListEXT**. If multiple descriptor types in **VkMutableDescriptorTypeListEXT** map to the same resource limit, only one descriptor is consumed for purposes of computing resource limits.

The pipeline layout **may** include descriptor sets and bindings which are not referenced by any variables statically used by the entry points for the shader stages in the binding’s **stageFlags**.

However, if a variable assigned to a given **DescriptorSet** and **Binding** is statically used by the entry point for a shader stage, the pipeline layout **must** contain a descriptor set binding in that descriptor set layout and for that binding number, and that binding’s **stageFlags must** include the appropriate **VkShaderStageFlagBits** for that stage. The variable **must** be of a valid resource type determined by its SPIR-V type and storage class, as defined in **Shader Resource and Storage Class Correspondence**. The descriptor set layout binding **must** be of a corresponding descriptor type, as defined in **Shader Resource and Descriptor Type Correspondence**.

**Note**

There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are **statically used** has an impact. If any shader variable identifying a resource is **statically used** in a shader, then the underlying descriptor bound at the declared set and binding must **support the declared type in the shader** when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and **Aliased** decorations should be used to avoid data hazards (see section 2.18.2 **Aliasing in the SPIR-V specification**).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type **VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER** that has multiple corresponding shader variables in the **UniformConstant** storage class, where some could be **OpTypeImage** (Sampled=1), some could be **OpTypeSampler**, and some could be **OpTypeSampledImage**.

Input attachments can only be used in the fragment shader stage

### 15.7.4. Offset and Stride Assignment

Certain objects must be explicitly laid out using the Offset, ArrayStride, and MatrixStride, as described in SPIR-V explicit layout validation rules. All such layouts also must conform to the following requirements.

**Note**
The numeric order of Offset decorations does not need to follow member declaration order.
Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with C columns and R rows is equivalent to a C element array of vectors with R components.
- A row-major matrix with C columns and R rows is equivalent to an R element array of vectors with C components.

The **scalar alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits **scalar alignment** from the equivalent array declaration.

The **base alignment** of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the `StorageBuffer` storage class, `StorageBuffer8BitAccess` or `UniformAndStorageBuffer8BitAccess` must be declared in the SPIR-V module.)
- A matrix type inherits **base alignment** from the equivalent array declaration.

The **extended alignment** of the type of an `OpTypeStruct` member is similarly defined as follows:

- A scalar or vector type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
- A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to **improperly straddle** if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at F and its last byte at L, where floor(F / 16) != floor(L / 16).
- It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first
Standard Buffer Layout

Every member of an `OpTypeStruct` that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the `scalarBlockLayout` feature is enabled on the device and the storage class is `Uniform`, `StorageBuffer`, `PhysicalStorageBuffer`, `ShaderRecordBufferKHR`, or `PushConstant` then every member must be aligned according to its scalar alignment.

2. If the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is enabled on the device and the storage class is `Workgroup` then every member must be aligned according to its scalar alignment.

3. All vectors must be aligned according to their scalar alignment.

4. If the `uniformBufferStandardLayout` feature is not enabled on the device, then any member of an `OpTypeStruct` with a storage class of `Uniform` and a decoration of `Block` must be aligned according to its extended alignment.

5. Every other member must be aligned according to its base alignment.

Note

Even if scalar alignment is supported, it is generally more performant to use the base alignment.

The memory layout must obey the following rules:

- The `Offset` decoration of any member must be a multiple of its alignment.
- Any `ArrayStride` or `MatrixStride` decoration must be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is `Uniform`, `StorageBuffer`, `PhysicalStorageBuffer`, `ShaderRecordBufferKHR`, or `PushConstant`, and the `scalarBlockLayout` feature is not enabled on the device.
- The storage class is `Workgroup`, and either the struct member is not part of a `Block` or the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is not enabled on the device.
- The storage class is any other storage class.

the memory layout must also obey the following rules:

- Vectors must not improperly straddle, as defined above.
- The `Offset` decoration of a member must not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

Note

The `std430 layout` in GLSL satisfies these rules for types using the base alignment. The `std140 layout` satisfies the rules for types using the extended alignment.
15.8. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a `BuiltIn SPIR-V` decoration. The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values can be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions below, but must be included when declaring the built-in.

**BaryCoordKHR**

The `BaryCoordKHR` decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

**Valid Usage**

- VUID-BaryCoordKHR-BaryCoordKHR-04154
  The `BaryCoordKHR` decoration must be used only within the Fragment Execution Model
- VUID-BaryCoordKHR-BaryCoordKHR-04155
  The variable decorated with `BaryCoordKHR` must be declared using the Input Storage Class
- VUID-BaryCoordKHR-BaryCoordKHR-04156
  The variable decorated with `BaryCoordKHR` must be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspAMD**

The `BaryCoordNoPerspAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment’s center. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

**Valid Usage**

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04157
  The `BaryCoordNoPerspAMD` decoration must be used only within the Fragment Execution Model
- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04158
  The variable decorated with `BaryCoordNoPerspAMD` must be declared using the Input Storage Class
- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04159
  The variable decorated with `BaryCoordNoPerspAMD` must be declared as a two-component vector of 32-bit floating-point values
BaryCoordNoPerspKHR

The `BaryCoordNoPerspKHR` decoration can be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

Valid Usage

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160
  The `BaryCoordNoPerspKHR` decoration must be used only within the Fragment Execution Model
- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161
  The variable decorated with `BaryCoordNoPerspKHR` must be declared using the Input Storage Class
- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04162
  The variable decorated with `BaryCoordNoPerspKHR` must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspCentroidAMD

The `BaryCoordNoPerspCentroidAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04163
  The `BaryCoordNoPerspCentroidAMD` decoration must be used only within the Fragment Execution Model
- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04164
  The variable decorated with `BaryCoordNoPerspCentroidAMD` must be declared using the Input Storage Class
- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04165
  The variable decorated with `BaryCoordNoPerspCentroidAMD` must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspSampleAMD

The `BaryCoordNoPerspSampleAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage
The `BaryCoordNoPerspSampleAMD` decoration **must** be used only within the `Fragment Execution Model`.

The variable decorated with `BaryCoordNoPerspSampleAMD` **must** be declared using the `Input Storage Class`.

The variable decorated with `BaryCoordNoPerspSampleAMD` **must** be declared as a two-component vector of 32-bit floating-point values.

**BaryCoordPullModelAMD**

The `BaryCoordPullModelAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain \((1/W, 1/I, 1/J)\) evaluated at the fragment center and **can** be used to calculate gradients and then interpolate \(I, J,\) and \(W\) at any desired sample location.

**Valid Usage**

- The `BaryCoordPullModelAMD` decoration **must** be used only within the `Fragment Execution Model`.
- The variable decorated with `BaryCoordPullModelAMD` **must** be declared using the `Input Storage Class`.
- The variable decorated with `BaryCoordPullModelAMD` **must** be declared as a three-component vector of 32-bit floating-point values.

**BaryCoordSmoothAMD**

The `BaryCoordSmoothAMD` decoration **can** be used to decorate a fragment shader input variable. This variable will contain the \((I,J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment's center. The \(K\) coordinate of the barycentric coordinates **can** be derived given the identity \(I + J + K = 1.0\).

**Valid Usage**

- The `BaryCoordSmoothAMD` decoration **must** be used only within the `Fragment Execution Model`.
- The variable decorated with `BaryCoordSmoothAMD` **must** be declared using the `Input Storage Class`.
- The variable decorated with `BaryCoordSmoothAMD` **must** be declared as a two-component vector of 32-bit floating-point values.
BaryCoordSmoothCentroidAMD

The BaryCoordSmoothCentroidAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04175
  The BaryCoordSmoothCentroidAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04176
  The variable decorated with BaryCoordSmoothCentroidAMD must be declared using the Input Storage Class

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04177
  The variable decorated with BaryCoordSmoothCentroidAMD must be declared as a two-component vector of 32-bit floating-point values

BaryCoordSmoothSampleAMD

The BaryCoordSmoothSampleAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04178
  The BaryCoordSmoothSampleAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04179
  The variable decorated with BaryCoordSmoothSampleAMD must be declared using the Input Storage Class

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04180
  The variable decorated with BaryCoordSmoothSampleAMD must be declared as a two-component vector of 32-bit floating-point values

BaseInstance

Decorating a variable with the BaseInstance built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. BaseInstance is the firstInstance parameter to a direct drawing command or the firstInstance member of a structure consumed by an indirect drawing command.
**Valid Usage**

- VUID-BaseInstance-BaseInstance-04181
  The *BaseInstance* decoration **must** be used only within the *Vertex Execution Model*

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with *BaseInstance* **must** be declared using the *Input Storage Class*

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with *BaseInstance* **must** be declared as a scalar 32-bit integer value

**BaseVertex**

Decorating a variable with the *BaseVertex* built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For *non-indexed drawing commands*, this variable is the *firstVertex* parameter to a *direct drawing command* or the *firstVertex* member of the structure consumed by an *indirect drawing command*. For *indexed drawing commands*, this variable is the *vertexOffset* parameter to a *direct drawing command* or the *vertexOffset* member of the structure consumed by an *indirect drawing command*.

**Valid Usage**

- VUID-BaseVertex-BaseVertex-04184
  The *BaseVertex* decoration **must** be used only within the *Vertex Execution Model*

- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with *BaseVertex* **must** be declared using the *Input Storage Class*

- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with *BaseVertex* **must** be declared as a scalar 32-bit integer value

**ClipDistance**

Decorating a variable with the *ClipDistance* built-in decoration will make that variable contain the mechanism for controlling user clipping. *ClipDistance* is an array such that the *i*th element of the array specifies the clip distance for plane *i*. A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

- **Note**
  The array variable decorated with *ClipDistance* is explicitly sized by the shader.

- **Note**
  In the last *pre-rasterization shader stage*, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If *ClipDistance* is then used by a fragment shader, *ClipDistance* contains these linearly interpolated values.
Valid Usage

- VUID-ClipDistance-ClipDistance-04187
  The `ClipDistance` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `Fragment`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- VUID-ClipDistance-ClipDistance-04188
  The variable decorated with `ClipDistance` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the `Output Storage Class`.

- VUID-ClipDistance-ClipDistance-04189
  The variable decorated with `ClipDistance` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- VUID-ClipDistance-ClipDistance-04190
  The variable decorated with `ClipDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared in a `Storage Class` other than `Input` or `Output`.

- VUID-ClipDistance-ClipDistance-04191
  The variable decorated with `ClipDistance` must be declared as an array of 32-bit floating-point values.

ClipDistancePerViewNV

Decorating a variable with the `ClipDistancePerViewNV` built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as `ClipDistance`.

Valid Usage

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04192
  The `ClipDistancePerViewNV` decoration must be used only within the `MeshNV Execution Model`.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04193
  The variable decorated with `ClipDistancePerViewNV` must be declared using the `Output Storage Class`.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04194
  The variable decorated with `ClipDistancePerViewNV` must also be decorated with the `PerViewNV` decoration.

- VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04195
  The variable decorated with `ClipDistancePerViewNV` must be declared as a two-dimensional array of 32-bit floating-point values.

CullDistance

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.
Note
In fragment shaders, the values of the CullDistance array are linearly interpolated across each primitive.

Note
If CullDistance decorates an input variable, that variable will contain the corresponding value from the CullDistance decorated output variable from the previous shader stage.

Valid Usage

• VUID-CullDistance-CullDistance-04196
  The CullDistance decoration must be used only within the MeshEXT, MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model

• VUID-CullDistance-CullDistance-04197
  The variable decorated with CullDistance within the MeshEXT, MeshNV or Vertex Execution Model must be declared using the Output Storage Class

• VUID-CullDistance-CullDistance-04198
  The variable decorated with CullDistance within the Fragment Execution Model must be declared using the Input Storage Class

• VUID-CullDistance-CullDistance-04199
  The variable decorated with CullDistance within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output

• VUID-CullDistance-CullDistance-04200
  The variable decorated with CullDistance must be declared as an array of 32-bit floating-point values

CullDistancePerViewNV
Decorating a variable with the CullDistancePerViewNV built-in decoration will make that variable contain the per-view cull distances. The per-view cull distances have the same semantics as CullDistance.

Valid Usage

• VUID-CullDistancePerViewNV-CullDistancePerViewNV-04201
  The CullDistancePerViewNV decoration must be used only within the MeshNV Execution Model

• VUID-CullDistancePerViewNV-CullDistancePerViewNV-04202
  The variable decorated with CullDistancePerViewNV must be declared using the Output Storage Class

• VUID-CullDistancePerViewNV-CullDistancePerViewNV-04203
  The variable decorated with CullDistancePerViewNV must also be decorated with the PerViewNV decoration
The variable decorated with `CullDistancePerViewNV` must be declared as a two-dimensional array of 32-bit floating-point values.

### CullPrimitiveEXT

Decorating a variable with the `CullPrimitiveEXT` built-in decoration will make that variable contain the culling state of output primitives. If the per-primitive boolean value is `true`, the primitive will be culled, if it is `false` it will not be culled.

### Valid Usage

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07034**
  The `CullPrimitiveEXT` decoration must be used only within the `MeshEXT Execution Model`.

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07035**
  The variable decorated with `CullPrimitiveEXT` must be declared using the `Output Storage Class`.

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07036**
  The variable decorated with `CullPrimitiveEXT` must be declared as an array of boolean values.

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07037**
  The size of the array decorated with `CullPrimitiveEXT` must match the value specified by `OutputPrimitivesEXT`.

- **VUID-CullPrimitiveEXT-CullPrimitiveEXT-07038**
  The variable decorated with `CullPrimitiveEXT` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.

### CullMaskKHR

A variable decorated with the `CullMaskKHR` decoration will specify the cull mask of the ray being processed. The value is given by the `Cull Mask` parameter passed into one of the `OpTrace*` instructions.

### Valid Usage

- **VUID-CullMaskKHR-CullMaskKHR-06735**
  The `CullMaskKHR` decoration must be used only within the `IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model`.

- **VUID-CullMaskKHR-CullMaskKHR-06736**
  The variable decorated with `CullMaskKHR` must be declared using the `Input Storage Class`.

- **VUID-CullMaskKHR-CullMaskKHR-06737**
  The variable decorated with `CullMaskKHR` must be declared as a scalar 32-bit integer value.
CurrentRayTimeNV

A variable decorated with the `CurrentRayTimeNV` decoration contains the time value passed in to `OpTraceRayMotionNV` which called this shader.

Valid Usage

- **VUID-CurrentRayTimeNV-CurrentRayTimeNV-04942**
  The `CurrentRayTimeNV` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- **VUID-CurrentRayTimeNV-CurrentRayTimeNV-04943**
  The variable decorated with `CurrentRayTimeNV` must be declared using the Input Storage Class.

- **VUID-CurrentRayTimeNV-CurrentRayTimeNV-04944**
  The variable decorated with `CurrentRayTimeNV` must be declared as a scalar 32-bit floating-point value.

DeviceIndex

The `DeviceIndex` decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range $[0, \max(1, physicalDeviceCount))$, where `physicalDeviceCount` is the `physicalDeviceCount` member of `VkDeviceGroupDeviceCreateInfo`.

Valid Usage

- **VUID-DeviceIndex-DeviceIndex-04205**
  The variable decorated with `DeviceIndex` must be declared using the Input Storage Class.

- **VUID-DeviceIndex-DeviceIndex-04206**
  The variable decorated with `DeviceIndex` must be declared as a scalar 32-bit integer value.

DrawIndex

Decorating a variable with the `DrawIndex` built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current task, mesh, or vertex shader invocation. For indirect drawing commands, `DrawIndex` begins at zero and increments by one for each drawing command executed. The number of drawing commands is given by the `drawCount` parameter. For direct drawing commands, if `vkCmdDrawMultiEXT` or `vkCmdDrawMultiIndexedEXT` is used, this variable contains the integer value corresponding to the zero-based index of the draw command. Otherwise `DrawIndex` is always zero. `DrawIndex` is dynamically uniform.

When task or mesh shaders are used, only the first active stage will have proper access to the variable. The value read by other stages is undefined.
Valid Usage

- VUID-DrawIndex-DrawIndex-04207
  The `DrawIndex` decoration **must** be used only within the `Vertex`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV Execution Model`.

- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with `DrawIndex` **must** be declared using the `Input Storage Class`.

- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with `DrawIndex` **must** be declared as a scalar 32-bit integer value.

FragCoord

Decorating a variable with the `FragCoord` built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{w})\) of the fragment being processed. The \((x,y)\) coordinate \((0,0)\) is the upper left corner of the upper left pixel in the framebuffer.

When **Sample Shading** is enabled, the \(x\) and \(y\) components of `FragCoord` reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the \(x\) and \(y\) components of `FragCoord` reflect the location of the center of the fragment.

The \(z\) component of `FragCoord` is the interpolated depth value of the primitive.

The \(w\) component is the interpolated \(\frac{1}{w'}\).

The **Centroid** interpolation decoration is ignored, but allowed, on `FragCoord`.

Valid Usage

- VUID-FragCoord-FragCoord-04210
  The `FragCoord` decoration **must** be used only within the `Fragment Execution Model`.

- VUID-FragCoord-FragCoord-04211
  The variable decorated with `FragCoord` **must** be declared using the `Input Storage Class`.

- VUID-FragCoord-FragCoord-04212
  The variable decorated with `FragCoord` **must** be declared as a four-component vector of 32-bit floating-point values.

FragDepth

To have a shader supply a fragment-depth value, the shader **must** declare the `DepthReplacing` execution mode. Such a shader's fragment-depth value will come from the variable decorated with the `FragDepth` built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See **fragment shader depth replacement** for details.
Valid Usage

• VUID-FragDepth-FragDepth-04213
  The FragDepth decoration must be used only within the Fragment Execution Model

• VUID-FragDepth-FragDepth-04214
  The variable decorated with FragDepth must be declared using the Output Storage Class

• VUID-FragDepth-FragDepth-04215
  The variable decorated with FragDepth must be declared as a scalar 32-bit floating-point value

• VUID-FragDepth-FragDepth-04216
  If the shader dynamically writes to the variable decorated with FragDepth, the DepthReplacing Execution Mode must be declared

FragInvocationCountEXT

Decorating a variable with the FragInvocationCountEXT built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by minSampleShading.

If Sample Shading is not enabled, FragInvocationCountEXT will be filled with a value of 1.

Valid Usage

• VUID-FragInvocationCountEXT-FragInvocationCountEXT-04217
  The FragInvocationCountEXT decoration must be used only within the Fragment Execution Model

• VUID-FragInvocationCountEXT-FragInvocationCountEXT-04218
  The variable decorated with FragInvocationCountEXT must be declared using the Input Storage Class

• VUID-FragInvocationCountEXT-FragInvocationCountEXT-04219
  The variable decorated with FragInvocationCountEXT must be declared as a scalar 32-bit integer value

FragSizeEXT

Decorating a variable with the FragSizeEXT built-in decoration will make that variable contain the dimensions in pixels of the area that the fragment covers for that invocation.

If fragment density map is not enabled, FragSizeEXT will be filled with a value of (1,1).

Valid Usage

• VUID-FragSizeEXT-FragSizeEXT-04220
  The FragSizeEXT decoration must be used only within the Fragment Execution Model

• VUID-FragSizeEXT-FragSizeEXT-04221
The variable decorated with `FragSizeEXT` **must** be declared using the *Input Storage Class*

- VUID-FragSizeEXT-FragSizeEXT-04222
  The variable decorated with `FragSizeEXT` **must** be declared as a two-component vector of 32-bit integer values

### **FragStencilRefEXT**

Decorating a variable with the `FragStencilRefEXT` built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to `FragStencilRefEXT`, a shader **must** declare the `StencilRefReplacingEXT` execution mode. If a shader declares the `StencilRefReplacingEXT` execution mode and there is an execution path through the shader that does not set `FragStencilRefEXT`, then the fragment's stencil reference value is undefined for executions of the shader that take that path.

Only the least significant \( s \) bits of the integer value of the variable decorated with `FragStencilRefEXT` are considered for stencil testing, where \( s \) is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

See [fragment shader stencil reference replacement](#) for more details.

### **Valid Usage**

- VUID-FragStencilRefEXT-FragStencilRefEXT-04223
  The `FragStencilRefEXT` decoration **must** be used only within the *Fragment Execution Model*

- VUID-FragStencilRefEXT-FragStencilRefEXT-04224
  The variable decorated with `FragStencilRefEXT` **must** be declared using the *Output Storage Class*

- VUID-FragStencilRefEXT-FragStencilRefEXT-04225
  The variable decorated with `FragStencilRefEXT` **must** be declared as a scalar integer value

### **FragmentSizeNV**

Decorating a variable with the `FragmentSizeNV` built-in decoration will make that variable contain the width and height of the fragment.

### **Valid Usage**

- VUID-FragmentSizeNV-FragmentSizeNV-04226
  The `FragmentSizeNV` decoration **must** be used only within the *Fragment Execution Model*

- VUID-FragmentSizeNV-FragmentSizeNV-04227
  The variable decorated with `FragmentSizeNV` **must** be declared using the *Input Storage Class*

- VUID-FragmentSizeNV-FragmentSizeNV-04228
  The variable decorated with `FragmentSizeNV` **must** be declared as a two-component vector
FrontFacing

Decorating a variable with the `FrontFacing` built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

**Valid Usage**

- VUID-FrontFacing-FrontFacing-04229
  The `FrontFacing` decoration **must** be used only within the Fragment Execution Model

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with `FrontFacing` **must** be declared using the Input Storage Class

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with `FrontFacing` **must** be declared as a boolean value

FullyCoveredEXT

Decorating a variable with the `FullyCoveredEXT` built-in decoration will make that variable indicate whether the fragment area is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

**Valid Usage**

- VUID-FullyCoveredEXT-FullyCoveredEXT-04232
  The `FullyCoveredEXT` decoration **must** be used only within the Fragment Execution Model

- VUID-FullyCoveredEXT-FullyCoveredEXT-04233
  The variable decorated with `FullyCoveredEXT` **must** be declared using the Input Storage Class

- VUID-FullyCoveredEXT-FullyCoveredEXT-04234
  The variable decorated with `FullyCoveredEXT` **must** be declared as a boolean value

- VUID-FullyCoveredEXT-conservativeRasterizationPostDepthCoverage-04235
  If `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativeRasterizationPostDepthCoverage` is not supported the `PostDepthCoverageExecution Mode` **must** not be declared, when a variable with the `FullyCoveredEXT` decoration is declared

GlobalInvocationId

Decorating a variable with the `GlobalInvocationId` built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus
LocalInvocationId.

Valid Usage

• VUID-GlobalInvocationId-GlobalInvocationId-04236
  The GlobalInvocationId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

• VUID-GlobalInvocationId-GlobalInvocationId-04237
  The variable decorated with GlobalInvocationId must be declared using the Input Storage Class

• VUID-GlobalInvocationId-GlobalInvocationId-04238
  The variable decorated with GlobalInvocationId must be declared as a three-component vector of 32-bit integer values

HelperInvocation

Decorating a variable with the HelperInvocation built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

Note

It is very likely that a helper invocation will have a value of SampleMask fragment shader input value that is zero.

Valid Usage

• VUID-HelperInvocation-HelperInvocation-04239
  The HelperInvocation decoration must be used only within the Fragment Execution Model

• VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with HelperInvocation must be declared using the Input Storage Class

• VUID-HelperInvocation-HelperInvocation-04241
  The variable decorated with HelperInvocation must be declared as a boolean value

HitKindKHR

A variable decorated with the HitKindKHR decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of OpReportIntersectionKHR. For triangle intersection candidates, this will be one of HitKindFrontFacingTriangleKHR or HitKindBackFacingTriangleKHR.
**Valid Usage**

- VUID-HitKindKHR-HitKindKHR-04242
  
  The `HitKindKHR` decoration **must** be used only within the `AnyHitKHR` or `ClosestHitKHR` Execution Model

- VUID-HitKindKHR-HitKindKHR-04243
  
  The variable decorated with `HitKindKHR` **must** be declared using the Input Storage Class

- VUID-HitKindKHR-HitKindKHR-04244
  
  The variable decorated with `HitKindKHR` **must** be declared as a scalar 32-bit integer value

**HitTNV**

A variable decorated with the `HitTNV` decoration is equivalent to a variable decorated with the `RayTmaxKHR` decoration.

**Valid Usage**

- VUID-HitTNV-HitTNV-04245
  
  The `HitTNV` decoration **must** be used only within the `AnyHitNV` or `ClosestHitNV` Execution Model

- VUID-HitTNV-HitTNV-04246
  
  The variable decorated with `HitTNV` **must** be declared using the Input Storage Class

- VUID-HitTNV-HitTNV-04247
  
  The variable decorated with `HitTNV` **must** be declared as a scalar 32-bit floating-point value

**IncomingRayFlagsKHR**

A variable with the `IncomingRayFlagsKHR` decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline **must** not cause any corresponding flags to be set in variables with this decoration.

**Valid Usage**

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  
  The `IncomingRayFlagsKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  
  The variable decorated with `IncomingRayFlagsKHR` **must** be declared using the Input Storage Class

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  
  The variable decorated with `IncomingRayFlagsKHR` **must** be declared as a scalar 32-bit integer value
InstanceCustomIndexKHR

A variable decorated with the InstanceCustomIndexKHR decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in VkAccelerationStructureKHR::instanceCustomIndex for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

Valid Usage

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The InstanceCustomIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with InstanceCustomIndexKHR must be declared using the Input Storage Class

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with InstanceCustomIndexKHR must be declared as a scalar 32-bit integer value

InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the InstanceId decoration will make that variable contain the index of the instance that intersects the current ray.

Valid Usage

- VUID-InstanceId-InstanceId-04254
  The InstanceId decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-InstanceId-InstanceId-04255
  The variable decorated with InstanceId must be declared using the Input Storage Class

- VUID-InstanceId-InstanceId-04256
  The variable decorated with InstanceId must be declared as a scalar 32-bit integer value

InvocationId

Decorating a variable with the InvocationId built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of instances declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then InvocationId will be zero.
Valid Usage

• VUID-InvocationId-InvocationId-04257
  The InvocationId decoration must be used only within the TessellationControl or Geometry Execution Model

• VUID-InvocationId-InvocationId-04258
  The variable decorated with InvocationId must be declared using the Input Storage Class

• VUID-InvocationId-InvocationId-04259
  The variable decorated with InvocationId must be declared as a scalar 32-bit integer value

InvocationsPerPixelNV

Decorating a variable with the InvocationsPerPixelNV built-in decoration will make that variable contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel may be less than the value of InvocationsPerPixelNV. If the shading rate indicates a fragment covering multiple pixels, then InvocationsPerPixelNV will be one.

Valid Usage

• VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04260
  The InvocationsPerPixelNV decoration must be used only within the Fragment Execution Model

• VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04261
  The variable decorated with InvocationsPerPixelNV must be declared using the Input Storage Class

• VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04262
  The variable decorated with InvocationsPerPixelNV must be declared as a scalar 32-bit integer value

InstanceIndex

Decorating a variable in a vertex shader with the InstanceIndex built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. InstanceIndex begins at the firstInstance parameter to vkCmdDraw or vkCmdDrawIndexed or at the firstInstance member of a structure consumed by vkCmdDrawIndirect or vkCmdDrawIndexedIndirect.

Valid Usage

• VUID-InstanceIndex-InstanceIndex-04263
  The InstanceIndex decoration must be used only within the Vertex Execution Model

• VUID-InstanceIndex-InstanceIndex-04264
The variable decorated with `InstanceIndex` must be declared using the `Input Storage Class`

- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with `InstanceIndex` must be declared as a scalar 32-bit integer value.

**LaunchIdKHR**

A variable decorated with the `LaunchIdKHR` decoration will specify the index of the work item being processed. One work item is generated for each of the `width \times height \times depth` items dispatched by a `vkCmdTraceRaysKHR` command. All shader invocations inherit the same value for variables decorated with `LaunchIdKHR`.

**Valid Usage**

- VUID-LaunchIdKHR-LaunchIdKHR-04266
  The `LaunchIdKHR` decoration must be used only within the `RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model`.

- VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with `LaunchIdKHR` must be declared using the `Input Storage Class`.

- VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with `LaunchIdKHR` must be declared as a three-component vector of 32-bit integer values.

**LaunchSizeKHR**

A variable decorated with the `LaunchSizeKHR` decoration will contain the `width`, `height`, and `depth` dimensions passed to the `vkCmdTraceRaysKHR` command that initiated this shader execution. The `width` is in the first component, the `height` is in the second component, and the `depth` is in the third component.

**Valid Usage**

- VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The `LaunchSizeKHR` decoration must be used only within the `RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model`.

- VUID-LaunchSizeKHR-LaunchSizeKHR-04267
  The variable decorated with `LaunchSizeKHR` must be declared using the `Input Storage Class`.

- VUID-LaunchSizeKHR-LaunchSizeKHR-04268
  The variable decorated with `LaunchSizeKHR` must be declared as a three-component vector of 32-bit integer values.

**Layer**

Decorating a variable with the `Layer` built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.
In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer` can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active pre-rasterization shader stage (in pipeline order) controls the `Layer` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `Layer`.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with `Layer`, then the first layer is used. If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with `Layer`, it must write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives may still be rasterized, fragment shaders may be executed, and the framebuffer values for all layers are undefined. In a mesh shader this also applies when the `Layer` value is greater than or equal to the `maxMeshOutputLayers` limit.

If a variable with the `Layer` decoration is also decorated with `ViewportRelativeNV`, then the `ViewportIndex` is added to the layer that is used for rendering and that is made available in the fragment shader.

If the shader writes to a variable decorated `ViewportMaskNV`, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

---

### Valid Usage

- **VUID-Layer-Layer-04272**
  The `Layer` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-Layer-Layer-04273**
  If the `shaderOutputLayer` feature is not enabled then the `Layer` decoration must be used only within the `Geometry` or `Fragment Execution Model`.

- **VUID-Layer-Layer-04274**
  The variable decorated with `Layer` within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` must be declared using the `Output Storage Class`.

- **VUID-Layer-Layer-04275**
  The variable decorated with `Layer` within the `Fragment Execution Model` must be declared using the `Input Storage Class`.

- **VUID-Layer-Layer-04276**
  The variable decorated with `Layer` must be declared as a scalar 32-bit integer value.

- **VUID-Layer-Layer-07039**
  The variable decorated with `Layer` within the `MeshEXT Execution Model` must also be decorated with the `PerPrimitiveEXT` decoration.
LayerPerViewNV

Decorating a variable with the `LayerPerViewNV` built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as `Layer`, for each view.

Valid Usage

• VUID-LayerPerViewNV-LayerPerViewNV-04277
  The `LayerPerViewNV` decoration must be used only within the `MeshNV Execution Model`.

• VUID-LayerPerViewNV-LayerPerViewNV-04278
  The variable decorated with `LayerPerViewNV` must be declared using the `Output Storage Class`.

• VUID-LayerPerViewNV-LayerPerViewNV-04279
  The variable decorated with `LayerPerViewNV` must also be decorated with the `PerViewNV` decoration.

• VUID-LayerPerViewNV-LayerPerViewNV-04280
  The variable decorated with `LayerPerViewNV` must be declared as an array of scalar 32-bit integer values.

LocalInvocationId

Decorating a variable with the `LocalInvocationId` built-in decoration will make that variable contain the location of the current task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

Note

If the size of the workgroup in a particular dimension is one, then the `LocalInvocationId` in that dimension will be zero. If the workgroup is effectively two-dimensional, then `LocalInvocationId.z` will be zero. If the workgroup is effectively one-dimensional, then both `LocalInvocationId.y` and `LocalInvocationId.z` will be zero.

Valid Usage

• VUID-LocalInvocationId-LocalInvocationId-04281
  The `LocalInvocationId` decoration must be used only within the `GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model`.

• VUID-LocalInvocationId-LocalInvocationId-04282
  The variable decorated with `LocalInvocationId` must be declared using the `Input Storage Class`.

• VUID-LocalInvocationId-LocalInvocationId-04283
  The variable decorated with `LocalInvocationId` must be declared as a three-component vector of 32-bit integer values.
LocalInvocationIndex

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

\[
\text{LocalInvocationIndex} = \text{LocalInvocationId.z} \times \text{WorkgroupSize.x} \times \text{WorkgroupSize.y} + \text{LocalInvocationId.y} \times \text{WorkgroupSize.x} + \text{LocalInvocationId.x};
\]

Valid Usage

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
  The `LocalInvocationIndex` decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with `LocalInvocationIndex` must be declared using the Input Storage Class

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with `LocalInvocationIndex` must be declared as a scalar 32-bit integer value

MeshViewCountNV

Decorating a variable with the `MeshViewCountNV` built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.

Valid Usage

- VUID-MeshViewCountNV-MeshViewCountNV-04287
  The `MeshViewCountNV` decoration must be used only within the MeshNV or TaskNV Execution Model

- VUID-MeshViewCountNV-MeshViewCountNV-04288
  The variable decorated with `MeshViewCountNV` must be declared using the Input Storage Class

- VUID-MeshViewCountNV-MeshViewCountNV-04289
  The variable decorated with `MeshViewCountNV` must be declared as a scalar 32-bit integer value

MeshViewIndicesNV

Decorating a variable with the `MeshViewIndicesNV` built-in decoration will make that variable contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The values of array elements with indices greater than or equal to `MeshViewCountNV` are undefined. If the value of `MeshViewIndicesNV[i]` is `j`, then any outputs decorated with `PerViewNV`
will take on the value of array element \( i \) when processing primitives for view index \( j \).

### Valid Usage

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04290**
  The `MeshViewIndicesNV` decoration must be used only within the `MeshNV` or `TaskNV` Execution Model.

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04291**
  The variable decorated with `MeshViewIndicesNV` must be declared using the Input Storage Class.

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04292**
  The variable decorated with `MeshViewIndicesNV` must be declared as an array of scalar 32-bit integer values.

### NumSubgroups

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

### Valid Usage

- **VUID-NumSubgroups-NumSubgroups-04293**
  The `NumSubgroups` decoration must be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model.

- **VUID-NumSubgroups-NumSubgroups-04294**
  The variable decorated with `NumSubgroups` must be declared using the Input Storage Class.

- **VUID-NumSubgroups-NumSubgroups-04295**
  The variable decorated with `NumSubgroups` must be declared as a scalar 32-bit integer value.

### NumWorkgroups

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

### Valid Usage

- **VUID-NumWorkgroups-NumWorkgroups-04296**
  The `NumWorkgroups` decoration must be used only within the `GLCompute`, `MeshEXT`, or `TaskEXT` Execution Model.

- **VUID-NumWorkgroups-NumWorkgroups-04297**
  The variable decorated with `NumWorkgroups` must be declared using the Input Storage Class.

- **VUID-NumWorkgroups-NumWorkgroups-04298**
The variable decorated with `NumWorkgroups` must be declared as a three-component vector of 32-bit integer values.

**ObjectRayDirectionKHR**

A variable decorated with the `ObjectRayDirectionKHR` decoration will specify the direction of the ray being processed, in object space.

**Valid Usage**

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299**
  The `ObjectRayDirectionKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300**
  The variable decorated with `ObjectRayDirectionKHR` must be declared using the Input Storage Class.

- **VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301**
  The variable decorated with `ObjectRayDirectionKHR` must be declared as a three-component vector of 32-bit floating-point values.

**ObjectRayOriginKHR**

A variable decorated with the `ObjectRayOriginKHR` decoration will specify the origin of the ray being processed, in object space.

**Valid Usage**

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302**
  The `ObjectRayOriginKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303**
  The variable decorated with `ObjectRayOriginKHR` must be declared using the Input Storage Class.

- **VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304**
  The variable decorated with `ObjectRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values.

**ObjectToWorldKHR**

A variable decorated with the `ObjectToWorldKHR` decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.

**Valid Usage**

- **VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305**
  The `ObjectToWorldKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.
or ClosestHitKHR Execution Model

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with `ObjectToWorldKHR` must be declared using the Input Storage Class

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with `ObjectToWorldKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values

**PatchVertices**

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the `name:patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`. In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

**Valid Usage**

- VUID-PatchVertices-PatchVertices-04308
  The `PatchVertices` decoration must be used only within the TessellationControl or TessellationEvaluation Execution Model

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with `PatchVertices` must be declared using the Input Storage Class

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` must be declared as a scalar 32-bit integer value

**PointCoord**

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

*Note*

Depending on how the point is rasterized, `PointCoord` may never reach (0,0) or (1,1).

**Valid Usage**

- VUID-PointCoord-PointCoord-04311
  The `PointCoord` decoration must be used only within the Fragment Execution Model
The variable decorated with `PointCoord` must be declared using the `Input Storage Class`.

The variable decorated with `PointCoord` must be declared as a two-component vector of 32-bit floating-point values.

### PointSize

Decorating a variable with the `PointSize` built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with `PointSize` by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

**Note**

When `PointSize` decorates a variable in the `Input Storage Class`, it contains the data written to the output variable decorated with `PointSize` from the previous shader stage.

### Valid Usage

- **VUID-PointSize-PointSize-04314**
  The `PointSize` decoration must be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-PointSize-PointSize-04315**
  The variable decorated with `PointSize` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` must be declared using the `Output Storage Class`.

- **VUID-PointSize-PointSize-04316**
  The variable decorated with `PointSize` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared using a Storage Class other than `Input` or `Output`.

- **VUID-PointSize-PointSize-04317**
  The variable decorated with `PointSize` must be declared as a scalar 32-bit floating-point value.

### Position

Decorating a variable with the `Position` built-in decoration will make that variable contain the position of the current vertex. In the last pre-rasterization shader stage, the value of the variable decorated with `Position` is used in subsequent primitive assembly, clipping, and rasterization operations.

**Note**

When `Position` decorates a variable in the `Input Storage Class`, it contains the data written to the output variable decorated with `Position` from the previous shader stage.
Valid Usage

- **VUID-Position-Position-04318**
  The `Position` decoration **must** be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-Position-Position-04319**
  The variable decorated with `Position` within the `MeshEXT`, `MeshNV`, or `Vertex Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-Position-Position-04320**
  The variable decorated with `Position` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` **must** not be declared using a `Storage Class` other than `Input` or `Output`.

- **VUID-Position-Position-04321**
  The variable decorated with `Position` **must** be declared as a four-component vector of 32-bit floating-point values.

---

**PositionPerViewNV**

Decorating a variable with the `PositionPerViewNV` built-in decoration will make that variable contain the position of the current vertex, for each view.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final pre-rasterization shader stage in the pipeline, values written to an output variable decorated with `PositionPerViewNV` are used in subsequent primitive assembly, clipping, and rasterization operations, as with `Position`. `PositionPerViewNV` output in an earlier pre-rasterization shader stage is available as an input in the subsequent pre-rasterization shader stage.

If a shader is compiled against a subpass that has the `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` bit set, then the position values for each view **must** not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.

---

Valid Usage

- **VUID-PositionPerViewNV-PositionPerViewNV-04322**
  The `PositionPerViewNV` decoration **must** be used only within the `MeshNV`, `Vertex`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04323**
  The variable decorated with `PositionPerViewNV` within the `Vertex`, or `MeshNV Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-PositionPerViewNV-PositionPerViewNV-04324**
  The variable decorated with `PositionPerViewNV` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` **must** not be declared using a `Storage Class` other than `Input` or `Output`. 

1182
The variable decorated with `PositionPerViewNV` must be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass’s view mask plus one.

The array variable decorated with `PositionPerViewNV` must only be indexed by a constant or specialization constant.

**PrimitiveCountNV**

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

**Valid Usage**

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04327**
  The `PrimitiveCountNV` decoration must be used only within the `MeshNV Execution Model`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04328**
  The variable decorated with `PrimitiveCountNV` must be declared using the `Output Storage Class`.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04329**
  The variable decorated with `PrimitiveCountNV` must be declared as a scalar 32-bit integer value.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see `Polygon Mode`), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`.

In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the mesh shader if a mesh
shader is present, or the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

*Note*

When the **PrimitiveId** decoration is applied to an output variable in the mesh shader or geometry shader, the resulting value is seen through the **PrimitiveId** decorated input variable in the fragment shader.

The fragment shader using **PrimitiveId** will need to declare either the **MeshShadingNV**, **MeshShadingEXT**, **Geometry** or **Tessellation** capability to satisfy the requirement SPIR-V has to use **PrimitiveId**.

### Valid Usage

- **VUID-PrimitiveId-PrimitiveId-04330**
  
  The **PrimitiveId** decoration **must** be used only within the **MeshEXT**, **MeshNV**, **IntersectionKHR**, **AnyHitKHR**, **ClosestHitKHR**, **TessellationControl**, **TessellationEvaluation**, **Geometry**, or **Fragment Execution Model**.

- **VUID-PrimitiveId-Fragment-04331**
  
  If pipeline contains both the **Fragment** and **Geometry Execution Model** and a variable decorated with **PrimitiveId** is read from **Fragment** shader, then the **Geometry** shader **must** write to the output variables decorated with **PrimitiveId** in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  
  If pipeline contains both the **Fragment** and **MeshEXT** or **MeshNV Execution Model** and a variable decorated with **PrimitiveId** is read from **Fragment** shader, then the **MeshEXT** or **MeshNV** shader **must** write to the output variables decorated with **PrimitiveId** in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
  
  If **Fragment Execution Model** contains a variable decorated with **PrimitiveId**, then either the **MeshShadingEXT**, **MeshShadingNV**, **Geometry** or **Tessellation** capability **must** also be declared.

- **VUID-PrimitiveId-PrimitiveId-04334**
  
  The variable decorated with **PrimitiveId** within the **TessellationControl**, **TessellationEvaluation**, **Fragment**, **IntersectionKHR**, **AnyHitKHR**, or **ClosestHitKHR** **Execution Model** **must** be declared using the **Input Storage Class**.

- **VUID-PrimitiveId-PrimitiveId-04335**
  
  The variable decorated with **PrimitiveId** within the **Geometry Execution Model** **must** be declared using the **Input** or **Output Storage Class**.

- **VUID-PrimitiveId-PrimitiveId-04336**
  
  The variable decorated with **PrimitiveId** within the **MeshEXT** or **MeshNV Execution Model** **must** be declared using the **Output Storage Class**.

- **VUID-PrimitiveId-PrimitiveId-04337**
The variable decorated with `PrimitiveId` **must** be declared as a scalar 32-bit integer value

- **VUID-PrimitiveId-PrimitiveId-07040**
  The variable decorated with `PrimitiveId` within the `MeshEXT Execution Model` **must** also be decorated with the `PerPrimitiveEXT` decoration

---

**PrimitiveIndicesNV**

Decorating a variable with the `PrimitiveIndicesNV` decoration will make that variable contain the output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (`OutputPoints`), two (`OutputLinesNV`), or three (`OutputTriangles`) indices and each group generates a primitive.

---

**Valid Usage**

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04338**
  The `PrimitiveIndicesNV` decoration **must** be used only within the `MeshNV Execution Model`

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04339**
  The variable decorated with `PrimitiveIndicesNV` **must** be declared using the `Output Storage Class`

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04340**
  The variable decorated with `PrimitiveIndicesNV` **must** be declared as an array of scalar 32-bit integer values

- **VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04341**
  All index values of the array decorated with `PrimitiveIndicesNV` **must** be in the range `[0, N-1]`, where N is the value specified by the `OutputVertices Execution Mode`

- **VUID-PrimitiveIndicesNV-OutputPoints-04342**
  If the Execution Mode is `OutputPoints`, then the array decorated with `PrimitiveIndicesNV` must be the size of the value specified by `OutputPrimitivesNV`

- **VUID-PrimitiveIndicesNV-OutputLinesNV-04343**
  If the Execution Mode is `OutputLinesNV`, then the array decorated with `PrimitiveIndicesNV` must be the size of two times the value specified by `OutputPrimitivesNV`

- **VUID-PrimitiveIndicesNV-OutputTrianglesNV-04344**
  If the Execution Mode is `OutputTrianglesNV`, then the array decorated with `PrimitiveIndicesNV` must be the size of three times the value specified by `OutputPrimitivesNV`

---

**PrimitivePointIndicesEXT**

Decorating a variable with the `PrimitivePointIndicesEXT` decoration will make that variable contain the output array of vertex index values for point primitives.

---

**Valid Usage**

- **VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07041**
  The `PrimitivePointIndicesEXT` decoration **must** be used only within the `MeshEXT Execution Model`
Model

- VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07042
  The PrimitivePointIndicesEXT decoration must be used only with the OutputPoints Execution Mode

- VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07043
  The variable decorated with PrimitivePointIndicesEXT must be declared using the Output Storage Class

- VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07044
  The variable decorated with PrimitivePointIndicesEXT must be declared as an array of scalar 32-bit integer values

- VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07045
  All index values of the array decorated with PrimitivePointIndicesEXT must be in the range \([0, N-1]\), where \(N\) is the value specified by the OutputVertices Execution Mode

- VUID-PrimitivePointIndicesEXT-PrimitivePointIndicesEXT-07046
  The size of the array decorated with PrimitivePointIndicesEXT must match the value specified by OutputPrimitivesEXT

**PrimitiveLineIndicesEXT**

Decorating a variable with the PrimitiveLineIndicesEXT decoration will make that variable contain the output array of vertex index values for line primitives.

**Valid Usage**

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07047
  The PrimitiveLineIndicesEXT decoration must be used only within the MeshEXT Execution Model

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07048
  The PrimitiveLineIndicesEXT decoration must be used only with the OutputLinesEXT Execution Mode

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07049
  The variable decorated with PrimitiveLineIndicesEXT must be declared using the Output Storage Class

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07050
  The variable decorated with PrimitiveLineIndicesEXT must be declared as an array of two component vector 32-bit integer values

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07051
  All index values of the array decorated with PrimitiveLineIndicesEXT must be in the range \([0, N-1]\), where \(N\) is the value specified by the OutputVertices Execution Mode

- VUID-PrimitiveLineIndicesEXT-PrimitiveLineIndicesEXT-07052
  The size of the array decorated with PrimitiveLineIndicesEXT must match the value specified by OutputPrimitivesEXT
**PrimitiveTriangleIndicesEXT**

Decorating a variable with the `PrimitiveTriangleIndicesEXT` decoration will make that variable contain the output array of vertex index values for triangle primitives.

**Valid Usage**

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07053**
  The `PrimitiveTriangleIndicesEXT` decoration must be used only within the `MeshEXT` Execution Model

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07054**
  The `PrimitiveTriangleIndicesEXT` decoration must be used only with the `OutputTrianglesEXT` Execution Mode

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07055**
  The variable decorated with `PrimitiveTriangleIndicesEXT` must be declared using the `Output Storage Class`

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07056**
  The variable decorated with `PrimitiveTriangleIndicesEXT` must be declared as an array of three component vector 32-bit integer values

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07057**
  All index values of the array decorated with `PrimitiveTriangleIndicesEXT` must be in the range \([0, N-1]\), where \(N\) is the value specified by the `OutputVerticesEXT` Execution Mode

- **VUID-PrimitiveTriangleIndicesEXT-PrimitiveTriangleIndicesEXT-07058**
  The size of the array decorated with `PrimitiveTriangleIndicesEXT` must match the value specified by `OutputPrimitivesEXT`

**PrimitiveShadingRateKHR**

Decorating a variable with the `PrimitiveShadingRateKHR` built-in decoration will make that variable contain the primitive fragment shading rate.

The value written to the variable decorated with `PrimitiveShadingRateKHR` by the last pre-rasterization shader stage in the pipeline is used as the primitive fragment shading rate. Outputs in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with `PrimitiveShadingRateKHR`, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has `PrimitiveShadingRateKHR` in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

**Valid Usage**

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484**
  The `PrimitiveShadingRateKHR` decoration must be used only within the `MeshEXT, MeshNV,`
Vertex, or Geometry Execution Model

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485
  The variable decorated with PrimitiveShadingRateKHR must be declared using the Output Storage Class

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486
  The variable decorated with PrimitiveShadingRateKHR must be declared as a scalar 32-bit integer value

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487
  The value written to PrimitiveShadingRateKHR must include no more than one of Vertical2Pixels and Vertical4Pixels

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488
  The value written to PrimitiveShadingRateKHR must include no more than one of Horizontal2Pixels and Horizontal4Pixels

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489
  The value written to PrimitiveShadingRateKHR must not have any bits set other than those defined by Fragment Shading Rate Flags enumerants in the SPIR-V specification

- VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-07059
  The variable decorated with PrimitiveShadingRateKHR within the MeshEXT Execution Model must also be decorated with the PerPrimitiveEXT decoration

RayGeometryIndexKHR

A variable decorated with the RayGeometryIndexKHR decoration will contain the geometry index for the acceleration structure geometry currently being shaded.

Valid Usage

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345
  The RayGeometryIndexKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04346
  The variable decorated with RayGeometryIndexKHR must be declared using the Input Storage Class

- VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04347
  The variable decorated with RayGeometryIndexKHR must be declared as a scalar 32-bit integer value

RayTmaxKHR

A variable decorated with the RayTmaxKHR decoration will contain the parametric $t_{\text{max}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into OpTraceRayKHR.

The $t_{\text{max}}$ value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-
hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling OpReportIntersectionKHR if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into OpTraceKHR.

### Valid Usage

- **VUID-RayTmaxKHR-RayTmaxKHR-04348**
  The RayTmaxKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- **VUID-RayTmaxKHR-RayTmaxKHR-04349**
  The variable decorated with RayTmaxKHR must be declared using the Input Storage Class.

- **VUID-RayTmaxKHR-RayTmaxKHR-04350**
  The variable decorated with RayTmaxKHR must be declared as a scalar 32-bit floating-point value.

### RayTminKHR

A variable decorated with the RayTminKHR decoration will contain the parametric t\textsubscript{min} value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into OpTraceKHR.

The t\textsubscript{min} value remains constant for the duration of the ray query.

### Valid Usage

- **VUID-RayTminKHR-RayTminKHR-04351**
  The RayTminKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- **VUID-RayTminKHR-RayTminKHR-04352**
  The variable decorated with RayTminKHR must be declared using the Input Storage Class.

- **VUID-RayTminKHR-RayTminKHR-04353**
  The variable decorated with RayTminKHR must be declared as a scalar 32-bit floating-point value.

### SampleId

Decorating a variable with the SampleId built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. SampleId ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with SampleId, Sample Shading is considered enabled with a minSampleShading value of 1.0.
Valid Usage

- VUID-SampleId-SampleId-04354
  The SampleId decoration must be used only within the Fragment Execution Model

- VUID-SampleId-SampleId-04355
  The variable decorated with SampleId must be declared using the Input Storage Class

- VUID-SampleId-SampleId-04356
  The variable decorated with SampleId must be declared as a scalar 32-bit integer value

SampleMask

Decorating a variable with the SampleMask built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the Input storage class decorated with SampleMask will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. SampleMask[] is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (SampleMask[M]) corresponds to sample $32 \times M + B$.

A variable in the Output storage class decorated with SampleMask is an array of integers forming a bit array in a manner similar to an input variable decorated with SampleMask, but where each bit represents coverage as computed by the shader. This computed SampleMask is combined with the generated coverage mask in the multisample coverage operation.

Variables decorated with SampleMask must be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with SampleMask, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with SampleMask, the sample mask has no effect on the processing of a fragment.

Valid Usage

- VUID-SampleMask-SampleMask-04357
  The SampleMask decoration must be used only within the Fragment Execution Model

- VUID-SampleMask-SampleMask-04358
  The variable decorated with SampleMask must be declared using the Input or Output Storage Class

- VUID-SampleMask-SampleMask-04359
  The variable decorated with SampleMask must be declared as an array of 32-bit integer values
SamplePosition

Decorating a variable with the SamplePosition built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate (0,0) and the bottom right of the fragment is considered to be at coordinate (1,1) for any fragment area.

If a fragment shader entry point's interface includes an input variable decorated with SamplePosition, Sample Shading is considered enabled with a minSampleShading value of 1.0.

If the current pipeline uses custom sample locations the value of any variable decorated with the SamplePosition built-in decoration is undefined.

Valid Usage

• VUID-SamplePosition-SamplePosition-04360
  The SamplePosition decoration must be used only within the Fragment Execution Model

• VUID-SamplePosition-SamplePosition-04361
  The variable decorated with SamplePosition must be declared using the Input Storage Class

• VUID-SamplePosition-SamplePosition-04362
  The variable decorated with SamplePosition must be declared as a two-component vector of 32-bit floating-point values

ShadingRateKHR

Decorating a variable with the ShadingRateKHR built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.

Valid Usage

• VUID-ShadingRateKHR-ShadingRateKHR-04490
  The ShadingRateKHR decoration must be used only within the Fragment Execution Model

• VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with ShadingRateKHR must be declared using the Input Storage Class

• VUID-ShadingRateKHR-ShadingRateKHR-04492
  The variable decorated with ShadingRateKHR must be declared as a scalar 32-bit integer value

SMCountNV

Decorating a variable with the SMCountNV built-in decoration will make that variable contain the
number of SMs on the device.

### Valid Usage

- **VUID-SMCountNV-SMCountNV-04363**
  The variable decorated with `SMCountNV` **must** be declared using the Input Storage Class

- **VUID-SMCountNV-SMCountNV-04364**
  The variable decorated with `SMCountNV` **must** be declared as a scalar 32-bit integer value

**SMIDNV**

Decorating a variable with the `SMIDNV` built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range \([0, SMCountNV-1]\).

### Valid Usage

- **VUID-SMIDNV-SMIDNV-04365**
  The variable decorated with `SMIDNV` **must** be declared using the Input Storage Class

- **VUID-SMIDNV-SMIDNV-04366**
  The variable decorated with `SMIDNV` **must** be declared as a scalar 32-bit integer value

**SubgroupId**

Decorating a variable with the `SubgroupId` built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range \([0, NumSubgroups-1]\).

### Valid Usage

- **VUID-SubgroupId-SubgroupId-04367**
  The `SubgroupId` decoration **must** be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

- **VUID-SubgroupId-SubgroupId-04368**
  The variable decorated with `SubgroupId` **must** be declared using the Input Storage Class

- **VUID-SubgroupId-SubgroupId-04369**
  The variable decorated with `SubgroupId` **must** be declared as a scalar 32-bit integer value

**SubgroupEqMask**

Decorating a variable with the `SubgroupEqMask` built-in decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bit corresponding to the `SubgroupLocalInvocationId` is set in the variable decorated with `SubgroupEqMask`. All other bits are set to zero.

`SubgroupEqMaskKHR` is an alias of `SubgroupEqMask`.
Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with `SubgroupEqMask` **must** be declared using the `Input Storage Class`

- VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with `SubgroupEqMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupGeMask

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

Valid Usage

- VUID-SubgroupGeMask-SubgroupGeMask-04372
  The variable decorated with `SubgroupGeMask` **must** be declared using the `Input Storage Class`

- VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with `SubgroupGeMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupGtMask

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

Valid Usage

- VUID-SubgroupGtMask-SubgroupGtMask-04374
  The variable decorated with `SubgroupGtMask` **must** be declared using the `Input Storage Class`

- VUID-SubgroupGtMask-SubgroupGtMask-04375
  The variable decorated with `SubgroupGtMask` **must** be declared as a four-component vector of 32-bit integer values
**SubgroupLeMask**

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

**Valid Usage**

- **VUID-SubgroupLeMask-SubgroupLeMask-04376**
  The variable decorated with `SubgroupLeMask` **must** be declared using the *Input Storage Class*

- **VUID-SubgroupLeMask-SubgroupLeMask-04377**
  The variable decorated with `SubgroupLeMask` **must** be declared as a four-component vector of 32-bit integer values

**SubgroupLtMask**

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the *subgroup mask* of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

**Valid Usage**

- **VUID-SubgroupLtMask-SubgroupLtMask-04378**
  The variable decorated with `SubgroupLtMask` **must** be declared using the *Input Storage Class*

- **VUID-SubgroupLtMask-SubgroupLtMask-04379**
  The variable decorated with `SubgroupLtMask` **must** be declared as a four-component vector of 32-bit integer values

**SubgroupLocalInvocationId**

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0,SubgroupSize-1].`

If `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT` is specified, or if module declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the `stage` is a multiple of `SubgroupSize`, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups **must** be launched with all invocations active, i.e., there is an active invocation with `SubgroupLocalInvocationId` for each value in range `[0,SubgroupSize-1].`
Note
There is no direct relationship between SubgroupLocalInvocationId and LocalInvocationId or LocalInvocationIndex. If the pipeline was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

Note
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT is effectively deprecated when compiling SPIR-V 1.6 shaders, as this behavior is the default for Vulkan with SPIR-V 1.6. This is more aligned with developer expectations, and avoids applications unexpectedly breaking in the future.

Valid Usage

- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380
  The variable decorated with SubgroupLocalInvocationId must be declared using the Input Storage Class

- VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381
  The variable decorated with SubgroupLocalInvocationId must be declared as a scalar 32-bit integer value

SubgroupSize

Decorating a variable with the SubgroupSize builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set, or the SPIR-V module is at least version 1.6, the SubgroupSize decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between minSubgroupSize and maxSubgroupSize and must be uniform with subgroup scope. The value may vary across a single draw call, and for fragment shaders may vary across a single primitive. In compute dispatches, SubgroupSize must be uniform with command scope.

If the pipeline was created with a chained VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure, the SubgroupSize decorated variable will match requiredSubgroupSize.

If the pipeline stage SPIR-V module is less than version 1.6 and was not created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set and no...
VkPipelineShaderStageRequiredSubgroupSizeCreateInfo structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**

The old behavior for `SubgroupSize` is considered deprecated as certain compute algorithms cannot be easily implemented without the guarantees of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`.

### Valid Usage

- **VUID-SubgroupSize-SubgroupSize-04382**  
  The variable decorated with `SubgroupSize` must be declared using the **Input Storage Class**

- **VUID-SubgroupSize-SubgroupSize-04383**  
  The variable decorated with `SubgroupSize` must be declared as a scalar 32-bit integer value

---

**TaskCountNV**

Decorating a variable with the `TaskCountNV` decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

### Valid Usage

- **VUID-TaskCountNV-TaskCountNV-04384**  
  The `TaskCountNV` decoration must be used only within the **TaskNV Execution Model**

- **VUID-TaskCountNV-TaskCountNV-04385**  
  The variable decorated with `TaskCountNV` must be declared using the **Output Storage Class**

- **VUID-TaskCountNV-TaskCountNV-04386**  
  The variable decorated with `TaskCountNV` must be declared as a scalar 32-bit integer value

---

**TessCoord**

Decorating a variable with the `TessCoord` built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the tessellation modes of **Quads** or **IsoLines**, the third component is always zero.

### Valid Usage

- **VUID-TessCoord-TessCoord-04387**  
  The `TessCoord` decoration must be used only within the **Tessellation Evaluation Execution Model**
The variable decorated with `TessCoord` must be declared using the **Input Storage Class**.

The variable decorated with `TessCoord` must be declared as a three-component vector of 32-bit floating-point values.

**TessLevelOuter**

Decorating a variable with the `TessLevelOuter` built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelOuter` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelOuter` can read the values written by the tessellation control shader.

**Valid Usage**

- **VUID-TessLevelOuter-TessLevelOuter-04390**
  The `TessLevelOuter` decoration must be used only within the **TessellationControl or TessellationEvaluation Execution Model**.

- **VUID-TessLevelOuter-TessLevelOuter-04391**
  The variable decorated with `TessLevelOuter` within the **TessellationControl Execution Model** must be declared using the **Output Storage Class**.

- **VUID-TessLevelOuter-TessLevelOuter-04392**
  The variable decorated with `TessLevelOuter` within the **TessellationEvaluation Execution Model** must be declared using the **Input Storage Class**.

- **VUID-TessLevelOuter-TessLevelOuter-04393**
  The variable decorated with `TessLevelOuter` must be declared as an array of size four, containing 32-bit floating-point values.

**TessLevelInner**

Decorating a variable with the `TessLevelInner` built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with `TessLevelInner` can be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and can be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.
**Valid Usage**

- **VUID-TessLevelInner-TessLevelInner-04394**
  The `TessLevelInner` decoration must be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`.

- **VUID-TessLevelInner-TessLevelInner-04395**
  The variable decorated with `TessLevelInner` within the `TessellationControl Execution Model` must be declared using the `Output Storage Class`.

- **VUID-TessLevelInner-TessLevelInner-04396**
  The variable decorated with `TessLevelInner` within the `TessellationEvaluation Execution Model` must be declared using the `Input Storage Class`.

- **VUID-TessLevelInner-TessLevelInner-04397**
  The variable decorated with `TessLevelInner` must be declared as an array of size two, containing 32-bit floating-point values.

**VertexIndex**

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

**Note**

`VertexIndex` starts at the same starting value for each instance.

**Valid Usage**

- **VUID-VertexIndex-VertexIndex-04398**
  The `VertexIndex` decoration must be used only within the `Vertex Execution Model`.

- **VUID-VertexIndex-VertexIndex-04399**
  The variable decorated with `VertexIndex` must be declared using the `Input Storage Class`.

- **VUID-VertexIndex-VertexIndex-04400**
  The variable decorated with `VertexIndex` must be declared as a scalar 32-bit integer value.

**ViewIndex**

The `ViewIndex` decoration can be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.

If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.
**Valid Usage**

- **VUID-ViewIndex-ViewIndex-04401**
  The `ViewIndex` decoration **must** be used only within the `MeshEXT`, `Vertex`, `Geometry`, `TessellationControl`, `TessellationEvaluation` or `Fragment Execution Model`

- **VUID-ViewIndex-ViewIndex-04402**
  The variable decorated with `ViewIndex` **must** be declared using the `Input Storage Class`

- **VUID-ViewIndex-ViewIndex-04403**
  The variable decorated with `ViewIndex` **must** be declared as a scalar 32-bit integer value

**ViewportIndex**

Decorating a variable with the `ViewportIndex` built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportIndex` can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active **pre-rasterization shader stage** (in pipeline order) controls the `ViewportIndex` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportIndex`.

If the last active **pre-rasterization shader stage** shader entry point's interface does not include a variable decorated with `ViewportIndex`, then the first viewport is used. If a **pre-rasterization shader stage** shader entry point's interface includes a variable decorated with `ViewportIndex`, it **must** write the same value to `ViewportIndex` for all output vertices of a given primitive.

In a fragment shader, the variable decorated with `ViewportIndex` contains the viewport index of the primitive that the fragment invocation belongs to.

**Valid Usage**

- **VUID-ViewportIndex-ViewportIndex-04404**
  The `ViewportIndex` decoration **must** be used only within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`

- **VUID-ViewportIndex-ViewportIndex-04405**
  If the `shaderOutputViewportIndex` feature is not enabled then the `ViewportIndex` decoration **must** be used only within the `Geometry` or `Fragment Execution Model`

- **VUID-ViewportIndex-ViewportIndex-04406**
  The variable decorated with `ViewportIndex` within the `MeshEXT`, `MeshNV`, `Vertex`, `TessellationEvaluation`, or `Geometry Execution Model` **must** be declared using the `Output Storage Class`
The variable decorated with `ViewportIndex` within the Fragment Execution Model must be declared using the Input Storage Class.

The variable decorated with `ViewportIndex` must be declared as a scalar 32-bit integer value.

The variable decorated with `ViewportIndex` within the MeshEXT Execution Model must also be decorated with the `PerPrimitiveEXT` decoration.

**ViewportMaskNV**

Decorating a variable with the `ViewportMaskNV` built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with `ViewportMaskNV` can be written to with the mask of which viewports the primitive produced by that shader will directed.

The `ViewportMaskNV` variable must be an array that has \( \lceil \frac{VkPhysicalDeviceLimits::maxViewports}{32} \rceil \) elements. When a shader writes to this variable, bit B of element M controls whether a primitive is emitted to viewport \( 32 \times M + B \). The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active pre-rasterization shader stage (in pipeline order) controls the `ViewportMaskNV` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `ViewportMaskNV`. When `ViewportMaskNV` is written by the final pre-rasterization shader stage, any variable decorated with `ViewportIndex` in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with `ViewportMaskNV`, it must write the same value to `ViewportMaskNV` for all output vertices of a given primitive.

**Valid Usage**

- The `ViewportMaskNV` decoration must be used only within the Vertex, MeshNV, TessellationEvaluation, or Geometry Execution Model.
- The variable decorated with `ViewportMaskNV` must be declared using the Output Storage Class.
- The variable decorated with `ViewportMaskNV` must be declared as an array of 32-bit integer values.
Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The value written to an element of `ViewportMaskPerViewNV` in the last pre-rasterization shader stage is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values **must** be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier pre-rasterization shader stage is not available as an input in the subsequent pre-rasterization shader stage.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.

---

**Valid Usage**

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04412**
  The `ViewportMaskPerViewNV` decoration **must** be used only within the Vertex, MeshNV, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04413**
  The variable decorated with `ViewportMaskPerViewNV` **must** be declared using the Output Storage Class

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04414**
  The variable decorated with `ViewportMaskPerViewNV` **must** be declared as an array of 32-bit integer values

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04415**
  The array decorated with `ViewportMaskPerViewNV` **must** be a size less than or equal to 32

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04416**
  The array decorated with `ViewportMaskPerViewNV` **must** be a size greater than the maximum view in the subpass's view mask

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04417**
  The array variable decorated with `ViewportMaskPerViewNV` **must** only be indexed by a constant or specialization constant

---

**WarpsPerSMNV**

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.
Valid Usage

• VUID-WarpsPerSMNV-WarpsPerSMNV-04418
  The variable decorated with WarpsPerSMNV must be declared using the Input Storage Class

• VUID-WarpsPerSMNV-WarpsPerSMNV-04419
  The variable decorated with WarpsPerSMNV must be declared as a scalar 32-bit integer value

WarpIDNV

Decorating a variable with the WarpIDNV built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range \([0, \text{WarpsPerSMNV}-1]\).

Valid Usage

• VUID-WarpIDNV-WarpIDNV-04420
  The variable decorated with WarpIDNV must be declared using the Input Storage Class

• VUID-WarpIDNV-WarpIDNV-04421
  The variable decorated with WarpIDNV must be declared as a scalar 32-bit integer value

WorkgroupId

Decorating a variable with the WorkgroupId built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

Valid Usage

• VUID-WorkgroupId-WorkgroupId-04422
  The WorkgroupId decoration must be used only within the GLCompute, MeshEXT, TaskEXT, MeshNV, or TaskNV Execution Model

• VUID-WorkgroupId-WorkgroupId-04423
  The variable decorated with WorkgroupId must be declared using the Input Storage Class

• VUID-WorkgroupId-WorkgroupId-04424
  The variable decorated with WorkgroupId must be declared as a three-component vector of 32-bit integer values

WorkgroupSize

Note

SPIR-V 1.6 deprecated WorkgroupSize in favor of using the LocalSizeId Execution Mode instead. Support for LocalSizeId was added with VK_KHR_maintenance4 and
promoted to core in Version 1.3.

Decorating an object with the `WorkgroupSize` built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the `WorkgroupSize` decoration, this takes precedence over any `LocalSize` or `LocalSizeId` execution mode.

### Valid Usage

- **VUID-WorkgroupSize-WorkgroupSize-04425**
  The `WorkgroupSize` decoration **must** be used only within the `GLCompute`, `MeshEXT`, `TaskEXT`, `MeshNV`, or `TaskNV` Execution Model

- **VUID-WorkgroupSize-WorkgroupSize-04426**
  The variable decorated with `WorkgroupSize` **must** be a specialization constant or a constant

- **VUID-WorkgroupSize-WorkgroupSize-04427**
  The variable decorated with `WorkgroupSize` **must** be declared as a three-component vector of 32-bit integer values

#### WorldRayDirectionKHR

A variable decorated with the `WorldRayDirectionKHR` decoration will specify the direction of the ray being processed, in world space. The value is the parameter passed into `OpTraceRayKHR`.

### Valid Usage

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428**
  The `WorldRayDirectionKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429**
  The variable decorated with `WorldRayDirectionKHR` **must** be declared using the *Input Storage Class*

- **VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430**
  The variable decorated with `WorldRayDirectionKHR` **must** be declared as a three-component vector of 32-bit floating-point values

#### WorldRayOriginKHR

A variable decorated with the `WorldRayOriginKHR` decoration will specify the origin of the ray being processed, in world space. The value is the parameter passed into `OpTraceRayKHR`.

### Valid Usage

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431**
  The `WorldRayOriginKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- **VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432**
The variable decorated with \texttt{WorldRayOriginKHR} \textbf{must} be declared using the \textit{Input Storage Class}

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433
  The variable decorated with \texttt{WorldRayOriginKHR} \textbf{must} be declared as a three-component vector of 32-bit floating-point values

\textbf{WorldToObjectKHR}

A variable decorated with the \texttt{WorldToObjectKHR} decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

\textbf{Valid Usage}

- VUID-WorldToObjectKHR-WorldToObjectKHR-04434
  The \texttt{WorldToObjectKHR} decoration \textbf{must} be used only within the \textit{IntersectionKHR, AnyHitKHR, or ClosestHitKHR} Execution Model

- VUID-WorldToObjectKHR-WorldToObjectKHR-04435
  The variable decorated with \texttt{WorldToObjectKHR} \textbf{must} be declared using the \textit{Input Storage Class}

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with \texttt{WorldToObjectKHR} \textbf{must} be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an OpTypeImage (representing a VkImageView) or OpTypeSampledImage (representing a (VkImageView, VkSampler) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of OpTypeImage is ignored.

Note

Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- **OpImageSample* and OpImageSparseSample* read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.**
  - Instructions with ImplicitLod in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with ExplicitLod in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with Proj in the name apply homogeneous projection to the coordinates.

- **OpImageFetch and OpImageSparseFetch** return a single texel of the image. No sampler is used.

- **OpImage*Gather and OpImageSparse*Gather** read neighboring texels and return a single component of each.

- **OpImageRead** (and OpImageSparseRead) and **OpImageWrite** read and write, respectively, a texel in the image. No sampler is used.

- **OpImageSampleFootprintNV** identifies and returns information about the set of texels in the image that would be accessed by an equivalent OpImageSample* instruction.

- **OpImage*Dref* instructions apply depth comparison on the texel values.**

- **OpImageSparse* instructions additionally return a sparse residency code.**

- **OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples** return properties of the image descriptor that would be accessed. The image itself is not accessed.

- **OpImageQueryLod** returns the lod parameters that would be used in a sample operation. The actual operation is not performed.

- **OpImageOpImageWeightedSampleQCOM** reads a 2D neighborhood of texels and computes a weighted average using weight values from a separate weight texture.
• opTextureBlockMatchSAD and opTextureBlockMatchSSD compare 2D neighborhoods of texels from two textures.
• OpImageBoxFilterQCOM reads a 2D neighborhood of texels and computes a weighted average of the texels.

16.1.1. Texel Coordinate Systems

Images are addressed by texel coordinates. There are three texel coordinate systems:

• normalized texel coordinates [0.0, 1.0]
• unnormalized texel coordinates [0.0, width / height / depth]
• integer texel coordinates [0, width / height / depth]

Other image instructions can use either normalized or unnormalized texel coordinates (selected by the unnormalizedCoordinates state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as (s,t,r,q,a), with the coordinates having the following meanings:

• s: Coordinate in the first dimension of an image.
• t: Coordinate in the second dimension of an image.
• r: Coordinate in the third dimension of an image.
  ◦ (s,t,r) are interpreted as a direction vector for Cube images.
• q: Fourth coordinate, for homogeneous (projective) coordinates.
• a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order (s, [t,] [r,] q), with t and r being conditionally present based on the Dim of the image. For non-Proj instructions, the coordinates are (s [,t] [,r] [,a]), with t and r being conditionally present based on the Dim of the image and a being conditionally present based on the Arrayed property of the image. Projective image instructions are not supported on Arrayed images.

Unnormalized texel coordinates are referred to as (u,v,w,a), with the coordinates having the following meanings:

• u: Coordinate in the first dimension of an image.
• v: Coordinate in the second dimension of an image.
• w: Coordinate in the third dimension of an image.
• a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-Arrayed) dimensionalities support unnormalized coordinates. The components are in order (u [,v]), with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as (i,j,k,l,n), with the coordinates having the following meanings:

• i: Coordinate in the first dimension of an image.
• j: Coordinate in the second dimension of an image.
• k: Coordinate in the third dimension of an image.
• l: Coordinate for array layer.
• n: Index of the sample within the texel.

They are extracted from the SPIR-V operand in order (i [,j] [,k] [,l] [,n]), with j and k conditionally present based on the Dim of the image, and l conditionally present based on the Arrayed property of the image. n is conditionally present and is taken from the Sample image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

![Figure 3. Texel Coordinate Systems, Linear Filtering](image)

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

• Normalized texel coordinates:
  ◦ The s coordinate goes from 0.0 to 1.0.
  ◦ The t coordinate goes from 0.0 to 1.0.
• Unnormalized texel coordinates:
  ◦ The u coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  ◦ The v coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

• Integer texel coordinates:
  ◦ The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
  ◦ The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

• Also shown for linear filtering:
  ◦ Given the unnormalized coordinates \((u,v)\), the four texels selected are \(i_0j_0, i_1j_0, i_0j_1, \) and \(i_1j_1\).
  ◦ The fractions \(\alpha\) and \(\beta\).
  ◦ Given the offset \(\Delta_i\) and \(\Delta_j\), the four texels selected by the offset are \(i_0j'_0, i_1j'_0, i_0j'_1, \) and \(i_1j'_1\).

**Note**

For formats with reduced-resolution components, \(\Delta_i\) and \(\Delta_j\) are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution components.

---

**Figure 4. Texel Coordinate Systems, Nearest Filtering**

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

• Texel coordinates as above. Also shown for nearest filtering:
  ◦ Given the unnormalized coordinates \((u,v)\), the texel selected is \(ij\).
Given the offset $\Delta_i$ and $\Delta_j$, the texel selected by the offset is $ij'$.

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.

**Figure 5. Texel Coordinate Systems, Corner Sampling**

### 16.2. Conversion Formulas

#### 16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color ($red_{\text{shared}}$, $green_{\text{shared}}$, $blue_{\text{shared}}$, $exp_{\text{shared}}$) as follows:

First, the components (red, green, blue) are clamped to ($red_{\text{clamped}}$, $green_{\text{clamped}}$, $blue_{\text{clamped}}$) as:

$$red_{\text{clamped}} = \max(0, \min(sharedexp_{\text{max}}, red))$$

$$green_{\text{clamped}} = \max(0, \min(sharedexp_{\text{max}}, green))$$

$$blue_{\text{clamped}} = \max(0, \min(sharedexp_{\text{max}}, blue))$$

where:
\[ N = 9 \]
\[ B = 15 \]
\[ E_{\text{max}} = 31 \]
\[ \text{shared exp}_{\text{max}} = \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)} \]

**Note**

NaN, if supported, is handled as in IEEE 754-2008 `minNum()` and `maxNum()`. This results in any NaN being mapped to zero.

The largest clamped component, \( \text{max}_{\text{clamped}} \) is determined:

\[ \text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}}) \]

A preliminary shared exponent \( \text{exp}' \) is computed:

\[ \text{exp}' = \begin{cases} \lfloor \log_2(\text{max}_{\text{clamped}}) \rfloor + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\ 0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)} \end{cases} \]

The shared exponent \( \text{exp}_{\text{shared}} \) is computed:

\[ \text{max}_{\text{shared}} = \left\lfloor \frac{\text{max}_{\text{clamped}}}{2^{(\text{exp}' - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{exp}_{\text{shared}} = \begin{cases} \text{exp}' & \text{for } 0 \leq \text{max}_{\text{shared}} < 2^N \\ \text{exp}' + 1 & \text{for } \text{max}_{\text{shared}} = 2^N \end{cases} \]

Finally, three integer values in the range 0 to \( 2^N \) are computed:

\[ \text{red}_{\text{shared}} = \left\lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{green}_{\text{shared}} = \left\lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{blue}_{\text{shared}} = \left\lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

### 16.2.2. Shared Exponent to RGB

A shared exponent color \((\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \text{exp}_{\text{shared}})\) is transformed to an RGB color \((\text{red}, \text{green}, \text{blue})\) as follows:

\[ \text{red} = \text{red}_{\text{shared}} \times 2^{(\text{exp}_{\text{shared}} - B - N)} \]
\[
green = \green_{shared} \times 2^{(\exp_{shared} - B - N)}
\]

\[
blue = \blue_{shared} \times 2^{(\exp_{shared} - B - N)}
\]

where:

\[N = 9\] (number of mantissa bits per component)

\[B = 15\] (exponent bias)

### 16.3. Texel Input Operations

*Texel input instructions* are SPIR-V image instructions that read from an image. *Texel input operations* are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- **Format conversion**
- **Texel replacement**
- **Depth comparison**
- **Conversion to RGBA**
- **Component swizzle**
- **Chroma reconstruction**
- **Y’C_bC_r conversion**

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If *Chroma Reconstruction* is implicit, *Texel Filtering* instead takes place during chroma reconstruction, before *sampler Y’C_bC_r conversion* occurs.

The operations described in *block matching* and *weight image sampling* are performed before *Conversion to RGBA* and *Component swizzle.*
16.3.1. Texel Input Validation Operations

Texel input validation operations inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction can mismatch with the sampler, the image view, or both, and a number of further cases where the sampler can mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

• The sampler borderColor is an integer type and the image view format is not one of the VkFormat integer types or a stencil component of a depth/stencil format.

• The sampler borderColor is a float type and the image view format is not one of the VkFormat float types or a depth component of a depth/stencil format.

• The sampler borderColor is one of the opaque black colors (VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK or VK_BORDER_COLOR_INT_OPAQUE_BLACK) and the image view VkComponentSwizzle for any of the VkComponentMapping components is not the identity swizzle, and VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage feature is not enabled, and VkSamplerBorderColorComponentMappingCreateInfoEXT is not specified.

• VkSamplerBorderColorComponentMappingCreateInfoEXT::components, if specified, has a component swizzle that does not match the component swizzle of the image view, and either component swizzle is not a form of identity swizzle.

• VkSamplerBorderColorComponentMappingCreateInfoEXT::srgb, if specified, does not match the sRGB encoding of the image view.

• The sampler borderColor is a custom color (VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT) and the supplied VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor is outside the bounds of the values representable in the image view's format.

• The sampler borderColor is a custom color (VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT) and the image view VkComponentSwizzle for any of the VkComponentMapping components is not the identity swizzle, and VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage feature is not enabled, and VkSamplerBorderColorComponentMappingCreateInfoEXT is not specified.

• The VkImageLayout of any subresource in the image view does not match the VkDescriptorImageInfo::imageLayout used to write the image descriptor.

• The SPIR-V Image Format is not compatible with the image view's format.

• The sampler unnormalizedCoordinates is VK_TRUE and any of the limitations of unnormalized coordinates are violated.

• The sampler was created with flags containing VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT and the image was not created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.
• The sampler was not created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• The sampler was created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and is used with a function that is not `OpImageSampleImplicitLod` or `OpImageSampleExplicitLod`, or is used with operands `Offset` or `ConstOffsets`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`.

• The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.

• The SPIR-V instruction is one of the `OpImage*Dref*` instructions, the image view `format` is one of the depth/stencil formats, and the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.

• The SPIR-V instruction's image variable's properties are not compatible with the image view:
  ◦ Rules for `viewType`:
    - `VK_IMAGEVIEW_TYPE_1D` must have `Dim = 1D`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGEVIEW_TYPE_2D` must have `Dim = 2D`, `Arrayed = 0`.
    - `VK_IMAGEVIEW_TYPE_3D` must have `Dim = 3D`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGEVIEW_TYPE_CUBE` must have `Dim = Cube`, `Arrayed = 0`, `MS = 0`.
    - `VK_IMAGEVIEW_TYPE_1D_ARRAY` must have `Dim = 1D`, `Arrayed = 1`, `MS = 0`.
    - `VK_IMAGEVIEW_TYPE_2D_ARRAY` must have `Dim = 2D`, `Arrayed = 1`.
    - `VK_IMAGEVIEW_TYPE_CUBE_ARRAY` must have `Dim = Cube`, `Arrayed = 1`, `MS = 0`.
  ◦ If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 0`.
  ◦ If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 1`.
  ◦ If the `Sampled Type` of the `OpTypeImage` does not match the numeric format of the image, as shown in the `SPIR-V Sampled Type` column of the `Interpretation of Numeric Format` table.
  ◦ If the `signedness of any read or sample operation` does not match the signedness of the image's format.

• If the image was created with `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, the sampler addressing modes must only use a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 2D` and `addressModeU` or `addressModeV` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 3D` and `addressModeU`, `addressModeV`, or `addressModeW` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.

• The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified
Only `OpImageSample` and `OpImageSparseSample` can be used with a sampler or image view that enables `sampler Y'CbCr conversion`.

`OpImageFetch`, `OpImageSparseFetch`, `OpImageGather`, and `OpImageSparseGather` must not be used with a sampler or image view that enables `sampler Y'CbCr conversion`.

The `ConstOffset` and `Offset` operands must not be used with a sampler or image view that enables `sampler Y'CbCr conversion`.

**Integer Texel Coordinate Validation**

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[0 \leq i < w_s\]
\[0 \leq j < h_s\]
\[0 \leq k < d_s\]
\[0 \leq l < \text{layers}\]
\[0 \leq n < \text{samples}\]

where:

\[w_s = \text{width of the image level}\]
\[h_s = \text{height of the image level}\]
\[d_s = \text{depth of the image level}\]
\[\text{layers} = \text{number of layers in the image}\]
samples = number of samples per texel in the image
then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates
   ◦ If the texel coordinates pass validation (that is, the coordinates lie within the image),
   then the texel value comes from the value in image memory.

2. Border Texel
   ◦ If the texel coordinates fail validation, and
     ◦ If the read is the result of an image sample instruction or image gather instruction, and
       ◦ If the image is not a cube image, or if a sampler created with
         `VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT` is used,

   then the texel is a border texel and texel replacement is performed.

3. Invalid Texel
   ◦ If the texel coordinates fail validation, and
     ◦ If the read is the result of an image fetch instruction, image read instruction, or atomic
       instruction,

   then the texel is an invalid texel and texel replacement is performed.

4. Cube Map Edge or Corner
   Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face,
   and Cube map edge handling is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face (as described in the prior section), the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **Cube Map Edge Texel**
  ◦ If the texel lies beyond the selected cube map face in either only i or only j, then the
    coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the
    appropriate neighboring face.

- **Cube Map Corner Texel**
  ◦ If the texel lies beyond the selected cube map face in both i and j, then there is no unique
    neighboring face from which to read that texel. The texel should be replaced by the average
    of the three values of the adjacent texels in each incident face. However, implementations
may replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel must have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel must have that value.

Sparse Validation

If the texel reads from an unbound region of a sparse image, the texel is a sparse unbound texel, and processing continues with texel replacement.

Layout Validation

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with sampler Y’CbCr conversion enabled.

16.3.2. Format Conversion

Texels undergo a format conversion from the VkFormat of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the aspectMask of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.

If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the borderColor of the sampler. The border color is:
### Table 23. Border Color B, Custom Border Color

<table>
<thead>
<tr>
<th>Sampler borderColor</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1, 1, 1, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
</tbody>
</table>

The custom border color \((U)\) may be rounded by implementations prior to texel replacement, but the error introduced by such a rounding must not exceed one ULP of the image's format.

**Note**

The names `VK_BORDER_COLOR_*_TRANSPARENT_BLACK`, `VK_BORDER_COLOR_*_OPAQUE_BLACK`, and `VK_BORDER_COLOR_*_OPAQUE_WHITE` are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of `VK_BORDER_COLOR_INT_OPAQUE_WHITE` is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format.

### Table 24. Border Texel Components After Replacement

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>Component Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>(D = B_r)</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>(S = B_r)</td>
</tr>
<tr>
<td>One component color format</td>
<td>Color(_r) = B(_r)</td>
</tr>
<tr>
<td>Two component color format</td>
<td>([\text{Color}_r,\text{Color}_g] = [B_r,B_g])</td>
</tr>
<tr>
<td>Three component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b] = [B_r,B_g,B_b])</td>
</tr>
<tr>
<td>Four component color format</td>
<td>([\text{Color}_r,\text{Color}_g,\text{Color}_b,\text{Color}_a] = [B_r,B_g,B_b,B_a])</td>
</tr>
</tbody>
</table>

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the `robustBufferAccess` feature is enabled. In that case, an invalid texel is replaced as described by the `robustBufferAccess` feature. If the access is to an image resource and the x, y, z, or layer coordinate validation fails and the `robustImageAccess` feature is enabled, then zero must be returned for the R, G, and B components, if present. Either zero or one must be returned for the A component, if present. If the `robustImageAccess2` feature is enabled, zero values must be returned. If only the sample index was invalid, the values returned are undefined.

Additionally, if the `robustImageAccess` feature is enabled, but the `robustImageAccess2` feature is not,
any invalid texels **may** be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo **conversion to RGBA** as normal.

Loads from a null descriptor return a four component color value of all zeros. However, for storage images and storage texel buffers using an explicit SPIR-V Image Format, loads from a null descriptor **may** return an alpha value of 1 (float or integer, depending on format) if the format does not include alpha.

If the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If `residencyNonResidentStrict` is `VK_FALSE`, the value of the sparse unbound texel is undefined.

### 16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the `aspectMask`, and the operation is an `OpImage*Dref*` instruction, a depth comparison is performed. The result is 1.0 if the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component $D$.

The compare operation is selected by the `VkCompareOp` value set by `VkSamplerCreateInfo::compareOp`. The reference value from the SPIR-V operand $D_{ref}$ and the texel depth value $D_{tex}$ are used as the `reference` and `test` values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then $D_{ref}$ is clamped to $[0,1)$ before the compare operation.

### 16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [D, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [S, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>One component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, 0, 0, \text{one}]$</td>
</tr>
<tr>
<td>Two component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, 0, \text{one}]$</td>
</tr>
<tr>
<td>Three component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{one}]$</td>
</tr>
<tr>
<td>Four component color format</td>
<td>$[\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a]$</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.
16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if sampler Y'C_bC_r conversion is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the sampler Y'C_bC_r conversion if sampler Y'C_bC_r conversion is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color}'\text{component} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{idenity} & \text{for IDENTITY swizzle}
\end{cases}
\]

where:

\[
\text{one} = \begin{cases} 
1.0f & \text{for floating point components} \\
1 & \text{for integer components}
\end{cases}
\]

\[
\text{idenity} = \begin{cases} 
\text{Color}_r & \text{for component} = r \\
\text{Color}_g & \text{for component} = g \\
\text{Color}_b & \text{for component} = b \\
\text{Color}_a & \text{for component} = a
\end{cases}
\]

If the border color is one of the `VK_BORDER_COLOR_* OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the identity swizzle for all components, the value of the texel after swizzle is undefined.

16.3.7. Sparse Residency

`OpImageSparse`* instructions return a structure which includes a residency code indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye's lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same
approach is used with additive color, since the green component dominates the eye’s sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.422” formats have downsampling in the x dimension (corresponding to \( u \) or \( s \) coordinates): they are sampled at half the resolution of luma in that dimension.
- “.420” formats have downsampling in the x dimension (corresponding to \( u \) or \( s \) coordinates) and the y dimension (corresponding to \( v \) or \( t \) coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the \( x\text{ChromaOffset} \) and \( y\text{ChromaOffset} \) members of the \( \text{VkSamplerYcbcrConversionCreateInfo} \) structure used to create the sampler \( Y'C_C'R \) conversion.

The following diagrams show the relationship between unnormalized \((u,v)\) coordinates and \((i,j)\) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.

**Note**

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to \( \text{Wrapping Operation} \). These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for \( \text{NEAREST} \) sampling is shown as a grid.
Figure 6. 4:2:2 downsampling, xChromaOffset=COSITED_EVEN

Figure 7. 4:2:2 downsampling, xChromaOffset=MIDPOINT
Figure 8. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN

Figure 9. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the
**VkSamplerYcbcrConversionCreateInfo**’s `forceExplicitReconstruction` is set to `VK_FALSE`, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the **Implicit Reconstruction** section.

**Explicit Reconstruction**

- If the `chromaFilter` member of the **VkSamplerYcbcrConversionCreateInfo** structure is `VK_FILTER_NEAREST`:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “422” format), the \( \tau_{ijk}[\text{level}] \) values accessed by **texel filtering** are reconstructed as follows:
    \[
    \begin{align*}
    \tau_R'(i, j) &= \tau_R([i \times 0.5], j)[\text{level}] \\
    \tau_B'(i, j) &= \tau_B([i \times 0.5], j)[\text{level}]
    \end{align*}
    \]
  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “420” format), the \( \tau_{ijk}[\text{level}] \) values accessed by **texel filtering** are reconstructed as follows:
    \[
    \begin{align*}
    \tau_R'(i, j) &= \tau_R([i \times 0.5], [j \times 0.5])[\text{level}] \\
    \tau_B'(i, j) &= \tau_B([i \times 0.5], [j \times 0.5])[\text{level}]
    \end{align*}
    \]

  *Note* \( \text{xChromaOffset} \) and \( \text{yChromaOffset} \) have no effect if `chromaFilter` is `VK_FILTER_NEAREST` for explicit reconstruction.

- If the `chromaFilter` member of the **VkSamplerYcbcrConversionCreateInfo** structure is `VK_FILTER_LINEAR`:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “422” format):
    - If \( \text{xChromaOffset} \) is `VK_CHROMA_LOCATION_COSITED_EVEN`:
      - If \( \text{xChromaOffset} \) is `VK_CHROMA_LOCATION_MIDPOINT`:
        - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “420” format), a similar relationship applies.

  Due to the number of options, these formulae are expressed more concisely as follows:
In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to chromaFilter=VK_FILTER_LINEAR, up to nine chroma samples may be required, depending on the sample location.

Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that chromaFilter takes precedence for the chroma samples.

If chromaFilter is VK_FILTER_NEAREST, an implementation may behave as if xChromaOffset and yChromaOffset were both VK_CHROMA_LOCATION_MIDPOINT, irrespective of the values set.

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

\[
\begin{align*}
    u_{RB}' (422 / 420) &= \begin{cases} 
        0.5 \times (u + 0.5), & \text{xChromaOffset=COSITED\_EVEN} \\
        0.5 \times u, & \text{xChromaOffset=MIDPOINT} 
    \end{cases} \\
    v_{RB}' (420) &= \begin{cases} 
        0.5 \times (v + 0.5), & \text{yChromaOffset=COSITED\_EVEN} \\
        0.5 \times v, & \text{yChromaOffset=MIDPOINT} 
    \end{cases}
\end{align*}
\]

16.3.9. Sampler Y'C'B'C_R Conversion

Sampler Y'C'B'C_R conversion performs the following operations, which an implementation may
combine into a single mathematical operation:

- Sampler Y’C₈C₉ Range Expansion
- Sampler Y’C₈C₉ Model Conversion

**Sampler Y’C₈C₉ Range Expansion**

Sampler Y’C₈C₉ range expansion is applied to color component values after all texel input operations which are not specific to sampler Y’C₈C₉ conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y’C₈C₉ range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector $C_{rgba}'$ as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel component values output by the Component Swizzle defined by the `components` member of `VkSamplerYcbcrConversionCreateInfo`. Range expansion applies independently to each component of the image. For the purposes of range expansion and Y’C₈C₉ model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y’C₈C₉ range expansion.

The range expansion to be applied is defined by the `ycbcrRange` member of the `VkSamplerYcbcrConversionCreateInfo` structure:

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_FULL`, the following transformations are applied:

\[
\begin{align*}
Y' &= C_{'rgba}[G]
\end{align*}
\]

\[
\begin{align*}
C_B &= C_{'rgba}[B] - \frac{2^{(n-1)}}{(2^n - 1)}
\end{align*}
\]

\[
\begin{align*}
C_R &= C_{'rgba}[R] - \frac{2^{(n-1)}}{(2^n - 1)}
\end{align*}
\]

**Note**

These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW`, the following transformations are applied:
These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the Khronos Data Format Specification.

\[ Y' = \frac{C'_{rgba}[G] \times (2^n - 1) - 16 \times 2^n - 8}{219 \times 2^n - 8} \]
\[ C_B = \frac{C'_{rgba}[B] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8} \]
\[ C_R = \frac{C'_{rgba}[R] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8} \]

* \( n \) is the bit-depth of the components in the format.

The precision of the operations performed during range expansion **must** be at least that of the source format.

An implementation **may** clamp the results of these range expansion operations such that \( Y' \) falls in the range \([0,1]\), and/or such that \( C_B \) and \( C_R \) fall in the range \([-0.5,0.5]\).

**Sampler \( Y'_C C_R \) Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the \( ycbcrModel \) member:

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY**

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; \( Y'_C C_R \) range expansion is also ignored.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY**

The color components are not modified by the color model conversion and are assumed to be treated as though in \( Y'_C C_R \) form both in memory and in the shader; \( Y'_C C_R \) range expansion is applied to the components as for other \( Y'_C C_R \) models, with the vector \( (C_B', Y', C_B, A) \) provided to the shader.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709**

The color components are transformed from a \( Y'_C C_R \) representation to an \( R'G'B' \) representation as described in the “BT.709 Y'_C C_R conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601**

The color components are transformed from a \( Y'_C C_R \) representation to an \( R'G'B' \) representation as described in the “BT.601 Y'_C C_R conversion” section of the Khronos Data Format Specification.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020**

The color components are transformed from a \( Y'_C C_R \) representation to an \( R'G'B' \) representation as described in the “BT.2020 Y'_C C_R conversion” section of the Khronos Data Format Specification.
In this operation, each output component is dependent on each input component.

An implementation may clamp the R'G'B' results of these conversions to the range [0,1].

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha component is not modified by these model conversions.

Note
Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.
- For a minFilter or magFilter of VK_FILTER_NEAREST:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler \(Y'C_bC_a\) conversion at this location.
- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_{[0,1]},j_{[0,1]})\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using sampler \(Y'C_bC_a\) conversion at each of these locations.
  4. Convert the non-linear A'R'G'B' outputs of the \(Y'C_bC_a\) conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these
operations are redundant and sampling using sampler $Y'C'_bC_r$ conversion at the desired sample coordinates will produce the “correct” results without further processing.

### 16.4. Texel Output Operations

**Texel output instructions** are SPIR-V image instructions that write to an image. **Texel output operations** are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- **Texel output format conversion**

#### 16.4.1. Texel Output Validation Operations

**Texel output validation operations** inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

**Texel Format Validation**

If the image format of the `OpTypeImage` is not compatible with the `VkImageView`'s format, the write causes the contents of the image’s memory to become undefined.

**Texel Type Validation**

If the `Sampled Type` of the `OpTypeImage` does not match the type defined for the format, as specified in the SPIR-V `Sampled Type` column of the *Interpretation of Numeric Format* table, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

#### 16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.
16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the \texttt{VkPhysicalDeviceSparseProperties::residencyNonResidentStrict} property is \texttt{VK_TRUE}, the sparse unbound texel write has no effect. If \texttt{residencyNonResidentStrict} is \texttt{VK_FALSE}, the write \textit{may} have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the \textit{Khronos Data Format Specification}. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the \texttt{VkFormat} of the image view. If the number of components in the texel data is larger than the number of components in the format, additional components are discarded.

Each component is converted based on its type and size (as defined in the \textit{Format Definition} section for each \texttt{VkFormat}). Floating-point outputs are converted as described in \textit{Floating-Point Format Conversions} and \textit{Fixed-Point Data Conversion}. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For \texttt{Proj} image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{\text{ref}}\) coordinate are transformed as follows:

\[
\begin{align*}
    s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\
    t &= \frac{t}{q}, & \text{for 2D or 3D image} \\
    r &= \frac{r}{q}, & \text{for 3D image} \\
    D_{\text{ref}} &= \frac{D_{\text{ref}}}{q}, & \text{if provided}
\end{align*}
\]

16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an \texttt{ImplicitLod} image instruction in a fragment shader) or explicit (provided explicitly by shader to the image
For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\begin{align*}
\frac{\partial s}{\partial x} &= dPdx(s), & \frac{\partial s}{\partial y} &= dPdy(s), & \text{for 1D, 2D, Cube, or 3D image} \\
\frac{\partial t}{\partial x} &= dPdx(t), & \frac{\partial t}{\partial y} &= dPdy(t), & \text{for 2D, Cube, or 3D image} \\
\frac{\partial r}{\partial x} &= dPdx(r), & \frac{\partial r}{\partial y} &= dPdy(r), & \text{for Cube or 3D image}
\end{align*}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand \texttt{Grad} is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the optional SPIR-V operand \texttt{Lod} is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to \(\lambda_{\text{base}}\) as described in Level-of-Detail Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and \texttt{quadDivergentImplicitLod} is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If \texttt{quadDivergentImplicitLod} is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

### 16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the \((s,t,r)\) coordinates are treated as a direction vector \((r_x,r_y,r_z)\). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system \((s_{\text{face}},t_{\text{face}})\). The direction vector is also used to transform the derivatives to per-face derivatives.

### 16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map’s faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that \(r_z\) wins over \(r_y\) and \(r_x\), and the second rule that \(r_y\) wins over \(r_x\). An implementation may choose other rules, but the rules must be deterministic and depend only on \((r_x,r_y,r_z)\).

The layer number (corresponding to a cube map face), the coordinate selections for \(s, t, r\), and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.

16.5.5. Cube Map Coordinate Transformation

\[
s_{face} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}
\]
\[
t_{face} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}
\]

16.5.6. Cube Map Derivative Transformation

\[
\frac{\partial s_{face}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right)
\]
\[
\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} \right)
\]
\[
\frac{\partial s_{face}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)
\]
16.5.7. Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with \texttt{mipmapPrecisionBits} of accuracy.

Scale Factor Operation

The magnitude of the derivatives are calculated by:

\[
\begin{align*}
\frac{\partial s_{face}}{\partial y} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right) \\
\frac{\partial t_{face}}{\partial x} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right) \\
\frac{\partial t_{face}}{\partial y} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\end{align*}
\]

where:

\[
\begin{align*}
\partial t/\partial x &= \partial t/\partial y = 0 \text{ (for 1D images)} \\
\partial r/\partial x &= \partial r/\partial y = 0 \text{ (for 1D, 2D or Cube images)}
\end{align*}
\]

and:

\[
w_{base} = \text{image.w}
\]
For corner-sampled images, the \( w_{\text{base}} \), \( h_{\text{base}} \), and \( d_{\text{base}} \) are instead:

\[
\begin{align*}
    w_{\text{base}} &= \text{image}.w - 1 \\
    h_{\text{base}} &= \text{image}.h - 1 \\
    d_{\text{base}} &= \text{image}.d - 1
\end{align*}
\]

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) **should** be the minor and major axes of this ellipse.

The scale factors \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in \(x\) and \(y\), are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) **may** be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

\[
\begin{align*}
    f_x \text{ is continuous and monotonically increasing in each of } & \ |m_{ux}|, |m_{vx}|, \text{ and } |m_{wx}| \\
    f_y \text{ is continuous and monotonically increasing in each of } & \ |m_{uy}|, |m_{vy}|, \text{ and } |m_{wy}|
\end{align*}
\]

\[
\begin{align*}
    \max(|m_{ux}|, |m_{vx}|, |m_{wx}|) &\leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|) \\
    \max(|m_{uy}|, |m_{vy}|, |m_{wy}|) &\leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|)
\end{align*}
\]

The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) are determined by:

\[
\begin{align*}
    \rho_{\text{max}} &= \max(\rho_x, \rho_y) \\
    \rho_{\text{min}} &= \min(\rho_x, \rho_y)
\end{align*}
\]

The ratio of anisotropy is determined by:

\[
\eta = \min(\rho_{\text{max}}/\rho_{\text{min}}, \max_{\text{Aniso}})
\]

where:
sampler.max\textsubscript{Aniso} = \text{id{maxAnisotropy}} (from sampler descriptor)

limits.max\textsubscript{Aniso} = \text{id{maxSamplerAnisotropy}} (from physical device limits)

\text{id{maxAniso}} = \min(\text{id{sampler.maxAniso}}, \text{id{limits.maxAniso}})

If \( \rho_{\text{max}} = \rho_{\text{min}} = 0 \), then all the partial derivatives are zero, the fragment's footprint in texel space is a point, and \( \eta \) \textbf{should} be treated as 1. If \( \rho_{\text{max}} \neq 0 \) and \( \rho_{\text{min}} = 0 \) then all partial derivatives along one axis are zero, the fragment's footprint in texel space is a line segment, and \( \eta \) \textbf{should} be treated as \text{id{maxAniso}}. However, anytime the footprint is small in texel space the implementation \textbf{may} use a smaller value of \( \eta \), even when \( \rho_{\text{min}} \) is zero or close to zero. If either \text{VkPhysicalDeviceFeatures::<\text{id{maxAnisotropy}}} \) or \text{VkSamplerCreateInfo::<\text{id{anisotropyEnable}}} \) are \text{id{VK_FALSE}}, \text{id{maxAniso}} is set to 1.

If \( \eta = 1 \), sampling is isotropic. If \( \eta > 1 \), sampling is anisotropic.

The sampling rate (\( N \)) is derived as:

\[
N = \lceil \eta \rceil
\]

An implementation \textbf{may} round \( N \) up to the nearest supported sampling rate. An implementation \textbf{may} use the value of \( N \) as an approximation of \( \eta \).

**Level-of-Detail Operation**

The LOD parameter \( \lambda \) is computed as follows:

\[
\lambda_{\text{base}}(x, y) = \begin{cases} \text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\ \log_2 \left( \frac{\rho_{\text{max}}}{\eta} \right) & \text{otherwise} \end{cases}
\]

\[
\lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias})
\]

\[
\lambda = \begin{cases} \text{lod}_{\text{max}}, & \lambda' > \text{lod}_{\text{max}} \\ \lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\ \text{lod}_{\text{min}}, & \lambda' < \text{lod}_{\text{min}} \\ \text{undefined}, & \text{lod}_{\text{min}} > \text{lod}_{\text{max}} \end{cases}
\]

where:

\[
s\text{ampler.bias} = \text{id{mipLodBias}} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.bias} = \begin{cases} \text{Bias} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}
\]

\[
s\text{ampler.lod}_\text{min} = \text{id{minLod}} \quad \text{(from sampler descriptor)}
\]

\[
\text{shaderOp.lod}_\text{min} = \begin{cases} \text{MinLod} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}
\]

\[
\text{lod}_\text{min} = \max(s\text{ampler.lod}_\text{min}, \text{shaderOp.lod}_\text{min}) \quad \text{(from sampler descriptor)}
\]

\[
\text{lod}_\text{max} = \text{id{maxLod}} \quad \text{(from sampler descriptor)}
\]

and maxSamplerLodBias is the value of the \text{VkPhysicalDeviceLimits} feature \text{id{maxSamplerLodBias}}.
Image Level(s) Selection

The image level(s) \(d, d_{hi}, \text{ and } d_{lo}\) which texels are read from are determined by an image-level parameter \(d_l\), which is computed based on the LOD parameter, as follows:

\[
d_l = \begin{cases} 
\text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\
\text{otherwise}
\end{cases}
\]

where:

\[
d' = \max(\text{level}_\text{base} + \text{clamp}(\lambda, 0, q), \text{minLod}_\text{imageView})
\]

\[
\text{nearest}(d') = \begin{cases} 
[d' + 0.5] - 1, & \text{preferred} \\
[d' + 0.5], & \text{alternative}
\end{cases}
\]

and:

\[
\text{minLod}_\text{imageView} = \begin{cases} 
\text{minLodFloat}_\text{imageView}, & \text{preferred} \\
\text{minLodInteger}_\text{imageView}, & \text{alternative}
\end{cases}
\]

\[
\text{level}_\text{base} = \text{baseMipLevel} \\
q = \text{levelCount} - 1
\]

\text{baseMipLevel} \text{ and } \text{levelCount} \text{ are taken from the subresourceRange of the image view.}

\text{minLod}_\text{imageView} \text{ must be less or equal to } \text{level}_\text{base} + q.

If the sampler's mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST, then the level selected is \(d = d_l\).

If the sampler's mipmapMode is VK_SAMPLER_MIPMAP_MODE_LINEAR, two neighboring levels are selected:

\[
d_{hi} = \lfloor d_l \rfloor \\
d_{lo} = \min(d_{hi} + 1, \text{level}_\text{base} + q) \\
\delta = d_l - d_{hi}
\]

\(\delta\) is the fractional value, quantized to the number of mipmap precision bits, used for linear filtering between levels.

16.5.8. (s,t,r,q,a) to (u,v,w,a) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in filtering (either \(d\), or \(d_{hi}\) and \(d_{lo}\)).
\[ u(x, y) = s(x, y) \times \text{width}_{\text{scale}} + \Delta_i \]
\[ v(x, y) = \begin{cases} 0 & \text{for 1D images} \\ t(x, y) \times \text{height}_{\text{scale}} + \Delta_j & \text{otherwise} \end{cases} \]
\[ w(x, y) = \begin{cases} 0 & \text{for 2D or Cube images} \\ r(x, y) \times \text{depth}_{\text{scale}} + \Delta_k & \text{otherwise} \end{cases} \]
\[ a(x, y) = \begin{cases} a(x, y) & \text{for array images} \\ 0 & \text{otherwise} \end{cases} \]

where:

\[ \text{width}_{\text{scale}} = \text{width}_{\text{level}} \]
\[ \text{height}_{\text{scale}} = \text{height}_{\text{level}} \]
\[ \text{depth}_{\text{scale}} = \text{depth}_{\text{level}} \]

for conventional images, and:

\[ \text{width}_{\text{scale}} = \text{width}_{\text{level}} - 1 \]
\[ \text{height}_{\text{scale}} = \text{height}_{\text{level}} - 1 \]
\[ \text{depth}_{\text{scale}} = \text{depth}_{\text{level}} - 1 \]

for corner-sampled images.

and where \((\Delta_i, \Delta_j, \Delta_k)\) are taken from the image instruction if it includes a \texttt{ConstOffset} or \texttt{Offset} operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

### 16.6. Unnormalized Texel Coordinate Operations

#### 16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:
\[ l = \text{clamp}(RNE(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer} \]

where \text{layerCount} is the number of layers in the image subresource range of the image view, \text{baseArrayLayer} is the first layer from the subresource range, and where:

\[
RNE(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
\lfloor a + 0.5 \rfloor & \text{alternative}
\end{cases}
\]

The sample index \( n \) is assigned the value 0.

Nearest filtering (VK_FILTER_NEAREST) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + \text{shift} \rfloor \\
j = \lfloor v + \text{shift} \rfloor \\
k = \lfloor w + \text{shift} \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

for conventional images, and:

\[
\text{shift} = 0.5
\]

for corner-sampled images.

Linear filtering (VK_FILTER_LINEAR) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \( i_0 \) or \( i_1 \), \( j_0 \) or \( j_1 \), \( k_0 \) or \( k_1 \), as well as weights \( \alpha \), \( \beta \), and \( \gamma \).

\[
i_0 = \lfloor u - \text{shift} \rfloor \\
i_1 = i_0 + 1 \\
j_0 = \lfloor v - \text{shift} \rfloor \\
j_1 = j_0 + 1 \\
k_0 = \lfloor w - \text{shift} \rfloor \\
k_1 = k_0 + 1
\]

\[
\alpha = \text{frac}(u - \text{shift}) \\
\beta = \text{frac}(v - \text{shift}) \\
\gamma = \text{frac}(w - \text{shift})
\]

where:
shift = 0.5

for conventional images, and:

shift = 0.0

for corner-sampled images, and where:

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \text{VkPhysicalDeviceLimits}::\text{subTexelPrecisionBits}.

Cubic filtering (VK_FILTER_CUBIC_EXT) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \(i_0, i_1, i_2\) or \(i_3, j_0, j_1, j_2\) or \(j_3, k_0, k_1, k_2\) or \(k_3\), as well as weights \(\alpha, \beta, \text{ and } \gamma\).

\[
i_0 = \lfloor u - \frac{3}{2} \rfloor \quad i_1 = i_0 + 1 \quad i_2 = i_1 + 1 \quad i_3 = i_2 + 1
\]

\[
j_0 = \lfloor v - \frac{3}{2} \rfloor \quad j_1 = j_0 + 1 \quad j_2 = j_1 + 1 \quad j_3 = j_2 + 1
\]

\[
k_0 = \lfloor w - \frac{3}{2} \rfloor \quad k_1 = k_0 + 1 \quad k_2 = k_1 + 1 \quad k_3 = k_2 + 1
\]

\[
\alpha = \text{frac}\left(u - \frac{1}{2}\right)
\]

\[
\beta = \text{frac}\left(v - \frac{1}{2}\right)
\]

\[
\gamma = \text{frac}\left(w - \frac{1}{2}\right)
\]

where:

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by \text{VkPhysicalDeviceLimits}::\text{subTexelPrecisionBits}.

16.7. Integer Texel Coordinate Operations

Integer texel coordinate operations \textbf{may} supply a LOD which texels are to be read from or written to using the optional SPIR-V operand \textbf{Lod}. If the \textbf{Lod} is provided then it \textbf{must} be an integer.

The image level selected is:
\[ d = level_{base} + \begin{cases} \text{LoD} & \text{from optional SPIR-V operand} \\ 0 & \text{otherwise} \end{cases} \]

If \( d \) does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) or \( d \) is less than \( \text{minLodInteger}_{\text{imageView}} \), then any values fetched are zero if the \text{robustImageAccess2} feature is enabled, otherwise are undefined, and any writes (if supported) are discarded.

### 16.8. Image Sample Operations

#### 16.8.1. Wrapping Operation

If the used sampler was created without \text{VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT}, Cube images ignore the wrap modes specified in the sampler. Instead, if \text{VK_FILTER_NEAREST} is used within a mip level then \text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE} is used, and if \text{VK_FILTER_LINEAR} is used within a mip level then sampling at the edges is performed as described earlier in the Cube map edge handling section.

The first integer texel coordinate \( i \) is transformed based on the \text{addressModeU} parameter of the sampler.

\[
\begin{align*}
i &= \begin{cases} 
    i \mod \text{size} & \text{for repeat} \\
    (\text{size} - 1) - \text{mirror}(i \mod (2 \times \text{size})) - \text{size} & \text{for mirrored repeat} \\
    \text{clamp}(i, 0, \text{size} - 1) & \text{for clamp to edge} \\
    \text{clamp}(i, -1, \text{size}) & \text{for clamp to border} \\
    \text{clamp}(\text{mirror}(i), 0, \text{size} - 1) & \text{for mirror clamp to edge}
\end{cases}
\end{align*}
\]

where:

\[
\text{mirror}(n) = \begin{cases} 
    n & \text{for } n \geq 0 \\
    -(1 + n) & \text{otherwise}
\end{cases}
\]

\( j \) (for 2D and Cube image) and \( k \) (for 3D image) are similarly transformed based on the \text{addressModeV} and \text{addressModeW} parameters of the sampler, respectively.

#### 16.8.2. Texel Gathering

SPIR-V instructions with \text{Gather} in the name return a vector derived from 4 texels in the base level of the image view. The rules for the \text{VK_FILTER_LINEAR} minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to conversion to RGBA and then swizzled. A four-component vector is then assembled by taking the component indicated by the \text{Component} value in the instruction from the swizzled color value of the four texels. If the operation does not use the \text{ConstOffsets} image operand then the four texels form the \( 2 \times 2 \) rectangle used for texture filtering:
If the operation does use the ConstOffsets image operand then the offsets allow a custom filter to be defined:

\[
\tau[R] = \tau_{i0j0}[level base][comp] + \Delta_0[level base][comp]
\]
\[
\tau[G] = \tau_{i0j0}[level base][comp] + \Delta_1[level base][comp]
\]
\[
\tau[B] = \tau_{i0j0}[level base][comp] + \Delta_2[level base][comp]
\]
\[
\tau[A] = \tau_{i0j0}[level base][comp] + \Delta_3[level base][comp]
\]

where:

\[
\tau[level base][comp] = \begin{cases} 
\tau[level base][R], & \text{for } comp = 0 \\
\tau[level base][G], & \text{for } comp = 1 \\
\tau[level base][B], & \text{for } comp = 2 \\
\tau[level base][A], & \text{for } comp = 3 
\end{cases}
\]

**OpImage*Gather** must not be used on a sampled image with sampler **Y'CbCr conversion** enabled.

If \(level base < \text{minLodInteger}_{\text{imageView}}\), then any values fetched are zero if robustImageAccess2 is enabled. Otherwise values are undefined.

### 16.8.3. Texel Filtering

Texel filtering is first performed for each level (either \(d\) or \(d_{hi}\) and \(d_{lo}\)).

If \(\lambda\) is less than or equal to zero, the texture is said to be **magnified**, and the filter mode within a mip level is selected by the **magFilter** in the sampler. If \(\lambda\) is greater than zero, the texture is said to be **minified**, and the filter mode within a mip level is selected by the **minFilter** in the sampler.

**Texel Nearest Filtering**

Within a mip level, **VK_FILTER_NEAREST** filtering selects a single value using the \((i, j, k)\) texel coordinates, with all texels taken from layer \(l\).

\[
\tau[level] = \begin{cases} 
\tau_{ijk}[level], & \text{for 3D image} \\
\tau_{ij}[level], & \text{for 2D or Cube image} \\
\tau_{i}[level], & \text{for 1D image} 
\end{cases}
\]

**Texel Linear Filtering**

Within a mip level, **VK_FILTER_LINEAR** filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D)
texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

\[ \begin{align*}
w_{i_0} &= (1 - \alpha) \\
w_{i_1} &= (\alpha) \\
w_{j_0} &= (1 - \beta) \\
w_{j_1} &= (\beta) \\
w_{k_0} &= (1 - \gamma) \\
w_{k_1} &= (\gamma)
\end{align*} \]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau_{3D} = \sum_{k = k_0}^{k_1} \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_i)(w_j)(w_k)\tau_{ijk}
\]
\[
\tau_{2D} = \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_i)(w_j)\tau_{ij}
\]
\[
\tau_{1D} = \sum_{i = i_0}^{i_1} (w_i)\tau_i
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Cubic Filtering**

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.
The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\begin{align*}
\tau_{3D} &= \sum_{k = j_0}^{k_3} \sum_{j = j_0}^{j_3} \sum_{i = i_0}^{i_3} (w_i)(w_j)(w_k)\tau_{ijk} \\
\tau_{2D} &= \sum_{j = j_0}^{j_3} \sum_{i = i_0}^{i_3} (w_i)(w_j)\tau_{ij} \\
\tau_{1D} &= \sum_{i = i_0}^{i_3} (w_i)\tau_i
\end{align*}
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level, \( \tau = \tau[d] \).

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels (\( \tau[hi] \) and \( \tau[lo] \)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
\begin{align*}
w_{hi} &= (1 - \delta) \\
w_{lo} &= (\delta)
\end{align*}
\]
The values of multiple mipmap levels, together with their weights, are combined to produce a final
filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` control the process by which multiple
texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to
`VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\tau = (w_{hi})\tau[hi] + (w_{lo})\tau[lo]
\]

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image
filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent. Implementations **should**
consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the
anisotropic filtering scheme used. In addition, implementations **should** consider `minLod` and `maxLod`
of the sampler.

The following describes one particular approach to implementing anisotropic filtering for the 2D
Image case, implementations **may** choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of
`VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, \( N \) isotropic samples are sampled within the image footprint of
the image level \( d \) to approximate an anisotropic filter. The sum \( \tau_{2D_{aniso}} \) is defined using the single
isotropic \( \tau_{2D}(u,v) \) at level \( d \).

\[
\begin{align*}
\tau_{2D_{aniso}} &= \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}\left(u\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right), v\left(x - \frac{1}{2} + \frac{i}{N+1}, y\right)\right), & \text{when } \rho_x > \rho_y \\
\tau_{2D_{aniso}} &= \frac{1}{N} \sum_{i=1}^{N} \tau_{2D}\left(u\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right), v\left(x, y - \frac{1}{2} + \frac{i}{N+1}\right)\right), & \text{when } \rho_y \geq \rho_x
\end{align*}
\]

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to
`VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the
reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process
operates on the above values, together with their weights, computing a component-wise minimum or
maximum, respectively, of the components of the values with non-zero weights.

### 16.9. Texel Footprint Evaluation

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level
that would be accessed during a texel filtering operation. In addition to the inputs that would be
accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two
additional inputs. The `Granularity` input is an integer identifying the size of texel groups used to
evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of
texels whose size is given by the following table:

Table 28. Texel footprint granularity values

<table>
<thead>

</tbody>
</table>

The Coarse input is used to select between the two mip levels that may be accessed during texel
filtering when using a mipmapMode of VK_SAMPLER_MIPMAP_MODE_LINEAR. When filtering between two
mip levels, a Coarse value of true requests the footprint in the lower-resolution mip level (higher
level number), while false requests the footprint in the higher-resolution mip level. If texel filtering
would access only a single mip level, the footprint in that level would be returned when Coarse is
set to false; an empty footprint would be returned when Coarse is set to true.

The footprint for OpImageSampleFootprintNV is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only
  a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor
  location. For two-dimensional images, the returned components are in units of eight texel
  groups. For three-dimensional images, the returned components are in units of four texel
  groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative
  to the anchor. All returned components are in units of texel groups.
- The fourth member is a two-component integer vector mask, which holds a bitfield identifying
  the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.
• The fifth member is an integer identifying the mip level containing the footprint identified by the anchor, offset, and mask.

• The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images (\texttt{Dim2D}), the mask returned by \texttt{OpImageSampleFootprintNV} indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy)\) is considered covered if and only if

\[
0 \neq ((mask \cdot x + (mask \cdot y << 32)) \& (1 << (lgy \times 8 + lgx)))
\]

where:

• \(0 \leq lgx < 8\) and \(0 \leq lgy < 8\); and

• \textit{mask} is the returned two-component mask.

The local group with coordinates \((lgx, lgy)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(r_{ij}\) in the returned miplevel where:

\[
\begin{align*}
i_0 &= \begin{cases} 
gran \cdot x \times (8 \times anchor \cdot x + lgx), & \text{if } lgx + offset \cdot x < 8 \\
gran \cdot x \times (8 \times (anchor \cdot x - 1) + lgx), & \text{otherwise}
\end{cases} \\
i_1 &= i_0 + gran \cdot x - 1 \\
j_0 &= \begin{cases} 
gran \cdot y \times (8 \times anchor \cdot y + lgy), & \text{if } lgy + offset \cdot y < 8 \\
gran \cdot y \times (8 \times (anchor \cdot y - 1) + lgy), & \text{otherwise}
\end{cases} \\
j_1 &= j_0 + gran \cdot y - 1
\end{align*}
\]

and

• \(i_0 \leq i \leq i_1\) and \(j_0 \leq j \leq j_1\);

• \textit{gran} is a two-component vector holding the width and height of the texel group identified by the granularity;

• \textit{anchor} is the returned two-component anchor vector; and

• \textit{offset} is the returned two-component offset vector.

For footprints in three-dimensional images (\texttt{Dim3D}), the mask returned by \texttt{OpImageSampleFootprintNV} indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or more texels accessed during texel filtering. In the mask, the texel group with local group coordinates \((lgx, lgy, lgz)\), is considered covered if and only if:

\[
0 \neq ((mask \cdot x + (mask \cdot y << 32)) \& (1 << (lgz \times 16 + lgy \times 4 + lgx)))
\]

where:

• \(0 \leq lgx < 4\), \(0 \leq lgy < 4\), and \(0 \leq lgz < 4\); and

• \textit{mask} is the returned two-component mask.
The local group with coordinates \((l_{gx}, l_{gy}, l_{gz})\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(t_{ijk}\) in the returned mipmap level where:

\[
i_0 = \begin{cases} 
    \text{gran}.x \times (4 \times \text{anchor}.x + l_{gx}), & \text{if} \ l_{gx} + \text{offset}.x < 4 \\
    \text{gran}.x \times (4 \times (\text{anchor}.x - 1) + l_{gx}), & \text{otherwise}
\end{cases}
\]

\[i_1 = i_0 + \text{gran}.x - 1\]

\[
j_0 = \begin{cases} 
    \text{gran}.y \times (4 \times \text{anchor}.y + l_{gy}), & \text{if} \ l_{gy} + \text{offset}.y < 4 \\
    \text{gran}.y \times (4 \times (\text{anchor}.y - 1) + l_{gy}), & \text{otherwise}
\end{cases}
\]

\[j_1 = j_0 + \text{gran}.y - 1\]

\[
k_0 = \begin{cases} 
    \text{gran}.z \times (4 \times \text{anchor}.z + l_{gz}), & \text{if} \ l_{gz} + \text{offset}.z < 4 \\
    \text{gran}.z \times (4 \times (\text{anchor}.z - 1) + l_{gz}), & \text{otherwise}
\end{cases}
\]

\[k_1 = k_0 + \text{gran}.z - 1\]

and

- \(i_0 \leq i \leq i_1, j_0 \leq j \leq j_1, k_0 \leq k \leq k_1\);
- \(\text{gran}\) is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;
- \(\text{anchor}\) is the returned three-component anchor vector; and
- \(\text{offset}\) is the returned three-component offset vector.

If the sampler used by \texttt{OpImageSampleFootprintNV} enables anisotropic texel filtering via \texttt{anisotropyEnable}, it is possible that the set of texel groups accessed in a mipmap level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, \texttt{OpImageSampleFootprintNV} returns an integer granularity value that can be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, \texttt{OpImageSampleFootprintNV} will use the requested granularity as-is and return a granularity value of zero.

\texttt{OpImageSampleFootprintNV} supports only two- and three-dimensional image accesses (\texttt{Dim2D} and \texttt{Dim3D}), and the footprint returned is undefined if a sampler uses an addressing mode other than \texttt{VK_SAMPLER_ADDRESS_MODE.Clamp_TO_EDGE}.

### 16.10. Weight Image Sampling

The SPIR-V instruction \texttt{OpImageWeightedSampleQCOM} specifies a texture sampling operation involving two images: the \textit{sampled image} and the \textit{weight image}. It is similar to bilinear filtering except more than 2x2 texels may participate in the filter and the filter weights are user-specified rather than computed by fixed-function hardware. The weight image view defines a 2D kernel weights used during sampling.

The \texttt{OpImageWeightedSampleQCOM} support normalized or unnormalized texel coordinates. In addition to the inputs that would be accepted by an equivalent \texttt{OpImageSample*} instruction,
OpImageWeightedSampleQCOM accepts a weight input that specifies the view of a sample weight image.

The input weight must be a view of a 2D or 1D image with mipmap levels equal to 1, samples equal to VK_SAMPLE_COUNT_1_BIT, created with an identity swizzle, and created with usage that includes VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM. The VkImageViewSampleWeightCreateInfoQCOM specifies additional parameters of the view: filterCenter, filterSize, and numPhases. described in more detail below.

The weight input must be bound using a sample weight image descriptor type. The weight view defines a filtering kernel that is a region of view's subresource range. The kernel spans a region from integer texel coordinate (0,0) to (filterSize.x-1, filterSize.y-1). It is valid for the view's subresource to have dimensions larger than the kernel but the texels with integer coordinates greater than filterSize.width-1,filterSize.height-1 are ignored by weight sampling. The value returned by queries OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples return for a weight image is undefined.

filterCenter designates an integer texel coordinate within the filter kernel as being the 'center' of the kernel. The center must be in the range (0,0) to (filterSize.x-1, filterSize.y-1). numPhases describes the number of filter phases used to provide sub-pixel filtering. Both are described in more detail below.

16.10.1. Weight Image Layout

The weight image specifies filtering kernel weight values. A 2D image view can be used to specify a 2D matrix of filter weights. For separable filters, a 1D image view can be used to specify the horizontal and vertical weights.

2D Non-Separable Weight Filters

A 2D image view defined with VkImageViewSampleWeightCreateInfoQCOM describes a 2D matrix (filterSize.width × filterSize.height) of weight elements with filter's center point at filterCenter. Note that filterSize can be smaller than the view's subresource, but the filter will always be located starting at integer texel coordinate (0,0).

The following figure illustrates a 2D convolution filter having filterSize of (4,3) and filterCenter at (1, 1).
For a 2D weight filter, the phases are stored as layers of a 2D array image. The width and height of the view’s subresource range must be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension`. The layers are stored in horizontal phase major order. Expressed as a formula, the layer index for each filter phase is computed as:

\[
\text{layerIndex}(\text{horizPhase}, \text{vertPhase}, \text{horizPhaseCount}) = (\text{vertPhase} \times \text{horizPhaseCount}) + \text{horizPhase}
\]

### 1D Separable Weight Filters

A separable weight filter is a 2D filter that can be specified by two 1D filters in the x and y directions such that their product yields the 2D filter. The following example shows a 2D filter and its associated separable 1D horizontal and vertical filters.
A 1D array image view defined with `VkImageViewSampleWeightCreateInfoQCOM` and with `layerCount` equal to '2' describes a separable weight filter. The horizontal weights are specified in slice '0' and the vertical weights in slice '1'. The `filterSize` and `filterCenter` specify the size and origin of the horizontal and vertical filters. For many use cases, 1D separable filters can offer a performance advantage over 2D filters.

For a 1D separable weight filter, the phases are arranged into a 1D array image with two layers. The horizontal weights are stored in layer 0 and the vertical weights in layer 1. Within each layer of the 1D array image, the weights are arranged into groups of 4, and then arranged by phase. Expressed as a formula, the 1D texel offset for each weight within each layer is computed as:

```
// Let horizontal weights have a weightIndex of [0, filterSize.width - 1]
// Let vertical weights have a weightIndex of [0, filterSize.height - 1]
// Let phaseCount be the number of phases in either the vertical or horizontal direction.

texelOffset(phaseIndex, weightIndex, phaseCount) = (phaseCount * 4 * (weightIndex / 4)) + (phaseIndex * 4) + (weightIndex % 4)
```

**16.10.2. Weight Sampling Phases**

When using weight image sampling, the texture coordinates may not align with a texel center in the sampled image. In this case, the filter weights can be adjusted based on the subpixel location. This is termed “subpixel filtering” to indicate that the origin of the filter lies at a subpixel location other than the texel center. Conceptually, this means that the weight filter is positioned such that filter taps do not align with sampled texels exactly. In such a case, modified filter weights may be needed to adjust for the off-center filter taps. Unlike bilinear filtering where the subpixel weights are computed by the implementation, subpixel weight image sampling requires that the per-phase filter weights are pre-computed by the application and stored in an array where each slice of the array is a “filter phase”. The array is indexed by the implementation based on subpixel positioning. Rather than a single 2D kernel of filter weights, the application provides an array of kernels, one set of filter weights per phase.

The number of phases are restricted by following requirements, which apply to both separable and non-separable filters:

- The number of phases in the vertical direction, `phaseCount_vert`, **must** be a power of two (i.e., 1, 2, 4, etc.).
- The number of phases in the horizontal direction `phaseCount_horiz`, **must** equal `phaseCount_vert`.
- The total number of phases, `phaseCount_vert × phaseCount_horiz`, **must** be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases`.

**16.10.3. Weight Sampler Parameters**

Weight sampling requires `VkSamplerCreateInfo addressModeU` and `addressModeV` **must** be set to `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`. If `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER` is used, then the border color **must** be set to transparent.
16.10.4. Weight Sampling Operation

The 2D unnormalized texel coordinates \((u, v)\) are transformed by \(\text{filterCenter}\) to specify coordinates \(i_0, j_0\).

\[
\begin{align*}
i_0 &= |u - \text{filterCenter}_x| \\
j_0 &= |v - \text{filterCenter}_y|
\end{align*}
\]

where \(\text{filterCenter}\) is specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM}::\text{filterCenter}\).

Two sets of neighboring integer 2D texel coordinates are generated. The first set is used for selecting texels from the sampled image \(\tau\) and the second set used for selecting texels from the weight image \(w\). The first set of neighboring coordinates are combinations of \(i_0\) to \(i_{\text{filterWidth} - 1}\) and \(j_0\) to \(j_{\text{filterHeight} - 1}\). The second set of neighboring coordinates are combinations of \(k_0\) to \(k_{\text{filterWidth} - 1}\) and \(l_0\) to \(l_{\text{filterHeight} - 1}\). The first and second sets each contain \((\text{filterWidth} \times \text{filterHeight})\) of pairs of \((i, j)\) and \((k, l)\) coordinates respectively.

\[
\begin{align*}
\{i_q\}_q = \text{filterWidth} - 1 &= i_0 + q \\
\{j_q\}_q = \text{filterHeight} - 1 &= j_0 + q \\
\{k_q\}_q = \text{filterWidth} - 1 &= q \\
\{l_q\}_q = \text{filterHeight} - 1 &= q
\end{align*}
\]

where \(\text{filterWidth}\) and \(\text{filterHeight}\) are specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM}::\text{filterSize}\).

Each of the generated integer coordinates \((i_q, j_q)\) is transformed by texture wrapping operation, followed by integer texel coordinate validation. If any coordinate fails coordinate validation, it is a Border Texel and texel replacement is performed.

The phase index \(\psi\) is computed from the fraction bits of the unnormalized 2D texel coordinates:

\[
\begin{align*}
\text{phaseCount}_h &= \text{phaseCount}_v = \sqrt{\text{numPhases}} \\
hPhase &= |\text{frac}(u) \times \text{phaseCount}_h| \\
vPhase &= |\text{frac}(v) \times \text{phaseCount}_v| \\
\psi &= (vPhase \times \text{phaseCount}_h) + hPhase
\end{align*}
\]

where the number of fraction bits retained is \(\log_2(\text{numPhases})\) specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM}::\text{numPhases}\).

Each pair of texel coordinates \((i, j)\) in the first set selects a single texel value \(\tau_{ij}\) from the sampled image. Each pair of texel coordinates \((k, l)\) in the second set, combined with phaseIndex \(\psi\), selects a
single weight from the weight image \( w(k, l, \psi) \).

\[
w(k, l, \psi) = \begin{cases} 
  w_{k\psi} (\psi as\ layer\ index) & \text{for 2D array view (non-separable filter)} \\
  \text{weight}_h \times \text{weight}_v & \text{for 1D array view (separable filter)}
\end{cases}
\]

If \( w \) is a 2D array view, then non-separable filtering is specified, and integer coordinates \((k, l)\) are used to select texels from layer \( \psi \) of \((w)\). If \( w \) is a 1D array view, then separable filtering is specified and integer coordinates \((k, l)\) are transformed to \((k_{\text{packed}}, l_{\text{packed}})\), and used to select horizontal weight \( \text{weight}_h \) and vertical weight \( \text{weight}_v \) texels from layer 0 and layer 1 of \((w)\) respectively.

\[
\begin{align*}
  k_{\text{packed}} &= (\text{phaseCount}_h \times 4 \times |k/4|) + (h\text{Phase} \times 4) + (k \% 4) \\
  l_{\text{packed}} &= (\text{phaseCount}_v \times 4 \times |l/4|) + (v\text{Phase} \times 4) + (l \% 4)
\end{align*}
\]

\[
\text{weight}_h = w_{k_{\text{packed}}}[0] \quad \text{(horizontal weights packed in layer 0)}
\]

\[
\text{weight}_v = w_{l_{\text{packed}}}[1] \quad \text{(vertical weights packed in layer 1)}
\]

Where \% refers to the integer modulo operator.

The values of multiple texels, together with their weights, are combined to produce a filtered value.

\[
\tau_{\text{weightSampling}} = \sum_{j = j_0}^{j \cdot \text{blockHeight} - 1} \sum_{i = i_0}^{i \cdot \text{blockHeight} - 1} \sum_{k = k_0}^{k \cdot \text{blockWidth} - 1} w(k, l, \psi) \tau_{ij}
\]

When \( \text{VkSamplerReductionModeCreateInfo::reductionMode} \) is set to \( \text{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE} \), the above summation is used. However, if the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), the process operates on the above values, computing a component-wise minimum or maximum of the texels with non-zero weights. If the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), each \( w(k, l, \psi) \) weight must be equal to 0.0 or 1.0, otherwise the undefined values are returned.

Finally, the operations described in Conversion to RGBA and Component swizzle are performed and the final result is returned to the shader.

### 16.11. Block Matching

The SPIR-V instruction \texttt{OpTextureBlockMatchSAD} and \texttt{OpTextureBlockMatchSSD} specify texture block matching operations where a block or region of texels within a target image is compared with a same-sized region a reference image. The instructions make use of two image views: the target view and the reference view. The target view and reference view can be the same view, allowing block matching of two blocks within a single image.

Similar to an equivalent \texttt{OpImageFetch} instruction, \texttt{textureBlockMatchSAD} and \texttt{textureBlockMatchSSD} specify a image and an integer texel coordinate which which describes the bottom-left texel of the target block. There are three additional inputs. The reference and refCoordinate specifies bottom-left
16.11.1. Block Matching Sampler Parameters

The input sampler must be created with addressModeU and addressModeV, equal to
VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER with
VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK. The input sampler must be create with
unnormalizedCoordinates equal to VK_FALSE.

Other sampler states are ignored.

16.11.2. Block Matching Operation

Block matching SPIR-V instructions opTextureBlockMatchSAD and opTextureBlockMatchSSD specify two
sets of 2D integer texel coordinates: target coordinates \((u, v)\) and reference coordinates \((s, t)\).

The coordinates define the bottom-left texel of the target block \((i_0, j_0)\) and the reference block
\((k_0, l_0)\).

\[
\begin{align*}
i_0 &= u \\
j_0 &= v \\
k_0 &= s \\
l_0 &= t
\end{align*}
\]

For the target block, a set of neighboring integer texel coordinates are generated. The neighboring
coordinates are combinations of \(i_0\) to \(i_{blockWidth-1}\) and \(j_0\) to \(j_{blockHeight-1}\). The set is of size
blockWidth \times blockHeight.

\[
\begin{align*}
\{i_q\}_q=0 &= blockWidth - 1 &= i_0 + q \\
\{j_q\}_q=0 &= blockHeight - 1 &= j_0 + q
\end{align*}
\]

where blockWidth and blockHeight is specified by the blockSize operand.

If any target integer texel coordinate \((i, j)\) in the set fails integer texel coordinate validation, then
the texel is an invalid texel and texel replacement is performed.

Similarly for the reference block, a set of neighboring integer texel coordinates are generated.

\[
\begin{align*}
\{k_q\}_q=0 &= blockWidth - 1 &= k_0 + q \\
\{l_q\}_q=0 &= blockHeight - 1 &= l_0 + q
\end{align*}
\]

Each reference texel coordinate \((k, l)\) in the set must not fail integer texel coordinate validation. To
avoid undefined behavior, application shader should guarantee that the reference block is fully
within the bounds of the reference image.

Each pair of texel coordinates \((i, j)\) in the set selects a single texel value from the target image \(t_{ij}\). Each pair of texel coordinates \((k, l)\) in the set selects a single texel value from the reference image \(v_{kl}\).

The difference between target and reference texel values is summed to compute a difference metric. The \texttt{opTextureBlockMatchSAD} computes the sum of absolute differences.

\[
\tau_{SAD} = \sum_{j = j_0}^{j_{blockHeight} - 1} \sum_{i = i_0}^{i_{blockWidth} - 1} |v_{kl} - t_{ij}|
\]

The \texttt{opTextureBlockMatchSSD} computes the sum of the squared differences.

\[
\tau_{SSD} = \sum_{j = j_0}^{j_{blockHeight} - 1} \sum_{i = i_0}^{i_{blockWidth} - 1} |v_{kl} - t_{ij}|^2
\]

When \texttt{VkSamplerReductionModeCreateInfo::reductionMode} is set to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, the above summation is used. However, if the reduction mode is \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX}, the process operates on the above values, computing a component-wise minimum or maximum of \(v_{kl} - t_{ij}\), respectively. For \(\tau_{SAD}\), the minimum or maximum difference is computed and for \(\tau_{SSD}\), the square of the minimum or maximum is computed.

Finally, the operations described in Conversion to RGBA and Component swizzle are performed and the final result is returned to the shader. The component swizzle is specified by the target image descriptor; any swizzle specified by the reference image descriptor is ignored.

### 16.12. Box Filter Sampling

The SPIR-V instruction \texttt{OpImageBoxFilterQCOM} specifies texture box filtering operation where a weighted average of a region of texels is computed, with the weights proportional to the coverage of each of the texels.

In addition to the inputs that would be accepted by an equivalent \texttt{OpImageSample*} instruction, \texttt{OpImageBoxFilterQCOM} accepts one additional input, \texttt{boxSize} which specifies the width and height in texels of the region to be averaged.

The figure below shows an example of using \texttt{OpImageBoxFilterQCOM} to sample from a \(8 \times 4\) texel two-dimensional image, with unnormalized texture coordinates \((4.125, 2.625)\) and \texttt{boxSize} of \((2.75, 2.25)\). The filter will read 12 texel values and compute a weights based portion of of each texel covered by the box.
If boxSize has height and width both equal to 1.0, then this instruction will behave as traditional bilinear filtering. The boxSize parameter must be greater than or equal to 1.0 and must not be greater than VkPhysicalDeviceImageProcessingPropertiesQCOM::maxBoxFilterBlockSize.

16.12.1. Box Filter Sampler Parameters

The input sampler must be created with addressModeU and addressModeV, equal to VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER with VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK.

16.12.2. Box Filter Operation

The 2D unnormalized texel coordinates \((u, v)\) are transformed by boxSize to specify integer texel coordinates \((i_0, j_0)\) of the bottom left texel for the filter.

\[
\begin{align*}
i_0 &= \lfloor u - \frac{box\text{Width}}{2} \rfloor \\
j_0 &= \lfloor v - \frac{box\text{Height}}{2} \rfloor
\end{align*}
\]

where boxWidth and boxHeight are specified by the code:(x,y) components of the boxSize operand.

The filter dimensions \((filter\text{Width} \times filter\text{Height})\) are computed from the fractional portion of the \((u, v)\) coordinates and the boxSize.
\[
\begin{align*}
\text{startFracU} &= \text{frac}\left(u - \frac{\text{boxWidth}}{2}\right) \\
\text{startFracV} &= \text{frac}\left(v - \frac{\text{boxHeight}}{2}\right) \\
\text{endFracU} &= \text{frac}(\text{startFracU} + \text{boxWidth}) \\
\text{endFracV} &= \text{frac}(\text{startFracV} + \text{boxHeight})
\end{align*}
\]

where the number of fraction bits retained by \text{frac}() is specified by \text{VkPhysicalDeviceLimits::subTexelPrecisionBits}.

A set of neighboring integer texel coordinates are generated. The neighboring coordinates are combinations of \(i_0\) to \(i_{\text{filterWidth}-1}\) and \(j_0\) to \(j_{\text{filterHeight}-1}\), with \(i_0, j_0\) being the top-left coordinate of this set. The set is of size \((\text{filterWidth} \times \text{filterHeight})\).

\[
\begin{align*}
\{i_q\}_q = \text{filterWidth} - 1 &= i_0 + q \\
\{j_q\}_q = \text{filterHeight} - 1 &= j_0 + q
\end{align*}
\]

Each of the generated integer coordinates \((i_q, j_q)\) is transformed by texture wrapping operation, followed by integer texel coordinate validation. If any coordinate fails coordinate validation, it is a Border Texel and texel replacement is performed.

Horizontal weights \(\text{horizWeight}_0\) to \(\text{horizWeight}_{\text{boxWidth}-1}\) and vertical weights \(\text{vertWeight}_0\) to \(\text{vertWeight}_{\text{boxHeight}-1}\) are computed. Texels that are fully covered by the box will have a horizontal and vertical weight of 1. Texels partially covered by the box will have will have a reduced weights proportional to the coverage.

\[
\begin{align*}
\text{horizWeight}_i &= \begin{cases} 
(1 - \text{startFracU}), & \text{for } i = 0 \\
(\text{endFracU}), & \text{for } i = \text{filterWidth} - 1 \text{ and } (\text{endFracU}! = 0) \\
(1), & \text{otherwise}
\end{cases} \\
\text{vertWeight}_j &= \begin{cases} 
(1 - \text{startFracV}), & \text{for } j = 0 \\
(\text{endFracV}), & \text{for } j = \text{filterHeight} - 1 \text{ and } (\text{endFracV}! = 0) \\
(1), & \text{otherwise}
\end{cases}
\end{align*}
\]

The values of multiple texels, together with their horizontal and vertical weights, are combined to produce a box filtered value.

\[
\tau_{\text{boxFilter}} = \frac{1}{\text{boxHeight} \times \text{boxWidth}} \sum_{j = j_0}^{\text{filterHeight} - 1} \sum_{i = i_0}^{\text{filterWidth} - 1} (\text{horizWeight}_i)(\text{vertWeight}_j)\tau_{ij}
\]

When \(\text{VkSamplerReductionModeCreateInfo::reductionMode}\) is set to...
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, the above summation is used. However, if the reduction mode is VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX, the process operates on the above values, computing a component-wise minimum or maximum of the texels.

### 16.13. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except OpImageWrite.
- Depth Comparison: Performed by OpImage*Dref instructions.
- All Texel output operations: Performed by OpImageWrite.
- Projection: Performed by all OpImage*Proj instructions.
- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all OpImageSample, OpImageSparseSample, and OpImage*Gather instructions.
- Texel Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.
- Sparse Residency: Performed by all OpImageSparse* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Weight Image Sampling: Performed by OpImageWeightedSample* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Block Matching: Performed by OpImageBlockMatch* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Box Filter Sampling: Performed by OpImageBoxFilter* instructions.

#### 16.14.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is undefined.
16.14.2. Lod Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then (0,0) is returned. Otherwise, the steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection. The return value is the vector \((\lambda', d)\). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
17.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

17.2. Fetch Density Value

Each local framebuffer region at center coordinate \((x, y)\) fetches a texel from the fragment density map.

First, the local framebuffer region center coordinate \((x, y)\) is offset by the value specified in VkSubpassFragmentDensityMapOffsetEndInfoQCOM. If no offset is specified, then the default offset \((0, 0)\) is used. The offsetted coordinate \((x', y')\) is computed as follows:

\[
\begin{align*}
x' &= \text{clamp}(x + p\text{FragmentDensityOffsets[layer]}_x, 0, \text{framebuffer}_\text{width} - 1) \\
y' &= \text{clamp}(y + p\text{FragmentDensityOffsets[layer]}_y, 0, \text{framebuffer}_\text{height} - 1)
\end{align*}
\]

The offsetted coordinate \((x', y')\) fetches a texel from the fragment density map at integer coordinates:

\[
\begin{align*}
i &= \lfloor \frac{x'}{\text{fragmentDensityTexelSize}_\text{width}} \rfloor \\
j &= \lfloor \frac{y'}{\text{fragmentDensityTexelSize}_\text{height}} \rfloor
\end{align*}
\]

Where the size of each region in the framebuffer is:

\[
\text{fragmentDensityTexelSize}_\text{width} = 2^{\lfloor \log_2(\text{framebuffer}_\text{width}) \rfloor}
\]
This region is subject to the limits in `VkPhysicalDeviceFragmentDensityMapPropertiesEXT` and therefore the final region size is clamped:

\[
\text{fragmentDensityTexelSize}_\text{height} = 2^{\left[\log_2\left(\frac{\text{framebufferHeight}}{\text{FragmentDensityMapHeight}}\right)\right]}
\]

When multiview is enabled for the render pass and the fragment density map attachment view was created with `layerCount` greater than 1, the layer used for offsets and for fetching from the fragment density map is:

\[
\text{layer} = \text{baseArrayLayer} + \text{ViewIndex}
\]

Otherwise:

\[
\text{layer} = \text{baseArrayLayer}
\]

The texel fetched from the density map at \((i,j,\text{layer})\) is next converted to density with the following operations.

### 17.2.1. Component Swizzle

The `components` member of `VkImageViewCreateInfo` is applied to the fetched texel as defined in Image component swizzle.

### 17.2.2. Component Mapping

The swizzled texel’s components are mapped to a density value:

\[
\text{densityValue}_{xy} = (C^r, C^g)
\]

### 17.3. Fragment Area Conversion

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than 0.0. Otherwise, the fetched fragment area for that region is derived as:

\[
\text{fragmentArea}_{wh} = \frac{1.0}{\text{densityValue}_{xy}}
\]
### 17.3.1. Fragment Area Filter

 Optionally, the implementation may fetch additional density map texels in an implementation defined window around \((i,j)\). The texels follow the standard conversion steps up to and including fragment area conversion.

A single fetched fragment area for the framebuffer region is chosen by the implementation and must have an area between the \(min\) and \(max\) areas of the fetched set.

### 17.3.2. Fragment Area Clamp

The implementation may clamp the fetched fragment area to one that it supports. The clamped fragment area must have a size less than or equal to the original fetched value. Implementations may vary the supported set of fragment areas per framebuffer region. Fragment area \((1,1)\) must always be in the supported set.

**Note**

For example, if the fetched fragment area is \((1,4)\) but the implementation only supports areas of \{(1,1),(2,2)\}, it could choose to clamp the area to \((2,2)\) since it has the same size as \((1,4)\). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.
Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Bitstream Queries, and Timestamp Queries. Performance Queries are supported if the associated extension is available. Transform Feedback Queries are supported if the associated extension is available. Intel performance queries are supported if the associated extension is available. Mesh Shader Queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

18.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool(
    VkDevice device,
    const VkQueryPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkQueryPool* pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pQueryPool` is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.

Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter

1262
device must be a valid VkDevice handle

• VUID-vkCreateQueryPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkQueryPoolCreateInfo structure

• VUID-vkCreateQueryPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateQueryPool-pQueryPool-parameter
  pQueryPool must be a valid pointer to a VkQueryPool handle

Return Codes

Success
  • VK_SUCCESS

Failure
  • VK_ERROR_OUT_OF_HOST_MEMORY
  • VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkQueryPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• flags is reserved for future use.

• queryType is a VkQueryType value specifying the type of queries managed by the pool.

• queryCount is the number of queries managed by the pool.

• pipelineStatistics is a bitmask of VkQueryPipelineStatisticFlagBits specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

pipelineStatistics is ignored if queryType is not VK_QUERY_TYPE_PIPELINE_STATISTICS.
Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
  If the pipelineStatisticsQuery feature is not enabled, queryType must not be VK_QUERY_TYPE_PIPELINE_STATISTICS

- VUID-VkQueryPoolCreateInfo-meshShaderQueries-07068
  If the meshShaderQueries feature is not enabled, queryType must not be VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT

- VUID-VkQueryPoolCreateInfo-meshShaderQueries-07069
  If the meshShaderQueries feature is not enabled, and queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must not contain VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT or VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT

- VUID-VkQueryPoolCreateInfo-queryType-00792
  If queryType is VK_QUERY_TYPE_PIPELINE_STATISTICS, pipelineStatistics must be a valid combination of VkQueryPipelineStatisticFlagBits values

- VUID-VkQueryPoolCreateInfo-queryType-03222
  If queryType is VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the pNext chain must include a VkQueryPoolPerformanceCreateInfoKHR structure

- VUID-VkQueryPoolCreateInfo-queryCount-02763
  queryCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO

- VUID-VkQueryPoolCreateInfo-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkQueryPoolPerformanceCreateInfoKHR, VkQueryPoolPerformanceQueryCreateInfoINTEL, VkVideoDecodeH264ProfileInfoEXT, VkVideoDecodeH265ProfileInfoEXT, VkVideoEncodeH264ProfileInfoEXT, or VkVideoProfileInfoKHR

- VUID-VkQueryPoolCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  flags must be 0

- VUID-VkQueryPoolCreateInfo-queryType-parameter
  queryType must be a valid VkQueryType value

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;
VkQueryPoolCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The VkQueryPoolPerformanceCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t queueFamilyIndex;
    uint32_t counterIndexCount;
    const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **queueFamilyIndex** is the queue family index to create this performance query pool for.
- **counterIndexCount** is the length of the **pCounterIndices** array.
- **pCounterIndices** is a pointer to an array of indices into the `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters` to enable in this performance query pool.

### Valid Usage

- VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236
  - `queueFamilyIndex` must be a valid queue family index of the device.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237
  - The `performanceCounterQueryPools` feature must be enabled.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321
  - Each element of **pCounterIndices** must be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in `queueFamilyIndex`.

### Valid Usage (Implicit)

- VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter
  - `pCounterIndices` must be a valid pointer to an array of `counterIndexCount uint32_t` values.

- VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength
  - `counterIndexCount` must be greater than 0.

To query the number of passes required to query a performance query pool on a physical device,
call:

```c
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
    uint32_t* pNumPasses);
```

- `physicalDevice` is the handle to the physical device whose queue family performance query counter properties will be queried.
- `pPerformanceQueryCreateInfo` is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.
- `pNumPasses` is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` **must** be a queue family of `physicalDevice`. The number of passes required to capture the counters specified in the `pPerformanceQueryCreateInfo` member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in `pNumPasses`.

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter` physicalDevice **must** be a valid `VkPhysicalDevice` handle
- `VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter` `pPerformanceQueryCreateInfo` **must** be a valid pointer to a valid `VkQueryPoolPerformanceCreateInfoKHR` structure
- `VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter` `pNumPasses` **must** be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the query pool.
- `queryPool` is the query pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to `queryPool` must have completed execution.

- VUID-vkDestroyQueryPool-queryPool-00794
  If `VkAllocationCallbacks` were provided when `queryPool` was created, a compatible set of callbacks must be provided here.

- VUID-vkDestroyQueryPool-queryPool-00795
  If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator` must be `NULL`.

Note

Applications can verify that `queryPool` can be destroyed by checking that `vkGetQueryPoolResults()` without the `VK_QUERY_RESULT_PARTIAL_BIT` flag returns `VK_SUCCESS` for all queries that are used in command buffers submitted for execution.

Valid Usage (Implicit)

- VUID-vkDestroyQueryPool-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkDestroyQueryPool-queryPool-parameter
  If `queryPool` is not `VK_NULL_HANDLE`, `queryPool` must be a valid `VkQueryPool` handle.

- VUID-vkDestroyQueryPool-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroyQueryPool-queryPool-parent
  If `queryPool` is a valid handle, it must have been created, allocated, or retrieved from `device`.

Host Synchronization

- Host access to `queryPool` must be externally synchronized.

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
};```
• **VK_QUERY_TYPE_OCCLUSION** specifies an occlusion query.

• **VK_QUERY_TYPE_PIPELINE_STATISTICS** specifies a pipeline statistics query.

• **VK_QUERY_TYPE_TIMESTAMP** specifies a timestamp query.

• **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** specifies a performance query.

• **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** specifies a transform feedback query.

• **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT** specifies a primitives generated query.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR** specifies a acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR** specifies a serialization acceleration structure size query.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR** specifies an acceleration structure size query for use with vkCmdWriteAccelerationStructuresPropertiesKHR or vkWriteAccelerationStructuresPropertiesKHR.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR** specifies a
• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV** specifies an acceleration structure size query for use with `vkCmdWriteAccelerationStructuresPropertiesNV`.

• **VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL** specifies an Intel performance query.

• **VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR** specifies a result status query.

• **VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR** specifies a video encode bitstream range query.

• **VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT** specifies a generated mesh primitives query.

### 18.2. Query Operation

The operation of queries is controlled by the commands `vkCmdBeginQuery`, `vkCmdEndQuery`, `vkCmdBeginQueryIndexedEXT`, `vkCmdEndQueryIndexedEXT`, `vkCmdResetQueryPool`, `vkCmdCopyQueryPoolResults`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp`.

In order for a `VkCommandBuffer` to record query management commands, the queue family for which its `VkCommandPool` was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either unavailable or available, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via `vkCmdResetQueryPool` or `vkResetQueryPool` sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, or `vkCmdWriteTimestamp`. Both the availability status and numerical results can be retrieved by calling either `vkGetQueryPoolResults` or `vkCmdCopyQueryPoolResults`.

After query pool creation, each query must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to `vkCmdBeginQuery` must execute the corresponding `vkCmdEndQuery` command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the handle of the query pool managing the queries being reset.
• `firstQuery` is the initial query index to reset.
• `queryCount` is the number of queries to reset.

When executed on a queue, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable.

This command defines an execution dependency between other query commands that reference the same query.

The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur earlier in submission order.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable for each pass of `queryPool` as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Note**
Because `vkCmdResetQueryPool` resets all the passes of the indicated queries, applications must not record a `vkCmdResetQueryPool` command for a `queryPool` created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` in a command buffer that needs to be submitted multiple times as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`. Otherwise applications will never be able to complete the recorded queries.

**Valid Usage**

- **VUID-vkCmdResetQueryPool-firstQuery-00796**
  `firstQuery` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-firstQuery-00797**
  The sum of `firstQuery` and `queryCount` **must** be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-None-02841**
  All queries used by the command **must** not be active

- **VUID-vkCmdResetQueryPool-firstQuery-02862**
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries `[firstQuery, firstQuery + queryCount - 1]`
Valid Usage (Implicit)

- VUID-vkCmdResetQueryPool-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdResetQueryPool-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdResetQueryPool-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdResetQueryPool-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdResetQueryPool-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdResetQueryPool-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdResetQueryPool-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>

</tbody>
</table>

To reset a range of queries in a query pool on the host, call:

```c
// Provided by VK_VERSION_1_2
void vkResetQueryPool(
  VkDevice device,
  VkQueryPool queryPool,
  uint32_t firstQuery,
```

1271
or the equivalent command

```c
// Provided by VK_EXT_host_query_reset
void vkResetQueryPoolEXT(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- **device** is the logical device that owns the query pool.
- **queryPool** is the handle of the query pool managing the queries being reset.
- **firstQuery** is the initial query index to reset.
- **queryCount** is the number of queries to reset.

This command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable.

If **queryPool** is **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** this command sets the status of query indices \([firstQuery, firstQuery + queryCount - 1]\) to unavailable for each pass.

### Valid Usage

- **VUID-vkResetQueryPool-None-02665**
  The **hostQueryReset** feature must be enabled

- **VUID-vkResetQueryPool-firstQuery-02666**
  **firstQuery** must be less than the number of queries in **queryPool**

- **VUID-vkResetQueryPool-firstQuery-02667**
  The sum of **firstQuery** and **queryCount** must be less than or equal to the number of queries in **queryPool**

- **VUID-vkResetQueryPool-firstQuery-02741**
  Submitted commands that refer to the range specified by **firstQuery** and **queryCount** in **queryPool** must have completed execution

- **VUID-vkResetQueryPool-firstQuery-02742**
  The range of queries specified by **firstQuery** and **queryCount** in **queryPool** must not be in use by calls to **vkGetQueryPoolResults** or **vkResetQueryPool** in other threads

### Valid Usage (Implicit)

- **VUID-vkResetQueryPool-device-parameter**
  **device** must be a valid **VkDevice** handle

- **VUID-vkResetQueryPool-queryPool-parameter**

1272
queryPool must be a valid VkQueryPool handle

- VUID-vkResetQueryPool-queryPool-parent
queryPool must have been created, allocated, or retrieved from device

Once queries are reset and ready for use, query commands can be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a vkCmdBeginQuery command and a vkCmdEndQuery command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query must begin and end in the same command buffer, although if it is a primary command buffer, and the inheritedQueries feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it must set the occlusionQueryEnable, queryFlags, and/or pipelineStatistics members of VkCommandBufferInheritanceInfo to conservative values, as described in the Command Buffer Recording section. A query must either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at query) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view's results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries must accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering must not span subpasses, i.e. they must begin and end in the same subpass.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags);
```

- commandBuffer is the command buffer into which this command will be recorded.
- queryPool is the query pool that will manage the results of the query.
- query is the query index within the query pool that will contain the results.
- flags is a bitmask of VkQueryControlFlagBits specifying constraints on the types of queries that can be performed.
If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation **must** return a result that matches the actual number of samples passed. This is described in more detail in [Occlusion Queries](#).

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the `index` parameter set to zero.

After beginning a query, that query is considered **active** within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

This command defines an execution dependency between other query commands that reference the same query.

The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in **submission order**.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in **submission order**.

The operation of this command happens after the first scope and happens before the second scope.

---

**Valid Usage**

- **VUID-vkCmdBeginQuery-None-00807**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdBeginQuery-queryType-02804**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQuery-queryType-04728**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIALIZATION_SIZE_KHR`

- **VUID-vkCmdBeginQuery-queryType-06741**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIALIZATION_BOTTOM_LEVEL_POINTERS_KHR`

- **VUID-vkCmdBeginQuery-queryType-04729**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV`

- **VUID-vkCmdBeginQuery-queryType-00800**
  If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, `flags` **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- **VUID-vkCmdBeginQuery-query-00802**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-00803**
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_OCCLUSION`, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginQuery-queryType-00804**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginQuery-queryType-00805**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from must support compute operations

- **VUID-vkCmdBeginQuery-commandBuffer-01885**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdBeginQuery-queryType-00808**
  If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-04862**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR` the `VkCommandPool` that `commandBuffer` was allocated from must support video encode operations

- **VUID-vkCmdBeginQuery-queryPool-01922**
  `queryPool` must have been created with a `queryType` that differs from that of any queries that are active within `commandBuffer`

- **VUID-vkCmdBeginQuery-queryType-07070**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT` the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdBeginQuery-queryType-02327**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` must be supported

- **VUID-vkCmdBeginQuery-queryType-02328**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `primitivesGeneratedQuery` must be enabled

- **VUID-vkCmdBeginQuery-queryPool-07289**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the
VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex queryPool was created with must equal the queue family index of the VkCommandPool that commandBuffer was allocated from

- VUID-vkCmdBeginQuery-queryPool-03223
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the profiling lock must have been held before vkBeginCommandBuffer was called on commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03224
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the query begin must be the first recorded command in commandBuffer

- VUID-vkCmdBeginQuery-queryPool-03225
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the begin command must not be recorded within a render pass instance

- VUID-vkCmdBeginQuery-queryPool-03226
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and another query pool with a queryType VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR has been used within commandBuffer, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as commandBuffer, the performanceCounterMultipleQueryPools feature must be enabled

- VUID-vkCmdBeginQuery-None-02863
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a vkCmdResetQueryPool command affecting the same query

Valid Usage (Implicit)

- VUID-vkCmdBeginQuery-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBeginQuery-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdBeginQuery-flags-parameter
  flags must be a valid combination of VkQueryControlFlagBits values

- VUID-vkCmdBeginQuery-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdBeginQuery-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, decode, or encode operations

- VUID-vkCmdBeginQuery-commonparent

1276
Both of `commandBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>

To begin an indexed query, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,  // Provided by VK_EXT_transform_feedback
    VkQueryPool queryPool,          // Provided by VK_EXT_transform_feedback
    uint32_t query,                 // Provided by VK_EXT_transform_feedback
    VkQueryControlFlags flags,      // Provided by VK_EXT_transform_feedback
    uint32_t index);                // Provided by VK_EXT_transform_feedback
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
- `index` is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` or `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.
The first synchronization scope includes all commands which reference the queries in queryPool indicated by query and index that occur earlier in submission order.

The second synchronization scope includes all commands which reference the queries in queryPool indicated by query and index that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

Valid Usage

- VUID-vkCmdBeginQueryIndexedEXT-None-00807
  All queries used by the command must be unavailable

- VUID-vkCmdBeginQueryIndexedEXT-queryType-02804
  The queryType used to create queryPool must not be VK_QUERY_TYPE_TIMESTAMP

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04728
  The queryType used to create queryPool must not be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR or VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR

- VUID-vkCmdBeginQueryIndexedEXT-queryType-06741
  The queryType used to create queryPool must not be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR or VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04729
  The queryType used to create queryPool must not be VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00800
  If the occlusionQueryPrecise feature is not enabled, or the queryType used to create queryPool was not VK_QUERY_TYPE_OCCLUSION, flags must not contain VK_QUERY_CONTROL_PRECISE_BIT

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00802
  query must be less than the number of queries in queryPool

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00803
  If the queryType used to create queryPool was VK_QUERY_TYPE_OCCLUSION, the VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00804
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any of the pipelineStatistics indicate graphics operations, the VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00805
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any of the pipelineStatistics indicate compute operations, the VkCommandPool that commandBuffer was allocated from must support compute operations

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-01885
  commandBuffer must not be a protected command buffer
If called within a render pass instance, the sum of query and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in queryPool.

If the queryType used to create queryPool was VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR, the VkCommandPool that commandBuffer was allocated from must support video encode operations.

If the queryPool was created with the same queryType as that of another active query within commandBuffer, then index must not match the index used for the active query.

If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

If the queryType used to create queryPool was VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, the VkCommandPool that commandBuffer was allocated from must support graphics operations.

If the queryType used to create queryPool was VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT and the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled, the index parameter must be zero.

If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT and not VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, the index must be zero.

If the queryType used to create queryPool was VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT and primitivesGeneratedQuery must be enabled.

If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT then VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries must be supported.

The queryType used to create queryPool must not be
VK_QUERY_TYPE_MESH_PRIMITIVES_GENERATED_EXT

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-07289
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then the `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` of `queryPool` was created with **must** equal the queue family index of the `VkCommandPool` that `commandBuffer` was allocated from.

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03223
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03224
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock **must** have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03225
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin **must** be the first recorded command in `commandBuffer`.

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-03226
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the ` performanceCounterMultipleQueryPools` feature **must** be enabled.

- VUID-vkCmdBeginQueryIndexedEXT-None-02863
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command **must** not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query.

---

**Valid Usage (Implicit)**

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter
  `queryPool` **must** be a valid `VkQueryPool` handle.

- VUID-vkCmdBeginQueryIndexedEXT-flags-parameter
  `flags` **must** be a valid combination of `VkQueryControlFlagBits` values.

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state.
- **VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- **VUID-vkCmdBeginQueryIndexedEXT-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdBeginQueryIndexedEXT-commonparent**
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.

---

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

---

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
<td>State</td>
</tr>
</tbody>
</table>

Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;
```

- **VK_QUERY_CONTROL_PRECISE_BIT** specifies the precision of occlusion queries.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;
```

`VkQueryControlFlags` is a bitmask type for setting a mask of zero or more `VkQueryControlFlagBits`.

To end a query after the set of desired drawing or dispatching commands is executed, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
```
VkQueryPool

uint32_t

queryPool,

query});

• commandBuffer is the command buffer into which this command will be recorded.
• queryPool is the query pool that is managing the results of the query.
• query is the query index within the query pool where the result is stored.

The command completes the query in queryPool identified by query, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

Calling vkCmdEndQuery is equivalent to calling vkCmdEndQueryIndexedEXT with the index parameter set to zero.

Valid Usage

• VUID-vkCmdEndQuery-None-01923
  All queries used by the command must be active

• VUID-vkCmdEndQuery-query-00810
  query must be less than the number of queries in queryPool

• VUID-vkCmdEndQuery-commandBuffer-01886
  commandBuffer must not be a protected command buffer

• VUID-vkCmdEndQuery-query-00812
  If vkCmdEndQuery is called within a render pass instance, the sum of query and the number of bits set in the current subpass’s view mask must be less than or equal to the number of queries in queryPool

• VUID-vkCmdEndQuery-queryPool-03227
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one or more of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR, the vkCmdEndQuery must be the last recorded command in commandBuffer

• VUID-vkCmdEndQuery-queryPool-03228
  If queryPool was created with a queryType of VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR and one or more of the counters used to create queryPool was VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR, the vkCmdEndQuery must not be recorded within a render pass instance

• VUID-vkCmdBeginQueryIndexedEXT-None-07007
  If called within a subpass of a render pass instance, the corresponding vkCmdBeginQuery* command must have been called previously within the same subpass
If called outside of a render pass instance, the corresponding \texttt{vkCmdBeginQuery} command must have been called outside of a render pass instance.

### Valid Usage (Implicit)

- \textbf{VUID-vkCmdEndQuery-commandBuffer-parameter}
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle
- \textbf{VUID-vkCmdEndQuery-queryPool-parameter}
  \texttt{queryPool} must be a valid \texttt{VkQueryPool} handle
- \textbf{VUID-vkCmdEndQuery-commandBuffer-recording}
  \texttt{commandBuffer} must be in the recording state
- \textbf{VUID-vkCmdEndQuery-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics, compute, decode, or encode operations
- \textbf{VUID-vkCmdEndQuery-commonparent}
  Both of \texttt{commandBuffer}, and \texttt{queryPool} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

To end an indexed query after the set of desired drawing or dispatching commands is recorded, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t index);
```
uint32_t query,  
uint32_t index);

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool that is managing the results of the query.
- **query** is the query index within the query pool where the result is stored.
- **index** is the query type specific index.

The command completes the query in **queryPool** identified by **query** and **index**, and marks it as available.

The **vkCmdEndQueryIndexedEXT** command operates the same as the **vkCmdEndQuery** command, except that it also accepts a query type specific **index** parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first **synchronization scope** includes all commands which reference the queries in **queryPool** indicated by **query** that occur earlier in submission order.

The second **synchronization scope** includes only the operation of this command.

### Valid Usage

- VUID-vkCmdEndQueryIndexedEXT-None-02342
  All queries used by the command **must** be active

- VUID-vkCmdEndQueryIndexedEXT-query-02343
  query **must** be less than the number of queries in **queryPool**

- VUID-vkCmdEndQueryIndexedEXT-commandBuffer-02344
  commandBuffer **must** not be a protected command buffer

- VUID-vkCmdEndQueryIndexedEXT-query-02345
  If **vkCmdEndQueryIndexedEXT** is called within a render pass instance, the sum of query and the number of bits set in the current subpass’s view mask **must** be less than or equal to the number of queries in **queryPool**

- VUID-vkCmdEndQueryIndexedEXT-queryType-06694
  If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** or **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT**, the **index** parameter **must** be less than **VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams**

- VUID-vkCmdEndQueryIndexedEXT-queryType-06695
  If the **queryType** used to create **queryPool** was not **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** and not **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT**, the **index** **must** be zero

- VUID-vkCmdEndQueryIndexedEXT-queryType-06696
  If the **queryType** used to create **queryPool** was **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** or **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT**, **index** **must** equal the **index** used to begin the...
• VUID-vkCmdBeginQueryIndexedEXT-None-07007
  If called within a subpass of a render pass instance, the corresponding `vkCmdBeginQuery` command must have been called previously within the same subpass

• VUID-vkCmdBeginQueryIndexedEXT-None-07008
  If called outside of a render pass instance, the corresponding `vkCmdBeginQuery` command must have been called outside of a render pass instance

Valid Usage (Implicit)

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

• VUID-vkCmdEndQueryIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdEndQueryIndexedEXT-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

</tbody>
</table>

An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is
defined as follows:

- The first query’s result is written starting at the first byte requested by the command, and each subsequent query’s result begins \texttt{stride} bytes later.

- Occlusion queries, pipeline statistics queries, transform feedback queries, primitives generated queries, mesh shader queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.

- Performance queries store results in a tightly packed array whose type is determined by the \texttt{unit} member of the corresponding \texttt{VkPerformanceCounterKHR}.

- If \texttt{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} is used, the final element of each query’s result is an integer indicating whether the query’s result is available, with any non-zero value indicating that it is available.

- If \texttt{VK_QUERY_RESULT_WITH_STATUS_BIT_KHR} is used, the final element of each query’s result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the \texttt{VkQueryResultStatusKHR} enumeration.

- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the \texttt{pipelineStatistics} when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one \texttt{VkPerformanceCounterResultKHR} value for each \texttt{VkPerformanceCounterKHR} in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the transform feedback buffers associated with that vertex stream were large enough. Primitives generated queries write the number of primitives output to the vertex stream, regardless of whether transform feedback is active or not, or whether they were successfully captured by transform feedback or not. This is identical to the second integer of the transform feedback queries if transform feedback is active. Mesh shader queries write a single integer.

- If more than one query is retrieved and \texttt{stride} is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
);```

1286
VkDeviceSize  stride,
VkQueryResultFlags  flags);  

- **device** is the logical device that owns the query pool.
- **queryPool** is the query pool managing the queries containing the desired results.
- **firstQuery** is the initial query index.
- **queryCount** is the number of queries to read.
- **dataSize** is the size in bytes of the buffer pointed to by **pData**.
- **pData** is a pointer to a user-allocated buffer where the results will be written.
- **stride** is the stride in bytes between results for individual queries within **pData**.
- **flags** is a bitmask of **VkQueryResultFlagBits** specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

If no bits are set in **flags**, and all requested queries are in the available state, results are written as an array of 32-bit unsigned integer values. Behavior when not all queries are available is described below.

If **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** is set, results for all queries in **queryPool** identified by **firstQuery** and **queryCount** are copied to **pData**, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** is set, results for all queries in **queryPool** identified by **firstQuery** and **queryCount** are copied to **pData**, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

**VkQueryResultStatusKHR** defines specific meaning for values returned here, though implementations are free to return other values.

Results for any available query written by this command are final and represent the final result of the query. If **VK_QUERY_RESULT_PARTIAL_BIT** is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If **VK_QUERY_RESULT_64_BIT** is set, results and availability or status values for all queries are written as an array of 64-bit values. If the **queryPool** was created with **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR**, results for each query are written as an array of the type indicated by **VkPerformanceCounterKHR::storage** for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query’s value overflows the result type, the value may either wrap or saturate. If a signed integer query’s value overflows the result type, the value is undefined. If a floating point query’s value is not representable as the result type, the
value is undefined.

If `VK_QUERY_RESULT_WAIT_BIT` is set, this command defines an execution dependency with any earlier commands that writes one of the identified queries. The first synchronization scope includes all instances of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, and `vkCmdWriteTimestamp` that reference any query in `queryPool` indicated by `firstQuery` and `queryCount`. The second synchronization scope includes the host operations of this command.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` may return `VK_NOT_READY` if there are queries in the unavailable state.

Note
Applications must take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit has the desired effect.

For example, if a query has been used previously and a command buffer records the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that query, then the query will remain in the available state until `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command executes on a queue. Applications can use fences or events to ensure that a query has already been reset before checking for its results or availability status. Otherwise, a stale value could be returned from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability status may reflect the result of a previous use of the query unless `vkResetQueryPool` is called or the `vkCmdResetQueryPool` command has been executed since the last use of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

Note
Applications can double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

Valid Usage

- `VUID-vkGetQueryPoolResults-firstQuery-00813`
  firstQuery must be less than the number of queries in `queryPool`

- `VUID-vkGetQueryPoolResults-flags-02828`
  If `VK_QUERY_RESULT_64_BIT` is not set in `flags` and the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then `pData` and `stride` must be multiples of 4

- `VUID-vkGetQueryPoolResults-flags-00815`
  If `VK_QUERY_RESULT_64_BIT` is set in `flags` then `pData` and `stride` must be multiples of 8

- `VUID-vkGetQueryPoolResults-queryType-03229`
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, then
pData and stride must be multiples of the size of VkPerformanceCounterResultKHR

- VUID-vkGetQueryPoolResults-queryType-04519
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then stride must be large enough to contain VkQueryPoolPerformanceCreateInfoKHR::counterIndexCount used to create queryPool times the size of VkPerformanceCounterResultKHR

- VUID-vkGetQueryPoolResults-firstQuery-00816
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkGetQueryPoolResults-dataSize-00817
  dataSize must be large enough to contain the result of each query, as described here

- VUID-vkGetQueryPoolResults-queryType-00818
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- VUID-vkGetQueryPoolResults-queryType-03230
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_PARTIAL_BIT or VK_QUERY_RESULT_64_BIT

- VUID-vkGetQueryPoolResults-queryType-03231
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkGetQueryPoolResults-queryType-04810
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

- VUID-vkGetQueryPoolResults-flags-04811
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

- VUID-vkGetQueryPoolResults-queryType-06900
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

Valid Usage (Implicit)

- VUID-vkGetQueryPoolResults-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetQueryPoolResults-queryPool-parameter
queryPool must be a valid VkQueryPool handle

- VUID-vkGetQueryPoolResults-pData-parameter
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkGetQueryPoolResults-flags-parameter
flags must be a valid combination of VkQueryResultFlagBits values
• VUID-vkGetQueryPoolResults-dataSize-arraylength
dataSize must be greater than 0

• VUID-vkGetQueryPoolResults-queryPool-parent
queryPool must have been created, allocated, or retrieved from device

---

## Return Codes

**Success**

- VK_SUCCESS
- VK_NOT_READY

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

---

Bits which can be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
    #endif
} VkQueryResultFlagBits;
```

- **VK_QUERY_RESULT_64_BIT** specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.

- **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query’s status to become available before retrieving its results.

- **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.

- **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.

- **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a `VkQueryResultStatusKHR` value. See result status query for information on how an application can determine whether the use of this flag bit is supported.

---

1290
typedef VkFlags VkQueryResultFlags;

VkQueryResultFlags is a bitmask type for setting a mask of zero or more VkQueryResultFlagBits.

Specific status codes that can be returned from a query are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
} VkQueryResultStatusKHR;
```

- **VK_QUERY_RESULT_STATUS_NOT_READY_KHR** specifies that the query result is not yet available.
- **VK_QUERY_RESULT_STATUS_ERROR_KHR** specifies that operations did not complete successfully.
- **VK_QUERY_RESULT_STATUS_COMPLETE_KHR** specifies that operations completed successfully and the query result is available.

To copy query statuses and numerical results directly to buffer memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer, 
    VkQueryPool queryPool, 
    uint32_t firstQuery, 
    uint32_t queryCount, 
    VkBuffer dstBuffer, 
    VkDeviceSize dstOffset, 
    VkDeviceSize stride, 
    VkQueryResultFlags flags);
```

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool managing the queries containing the desired results.
- **firstQuery** is the initial query index.
- **queryCount** is the number of queries. **firstQuery** and **queryCount** together define a range of queries.
- **dstBuffer** is a VkBuffer object that will receive the results of the copy command.
- **dstOffset** is an offset into **dstBuffer**.
- **stride** is the stride in bytes between results for individual queries within **dstBuffer**. The required size of the backing memory for **dstBuffer** is determined as described above for vkGetQueryPoolResults.
- **flags** is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.
Any results written for a query are written according to a layout dependent on the query type.

Results for any query in `queryPool` identified by `firstQuery` and `queryCount` that is available are copied to `dstBuffer`.

If `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `dstBuffer`, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` is set, results for all queries in `queryPool` identified by `firstQuery` and `queryCount` are copied to `dstBuffer`, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

`VkQueryResultStatusKHR` defines specific meaning for values returned here, though implementations are free to return other values.

Results for any available query written by this command are final and represent the final result of the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and availability or status values for all queries are written as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR::storage` for the counter being queried. Otherwise, results and availability or status values are written as an array of 32-bit values. If an unsigned integer query’s value overflows the result type, the value may either wrap or saturate. If a signed integer query’s value overflows the result type, the value is undefined. If a floating point query’s value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order. If `flags` does not include `VK_QUERY_RESULT_WAIT_BIT`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, `vkCmdEndQuery`, and `vkCmdWriteTimestamp` are excluded from this scope.

The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

`vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory must be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT`.
before using the results.

**Valid Usage**

- VUID-vkCmdCopyQueryPoolResults-dstOffset-00819
dstOffset must be less than the size of dstBuffer

- VUID-vkCmdCopyQueryPoolResults-firstQuery-00820
firstQuery must be less than the number of queries in queryPool

- VUID-vkCmdCopyQueryPoolResults-firstQuery-00821
The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- VUID-vkCmdCopyQueryPoolResults-flags-00822
If VK_QUERY_RESULT_64_BIT is not set in flags then dstOffset and stride must be multiples of 4

- VUID-vkCmdCopyQueryPoolResults-flags-00823
If VK_QUERY_RESULT_64_BIT is set in flags then dstOffset and stride must be multiples of 8

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824
dstBuffer must have enough storage, from dstOffset, to contain the result of each query, as described here

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyQueryPoolResults-queryType-00827
If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags must not contain VK_QUERY_RESULT_PARTIAL_BIT

- VUID-vkCmdCopyQueryPoolResults-queryType-03232
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies must be VK_TRUE

- VUID-vkCmdCopyQueryPoolResults-queryType-03233
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_PARTIAL_BIT or VK_QUERY_RESULT_64_BIT

- VUID-vkCmdCopyQueryPoolResults-queryType-03234
If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool must have been submitted once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- VUID-vkCmdCopyQueryPoolResults-queryType-02734
vkCmdCopyQueryPoolResults must not be called if the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL
• VUID-vkCmdCopyQueryPoolResults-queryType-06901
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, flags must include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

• VUID-vkCmdCopyQueryPoolResults-flags-06902
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, it must not include VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

• VUID-vkCmdCopyQueryPoolResults-queryType-06903
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags must not contain VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

Valid Usage (Implicit)

• VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

• VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
  dstBuffer must be a valid VkBuffer handle

• VUID-vkCmdCopyQueryPoolResults-flags-parameter
  flags must be a valid combination of VkQueryResultFlagBits values

• VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdCopyQueryPoolResults-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyQueryPoolResults-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdCopyQueryPoolResults-commonparent
  Each of commandBuffer, dstBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits may count towards the results of queries. This behavior is implementation-dependent and may vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which may include vertices and some not.

### 18.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application can then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation may generate any non-zero result value for the query if the count of passing samples is non-zero.

**Note**

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode may be more efficient on some implementations, and should be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations may only return zero or one, indifferent to the actual number of samples passing the per-fragment tests.

When an occlusion query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

### 18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics
A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set in `VkQueryPoolCreateInfo::pipelineStatistics` for query pools and in `VkCommandBufferInheritanceInfo::pipelineStatistics` for secondary command buffers, individually enabling pipeline statistics counters, are:

```cpp
// Provided by VK_VERSION_1_0
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
    // Provided by VK_EXT_mesh_shader
    VK_QUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT = 0x00000800,
    // Provided by VK_EXT_mesh_shader
    VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT = 0x00001000,
} VkQueryPipelineStatisticFlagBits;
```

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.

- **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

- **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter’s value is incremented each time a vertex shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter’s value is incremented each time a vertex shader is invoked.
by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

- **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.

- **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:
  - If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.
  - Otherwise, the counter is incremented by zero or more.

- **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

- **VKQUERY_PIPELINE_STATISTIC_TASK_SHADER_INVOCATIONS_BIT_EXT** specifies that queries managed by the pool will count the number of task shader invocations. The counter's value is incremented every time the task shader is invoked.

- **VK_QUERY_PIPELINE_STATISTIC_MESH_SHADER_INVOCATIONS_BIT_EXT** specifies that queries managed by the pool will count the number of mesh shader invocations. The counter's value is
incremented every time the mesh shader is invoked.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters may be affected by the issues described in Query Operation.

This counting difference is especially true if the pipeline contains mesh or task shaders, which may affect several of the counters in unexpected ways.

Note
For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has rasterizerDiscardEnable enabled, implementations may discard primitives after the final pre-rasterization shader stage. As a result, if rasterizerDiscardEnable is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via vkCmdCopyQueryPoolResults), or request it be put into host memory (via vkGetQueryPoolResults).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

VkQueryPipelineStatisticFlags is a bitmask type for setting a mask of zero or more VkQueryPipelineStatisticFlagBits.

### 18.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).

The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from VkPhysicalDeviceLimits::timestampPeriod after a call to vkGetPhysicalDeviceProperties.
To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWriteTimestamp2(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```
or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `stage`.

The second synchronization scope includes only the timestamp write operation.

When the timestamp value is written, the availability status of the query is set to available.

**Note**

If an implementation is unable to detect completion and latch the timer immediately after `stage` has completed, it may instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

**Note**

An example of such a comparison is subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands.

If `vkCmdWriteTimestamp2` is called while executing a render pass instance that has multiview enabled,
the timestamp uses \( N \) consecutive query indices in the query pool (starting at query) where \( N \) is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All \( N \) queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all \( N \) queries to determine the total execution time.

---

**Valid Usage**

- VUID-vkCmdWriteTimestamp2-stage-03929
  If the geometryShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- VUID-vkCmdWriteTimestamp2-stage-03930
  If the tessellationShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- VUID-vkCmdWriteTimestamp2-stage-03931
  If the conditionalRendering feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- VUID-vkCmdWriteTimestamp2-stage-03932
  If the fragmentDensityMap feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- VUID-vkCmdWriteTimestamp2-stage-03933
  If the transformFeedback feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- VUID-vkCmdWriteTimestamp2-stage-03934
  If the meshShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- VUID-vkCmdWriteTimestamp2-stage-03935
  If the taskShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`

- VUID-vkCmdWriteTimestamp2-shadingRateImage-07316
  If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdWriteTimestamp2-stage-04957
If the `subpassShading` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI`

- VUID-vkCmdWriteTimestamp2-stage-04995
  If the `invocationMask` feature is not enabled, `stage` must not contain `VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI`

- VUID-vkCmdWriteTimestamp2-synchronization2-03858
  The `synchronization2` feature must be enabled

- VUID-vkCmdWriteTimestamp2-stage-03859
  `stage` must only include a single pipeline stage

- VUID-vkCmdWriteTimestamp2-stage-03860
  `stage` must only include stages valid for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- VUID-vkCmdWriteTimestamp2-queryPool-03861
  `queryPool` must have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`

- VUID-vkCmdWriteTimestamp2-queryPool-03862
  The query identified by `queryPool` and `query` must be unavailable

- VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
  The command pool's queue family must support a non-zero `timestampValidBits`

- VUID-vkCmdWriteTimestamp2-query-04903
  `query` must be less than the number of queries in `queryPool`

- VUID-vkCmdWriteTimestamp2-None-03864
  All queries used by the command must be unavailable

- VUID-vkCmdWriteTimestamp2-query-03865
  If `vkCmdWriteTimestamp2` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`

---

**Valid Usage (Implicit)**

- VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdWriteTimestamp2-stage-parameter
  `stage` must be a valid combination of `VkPipelineStageFlagBits2` values

- VUID-vkCmdWriteTimestamp2-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle

- VUID-vkCmdWriteTimestamp2-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, compute, decode, or encode operations

- VUID-vkCmdWriteTimestamp2-commonparent
Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

</tr>
</tbody>
</table>

To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `pipelineStage`.

The second synchronization scope includes only the timestamp write operation.

When the timestamp value is written, the availability status of the query is set to available.
Note
If an implementation is unable to detect completion and latch the timer immediately after stage has completed, it may instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

Note
An example of such a comparison is subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands.

If vkCmdWriteTimestamp is called while executing a render pass instance that has multiview enabled, the timestamp uses N consecutive query indices in the query pool (starting at query) where N is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All N queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries may be the execution time of a single view.

In either case, the application can sum the differences between all N queries to determine the total execution time.

### Valid Usage

- VUID-vkCmdWriteTimestamp-pipelineStage-04074  
  pipelineStage must be a valid stage for the queue family that was used to create the command pool that commandBuffer was allocated from.

- VUID-vkCmdWriteTimestamp-pipelineStage-04075  
  If the geometryShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04076  
  If the tessellationShader feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT or VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04077  
  If the conditionalRendering feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT.

- VUID-vkCmdWriteTimestamp-pipelineStage-04078
If the `fragmentDensityMap` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04079**
  If the `transformFeedback` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04080**
  If the `meshShader` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-07077**
  If the `task shaders` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-vkCmdWriteTimestamp-shadingRateImage-07314**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdWriteTimestamp-synchronization2-06489**
  If the `synchronization2` feature is not enabled, `pipelineStage` **must** not be `VK_PIPELINE_STAGE_NONE`

- **VUID-vkCmdWriteTimestamp-queryPool-01416**
  `queryPool` **must** have been created with a `queryType` of `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdWriteTimestamp-queryPool-00828**
  The query identified by `queryPool` and `query` **must** be **unavailable**

- **VUID-vkCmdWriteTimestamp-timestampValidBits-00829**
  The command pool's queue family **must** support a non-zero `timestampValidBits`

- **VUID-vkCmdWriteTimestamp-query-04904**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdWriteTimestamp-None-00830**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdWriteTimestamp-query-00831**
  If `vkCmdWriteTimestamp` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask **must** be less than or equal to the number of queries in `queryPool`

**Valid Usage (Implicit)**

- **VUID-vkCmdWriteTimestamp-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdWriteTimestamp-pipelineStage-parameter**
  `pipelineStage` **must** be a valid `VkPipelineStageFlagBits` value

- **VUID-vkCmdWriteTimestamp-queryPool-parameter**
  `queryPool` **must** be a valid `VkQueryPool` handle

- **VUID-vkCmdWriteTimestamp-commandBuffer-recording**
commandBuffer must be in the recording state

- VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations

- VUID-vkCmdWriteTimestamp-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

18.6. Performance Queries

Performance queries provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

Note

This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing vkCmdBeginQuery and vkCmdEndQuery to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or
commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a `VkPerformanceQuerySubmitInfoKHR` structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Note**
Command buffers created with `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the `VK_COMMAND_BUFFER_USAGE_ONE_TIME_SUBMIT_BIT` when multiple counter passes are required.

Performance counter results from a performance query pool can be obtained with the command `vkGetQueryPoolResults`.

The `VkPerformanceCounterResultKHR` union is defined as:

```c
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t     int32;
    int64_t     int64;
    uint32_t    uint32;
    uint64_t    uint64;
    float       float32;
    double      float64;
} VkPerformanceCounterResultKHR;
```

- `int32` is a 32-bit signed integer value.
- `int64` is a 64-bit signed integer value.
- `uint32` is a 32-bit unsigned integer value.
- `uint64` is a 64-bit unsigned integer value.
- `float32` is a 32-bit floating-point value.
- `float64` is a 64-bit floating-point value.

Performance query results are returned in an array of `VkPerformanceCounterResultKHR` unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in `pCounterIndices` when creating the performance query. The `VkPerformanceCounterKHR::unit` enumeration specifies how to parse the counter data.

### 18.6.1. Profiling Lock

To record and submit a command buffer containing a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to `vkBeginCommandBuffer` that will be using a performance query pool. The profiling lock must be held while any command buffer containing a performance query pool is in the `recording`, `executable`, or `pending` state. To acquire the
profiling lock, call:

```c
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);
```

- **device** is the logical device to profile.
- **pInfo** is a pointer to a `VkAcquireProfilingLockInfoKHR` structure containing information about how the profiling is to be acquired.

Implementations may allow multiple actors to hold the profiling lock concurrently.

**Valid Usage (Implicit)**

- VUID-vkAcquireProfilingLockKHR-device-parameter
  - device must be a valid `VkDevice` handle
- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
  - pInfo must be a valid pointer to a valid `VkAcquireProfilingLockInfoKHR` structure

**Return Codes**

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_TIMEOUT

The `VkAcquireProfilingLockInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **timeout** indicates how long the function waits, in nanoseconds, if the profiling lock is not
If timeout is 0, vkAcquireProfilingLockKHR will not block while attempting to acquire the profiling lock. If timeout is UINT64_MAX, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;
```

```c
// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

VkAcquireProfilingLockFlagsKHR is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
```

- device is the logical device to cease profiling on.

**Valid Usage**

- VUID-vkReleaseProfilingLockKHR-device-03235
  The profiling lock of device must have been held via a previous successful call to vkAcquireProfilingLockKHR

**Valid Usage (Implicit)**

- VUID-vkReleaseProfilingLockKHR-device-parameter
  device must be a valid VkDevice handle
18.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during drawing commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

18.8. Primitives Generated Queries

When a generated primitive query for a vertex stream is active, the primitives-generated count is incremented every time a primitive emitted to that stream reaches the transform feedback stage, whether or not transform feedback is active. A primitives generated query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end primitives generated queries for any supported vertex stream. When a primitives generated query begins, the count of primitives generated starts from zero.

When a primitives generated query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**
The result of this query is typically identical to `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, but the primitives generated query is deterministic, i.e. it must be identical to the number of primitives processed. `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT` may vary for implementation dependent reasons, e.g. the same primitive may be processed multiple times for purposes of clipping.

18.9. Mesh Shader Queries

When a generated mesh primitives query is active, the mesh-primitives-generated count is incremented every time a primitive emitted from the mesh shader stage reaches the fragment shader stage. When a generated mesh primitives query begins, the mesh-primitives-generated count starts from zero.
Mesh and task shader pipeline statistics queries function the same way that invocation queries work for other shader stages, counting the number of times the respective shader stage has been run. When the statistics query begins, the invocation counters start from zero.

### 18.10. Intel performance queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable to produce human readable results rather than being read directly by an application.

Prior to creating a performance query pool, initialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkInitializePerformanceApiINTEL(
    VkDevice device,
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

#### Valid Usage (Implicit)

- VUID-vkInitializePerformanceApiINTEL-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkInitializePerformanceApiINTEL-pInitializeInfo-parameter
  - `pInitializeInfo` must be a valid pointer to a valid `VkInitializePerformanceApiInfoINTEL` structure

#### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkInitializePerformanceApiInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkInitializePerformanceApiInfoINTEL {
```
VkStructureType sType;
  const void* pNext;
  void* pUserData;
} VkInitializePerformanceApiInfoINTEL;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **pUserData** is a pointer for application data.

### Valid Usage (Implicit)

- VUID-VkInitializePerformanceApiInfoINTEL-sType-sType  
  sType must be VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL
- VUID-VkInitializePerformanceApiInfoINTEL-pNext-pNext  
  pNext must be NULL

Once performance query operations have completed, uninitialized the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
void vkUninitializePerformanceApiINTEL(
  VkDevice device);
```

- **device** is the logical device used for the queries.

### Valid Usage (Implicit)

- VUID-vkUninitializePerformanceApiINTEL-device-parameter  
  device must be a valid VkDevice handle

Some performance query features of a device can be discovered with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkGetPerformanceParameterINTEL(
  VkDevice device,
  VkPerformanceParameterTypeINTEL parameter,
  VkPerformanceValueINTEL* pValue);
```

- **device** is the logical device to query.
- **parameter** is the parameter to query.
- **pValue** is a pointer to a VkPerformanceValueINTEL structure in which the type and value of the parameter are returned.
Valid Usage (Implicit)

- VUID-vkGetPerformanceParameterINTEL-device-parameter
device must be a valid VkDevice handle
- VUID-vkGetPerformanceParameterINTEL-parameter-parameter
parameter must be a valid VkPerformanceParameterTypeINTEL value
- VUID-vkGetPerformanceParameterINTEL-pValue-parameter
pValue must be a valid pointer to a VkPerformanceValueINTEL structure

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

Possible values of vkGetPerformanceParameterINTEL::parameter, specifying a performance query feature, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
    VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
} VkPerformanceParameterTypeINTEL;
```

- VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL has a boolean result which tells whether hardware counters can be captured.
- VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL has a 32 bits integer result which tells how many bits can be written into the VkPerformanceValueINTEL value.

The VkPerformanceValueINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL    type;
    VkPerformanceValueDataINTEL   data;
} VkPerformanceValueINTEL;
```

- type is a VkPerformanceValueTypeINTEL value specifying the type of the returned data.
- data is a VkPerformanceValueDataINTEL union specifying the value of the returned data.
Valid Usage (Implicit)

• VUID-VkPerformanceValueINTEL-type-parameter
type must be a valid VkPerformanceValueTypeINTEL value

• VUID-VkPerformanceValueINTEL-valueString-parameter
If type is VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL, the valueString member of data must be a null-terminated UTF-8 string

Possible values of VkPerformanceValueINTEL::type, specifying the type of the data returned in VkPerformanceValueINTEL::data, are:

• VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL specifies that unsigned 32-bit integer data is returned in data.value32.
• VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL specifies that unsigned 64-bit integer data is returned in data.value64.
• VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL specifies that floating-point data is returned in data.valueFloat.
• VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL specifies that Bool32 data is returned in data.valueBool.
• VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL specifies that a pointer to a null-terminated UTF-8 string is returned in data.valueString. The pointer is valid for the lifetime of the device parameter passed to vkGetPerformanceParameterINTEL.

// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
} VkPerformanceValueTypeINTEL;

The VkPerformanceValueDataINTEL union is defined as:

// Provided by VK_INTEL_performance_query
typedef union VkPerformanceValueDataINTEL {
    uint32_t value32;
    uint64_t value64;
    float valueFloat;
    VkBool32 valueBool;
    const char* valueString;
} VkPerformanceValueDataINTEL;

• data.value32 represents 32-bit integer data.
• data.value64 represents 64-bit integer data.
• `data.valueFloat` represents floating-point data.
• `data.valueBool` represents `Bool32` data.
• `data.valueString` represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated `VkPerformanceValueTypeINTEL` value.

The `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure is defined as:

```plaintext
// Provided by VK_INTEL_performance_query
typedef struct VkQueryPoolPerformanceQueryCreateInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolSamplingModeINTEL performanceCountersSampling;
} VkQueryPoolPerformanceQueryCreateInfoINTEL;
```

To create a pool for Intel performance queries, set `VkQueryPoolCreateInfo::queryType` to `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` and add a `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure to the `pNext` chain of the `VkQueryPoolCreateInfo` structure.

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `performanceCountersSampling` describe how performance queries should be captured.

**Valid Usage (Implicit)**

• `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-sType-sType` `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_QUERY_CREATE_INFO_INTEL`
• `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-performanceCountersSampling-parameter` `performanceCountersSampling` must be a valid `VkQueryPoolSamplingModeINTEL` value

Possible values of `VkQueryPoolPerformanceQueryCreateInfoINTEL::performanceCountersSampling` are:

```plaintext
// Provided by VK_INTEL_performance_query
typedef enum VkQueryPoolSamplingModeINTEL {
    VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL = 0,
} VkQueryPoolSamplingModeINTEL;
```
• **VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL** is the default mode in which the application calls **vkCmdBeginQuery** and **vkCmdEndQuery** to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceMarkerInfoINTEL* pMarkerInfo);
```

The last marker set onto a command buffer before the end of a query will be part of the query result.

### Valid Usage (Implicit)

- **VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdSetPerformanceMarkerINTEL-pMarkerInfo-parameter**
  - `pMarkerInfo` must be a valid pointer to a valid `VkPerformanceMarkerInfoINTEL` structure

- **VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations

- **VUID-vkCmdSetPerformanceMarkerINTEL-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute Transfer</td>
<td>Action State</td>
</tr>
</tbody>
</table>
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

The `VkPerformanceMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint64_t marker;
} VkPerformanceMarkerInfoINTEL;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `marker` is the marker value that will be recorded into the opaque query results.

Valid Usage (Implicit)

• VUID-VkPerformanceMarkerInfoINTEL-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL`

• VUID-VkPerformanceMarkerInfoINTEL-pNext-pNext
  `pNext` must be `NULL`

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceStreamMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceStreamMarkerInfoINTEL* pMarkerInfo);
```

Valid Usage (Implicit)

• VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
• **VUID-vkCmdSetPerformanceStreamMarkerINTEL-pMarkerInfo-parameter**
  pMarkerInfo must be a valid pointer to a valid VkPerformanceStreamMarkerInfoINTEL structure

• **VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-recording**
  commandBuffer must be in the recording state

• **VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-cmdpool**
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

• **VUID-vkCmdSetPerformanceStreamMarkerINTEL-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>

<td>Graphics, Compute, Transfer</td>
<td>Action, State</td>
</tr>
</tbody>
</table>

---

**Return Codes**

**Success**

• VK_SUCCESS

**Failure**

• VK_ERROR_TOO_MANY_OBJECTS

• VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceStreamMarkerInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint32_t marker;
} VkPerformanceStreamMarkerInfoINTEL;
```
• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• marker is the marker value that will be recorded into the reports consumed by an external application.

Valid Usage

• VUID-VkPerformanceStreamMarkerInfoINTEL-marker-02735
  The value written by the application into marker must only used the valid bits as reported by
  vkGetPerformanceParameterINTEL
  with the
  VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL

Valid Usage (Implicit)

• VUID-VkPerformanceStreamMarkerInfoINTEL-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL
• VUID-VkPerformanceStreamMarkerInfoINTEL-pNext-pNext
  pNext must be NULL

Some applications might want measure the effect of a set of commands with a different settings. It is possible to override a particular settings using:

// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceOverrideINTEL(
  VkCommandBuffer commandBuffer,
  const VkPerformanceOverrideInfoINTEL* pOverrideInfo);

• commandBuffer is the command buffer where the override takes place.
• pOverrideInfo is a pointer to a VkPerformanceOverrideInfoINTEL structure selecting the parameter to override.

Valid Usage

• VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-02736
  pOverrideInfo must not be used with a VkPerformanceOverrideTypeINTEL that is not reported available by vkGetPerformanceParameterINTEL

Valid Usage (Implicit)

• VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-parameter
  pOverrideInfo must be a valid pointer to a valid VkPerformanceOverrideInfoINTEL structure

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, compute, or transfer operations

- VUID-vkCmdSetPerformanceOverrideINTEL-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute Transfer</td>
<td>State</td>
</tr>
</tbody>
</table>

### Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceOverrideInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType sType;
    const void* pNext;
} VkPerformanceOverrideInfoINTEL;
```
VkPerformanceOverrideTypeINTEL  
VkBool32  
uint64_t  
} VkPerformanceOverrideInfoINTEL;

- **type** is the particular `VkPerformanceOverrideTypeINTEL` to set.
- **enable** defines whether the override is enabled.
- **parameter** is a potential required parameter for the override.

### Valid Usage (Implicit)

- VUID-VkPerformanceOverrideInfoINTEL-sType-sType
  
  sType must be `VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL`

- VUID-VkPerformanceOverrideInfoINTEL-pNext-pNext
  
  pNext must be `NULL`

- VUID-VkPerformanceOverrideInfoINTEL-type-parameter
  
  type must be a valid `VkPerformanceOverrideTypeINTEL` value

Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
} VkPerformanceOverrideTypeINTEL;
```

- `VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL` turns all rendering operations into noop.
- `VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL` stalls the stream of commands until all previously emitted commands have completed and all caches been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```c
// Provided by VK_INTEL_performance_query
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkAcquirePerformanceConfigurationINTEL(
```
device is the logical device that the performance query commands will be submitted to.

pAcquireInfo is a pointer to a VkPerformanceConfigurationAcquireInfoINTEL structure, specifying the performance configuration to acquire.

pConfiguration is a pointer to a VkPerformanceConfigurationINTEL handle in which the resulting configuration object is returned.

Valid Usage (Implicit)

- VUID-vkAcquirePerformanceConfigurationINTEL-device-parameter device must be a valid VkDevice handle
- VUID-vkAcquirePerformanceConfigurationINTEL-pAcquireInfo-parameter pAcquireInfo must be a valid pointer to a valid VkPerformanceConfigurationAcquireInfoINTEL structure
- VUID-vkAcquirePerformanceConfigurationINTEL-pConfiguration-parameter pConfiguration must be a valid pointer to a VkPerformanceConfigurationINTEL handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPerformanceConfigurationAcquireInfoINTEL structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {
    VkStructureType              sType;
    const void*                  pNext;
    VkPerformanceConfigurationTypeINTEL type;
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- type is one of the VkPerformanceConfigurationTypeINTEL type of performance configuration that will be acquired.
Valid Usage (Implicit)

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-pNext-pNext
  pNext must be NULL

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-type-parameter
  type must be a valid VkPerformanceConfigurationTypeINTEL value

Possible values of VkPerformanceConfigurationAcquireInfoINTEL::type, specifying performance configuration types, are:

```cpp
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERY_ACTIVATED_INTEL = 0,
} VkPerformanceConfigurationTypeINTEL;
```

To set a performance configuration, call:

```cpp
// Provided by VK_INTEL_performance_query
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue queue,
    VkPerformanceConfigurationINTEL configuration);
```

- `queue` is the queue on which the configuration will be used.
- `configuration` is the configuration to use.

Valid Usage (Implicit)

- VUID-vkQueueSetPerformanceConfigurationINTEL-queue-parameter
  queue must be a valid VkQueue handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-configuration-parameter
  configuration must be a valid VkPerformanceConfigurationINTEL handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-commonparent
  Both of configuration, and queue must have been created, allocated, or retrieved from the same VkDevice
Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
</table>

Return Codes

Success

• VK_SUCCESS

Failure

• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

To release a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkReleasePerformanceConfigurationINTEL(
    VkDevice device,
    VkPerformanceConfigurationINTEL configuration);
```

• `device` is the device associated to the configuration object to release.
• `configuration` is the configuration object to release.

Valid Usage

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-02737
  `configuration` must not be released before all command buffers submitted while the configuration was set are in pending state

Valid Usage (Implicit)

• VUID-vkReleasePerformanceConfigurationINTEL-device-parameter
  `device` must be a valid `VkDevice` handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parameter
  If `configuration` is not `VK_NULL_HANDLE`, `configuration` must be a valid `VkPerformanceConfigurationINTEL` handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parent
  If `configuration` is a valid handle, it must have been created, allocated, or retrieved from `device`
Host Synchronization

- Host access to configuration must be externally synchronized

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY

18.11. Result Status Queries

Result status queries are used for a single purpose - to check whether a set of operations has completed successfully or not, using the VK_QUERY_RESULT_WITH_STATUS_BIT_KHR flag.

No other data is written to such a query.

In order to determine if a queue family supports result status queries and use of VK_QUERY_RESULT_WITH_STATUS_BIT_KHR flag, add a VkQueueFamilyQueryResultStatusPropertiesKHR structure to the pNext chain of VkQueueFamilyProperties2 when calling vkGetPhysicalDeviceQueueFamilyProperties2.

The VkQueueFamilyQueryResultStatusPropertiesKHR structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusPropertiesKHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusPropertiesKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `queryResultStatusSupport` reports VK_TRUE if query type VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR and use of VK_QUERY_RESULT_WITH_STATUS_BIT_KHR are supported.

Valid Usage (Implicit)

- VUID-VkQueueFamilyQueryResultStatusPropertiesKHR-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_KHR
**18.12. Video Encode Bitstream Buffer Range**

Bitstream buffer range queries describe the range of bytes written in the bitstream buffer by video encode commands.

When an encode command is recorded within a bitstream buffer range query, two values are written to the query slot. The first value is an offset into the bitstream buffer where the encoded video data was written. This offset is an additional offset from the start of the range specified by the application. The second value is a size value describing the number of bytes written to the bitstream buffer beyond the offset.

One slot is consumed for each slice in each command recorded between a begin and end query pair.
Chapter 19. Clear Commands

19.1. Clearing Images Outside A Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(  
    VkCommandBuffer commandBuffer,  
    VkImage image,  
    VkImageLayout imageLayout,  
    const VkClearColorValue* pColor,  
    uint32_t rangeCount,  
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`
- VUID-vkCmdClearColorImage-image-00002
  `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag
- VUID-vkCmdClearColorImage-image-01545
  `image` must not use any of the formats that require a sampler Y'CbCr conversion
- VUID-vkCmdClearColorImage-image-00003
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice.

imageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR.

The VkImageSubresourceRange::aspectMask members of the elements of the pRanges array must each only include VK_IMAGE_ASPECT_COLOR_BIT.

The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the levelCount member is not VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than the mipLevels specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than the arrayLayers specified in VkImageCreateInfo when image was created.

image must not have a compressed or depth/stencil format.

color must be a valid pointer to a VkClearColorValue union.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, image must not be a protected image.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, must not be an unprotected image.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

image must be a valid VkImage handle.
- VUID-vkCmdClearColorImage-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value

- VUID-vkCmdClearColorImage-pRanges-parameter
  `pRanges` must be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures

- VUID-vkCmdClearColorImage-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

- VUID-vkCmdClearColorImage-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdClearColorImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdClearColorImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearColorImage-rangeCount-arraylength
  `rangeCount` must be greater than 0

- VUID-vkCmdClearColorImage-commonparent
  Both of `commandBuffer`, and `image` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearDepthStencilImage(
    VkCommandBuffer commandBuffer,  
    VkImage image,  
    VkImageLayout imageLayout,  
    const VkClearColorDepthStencilValue* pDepthStencil,
);```

1328
uint32_t rangeCount,
const VkImageSubresourceRange* pRanges);

• commandBuffer is the command buffer into which the command will be recorded.
• image is the image to be cleared.
• imageLayout specifies the current layout of the image subresource ranges to be cleared, and must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL.
• pDepthStencil is a pointer to a VkClearDepthStencilValue structure containing the values that the depth and stencil image subresource ranges will be cleared to (see Clear Values below).
• rangeCount is the number of image subresource range structures in pRanges.
• pRanges is a pointer to an array of VkImageSubresourceRange structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Valid Usage

• VUID-vkCmdClearDepthStencilImage-image-01994
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-vkCmdClearDepthStencilImage-pRanges-02658
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02659
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02660
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_DEPTH_BIT, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-image-00010
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdClearDepthStencilImage-imageLayout-00011
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

• VUID-vkCmdClearDepthStencilImage-imageLayout-00012
  imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdClearDepthStencilImage-aspectMask-02824
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
If the image's format does not have a stencil component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_STENCIL_BIT` bit.

If the image's format does not have a depth component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_DEPTH_BIT` bit.

The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array must each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array must each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

image must have a depth/stencil format.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `image` must not be a protected image.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `image` must not be an unprotected image.

Valid Usage (Implicit)

- VUID-vkCmdClearDepthStencilImage-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdClearDepthStencilImage-image-parameter
  `image` must be a valid `VkImage` handle.

- VUID-vkCmdClearDepthStencilImage-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value.

- VUID-vkCmdClearDepthStencilImage-pDepthStencil-parameter
**pDepthStencil** must be a valid pointer to a valid `VkClearDepthStencilValue` structure

- **VUID-vkCmdClearDepthStencilImage-pRanges-parameter**
  **pRanges** must be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures

- **VUID-vkCmdClearDepthStencilImage-commandBuffer-recording**
  **commandBuffer** must be in the recording state

- **VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdClearDepthStencilImage-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdClearDepthStencilImage-videoencoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength**
  **rangeCount** must be greater than 0

- **VUID-vkCmdClearDepthStencilImage-commonparent**
  Both of `commandBuffer`, and **image** must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to **commandBuffer** must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

### 19.2. Clearing Images Inside A Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:
```c
definition of vkCmdClearAttachments
void vkCmdClearAttachments(  
    VkCommandBuffer commandBuffer,  
    uint32_t attachmentCount,  
    const VkClearAttachment* pAttachments,  
    uint32_t rectCount,  
    const VkClearRect* pRects);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `attachmentCount` is the number of entries in the `pAttachments` array.
- `pAttachments` is a pointer to an array of `VkClearAttachment` structures defining the attachments to clear and the clear values to use.
- `rectCount` is the number of entries in the `pRects` array.
- `pRects` is a pointer to an array of `VkClearRect` structures defining regions within each selected attachment to clear.

If the render pass has a fragment density map attachment, clears follow the operations of fragment density maps as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment's area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.

Unlike other clear commands, `vkCmdClearAttachments` is not a transfer command. It performs its operations in rasterization order. For color attachments, the operations are executed as color attachment writes, by the `VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT` stage. For depth/stencil attachments, the operations are executed as depth writes and stencil writes by the `VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT` and `VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT` stages.

`vkCmdClearAttachments` is not affected by the bound pipeline state.

---

**Note**

It is generally preferable to clear attachments by using the `VK_ATTACHMENT_LOAD_OP_CLEAR` load operation at the start of rendering, as it is more efficient on some implementations.

If any attachment's `aspectMask` to be cleared is not backed by an image view, the clear has no effect on that aspect.
VK_IMAGE_ASPECT_COLOR_BIT, the colorAttachment must be a valid color attachment index in the current render pass instance

- VUID-vkCmdClearAttachments-rect-02682
  The rect member of each element of pRects must have an extent.width greater than 0

- VUID-vkCmdClearAttachments-rect-02683
  The rect member of each element of pRects must have an extent.height greater than 0

- VUID-vkCmdClearAttachments-pRects-00016
  The rectangular region specified by each element of pRects must be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-06937
  The layers specified by each element of pRects must be contained within every attachment that pAttachments refers to, i.e. for each element of pRects, VkClearRect
  
  VkClearRect::layerCount must be less than or equal to the number of layers rendered to in the current render pass instance

- VUID-vkCmdClearAttachments-layerCount-01934
  The layerCount member of each element of pRects must not be 0

- VUID-vkCmdClearAttachments-commandBuffer-02504
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be a protected image

- VUID-vkCmdClearAttachments-commandBuffer-02505
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be an unprotected image

- VUID-vkCmdClearAttachments-baseArrayLayer-00018
  If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one

Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdClearAttachments-pAttachments-parameter
  pAttachments must be a valid pointer to an array of attachmentCount valid VkClearAttachment structures

- VUID-vkCmdClearAttachments-pRects-parameter
  pRects must be a valid pointer to an array of rectCount VkClearRect structures

- VUID-vkCmdClearAttachments-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdClearAttachments-renderpass
This command **must** only be called inside of a render pass instance

- **VUID-vkCmdClearAttachments-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdClearAttachments-attachmentCount-arraylength**
  attachmentCount **must** be greater than 0

- **VUID-vkCmdClearAttachments-rectCount-arraylength**
  rectCount **must** be greater than 0

### Host Synchronization

- Host access to **commandBuffer** **must** be externally synchronized
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The **VkClearRect** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D    rect;
    uint32_t    baseArrayLayer;
    uint32_t    layerCount;
} VkClearRect;
```

- **rect** is the two-dimensional region to be cleared.
- **baseArrayLayer** is the first layer to be cleared.
- **layerCount** is the number of layers to clear.

The layers \([\text{\text{baseArrayLayer}}, \text{\text{baseArrayLayer}} + \text{\text{layerCount}}]\) counting from the base layer of the attachment image view are cleared.

The **VkClearAttachment** structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearAttachment {
    VkImageAspectFlags aspectMask;
}
```
aspectMask is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.

colorAttachment is only meaningful if VK_IMAGE_ASPECT_COLOR_BIT is set in aspectMask, in which case it is an index into the currently bound color attachments.

clearValue is the color or depth/stencil value to clear the attachment to, as described in Clear Values below.

Valid Usage

• VUID-VkClearAttachment-aspectMask-00019
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, it must not include VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-VkClearAttachment-aspectMask-00020
  aspectMask must not include VK_IMAGE_ASPECT_METADATA_BIT

• VUID-VkClearAttachment-aspectMask-02246
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

• VUID-VkClearAttachment-clearValue-00021
  clearValue must be a valid VkClearValue union

Valid Usage (Implicit)

• VUID-VkClearAttachment-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkClearAttachment-aspectMask-requiredbitmask
  aspectMask must not be 0

19.3. Clear Values

The VkClearColorValue structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearColorValue {
    float   float32[4];
    int32_t  int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

• float32 are the color clear values when the format of the image or attachment is one of the
formats in the Interpretation of Numeric Format table other than signed integer (SINT) or unsigned integer (UINT). Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- int32 are the color clear values when the format of the image or attachment is signed integer (SINT). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- uint32 are the color clear values when the format of the image or attachment is unsigned integer (UINT). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The VkClearDepthStencilValue structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```

- depth is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.

- stencil is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment's format by taking the appropriate number of LSBs.

**Valid Usage**

- VUID-VkClearDepthStencilValue-depth-00022
  Unless the VK_EXT_depth_range_unrestricted extension is enabled depth must be between 0.0 and 1.0, inclusive

The VkClearValue union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
    VkClearColorValue color;
    VkClearDepthStencilValue depthStencil;
} VkClearValue;
```
• **color** specifies the color image clear values to use when clearing a color image or attachment.

• **depthStencil** specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the **VkRenderPassBeginInfo** structure.

### 19.4. Filling Buffers

To clear buffer data, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **dstBuffer** is the buffer to be filled.

• **dstOffset** is the byte offset into the buffer at which to start filling, and **must** be a multiple of 4.

• **size** is the number of bytes to fill, and **must** be either a multiple of 4, or **VK_WHOLE_SIZE** to fill the range from **offset** to the end of the buffer. If **VK_WHOLE_SIZE** is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.

• **data** is the 4-byte word written repeatedly to the buffer to fill **size** bytes of data. The data word is written to memory according to the host endianness.

**vkCmdFillBuffer** is treated as a “transfer” operation for the purposes of synchronization barriers. The **VK_BUFFER_USAGE_TRANSFER_DST_BIT** must be specified in **usage** of **VkBufferCreateInfo** in order for the buffer to be compatible with **vkCmdFillBuffer**.

### Valid Usage

- **VUID-vkCmdFillBuffer-dstOffset-00024**
  - **dstOffset** must be less than the size of **dstBuffer**

- **VUID-vkCmdFillBuffer-dstOffset-00025**
  - **dstOffset** must be a multiple of 4

- **VUID-vkCmdFillBuffer-size-00026**
  - If **size** is not equal to **VK_WHOLE_SIZE**, **size** must be greater than 0

- **VUID-vkCmdFillBuffer-size-00027**
  - If **size** is not equal to **VK_WHOLE_SIZE**, **size** must be less than or equal to the size of **dstBuffer** minus **dstOffset**
• VUID-vkCmdFillBuffer-size-00028  
  If size is not equal to VK_WHOLE_SIZE, size must be a multiple of 4

• VUID-vkCmdFillBuffer-dstBuffer-00029  
  dstBuffer must have been created with Vk_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdFillBuffer-dstBuffer-00031  
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdFillBuffer-commandBuffer-01811  
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer

• VUID-vkCmdFillBuffer-commandBuffer-01812  
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstBuffer must not be an unprotected buffer

Valid Usage (Implicit)

• VUID-vkCmdFillBuffer-commandBuffer-parameter  
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdFillBuffer-dstBuffer-parameter  
  dstBuffer must be a valid VkBuffer handle

• VUID-vkCmdFillBuffer-commandBuffer-recording  
  commandBuffer must be in the recording state

• VUID-vkCmdFillBuffer-commandBuffer-cmdpool  
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics or compute operations

• VUID-vkCmdFillBuffer-renderpass  
  This command must only be called outside of a render pass instance

• VUID-vkCmdFillBuffer-videcoading  
  This command must only be called outside of a video coding scope

• VUID-vkCmdFillBuffer-commonparent  
  Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
19.5. Updating Buffers

To update buffer data inline in a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize dataSize,
    const void* pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications **can** use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.

Applications **can** work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended...
that they **should** not.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in usage of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

### Valid Usage

- VUID-vkCmdUpdateBuffer-dstOffset-00032
  - `dstOffset` **must** be less than the size of `dstBuffer`

- VUID-vkCmdUpdateBuffer-dataSize-00033
  - `dataSize` **must** be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdUpdateBuffer-dstBuffer-00034
  - `dstBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdUpdateBuffer-dstBuffer-00035
  - If `dstBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdUpdateBuffer-dstOffset-00036
  - `dstOffset` **must** be a multiple of 4

- VUID-vkCmdUpdateBuffer-dataSize-00037
  - `dataSize` **must** be less than or equal to 65536

- VUID-vkCmdUpdateBuffer-dataSize-00038
  - `dataSize` **must** be a multiple of 4

- VUID-vkCmdUpdateBuffer-commandBuffer-01813
  - If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be a protected buffer

- VUID-vkCmdUpdateBuffer-commandBuffer-01814
  - If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` **must** not be an unprotected buffer

### Valid Usage (Implicit)

- VUID-vkCmdUpdateBuffer-commandBuffer-parameter
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdUpdateBuffer-dstBuffer-parameter
  - `dstBuffer` **must** be a valid `VkBuffer` handle

- VUID-vkCmdUpdateBuffer-pData-parameter
  - `pData` **must** be a valid pointer to an array of `dataSize` bytes
• VUID-vkCmdUpdateBuffer-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

• VUID-vkCmdUpdateBuffer-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdUpdateBuffer-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdUpdateBuffer-dataSize-arraylength
  dataSize must be greater than 0

• VUID-vkCmdUpdateBuffer-commonparent
  Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>

<td>Transfer Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

---

**Note**

The pData parameter was of type uint32_t* instead of void* prior to version 1.0.19 of the Specification and VK_HEADER_VERSION 19 of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 20. Copy Commands

An application can copy buffer and image data using several methods described in this chapter, depending on the type of data transfer.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

20.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source buffer to the same region of the destination buffer. `srcBuffer` and `dstBuffer` can be the same buffer or alias the same memory, but the resulting values are undefined if the copy regions overlap in memory.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01824
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- VUID-vkCmdCopyBuffer-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- VUID-vkCmdCopyBuffer-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- VUID-vkCmdCopyBuffer-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- VUID-vkCmdCopyBuffer-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdCopyBuffer-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- VUID-vkCmdCopyBuffer-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-vkCmdCopyBuffer-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBuffer-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdCopyBuffer-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
• VUID-vkCmdCopyBuffer-renderpass
  This command must only be called outside of a render pass instance
• VUID-vkCmdCopyBuffer-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdCopyBuffer-regionCount-arraylength
  regionCount must be greater than 0
• VUID-vkCmdCopyBuffer-commonparent
  Each of commandBuffer, dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Outside</td>

<td>Transfer Graphics Compute</td>
<td>Action</td>
</tr>
</tbody>
</table>

The VkBufferCopy structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferCopy {
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy;
```

• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy-size-01988
  The size must be greater than 0
A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferInfo` is a pointer to a `VkCopyBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBuffer`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyBuffer2-commandBuffer-01822**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBuffer2-commandBuffer-01823**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBuffer2-commandBuffer-01824**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

### Valid Usage (Implicit)

- **VUID-vkCmdCopyBuffer2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter**
  `pCopyBufferInfo` must be a valid pointer to a valid `VkCopyBufferInfo2` structure

- **VUID-vkCmdCopyBuffer2-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdCopyBuffer2-commandBuffer-cmdpool**
  `cmdpool` must be a valid `VkCommandPool` handle
The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

- VUID-vkCmdCopyBuffer2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBuffer2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Secondary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
</tr>
</tbody>
</table>

The `VkCopyBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferInfo2 {
    VkStructureType     sType;
    const void*         pNext;
    VkBuffer            srcBuffer;
    VkBuffer            dstBuffer;
    uint32_t            regionCount;
    const VkBufferCopy2* pRegions;
} VkCopyBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
• **dstBuffer** is the destination buffer.

• **regionCount** is the number of regions to copy.

• **pRegions** is a pointer to an array of **VkBufferCopy2** structures specifying the regions to copy.

Members defined by this structure with the same name as parameters in **vkCmdCopyBuffer** have the identical effect to those parameters; the child structure **VkBufferCopy2** is a variant of **VkBufferCopy** which includes **sType** and **pNext** parameters, allowing it to be extended.

---

**Valid Usage**

- VUID-VkCopyBufferInfo2-srcOffset-00113
  The **srcOffset** member of each element of **pRegions** must be less than the size of **srcBuffer**

- VUID-VkCopyBufferInfo2-dstOffset-00114
  The **dstOffset** member of each element of **pRegions** must be less than the size of **dstBuffer**

- VUID-VkCopyBufferInfo2-size-00115
  The **size** member of each element of **pRegions** must be less than or equal to the size of **srcBuffer** minus **srcOffset**

- VUID-VkCopyBufferInfo2-size-00116
  The **size** member of each element of **pRegions** must be less than or equal to the size of **dstBuffer** minus **dstOffset**

- VUID-VkCopyBufferInfo2-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of **pRegions**, must not overlap in memory

- VUID-VkCopyBufferInfo2-srcBuffer-00118
  **srcBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag

- VUID-VkCopyBufferInfo2-srcBuffer-00119
  If **srcBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- VUID-VkCopyBufferInfo2-dstBuffer-00120
  **dstBuffer** must have been created with **VK_BUFFER_USAGE_TRANSFER_DST_BIT** usage flag

- VUID-VkCopyBufferInfo2-dstBuffer-00121
  If **dstBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

---

**Valid Usage (Implicit)**

- VUID-VkCopyBufferInfo2-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2**

- VUID-VkCopyBufferInfo2-pNext-pNext
  **pNext** must be **NULL**

- VUID-VkCopyBufferInfo2-srcBuffer-parameter
  **srcBuffer** must be a valid **VkBuffer** handle
• VUID-VkCopyBufferInfo2-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

• VUID-VkCopyBufferInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkBufferCopy2 structures

• VUID-VkCopyBufferInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkCopyBufferInfo2-commonparent
Both of dstBuffer, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

The VkBufferCopy2 structure is defined as:

```
// Provided by VK_VERSION_1_3
typedef struct VkBufferCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2;
```

or the equivalent

```
// Provided by VK_KHR_copy_commands2
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcOffset is the starting offset in bytes from the start of srcBuffer.
• dstOffset is the starting offset in bytes from the start of dstBuffer.
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy2-size-01988
The size must be greater than 0

Valid Usage (Implicit)

• VUID-VkBufferCopy2-sType-sType
sType must be VK_STRUCTURE_TYPE_BUFFER_COPY_2
20.2. Copying Data Between Images

`vkCmdCopyImage` performs image copies in a similar manner to a host memcpy. It does not perform general-purpose conversions such as scaling, resizing, blending, color-space conversion, or format conversions. Rather, it simply copies raw image data. `vkCmdCopyImage` can copy between images with different formats, provided the formats are compatible as defined below.

To copy data between image objects, call:

```
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source image to the same region of the destination image. `srcImage` and `dstImage` can be the same image or alias the same memory.

If either `srcImage` or `dstImage` has a multi-planar format, regions of each plane to be copied must be specified separately using the `srcSubresource` and `dstSubresource` members of the `VkImageCopy` structure. In this case, the `aspectMask` of the `srcSubresource` or `dstSubresource` that refers to the multi-planar image must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyImage`, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy, which correspond to texels in the `plane` rather than how these texels map to coordinates in the image as a whole.

Note
For example, the `VK_IMAGE_ASPECT_PLANE_1_BIT` plane of a `VK_FORMAT_G8_B8R8_2PLANE_420_UNORM` image is compatible with an image of format `VK_FORMAT_R8G8_UNORM` and (less usefully) with the `VK_IMAGE_ASPECT_PLANE_0_BIT` plane of an image of format `VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16`, as each texel is 2 bytes in size.

If the format of the destination image has a different block extent than the source image (e.g. one is a compressed format), the offset and extent for each of the regions specified is scaled according to the block extents of each format to match in size.

`vkCmdCopyImage` can be used to copy image data between multisample images, but both images must have the same number of samples.

### Valid Usage

- **VUID-vkCmdCopyImage-commandBuffer-01825**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdCopyImage-commandBuffer-01826**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyImage-commandBuffer-01827**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

- **VUID-vkCmdCopyImage-pRegions-00124**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-vkCmdCopyImage-srcImage-01995**
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-vkCmdCopyImage-srcImage-01546**
  If `srcImage` is non-sparse then the image or disjoint plane to be copied must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImage-srcImageLayout-00128**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImage-srcImageLayout-01917**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`

- **VUID-vkCmdCopyImage-dstImage-01996**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- **VUID-vkCmdCopyImage-dstImage-01547**
  If `dstImage` is non-sparse then the image or disjoint plane that is the destination of the copy must be bound completely and contiguously to a single `VkDeviceMemory` object
• VUID-vkCmdCopyImage-dstImageLayout-00133
dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-vkCmdCopyImage-dstImageLayout-01395
dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-vkCmdCopyImage-srcImage-01548
If the VkFormat of each of srcImage and dstImage is not a multi-planar format, the VkFormat of each of srcImage and dstImage must be size-compatible

• VUID-vkCmdCopyImage-None-01549
In a copy to or from a plane of a multi-planar image, the VkFormat of the image and plane must be compatible according to the description of compatible planes for the plane being copied

• VUID-vkCmdCopyImage-srcImage-00136
The sample count of srcImage and dstImage must match

• VUID-vkCmdCopyImage-srcSubresource-01696
The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImage-dstSubresource-01697
The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyImage-srcSubresource-01698
The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-vkCmdCopyImage-dstSubresource-01699
The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyImage-srcOffset-01783
The srcOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-vkCmdCopyImage-dstOffset-01784
The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-vkCmdCopyImage-dstImage-02542
dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-vkCmdCopyImage-srcImage-01551
If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match
• VUID-vkCmdCopyImage-srcImage-01552
  If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-vkCmdCopyImage-srcImage-01553
  If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-vkCmdCopyImage-dstImage-01554
  If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT

• VUID-vkCmdCopyImage-dstImage-01555
  If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-vkCmdCopyImage-srcImage-01556
  If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-vkCmdCopyImage-dstImage-01557
  If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

• VUID-vkCmdCopyImage-srcImage-04443
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

• VUID-vkCmdCopyImage-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

• VUID-vkCmdCopyImage-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

• VUID-vkCmdCopyImage-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

• VUID-vkCmdCopyImage-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

• VUID-vkCmdCopyImage-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified
srcSubresource of srcImage

- **VUID-vkCmdCopyImage-srcImage-00146**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1

- **VUID-vkCmdCopyImage-srcOffset-00147**
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- **VUID-vkCmdCopyImage-srcImage-01785**
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1

- **VUID-vkCmdCopyImage-dstImage-01786**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1

- **VUID-vkCmdCopyImage-srcImage-01787**
  If `srcImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0

- **VUID-vkCmdCopyImage-dstImage-01788**
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0

- **VUID-vkCmdCopyImage-srcImage-01790**
  If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must equal `srcSubresource.layerCount`

- **VUID-vkCmdCopyImage-dstImage-01792**
  If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`

- **VUID-vkCmdCopyImage-dstOffset-00150**
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- **VUID-vkCmdCopyImage-dstOffset-00151**
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- **VUID-vkCmdCopyImage-dstImage-00152**
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1

- **VUID-vkCmdCopyImage-dstOffset-00153**
  If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage
equal to the depth of the specified dstSubresource of dstImage

- VUID-vkCmdCopyImage-pRegions-07278
  For each element of pRegions, srcOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImage-pRegions-07279
  For each element of pRegions, srcOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImage-pRegions-07280
  For each element of pRegions, srcOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImage-pRegions-07281
  For each element of pRegions, dstOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-vkCmdCopyImage-pRegions-07282
  For each element of pRegions, dstOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-vkCmdCopyImage-pRegions-07283
  For each element of pRegions, dstOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage

- VUID-vkCmdCopyImage-srcImage-01728
  For each element of pRegions, if the sum of srcOffset.x and extent.width does not equal the width of the the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImage-srcImage-01729
  For each element of pRegions, if the sum of srcOffset.y and extent.height does not equal the height of the the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImage-srcImage-01730
  For each element of pRegions, if the sum of srcOffset.z and extent.depth does not equal the depth of the the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImage-dstImage-01732
  For each element of pRegions, if the sum of dstOffset.x and extent.width does not equal the width of the the subresource specified by dstSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage

- VUID-vkCmdCopyImage-dstImage-01733
  For each element of pRegions, if the sum of dstOffset.y and extent.height does not equal the height of the the subresource specified by dstSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage

- VUID-vkCmdCopyImage-dstImage-01734
  For each element of pRegions, if the sum of dstOffset.z and extent.depth does not equal the depth of the the subresource specified by dstSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage
If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `srcImage` was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` must have been included in the `VkImageCreateInfo` ::`usage` used to create `srcImage`.

If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `dstImage` was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageCreateInfo` ::`usage` used to create `dstImage`.

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `srcImage` was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` must have been included in the `VkImageStencilUsageCreateInfo` ::`stencilUsage` used to create `srcImage`.

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `dstImage` was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageStencilUsageCreateInfo` ::`stencilUsage` used to create `dstImage`.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImage-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyImage-srcImage-parameter**
  `srcImage` must be a valid `VkImage` handle.

- **VUID-vkCmdCopyImage-srcImageLayout-parameter**
  `srcImageLayout` must be a valid `VkImageLayout` value.

- **VUID-vkCmdCopyImage-dstImage-parameter**
  `dstImage` must be a valid `VkImage` handle.

- **VUID-vkCmdCopyImage-dstImageLayout-parameter**
  `dstImageLayout` must be a valid `VkImageLayout` value.

- **VUID-vkCmdCopyImage-pRegions-parameter**
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageCopy` structures.

- **VUID-vkCmdCopyImage-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyImage-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

- **VUID-vkCmdCopyImage-renderpass**
  This command must only be called outside of a render pass instance.
This command **must** only be called outside of a video coding scope.

**regionCount must** be greater than 0

Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageCopy` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;  
    VkOffset3D srcOffset;  
    VkImageSubresourceLayers dstSubresource;  
    VkOffset3D dstOffset;  
    VkExtent3D extent;
} VkImageCopy;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively.
- `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the image to copy in width, height and depth.

For `VK_IMAGE_TYPE_3D` images, copies are performed slice by slice starting with the z member of the `srcOffset` or `dstOffset`, and copying depth slices. For images with multiple layers, copies are performed layer by layer starting with the `baseArrayLayer` member of the `srcSubresource` or
The `dstSubresource` and copying `layerCount` layers. Image data can be copied between images with different image types. If one image is `VK_IMAGE_TYPE_3D` and the other image is `VK_IMAGE_TYPE_2D` with multiple layers, then each slice is copied to or from a different layer; depth slices in the 3D image correspond to `layerCount` layers in the 2D image, with an effective depth of 1 used for the 2D image.

### Valid Usage

- **VUID-VkImageCopy-extent-00140**
  The number of slices of the `extent` (for 3D) or layers of the `srcSubresource` (for non-3D) **must** match the number of slices of the `extent` (for 3D) or layers of the `dstSubresource` (for non-3D)

- **VUID-VkImageCopy-extent-06668**
  `extent.width` **must** not be 0

- **VUID-VkImageCopy-extent-06669**
  `extent.height` **must** not be 0

- **VUID-VkImageCopy-extent-06670**
  `extent.depth` **must** not be 0

### Valid Usage (Implicit)

- **VUID-VkImageCopy-srcSubresource-parameter**
  `srcSubresource` **must** be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageCopy-dstSubresource-parameter**
  `dstSubresource` **must** be a valid `VkImageSubresourceLayers` structure

The `VkImageSubresourceLayers` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;
```

- **aspectMask** is a combination of `VkImageAspectFlagBits`, selecting the color, depth and/or stencil aspects to be copied.
- **mipLevel** is the mipmap level to copy
- **baseArrayLayer** and **layerCount** are the starting layer and number of layers to copy.

### Valid Usage

- **VUID-VkImageSubresourceLayers-aspectMask-00167**
If aspectMask contains VK_IMAGE_ASPECT_COLOR_BIT, it must not contain either of VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

- VUID-VkImageSubresourceLayers-aspectMask-00168
  aspectMask must not contain VK_IMAGE_ASPECT_METADATA_BIT

- VUID-VkImageSubresourceLayers-aspectMask-02247
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

- VUID-VkImageSubresourceLayers-layerCount-01700
  layerCount must be greater than 0

Valid Usage (Implicit)

- VUID-VkImageSubresourceLayers-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

- VUID-VkImageSubresourceLayers-aspectMask-requiredbitmap
  aspectMask must not be 0

A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```cpp
// Provided by VK_VERSION_1_3
void vkCmdCopyImage2(
    VkCommandBuffer commandBuffer,            
    const VkCopyImageInfo2* pCopyImageInfo);  
```

or the equivalent command

```cpp
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer commandBuffer,            
    const VkCopyImageInfo2* pCopyImageInfo);  
```

- commandBuffer is the command buffer into which the command will be recorded.
- pCopyImageInfo is a pointer to a VkCopyImageInfo2 structure describing the copy parameters.

This command is functionally identical to vkCmdCopyImage, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdCopyImage2-commandBuffer-01825
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image
Valid Usage (Implicit)

- VUID-vkCmdCopyImage2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdCopyImage2-pCopyImageInfo-parameter
  pCopyImageInfo must be a valid pointer to a valid VkCopyImageInfo2 structure
- VUID-vkCmdCopyImage2-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdCopyImage2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdCopyImage2-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyImage2-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

</table>

The VkCopyImageInfo2 structure is defined as:

// Provided by VK_VERSION_1_3
typedef struct VkCopyImageInfo2 {
    VkStructureType     sType;
    const void*         pNext;
    VkImage             srcImage;
    VkImageLayout       srcImageLayout;
    VkImage             dstImage;
    VkImageLayout       dstImageLayout;
    uint32_t            regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageInfo2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the current layout of the source image subresource.
- **dstImage** is the destination image.
- **dstImageLayout** is the current layout of the destination image subresource.
- **regionCount** is the number of regions to copy.
- **pRegions** is a pointer to an array of **VkImageCopy2** structures specifying the regions to copy.

### Valid Usage

- **VUID-VkCopyImageInfo2-pRegions-00124**
The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, must not overlap in memory

- **VUID-VkCopyImageInfo2-srcImage-01995**
The format features of **srcImage** must contain **VK_FORMAT_FEATURE_TRANSFER_SRC_BIT**

- **VUID-VkCopyImageInfo2-srcImage-01546**
If **srcImage** is non-sparse then the image or disjoint plane to be copied must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-VkCopyImageInfo2-srcImageLayout-00128**
**srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyImageInfo2-srcImageLayout-01917**
**srcImageLayout** must be **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkCopyImageInfo2-dstImage-01996**
The **format features** of *dstImage* must contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- **VUID-VkCopyImageInfo2-dstImage-01547**
  If *dstImage* is non-sparse then the image or *disjoint* plane that is the destination of the copy must be bound completely and contiguously to a single *VkDeviceMemory* object

- **VUID-VkCopyImageInfo2-dstImageLayout-00133**
  *dstImageLayout* must specify the layout of the image subresources of *dstImage* specified in *pRegions* at the time this command is executed on a *VkDevice*

- **VUID-VkCopyImageInfo2-dstImageLayout-01395**
  *dstImageLayout* must be **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkCopyImageInfo2-srcImage-01548**
  If the *VkFormat* of each of *srcImage* and *dstImage* is not a *multi-planar format*, the *VkFormat* of each of *srcImage* and *dstImage* must be size-compatible

- **VUID-VkCopyImageInfo2-None-01549**
  In a copy to or from a plane of a *multi-planar image*, the *VkFormat* of the image and plane must be compatible according to the description of compatible planes for the plane being copied

- **VUID-VkCopyImageInfo2-srcImage-00136**
  The sample count of *srcImage* and *dstImage* must match

- **VUID-VkCopyImageInfo2-srcSubresource-01696**
  The *srcSubresource.mipLevel* member of each element of *pRegions* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-VkCopyImageInfo2-dstSubresource-01697**
  The *dstSubresource.mipLevel* member of each element of *pRegions* must be less than the *mipLevels* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-VkCopyImageInfo2-srcSubresource-01698**
  The *srcSubresource.baseArrayLayer + srcSubresource.layerCount* of each element of *pRegions* must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *srcImage* was created

- **VUID-VkCopyImageInfo2-dstSubresource-01699**
  The *dstSubresource.baseArrayLayer + dstSubresource.layerCount* of each element of *pRegions* must be less than or equal to the *arrayLayers* specified in *VkImageCreateInfo* when *dstImage* was created

- **VUID-VkCopyImageInfo2-srcOffset-01783**
  The *srcOffset* and *extent* members of each element of *pRegions* must respect the image transfer granularity requirements of *commandBuffer*’s command pool’s queue family, as described in *VkQueueFamilyProperties*

- **VUID-VkCopyImageInfo2-dstOffset-01784**
  The *dstOffset* and *extent* members of each element of *pRegions* must respect the image transfer granularity requirements of *commandBuffer*’s command pool’s queue family, as described in *VkQueueFamilyProperties*

- **VUID-VkCopyImageInfo2-dstImage-02542**
  *dstImage* and *srcImage* must not have been created with *flags* containing
• VUID-VkCopyImageInfo2-srcImage-01551
If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match.

• VUID-VkCopyImageInfo2-srcImage-01552
If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT.

• VUID-VkCopyImageInfo2-srcImage-01553
If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT.

• VUID-VkCopyImageInfo2-dstImage-01554
If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT.

• VUID-VkCopyImageInfo2-dstImage-01555
If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT.

• VUID-VkCopyImageInfo2-srcImage-01556
If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

• VUID-VkCopyImageInfo2-dstImage-01557
If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

• VUID-VkCopyImageInfo2-srcImage-04443
If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1.

• VUID-VkCopyImageInfo2-dstImage-04444
If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1.

• VUID-VkCopyImageInfo2-aspectMask-00142
For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage.

• VUID-VkCopyImageInfo2-aspectMask-00143
For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage.

• VUID-VkCopyImageInfo2-srcOffset-00144
For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified...
For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

If `srcImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` and `dstImage` are both of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `extent.depth` must be equal to `srcSubresource.layerCount`.

If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`.

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.

For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.

If `dstImage` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1.

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.
must be 0 and extent.height must be 1

- VUID-VkCopyImageInfo2-dstOffset-00153
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage.

- VUID-VkCopyImageInfo2-pRegions-07278
  For each element of pRegions, srcOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-pRegions-07279
  For each element of pRegions, srcOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-pRegions-07280
  For each element of pRegions, srcOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-pRegions-07281
  For each element of pRegions, dstOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage.

- VUID-VkCopyImageInfo2-pRegions-07282
  For each element of pRegions, dstOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage.

- VUID-VkCopyImageInfo2-pRegions-07283
  For each element of pRegions, dstOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage.

- VUID-VkCopyImageInfo2-srcImage-01728
  For each element of pRegions, if the sum of srcOffset.x and extent.width does not equal the width of the the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-srcImage-01729
  For each element of pRegions, if the sum of srcOffset.y and extent.height does not equal the height of the the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-srcImage-01730
  For each element of pRegions, if the sum of srcOffset.z and extent.depth does not equal the depth of the the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage.

- VUID-VkCopyImageInfo2-dstImage-01732
  For each element of pRegions, if the sum of dstOffset.x and extent.width does not equal the width of the the subresource specified by dstSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage.

- VUID-VkCopyImageInfo2-dstImage-01733
  For each element of pRegions, if the sum of dstOffset.y and extent.height does not equal the height of the the subresource specified by dstSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage.
For each element of `pRegions`, if the sum of `dstOffset.z` and `extent.depth` does not equal the depth of the the subresource specified by `dstSubresource`, `extent.depth` must be a multiple of the `texel block extent depth` of the `VkFormat` of `dstImage`.

If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `srcImage` was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` must have been included in the `VkImageCreateInfo::usage` used to create `srcImage`.

If the `aspect` member of any element of `pRegions` includes any flag other than `VK_IMAGE_ASPECT_STENCIL_BIT` or `dstImage` was not created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageCreateInfo::usage` used to create `dstImage`.

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `srcImage` was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` must have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create `srcImage`.

If the `aspect` member of any element of `pRegions` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, and `dstImage` was created with separate stencil usage, `VK_IMAGE_USAGE_TRANSFER_DST_BIT` must have been included in the `VkImageStencilUsageCreateInfo::stencilUsage` used to create `dstImage`.

```
• VUID-VkCopyImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2

• VUID-VkCopyImageInfo2-pNext-pNext
  pNext must be NULL

• VUID-VkCopyImageInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

• VUID-VkCopyImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

• VUID-VkCopyImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

• VUID-VkCopyImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

• VUID-VkCopyImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageCopy2 structures
```
• VUID-VkCopyImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

• VUID-VkCopyImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageCopy2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageCopy2 {
  VkStructureType sType;
  const void*    pNext;
  VkImageSubresourceLayers srcSubresource;
  VkOffset3D     srcOffset;
  VkImageSubresourceLayers dstSubresource;
  VkOffset3D     dstOffset;
  VkExtent3D     extent;
} VkImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageCopy2 VkImageCopy2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubresource and dstSubresource are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively.
• srcOffset and dstOffset select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
• extent is the size in texels of the image to copy in width, height and depth.

**Valid Usage**

• VUID-VkImageCopy2-extent-00140
  The number of slices of the extent (for 3D) or layers of the srcSubresource (for non-3D) must match the number of slices of the extent (for 3D) or layers of the dstSubresource (for non-3D)

• VUID-VkImageCopy2-extent-06668
  extent.width must not be 0

• VUID-VkImageCopy2-extent-06669
  extent.height must not be 0

• VUID-VkImageCopy2-extent-06670
Valid Usage (Implicit)

- VUID-VkImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_COPY_2

- VUID-VkImageCopy2-pNext-pNext
  pNext must be NULL

- VUID-VkImageCopy2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageCopy2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

20.3. Copying Data Between Buffers and Images

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of VkBufferImageCopy structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source buffer to the specified region of the destination image.

If `dstImage` has a multi-planar format, regions of each plane to be a target of a copy must be specified separately using the `pRegions` member of the VkBufferImageCopy structure. In this case, the aspectMask of imageSubresource must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the aspectMask of
the corresponding subresource. This applies both to \texttt{VkFormat} and to coordinates used in the copy, which correspond to texels in the \textit{plane} rather than how these texels map to coordinates in the image as a whole.

### Valid Usage

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01828**
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{srcBuffer} must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01829**
  If \texttt{commandBuffer} is an unprotected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstImage} must not be a protected image

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01830**
  If \texttt{commandBuffer} is a protected command buffer and \texttt{protectedNoFault} is not supported, \texttt{dstImage} must not be an unprotected image

- **VUID-vkCmdCopyBufferToImage-pRegions-06217**
  The image region specified by each element of \texttt{pRegions} must be contained within the specified \texttt{imageSubresource} of \texttt{dstImage}

- **VUID-vkCmdCopyBufferToImage-pRegions-00171**
  \texttt{srcBuffer} must be large enough to contain all buffer locations that are accessed according to \texttt{Buffer and Image Addressing}, for each element of \texttt{pRegions}

- **VUID-vkCmdCopyBufferToImage-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of \texttt{pRegions}, must not overlap in memory

- **VUID-vkCmdCopyBufferToImage-srcBuffer-00174**
  \texttt{srcBuffer} must have been created with \texttt{VK_BUFFER_USAGE_TRANSFER_SRC_BIT} usage flag

- **VUID-vkCmdCopyBufferToImage-dstImage-01997**
  The format features of \texttt{dstImage} must contain \texttt{VK_FORMAT_FEATURE_TRANSFER_DST_BIT}

- **VUID-vkCmdCopyBufferToImage-srcBuffer-00176**
  If \texttt{srcBuffer} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- **VUID-vkCmdCopyBufferToImage-dstImage-00177**
  \texttt{dstImage} must have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_DST_BIT} usage flag

- **VUID-vkCmdCopyBufferToImage-dstImage-00178**
  If \texttt{dstImage} is non-sparse then it must be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- **VUID-vkCmdCopyBufferToImage-dstImage-00179**
  \texttt{dstImage} must have a sample count equal to \texttt{VK_SAMPLE_COUNT_1_BIT}

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-00180**
  \texttt{dstImageLayout} must specify the layout of the image subresources of \texttt{dstImage} specified in \texttt{pRegions} at the time this command is executed on a \texttt{VkDevice}

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-01396**
The `dstImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`, or `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`.

- VUID-vkCmdCopyBufferToImage-imageSubresource-01701
  The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdCopyBufferToImage-imageOffset-01702
  The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

- VUID-vkCmdCopyBufferToImage-imageOffset-01793
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`’s command pool’s queue family, as described in `VkQueueFamilyProperties`.

- VUID-vkCmdCopyBufferToImage-dstImage-02543
  `dstImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

- VUID-vkCmdCopyBufferToImage-commandBuffer-04477
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT`, for each element of `pRegions`, the `aspectMask` member of `imageSubresource` must not be `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`.

- VUID-vkCmdCopyBufferToImage-pRegions-06218
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `dstImage`.

- VUID-vkCmdCopyBufferToImage-pRegions-06219
  For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `dstImage`.

- VUID-vkCmdCopyBufferToImage-bufferOffset-01558
  If `dstImage` does not have either a depth/stencil or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the format's texel block size.

- VUID-vkCmdCopyBufferToImage-bufferOffset-01559
  If `dstImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in `Compatible formats of planes of multi-planar formats`.

- VUID-vkCmdCopyBufferToImage-srcImage-00199
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1.

- VUID-vkCmdCopyBufferToImage-imageOffset-00200
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`. 
• VUID-vkCmdCopyBufferToImage-srcImage-00201
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1.

• VUID-vkCmdCopyBufferToImage-bufferRowLength-00203
  For each element of pRegions, bufferRowLength must be a multiple of the texel block extent width of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-bufferImageHeight-00204
  For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-pRegions-07273
  For each element of pRegions, bufferOffset must be a multiple of the texel block size of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-pRegions-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-pRegions-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-pRegions-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-imageExtent-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-imageExtent-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-imageExtent-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of dstImage.

• VUID-vkCmdCopyBufferToImage-aspectMask-00211
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage.

• VUID-vkCmdCopyBufferToImage-aspectMask-01560
  If dstImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes).

• VUID-vkCmdCopyBufferToImage-baseArrayLayer-00213
  1370
If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1.

- VUID-vkCmdCopyBufferToImage-pRegions-07277
  For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of dstImage must be less than or equal to 2\(^31\)-1

- VUID-vkCmdCopyBufferToImage-commandBuffer-04052
  If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset member of any element of pRegions must be a multiple of 4

- VUID-vkCmdCopyBufferToImage-srcImage-04053
  If dstImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBufferToImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyBufferToImage-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle

- VUID-vkCmdCopyBufferToImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyBufferToImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy structures

- VUID-vkCmdCopyBufferToImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyBufferToImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyBufferToImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdCopyBufferToImage-regionCount-arraylength
  regionCount must be greater than 0

- VUID-vkCmdCopyBufferToImage-commonparent
  Each of commandBuffer, dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source image to the specified region of the destination buffer.

If `srcImage` has a multi-planar format, regions of each plane to be a source of a copy must be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the `aspectMask` of `imageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in `Compatible formats of planes of multi-planar formats` for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy.
which correspond to texels in the *plane* rather than how these texels map to coordinates in the image as a whole.

### Valid Usage

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01831**
  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01832**
  
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer.

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01833**
  
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer.

- **VUID-vkCmdCopyImageToBuffer-pRegions-06220**
  
  The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `srcImage`.

- **VUID-vkCmdCopyImageToBuffer-pRegions-00183**
  
  `dstBuffer` must be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`.

- **VUID-vkCmdCopyImageToBuffer-pRegions-00184**
  
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory.

- **VUID-vkCmdCopyImageToBuffer-srcImage-00186**
  
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-vkCmdCopyImageToBuffer-srcImage-01998**
  
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- **VUID-vkCmdCopyImageToBuffer-srcImage-00187**
  
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00191**
  
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00192**
  
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdCopyImageToBuffer-srcImage-00188**
  
  `srcImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`.

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189**
  
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397**
  
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL`, `VK_IMAGE_LAYOUT_GENERAL`,
or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01703
  The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01704
  The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageOffset-01794
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

- VUID-vkCmdCopyImageToBuffer-srcImage-02544
  `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

- VUID-vkCmdCopyImageToBuffer-pRegions-06221
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-pRegions-06222
  For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01558
  If `srcImage` does not have either a depth/stencil or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the format's texel block size.

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01559
  If `srcImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible formats of planes of multi-planar formats.

- VUID-vkCmdCopyImageToBuffer-srcImage-00199
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1.

- VUID-vkCmdCopyImageToBuffer-imageOffset-00200
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-srcImage-00201
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

- VUID-vkCmdCopyImageToBuffer-bufferRowLength-00203
  For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent.
width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-bufferImageHeight-00204
  For each element of pRegions, bufferImageHeight must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-pRegions-07273
  For each element of pRegions, bufferOffset must be a multiple of the texel block size of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-pRegions-07274
  For each element of pRegions, imageOffset.x must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-pRegions-07275
  For each element of pRegions, imageOffset.y must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-pRegions-07276
  For each element of pRegions, imageOffset.z must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-imageExtent-00207
  For each element of pRegions, if the sum of imageOffset.x and extent.width does not equal the width of the the subresource specified by srcSubresource, extent.width must be a multiple of the texel block extent width of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-imageExtent-00208
  For each element of pRegions, if the sum of imageOffset.y and extent.height does not equal the height of the the subresource specified by srcSubresource, extent.height must be a multiple of the texel block extent height of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-imageExtent-00209
  For each element of pRegions, if the sum of imageOffset.z and extent.depth does not equal the depth of the the subresource specified by srcSubresource, extent.depth must be a multiple of the texel block extent depth of the VkFormat of srcImage

- VUID-vkCmdCopyImageToBuffer-aspectMask-00211
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in srcImage

- VUID-vkCmdCopyImageToBuffer-aspectMask-01560
  If srcImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes)

- VUID-vkCmdCopyImageToBuffer-baseArrayLayer-00213
  If srcImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-vkCmdCopyImageToBuffer-pRegions-07277
  For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of srcImage must be less than or equal to $2^{31}$-1

- VUID-vkCmdCopyImageToBuffer-commandBuffer-04052

1375
If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4.

- **VUID-vkCmdCopyImageToBuffer-srcImage-04053**
  If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` **must** be a multiple of 4.

**Valid Usage (Implicit)**

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImageToBuffer-srcImage-parameter**
  `srcImage` **must** be a valid `VkImage` handle

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter**
  `srcImageLayout` **must** be a valid `VkImageLayout` value

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter**
  `dstBuffer` **must** be a valid `VkBuffer` handle

- **VUID-vkCmdCopyImageToBuffer-pRegions-parameter**
  `pRegions` **must** be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy` structures

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-recording**
  `commandBuffer` **must** be in the `recording` state

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImageToBuffer-renderpass**
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdCopyImageToBuffer-videocoding**
  This command **must** only be called outside of a video coding scope

- **VUID-vkCmdCopyImageToBuffer-regionCount-arraylength**
  `regionCount` **must** be greater than 0

- **VUID-vkCmdCopyImageToBuffer-commonparent**
  Each of `commandBuffer`, `dstBuffer`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial $x$, $y$, $z$ offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in width, height and depth.

When copying to or from a depth or stencil aspect, the data in buffer memory uses a layout that is a (mostly) tightly packed representation of the depth or stencil data. Specifically:

- data copied to or from the stencil aspect of any depth/stencil format is tightly packed with one `VK_FORMAT_S8_UINT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D16_UNORM` or `VK_FORMAT_D16_UNORM_S8_UINT` format is tightly packed with one `VK_FORMAT_D16_UNORM` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D32_SFLOAT` or `VK_FORMAT_D32_SFLOAT_S8_UINT` format is tightly packed with one `VK_FORMAT_D32_SFLOAT` value per texel.
• data copied to or from the depth aspect of a `VK_FORMAT_X8_D24_UNORM_PACK32` or `VK_FORMAT_D24_UNORM_S8_UINT` format is packed with one 32-bit word per texel with the D24 value in the LSBs of the word, and undefined values in the eight MSBs.

**Note**

To copy both the depth and stencil aspects of a depth/stencil format, two entries in `pRegions` can be used, where one specifies the depth aspect in `imageSubresource`, and the other specifies the stencil aspect.

Because depth or stencil aspect buffer to image copies may require format conversions on some implementations, they are not supported on queues that do not support graphics.

When copying to a depth aspect, and the `VK_EXT_depth_range_unrestricted` extension is not enabled, the data in buffer memory must be in the range [0,1], or the resulting values are undefined.

Copies are done layer by layer starting with image layer `baseArrayLayer` member of `imageSubresource`. `layerCount` layers are copied from the source image or to the destination image.

**Valid Usage**

- VUID-VkBufferImageCopy-bufferRowLength-00195
  *bufferRowLength* must be 0, or greater than or equal to the *width* member of `imageExtent`

- VUID-VkBufferImageCopy-bufferImageHeight-00196
  *bufferImageHeight* must be 0, or greater than or equal to the *height* member of `imageExtent`

- VUID-VkBufferImageCopy-aspectMask-00212
  The *aspectMask* member of `imageSubresource` must only have a single bit set

- VUID-VkBufferImageCopy-imageExtent-06659
  *imageExtent.width* must not be 0

- VUID-VkBufferImageCopy-imageExtent-06660
  *imageExtent.height* must not be 0

- VUID-VkBufferImageCopy-imageExtent-06661
  *imageExtent.depth* must not be 0

**Valid Usage (Implicit)**

- VUID-VkBufferImageCopy-imageSubresource-parameter
  *imageSubresource* must be a valid `VkImageSubresourceLayers` structure

More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBufferToImage2(
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01828**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01829**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-01830**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter**
  `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2` structure

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBufferToImage2-renderpass**
  This command must only be called outside of a render pass instance
This command **must** only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

</tbody>
</table>

The `VkCopyBufferToImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferToImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyBufferToImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the copy.
- `regionCount` is the number of regions to copy.
• `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

## Valid Usage

- **VUID-VkCopyBufferToImageInfo2-pRegions-04565**
  If the image region specified by each element of `pRegions` does not contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, it **must** be a region that is contained within the specified `imageSubresource` of `dstImage`.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-04554**
  If the image region specified by each element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, the rotated destination region as described in Buffer and Image Addressing with Rotation **must** be contained within `dstImage`.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-04555**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` **must** have a 1x1x1 texel block extent.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06203**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` **must** be of type `VK_IMAGE_TYPE_2D`.

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06204**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `dstImage` **must** not have a multi-planar format.

- **VUID-VkCopyBufferToImageInfo2-pRegions-00171**
  `srcBuffer` **must** be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of `pRegions`.

- **VUID-VkCopyBufferToImageInfo2-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00174**
  `srcBuffer` **must** have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-VkCopyBufferToImageInfo2-dstImage-01997**
  The `format features` of `dstImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`.

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00176**
  If `srcBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyBufferToImageInfo2-dstImage-00177**
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- **VUID-VkCopyBufferToImageInfo2-dstImage-00178**
  If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkCopyBufferToImageInfo2-dstImage-00179**
**dstImage** must have a sample count equal to **VK_SAMPLE_COUNT_1_BIT**

- **VUID-VkCopyBufferToImageInfo2-dstImageLayout-00180**
  **dstImageLayout** must specify the layout of the image subresources of **dstImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- **VUID-VkCopyBufferToImageInfo2-dstImageLayout-01396**
  **dstImageLayout** must be **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-01701**
  The **imageSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyBufferToImageInfo2-imageSubresource-01702**
  The **imageSubresource.baseArrayLayer** + **imageSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created

- **VUID-VkCopyBufferToImageInfo2-imageOffset-01793**
  The **imageOffset** and **imageExtent** members of each element of **pRegions** must respect the image transfer granularity requirements of **commandBuffer**'s command pool's queue family, as described in **VkQueueFamilyProperties**

- **VUID-VkCopyBufferToImageInfo2-dstImage-02543**
  **dstImage** must not have been created with **flags** containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-VkCopyBufferToImageInfo2-commandBuffer-04477**
  If the queue family used to create the **VkCommandPool** which **commandBuffer** was allocated from does not support **VK_QUEUE_GRAPHICS_BIT**, for each element of **pRegions**, the **aspectMask** member of **imageSubresource** must not be **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT**

- **VUID-VkCopyBufferToImageInfo2-pRegions-06223**
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.x** and (**imageExtent.width + imageOffset.x**) must both be greater than or equal to 0 and less than or equal to the width of the specified **imageSubresource** of **dstImage**

- **VUID-VkCopyBufferToImageInfo2-pRegions-06224**
  For each element of **pRegions** not containing **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, **imageOffset.y** and (**imageExtent.height + imageOffset.y**) must both be greater than or equal to 0 and less than or equal to the height of the specified **imageSubresource** of **dstImage**

- **VUID-VkCopyBufferToImageInfo2-bufferOffset-01558**
  If **dstImage** does not have either a depth/stencil or a **multi-planar format**, then for each element of **pRegions**, **bufferOffset** must be a multiple of the format's texel block size

- **VUID-VkCopyBufferToImageInfo2-bufferOffset-01559**
  If **dstImage** has a **multi-planar format**, then for each element of **pRegions**, **bufferOffset** must be a multiple of the element size of the compatible format for the format and the **aspectMask** of the **imageSubresource** as defined in **Compatible formats of planes of multi-planar formats**
If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1.

For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `dstImage`.

If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `imageOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `imageOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, `imageOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `dstImage`.

For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `dstImage`.

For each element of `pRegions, imageSubresource.aspectMask` must specify aspects present in `dstImage`.
If dstImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes).

If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1.

For each element of pRegions, bufferRowLength divided by the texel block extent width and then multiplied by the texel block size of dstImage must be less than or equal to $2^{31} - 1$.

If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset member of any element of pRegions must be a multiple of 4.

If dstImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4.

Valid Usage (Implicit)

- VUID-VkCopyBufferToImageInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2

- VUID-VkCopyBufferToImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkCopyBufferToImageInfo2-srcBuffer-parameter
  srcBuffer must be a valid VkBuffer handle

- VUID-VkCopyBufferToImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-VkCopyBufferToImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-VkCopyBufferToImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy2 structures

- VUID-VkCopyBufferToImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkCopyBufferToImageInfo2-commonparent
  Both of dstImage, and srcBuffer must have been created, allocated, or retrieved from the same VkDevice

To copy data from an image object to a buffer object, call:
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer.

### Valid Usage (Implicit)

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter**
  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.
• VUID-vkCmdCopyImageToBuffer2-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdCopyImageToBuffer2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`’s command pool’s queue family, as described in `VkQueueFamilyProperties`

- **VUID-VkCopyImageToBufferInfo2-srcImage-00199**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1
For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

For each element of `pRegions`, `bufferRowLength` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferImageHeight` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `bufferOffset` must be a multiple of the texel block size of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageOffset.x` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageOffset.y` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageOffset.z` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.x` and `extent.width` does not equal the width of the the subresource specified by `srcSubresource`, `extent.width` must be a multiple of the texel block extent width of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.y` and `extent.height` does not equal the height of the the subresource specified by `srcSubresource`, `extent.height` must be a multiple of the texel block extent height of the `VkFormat` of `srcImage`.

For each element of `pRegions`, if the sum of `imageOffset.z` and `extent.depth` does not equal the depth of the the subresource specified by `srcSubresource`, `extent.depth` must be a multiple of the texel block extent depth of the `VkFormat` of `srcImage`.

For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`.

If `srcImage` has a multi-planar format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`. 
VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes)

- VUID-VkCopyImageToBufferInfo2-baseArrayLayer-00213
  If `srcImage` is of type VK_IMAGE_TYPE_3D, for each element of `pRegions`, `imageSubresource.baseArrayLayer` must be 0 and `imageSubresource.layerCount` must be 1

- VUID-VkCopyImageToBufferInfo2-pRegions-07277
  For each element of `pRegions`, `bufferRowLength` divided by the texel block extent width and then multiplied by the texel block size of `srcImage` must be less than or equal to $2^{31}-1$

- VUID-VkCopyImageToBufferInfo2-commandBuffer-04052
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

- VUID-VkCopyImageToBufferInfo2-srcImage-04053
  If `srcImage` has a depth/stencil format, the `bufferOffset` member of any element of `pRegions` must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkCopyImageToBufferInfo2-sType-sType
  `sType` must be VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2

- VUID-VkCopyImageToBufferInfo2-pNext-pNext
  `pNext` must be NULL

- VUID-VkCopyImageToBufferInfo2-srcImage-parameter
  `srcImage` must be a valid `VkImage` handle

- VUID-VkCopyImageToBufferInfo2-srcImageLayout-parameter
  `srcImageLayout` must be a valid `VkImageLayout` value

- VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-VkCopyImageToBufferInfo2-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkBufferImageCopy2` structures

- VUID-VkCopyImageToBufferInfo2-regionCount-arraylength
  `regionCount` must be greater than 0

- VUID-VkCopyImageToBufferInfo2-commonparent
  Both of `dstBuffer`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice`

For both `vkCmdCopyBufferToImage2` and `vkCmdCopyImageToBuffer2`, each element of `pRegions` is a structure defined as:

```c
// Provided by VK_VERSION_1_3
```
typedef struct VkBufferImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.
• **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.
• **imageSubresource** is a **VkImageSubresourceLayers** used to specify the specific image subresources of the image used for the source or destination image data.
• **imageOffset** selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.
• **imageExtent** is the size in texels of the image to copy in **width**, **height** and **depth**.

This structure is functionally identical to **VkBufferImageCopy**, but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

### Valid Usage

- **VUID-VkBufferImageCopy2-bufferRowLength-00195**
  
  bufferRowLength **must** be 0, or greater than or equal to the width member of **imageExtent**

- **VUID-VkBufferImageCopy2-bufferImageHeight-00196**
  
  bufferImageHeight **must** be 0, or greater than or equal to the height member of **imageExtent**

- **VUID-VkBufferImageCopy2-aspectMask-00212**
  
  The aspectMask member of **imageSubresource** **must** only have a single bit set

- **VUID-VkBufferImageCopy2-imageExtent-06659**
  
  imageExtent.width **must** not be 0
• VUID-VkBufferImageCopy2-imageExtent-06660
  imageExtent.height must not be 0
• VUID-VkBufferImageCopy2-imageExtent-06661
  imageExtent.depth must not be 0

Valid Usage (Implicit)
• VUID-VkBufferImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2
• VUID-VkBufferImageCopy2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of
  VkCopyCommandTransformInfoQCOM
• VUID-VkBufferImageCopy2-sType-unique
  The sType value of each struct in the pNext chain must be unique
• VUID-VkBufferImageCopy2-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

For both vkCmdCopyBufferToImage2 and vkCmdCopyImageToBuffer2, each region copied can include a rotation. To specify a region with rotation, add the VkCopyCommandTransformInfoQCOM to the pNext chain of VkBufferImageCopy2. When a rotation is specified, Buffer and Image Addressing with Rotation specifies how coordinates of texels in the source region are rotated by transform to produce texel coordinates in the destination region. When rotation is specified, the source and destination images must each be 2D images.

The VkRenderPassTransformBeginInfoQCOM structure is defined as:

```c
// Provided by VK_QCOM_rotated_copy_commands
typedef struct VkCopyCommandTransformInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkCopyCommandTransformInfoQCOM;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• transform is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied.

Valid Usage
• VUID-VkCopyCommandTransformInfoQCOM-transform-04560
  transform must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,
  VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR, VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR, or
  VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR
20.3.1. Buffer and Image Addressing

Pseudocode for image/buffer addressing of uncompressed formats is:

```plaintext
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;
address of (x,y,z) = region->bufferOffset + ((z * imageHeight) + y) * rowLength + x) * texelBlockSize;

where x,y,z range from (0,0,0) to region->imageExtent.{width,height,depth}.
```

Note that `imageOffset` does not affect addressing calculations for buffer memory. Instead, `bufferOffset` can be used to select the starting address in buffer memory.

For block-compressed formats, all parameters are still specified in texels rather than compressed texel blocks, but the addressing math operates on whole compressed texel blocks. Pseudocode for compressed copy addressing is:

```plaintext
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

compressedTexelBlockSizeInBytes = <compressed texel block size taken from the src/dstImage>;
rowLength = (rowLength + compressedTexelBlockWidth - 1) / compressedTexelBlockWidth;
imageHeight = (imageHeight + compressedTexelBlockHeight - 1) / compressedTexelBlockHeight;

address of (x,y,z) = region->bufferOffset + ((z * imageHeight) + y) * rowLength + x) * compressedTexelBlockSizeInBytes;
```
where \( x, y, z \) range from \((0, 0, 0)\) to \(\text{region->imageExtent.} \{\text{width/compressedTexelBlockWidth, height/compressedTexelBlockHeight, depth/compressedTexelBlockDepth}\}\).

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the \texttt{imageExtent} must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions:

- If \texttt{imageExtent.width} is not a multiple of the compressed texel block width, then \((\text{imageExtent.width} + \text{imageOffset.x})\) must equal the image subresource width.
- If \texttt{imageExtent.height} is not a multiple of the compressed texel block height, then \((\text{imageExtent.height} + \text{imageOffset.y})\) must equal the image subresource height.
- If \texttt{imageExtent.depth} is not a multiple of the compressed texel block depth, then \((\text{imageExtent.depth} + \text{imageOffset.z})\) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

### 20.3.2. Buffer and Image Addressing with Rotation

When \texttt{VkCopyCommandTransformInfoQCOM} is in the \texttt{pNext} chain of \texttt{VkBufferImageCopy2}, a \textit{rotated copy} is specified. For both \texttt{vkCmdCopyImageToBuffer2} and \texttt{vkCmdCopyBufferToImage2}, a rotation is applied to the region used for image accesses, but a non-rotated region is used for buffer accesses. In the case of rotated \texttt{vkCmdCopyImageToBuffer2}, the source image region is rotated. In the case of rotated \texttt{vkCmdCopyBufferToImage2}, the destination image region is rotated.

For a \textit{rotated copy}, the following description of rotated addressing replaces the description in \textit{Buffer and Image Addressing}.

The following code computes rotation of unnormalized coordinates.

```c
// Forward rotation of unnormalized coordinates
VkOffset2D RotateUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = -in.y;
            out.y = in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
```
Pseudocode for image/buffer addressing of uncompressed formats with rotation is:

```c
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

// Buffer addressing is unaffected by rotation:
address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) *
texelBlockSize;

// When copying from buffer to image, the source buffer coordinates x,y,z range from
// (0,0,0) to
// region->imageExtent.{width,height,depth}. The source extent is rotated by the
// specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated destination
// region.
// For each source buffer texel with coordinates (x,y) the rotated destination image
// texel has
// coordinates (x',y') defined as:
// (x',y') = RotateUV(x,y) + ImageOffset.{x,y}

// When copying from image to buffer, the the destination buffer coordinates x,y,z
// range from (0,0,0) to
// region->imageExtent.{width,height,depth}. The destination extent is rotated by the
// specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated source
// region. For each destination
// buffer texel with coordinates (x,y) the rotated source image texel has coordinates
// (x',y') defined as:
// (x',y') = RotateUV(x,y) + ImageOffset.{x,y}
```

Note that `imageOffset` does not affect addressing calculations for buffer memory. Instead,
bufferOffset can be used to select the starting address in buffer memory.

20.4. Image Copies with Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageBlit* pRegions,
    VkFilter filter);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

`vkCmdBlitImage` must not be used for multisampled source or destination images. Use `vkCmdResolveImage` for this purpose.

As the sizes of the source and destination extents can differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

  \[
  u_{\text{base}} = i + \frac{1}{2} \\
  v_{\text{base}} = j + \frac{1}{2} \\
  w_{\text{base}} = k + \frac{1}{2}
  \]
• These base coordinates are then offset by the first destination offset:

\[ u_{\text{offset}} = u_{\text{base}} - x_{\text{dst}0} \]

\[ v_{\text{offset}} = v_{\text{base}} - y_{\text{dst}0} \]

\[ w_{\text{offset}} = w_{\text{base}} - z_{\text{dst}0} \]

\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

• The scale is determined from the source and destination regions, and applied to the offset coordinates:

\[ \text{scale}_u = (x_{\text{src}1} - x_{\text{src}0}) / (x_{\text{dst}1} - x_{\text{dst}0}) \]

\[ \text{scale}_v = (y_{\text{src}1} - y_{\text{src}0}) / (y_{\text{dst}1} - y_{\text{dst}0}) \]

\[ \text{scale}_w = (z_{\text{src}1} - z_{\text{src}0}) / (z_{\text{dst}1} - z_{\text{dst}0}) \]

\[ u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u \]

\[ v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

• Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from \textit{srcImage}:

\[ u = u_{\text{scaled}} + x_{\text{src}0} \]

\[ v = v_{\text{scaled}} + y_{\text{src}0} \]

\[ w = w_{\text{scaled}} + z_{\text{src}0} \]

\[ q = \text{mipLevel} \]
These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of filter, a mipmap mode of VK_SAMPLER_MIPMAP_MODE_NEAREST and an address mode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

Note
Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the baseArrayLayer member of srcSubresource for the source and dstSubresource for the destination. layerCount layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by dstOffsets[0].z and dstOffsets[1].z are sampled from slices in the source region bounded by srcOffsets[0].z and srcOffsets[1].z. If the filter parameter is VK_FILTER_LINEAR then the value sampled from the source image is taken by doing linear filtering using the interpolated z coordinate represented by w in the previous equations. If the filter parameter is VK_FILTER_NEAREST then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

• Integer formats can only be converted to other integer formats with the same signedness.
• No format conversion is supported between depth/stencil images. The formats must match.
• Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
• For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
• After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

Valid Usage
• VUID-vkCmdBlitImage-commandBuffer-01834
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image.

The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`.

The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`.

The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation.

The format features of `srcImage` must contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

`srcImage` must not use a format that requires a sampler Y'CbCr conversion.

`srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

`srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

The format features of `dstImage` contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`.

`dstImage` must not use a format that requires a sampler Y'CbCr conversion.

`dstImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

If `dstImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`dstImageLayout` must specify the layout of the image subresources of `dstImage` specified in...
pRegions at the time this command is executed on a VkDevice

- VUID-vkCmdBlitImage-dstImageLayout-01399
  
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdBlitImage-srcImage-00229
  
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

- VUID-vkCmdBlitImage-srcImage-00230
  
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

- VUID-vkCmdBlitImage-srcImage-00231
  
  If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format

- VUID-vkCmdBlitImage-srcImage-00232
  
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

- VUID-vkCmdBlitImage-srcImage-00233
  
  srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdBlitImage-dstImage-00234
  
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdBlitImage-filter-02001
  
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdBlitImage-filter-02002
  
  If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdBlitImage-filter-00237
  
  If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D

- VUID-vkCmdBlitImage-srcSubresource-01705
  
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdBlitImage-dstSubresource-01706
  
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdBlitImage-srcSubresource-01707
  
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-vkCmdBlitImage-dstSubresource-01708
  
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-vkCmdBlitImage-dstImage-02545
**dstImage** and **srcImage** **must** not have been created with **flags** containing **VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT**

- **VUID-vkCmdBlitImage-srcImage-00240**
  If either **srcImage** or **dstImage** is of type **VK_IMAGE_TYPE_3D**, then for each element of **pRegions**, **srcSubresource.baseArrayLayer** and **dstSubresource.baseArrayLayer** **must** each be 0, and **srcSubresource.layerCount** and **dstSubresource.layerCount** **must** each be 1

- **VUID-vkCmdBlitImage-aspectMask-00241**
  For each element of **pRegions**, **srcSubresource.aspectMask** **must** specify aspects present in **srcImage**

- **VUID-vkCmdBlitImage-aspectMask-00242**
  For each element of **pRegions**, **dstSubresource.aspectMask** **must** specify aspects present in **dstImage**

- **VUID-vkCmdBlitImage-srcOffset-00243**
  For each element of **pRegions**, **srcOffsets[0].x** and **srcOffsets[1].x** **must** both be greater than or equal to 0 and less than or equal to the width of the specified **srcSubresource** of **srcImage**

- **VUID-vkCmdBlitImage-srcOffset-00244**
  For each element of **pRegions**, **srcOffsets[0].y** and **srcOffsets[1].y** **must** both be greater than or equal to 0 and less than or equal to the height of the specified **srcSubresource** of **srcImage**

- **VUID-vkCmdBlitImage-srcOffset-00245**
  If **srcImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **srcOffsets[0].y** **must** be 0 and **srcOffsets[1].y** **must** be 1

- **VUID-vkCmdBlitImage-dstOffset-00246**
  For each element of **pRegions**, **dstOffsets[0].x** and **dstOffsets[1].x** **must** both be greater than or equal to 0 and less than or equal to the width of the specified **dstSubresource** of **dstImage**

- **VUID-vkCmdBlitImage-dstOffset-00247**
  For each element of **pRegions**, **dstOffsets[0].y** and **dstOffsets[1].y** **must** both be greater than or equal to 0 and less than or equal to the height of the specified **dstSubresource** of **dstImage**

- **VUID-vkCmdBlitImage-dstOffset-00248**
  If **dstImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **dstOffsets[0].y** **must** be 0 and **dstOffsets[1].y** **must** be 1

- **VUID-vkCmdBlitImage-dstOffset-00249**
  For each element of **pRegions**, **dstOffsets[0].z** and **dstOffsets[1].z** **must** both be greater than or equal to 0 and less than or equal to the depth of the specified **dstSubresource** of **dstImage**

- **VUID-vkCmdBlitImage-dstOffset-00250**
  If **dstImage** is of type **VK_IMAGE_TYPE_1D**, then for each element of **pRegions**, **dstOffsets[0].y** **must** be 0 and **dstOffsets[1].y** **must** be 1
than or equal to \( \theta \) and less than or equal to the depth of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \)

- VUID-vkCmdBlitImage-dstImage-00252
  If \( \text{dstImage} \) is of type \( \text{VK_IMAGE_TYPE_1D} \) or \( \text{VK_IMAGE_TYPE_2D} \), then for each element of \( p\text{Regions}, \text{dstOffsets}[0].z \) must be \( \theta \) and \( \text{dstOffsets}[1].z \) must be 1

---

**Valid Usage (Implicit)**

- VUID-vkCmdBlitImage-commandBuffer-parameter
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- VUID-vkCmdBlitImage-srcImage-parameter
  \( \text{srcImage} \) must be a valid \( \text{VkImage} \) handle

- VUID-vkCmdBlitImage-srcImageLayout-parameter
  \( \text{srcImageLayout} \) must be a valid \( \text{VkImageLayout} \) value

- VUID-vkCmdBlitImage-dstImage-parameter
  \( \text{dstImage} \) must be a valid \( \text{VkImage} \) handle

- VUID-vkCmdBlitImage-dstImageLayout-parameter
  \( \text{dstImageLayout} \) must be a valid \( \text{VkImageLayout} \) value

- VUID-vkCmdBlitImage-pRegions-parameter
  \( p\text{Regions} \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkImageBlit} \) structures

- VUID-vkCmdBlitImage-filter-parameter
  \( \text{filter} \) must be a valid \( \text{VkFilter} \) value

- VUID-vkCmdBlitImage-commandBuffer-recording
  \( \text{commandBuffer} \) must be in the \( \text{recording state} \)

- VUID-vkCmdBlitImage-commandBuffer-cmdpool
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics operations

- VUID-vkCmdBlitImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBlitImage-regionCount-arraylength
  \( \text{regionCount} \) must be greater than \( \theta \)

- VUID-vkCmdBlitImage-commonparent
  Each of \( \text{commandBuffer}, \text{dstImage}, \) and \( \text{srcImage} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)

---

**Host Synchronization**

- Host access to \( \text{commandBuffer} \) must be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageBlit` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

### Valid Usage

- VUID-VkImageBlit-aspectMask-00238
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match
- VUID-VkImageBlit-layerCount-00239
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

### Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure
- VUID-VkImageBlit-dstSubresource-parameter
A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBlitImage2(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- **VUID-vkCmdBlitImage2-commandBuffer-01834**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01835**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdBlitImage2-commandBuffer-01836**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

### Valid Usage (Implicit)

- **VUID-vkCmdBlitImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdBlitImage2-pBlitImageInfo-parameter**
  `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2` structure
• VUID-vkCmdBlitImage2-commandBuffer-recording
  `commandBuffer` must be in the `recording` state

• VUID-vkCmdBlitImage2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdBlitImage2-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdBlitImage2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>

The `VkBlitImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBlitImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageBlit2* pRegions;
    VkFilter filter;
} VkBlitImageInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
```
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the blit.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the blit.
- **regionCount** is the number of regions to blit.
- **pRegions** is a pointer to an array of `VkImageBlit2` structures specifying the regions to blit.
- **filter** is a `VkFilter` specifying the filter to apply if the blits require scaling.

### Valid Usage

- **VUID-VkBlitImageInfo2-pRegions-00215**
  The source region specified by each element of `pRegions` must be a region that is contained within `srcImage`

- **VUID-VkBlitImageInfo2-pRegions-00216**
  The destination region specified by each element of `pRegions` must be a region that is contained within `dstImage`

- **VUID-VkBlitImageInfo2-pRegions-00217**
  The union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory with any texel that may be sampled during the blit operation

- **VUID-VkBlitImageInfo2-srcImage-01999**
  The format features of `srcImage` must contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`

- **VUID-VkBlitImageInfo2-srcImage-06421**
  `srcImage` must not use a format that requires a sampler Y’C_bC_r conversion

- **VUID-VkBlitImageInfo2-srcImage-00219**
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-VkBlitImageInfo2-srcImage-00220**
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkBlitImageInfo2-srcImageLayout-00221**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkBlitImageInfo2-srcImageLayout-01398**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`

- **VUID-VkBlitImageInfo2-dstImage-02000**
  The format features of `dstImage` must contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`
- VUID-VkBlitImageInfo2-dstImage-06422
  \textit{dstImage} \textbf{must} not use a format that requires a sampler \(Y'CBCR\) conversion

- VUID-VkBlitImageInfo2-dstImage-00224
  \textit{dstImage} \textbf{must} have been created with \texttt{VK_IMAGE_USAGE_TRANSFER_DST_BIT} usage flag

- VUID-VkBlitImageInfo2-dstImage-00225
  If \textit{dstImage} is non-sparse then it \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-VkBlitImageInfo2-dstImageLayout-00226
  \textit{dstImageLayout} \textbf{must} specify the layout of the image subresources of \textit{dstImage} specified in \textit{pRegions} at the time this command is executed on a \texttt{VkDevice}

- VUID-VkBlitImageInfo2-dstImageLayout-01399
  \textit{dstImageLayout} \textbf{must} be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}

- VUID-VkBlitImageInfo2-srcImage-00229
  If either of \textit{srcImage} or \textit{dstImage} was created with a signed integer \texttt{VkFormat}, the other \textbf{must} also have been created with a signed integer \texttt{VkFormat}

- VUID-VkBlitImageInfo2-srcImage-00230
  If either of \textit{srcImage} or \textit{dstImage} was created with an unsigned integer \texttt{VkFormat}, the other \textbf{must} also have been created with an unsigned integer \texttt{VkFormat}

- VUID-VkBlitImageInfo2-srcImage-00231
  If either of \textit{srcImage} or \textit{dstImage} was created with a depth/stencil format, the other \textbf{must} have exactly the same format

- VUID-VkBlitImageInfo2-srcImage-00232
  If \textit{srcImage} was created with a depth/stencil format, \textit{filter} \textbf{must} be \texttt{VK_FILTER_NEAREST}

- VUID-VkBlitImageInfo2-srcImage-00233
  \textit{srcImage} \textbf{must} have been created with a \texttt{samples} value of \texttt{VK_SAMPLE_COUNT_1_BIT}

- VUID-VkBlitImageInfo2-dstImage-00234
  \textit{dstImage} \textbf{must} have been created with a \texttt{samples} value of \texttt{VK_SAMPLE_COUNT_1_BIT}

- VUID-VkBlitImageInfo2-filter-02001
  If \textit{filter} is \texttt{VK_FILTER_LINEAR}, then the format features of \textit{srcImage} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT}

- VUID-VkBlitImageInfo2-filter-02002
  If \textit{filter} is \texttt{VK_FILTER_CUBIC_EXT}, then the format features of \textit{srcImage} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT}

- VUID-VkBlitImageInfo2-filter-00237
  If \textit{filter} is \texttt{VK_FILTER_CUBIC_EXT}, \textit{srcImage} \textbf{must} be of type \texttt{VK_IMAGE_TYPE_2D}

- VUID-VkBlitImageInfo2-srcSubresource-01705
  The \texttt{srcSubresource.mipLevel} member of each element of \textit{pRegions} \textbf{must} be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \textit{srcImage} was created

- VUID-VkBlitImageInfo2-dstSubresource-01706
  The \texttt{dstSubresource.mipLevel} member of each element of \textit{pRegions} \textbf{must} be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \textit{dstImage} was created
The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

dstImage and srcImage must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions, srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

For each element of `pRegions, srcSubresource.aspectMask` must specify aspects present in `srcImage`.

For each element of `pRegions, dstSubresource.aspectMask` must specify aspects present in `dstImage`.

For each element of `pRegions, srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

For each element of `pRegions, srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

For each element of `pRegions, srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions, srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1.

For each element of `pRegions, dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`.
For each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].y \) and \( \text{dstOffsets}[1].y \) must both be greater than or equal to 0 and less than or equal to the height of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is of type \VK_IMAGE_TYPE_1D\, then for each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].y \) must be 0 and \( \text{dstOffsets}[1].y \) must be 1.

For each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].z \) and \( \text{dstOffsets}[1].z \) must both be greater than or equal to 0 and less than or equal to the depth of the specified \( \text{dstSubresource} \) of \( \text{dstImage} \).

If \( \text{dstImage} \) is of type \VK_IMAGE_TYPE_1D\ or \VK_IMAGE_TYPE_2D\, then for each element of \( \text{pRegions} \), \( \text{dstOffsets}[0].z \) must be 0 and \( \text{dstOffsets}[1].z \) must be 1.

If any element of \( \text{pRegions} \) contains \VKCopyCommandTransformInfoQCOM\ in its \( \text{pNext} \) chain, then \( \text{srcImage} \) and \( \text{dstImage} \) must not be block-compressed images.

If any element of \( \text{pRegions} \) contains \VKCopyCommandTransformInfoQCOM\ in its \( \text{pNext} \) chain, then \( \text{srcImage} \) must be of type \VK_IMAGE_TYPE_2D\.

If any element of \( \text{pRegions} \) contains \VKCopyCommandTransformInfoQCOM\ in its \( \text{pNext} \) chain, then \( \text{srcImage} \) must not have a multi-planar format.

**Valid Usage (Implicit)**

- \( \text{VKBlitImageInfo2-sType-sType} \) must be \VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2\.
  - The \( \text{pNext} \) must be \text{NULL}\.
  - The \( \text{srcImage} \) must be a valid \VKImage\ handle.
  - The \( \text{srcImageLayout} \) must be a valid \VKImageLayout\ value.
  - The \( \text{dstImage} \) must be a valid \VKImage\ handle.
  - The \( \text{dstImageLayout} \) must be a valid \VKImageLayout\ value.
  - The \( \text{pRegions} \) must be a valid pointer to an array of \regionCount\ valid \VKImageBlit2\ structures.
  - The \( \text{filter} \) must be a valid \VKFilter\ value.
• VUID-VkBlitImageInfo2-regionCount-arraylength
  regionCount must be greater than 0
• VUID-VkBlitImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageBlit2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageBlit2 {
  VkStructureType sType;
  const void* pNext;
  VkImageSubresourceLayers srcSubresource;
  VkOffset3D srcOffsets[2];
  VkImageSubresourceLayers dstSubresource;
  VkOffset3D dstOffsets[2];
} VkImageBlit2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageBlit2 VkImageBlit2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubresource is the subresource to blit from.
• srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the source region within srcSubresource.
• dstSubresource is the subresource to blit into.
• dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.

For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.

Valid Usage

• VUID-VkImageBlit2-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match
• VUID-VkImageBlit2-layerCount-00239
  The layerCount member of srcSubresource and dstSubresource must match
Valid Usage (Implicit)

- **VUID-VkImageBlit2-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_IMAGE_BLIT_2`

- **VUID-VkImageBlit2-pNext-pNext**
  
  *pNext* must be `NULL` or a pointer to a valid instance of `VkCopyCommandTransformInfoQCOM`

- **VUID-VkImageBlit2-sType-unique**
  
  The *sType* value of each struct in the *pNext* chain must be unique

- **VUID-VkImageBlit2-srcSubresource-parameter**
  
  *srcSubresource* must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageBlit2-dstSubresource-parameter**
  
  *dstSubresource* must be a valid `VkImageSubresourceLayers` structure

For `vkCmdBlitImage2`, each region copied can include a rotation. To specify a rotated region, add `VkCopyCommandTransformInfoQCOM` to the *pNext* chain of `VkImageBlit2`. For each region with a rotation specified, Image Blits with Scaling and Rotation specifies how coordinates are rotated prior to sampling from the source image. When rotation is specified, the source and destination images must each be 2D images, have a 1x1x1 texel block extent, and only one plane.

### 20.4.1. Image Blits with Scaling and Rotation

When `VkCopyCommandTransformInfoQCOM` is in the *pNext* chain of `VkImageBlit2`, the specified region is rotated during the blit. The following description of rotated addressing replaces the description in `vkCmdBlitImage`.

The following code computes rotation of normalized coordinates.

```c
// rotation of normalized coordinates
VkOffset2D RotateNormUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = in.y;
            out.y = 1.0 - in.x;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
            out.x = 1.0 - in.x;
            out.y = 1.0 - in.y;
            break;
    }
}
```
• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

\[ u_{\text{base}} = i + \frac{1}{2} \]
\[ v_{\text{base}} = j + \frac{1}{2} \]
\[ w_{\text{base}} = k + \frac{1}{2} \]

• These base coordinates are then offset by the first destination offset:

\[ u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}} \]
\[ v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}} \]
\[ w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}} \]
\[ a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}} \]

• The UV destination coordinates are scaled by the destination region, rotated, and scaled by the source region.

\[ u_{\text{dest scaled}} = u_{\text{offset}} / (x_{\text{dst1}} - x_{\text{dst0}}) \]
\[ v_{\text{dest scaled}} = v_{\text{offset}} / (y_{\text{dst1}} - y_{\text{dst0}}) \]

\[ (u_{\text{src scaled}}, v_{\text{src scaled}}) = \text{RotateNormUV}(u_{\text{dest scaled}}, v_{\text{dest scaled}}, \text{transform}) \]

\[ u_{\text{scaled}} = u_{\text{src scaled}} \times (x_{\text{src1}} - x_{\text{src0}}) \]
\[ v_{\text{scaled}} = v_{\text{src\_scaled}} \times (y_{\text{Src1}} - y_{\text{Src0}}) \]

- The \( W \) coordinate is unaffected by rotation. The scale is determined from the ratio of source and destination regions, and applied to the offset coordinate:

\[ \text{scale}_w = (z_{\text{Src1}} - z_{\text{Src0}}) / (z_{\text{dst1}} - z_{\text{dst0}}) \]

\[ w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w \]

- Finally the source offset is added to the scaled source coordinates, to determine the final unnormalized coordinates used to sample from \( \text{srcImage} \):

\[ u = u_{\text{scaled}} + x_{\text{Src0}} \]

\[ v = v_{\text{scaled}} + y_{\text{Src0}} \]

\[ w = w_{\text{scaled}} + z_{\text{Src0}} \]

\[ q = \text{mipLevel} \]

\[ a = a_{\text{offset}} + \text{baseArrayCount}_{\text{src}} \]

These coordinates are used to sample from the source image as described for Image Operations, with the filter mode equal to that of \( \text{filter} \); a mipmap mode of \( \text{VK_SAMPLER_MIPMAP_MODE_NEAREST} \); and an address mode of \( \text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE} \). Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

### 20.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResolveImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageResolve* pRegions);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **srcImage** is the source image.
• **srcImageLayout** is the layout of the source image subresources for the resolve.
• **dstImage** is the destination image.
• **dstImageLayout** is the layout of the destination image subresources for the resolve.
• **regionCount** is the number of regions to resolve.
• **pRegions** is a pointer to an array of **VkImageResolve** structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample's value is selected for each pixel.

**srcOffset** and **dstOffset** select the initial *x*, *y*, and *z* offsets in texels of the sub-regions of the source and destination image data. **extent** is the size in texels of the source image to resolve in *width*, *height* and *depth*. Each element of **pRegions** **must** be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with **baseArrayLayer** member of **srcSubresource** for the source and **dstSubresource** for the destination. **layerCount** layers are resolved to the destination image.

### Valid Usage

- **VUID-vkCmdResolveImage-commandBuffer-01837**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcImage** **must** not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01838**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstImage** **must** not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01839**
  If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstImage** **must** not be an unprotected image

- **VUID-vkCmdResolveImage-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory

- **VUID-vkCmdResolveImage-srcImage-00256**
  If **srcImage** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdResolveImage-srcImage-00257**
  **srcImage** **must** have a sample count equal to any valid sample count value other than **VK_SAMPLE_COUNT_1_BIT**

- **VUID-vkCmdResolveImage-dstImage-00258**

1414
If \textit{dstImage} is non-sparse then \textbf{must} be bound completely and contiguously to a single \texttt{VkDeviceMemory} object

- VUID-vkCmdResolveImage-dstImage-00259
  \textit{dstImage} \textbf{must} have a sample count equal to \texttt{VK_SAMPLE_COUNT_1_BIT}

- VUID-vkCmdResolveImage-srcImageLayout-00260
  \textit{srcImageLayout} \textbf{must} specify the layout of the image subresources of \textit{srcImage} specified in \textit{pRegions} at the time this command is executed on a \texttt{VkDevice}

- VUID-vkCmdResolveImage-srcImageLayout-01400
  \textit{srcImageLayout} \textbf{must} be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}

- VUID-vkCmdResolveImage-dstImageLayout-00262
  \textit{dstImageLayout} \textbf{must} specify the layout of the image subresources of \textit{dstImage} specified in \textit{pRegions} at the time this command is executed on a \texttt{VkDevice}

- VUID-vkCmdResolveImage-dstImageLayout-01401
  \textit{dstImageLayout} \textbf{must} be \texttt{VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR}, \texttt{VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL} or \texttt{VK_IMAGE_LAYOUT_GENERAL}

- VUID-vkCmdResolveImage-dstImage-02003
  The \textit{format features} of \textit{dstImage} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT}

- VUID-vkCmdResolveImage-linearColorAttachment-06519
  If the \textit{linearColorAttachment} feature is enabled and the image is created with \texttt{VK_IMAGE_TILING_LINEAR}, the \textit{format features} of \textit{dstImage} \textbf{must} contain \texttt{VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV}

- VUID-vkCmdResolveImage-srcImage-01386
  \textit{srcImage} and \textit{dstImage} \textbf{must} have been created with the same image format

- VUID-vkCmdResolveImage-srcSubresource-01709
  The \textit{srcSubresource.mipLevel} member of each element of \textit{pRegions} \textbf{must} be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \textit{srcImage} was created

- VUID-vkCmdResolveImage-dstSubresource-01710
  The \textit{dstSubresource.mipLevel} member of each element of \textit{pRegions} \textbf{must} be less than the \texttt{mipLevels} specified in \texttt{VkImageCreateInfo} when \textit{dstImage} was created

- VUID-vkCmdResolveImage-srcSubresource-01711
  The \textit{srcSubresource.baseArrayLayer} + \textit{srcSubresource.layerCount} of each element of \textit{pRegions} \textbf{must} be less than or equal to the \texttt{arrayLayers} specified in \texttt{VkImageCreateInfo} when \textit{srcImage} was created

- VUID-vkCmdResolveImage-dstSubresource-01712
  The \textit{dstSubresource.baseArrayLayer} + \textit{dstSubresource.layerCount} of each element of \textit{pRegions} \textbf{must} be less than or equal to the \texttt{arrayLayers} specified in \texttt{VkImageCreateInfo} when \textit{dstImage} was created

- VUID-vkCmdResolveImage-dstImage-02546
  \textit{dstImage} and \textit{srcImage} \textbf{must} not have been created with \texttt{flags} containing \texttt{VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT}

- VUID-vkCmdResolveImage-srcImage-04446
If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1.

- VUID-vkCmdResolveImage-srcImage-04447
  If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1.

- VUID-vkCmdResolveImage-srcOffset-00269
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

- VUID-vkCmdResolveImage-srcOffset-00270
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

- VUID-vkCmdResolveImage-srcImage-00271
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1.

- VUID-vkCmdResolveImage-srcOffset-00272
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

- VUID-vkCmdResolveImage-dstSubresource-00274
  If `dstSubresource` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1.

- VUID-vkCmdResolveImage-dstSubresource-00275
  For each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`.

- VUID-vkCmdResolveImage-dstSubresource-00276
  If `dstSubresource` is of type `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1.

- VUID-vkCmdResolveImage-dstSubresource-00277
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`.

- VUID-vkCmdResolveImage-dstOffset-00278
  If `dstImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `dstOffset.z` must be 0 and `extent.depth` must be 1.
Valid Usage (Implicit)

- VUID-vkCmdResolveImage-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdResolveImage-srcImage-parameter
  `srcImage` must be a valid `VkImage` handle
- VUID-vkCmdResolveImage-srcImageLayout-parameter
  `srcImageLayout` must be a valid `VkImageLayout` value
- VUID-vkCmdResolveImage-dstImage-parameter
  `dstImage` must be a valid `VkImage` handle
- VUID-vkCmdResolveImage-dstImageLayout-parameter
  `dstImageLayout` must be a valid `VkImageLayout` value
- VUID-vkCmdResolveImage-pRegions-parameter
  `pRegions` must be a valid pointer to an array of `regionCount` valid `VkImageResolve` structures
- VUID-vkCmdResolveImage-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdResolveImage-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdResolveImage-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdResolveImage-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdResolveImage-regionCount-arraylength
  `regionCount` must be greater than 0
- VUID-vkCmdResolveImage-commonparent
  Each of `commandBuffer`, `dstImage`, and `srcImage` must have been created, allocated, or retrieved from the same `VkDevice"
Host Synchronization

• Host access to `commandBuffer` must be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;  
    VkOffset3D srcOffset;  
    VkImageSubresourceLayers dstSubresource;  
    VkOffset3D dstOffset;  
    VkExtent3D extent;
} VkImageResolve;
```

• `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.
• `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
• `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

Valid Usage

• VUID-VkImageResolve-aspectMask-00266
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`
• VUID-VkImageResolve-layerCount-00267
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match
Valid Usage (Implicit)

- VUID-VkImageResolve-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageResolve-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
   VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);

or the equivalent command

// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);

- commandBuffer is the command buffer into which the command will be recorded.
- pResolveImageInfo is a pointer to a VkResolveImageInfo2 structure describing the resolve parameters.

This command is functionally identical to vkCmdResolveImage, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdResolveImage2-commandBuffer-01837
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image

- VUID-vkCmdResolveImage2-commandBuffer-01838
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- VUID-vkCmdResolveImage2-commandBuffer-01839
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image
Valid Usage (Implicit)

- **VUID-vkCmdResolveImage2-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdResolveImage2-pResolveImageInfo-parameter**
  
  `pResolveImageInfo` **must** be a valid pointer to a valid `VkResolveImageInfo2` structure

- **VUID-vkCmdResolveImage2-commandBuffer-recording**
  
  `commandBuffer` **must** be in the **recording state**

- **VUID-vkCmdResolveImage2-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdResolveImage2-renderpass**
  
  This command **must** only be called outside of a render pass instance

- **VUID-vkCmdResolveImage2-videocoding**
  
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

The `VkResolveImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageResolve2* pRegions;
};
```
VkResolveImageInfo2;

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the resolve.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the resolve.
- `regionCount` is the number of regions to resolve.
- `pRegions` is a pointer to an array of `VkImageResolve2` structures specifying the regions to resolve.

### Valid Usage

- **VUID-VkResolveImageInfo2-pRegions-00255**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory

- **VUID-VkResolveImageInfo2-srcImage-00256**
  If `srcImage` is non-sparse then **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-srcImage-00257**
  `srcImage` **must** have a sample count equal to any valid sample count value other than `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-dstImage-00258**
  If `dstImage` is non-sparse then **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkResolveImageInfo2-dstImage-00259**
  `dstImage` **must** have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- **VUID-VkResolveImageInfo2-srcImageLayout-01400**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2-srcImageLayout-00260**
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-VkResolveImageInfo2-dstImageLayout-00261**
  `dstImageLayout` **must** specify the layout of the image subresources of `dstImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
pRegions at the time this command is executed on a VkDevice

- VUID-VkResolveImageInfo2-dstImageLayout-01401
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-VkResolveImageInfo2-dstImage-02003
The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT

- VUID-VkResolveImageInfo2-linearColorAttachment-06519
If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, the format features of dstImage must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

- VUID-VkResolveImageInfo2-srcImage-01386
srcImage and dstImage must have been created with the same image format

- VUID-VkResolveImageInfo2-srcSubresource-01709
The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

- VUID-VkResolveImageInfo2-dstSubresource-01710
The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

- VUID-VkResolveImageInfo2-srcSubresource-01711
The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

- VUID-VkResolveImageInfo2-dstSubresource-01712
The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

- VUID-VkResolveImageInfo2-dstImage-02546
dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-VkResolveImageInfo2-srcImage-04446
If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

- VUID-VkResolveImageInfo2-dstImage-02547
If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

- VUID-VkResolveImageInfo2-srcOffset-00269
For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkResolveImageInfo2-srcOffset-00270
For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be
greater than or equal to 0 and less than or equal to the height of the specified 
srcSubresource of srcImage

• VUID-VkResolveImageInfo2-srcImage-00271
If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

• VUID-VkResolveImageInfo2-srcOffset-00272
For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

• VUID-VkResolveImageInfo2-srcImage-00273
If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

• VUID-VkResolveImageInfo2-dstOffset-00274
For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

• VUID-VkResolveImageInfo2-dstOffset-00275
For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

• VUID-VkResolveImageInfo2-dstImage-00276
If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

• VUID-VkResolveImageInfo2-dstOffset-00277
For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

• VUID-VkResolveImageInfo2-dstImage-00278
If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

• VUID-VkResolveImageInfo2-srcImage-06762
srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

• VUID-VkResolveImageInfo2-srcImage-06763
The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

• VUID-VkResolveImageInfo2-dstImage-06764
dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-VkResolveImageInfo2-dstImage-06765
The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

Valid Usage (Implicit)

• VUID-VkResolveImageInfo2-sType-sType
sType must be VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2

- VUID-VkResolveImageInfo2-pNext-pNext
  pNext must be NULL

- VUID-VkResolveImageInfo2-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-VkResolveImageInfo2-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-VkResolveImageInfo2-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve2 structures

- VUID-VkResolveImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkResolveImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageResolve2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcSubresource and dstSubresource are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively.
Resolve of depth/stencil images is not supported.

- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.
- `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

## Valid Usage

- **VUID-VkImageResolve2-aspectMask-00266**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageResolve2-layerCount-00267**
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

## Valid Usage (Implicit)

- **VUID-VkImageResolve2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2`

- **VUID-VkImageResolve2-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkImageResolve2-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageResolve2-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

## 20.6. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
void vkCmdWriteBufferMarker2AMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies the pipeline stage whose completion triggers the marker write.
- `dstBuffer` is the buffer where the marker will be written.
- `dstOffset` is the byte offset into the buffer where the marker will be written.
- `marker` is the 32-bit value of the marker.
The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarker2AMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command’s specified stage.

While consecutive buffer marker writes with the same stage parameter implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both stage and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**
Similar to `vkCmdWriteTimestamp2`, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.

**Note**
Implementations may only support a limited number of pipelined marker write operations in flight at a given time. Thus an excessive number of marker write operations may degrade command execution performance.

### Valid Usage

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03929**
  If the geometryShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03930**
  If the tessellationShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03931**
  If the conditionalRendering feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03932**
  If the fragmentDensityMap feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_FRAGMENT DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03933**
  If the transformFeedback feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03934**
  If the meshShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_MESH_SHADER_BIT_EXT`

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03935**
  If the taskShader feature is not enabled, stage must not contain `VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_EXT`
If neither the shadingRateImage or attachmentFragmentShadingRate are enabled, stage must not contain VK_PIPELINE_STAGE_2_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If the subpassShading feature is not enabled, stage must not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI.

If the invocationMask feature is not enabled, stage must not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI.

The synchronization2 feature must be enabled.

Stage must include only a single pipeline stage.

Stage must include only stages that are valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

DstOffset must be less than or equal to the size of dstBuffer minus 4.

DstBuffer must have been created with the VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag.

If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

DstOffset must be a multiple of 4.

Valid Usage (Implicit)

CommandBuffer must be a valid VkCommandBuffer handle.

Stage must be a valid combination of VkPipelineStageFlagBits2 values.

DstBuffer must be a valid VkBuffer handle.

CommandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations.

This command must only be called outside of a video coding scope.
Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_AMD_buffer_marker
void vkCmdWriteBufferMarkerAMD(
    VkCommandBuffer commandBuffer,    
    VkPipelineStageFlagBits pipelineStage,    
    VkBuffer dstBuffer,    
    VkDeviceSize dstOffset,    
    uint32_t marker);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value specifying the pipeline stage whose completion triggers the marker write.
- `dstBuffer` is the buffer where the marker will be written to.
- `dstOffset` is the byte offset into the buffer where the marker will be written to.
- `marker` is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarkerAMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes...
and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**
Similar to `vkCmdWriteTimestamp`, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.

**Note**
Implementations may only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations may degrade command execution performance.

**Valid Usage**

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04074**
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04075**
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04076**
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04077**
  If the `conditionalRendering` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04078**
  If the `fragmentDensityMap` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079**
  If the `transformFeedback` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04080**
  If the `meshShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-07077**
  If the `task shaders` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TASK_SHADER_BIT_EXT`

- **VUID-vkCmdWriteBufferMarkerAMD-shadingRateImage-07314**
  If neither the `shadingRateImage` or `attachmentFragmentShadingRate` are enabled,
pipelineStage must not be VK_PIPELINE_STAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdWriteBufferMarkerAMD-synchronization2-06489
  If the synchronization2 feature is not enabled, pipelineStage must not be VK_PIPELINE_STAGE_NONE

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01798
dstOffset must be less than or equal to the size of dstBuffer minus 4

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01799
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01800
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01801
dstOffset must be a multiple of 4

Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-parameter
  If pipelineStage is not 0, pipelineStage must be a valid VkPipelineStageFlagBits value

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-parameter
dstBuffer must be a valid VkBuffer handle

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarkerAMD-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteBufferMarkerAMD-commonparent
  Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Chapter 21. Drawing Commands

Drawing commands (commands with Draw in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline must be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the pInputAssemblyState member of the VkGraphicsPipelineCreateInfo structure, which is of type VkPipelineInputAssemblyStateCreateInfo:

```plaintext
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **topology** is a VkPrimitiveTopology defining the primitive topology, as described below.
- **primitiveRestartEnable** controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (vkCmdDrawIndexed, vkCmdDrawMultiIndexedEXT, and vkCmdDrawIndexedIndirect), and the special index value is either 0xFFFFFFFF when the indexType parameter of vkCmdBindIndexBuffer is equal to VK_INDEX_TYPE_UINT32, 0xFF when indexType is equal to VK_INDEX_TYPE_UINT8_EXT, or 0xFFFF when indexType is equal to VK_INDEX_TYPE_UINT16. Primitive restart is not allowed for “list” topologies, unless one of the features primitiveTopologyPatchListRestart (for VK_PRIMITIVE_TOPOLOGY_PATCH_LIST) or primitiveTopologyListRestart (for all other list topologies) is enabled.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified elements. The primitive restart index value comparison is performed before adding the vertexOffset value to the index value.
Valid Usage

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252
  If `topology` is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, and `primitiveRestartEnable` is `VK_TRUE`, the `primitiveTopologyListRestart` feature must be enabled.

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253
  If `topology` is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, and `primitiveRestartEnable` is `VK_TRUE`, the `primitiveTopologyPatchListRestart` feature must be enabled.

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429
  If the `geometryShader` feature is not enabled, `topology` must not be any of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`.

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430
  If the `tessellationShader` feature is not enabled, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`.

• VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, `topology` must not be `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`.

Valid Usage (Implicit)

• VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO`.

• VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext
  `pNext` must be `NULL`.

• VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask
  `flags` must be `0`.

• VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter
  `topology` must be a valid `VkPrimitiveTopology` value.

```c
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

`VkPipelineInputAssemblyStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of
primitives, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the primitive restart enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- **VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetPrimitiveRestartEnable-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
21.1. Primitive Topologies

Primitive topology determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by VkPrimitiveTopology are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of separate point primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of separate line primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of connected line primitives with consecutive lines sharing a vertex.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all triangles sharing a common vertex. If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR:triangleFans is VK_FALSE, then triangle fans are not supported by the implementation, and **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** must not be used.
• **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** specifies a series of separate line primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY** specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** specifies a series of separate triangle primitives with adjacency.

• **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY** specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.

• **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST** specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>•</td>
<td>Vertex</td>
</tr>
<tr>
<td>5</td>
<td>Vertex Number</td>
</tr>
<tr>
<td>🔴</td>
<td>Provoking Vertex</td>
</tr>
<tr>
<td>————</td>
<td>Primitive Edge</td>
</tr>
<tr>
<td>.......</td>
<td>Adjacency Edge</td>
</tr>
<tr>
<td>△</td>
<td>Winding Order</td>
</tr>
</tbody>
</table>

A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only.

Sequence position of a vertex within the provided vertex data.

Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading.

An edge connecting the points of a main primitive.

Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader.

The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point.

The diagrams are supported with mathematical definitions where the vertices \( v \) and primitives \( p \) are numbered starting from 0; \( v_0 \) is the first vertex in the provided data and \( p_0 \) is the first primitive in the set of primitives defined by the vertices and topology.

To dynamically set primitive topology, call:

```cpp
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveTopology(  
    VkCommandBuffer commandBuffer,  
    VkPrimitiveTopology primitiveTopology);
```

or the equivalent command

```cpp
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetPrimitiveTopologyEXT(  
    VkCommandBuffer commandBuffer,  
    VkPrimitiveTopology primitiveTopology);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter  
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter  
  `primitiveTopology` must be a valid `VkPrimitiveTopology` value
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording  
  `commandBuffer` must be in the `recording` state
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetPrimitiveTopology-videoencoding  
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 21.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

*Table 29. Topology classes*
<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</td>
</tr>
<tr>
<td>Line</td>
<td>VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Triangle</td>
<td>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Patch</td>
<td>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</td>
</tr>
</tbody>
</table>

### 21.1.2. Point Lists

When the topology is `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to `vertexCount`.

![Diagram of point list](image)

### 21.1.3. Line Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST`, each consecutive pair of vertices defines a single line primitive, according to the equation:

\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \(\lceil \text{vertexCount}/2 \rceil\).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i+1} \).

### 21.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[
p_i = \{ v_i, v_{i+1} \}
\]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

### 21.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[
p_i = \{ v_{3i}, v_{3i+1}, v_{3i+2} \}
\]
The number of primitives generated is equal to $\lfloor \text{vertexCount}/3 \rfloor$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{3i}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{3i+2}$.

### 21.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

$$p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\}$$

The number of primitives generated is equal to $\max(0, \text{vertexCount}-2)$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_i$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is $v_{i+2}$. 
The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

### 21.1.7. Triangle Fans

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

\[ p_i = \{ v_{i+1}, v_{i+2}, v_0 \} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

Note
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.
21.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[ p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/4 \rfloor \).

When the provokingVertexMode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+1} \).

When the provokingVertexMode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{4i+2} \).

21.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-3) \).

When the provokingVertexMode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p \) is \( v_{i+2} \).

21.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[
p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\}
\]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a geometry shader.

The number of primitives generated is equal to \( \left\lfloor \text{vertexCount}/6 \right\rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p \) is \( v_{6i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p \) is \( v_{6i+4} \).
21.1.11. Triangle Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices. The number of primitives generated, \( n \), is equal to \( \lfloor \max(0, \text{vertexCount} - 4)/2 \rfloor \).

If \( n=1 \), the primitive is defined as:

\[
p = \{v_0, v_1, v_2, v_5, v_4, v_3\}
\]

If \( n>1 \), the total primitive consists of different vertices according to where it is in the strip:

\[
p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+6}, v_{2i+4}, v_{2i+3}\} \text{ when } i=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+2}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+5}, v_{2i+2}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0
\]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex
for $p_i$ is always $v_{2i}$.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for $p_i$ is always $v_{2i+4}$. 
21.1.12. Patch Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`, each consecutive set of \( m \) vertices defines a single patch primitive, according to the equation:

\[
p_i = \{v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)}\}
\]

where \( m \) is equal to `VkPipelineTessellationStateCreateInfo::patchControlPoints`.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \([\text{vertexCount}/m]\).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the
VkDrawIndirectCommand are stored in buffer, from lower indirect buffer addresses to higher addresses.

3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered vertexIndex to a higher numbered vertexIndex.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
   - For draws using mesh shaders, the order is provided by mesh shading.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.

6. If geometry shading is active, by the order new primitives are generated by geometry shading.

7. If the polygon mode is not VK_POLYGON_MODE_FILL, or VK_POLYGON_MODE_FILL_RECTANGLE_NV, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.

### 21.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
  - vkCmdDrawIndirectCount
Indexed drawing commands read index values from an index buffer and use this to compute the vertexIndex value for the vertex shader. These commands are:

- `vkCmdDrawIndexed`
- `vkCmdDrawIndexedIndirect`
- `vkCmdDrawIndexedIndirectCount`
- `vkCmdDrawIndexedIndirectCountKHR`
- `vkCmdDrawIndexedIndirectCountAMD`
- `vkCmdDrawMultiIndexedEXT`

To bind an index buffer to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
define void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkBuffer buffer,                // Provided by VK_VERSION_1_0
    VkDeviceSize offset,            // Provided by VK_VERSION_1_0
    VkIndexType indexType           // Provided by VK_VERSION_1_0
)
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `indexType` is a `VkIndexType` value specifying the size of the indices.

**Valid Usage**

- **VUID-vkCmdBindIndexBuffer-offset-00431**
  - `offset` must be less than the size of `buffer`
- **VUID-vkCmdBindIndexBuffer-offset-00432**
  - The sum of `offset` and the address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the type indicated by `indexType`
- **VUID-vkCmdBindIndexBuffer-buffer-00433**
  - `buffer` must have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag
- **VUID-vkCmdBindIndexBuffer-buffer-00434**
  - If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
- **VUID-vkCmdBindIndexBuffer-indexType-02507**
  - `indexType` must not be `VK_INDEX_TYPE_NONE_KHR`
If `indexType` is `VK_INDEX_TYPE_UINT8_EXT`, the `indexTypeUint8` feature must be enabled.

**Valid Usage (Implicit)**

- VUID-vkCmdBindIndexBuffer-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdBindIndexBuffer-buffer-parameter
  buffer must be a valid `VkBuffer` handle
- VUID-vkCmdBindIndexBuffer-indexType-parameter
  indexType must be a valid `VkIndexType` value
- VUID-vkCmdBindIndexBuffer-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdBindIndexBuffer-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdBindIndexBuffer-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
```
VK_INDEX_TYPE_UINT32 = 1,
// Provided by VK_KHR_acceleration_structure
VK_INDEX_TYPE_NONE_KHR = 1000165000,
// Provided by VK_EXT_index_type_uint8
VK_INDEX_TYPE_UINT8_EXT = 1000265000,
// Provided by VK_NV_ray_tracing
VK_INDEX_TYPE_NONE_NV = VK_INDEX_TYPE_NONE_KHR,
} VkIndexType;

- VK_INDEX_TYPE_UINT16 specifies that indices are 16-bit unsigned integer values.
- VK_INDEX_TYPE_UINT32 specifies that indices are 32-bit unsigned integer values.
- VK_INDEX_TYPE_NONE_KHR specifies that no indices are provided.
- VK_INDEX_TYPE_UINT8_EXT specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as indirect drawing commands.

All drawing commands interact with the robustBufferAccess feature.

To record a non-indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDraw(  
    VkCommandBuffer commandBuffer,  
    uint32_t vertexCount,  
    uint32_t instanceCount,  
    uint32_t firstVertex,  
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

**Valid Usage**

- VUID-vkCmdDraw-magFilter-04553
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDraw-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDraw-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDraw-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDraw-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDraw-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- **VUID-vkCmdDraw-OpTypeImage-07027**
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITEWITHOUT_FORMAT_BIT`

- **VUID-vkCmdDraw-OpTypeImage-07028**
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READWITHOUT_FORMAT_BIT`
For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDraw-OpTypeImage-07030**
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- **VUID-vkCmdDraw-None-02697**
  For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDraw-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- **VUID-vkCmdDraw-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDraw-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdDraw-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDraw-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDraw-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with ImplicitLod,
Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDraw-None-02704**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDraw-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDraw-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDraw-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdDraw-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDraw-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdDraw-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

- **VUID-vkCmdDraw-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

- **VUID-vkCmdDraw-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 64

- **VUID-vkCmdDraw-SampledType-04471**
  If a **VkImageView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 32

- **VUID-vkCmdDraw-SampledType-04472**
  If a **VkBufferView** with a **VkFormat** that has a 64-bit component width is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 64

- **VUID-vkCmdDraw-SampledType-04473**
  If a **VkBufferView** with a **VkFormat** that has a component width less than 64-bit is accessed as a result of this command, the **SampledType** of the **OpTypeImage** operand of that instruction must have a **Width** of 32

- **VUID-vkCmdDraw-sparseImageInt64Atomics-04474**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkImage** objects created with the **VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT** flag must not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDraw-sparseImageInt64Atomics-04475**
  If the **sparseImageInt64Atomics** feature is not enabled, **VkBuffer** objects created with the **VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT** flag must not be accessed by atomic instructions through an **OpTypeImage** with a **SampledType** with a **Width** of 64 by this command

- **VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06971**
  If **OpImageWeightedSampleQCOM** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM**

- **VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06972**
  If **OpImageWeightedSampleQCOM** uses a **VkImageView** as a sample weight image as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM**

- **VUID-vkCmdDraw-OpImageBoxFilterQCOM-06973**
  If **OpImageBoxFilterQCOM** is used to sample a **VkImageView** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM**

- **VUID-vkCmdDraw-OpImageBlockMatchSSDQCOM-06974**
  If **OpImageBlockMatchSSDQCOM** is used to read from an **VkImageView** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_2_BLOCK_Matching_BIT_QCOM**

- **VUID-vkCmdDraw-OpImageBlockMatchSADQCOM-06975**
  If **OpImageBlockMatchSADQCOM** is used to read from an **VkImageView** as a result of this command, then the image view's **format features** must contain **VK_FORMAT_FEATURE_2_BLOCK_Matching_BIT_QCOM**
If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDraw-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDraw-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDraw-subpass-02685**
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDraw-None-02686**
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDraw-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDraw-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

- **VUID-vkCmdDraw-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- **VUID-vkCmdDraw-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- **VUID-vkCmdDraw-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`. 
• VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**

• VUID-vkCmdDraw-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set

• VUID-vkCmdDraw-viewportCount-03417
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled but not the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, then **vkCmdSetViewportWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

• VUID-vkCmdDraw-scissorCount-03418
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then **vkCmdSetScissorWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **scissorCount** parameter of **vkCmdSetScissorWithCount** must match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

• VUID-vkCmdDraw-viewportCount-03419
  If the bound graphics pipeline state was created with both the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**

• VUID-vkCmdDraw-viewportCount-04137
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline **must** have been created with **VkPipelineViewportWScalingStateCreateInfoNV::viewportCount** greater or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**

• VUID-vkCmdDraw-viewportCount-04138
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDraw-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called in the current command buffer prior to this drawing command
dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} \textbf{must} have been called in the current command buffer prior to this drawing command and the \texttt{logicOp} \textbf{must} be a valid \texttt{VkLogicOp} value

- \textbf{VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552}
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the bound graphics pipeline was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCount} \textbf{must} have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} \textbf{must} be \texttt{1}

- \textbf{VUID-vkCmdDraw-blendEnable-04727}
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain \texttt{VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT}, then the \texttt{blendEnable} member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} \textbf{must} be \texttt{VK_FALSE}

- \textbf{VUID-vkCmdDraw-multisampledRenderToSingleSampled-07284}
  If rasterization is not disabled in the bound graphics pipeline, and none of the \texttt{VK_AMD_mixed_attachment_samples} extension, the \texttt{VK_NV_framebuffer_mixed_samples} extension, or the \texttt{multisampledRenderToSingleSampled} feature are enabled, then \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} \textbf{must} be the same as the current subpass color and/or depth/stencil attachments

- \textbf{VUID-vkCmdDraw-imageView-06172}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the depth attachment

- \textbf{VUID-vkCmdDraw-imageView-06173}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the stencil attachment

- \textbf{VUID-vkCmdDraw-imageView-06174}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL}, this command \textbf{must} not write any values to the depth attachment

- \textbf{VUID-vkCmdDraw-imageView-06175}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the stencil attachment

- \textbf{VUID-vkCmdDraw-imageView-06176}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of
**pDepthAttachment** is **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL**, this command **must** not write any values to the depth attachment

- **VUID-vkCmdDraw-imageView-06177**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the **imageView** member of **pStencilAttachment** is not **VK_NULL_HANDLE**, and the **layout** member of **pStencilAttachment** is **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDraw-viewMask-06178**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the currently bound graphics pipeline **must** have been created with a **VkPipelineRenderingCreateInfo::viewMask** equal to **VkRenderingInfo::viewMask**

- **VUID-vkCmdDraw-colorAttachmentCount-06179**
  If the current render pass instance was begun with **vkCmdBeginRendering**, the currently bound graphics pipeline **must** have been created with a **VkPipelineRenderingCreateInfo::colorAttachmentCount** equal to **VkRenderingInfo::colorAttachmentCount**

- **VUID-vkCmdDraw-colorAttachmentCount-06180**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingInfo::colorAttachmentCount** greater than **0**, then each element of the **VkRenderingInfo::pColorAttachments** array with a **imageView** not equal to **VK_NULL_HANDLE** **must** have been created with a **VkFormat** equal to the corresponding element of **VkPipelineRenderingCreateInfo::pColorAttachmentFormats** used to create the currently bound graphics pipeline

- **VUID-vkCmdDraw-attachmentCount-06667**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** dynamic state enabled then **vkCmdSetColorWriteEnableEXT** **must** have been called in the current command buffer prior to this drawing command, and the **attachmentCount** parameter of **vkCmdSetColorWriteEnableEXT** **must** be greater than or equal to the **VkPipelineColorBlendStateCreateInfo::attachmentCount** of the currently bound graphics pipeline

- **VUID-vkCmdDraw-attachmentCount-06815**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** dynamic state enabled then **vkCmdSetColorWriteEnableEXT** **must** have been called in the current command buffer prior to this drawing command, and the **attachmentCount** parameter of **vkCmdSetColorWriteEnableEXT** **must** be less than or equal to the **maxColorAttachments** member of **VkPhysicalDeviceLimits**

- **VUID-vkCmdDraw-pDepthAttachment-06181**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline **must** be equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**

- **VUID-vkCmdDraw-pStencilAttachment-06182**
  If the current render pass instance was begun with **vkCmdBeginRendering** and
VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDraw-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDraw-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdDraw-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

- VUID-vkCmdDraw-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDraw-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDraw-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the
VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

• VUID-vkCmdDraw-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDraw-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDraw-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

• VUID-vkCmdDraw-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

• VUID-vkCmdDraw-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

• VUID-vkCmdDraw-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

• VUID-vkCmdDraw-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

• VUID-vkCmdDraw-commandBuffer-02713
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must** not write to any resource.

- **VUID-vkCmdDraw-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` **must** not be a protected command buffer.

- **VUID-vkCmdDraw-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDraw-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDraw-None-02721**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in `Vertex Input Description`.

- **VUID-vkCmdDraw-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDraw-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`.

- **VUID-vkCmdDraw-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-None-04875**
  If the bound graphics pipeline state was created with the```
VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT  dynamic state enabled then
vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-None-04879
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT  dynamic state enabled then
  vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDraw-stage-06481
  The bound graphics pipeline must not have been created with the
  VkPipelineShaderStageCreateInfo::stage member of an element of
  VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or
  VK_SHADER_STAGE_MESH_BIT_EXT

Valid Usage (Implicit)

- VUID-vkCmdDraw-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDraw-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDraw-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDraw-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDraw-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>

</table>
To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer` ::`indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_EXT` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

### Valid Usage

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndexed-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDrawIndexed-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawIndexed-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDrawIndexed-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawIndexed-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- VUID-vkCmdDrawIndexed-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

- VUID-vkCmdDrawIndexed-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is Unknown, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDrawIndexed-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is Unknown, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDrawIndexed-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`

- VUID-vkCmdDrawIndexed-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is Unknown then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`
For each set $n$ that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.

If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawIndexed-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdDrawIndexed-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_b C_R conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDrawIndexed-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_b C_R conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdDrawIndexed-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawIndexed-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawIndexed-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawIndexed-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawIndexed-SampledType-04472**
If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- VUID-vkCmdDrawIndexed-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- VUID-vkCmdDrawIndexed-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- VUID-vkCmdDrawIndexed-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- VUID-vkCmdDrawIndexed-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDrawIndexed-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDrawIndexed-OpImageBlockMatchSADQCOM-06976
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDrawIndexed-OpImageWeightedSampleQCOM-06977
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`. 
If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`.

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and...
the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set.

- VUID-vkCmdDrawIndexed-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then *vkCmdSetSampleLocationsEXT must* have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexed-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then *vkCmdSetViewportWithCount must* have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of *vkCmdSetViewportWithCount must* match the `viewportCount` parameter of the pipeline.

- VUID-vkCmdDrawIndexed-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then *vkCmdSetScissorWithCount must* have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of *vkCmdSetScissorWithCount must* match the `viewportCount` parameter of the pipeline.

- VUID-vkCmdDrawIndexed-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both *vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must* have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of *vkCmdSetViewportWithCount must* match the `viewportCount` parameter of the pipeline.

- VUID-vkCmdDrawIndexed-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline **must** have been created with *VkPipelineViewportWScalingStateCreateInfoNV :viewportCount* greater or equal to the `viewportCount` parameter in the last call to *vkCmdSetViewportWithCount*.

- VUID-vkCmdDrawIndexed-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the `viewportCount` parameter in the last call to *vkCmdSetViewportWScalingNV must be* greater than or equal to the `viewportCount` parameter in the last call to *vkCmdSetViewportWithCount*.

- VUID-vkCmdDrawIndexed-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
If the bound graphics pipeline is created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} and
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV} dynamic states enabled, then the
\texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} must
be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}.

If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a
\texttt{VkPipelineViewportSwizzleStateCreateInfoNV} structure chained from
\texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline must have been
created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}.

If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a
\texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure chained from
\texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline must have been
created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}.

If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_RASTERIZER\_DISCARD\_ENABLE} dynamic state enabled then
\texttt{vkCmdSetRasterizerDiscardEnable} must have been called in the current command buffer
prior to this drawing command.

If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_DEPTH\_BIAS\_ENABLE} dynamic state enabled then
\texttt{vkCmdSetDepthBiasEnable} must have been called in the current command buffer prior
to this drawing command.

If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_LOGIC\_OP\_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current
command buffer prior to this drawing command and the \texttt{logicOp} must be a valid
\texttt{VkLogicOp} value.

If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the
bound graphics pipeline was created with the \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT}
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write
to the PrimitiveShadingRateKHR built-in, then *vkCmdSetViewportWithCount must* have been called in the current command buffer prior to this drawing command, and the *viewportCount* parameter of *vkCmdSetViewportWithCount must* be 1

- **VUID-vkCmdDrawIndexed-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s *format features* do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the *pAttachments* member of *pColorBlendState must* be `VK_FALSE`

- **VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07284**
  If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples must` be the same as the current subpass color and/or depth/stencil attachments

- **VUID-vkCmdDrawIndexed-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pDepthAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pDepthAttachment is* `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command *must* not write any values to the depth attachment

- **VUID-vkCmdDrawIndexed-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pStencilAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pStencilAttachment is* `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command *must* not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexed-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pDepthAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pDepthAttachment is* `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command *must* not write any values to the depth attachment

- **VUID-vkCmdDrawIndexed-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pStencilAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pStencilAttachment is* `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command *must* not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexed-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pDepthAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pDepthAttachment is* `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command *must* not write any values to the depth attachment

- **VUID-vkCmdDrawIndexed-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of *pStencilAttachment is not* `VK_NULL_HANDLE`, and the `layout` member of *pStencilAttachment is* `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command *must* not write any values to the stencil attachment
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo`::`attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`pDepthAttachment`->`imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo`::`depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo`::`pDepthAttachment`->`imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`pStencilAttachment`->`imageView` was not `VK_NULL_HANDLE`, the value of ` VkPipelineRenderingCreateInfo`::`stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo`::`pStencilAttachment`->`imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR`::`imageView` was not `VK_NULL_HANDLE`, the value of `VkRenderingFragmentShadingRateAttachmentInfoKHR`::`imageView` was not
VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

- VUID-vkCmdDrawIndexed-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT.

- VUID-vkCmdDrawIndexed-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawIndexed-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.

- VUID-vkCmdDrawIndexed-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView.

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or
VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexed-multisampledRenderToSingleSampled-07287
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexed-renderPass-06198
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndexed-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

- VUID-vkCmdDrawIndexed-primitivesGeneratedQueryWithNonZeroStreams-06709
If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

- VUID-vkCmdDrawIndexed-stage-07073
If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

- VUID-vkCmdDrawIndexed-commandBuffer-02712
If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDrawIndexed-commandBuffer-02713
If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDrawIndexed-commandBuffer-04617
If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected
command buffer

- **VUID-vkCmdDrawIndexed-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or VK_NULL_HANDLE buffers bound

- **VUID-vkCmdDrawIndexed-None-04008**
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be VK_NULL_HANDLE

- **VUID-vkCmdDrawIndexed-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- **VUID-vkCmdDrawIndexed-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state

- **VUID-vkCmdDrawIndexed-None-04912**
  If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexed-pStrides-04913**
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL

- **VUID-vkCmdDrawIndexed-None-04914**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexed-None-04875**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-None-04879**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command
buffer prior to this drawing command

- **VUID-vkCmdDrawIndexed-stage-06481**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdDrawIndexed-None-07312**
  An index buffer **must** be bound

- **VUID-vkCmdDrawIndexed-firstIndex-04932**
  `(indexSize × (firstIndex + indexCount) + offset)` **must** be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndexed-commandBuffer-parameter**
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawIndexed-commandBuffer-recording**
  `commandBuffer` **must** be in the recording state

- **VUID-vkCmdDrawIndexed-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdDrawIndexed-renderpass**
  This command **must** only be called inside of a render pass instance

- **VUID-vkCmdDrawIndexed-videocoding**
  This command **must** only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
</tbody>
</table>
To record an ordered sequence of drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiEXT(
    VkCommandBuffer commandBuffer,
    uint32_t drawCount,
    const VkMultiDrawInfoEXT* pVertexInfo,
    uint32_t instanceCount,
    uint32_t firstInstance,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pVertexInfo` is a pointer to an array of `VkMultiDrawInfoEXT` with vertex information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pVertexInfo`.

`drawCount` draws are executed with parameters taken from `pVertexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstVertex` and a `vertexCount` from `pVertexInfo`.

### Valid Usage

- **VUID-vkCmdDrawMultiEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMultiEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLER_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMultiEXT-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDrawMultiEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawMultiEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the
image view’s format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawMultiEXT-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMultiEXT-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMultiEXT-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMultiEXT-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-None-02697
For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMultiEXT-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to
create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMultiEXT-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMultiEXT-None-02700
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMultiEXT-commandBuffer-02701
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawMultiEXT-None-02859
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMultiEXT-None-02702
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- VUID-vkCmdDrawMultiEXT-None-02703
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- VUID-vkCmdDrawMultiEXT-None-02704
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawMultiEXT-uniformBuffers-06935
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMultiEXT-storageBuffers-06936
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either
or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMultiEXT-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdDrawMultiEXT-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

- **VUID-vkCmdDrawMultiEXT-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands.

- **VUID-vkCmdDrawMultiEXT-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format.

- **VUID-vkCmdDrawMultiEXT-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format.

- **VUID-vkCmdDrawMultiEXT-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMultiEXT-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMultiEXT-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

- **VUID-vkCmdDrawMultiEXT-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

- **VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions.
through an \texttt{OpTypeImage} with a \texttt{SampledType} with a Width of 64 by this command.

- **VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04475**
  If the \texttt{sparseImageInt64Atomics} feature is not enabled, \texttt{VkBuffer} objects created with the \texttt{VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT} flag must not be accessed by atomic instructions through an \texttt{OpTypeImage} with a \texttt{SampledType} with a Width of 64 by this command.

- **VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06971**
  If \texttt{OpImageWeightedSampleQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view’s format features must contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06972**
  If \texttt{OpImageWeightedSampleQCOM} uses a \texttt{VkImageView} as a sample weight image as a result of this command, then the image view’s format features must contain \texttt{VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageBoxFilterQCOM-06973**
  If \texttt{OpImageBoxFilterQCOM} is used to sample a \texttt{VkImageView} as a result of this command, then the image view’s format features must contain \texttt{VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSSDQCOM-06974**
  If \texttt{OpImageBlockMatchSSDQCOM} is used to read from a \texttt{VkImageView} as a result of this command, then the image view’s format features must contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSADQCOM-06975**
  If \texttt{OpImageBlockMatchSADQCOM} is used to read from a \texttt{VkImageView} as a result of this command, then the image view’s format features must contain \texttt{VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSADQCOM-06976**
  If \texttt{OpImageBlockMatchSADQCOM} or \texttt{OpImageBlockMatchSSDQCOM} is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06977**
  If \texttt{OpImageWeightedSampleQCOM}, \texttt{OpImageBoxFilterQCOM}, \texttt{OpImageBlockMatchSSDQCOM}, or \texttt{OpImageBlockMatchSADQCOM} uses a \texttt{VkSampler} as a result of this command, then the sampler must have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06978**
  If any command other than \texttt{OpImageWeightedSampleQCOM}, \texttt{OpImageBoxFilterQCOM}, \texttt{OpImageBlockMatchSSDQCOM}, or \texttt{OpImageBlockMatchSADQCOM} uses a \texttt{VkSampler} as a result of this command, then the sampler must not have been created with \texttt{VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM}.

- **VUID-vkCmdDrawMultiEXT-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDrawMultiEXT-renderPass-02684**
  The current render pass must be compatible with the renderPass member of the \texttt{VkGraphicsPipelineCreateInfo} structure specified when creating the \texttt{VkPipeline} bound to
VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawMultiEXT-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the
  VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to
  VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawMultiEXT-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a
descriptor set

• VUID-vkCmdDrawMultiEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass
  must not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawMultiEXT-None-06538
  If any recorded command in the current subpass will write to an image subresource as an
  attachment, this command must not read from the memory backing that image
  subresource in any other way than as an attachment

• VUID-vkCmdDrawMultiEXT-None-06539
  If any recorded command in the current subpass will read from an image subresource
  used as an attachment in any way other than as an attachment, this command must not
  write to that image subresource as an attachment

• VUID-vkCmdDrawMultiEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawMultiEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the stencil aspect and stencil test is enabled, all stencil ops must be
  VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawMultiEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum
  instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties
  ::maxMultiviewInstanceIndex

• VUID-vkCmdDrawMultiEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with
  VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and
  the current subpass has a depth/stencil attachment, then that attachment must have been
  created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawMultiEXT-None-06666
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then
  vkCmdSetSampleLocationsEXT must have been called in the current command buffer
  prior to this drawing command

• VUID-vkCmdDrawMultiEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the bound graphics pipeline must have been created with
VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportShadingRatePaletteStateCreateInfoNV::viewportCount greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of
vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, and the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of
vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of
vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with
VkPipelineViewportShadingRatePaletteStateCreateInfoNV::viewportCount greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV

If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount
vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiEXT-VkPipelineViewportCreateInfo-04141
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdDrawMultiEXT-VkPipelineViewportCreateInfo-04142
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• VUID-vkCmdDrawMultiEXT-None-04876
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawMultiEXT-None-04877
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawMultiEXT-logicOp-04878
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

• VUID-vkCmdDrawMultiEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

• VUID-vkCmdDrawMultiEXT-blendEnable-04727
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

• VUID-vkCmdDrawMultiEXT-multisampledRenderToSingleSampled-07284
If rasterization is not disabled in the bound graphics pipeline, and none of the
VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples
extension, or the multisampledRenderToSingleSampled feature are enabled, then
VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the
current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawMultiEXT-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
  not write any values to the depth attachment

- VUID-vkCmdDrawMultiEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
  pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
  not write any values to the stencil attachment

- VUID-vkCmdDrawMultiEXT-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this
  command must not write any values to the depth attachment

- VUID-vkCmdDrawMultiEXT-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
  pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this
  command must not write any values to the stencil attachment

- VUID-vkCmdDrawMultiEXT-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
  pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must
  not write any values to the depth attachment

- VUID-vkCmdDrawMultiEXT-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
  member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
  pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must
  not write any values to the stencil attachment

- VUID-vkCmdDrawMultiEXT-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently
  bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo
  ::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06179
  If the current render pass instance was begun with vkCmdBeginRendering, the currently
  bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo
  ::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06180
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMultiEXT-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- **VUID-vkCmdDrawMultiEXT-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- **VUID-vkCmdDrawMultiEXT-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMultiEXT-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMultiEXT-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdDrawMultiEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- **VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD`...
or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

• VUID-vkCmdDrawMultiEXT-pDepthAttachment-06186
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawMultiEXT-pStencilAttachment-06187
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawMultiEXT-multisampledRenderToSingleSampled-07285
If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

• VUID-vkCmdDrawMultiEXT-multisampledRenderToSingleSampled-07286
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawMultiEXT-multisampledRenderToSingleSampled-07287
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not
the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMultiEXT-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawMultiEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

- VUID-vkCmdDrawMultiEXT-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

- VUID-vkCmdDrawMultiEXT-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

- VUID-vkCmdDrawMultiEXT-commandBuffer-02712
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, any resource written to by the VkPipeline object bound to the pipeline bind point used by this command must not be an unprotected resource

- VUID-vkCmdDrawMultiEXT-commandBuffer-02713
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, pipeline stages other than the framebuffer-space and compute stages in the VkPipeline object bound to the pipeline bind point used by this command must not write to any resource

- VUID-vkCmdDrawMultiEXT-commandBuffer-04617
  If any of the shader stages of the VkPipeline bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawMultiEXT-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawMultiEXT-None-04008
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE
For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`.

The **multiDraw** feature **must** be enabled.

The **multiDraw** feature **must** be enabled.
**drawCount** must be less than `VkPhysicalDeviceMultiDrawPropertiesEXT::maxMultiDrawCount`

- VUID-vkCmdDrawMultiEXT-drawCount-04935
  If **drawCount** is greater than zero, `pVertexInfo` must be a valid pointer to memory containing one or more valid instances of `VkMultiDrawInfoEXT` structures

- VUID-vkCmdDrawMultiEXT-stride-04936
  **stride** must be a multiple of 4

**Valid Usage (Implicit)**

- VUID-vkCmdDrawMultiEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawMultiEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawMultiEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawMultiEXT-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMultiEXT-videocoding
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

<table>

To record an ordered sequence of indexed drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiIndexedEXT(
    VkCommandBuffer commandBuffer,
```
uint32_t
const VkMultiDrawIndexedInfoEXT*
drawCount,
const VkMultiDrawIndexedInfoEXT*
pIndexInfo,
uint32_t
instanceCount,
uint32_t
firstInstance,
uint32_t
stride,
const int32_t*
pVertexOffset);

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pIndexInfo` is a pointer to an array of `VkMultiDrawIndexedInfoEXT` with index information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pIndexInfo`.
- `pVertexOffset` is NULL or a pointer to the value added to the vertex index before indexing into the vertex buffer. When specified, `VkMultiDrawIndexedInfoEXT::offset` is ignored.

drawCount indexed draws are executed with parameters taken from `pIndexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstIndex` and an `indexCount` from `pIndexInfo`. If `pVertexOffset` is NULL, a `vertexOffset` is also read from `pIndexInfo`, otherwise the value from dereferencing `pVertexOffset` is used.

**Valid Usage**

- VUID-vkCmdDrawMultiIndexedEXT-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMultiIndexedEXT-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMulti IndexedEXT-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDrawMultiIndexedEXT-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawMultiIndexedEXT-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

For any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawMultiIndexedEXT-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMultiIndexedEXT-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values.
outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

- VUID-vkCmdDrawMultiIndexedEXT-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawMultiIndexedEXT-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawMultiIndexedEXT-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawMultiIndexedEXT-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawMultiIndexedEXT-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawMultiIndexedEXT-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawMultiIndexedEXT-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawMultiIndexedEXT-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageBlockMatchSADQCOM-06976**
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDrawMultiIndexedEXT-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawMultiIndexedEXT-subpass-02685**
  The current subpass must be compatible with the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.
The subpass index of the current render pass must be equal to the subpass member of the 
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to 
VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawMultiIndexedEXT-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a 
descriptor set

- VUID-vkCmdDrawMultiIndexedEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass must 
not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawMultiIndexedEXT-None-06538
  If any recorded command in the current subpass will write to an image subresource as an 
attachment, this command must not read from the memory backing that image 
subresource in any other way than as an attachment

- VUID-vkCmdDrawMultiIndexedEXT-None-06539
  If any recorded command in the current subpass will read from an image subresource 
used as an attachment in any way other than as an attachment, this command must not 
write to that image subresource as an attachment

- VUID-vkCmdDrawMultiIndexedEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only 
layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawMultiIndexedEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only 
layout for the stencil aspect and stencil test is enabled, all stencil ops must be 
VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawMultiIndexedEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum 
instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawMultiIndexedEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with 
VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and 
the current subpass has a depth/stencil attachment, then that attachment must have been 
created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMultiIndexedEXT-None-06666
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then 
vkCmdSetSampleLocationsEXT must have been called in the current command buffer 
prior to this drawing command

- VUID-vkCmdDrawMultiIndexedEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the 
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then 
vkCmdSetViewportWithCount must have been called in the current command buffer 
prior to this drawing command, and the viewportCount parameter of
vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04137**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04139**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- **VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04140**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- **VUID-vkCmdDrawMultiIndexedEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a 
VkPipelineViewportSwizzleStateCreateInfoNV structure chained from 
VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been 
created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or 
equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-VkPipelineVieporCreateInfo-04142
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a 
VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been 
created with VkPipelineViewportExclusiveScissorStateCreateInfoNV ::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to 
vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-None-04876
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then 
vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMultiIndexedEXT-None-04877
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then 
vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMultiIndexedEXT-logicOp-04878
  If the bound graphics pipeline state was created with the 
VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then 
VkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

• VUID-vkCmdDrawMultiIndexedEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the 
bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT 
dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the 
PrimitiveShadingRateKHR built-in, then 
vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the 
viewportCount parameter of vkCmdSetViewportWithCount must be 1

• VUID-vkCmdDrawMultiIndexedEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color 
attachment in the subpass, if the corresponding image view’s format features do not 
contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the 
corresponding element of the pAttachments member of pColorBlendState must be 
VK_FALSE

• VUID-vkCmdDrawMultiIndexedEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the 
VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples
extension, or the multisampledRenderToSingleSampled feature are enabled, then
VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the
current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawMultiIndexedEXT-imageView-06172
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must
not write any values to the depth attachment

• VUID-vkCmdDrawMultiIndexedEXT-imageView-06173
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawMultiIndexedEXT-imageView-06174
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

• VUID-vkCmdDrawMultiIndexedEXT-imageView-06175
If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawMultiIndexedEXT-viewMask-06178
If the current render pass instance was begun with vkCmdBeginRendering, the currently
bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo
::viewMask equal to VkRenderingInfo::viewMask

• VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06179
If the current render pass instance was begun with vkCmdBeginRendering, the currently
bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo
::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

• VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06180
If the current render pass instance was begun with vkCmdBeginRendering and
VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the
VkRenderingInfo::pColorAttachments array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMultiIndexedEXT-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- **VUID-vkCmdDrawMultiIndexedEXT-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- **VUID-vkCmdDrawMultiIndexedEXT-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMultiIndexedEXT-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` and the `VkRenderingInfo::colorAttachmentCount` was 1501, then the following conditions must be met:
  - `VkRenderingInfo::pColorAttachments` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.
  - If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.
parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

• VUID-vkCmdDrawMultiIndexedEXT-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawMultiIndexedEXT-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawMultiIndexedEXT-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

• VUID-vkCmdDrawMultiIndexedEXT-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawMultiIndexedEXT-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal
to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMultiIndexedEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, **rasterization discard must not** be enabled.

- **VUID-vkCmdDrawMultiIndexedEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must not** have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMultiIndexedEXT-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then **Mesh Shader Queries must not** be active.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command **must not** be an unprotected resource.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command **must not** write to any resource.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` **must not** be a protected command buffer.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must not** be `VK_NULL_HANDLE`. 
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSet Primitive Restart EnableEXT must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT.

An index buffer must be bound.

If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSet Primitive Restart EnableEXT must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT.

An index buffer must be bound.

If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSet Primitive Restart EnableEXT must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT.

An index buffer must be bound.

If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.
The multiDraw feature must be enabled:

- VUID-vkCmdDrawMultiIndexedEXT-firstIndex-04938
  (indexSize × (firstIndex + indexCount) + offset) must be less than or equal to the size of the bound index buffer, with indexSize being based on the type specified by indexType, where the index buffer, indexType, and offset are specified via vkCmdBindIndexBuffer

- VUID-vkCmdDrawMultiIndexedEXT-drawCount-04939
drawCount must be less than VkPhysicalDeviceMultiDrawPropertiesEXT::maxMultiDrawCount

- VUID-vkCmdDrawMultiIndexedEXT-drawCount-04940
  If drawCount is greater than zero, pIndexInfo must be a valid pointer to memory containing one or more valid instances of VkMultiDrawIndexedInfoEXT structures

- VUID-vkCmdDrawMultiIndexedEXT-stride-04941
  stride must be a multiple of 4

Valid Usage (Implicit):

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawMultiIndexedEXT-pVertexOffset-parameter
  If pVertexOffset is not NULL, pVertexOffset must be a valid pointer to a valid int32_t value

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawMultiIndexedEXT-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMultiIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization:

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkMultiDrawInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkMultiDrawInfoEXT {
    uint32_t firstVertex;
    uint32_t vertexCount;
} VkMultiDrawInfoEXT;
```

- `firstVertex` is the first vertex to draw.
- `vertexCount` is the number of vertices to draw.

The members of `VkMultiDrawInfoEXT` have the same meaning as the `firstVertex` and `vertexCount` parameters in `vkCmdDraw`.

The `VkMultiDrawIndexedInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkMultiDrawIndexedInfoEXT {
    uint32_t firstIndex;
    uint32_t indexCount;
    int32_t vertexOffset;
} VkMultiDrawIndexedInfoEXT;
```

- `firstIndex` is the first index to draw.
- `indexCount` is the number of vertices to draw.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer for indexed multidraws.

The `firstIndex`, `indexCount`, and `vertexOffset` members of `VkMultiDrawIndexedInfoEXT` have the same meaning as the `firstIndex`, `indexCount`, and `vertexOffset` parameters, respectively, of `vkCmdDrawIndexed`.

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,
```
vkCmdDrawIndirect behaves similarly to vkCmdDraw except that the parameters are read by the device from a buffer during execution. drawCount draws are executed by the command, with parameters taken from buffer starting at offset and increasing by stride bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndirectCommand structures. If drawCount is less than or equal to one, stride is ignored.

Valid Usage

- **VUID-vkCmdDrawIndirect-magFilter-04553**
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDrawIndirect-mipmapMode-04770**
  If a VkSampler created with.mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDrawIndirect-None-06479**
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- **VUID-vkCmdDrawIndirect-None-02691**
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- **VUID-vkCmdDrawIndirect-None-02692**
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- **VUID-vkCmdDrawIndirect-filterCubic-02694**
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

For any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, then the view's buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.
If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by
this command must not be a protected resource

- VUID-vkCmdDrawIndirect-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y′CBCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawIndirect-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y′CBCr conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawIndirect-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawIndirect-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawIndirect-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndirect-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndirect-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndirect-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this
command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06976**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-OpImageBoxFilterQCOM-06977**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirect-None-02686**
  Every input attachment used by the current subpass must be bound to the pipeline via a
• **VUID-vkCmdDrawIndirect-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• **VUID-vkCmdDrawIndirect-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

• **VUID-vkCmdDrawIndirect-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

• **VUID-vkCmdDrawIndirect-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

• **VUID-vkCmdDrawIndirect-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`.

• **VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

• **VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

• **VUID-vkCmdDrawIndirect-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

• **VUID-vkCmdDrawIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

• **VUID-vkCmdDrawIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the...
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- VUID-vkCmdDrawIndirect-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- VUID-vkCmdDrawIndirect-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirect-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirect-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirect-VkPipelineVieportCreateInfo-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of
pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirect-imageView-06173
  If the current render pass instance was begun with `vkCmdBeginRendering`, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirect-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirect-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirect-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawIndirect-colorAttachmentCount-06179
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawIndirect-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-attachmentCount-06667
  If the bound graphics pipeline state was created with the
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then
vkCmdSetColorWriteEnableEXT must have been called in the current command buffer
prior to this drawing command, and the attachmentCount parameter of
vkCmdSetColorWriteEnableEXT must be greater than or equal to the
VkPipelineColorBlendStateCreateInfo::attachmentCount of the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-attachmentCount-06815
  If the bound graphics pipeline state was created with the
  VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then
  vkCmdSetColorWriteEnableEXT must have been called in the current command buffer
  prior to this drawing command, and the attachmentCount parameter of
  vkCmdSetColorWriteEnableEXT must be less than or equal to the
  maxColorAttachments member of VkPhysicalDeviceLimits

- VUID-vkCmdDrawIndirect-pDepthAttachment-06181
  If the current render pass instance was begun with vkCmdBeginRendering and
  VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of
  VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo
  ::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirect-pStencilAttachment-06182
  If the current render pass instance was begun with vkCmdBeginRendering and
  VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of
  VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo
  ::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirect-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and
  VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with
  VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawIndirect-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and
  VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with
  VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdDrawIndirect-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or
  VkAttachmentSampleCountInfoNV structure, and the current render pass instance was
  begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a
  sample count equal to the corresponding element of the pColorAttachmentSamples member of
  VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to
  create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-pDepthAttachment-06186
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawIndirect-pStencilAttachment-06187
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07285
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07286
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawIndirect-multisampledRenderToSingleSampled-07287
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawIndirect-renderPass-06198
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffer2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of
vkCmdBindVertexBuffers2EXT must not be NULL

- VUID-vkCmdDrawIndirect-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command

- VUID-vkCmdDrawIndirect-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirect-stage-06481
  The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT

- VUID-vkCmdDrawIndirect-buffer-02708
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdDrawIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

- VUID-vkCmdDrawIndirect-offset-02710
  offset must be a multiple of 4

- VUID-vkCmdDrawIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

- VUID-vkCmdDrawIndirect-drawCount-02718
  If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1

- VUID-vkCmdDrawIndirect-drawCount-02719
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

- VUID-vkCmdDrawIndirect-drawCount-00476
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

- VUID-vkCmdDrawIndirect-drawCount-00476
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirect-drawCount-00487
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

- VUID-vkCmdDrawIndirect-drawCount-00488
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer
Valid Usage (Implicit)

- VUID-vkCmdDrawIndirect-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawIndirect-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndirect-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawIndirect-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawIndirect-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirect-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawIndirect-commonparent
  Both of `buffer` and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

The `VkDrawIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
    uint32_t vertexCount;
    uint32_t instanceCount;
    uint32_t firstVertex;
    uint32_t firstInstance;
} VkDrawIndirectCommand;
```
• **vertexCount** is the number of vertices to draw.
• **instanceCount** is the number of instances to draw.
• **firstVertex** is the index of the first vertex to draw.
• **firstInstance** is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

**Valid Usage**

- **VUID-VkDrawIndirectCommand-None-00500**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in [Vertex Input Description](#).

- **VUID-VkDrawIndirectCommand-firstInstance-00501**
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` **must be** 0

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer commandBuffer, 
    VkBuffer buffer, 
    VkDeviceSize offset, 
    VkBuffer countBuffer, 
    VkDeviceSize countBufferOffset, 
    uint32_t maxDrawCount, 
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer commandBuffer, 
    VkBuffer buffer, 
    VkDeviceSize offset, 
    VkBuffer countBuffer, 
    VkDeviceSize countBufferOffset, 
    uint32_t maxDrawCount, 
    uint32_t stride);
```
void vkCmdDrawIndirectCountAMD(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,  
    VkDeviceSize offset,  
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
- `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

Valid Usage

- **VUID-vkCmdDrawIndirectCount-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the
image view's format features must contain
VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawIndirectCount-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by
vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawIndirectCount-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by
vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawIndirectCount-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing
VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawIndirectCount-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain
VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectCount-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain
VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectCount-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain
VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectCount-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain
VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectCount-None-02697
For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawIndirectCount-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to
create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndirectCount-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirectCount-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndirectCount-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawIndirectCount-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndirectCount-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawIndirectCount-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawIndirectCount-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndirectCount-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either
or

VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT

for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndirectCount-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdDrawIndirectCount-None-06550
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDrawIndirectCount-ConstOffset-06551
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands

• VUID-vkCmdDrawIndirectCount-None-04115
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDrawIndirectCount-OpImageWrite-04469
If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDrawIndirectCount-SampledType-04470
If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawIndirectCount-SampledType-04471
If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawIndirectCount-SampledType-04472
If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawIndirectCount-SampledType-04473
If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474
If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions
through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSSDQCOM-06976**
  If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawIndirectCount-None-07288**
  Any shader invocation executed by this command must terminate.

- **VUID-vkCmdDrawIndirectCount-renderPass-02684**
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to
VK_PIPELINE_BIND_POINT_GRAPHICS

- **VUID-vkCmdDrawIndirectCount-subpass-02685**
  The subpass index of the current render pass **must** be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- **VUID-vkCmdDrawIndirectCount-None-02686**
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDrawIndirectCount-None-06537**
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndirectCount-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment.

- **VUID-vkCmdDrawIndirectCount-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

- **VUID-vkCmdDrawIndirectCount-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**.

- **VUID-vkCmdDrawIndirectCount-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**.

- **VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex.

- **VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set.

- **VUID-vkCmdDrawIndirectCount-None-06666**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectCount-viewportCount-03417**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the...
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- VUID-vkCmdDrawIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- VUID-vkCmdDrawIndirectCount-viewportCount-03419
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- VUID-vkCmdDrawIndirectCount-viewportCount-04137
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirectCount-viewportCount-04138
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirectCount-viewportCount-04139
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- VUID-vkCmdDrawIndirectCount-viewportCount-04140
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.
vkCmdSetViewportWithCount

- VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the 
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a 
  \texttt{VkPipelineViewportSwizzleStateCreateInfoNV} structure chained from 
  \texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline \textbf{must} have been 
  created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV:viewportCount} greater or 
  equal to the \texttt{viewportCount} parameter in the last call to 
  \texttt{vkCmdSetViewportWithCount}

- VUID-vkCmdDrawIndirectCount-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the 
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a 
  \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure chained from 
  \texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline \textbf{must} have been 
  created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV:exclusiveScissorCount} greater or 
  equal to the \texttt{viewportCount} parameter in the last call to 
  \texttt{vkCmdSetViewportWithCount}

- VUID-vkCmdDrawIndirectCount-None-04876
  If the bound graphics pipeline state was created with the 
  \texttt{VK\_DYNAMIC\_STATE\_RASTERIZER\_DISCARD\_ENABLE} dynamic state enabled then 
  \texttt{vkCmdSetRasterizerDiscardEnable} \textbf{must} have been called in the current command buffer 
  prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-04877
  If the bound graphics pipeline state was created with the 
  \texttt{VK\_DYNAMIC\_STATE\_DEPTH\_BIAS\_ENABLE} dynamic state enabled then 
  \texttt{vkCmdSetDepthBiasEnable} \textbf{must} have been called in the current command buffer prior 
  to this drawing command

- VUID-vkCmdDrawIndirectCount-logicOp-04878
  If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_LOGIC\_OP\_EXT} 
  dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} \textbf{must} have been called in the current 
  command buffer prior to this drawing command and the \texttt{logicOp} \textbf{must} be a valid 
  \texttt{VkLogicOp} value

- VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the \texttt{primitiveFragmentShadingRateWithMultipleViewports} limit is not supported, the 
  bound graphics pipeline was created with the \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} 
  dynamic state enabled, and any of the shader stages of the bound graphics pipeline write 
  to the \texttt{PrimitiveShadingRateKHR} built-in, then \texttt{vkCmdSetViewportWithCount} \textbf{must} have 
  been called in the current command buffer prior to this drawing command, and the 
  \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} \textbf{must} be \texttt{1}

- VUID-vkCmdDrawIndirectCount-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color 
  attachment in the subpass, if the corresponding image view’s \texttt{format features} do not 
  contain \texttt{VK\_FORMAT\_FEATURE\_COLOR\_ATTACHMENT\_BLEND\_BIT}, then the \texttt{blendEnable} member of 
  the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} \textbf{must} be 
  \texttt{VK\_FALSE}
If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUTDEPTH_STENCIL_READ_ONLYOPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUTDEPTH_STENCIL_READ_ONLYOPTIMAL, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUTDEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUTDEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask.

If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount.
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.
If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndirectCount-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndirectCount-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndirectCount-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderInfo::pStencilAttachment->imageView`.  

1532
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT`
dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- **VUID-vkCmdDrawIndirectCount-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndirectCount-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndirectCount-stage-06481**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdDrawIndirectCount-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawIndirectCount-buffer-02709**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawIndirectCount-offset-02710**
  `offset` **must** be a multiple of `4`

- **VUID-vkCmdDrawIndirectCount-commandBuffer-02711**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDrawIndirectCount-countBuffer-02714**
  If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawIndirectCount-countBuffer-02715**
  `countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set
countBufferOffset must be a multiple of 4

The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

(countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

If drawIndirectCount is not enabled this function must not be used

stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand)

If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer

commandBuffer must be a valid VkCommandBuffer handle

buffer must be a valid VkBuffer handle

countBuffer must be a valid VkBuffer handle

commandBuffer must be in the recording state

The VkCommandPool that commandBuffer was allocated from must support graphics operations

This command must only be called inside of a render pass instance

This command must only be called outside of a video coding scope

Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

To record an indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexedIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndexedIndirect` behaves similarly to `vkCmdDrawIndexed` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawIndexedIndirectCommand` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

Valid Usage

- VUID-vkCmdDrawIndexedIndirect-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and
compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndexedIndirect-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2/dashboard SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawIndexedIndirect-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2/dashboard STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawIndexedIndirect-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDrawIndexedIndirect-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirect-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2/dashboard STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2/dashboard STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format...
field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirect-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirect-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirect-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawIndexedIndirect-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawIndexedIndirect-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndexedIndirect-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage
If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.
If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.
• VUID-vkCmdDrawIndexedIndirect-OpImageWeightedSampleQCOM-06977
If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndexedIndirect-OpImageWeightedSampleQCOM-06978
If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndexedIndirect-None-07288
Any shader invocation executed by this command must terminate

• VUID-vkCmdDrawIndexedIndirect-renderPass-02684
The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndexedIndirect-subpass-02685
The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndexedIndirect-None-02686
Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

• VUID-vkCmdDrawIndexedIndirect-None-06537
Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirect-None-06538
If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

• VUID-vkCmdDrawIndexedIndirect-None-06539
If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawIndexedIndirect-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndexedIndirect-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties
maxMultiviewInstanceIndex

- **VUID-vkCmdDrawIndexedIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT:::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawIndexedIndirect-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `VkPipelineViewportStateCreateInfo:::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` **must** match the `VkPipelineViewportStateCreateInfo:::viewportCount` of the pipeline.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV:::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount`...
• VUID-vkCmdDrawIndexedIndirect-viewportCount-04139
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV} dynamic state enabled, then the bound graphics pipeline must have been created with
\texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

• VUID-vkCmdDrawIndexedIndirect-viewportCount-04140
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} and \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV} dynamic states enabled then the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportShadingRatePaletteNV} must be greater than or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

• VUID-vkCmdDrawIndexedIndirect-VkPipelineVieportCreateInfo-04141
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a
\texttt{VkPipelineViewportSwizzleStateCreateInfoNV} structure chained from
\texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

• VUID-vkCmdDrawIndexedIndirect-VkPipelineVieportCreateInfo-04142
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled and a
\texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV} structure chained from
\texttt{VkPipelineViewportStateCreateInfo}, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

• VUID-vkCmdDrawIndexedIndirect-None-04876
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_RASERIZER\_DISCARD\_ENABLE} dynamic state enabled then\texttt{vkCmdSetRasterizerDiscardEnable} must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-None-04877
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_DEPTH\_BIAS\_ENABLE} dynamic state enabled then\texttt{vkCmdSetDepthBiasEnable} must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndexedIndirect-logicOp-04878
If the bound graphics pipeline state was created with the \texttt{VK\_DYNAMIC\_STATE\_LOGIC\_OP\_EXT} dynamic state enabled then \texttt{vkCmdSetLogicOpEXT} must have been called in the current command buffer prior to this drawing command and the \texttt{logicOp} must be a valid \texttt{VkLogicOp} value
If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::*viewMask* equal to `VkRenderingInfo`::*viewMask*.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::*colorAttachmentCount* equal to `VkRenderingInfo`::*colorAttachmentCount*.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::*colorAttachmentCount* greater than 0, then each element of the `VkRenderingInfo`::*pColorAttachments* array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::*pColorAttachmentFormats* used to create the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo`::*attachmentCount* of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::*pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo`::*depthAttachmentFormat* used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo`::*pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::*pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo`::*stencilAttachmentFormat* used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo`::*pStencilAttachment->imageView`.
bound graphics pipeline \textbf{must} be equal to the \texttt{VkFormat} used to create \texttt{VkRenderingInfo::pStencilAttachment->imageView}

- \textbf{VUID-vkCmdDrawIndexedIndirect-imageView-06183}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView} was not \texttt{VK_NULL_HANDLE}, the currently bound graphics pipeline \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR}

- \textbf{VUID-vkCmdDrawIndexedIndirect-imageView-06184}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView} was not \texttt{VK_NULL_HANDLE}, the currently bound graphics pipeline \textbf{must} have been created with \texttt{VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT}

- \textbf{VUID-vkCmdDrawIndexedIndirect-colorAttachmentCount-06185}
  If the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and the current render pass instance was begun with \texttt{vkCmdBeginRendering} with a \texttt{VkRenderingInfo::colorAttachmentCount} parameter greater than \texttt{0}, then each element of the \texttt{VkRenderingInfo::pColorAttachments} array with a \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} \textbf{must} have been created with a sample count equal to the corresponding element of the \texttt{pColorAttachmentSamples} member of \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} used to create the currently bound graphics pipeline

- \textbf{VUID-vkCmdDrawIndexedIndirect-pDepthAttachment-06186}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and \texttt{VkRenderingInfo::pDepthAttachment->imageView} was not \texttt{VK_NULL_HANDLE} \textbf{must} be equal to the sample count used to create \texttt{VkRenderingInfo::pDepthAttachment->imageView}

- \textbf{VUID-vkCmdDrawIndexedIndirect-pStencilAttachment-06187}
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound pipeline was created with a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and \texttt{VkRenderingInfo::pStencilAttachment->imageView} was not \texttt{VK_NULL_HANDLE} \textbf{must} be equal to the sample count used to create \texttt{VkRenderingInfo::pStencilAttachment->imageView}

- \textbf{VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07285}
  If the currently bound pipeline was created without a \texttt{VkAttachmentSampleCountInfoAMD} or \texttt{VkAttachmentSampleCountInfoNV} structure, and the \texttt{multisampledRenderToSingleSampled} feature is not enabled, and the current render pass instance was begun with \texttt{vkCmdBeginRendering} with a \texttt{VkRenderingInfo::colorAttachmentCount} parameter greater than \texttt{0}, then each element of the \texttt{VkRenderingInfo::pColorAttachments} array with a \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} \textbf{must} have been created with a sample count equal to the value of
VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndexedIndirect-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndexedIndirect-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

- VUID-vkCmdDrawIndexedIndirect-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

- VUID-vkCmdDrawIndexedIndirect-stage-07073
  If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active

- VUID-vkCmdDrawIndexedIndirect-None-04007
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound

- VUID-vkCmdDrawIndexedIndirect-None-04008
If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface **must** not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndexedIndirect-None-02721**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in *Vertex Input Description*.

- **VUID-vkCmdDrawIndexedIndirect-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndexedIndirect-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexedIndirect-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`.

- **VUID-vkCmdDrawIndexedIndirect-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexedIndirect-stage-06481**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`.
If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

offset must be a multiple of 4.

commandBuffer must not be a protected command buffer.

If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1.

drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount.

An index buffer must be bound.

If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand).

If drawCount is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer.

If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof (VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer.

commandBuffer must be a valid VkCommandBuffer handle.

buffer must be a valid VkBuffer handle.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support graphics operations.

This command must only be called inside of a render pass instance.

This command must only be called outside of a video coding scope.
Both of buffer and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

The VkDrawIndexedIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- indexCount is the number of vertices to draw.
- instanceCount is the number of instances to draw.
- firstIndex is the base index within the index buffer.
- vertexOffset is the value added to the vertex index before indexing into the vertex buffer.
- firstInstance is the instance ID of the first instance to draw.

The members of VkDrawIndexedIndirectCommand have the same meaning as the similarly named parameters of vkCmdDrawIndexed.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-None-00552
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description
To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_2
    VkBuffer buffer,                // Provided by VK_VERSION_1_2
    VkDeviceSize offset,            // Provided by VK_VERSION_1_2
    VkBuffer countBuffer,           // Provided by VK_VERSION_1_2
    VkDeviceSize countBufferOffset, // Provided by VK_VERSION_1_2
    uint32_t maxDrawCount,          // Provided by VK_VERSION_1_2
    uint32_t stride);              // Provided by VK_VERSION_1_2
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_draw_indirect_count
    VkBuffer buffer,                // Provided by VK_KHR_draw_indirect_count
    VkDeviceSize offset,            // Provided by VK_KHR_draw_indirect_count
    VkBuffer countBuffer,           // Provided by VK_KHR_draw_indirect_count
    VkDeviceSize countBufferOffset, // Provided by VK_KHR_draw_indirect_count
    uint32_t maxDrawCount,          // Provided by VK_KHR_draw_indirect_count
    uint32_t stride);              // Provided by VK_KHR_draw_indirect_count
```

or the equivalent command

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndexedIndirectCountAMD(
    VkCommandBuffer commandBuffer,  // Provided by VK_AMD_draw_indirect_count
    VkBuffer buffer,                // Provided by VK_AMD_draw_indirect_count
    VkDeviceSize offset,            // Provided by VK_AMD_draw_indirect_count
    VkBuffer countBuffer,           // Provided by VK_AMD_draw_indirect_count
    VkDeviceSize countBufferOffset, // Provided by VK_AMD_draw_indirect_count
    uint32_t maxDrawCount,          // Provided by VK_AMD_draw_indirect_count
    uint32_t stride);              // Provided by VK_AMD_draw_indirect_count
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
• **offset** is the byte offset into **buffer** where parameters begin.

• **countBuffer** is the buffer containing the draw count.

• **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.

• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.

• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawIndexedIndirectCount** behaves similarly to **vkCmdDrawIndexedIndirect** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

### Valid Usage

- **VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImage** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-06479**
  If a **VkImageView** is sampled with depth comparison, the image view’s format features must contain **VK_FORMAT_FEATURE_2_SAMPED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view’s format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic** returned by **vkGetPhysicalDeviceImageFormatProperties2**

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering together with minmax filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirectCount-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawIndexedIndirectCount-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDrawIndexedIndirectCount-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as...
dynamic

• VUID-vkCmdDrawIndexedIndirectCount-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

• VUID-vkCmdDrawIndexedIndirectCount-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDrawIndexedIndirectCount-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDrawIndexedIndirectCount-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDrawIndexedIndirectCount-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexedIndirectCount-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdDrawIndexedIndirectCount-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_r conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions
If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler $Y'{C_b}C_r$ conversion, that object must not use the `ConstOffset` and `Offset` operands.

If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.
• VUID-vkCmdDrawIndexedIndirectCount-OpImageBoxFilterQCOM-06973
If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT-feature-2-box-filter-sampled-bit-QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageBlockMatchSSDQCOM-06974
If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT-feature-2-block-matching-bit-QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageBlockMatchSADQCOM-06975
If OpImageBlockMatchSADQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT-feature-2-block-matching-bit-QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWeightedSampleQCOM-06977
If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWeightedSampleQCOM-06978
If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-None-07288
Any shader invocation executed by this command must terminate.

• VUID-vkCmdDrawIndexedIndirectCount-renderPass-02684
The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawIndexedIndirectCount-subpass-02685
The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawIndexedIndirectCount-None-02686
Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

• VUID-vkCmdDrawIndexedIndirectCount-None-06537
Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• VUID-vkCmdDrawIndexedIndirectCount-None-06538
If any recorded command in the current subpass will write to an image subresource as an
attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdDrawIndexedIndirectCount-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawIndexedIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawIndexedIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawIndexedIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawIndexedIndirectCount-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawIndexedIndirectCount-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndexedIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawIndexedIndirectCount-viewportCount-03419
  If the bound graphics pipeline state was created with both the
**VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the **scissorCount** parameter of **vkCmdSetScissorWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04137**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline must have been created with **VkPipelineViewportWScalingStateCreateInfoNV** ::**viewportCount** greater or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04138**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic states enabled then the **viewportCount** parameter in the last call to **vkCmdSetViewportWScalingNV** must be greater than or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04139**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic state enabled, then the bound graphics pipeline must have been created with **VkPipelineViewportShadingRateImageStateCreateInfoNV** ::**viewportCount** greater or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04140**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic states enabled then the **viewportCount** parameter in the last call to **vkCmdSetViewportShadingRatePaletteNV** must be greater than or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled and a **VkPipelineViewportSwizzleStateCreateInfoNV** structure chained from **VkPipelineViewportStateCreateInfo**, then the bound graphics pipeline must have been created with **VkPipelineViewportSwizzleStateCreateInfoNV** ::**viewportCount** greater or equal to the **viewportCount** parameter in the last call to **vkCmdSetViewportWithCount**.

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled and a **VkPipelineViewportExclusiveScissorStateCreateInfoNV** structure chained from **VkPipelineViewportStateCreateInfo**, then the bound graphics pipeline must have been created with **VkPipelineViewportExclusiveScissorStateCreateInfoNV**.
exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawIndexedIndirectCount-none-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-none-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndexedIndirectCount-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndexedIndirectCount-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06179
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06180
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndexedIndirectCount-attachmentCount-06667
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachmentCount parameter of VkPipelineColorBlendStateCreateInfo::attachmentCount of the currently bound graphics pipeline
• VUID-vkCmdDrawIndexedIndirectCount-attachmentCount-06815
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

• VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-06181
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

• VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-06182
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

• VUID-vkCmdDrawIndexedIndirectCount-imageView-06183
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

• VUID-vkCmdDrawIndexedIndirectCount-imageView-06184
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

• VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06185
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

• VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-06186
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count.
used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::colorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndexedIndirectCount-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndexedIndirectCount-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- **VUID-vkCmdDrawIndexedIndirectCount-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawIndexedIndirectCount-
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawIndexedIndirectCount-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo :::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then **Mesh Shader Queries** must not be active

- **VUID-vkCmdDrawIndexedIndirectCount-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound

- **VUID-vkCmdDrawIndexedIndirectCount-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`

- **VUID-vkCmdDrawIndexedIndirectCount-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo :::topology` state

- **VUID-vkCmdDrawIndexedIndirectCount-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`

- **VUID-vkCmdDrawIndexedIndirectCount-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT`
must have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexedIndirectCount-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-stage-06481**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_EXT` or `VK_SHADER_STAGE_MESH_BIT_EXT`

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawIndexedIndirectCount-offset-02710**
  `offset` must be a multiple of 4

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714**
  If `countBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715**
  `countBuffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716**
  `countBufferOffset` must be a multiple of 4

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717**
  The count stored in `countBuffer` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`

- **VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129**
  `(countBufferOffset + sizeof(uint32_t))` must be less than or equal to the size of `countBuffer`

- **VUID-vkCmdDrawIndexedIndirectCount-None-04445**
  If `drawIndirectCount` is not enabled this function must not be used

- **VUID-vkCmdDrawIndexedIndirectCount-None-07312**
  An index buffer must be bound
• VUID-vkCmdDrawIndexedIndirectCount-stride-03142
  
  * **stride** must be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawIndexedIndirectCommand)`

• VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143
  
  * If `maxDrawCount` is greater than or equal to 1, `(stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03153
  
  * If count stored in `countBuffer` is equal to 1, `(offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03154
  
  * If count stored in `countBuffer` is greater than 1, `(stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))` **must** be less than or equal to the size of `buffer`

**Valid Usage (Implicit)**

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter
  
  * `commandBuffer` **must** be a valid `VkCommandBuffer` handle

• VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter
  
  * `buffer` **must** be a valid `VkBuffer` handle

• VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter
  
  * `countBuffer` **must** be a valid `VkBuffer` handle

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording
  
  * `commandBuffer` **must** be in the `recording` state

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool
  
  * The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

• VUID-vkCmdDrawIndexedIndirectCount-renderpass
  
  * This command **must** only be called inside of a render pass instance

• VUID-vkCmdDrawIndexedIndirectCount-videocoding
  
  * This command **must** only be called outside of a video coding scope

• VUID-vkCmdDrawIndexedIndirectCount-commonparent
  
  * Each of `buffer`, `commandBuffer`, and `countBuffer` **must** have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

• Host access to `commandBuffer` **must** be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
21.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is \texttt{VK\_ACCESS\_TRANSFORM\_FEEDBACK\_WRITE\_BIT\_EXT} and the destination access is \texttt{VK\_ACCESS\_VERTEX\_ATTRIBUTE\_READ\_BIT} for the pipeline stages \texttt{VK\_PIPELINE\_STAGE\_TRANSFORM\_FEEDBACK\_BIT\_EXT} and \texttt{VK\_PIPELINE\_STAGE\_VERTEX\_INPUT\_BIT} respectively. The value written to the counter buffer by \texttt{vkCmdEndTransformFeedbackEXT} can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for \texttt{vkCmdEndTransformFeedbackEXT} and \texttt{vkCmdDrawIndirectByteCountEXT} where the source access is \texttt{VK\_ACCESS\_TRANSFORM\_FEEDBACK\_COUNTER\_WRITE\_BIT\_EXT} and the destination access is \texttt{VK\_ACCESS\_INDIRECT\_COMMAND\_READ\_BIT} for the pipeline stages \texttt{VK\_PIPELINE\_STAGE\_TRANSFORM\_FEEDBACK\_BIT\_EXT} and \texttt{VK\_PIPELINE\_STAGE\_DRAW\_INDIRECT\_BIT} respectively.

To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```c
// Provided by VK\_EXT\_transform\_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t instanceCount,
    uint32_t firstInstance,
    VkBuffer counterBuffer,
    VkDeviceSize counterBufferOffset,
    uint32_t counterOffset,
    uint32_t vertexStride);
```

- \texttt{commandBuffer} is the command buffer into which the command is recorded.
- \texttt{instanceCount} is the number of instances to draw.
- \texttt{firstInstance} is the instance ID of the first instance to draw.
- \texttt{counterBuffer} is the buffer handle from where the byte count is read.
- \texttt{counterBufferOffset} is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- \texttt{counterOffset} is subtracted from the byte count read from the \texttt{counterBuffer} at the
counterBufferOffset

- vertexStride is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the XfbStride.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the vertexCount is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective vertexCount is calculated as follows:

```c
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address + counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective firstVertex is zero.

### Valid Usage

- **VUID-vkCmdDrawIndirectByteCountEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawIndirectByteCountEXT-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.
• VUID-vkCmdDrawIndirectByteCountEXT-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawIndirectByteCountEXT-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawIndirectByteCountEXT-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawIndirectByteCountEXT-None-02697
For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawIndirectByteCountEXT-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawIndirectByteCountEXT-None-02699
Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

• VUID-vkCmdDrawIndirectByteCountEXT-None-02700
A valid pipeline must be bound to the pipeline bind point used by this command
If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by
This command must not be a protected resource

- VUID-vkCmdDrawIndirectByteCountEXT-None-06550
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CBCR` conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- VUID-vkCmdDrawIndirectByteCountEXT-ConstOffset-06551
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CBCR` conversion, that object must not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDrawIndirectByteCountEXT-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format

- VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04475
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06971
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this
command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06977
  IfOpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndirectByteCountEXT-None-07288
  Any shader invocation executed by this command must terminate

• VUID-vkCmdDrawIndirectByteCountEXT-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndirectByteCountEXT-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawIndirectByteCountEXT-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a
descriptor set

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06537**
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06537**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06537**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be **VK_STENCIL_OP_KEEP**.

- **VUID-vkCmdDrawIndirectByteCountEXT-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to *VkPhysicalDeviceMultiviewProperties*::maxMultiviewInstanceIndex.

- **VUID-vkCmdDrawIndirectByteCountEXT-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with *VkPipelineSampleLocationsStateCreateInfoEXT*::sampleLocationsEnable set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment must have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06537**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled then **vkCmdSetSampleLocationsEXT** must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then **vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of **vkCmdSetViewportWithCount** must match the **VkPipelineViewportStateCreateInfo**::scissorCount of the pipeline.

- **VUID-vkCmdDrawIndirectByteCountEXT-scissorCount-03418**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then **vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of **vkCmdSetViewportWithCount** must match the **VkPipelineViewportStateCreateInfo**::scissorCount of the pipeline.
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCount must have been called in the current command buffer prior
to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount
must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-03419
If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic
states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount
must have been called in the current command buffer prior to this drawing command,
and the viewportCount parameter of vkCmdSetViewportWithCount must match the
scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04137
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics
pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV
::viewportCount greater or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04138
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic
states enabled then the viewportCount parameter in the last call to
vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount
parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04139
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics
pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal
to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-viewportCount-04140
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the
viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must
be greater than or equal to the viewportCount parameter in the last call to
vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewpo-04141
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a
VkPipelineViewportSwizzleStateCreateInfoNV structure chained from
VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal
to the viewportCount parameter in the last call to vkCmdSetViewportWithCount
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView`
member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06179
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06180
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirectByteCountEXT-attachmentCount-06667
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

• **VUID-vkCmdDrawIndirectByteCountEXT-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

• **VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

• **VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

• **VUID-vkCmdDrawIndirectByteCountEXT-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

• **VUID-vkCmdDrawIndirectByteCountEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

• **VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.
VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-06186

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-06187

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07285

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07286

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

VUID-vkCmdDrawIndirectByteCountEXT-multisampledRenderToSingleSampled-07287

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

VUID-vkCmdDrawIndirectByteCountEXT-renderPass-06198

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.
• VUID-vkCmdDrawIndirectByteCountEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

• VUID-vkCmdDrawIndirectByteCountEXT-primitivesGeneratedQueryWithNonZeroStreams-06709
If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateCreateInfo::rasterizationStream.

• VUID-vkCmdDrawIndirectByteCountEXT-stage-07073
If the currently bound pipeline was created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT or VK_SHADER_STAGE_GEOMETRY_BIT, then Mesh Shader Queries must not be active.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04008
If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be VK_NULL_HANDLE.

• VUID-vkCmdDrawIndirectByteCountEXT-None-02721
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

• VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-03420
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then vkCmdSetPrimitiveTopologyEXT must have been called in the current command buffer prior to this drawing command, and the primitiveTopology parameter of vkCmdSetPrimitiveTopologyEXT must be of the same topology class as the pipeline VkPipelineInputAssemblyStateCreateInfo::topology state.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04912
If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

• VUID-vkCmdDrawIndirectByteCountEXT-pStrides-04913
If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then...
vkCmdBindVertexBuffers2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffers2EXT must not be NULL.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectByteCountEXT-stage-06481
  The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_EXT or VK_SHADER_STAGE_MESH_BIT_EXT.

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedback-02287
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled.

- VUID-vkCmdDrawIndirectByteCountEXT-transformFeedbackDraw-02288
  The implementation must support VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw.

- VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-02289
  vertexStride must be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTransformFeedbackBufferDataStride.

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-04567
  If counterBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-02290
  counterBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

- VUID-vkCmdDrawIndirectByteCountEXT-counterBufferOffset-04568
  counterBufferOffset must be a multiple of 4.

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02646
  commandBuffer must not be a protected command buffer.
### Valid Usage (Implicit)

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter**
  - `counterBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording**
  - `commandBuffer` must be in the recording state

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDrawIndirectByteCountEXT-renderpass**
  - This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawIndirectByteCountEXT-videocoding**
  - This command must only be called outside of a video coding scope

- **VUID-vkCmdDrawIndirectByteCountEXT-commonparent**
  - Both of `commandBuffer`, and `counterBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### 21.4. Conditional Rendering

Certain rendering commands can be executed conditionally based on a value in buffer memory. These rendering commands are limited to drawing commands, dispatching commands, and clearing attachments with `vkCmdClearAttachments` within a conditional rendering block which is defined by commands `vkCmdBeginConditionalRenderingEXT` and `vkCmdEndConditionalRenderingEXT`. Other rendering commands remain unaffected by conditional rendering.
After beginning conditional rendering, it is considered active within the command buffer it was called until it is ended with `vkCmdEndConditionalRenderingEXT`.

Conditional rendering **must** begin and end in the same command buffer. When conditional rendering is active, a primary command buffer **can** execute secondary command buffers if the `inheritedConditionalRendering` feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it **must** set the `conditionalRenderingEnable` flag of `VkCommandBufferInheritanceConditionalRenderingInfoEXT`, as described in the Command Buffer Recording section.

Conditional rendering **must** also either begin and end inside the same subpass of a render pass instance, or **must** both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdBeginConditionalRenderingEXT(
    VkCommandBuffer commandBuffer,
    const VkConditionalRenderingBeginInfoEXT* pConditionalRenderingBegin);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `pConditionalRenderingBegin` is a pointer to a `VkConditionalRenderingBeginInfoEXT` structure specifying parameters of conditional rendering.

**Valid Usage**

- VUID-vkCmdBeginConditionalRenderingEXT-None-01980
  Conditional rendering **must** not already be active

**Valid Usage (Implicit)**

- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdBeginConditionalRenderingEXT-pConditionalRenderingBegin-parameter
  `pConditionalRenderingBegin` **must** be a valid pointer to a valid `VkConditionalRenderingBeginInfoEXT` structure
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics, or compute operations
- VUID-vkCmdBeginConditionalRenderingEXT-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
<td>Action, State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkConditionalRenderingBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
    VkDeviceSize offset;
    VkConditionalRenderingFlagsEXT flags;
} VkConditionalRenderingBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a buffer containing the predicate for conditional rendering.
- `offset` is the byte offset into `buffer` where the predicate is located.
- `flags` is a bitmask of `VkConditionalRenderingFlagsEXT` specifying the behavior of conditional rendering.

If the 32-bit value at `offset` in `buffer` memory is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in `buffer` memory changes while conditional rendering is active, the rendering commands **may** be discarded in an implementation-dependent way. Some implementations may latch the value of the predicate upon beginning conditional rendering while others may read it before every rendering command.

Valid Usage

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01981
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
• VUID-VkConditionalRenderingBeginInfoEXT-buffer-01982
  buffer must have been created with the VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT bit set

• VUID-VkConditionalRenderingBeginInfoEXT-offset-01983
  offset must be less than the size of buffer by at least 32 bits

• VUID-VkConditionalRenderingBeginInfoEXT-offset-01984
  offset must be a multiple of 4

Valid Usage (Implicit)

• VUID-VkConditionalRenderingBeginInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT

• VUID-VkConditionalRenderingBeginInfoEXT-pNext-pNext
  pNext must be NULL

• VUID-VkConditionalRenderingBeginInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-VkConditionalRenderingBeginInfoEXT-flags-parameter
  flags must be a valid combination of VkConditionalRenderingFlagBitsEXT values

Bits which can be set in vkCmdBeginConditionalRenderingEXT::flags, specifying the behavior of conditional rendering, are:

```c
// Provided by VK_EXT_conditional_rendering
typedef enum VkConditionalRenderingFlagBitsEXT {
  VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT = 0x00000001,
} VkConditionalRenderingFlagBitsEXT;
```

• VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from buffer memory at offset is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

```c
// Provided by VK_EXT_conditional_rendering
typedef VkFlags VkConditionalRenderingFlagsEXT;
```

VkConditionalRenderingFlagsEXT is a bitmask type for setting a mask of zero or more VkConditionalRenderingFlagBitsEXT.

To end conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdEndConditionalRenderingEXT();
```
commandBuffer is the command buffer into which this command will be recorded.

Once ended, conditional rendering becomes inactive.

Valid Usage

- VUID-vkCmdEndConditionalRenderingEXT-None-01985
  Conditional rendering must be active

- VUID-vkCmdEndConditionalRenderingEXT-None-01986
  If conditional rendering was made active outside of a render pass instance, it must not be ended inside a render pass instance

- VUID-vkCmdEndConditionalRenderingEXT-None-01987
  If conditional rendering was made active within a subpass it must be ended in the same subpass

Valid Usage (Implicit)

- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdEndConditionalRenderingEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
<td>Action State</td>
</tr>
</tbody>
</table>
21.5. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. Mesh shading operates similarly to dispatching compute as the shaders make use of workgroups.

To record a mesh tasks drawing command, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksNV(
    VkCommandBuffer commandBuffer,
    uint32_t taskCount,
    uint32_t firstTask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

When the command is executed, a global workgroup consisting of `taskCount` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDrawMeshTasksNV-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- VUID-vkCmdDrawMeshTasksNV-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- VUID-vkCmdDrawMeshTasksNV-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- VUID-vkCmdDrawMeshTasksNV-filterCubic-02694
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdDrawMeshTasksNV-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- VUID-vkCmdDrawMeshTasksNV-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- VUID-vkCmdDrawMeshTasksNV-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDrawMeshTasksNV-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDrawMeshTasksNV-OpTypeImage-07029
  For any `VkBufferView` being written as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown`, the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDrawMeshTasksNV-OpTypeImage-07030
  Any `VkBufferView` being read as a storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s buffer features must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- VUID-vkCmdDrawMeshTasksNV-None-02697
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDrawMeshTasksNV-maintenance4-06425
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- VUID-vkCmdDrawMeshTasksNV-None-02699
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be...
valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-None-02700
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawMeshTasksNV-None-02859
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksNV-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksNV-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point
pipeline bind point

- **VUID-vkCmdDrawMeshTasksNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource.

- **VUID-vkCmdDrawMeshTasksNV-None-06550**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler $Y'CbCr$ conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdDrawMeshTasksNV-ConstOffset-06551**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler $Y'CbCr$ conversion, that object **must** not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdDrawMeshTasksNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the
VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_IMAGE_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_IMAGE_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_IMAGE_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawMeshTasksNV-None-07288
  Any shader invocation executed by this command must terminate.

- VUID-vkCmdDrawMeshTasksNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDrawMeshTasksNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the
VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawMeshTasksNV-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawMeshTasksNV-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawMeshTasksNV-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdDrawMeshTasksNV-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawMeshTasksNV-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawMeshTasksNV-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawMeshTasksNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawMeshTasksNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMeshTasksNV-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksNV-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo
If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, but not the
**VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, then
**vkCmdSetScissorWithCount** must have been called in the current command buffer prior
to this drawing command, and the **scissorCount** parameter of **vkCmdSetScissorWithCount**
**must** match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

If the bound graphics pipeline state was created with both both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount**
**must** have been called in the current command buffer prior to this drawing command,
and the **viewportCount** parameter of **vkCmdSetViewportWithCount** **must** match the
**scissorCount** parameter of **vkCmdSetScissorWithCount**

If the bound graphics pipeline state was created with both **vkCmdSetViewportWithCount** and **vkCmdSetViewportWScalingNV**
dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount**
**must** have been called in the current command buffer prior to this drawing command,
and the **viewportCount** parameter of **vkCmdSetViewportWithCount** **must** match the
**scissorCount** parameter of **vkCmdSetScissorWithCount**

If the bound graphics pipeline state was created with the
**VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled and a
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value.

If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then...
 VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksNV-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE.Layout.DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksNV-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE.Layout.DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksNV-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE.Layout.DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksNV-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE.Layout.DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksNV-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE.Layout.DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksNV-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE.Layout.STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksNV-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06179
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06180
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to
**VK_NULL_HANDLE** must have been created with a **VkFormat** equal to the corresponding element of **VkPipelineRenderingCreateInfo::pColorAttachmentFormats** used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawMeshTasksNV-attachmentCount-06667**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** dynamic state enabled then **vkCmdSetColorWriteEnableEXT** must have been called in the current command buffer prior to this drawing command, and the **attachmentCount** parameter of **vkCmdSetColorWriteEnableEXT** must be greater than or equal to the **VkPipelineColorBlendStateCreateInfo::attachmentCount** of the currently bound graphics pipeline

- **VUID-vkCmdDrawMeshTasksNV-attachmentCount-06815**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT** dynamic state enabled then **vkCmdSetColorWriteEnableEXT** must have been called in the current command buffer prior to this drawing command, and the **attachmentCount** parameter of **vkCmdSetColorWriteEnableEXT** must be less than or equal to the **maxColorAttachments** member of **VkPhysicalDeviceLimits**

- **VUID-vkCmdDrawMeshTasksNV-pDepthAttachment-06181**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingInfo::pDepthAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::depthAttachmentFormat** used to create the currently bound graphics pipeline must be equal to the **VkFormat** used to create **VkRenderingInfo::pDepthAttachment->imageView**

- **VUID-vkCmdDrawMeshTasksNV-pStencilAttachment-06182**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingInfo::pStencilAttachment->imageView** was not **VK_NULL_HANDLE**, the value of **VkPipelineRenderingCreateInfo::stencilAttachmentFormat** used to create the currently bound graphics pipeline must be equal to the **VkFormat** used to create **VkRenderingInfo::pStencilAttachment->imageView**

- **VUID-vkCmdDrawMeshTasksNV-imageView-06183**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView** was not **VK_NULL_HANDLE**, the currently bound graphics pipeline must have been created with **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR**

- **VUID-vkCmdDrawMeshTasksNV-imageView-06184**
  If the current render pass instance was begun with **vkCmdBeginRendering** and **VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView** was not **VK_NULL_HANDLE**, the currently bound graphics pipeline must have been created with **VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT**

- **VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a **VkAttachmentSampleCountInfoAMD** or **VkAttachmentSampleCountInfoNV** structure, and the current render pass instance was begun with **vkCmdBeginRendering** with a **VkRenderingInfo::colorAttachmentCount** parameter greater than 0, then each element of the **VkRenderingInfo::pColorAttachments**
array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksNV-pDepthAttachment-06186
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-pStencilAttachment-06187
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksNV-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard **must** not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateCreateInfo::rasterizationStream`.

If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries **must** not be active.

The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`.

Transform Feedback Queries **must** not be active.

Primitives Generated Queries **must** not be active.

The `pipelineStatistics` member used to create any active Pipeline Statistics Query **must** not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`.

`taskCount` **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount`.

**UID-vkCmdDrawMeshTasksNV-MeshNV-07080**
The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` must contain a shader stage using the MeshNV Execution Model.

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdDrawMeshTasksNV-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDrawMeshTasksNV-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdDrawMeshTasksNV-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawMeshTasksNV-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the `VkCommandPool` that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>

To record an indirect mesh tasks drawing command, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectNV(
    VkCommandBuffer commandBuffer,  
    VkBuffer buffer,  
    VkDeviceSize offset,  
    uint32_t drawCount,  
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
• **buffer** is the buffer containing draw parameters.

• **offset** is the byte offset into **buffer** where parameters begin.

• **drawCount** is the number of draws to execute, and **can** be zero.

• **stride** is the byte stride between successive sets of draw parameters.

*vkCmdDrawMeshTasksIndirectNV* behaves similarly to *vkCmdDrawMeshTasksNV* except that the parameters are read by the device from a buffer during execution. **drawCount** draws are executed by the command, with parameters taken from **buffer** starting at **offset** and increasing by **stride** bytes for each successive draw. The parameters of each draw are encoded in an array of *VkDrawMeshTasksIndirectCommandNV* structures. If **drawCount** is less than or equal to one, **stride** is ignored.

### Valid Usage

- **VUID-vkCmdDrawMeshTasksIndirectNV-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectNV-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06479**
  If a **VkImageView** is sampled with **depth comparison**, the image view’s **format features** must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectNV-filterCubic-02694**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by

  ```
  VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic
  ```

  returned by **vkGetPhysicalDeviceImageFormatProperties2**

- **VUID-vkCmdDrawMeshTasksIndirectNV-filterCubicMinmax-02695**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering together with minmax filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by
vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing
  VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be
  sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of
  the OpTypeImage is Unknown, the view’s format features must contain
  VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the
  OpTypeImage is Unknown, the view’s format features must contain
  VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format
  field of the OpTypeImage is Unknown, the view’s buffer features must contain
  VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of
  the OpTypeImage is Unknown then the view’s buffer features must contain
  VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point
  used by this command, a descriptor set must have been bound to n at the same pipeline
  bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout
  used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectNV-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically
  used by the VkPipeline bound to the pipeline bind point used by this command, a push
  constant value must have been set for the same pipeline bind point, with a VkPipelineLayout
  that is compatible for push constants, with the VkPipelineLayout used to
  create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be
  valid if they are statically used by the VkPipeline bound to the pipeline bind point used by
  this command

• VUID-vkCmdDrawMeshTasksIndirectNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

• VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires
  any dynamic state, that state must have been set or inherited (if the
  VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so
  after any previously bound pipeline with the corresponding state not specified as
There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_bC_r conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.
If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler YC6C8 conversion, that object **must** not use the `ConstOffset` and `Offset` operands.

If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.
If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If OpImageBlockMatchSADQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an
attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**

- **VUID-vkCmdDrawMeshTasksIndirectNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

- **VUID-vkCmdDrawMeshTasksIndirectNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawMeshTasksIndirectNV-scissorCount-03418**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` **must** match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the...
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.
exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04876**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then **vkCmdSetRasterizerDiscardEnable must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04877**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then **vkCmdSetDepthBiasEnable must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectNV-logicOp-04878**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then **vkCmdSetLogicOpEXT must** have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value.

- **VUID-vkCmdDrawMeshTasksIndirectNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then **vkCmdSetViewportWithCount must** have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1.

- **VUID-vkCmdDrawMeshTasksIndirectNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

- **VUID-vkCmdDrawMeshTasksIndirectNV-multisampledRenderToSingleSampled-07284**
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06172**
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06173**
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of
pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06176
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectNV-imageView-06177
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectNV-viewMask-06178
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawMeshTasksIndirectNV-colorAttachmentCount-06179
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount

- VUID-vkCmdDrawMeshTasksIndirectNV-colorAttachmentCount-06180
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectNV-attachmentCount-06667
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachmentCount parameter of vkCmdSetColorWriteEnableEXT must be greater than or equal to the VkPipelineColorBlendStateCreateInfo::attachmentCount of the currently bound graphics pipeline
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::pColorAttachments` parameter greater than `0`, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count.
used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectNV-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectNV-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectNV-multisampledRenderToSingleSampled-07286
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectNV-multisampledRenderToSingleSampled-07287
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectNV-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawMeshTasksIndirectNV-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

- VUID-vkCmdDrawMeshTasksIndirectNV-primitivesGeneratedQueryWithNonZeroStreams-1608
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the
`VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectNV-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active

- **VUID-vkCmdDrawMeshTasksIndirectNV-stage-06480**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-07074**
  Transform Feedback Queries must not be active

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-07075**
  Primitives Generated Queries must not be active

- **VUID-vkCmdDrawMeshTasksIndirectNV-pipelineStatistics-07076**
  The `pipelineStatistics` member used to create any active Pipeline Statistics Query must not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawMeshTasksIndirectNV-offset-02710**
  `offset` must be a multiple of 4

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02711**
  `commandBuffer` must not be a protected command buffer

- **VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02718**
  If the `multiDrawIndirect` feature is not enabled, `drawCount` must be 0 or 1
**Valid Usage (Implicit)**

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-parameter**
  
  commandBuffer must be a valid VkCommandBuffer handle

- **VUID-vkCmdDrawMeshTasksIndirectNV-buffer-parameter**
  
  buffer must be a valid VkBuffer handle

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-recording**
  
  commandBuffer must be in the recording state

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-cmdpool**
  
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- **VUID-vkCmdDrawMeshTasksIndirectNV-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawMeshTasksIndirectNV-videocoding**
  
  This command must only be called outside of a video coding scope

- **VUID-vkCmdDrawMeshTasksIndirectNV-commonparent**
  
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
The `VkDrawMeshTasksIndirectCommandNV` structure is defined as:

```c
// Provided by VK_NV_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandNV {
    uint32_t taskCount;
    uint32_t firstTask;
} VkDrawMeshTasksIndirectCommandNV;
```

- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

The members of `VkDrawMeshTasksIndirectCommandNV` have the same meaning as the similarly named parameters of `vkCmdDrawMeshTasksNV`.

### Valid Usage

- **VUID-VkDrawMeshTasksIndirectCommandNV-taskCount-02175**
  
  `taskCount` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount`

To record an indirect mesh tasks drawing command with the draw count sourced from a buffer, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectCountNV(
    VkCommandBuffer commandBuffer,  commandBuffer,
    VkBuffer buffer,                buffer,
    VkDeviceSize offset,           offset,
    VkBuffer countBuffer,         countBuffer,
    VkDeviceSize countBufferOffset,  countBufferOffset,
    uint32_t maxDrawCount,          maxDrawCount,
    uint32_t stride);               stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.

---

The table:

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>Action</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
• **offset** is the byte offset into **buffer** where parameters begin.

• **countBuffer** is the buffer containing the draw count.

• **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.

• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.

• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawMeshTasksIndirectCountNV** behaves similarly to **vkCmdDrawMeshTasksIndirectNV** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

---

**Valid Usage**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-magFilter-04553** If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-mipmapMode-04770** If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features** must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06479** If a **VkImageView** is sampled with **depth comparison**, the image view’s **format features** must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02691** If a **VkImageView** is accessed using atomic operations as a result of this command, then the **image view’s format features** must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubic-02694** Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified by **VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic** returned by **vkGetPhysicalDeviceImageFormatProperties2**

• **VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubicMinmax-02695** Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command must have a **VkImageViewType** and format that supports cubic filtering together with **minmax** filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawMeshTasksIndirectCountNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksIndirectCountNV-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as
There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b C_a` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.
If the *VkPipeline* object bound to the pipeline bind point used by this command accesses a *VkSampler* or *VkImageView* object that enables sampler Y′CbCr conversion, that object must not use the *ConstOffset* and *Offset* operands.

If a *VkImageView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction must have at least as many components as the image view's format.

If a *VkBufferView* is accessed using *OpImageWrite* as a result of this command, then the *Type* of the *Texel* operand of that instruction must have at least as many components as the buffer view's format.

If a *VkImageView* with a *VkFormat* that has a 64-bit component width is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction must have a *Width* of 64.

If a *VkBufferView* with a *VkFormat* that has a component width less than 64-bit is accessed as a result of this command, the *SampledType* of the *OpTypeImage* operand of that instruction must have a *Width* of 32.

If the *sparseImageInt64Atomics* feature is not enabled, *VkImage* objects created with the *VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT* flag must not be accessed by atomic instructions through an *OpTypeImage* with a *SampledType* with a *Width* of 64 by this command.

If the *sparseImageInt64Atomics* feature is not enabled, *VkBuffer* objects created with the *VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT* flag must not be accessed by atomic instructions through an *OpTypeImage* with a *SampledType* with a *Width* of 64 by this command.

If *OpImageWeightedSampleQCOM* is used to sample a *VkImageView* as a result of this command, then the image view's format features must contain *VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM*.

If *OpImageWeightedSampleQCOM* uses a *VkImageView* as a sample weight image as a result of this command, then the image view's format features must contain *VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM*. 
• VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-07288
  Any shader invocation executed by this command must terminate.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06538
  If any recorded command in the current subpass will write to an image subresource as an
attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawMeshTasksIndirectCountNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawMeshTasksIndirectCountNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-scissorCount-03418
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03419
  If the bound graphics pipeline state was created with both the
VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV
exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawMeshTasksIndirectCountNV-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawMeshTasksIndirectCountNV-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawMeshTasksIndirectCountNV-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06179
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-attachmentCount-06667
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics.
pipeline

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV`
used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitivesGeneratedQueryWithRasterizerDiscard-06708**
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-stage-06480**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-07074**
  Transform Feedback Queries must not be active.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-None-07075**
  Primitives Generated Queries must not be active.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-pipelineStatistics-07076**
  The `pipelineStatistics` member used to create any active Pipeline Statistics Query must not contain `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT`, `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT`, or `VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02709**
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-offset-02710**
  `offset` must be a multiple of 4.
commandBuffer must not be a protected command buffer

If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

countBufferOffset must be a multiple of 4

The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

(countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

If drawIndirectCount is not enabled this function must not be used

stride must be a multiple of 4 and must be greater than or equal to sizeof (VkDrawMeshTasksIndirectCommandNV)

If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

If the count stored in countBuffer is equal to 1, (offset + sizeof (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

The current pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS must contain a shader stage using the MeshNV Execution Model.
commandBuffer must be in the recording state

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksIndirectCountNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksIndirectCountNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or retrieved from the same VkDevice

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>

To record a mesh tasks drawing command, call:

```c
// Provided by VK_EXT_mesh_shader
void vkCmdDrawMeshTasksEXT(
    VkCommandBuffer commandBuffer,
    uint32_t groupCountX,
    uint32_t groupCountY,
    uint32_t groupCountZ);
```

- commandBuffer is the command buffer into which the command will be recorded.
- groupCountX is the number of local workgroups to dispatch in the X dimension.
- groupCountY is the number of local workgroups to dispatch in the Y dimension.
- groupCountZ is the number of local workgroups to dispatch in the Z dimension.

When the command is executed, a global workgroup consisting of groupCountX × groupCountY × groupCountZ local workgroups is assembled.
Valid Usage

• VUID-vkCmdDrawMeshTasksEXT-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

• VUID-vkCmdDrawMeshTasksEXT-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

• VUID-vkCmdDrawMeshTasksEXT-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGEDEPTH_COMPARE_BIT_EXT`

• VUID-vkCmdDrawMeshTasksEXT-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

• VUID-vkCmdDrawMeshTasksEXT-None-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

• VUID-vkCmdDrawMeshTasksEXT-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

• VUID-vkCmdDrawMeshTasksEXT-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

• VUID-vkCmdDrawMeshTasksEXT-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`

• VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07027
  For any `VkImageView` being written as a storage image where the image format field of the `OpTypeImage` is `Unknown`, the view's format features must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITEWITHOUTFORMAT_BIT`

• VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07028
  For any `VkImageView` being read as a storage image where the image format field of the
OpTypeImage is Unknown, the view's format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksEXT-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksEXT-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksEXT-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksEXT-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksEXT-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawMeshTasksEXT-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksEXT-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawMeshTasksEXT-None-02703
If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDrawMeshTasksEXT-None-02704**

  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawMeshTasksEXT-uniformBuffers-06935**

  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawMeshTasksEXT-storageBuffers-06936**

  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawMeshTasksEXT-commandBuffer-02707**

  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command must not be a protected resource

- **VUID-vkCmdDrawMeshTasksEXT-None-06550**

  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler Y’CbCr conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDrawMeshTasksEXT-ConstOffset-06551**

  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler Y’CbCr conversion, that object must not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDrawMeshTasksEXT-None-04115**

  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the `Texel` operand of that instruction must have at least as many components as the image view’s format

- **VUID-vkCmdDrawMeshTasksEXT-OpImageWrite-04469**

  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format
If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER>Create_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.
• VUID-vkCmdDrawMeshTasksEXT-OpImageBlockMatchSADQCOM-06976
If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as a result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

• VUID-vkCmdDrawMeshTasksEXT-OpImageWeightedSampleQCOM-06977
If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksEXT-OpImageWeightedSampleQCOM-06978
If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawMeshTasksEXT-None-07288
Any shader invocation executed by this command must terminate.

• VUID-vkCmdDrawMeshTasksEXT-renderPass-02684
The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawMeshTasksEXT-subpass-02685
The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

• VUID-vkCmdDrawMeshTasksEXT-None-02686
Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

• VUID-vkCmdDrawMeshTasksEXT-None-06537
Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

• VUID-vkCmdDrawMeshTasksEXT-None-06538
If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

• VUID-vkCmdDrawMeshTasksEXT-None-06539
If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

• VUID-vkCmdDrawMeshTasksEXT-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

• VUID-vkCmdDrawMeshTasksEXT-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be
• VUID-vkCmdDrawMeshTasksEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex.

• VUID-vkCmdDrawMeshTasksEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set.

• VUID-vkCmdDrawMeshTasksEXT-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawMeshTasksEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

• VUID-vkCmdDrawMeshTasksEXT-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

• VUID-vkCmdDrawMeshTasksEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

• VUID-vkCmdDrawMeshTasksEXT-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

• VUID-vkCmdDrawMeshTasksEXT-viewportCount-04138
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksEXT-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksEXT-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksEXT-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportStateCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksEXT-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksEXT-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksEXT-logicOp-04878**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- VUID-vkCmdDrawMeshTasksEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- VUID-vkCmdDrawMeshTasksEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the `VK_AMD_mixed_attachment_samples` extension, the `VK_NV_framebuffer_mixed_samples` extension, or the `multisampledRenderToSingleSampled` feature are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDrawMeshTasksEXT-imageView-06172
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksEXT-imageView-06173
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksEXT-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksEXT-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksEXT-imageView-06176
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksEXT-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksEXT-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

- VUID-vkCmdDrawMeshTasksEXT-colorAttachmentCount-06179
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksEXT-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-attachmentCount-06667
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo`::`attachmentCount` of the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksEXT-attachmentCount-06815
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

- VUID-vkCmdDrawMeshTasksEXT-pDepthAttachment-06181
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo`::`depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo`::`pDepthAttachment->imageView`
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass
instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksEXT-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMeshTasksEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawMeshTasksEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksEXT-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

- **VUID-vkCmdDrawMeshTasksEXT-groupCountX-07083**
  `groupCountX` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[0]`.

- **VUID-vkCmdDrawMeshTasksEXT-groupCountY-07084**

groupCountY must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[1]

- VUID-vkCmdDrawMeshTasksEXT-groupCountZ-07085
  groupCountZ must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[2]

- VUID-vkCmdDrawMeshTasksEXT-groupCountX-07086
  The product of groupCountX, groupCountY and groupCountZ must be less than or equal to
  VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupTotalCount

- VUID-vkCmdDrawMeshTasksEXT-MeshEXT-07087
  The current pipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS must contain a shader stage using the MeshEXT Execution Model.

Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawMeshTasksEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksEXT-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

To record an indirect mesh tasks drawing command, call:
// Provided by VK_EXT_mesh_shader

void vkCmdDrawMeshTasksIndirectEXT(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);

- **commandBuffer** is the command buffer into which the command is recorded.
- **buffer** is the buffer containing draw parameters.
- **offset** is the byte offset into **buffer** where parameters begin.
- **drawCount** is the number of draws to execute, and **can** be zero.
- **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawMeshTasksIndirectEXT** behaves similarly to **vkCmdDrawMeshTasksEXT** except that the parameters are read by the device from a buffer during execution. **drawCount** draws are executed by the command, with parameters taken from **buffer** starting at **offset** and increasing by **stride** bytes for each successive draw. The parameters of each draw are encoded in an array of **VkDrawMeshTasksIndirectCommandEXT** structures. If **drawCount** is less than or equal to one, **stride** is ignored.

**Valid Usage**

- **VUID-vkCmdDrawMeshTasksIndirectEXT-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectEXT-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06479**
  If a **VkImageView** is sampled with depth comparison, the image view's format features must contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the image view's format features must contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**
• VUID-vkCmdDrawMeshTasksIndirectEXT-filterCubic-02694
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectEXT-filterCubicMinmax-02695
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectEXT-flags-02696
Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07027
For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07028
For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07029
For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectEXT-OpTypeImage-07030
Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMeshTasksIndirectEXT-None-02697
For each set \( n \) that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a VkPipelineLayout that is compatible for set \( n \), with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectEXT-maintenance4-06425
If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMeshTasksIndirectEXT-None-02699
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02700**
  A valid pipeline **must** be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02702**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02703**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02704**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-uniformBuffers-06935**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values.
outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-02707
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command must not be a protected resource

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-06550
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler Y’CbCr conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- VUID-vkCmdDrawMeshTasksIndirectEXT-ConstOffset-06551
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler Y’CbCr conversion, that object must not use the `ConstOffset` and `Offset` operands

- VUID-vkCmdDrawMeshTasksIndirectEXT-None-04115
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWrite-04469
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04470
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04471
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04472
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64

- VUID-vkCmdDrawMeshTasksIndirectEXT-SampledType-04473
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32

- VUID-vkCmdDrawMeshTasksIndirectEXT-sparseImageInt64Atomics-04474
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- VUID-vkCmdDrawMeshTasksIndirectEXT-sparseImageInt64Atomics-04475
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageBoxFilterQCOM-06973**
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageBlockMatchSSDQCOM-06974**
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageBlockMatchSADQCOM-06975**
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageBlockMatchSSDQCOM-06976**
  If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06977**
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06978**
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-07288**
  Any shader invocation executed by this command **must** terminate

- **VUID-vkCmdDrawMeshTasksIndirectEXT-renderPass-02684**
  The current render pass **must** be **compatible** with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-subpass-02685**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06971**
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-OpImageWeightedSampleQCOM-06972**
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`
The subpass index of the current render pass **must** be equal to the *subpass* member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-02686**
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06537**
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must** be `VK_STENCIL_OP_KEEP`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-None-06666**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of...
vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectEXT-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMeshTasksIndirectEXT-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportStateCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMeshTasksIndirectEXT-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMeshTasksIndirectEXT-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMeshTasksIndirectEXT-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

• VUID-vkCmdDrawMeshTasksIndirectEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

• VUID-vkCmdDrawMeshTasksIndirectEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples
extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawMeshTasksIndirectEXT-viewMask-06178
  If the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask.

- VUID-vkCmdDrawMeshTasksIndirectEXT-colorAttachmentCount-06179
  If the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::colorAttachmentCount equal to VkRenderingInfo::colorAttachmentCount.

- VUID-vkCmdDrawMeshTasksIndirectEXT-colorAttachmentCount-06180
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::colorAttachmentCount greater than 0, then each element of the
VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a VkFormat equal to the corresponding element of VkPipelineRenderingCreateInfo::pColorAttachmentFormats used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-attachmentCount-06667
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachmentCount parameter of vkCmdSetColorWriteEnableEXT must be greater than or equal to the VkPipelineColorBlendStateCreateInfo::attachmentCount of the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectEXT-attachmentCount-06815
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachmentCount parameter of vkCmdSetColorWriteEnableEXT must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

- VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthAttachment-06181
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectEXT-pStencilAttachment-06182
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06183
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

- VUID-vkCmdDrawMeshTasksIndirectEXT-imageView-06184
  If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdDrawMeshTasksIndirectEXT-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount
parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07285**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07286**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-multisampledRenderToSingleSampled-07287**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the `multisampledRenderToSingleSampled` feature is not enabled, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

1648
to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard **must** not be enabled.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-stage-07073**
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries **must** not be active

- **VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-02709**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set

- **VUID-vkCmdDrawMeshTasksIndirectEXT-offset-02710**
  `offset` **must** be a multiple of 4

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-02711**
  `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-02718**
  If the `multiDrawIndirect` feature is not enabled, `drawCount` **must** be 0 or 1

- **VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-02719**
  `drawCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07088**
  If `drawCount` is greater than 1, `stride` **must** be a multiple of 4 and **must** be greater than or equal to `sizeof(VkDrawMeshTasksIndirectCommandEXT)`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07089**
  If `drawCount` is equal to 1, `(offset + sizeof(VkDrawMeshTasksIndirectCommandEXT))` **must** be less than or equal to the size of `buffer`

- **VUID-vkCmdDrawMeshTasksIndirectEXT-drawCount-07090**
If `drawCount` is greater than 1, \((\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof} (\text{VkDrawMeshTasksIndirectCommandEXT}))\) must be less than or equal to the size of `buffer`.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-MeshEXT-07091**
  The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` must contain a shader stage using the `MeshEXT Execution Model`.

### Valid Usage (Implicit)

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-buffer-parameter**
  `buffer` must be a valid `VkBuffer` handle.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-renderpass**
  This command must only be called inside of a render pass instance.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-videocoding**
  This command must only be called outside of a video coding scope.

- **VUID-vkCmdDrawMeshTasksIndirectEXT-commonparent**
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

The `VkDrawMeshTasksIndirectCommandEXT` structure is defined as:
typedef struct VkDrawMeshTasksIndirectCommandEXT {
    uint32_t groupCountX;
    uint32_t groupCountY;
    uint32_t groupCountZ;
} VkDrawMeshTasksIndirectCommandEXT;

- `groupCountX` is the number of local workgroups to dispatch in the X dimension.
- `groupCountY` is the number of local workgroups to dispatch in the Y dimension.
- `groupCountZ` is the number of local workgroups to dispatch in the Z dimension.

The members of `VkDrawMeshTasksIndirectCommandEXT` have the same meaning as the similarly named parameters of `vkCmdDrawMeshTasksEXT`.

**Valid Usage**

- VUID-VkDrawMeshTasksIndirectCommandEXT-groupCountX-07092
  - `groupCountX` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[0]`

- VUID-VkDrawMeshTasksIndirectCommandEXT-groupCountY-07093
  - `groupCountY` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[1]`

- VUID-VkDrawMeshTasksIndirectCommandEXT-groupCountZ-07094
  - `groupCountZ` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupCount[2]`

- VUID-VkDrawMeshTasksIndirectCommandEXT-groupCountX-07095
  - The product of `groupCountX`, `groupCountY` and `groupCountZ` must be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesEXT::maxTaskWorkGroupTotalCount`

To record an indirect mesh tasks drawing command with the draw count sourced from a buffer, call:

```c
// Provided by VK_EXT_mesh_shader
void vkCmdDrawMeshTasksIndirectCountEXT(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
• offset is the byte offset into buffer where parameters begin.

• countBuffer is the buffer containing the draw count.

• countBufferOffset is the byte offset into countBuffer where the draw count begins.

• maxDrawCount specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in countBuffer and maxDrawCount.

• stride is the byte stride between successive sets of draw parameters.

vkCmdDrawMeshTasksIndirectCountEXT behaves similarly to vkCmdDrawMeshTasksIndirectEXT except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from countBuffer located at countBufferOffset and use this as the draw count.

Valid Usage

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by
VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07027
  For any VkImageView being written as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07028
  For any VkImageView being read as a storage image where the image format field of the OpTypeImage is Unknown, the view’s format features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07029
  For any VkBufferView being written as a storage texel buffer where the image format field of the OpTypeImage is Unknown, the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-OpTypeImage-07030
  Any VkBufferView being read as a storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s buffer features must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as
There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler \( Y'CbCr \) conversion, that object must not use the ConstOffset and Offset operands.

If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64.

If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32.

If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.
If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's `format features` must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

Any shader invocation executed by this command must terminate.

If any recorded command in the current subpass will write to an image subresource as an attachment, then memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.
attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal toVkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created withVkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with theVK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03417
  If the bound graphics pipeline state was created with theVK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not theVK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, thenvkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and theviewportCount parameter ofvkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-scissorCount-03418
  If the bound graphics pipeline state was created with theVK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not theVK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, thenvkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and thescissorCount parameter ofvkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the
**VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of **vkCmdSetViewportWithCount** must match the `scissorCount` parameter of **vkCmdSetScissorWithCount**

- **VID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04137**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline must have been created with **VkPipelineViewportWScalingStateCreateInfoNV**::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04138**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic states enabled then the `viewportCount` parameter in the last call to **vkCmdSetViewportWScalingNV** must be greater than or equal to the `viewportCount` parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04139**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic state enabled, then the bound graphics pipeline must have been created with **VkPipelineViewportShadingRateImageStateCreateInfoNV**::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewportCount-04140**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV** dynamic states enabled then the `viewportCount` parameter in the last call to **vkCmdSetViewportShadingRatePaletteNV** must be greater than or equal to the `viewportCount` parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled and a **VkPipelineViewportSwizzleStateCreateInfoNV** structure chained from **VkPipelineViewportStateCreateInfo**, then the bound graphics pipeline must have been created with **VkPipelineViewportSwizzleStateCreateInfoNV**::`viewportCount` greater or equal to the `viewportCount` parameter in the last call to **vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawMeshTasksIndirectCountEXT-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled and a **VkPipelineViewportExclusiveScissorStateCreateInfoNV** structure chained from **VkPipelineViewportStateCreateInfo**, then the bound graphics pipeline must have been created with **VkPipelineViewportExclusiveScissorStateCreateInfoNV**
exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07284
  If rasterization is not disabled in the bound graphics pipeline, and none of the VK_AMD_mixed_attachment_samples extension, the VK_NV_framebuffer_mixed_samples extension, or the multisampledRenderToSingleSampled feature are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView
member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06174
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL}, this command \textbf{must} not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06175
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06176
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the depth attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06177
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK_NULL_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL}, this command \textbf{must} not write any values to the stencil attachment

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-viewMask-06178
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound graphics pipeline \textbf{must} have been created with a \texttt{VkPipelineRenderingCreateInfo}::\texttt{viewMask} equal to \texttt{VkRenderingInfo}::\texttt{viewMask}

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06179
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound graphics pipeline \textbf{must} have been created with a \texttt{VkPipelineRenderingCreateInfo}::\texttt{colorAttachmentCount} equal to \texttt{VkRenderingInfo}::\texttt{colorAttachmentCount}

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06180
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering} and \texttt{VkRenderingInfo}::\texttt{colorAttachmentCount} greater than \texttt{0}, then each element of the \texttt{VkRenderingInfo}::\texttt{pColorAttachments} array with a \texttt{imageView} not equal to \texttt{VK_NULL_HANDLE} \textbf{must} have been created with a \texttt{VkFormat} equal to the corresponding element of \texttt{VkPipelineRenderingCreateInfo}::\texttt{pColorAttachmentFormats} used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-attachmentCount-06667
  If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT} dynamic state enabled then \texttt{vkCmdSetColorWriteEnableEXT} \textbf{must} have been called in the current command buffer prior to this drawing command, and the \texttt{attachmentCount} parameter of \texttt{vkCmdSetColorWriteEnableEXT} \textbf{must} be greater than or equal to the \texttt{VkPipelineColorBlendStateCreateInfo}::\texttt{attachmentCount} of the currently bound graphics
pipeline

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-attachmentCount-06815
If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT dynamic state enabled then
vkCmdSetColorWriteEnableEXT must have been called in the current command buffer prior to this drawing command, and the attachmentCount parameter of
vkCmdSetColorWriteEnableEXT must be less than or equal to the maxColorAttachments member of VkPhysicalDeviceLimits

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-06181
If the current render pass instance was begun with vkCmdBeginRendering and
VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of
VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-06182
If the current render pass instance was begun with vkCmdBeginRendering and
VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of
VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06183
If the current render pass instance was begun with vkCmdBeginRendering and
VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-imageView-06184
If the current render pass instance was begun with vkCmdBeginRendering and
VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-colorAttachmentCount-06185
If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

• VUID-vkCmdDrawMeshTasksIndirectCountEXT-pDepthAttachment-06186
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV
used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07285
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07286
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-multisampledRenderToSingleSampled-07287
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the multisampledRenderToSingleSampled feature is not enabled, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stage-07073
  If the currently bound pipeline was created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT, VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT, VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`, then Mesh Shader Queries must not be active.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02708
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-02709
  If `buffer` is non-sparse then it must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-offset-02710
  If `offset` is non-sparse then it must be a multiple of 4.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-02711
  `commandBuffer` must not be a protected command buffer.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02714
  If `countBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02715
  If `countBuffer` is non-sparse then it must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-02716
  If `countBufferOffset` is non-sparse then it must be a multiple of 4.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-04129
  If `countBufferOffset` is non-sparse then it must be a multiple of 4.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-02717
  The count stored in `countBuffer` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBufferOffset-04129
  If `countBufferOffset` is non-sparse then it must be less than or equal to the size of `countBuffer`.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-None-04445
  If `drawIndirectCount` is not enabled this function must not be used.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-stride-07096
  `stride` must be a multiple of 4 and `must be greater than or equal to sizeof (VkDrawMeshTasksIndirectCommandEXT)`.
If `maxDrawCount` is greater than or equal to 1, 
\[(\text{stride} \times (\text{maxDrawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))\] must be less than or equal to the size of `buffer`.

If the count stored in `countBuffer` is equal to 1, 
\[(\text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))\] must be less than or equal to the size of `buffer`.

If the count stored in `countBuffer` is greater than 1, 
\[(\text{stride} \times (\text{drawCount} - 1) + \text{offset} + \text{sizeof}(\text{VkDrawMeshTasksIndirectCommandEXT}))\] must be less than or equal to the size of `buffer`.

The current pipeline bound to `VK_PIPELINE_BIND_POINT_GRAPHICS` must contain a shader stage using the `MeshEXT Execution Model`.

**Valid Usage (Implicit)**

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-buffer-parameter
  
  `buffer` must be a valid `VkBuffer` handle.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-countBuffer-parameter
  
  `countBuffer` must be a valid `VkBuffer` handle.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-renderpass
  
  This command must only be called inside of a render pass instance.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-videocoding
  
  This command must only be called outside of a video coding scope.

- VUID-vkCmdDrawMeshTasksIndirectCountEXT-commonparent
  
  Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

**SPIR-V example**

```glsl
...%1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```

1666
22.1.1. Attribute Location and Component Assignment

Vertex shaders allow Location and Component decorations on input variable declarations. The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume. The Component decoration allows the location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable starting at component N will consume components N, N+1, N+2, … up through its size. For single precision types, it is invalid if the sequence of components gets larger than 3.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

Table 30. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>scalar</td>
<td>0 or unspecified</td>
<td>(x, o, o, o)</td>
</tr>
<tr>
<td>scalar</td>

<tr>
<td>two-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, o, o)</td>
</tr>
</tbody>
</table>
### 16-bit or 32-bit data type

<table>
<thead>
<tr>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>
<td>two-component vector</td>
<td>1 (o, y, z, o)</td>
</tr>
<tr>
<td>two-component vector</td>
<td>2 (o, o, z, w)</td>
</tr>
<tr>
<td>three-component vector</td>
<td>0 or unspecified (x, y, z, o)</td>
</tr>
<tr>
<td>three-component vector</td>
<td>1 (o, y, z, w)</td>
</tr>
<tr>
<td>four-component vector</td>
<td>0 or unspecified (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a location \(i\), its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in **Input attributes accessed by 32-bit input matrix variables**. The `VkVertexInputAttributeDescription::format` **must** be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The Component decoration **must** not be used with matrix types.

### Table 31. Input attributes accessed by 32-bit input matrix variables

<td>two-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)</td>
</tr>
<tr>
<td>mat4x3</td>
<td>three-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.
When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a location \( i \), its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The locations and components used depend on the type of variable and the `Component` decoration specified in the variable declaration, as identified in `Input attribute locations and components accessed by 64-bit input variables`. For 64-bit data types, no default attribute values are provided. Input variables must not use more components than provided by the attribute. Input attributes which have one- or two-component 64-bit formats will consume a single location. Input attributes which have three- or four-component 64-bit formats will consume two consecutive locations. A 64-bit scalar data type will consume two components, and a 64-bit two-component vector data type will consume all four components available within a location. A three- or four-component 64-bit data type must not specify a component. A three-component 64-bit data type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations. A four-component 64-bit data type will consume all four components of the first location and all four components of the second location. It is invalid for a scalar or two-component 64-bit data type to specify a component of 1 or 3.

</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location $i$, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in Input attribute locations and components accessed by 64-bit input variables. Each column vector starts at the location immediately following the last location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. Location aliasing is causing two variables to have the same location number. Component aliasing is assigning the same (or overlapping) component number for two location aliases. Location aliasing is allowed only if it does not cause component aliasing. Further, when
location aliasing, the aliases sharing the location must all have the same SPIR-V floating-point component type or all have the same width integer-type components.

### 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer to a `VkPipelineVertexInputStateCreateInfo` structure. Alternatively, if the graphics pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with `vkCmdSetVertexInputEXT`, and the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer is ignored.

The `VkPipelineVertexInputStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- **pVertexBindingDescriptions** is a pointer to an array of `VkVertexInputBindingDescription` structures.
- **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- **pVertexAttributeDescriptions** is a pointer to an array of `VkVertexInputAttributeDescription` structures.

### Valid Usage

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613**
  
  `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614**
  
  `vertexAttributeDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`
For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription` must exist in `pVertexBindingDescriptions` with the same value of binding.

All elements of `pVertexBindingDescriptions` must describe distinct binding numbers.

All elements of `pVertexAttributeDescriptions` must describe distinct attribute locations.

**Valid Usage (Implicit)**

- The `sType` value of each struct in the `pNext` chain must be unique.

Each vertex input binding is specified by the `VkVertexInputBindingDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
} VkVertexInputBindingDescription;
```

`VkPipelineVertexInputStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.
VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;

- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a **VkVertexInputRate** value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

### Valid Usage

- **VUID-VkVertexInputBindingDescription-binding-00618**
  binding must be less than **VkPhysicalDeviceLimits::maxVertexInputBindings**

- **VUID-VkVertexInputBindingDescription-stride-00619**
  stride must be less than or equal to **VkPhysicalDeviceLimits::maxVertexInputBindingStride**

- **VUID-VkVertexInputBindingDescription-stride-04456**
  If the **VK_KHR_portability_subset** extension is enabled, stride must be a multiple of, and at least as large as, **VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment**

### Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription-inputRate-parameter**
  inputRate must be a valid **VkVertexInputRate** value

Possible values of **VkVertexInputBindingDescription::inputRate**, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- **VK_VERTEX_INPUT_RATE_VERTEX** specifies that vertex attribute addressing is a function of the vertex index.
- **VK_VERTEX_INPUT_RATE_INSTANCE** specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the **VkVertexInputAttributeDescription** structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
```
uint32_t location;
uint32_t binding;
VkFormat format;
uint32_t offset;
} VkVertexInputAttributeDescription;

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

**Valid Usage**

- VUID-VkVertexInputAttributeDescription-location-00620
  
  *location* must be less than *VkPhysicalDeviceLimits::maxVertexInputAttributes*

- VUID-VkVertexInputAttributeDescription-binding-00621
  
  *binding* must be less than *VkPhysicalDeviceLimits::maxVertexInputBindings*

- VUID-VkVertexInputAttributeDescription-offset-00622
  
  *offset* must be less than or equal to *VkPhysicalDeviceLimits::maxVertexInputAttributeOffset*

- VUID-VkVertexInputAttributeDescription-format-00623
  
  *format* must be allowed as a vertex buffer format, as specified by the *VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT* flag in *VkFormatProperties::bufferFeatures* returned by *vkGetPhysicalDeviceFormatProperties*

- VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457
  
  If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride* is *VK_FALSE*, the sum of *offset* plus the size of the vertex attribute data described by *format* must not be greater than *stride* in the *VkVertexInputBindingDescription* referenced in *binding*

**Valid Usage (Implicit)**

- VUID-VkVertexInputAttributeDescription-format-parameter
  
  *format* must be a valid *VkFormat* value

To dynamically set the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t vertexBindingDescriptionCount,
```
```c
const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions,
uint32_t vertexAttributeDescriptionCount,
const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
- `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.

**Valid Usage**

- VUID-vkCmdSetVertexInputEXT-None-04790
  The `vertexInputDynamicState` feature **must** be enabled

- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` **must** exist in `pVertexBindingDescriptions` with the same value of `binding`

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations
Valid Usage (Implicit)

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter**
  
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` must be a valid pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT` structures.

- **VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter**
  
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT` structures.

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdSetVertexInputEXT-videocoding**
  
  This command must only be called outside of a video coding scope.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
} VkVertexInputBindingDescription2EXT;
```
VkVertexInputRate   inputRate;
uint32_t             divisor;
} VkVertexInputBindingDescription2EXT;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **binding** is the binding number that this structure describes.
- **stride** is the byte stride between consecutive elements within the buffer.
- **inputRate** is a *VkVertexInputRate* value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
- **divisor** is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the *vertexAttributeInstanceRateDivisor* feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using *VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor*. A value of 0 can be used for the divisor if the *vertexAttributeInstanceRateZeroDivisor* feature is enabled. In this case, the same vertex attribute will be applied to all instances.

### Valid Usage

- **VUID-VkVertexInputBindingDescription2EXT-binding-04796**
  
  binding must be less than *VkPhysicalDeviceLimits::maxVertexInputBindings*

- **VUID-VkVertexInputBindingDescription2EXT-stride-04797**
  
  stride must be less than or equal to *VkPhysicalDeviceLimits::maxVertexInputBindingStride*

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04798**
  
  If the *vertexAttributeInstanceRateZeroDivisor* feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDescription2EXT-divisor-04799**
  
  If the *vertexAttributeInstanceRateDivisor* feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06226**
  
  divisor must be a value between 0 and *VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor*, inclusive

- **VUID-VkVertexInputBindingDescription2EXT-divisor-06227**
  
  If divisor is not 1 then inputRate must be of type *VK_VERTEX_INPUT_RATE_INSTANCE*

### Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription2EXT-sType-sType**
  
  sType must be *VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT*

- **VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter**
  
  inputRate must be a valid *VkVertexInputRate* value
The `VkVertexInputAttributeDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `location` is the shader input location number for this attribute.
- `binding` is the binding number which this attribute takes its data from.
- `format` is the size and type of the vertex attribute data.
- `offset` is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
  location must be less than `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
  offset must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributeOffset`

- VUID-VkVertexInputAttributeDescription2EXT-format-04805
  format must be allowed as a vertex buffer format, as specified by the `VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT` flag in `VkFormatProperties::bufferFeatures` returned by `vkGetPhysicalDeviceFormatProperties`

- VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride` is `VK_FALSE`, the sum of `offset` plus the size of the vertex attribute data described by `format` must not be greater than `stride` in the `VkVertexInputBindingDescription2EXT` referenced in `binding`
Valid Usage (Implicit)

- **VUID-VkVertexInputAttributeDescription2EXT-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT`

- **VUID-VkVertexInputAttributeDescription2EXT-format-parameter**
  - `format` must be a valid `VkFormat` value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
define void vkCmdBindVertexBuffers
    (VkCommandBuffer
        commandBuffer,
        uint32_t
        firstBinding,
        uint32_t
        bindingCount,
        const VkBuffer
        *pBuffers,
        const VkDeviceSize
        *pOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with `(0,0,1)`.

Valid Usage

- **VUID-vkCmdBindVertexBuffers-firstBinding-00624**
  - `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers-firstBinding-00625**
  - The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-vkCmdBindVertexBuffers-pOffsets-00626**
  - All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`
All elements of pBuffers must have been created with the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag.

Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object.

If the nullDescriptor feature is not enabled, all elements of pBuffers must not be VK_NULL_HANDLE.

If an element of pBuffers is VK_NULL_HANDLE, then the corresponding element of pOffsets must be zero.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE VkBuffer handles.

pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values.

commandBuffer must be in the recording state.

The VkCommandPool that commandBuffer was allocated from must support graphics operations.

This command must only be called outside of a video coding scope.

bindingCount must be greater than 0.

Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice.

Host Synchronization

Host access to commandBuffer must be externally synchronized.

Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.
Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,            // Provided by VK_VERSION_1_3
    uint32_t firstBinding,                   // Provided by VK_VERSION_1_3
    uint32_t bindingCount,                   // Provided by VK_VERSION_1_3
    const VkBuffer* pBuffer,                 // Provided by VK_VERSION_1_3
    const VkDeviceSize* pOffsets,            // Provided by VK_VERSION_1_3
    const VkDeviceSize* pSizes,              // Provided by VK_VERSION_1_3
    const VkDeviceSize* pStrides);           // Provided by VK_VERSION_1_3
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,            // Provided by VK_EXT_extended_dynamic_state
    uint32_t firstBinding,                   // Provided by VK_EXT_extended_dynamic_state
    uint32_t bindingCount,                   // Provided by VK_EXT_extended_dynamic_state
    const VkBuffer* pBuffer,                 // Provided by VK_EXT_extended_dynamic_state
    const VkDeviceSize* pOffsets,            // Provided by VK_EXT_extended_dynamic_state
    const VkDeviceSize* pSizes,              // Provided by VK_EXT_extended_dynamic_state
    const VkDeviceSize* pStrides);           // Provided by VK_EXT_extended_dynamic_state
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is NULL or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is NULL or a pointer to an array of buffer strides.

The values taken from elements `i` of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for `i` in `[0, bindingCount)`. The vertex input binding is updated to start
at the offset indicated by \( pOffsets[i] \) from the start of the buffer \( pBuffers[i] \). If \( pSizes \) is not \( NULL \) then \( pSizes[i] \) specifies the bound size of the vertex buffer starting from the corresponding elements of \( pBuffers[i] \) plus \( pOffsets[i] \). All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of \( pBuffers \) can be \( VK_NULL_HANDLE \), and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is \( VK_NULL_HANDLE \), the values taken from memory are considered to be zero, and missing G, B, or A components are filled with \((0,0,1)\).

This command also dynamically sets the byte strides between consecutive elements within buffer \( pBuffers[i] \) to the corresponding \( pStrides[i] \) value when the graphics pipeline is created with \( VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE \) set in \( VkPipelineDynamicStateCreateInfo::pDynamicStates \). Otherwise, strides are specified by the \( VkVertexInputBindingDescription::stride \) values used to create the currently active pipeline.

Valid Usage

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03355**
  firstBinding must be less than \( \text{VkPhysicalDeviceLimits::maxVertexInputBindings} \)

- **VUID-vkCmdBindVertexBuffers2-firstBinding-03356**
  The sum of firstBinding and bindingCount must be less than or equal to \( \text{VkPhysicalDeviceLimits::maxVertexInputBindings} \)

- **VUID-vkCmdBindVertexBuffers2-pOffsets-03357**
  All elements of \( pOffsets \) must be less than the size of the corresponding element in \( pBuffers \)

- **VUID-vkCmdBindVertexBuffers2-pSizes-03358**
  If \( pSizes \) is not \( NULL \), all elements of \( pOffsets \) plus \( pSizes \) must be less than or equal to the size of the corresponding element in \( pBuffers \)

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03359**
  All elements of \( pBuffers \) must have been created with the \( VK_BUFFER_USAGE_VERTEX_BUFFER_BIT \) flag

- **VUID-vkCmdBindVertexBuffers2-pBuffers-03360**
  Each element of \( pBuffers \) that is non-sparse must be bound completely and contiguously to a single \( VkDeviceMemory \) object

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04111**
  If the nullDescriptor feature is not enabled, all elements of \( pBuffers \) must not be \( VK_NULL_HANDLE \)

- **VUID-vkCmdBindVertexBuffers2-pBuffers-04112**
  If an element of \( pBuffers \) is \( VK_NULL_HANDLE \), then the corresponding element of \( pOffsets \) must be zero

- **VUID-vkCmdBindVertexBuffers2-pStrides-03362**
If `pStrides` is not NULL each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-vkCmdBindVertexBuffer2-pStrides-06209
  If `pStrides` is not NULL each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format size`.

**Valid Usage (Implicit)**

- VUID-vkCmdBindVertexBuffer2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindVertexBuffer2-pBuffers-parameter
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles.

- VUID-vkCmdBindVertexBuffer2-pOffsets-parameter
  `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffer2-pSizes-parameter
  If `pSizes` is not NULL, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffer2-pStrides-parameter
  If `pStrides` is not NULL, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values.

- VUID-vkCmdBindVertexBuffer2-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindVertexBuffer2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBindVertexBuffer2-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindVertexBuffer2-bindingCount-arraylength
  If any of `pSizes`, or `pStrides` are not NULL, `bindingCount` must be greater than 0.

- VUID-vkCmdBindVertexBuffer2-commonparent
  Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
22.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures specifying the divisor value for each binding.

**Valid Usage (Implicit)**

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter`  
  `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures

- `VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength`  
  `vertexBindingDivisorCount` must be greater than 0
The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionEXT` structure which is defined as:

```
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- `binding` is the binding number for which the divisor is specified.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869**
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228**
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229**
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870**
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871**
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

### 22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo`
Let bindingDesc be the member of VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions with VkVertexInputAttributeDescription::location equal to the vertex input attribute number.

Let vertexIndex be the index of the vertex within the draw (a value between firstVertex and firstVertex+vertexCount for vkCmdDraw, or a value taken from the index buffer plus vertexOffset for vkCmdDrawIndexed), and let instanceIndex be the instance number of the draw (a value between firstInstance and firstInstance+instanceCount).

Let offset be an array of offsets into the currently bound vertex buffers specified during vkCmdBindVertexBuffers or vkCmdBindVertexBuffers2 with pOffsets.

Let divisor be the member of VkPipelineVertexInputDivisorStateCreateInfoEXT::pVertexBindingDivisors with VkVertexInputBindingDivisorDescriptionEXT::binding equal to attribDesc.binding.

```cpp
bufferBindingAddress = buffer[binding].baseAddress + offset[binding];
if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * bindingDesc.stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * bindingDesc.stride;
attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;
```

### 22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at attribAddress and is converted from the VkVertexInputAttributeDescription's format to either floating-point, unsigned integer, or signed integer based on the base type of the format; the base type of the format must match the base type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if format is a 64-bit data type. If format is a packed format, attribAddress must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, attribAddress must be a multiple of the size in bytes of the component type indicated by format (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Signed 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a tessellation control shader transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a tessellation evaluation shader transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables \texttt{TessLevelOuter} and \texttt{TessLevelInner}, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an \texttt{OpExecutionMode} instruction in the tessellation evaluation or tessellation control shader using one of execution modes \texttt{Triangles}, \texttt{Quads}, and \texttt{IsoLines}. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders, and if they are specified in both then the modes must be the same.

Tessellation execution modes include:

- \texttt{Triangles}, \texttt{Quads}, and \texttt{IsoLines}. These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages. If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines} is \texttt{VK_FALSE}, then isoline tessellation is not supported by the implementation, and \texttt{IsoLines} must not be used in either tessellation shader stage.

- \texttt{VertexOrderCw} and \texttt{VertexOrderCcw}. These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.

- \texttt{PointMode}. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode} is \texttt{VK_FALSE}, then point mode tessellation is not supported by the implementation, and \texttt{PointMode} must not be used in either tessellation shader stage.

- \texttt{SpacingEqual}, \texttt{SpacingFractionalEven}, and \texttt{SpacingFractionalOdd}. Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
• **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the \( u \) dimension (i.e. the coordinates in \text{TessCoord} are of the form \((0,x)\) through \((1,x)\) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated \((u,v,w)\) or \((u,v)\) position in a normalized parameter space, with parameter values in the range \([0,1]\), as illustrated in figures **Domain parameterization for tessellation primitive modes (upper-left origin)** and **Domain parameterization for tessellation primitive modes (lower-left origin)**. The domain space **can** have either an upper-left or lower-left origin, selected by the \text{domainOrigin} member of \text{VkPipelineTessellationDomainOriginStateCreateInfo}.

![Diagram of Domain Parameterization](image)

*Figure 15. Domain parameterization for tessellation primitive modes (upper-left origin)*
In the domain parameterization diagrams, the coordinates illustrate the value of \texttt{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (IL0 and IL1) and outer (OL0 through OL3) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex's position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point...
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For **Quads**, all four outer levels are relevant. For **Triangles** and **IsoLines**, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an **OpExecutionMode** in the tessellation control or tessellation evaluation shader using one of the identifiers **SpacingEqual**, **SpacingFractionalEven**, or **SpacingFractionalOdd**.

If **SpacingEqual** is used, the floating-point tessellation level is first clamped to \([1, \text{maxLevel}]\), where \(\text{maxLevel}\) is the implementation-dependent maximum tessellation level (**VkPhysicalDeviceLimits::maxTessellationGenerationLevel**). The result is rounded up to the nearest integer \(n\), and the corresponding edge is divided into \(n\) segments of equal length in (u,v) space.

If **SpacingFractionalEven** is used, the tessellation level is first clamped to \([2, \text{maxLevel}]\) and then rounded up to the nearest even integer \(n\). If **SpacingFractionalOdd** is used, the tessellation level is clamped to \([1, \text{maxLevel} - 1]\) and then rounded up to the nearest odd integer \(n\). If \(n\) is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into \(n - 2\) segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with \(n - f\), where \(f\) is the clamped floating-point tessellation level. When \(n - f\) is zero, the additional segments will have equal length to the other segments. As \(n - f\) approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments **must** be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but **must** be identical for any pair of subdivided edges with identical values of \(f\).

When tessellating triangles or quads using **point mode** with fractional odd spacing, the tessellator **may** produce **interior vertices** that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to **primitive order**.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an OpExecutionMode of VertexOrderCw or VertexOrderCcw in the tessellation control or tessellation evaluation shaders. If the order is VertexOrderCw, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is VertexOrderCcw, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if a is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

**Note**

The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

23.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating \( n \) segments. For the outermost inner triangle, the inner triangle is degenerate—a single point at the center of the triangle—if \( n \) is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If \( n \) is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into \( n - 2 \) segments, with the \( n - 1 \) vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in \textit{Inner Triangle Tessellation}.

\[\text{Figure 17. Inner Triangle Tessellation}\]

\begin{center}
\begin{figure}
\centering
\includegraphics[width=\textwidth]{inner_triangle_tessellation}
\caption{Caption}
\end{figure}
\end{center}

\textbf{Caption}

In the \textit{Inner Triangle Tessellation} diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge running through the \( n - 1 \) innermost vertices of the subdivision of the outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric \((u,v,w)\) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in \((u,v,w)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the \( u = 0 \) and \( u = 1 \) (vertical) and \( v = 0 \) and \( v = 1 \) (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), \( u = 1 \) (right), and \( v = 1 \) (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as \( 1 + \varepsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the \( u = 0 \) and \( u = 1 \) edges of the outer rectangle into \( m \) segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The \( v = 0 \) and \( v = 1 \) edges are subdivided into \( n \) segments using the second inner tessellation level. Each vertex on the \( u = 0 \) and \( v = 0 \) edges are joined with the corresponding vertex on the \( u = 1 \) and \( v = 1 \) edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either m or n is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), \( u = 1 \), and \( v = 1 \) edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in \((u,v)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.8. Isoline Tessellation

If the tessellation primitive mode is *Isolines*, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called *isolines*, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range \([0,1]\). The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The \(u = 0\) and \(u = 1\) edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the \(u = 0\) rectangle edge to the corresponding vertex on the \(u = 1\) rectangle edge, except that no line is drawn between \((0,1)\) and \((1,1)\). If the number of isolines on the subdivided \(u = 0\) and \(u = 1\) edges is \(n\), this process will result in \(n\) equally spaced lines with constant v coordinates of 0, \(\frac{1}{n}\), \(\frac{2}{n}\), ..., \(\frac{n-1}{n}\).

Each of the \(n\) isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in \(m\) line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to *line lists*, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

#### Note

If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines* is *VK_FALSE*, then isoline tessellation is not supported by the implementation.

### 23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the *OpExecutionMode PointMode*, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to *point lists*, except the order in which the points are generated for each input primitive is undefined.

#### Note

If the *VK_KHR_portability_subset* extension is enabled, and *VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode* is *VK_FALSE*, then tessellation point mode is not supported by the implementation.
23.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

### Valid Usage

- `VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214`
  `patchControlPoints` must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

- `VUID-VkPipelineTessellationStateCreateInfo-sType-sType`
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- `VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext`
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`

- `VUID-VkPipelineTessellationStateCreateInfo-sType-unique`
  The `sType` value of each struct in the `pNext` chain must be unique

- `VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask`
  `flags` must be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
The `VkPipelineTessellationDomainOriginStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
    VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `domainOrigin` is a `VkTessellationDomainOrigin` value controlling the origin of the tessellation domain space.

If the `VkPipelineTessellationDomainOriginStateCreateInfo` structure is included in the `pNext` chain of `VkPipelineTessellationStateCreateInfo`, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT`.

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO`
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter `domainOrigin` must be a valid `VkTessellationDomainOrigin` value

The possible tessellation domain origins are specified by the `VkTessellationDomainOrigin` enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR =
        VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;
```

- `VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT` specifies that the origin of the domain space is in the upper left corner, as shown in figure [Domain parameterization for tessellation primitive modes (upper-left origin)].

- `VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT` specifies that the origin of the domain space is in the lower left corner, as shown in figure [Domain parameterization for tessellation primitive modes (lower-left origin)].

This enum affects how the `VertexOrderCw` and `VertexOrderCcw` tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.
Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an `OpExecutionMode` instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline’s primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of `InputPoints` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_POINT_LIST`, or with a tessellation shader specifying `PointMode`. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of `InputLines` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, or with a tessellation shader specifying `IsoLines` that does not specify `PointMode`. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isoline tessellation.

- An input primitive type of `InputLinesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of `Triangles` must only be used with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`; or with a tessellation shader specifying `Quads` or `Triangles` that does not specify `PointMode`. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of `InputTrianglesAdjacency` must only be used when tessellation is inactive, with a pipeline topology of `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` or `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip` or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the `PassthroughNV` decoration and modifications to the interface matching rules when using passthrough geometry shaders.

### 24.5.1. `PassthroughNV` Decoration

Decorating a geometry shader input variable with the `PassthroughNV` decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the `PassthroughNV` decoration are consumed by the geometry shader without being passed through to subsequent stages.

The `PassthroughNV` decoration **must** only be used within a geometry shader.

Any variable decorated with `PassthroughNV` **must** be declared using the `Input` storage class.

The `PassthroughNV` decoration **must** not be used with any of:

- an input primitive type other than `InputPoints`, `InputLines`, or `Triangles`, as specified by the mode for `OpExecutionMode`.
- an invocation count other than one, as specified by the `Invocations` mode for `OpExecutionMode`.
- an `OpEntryPoint` which statically uses the `OpEmitVertex` or `OpEndPrimitive` instructions.
- a variable decorated with the `InvocationId` built-in decoration.
- a variable decorated with the `PrimitiveId` built-in decoration that is declared using the `Input` storage class.

### 24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the `PassthroughNV` decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the `PassthroughNV` decoration is considered to add an equivalent output variable with the same type, decoration (other than `PassthroughNV`), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with `PassthroughNV` will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with `PassthroughNV` or having members decorated with `PassthroughNV` will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with `PassthroughNV`, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block...
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated. Shaders using the TaskNV Execution Model can do so using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount. Shaders using the TaskEXT Execution Model can do so using the OpEmitMeshTasksEXT instruction. The groupCountX, groupCountY and groupCountZ arguments passed to this instruction must be less than or equal to the respective dimension within VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupCount. The product of these arguments must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshWorkGroupTotalCount.

The task shader can also pass user-defined data to all mesh shader invocations that it creates. Shaders using the TaskNV Execution Model can do so by writing to output variables that are decorated with PerTaskNV. They are available as inputs in mesh shaders. Shaders using the TaskEXT Execution Model can do so by writing to a payload variable with TaskPayloadWorkgroupEXT storage class that is passed to the OpEmitMeshTasksEXT instruction.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task's output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV or the payload variable passed to the
OpEmitMeshTasksEXT instruction by the task shader that spawned the mesh shader's workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. For shaders using the MeshNV Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. For shaders using the MeshEXT Execution Model the primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesEXT, or OutputTrianglesEXT modes, respectively. Each mesh shader must include exactly one output primitive mode.

For shaders using the MeshNV Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices. For shaders using the MeshEXT Execution Model the maximum output vertex count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputVertices and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputVertices.

For shaders using the MeshNV Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesNV and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives. For shaders using the MeshEXT Execution Model the maximum output primitive count is specified as a literal in the shader using an OpExecutionMode instruction with the mode set to OutputPrimitivesEXT, and must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesEXT::maxMeshOutputPrimitives.

For shaders using the MeshNV Execution Model the number of primitives output by the mesh shader is provided via writing to the built-in variable PrimitiveCountNV and must be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with PrimitiveIndicesNV is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. For shaders using the MeshEXT Execution Model the number of vertices and primitives output by the mesh shader is provided via calling the OpSetMeshOutputsEXT instruction. The vertexCount argument must be less than or equal to the maximum output vertex count specified in the shader. The primitiveCount argument must be less than or equal to the maximum output primitive count specified in the shader.

Depending on the output primitive mode an appropriately-decorated variable is the output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type:

- OutputPoints uses the PrimitivePointIndicesEXT decoration.
- OutputLinesEXT uses the PrimitiveLineIndicesEXT decoration.
- OutputTrianglesEXT uses the PrimitiveTriangleIndicesEXT decoration.

These resulting primitives are then further processed as described in Rasterization.
With the exception of primitive indices, all output built-ins and custom attributes count towards the total storage size occupied by output variables in mesh shaders. This size can be calculated as follows, taking into account the fact that the number of effective scalar attributes is 4 times the number of effective locations used according to the location assignment rules. Let \( v \) be the number of views, \( n_v \) be the number of effective scalar per-vertex attributes not dependent on ViewIndex, \( n_{vpv} \) be the number of effective scalar per-vertex attributes dependent on ViewIndex, \( m_v \) be the maximum number of vertices specified by the OutputVertices Execution Mode, \( g_v \) be meshOutputPerVertexGranularity, \( n_p \) be the number of effective scalar per-primitive attributes not dependent on ViewIndex, \( n_{ppv} \) be the number of effective scalar per-primitive attributes dependent on ViewIndex, \( m_p \) be the maximum number of primitives specified by the OutputPrimitivesEXT Execution Mode and \( g_p \) be meshOutputPerPrimitiveGranularity:

\[
(n_v + (n_{vpv} \times v)) \times 4 \times \text{align}(m_v, g_v) + (n_p + (n_{ppv} \times v)) \times 4 \times \text{align}(m_p, g_p)
\]

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the PositionPerViewNV, ClipDistancePerViewNV, CullDistancePerViewNV, LayerPerViewNV, and ViewportMaskPerViewNV built-in decorations are the per-view versions of the single-view variables with equivalent names (that is Position, ClipDistance, CullDistance, Layer, and ViewportMaskNV, respectively). If a shader statically assigns a value to any element of a per-view array it must not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the ClipDistancePerViewNV, and CullDistancePerViewNV arrays have the same requirements as the ClipDistance, and CullDistance arrays.

If a mesh shader output is per-view, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

These per-view outputs are available only in shaders using the MeshNV Execution Model. They are not available in shaders using the MeshEXT Execution Model.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to primitive order.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

26.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither **geometry** or **tessellation shading** is active, vertices within a primitive are appended according to the winding order described by the **primitive topology** defined by the `VkPipelineInputAssemblyStateCreateInfo:topology` used to execute the **drawing command**.

- If **geometry shading** is active, vertices within a primitive are appended according to the winding order described by the **primitive topology** defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.

- If **tessellation shading** is active but **geometry shading** is not, vertices within a primitive are appended according to the winding order defined by **triangle tessellation**, **quad tessellation**, and **isoline tessellation**.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order **must** preserve the **provoking vertex** of each primitive:

- When the pipeline's **provoking vertex mode** is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.

- When the pipeline's **provoking vertex mode** is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither **geometry** nor **tessellation shading** is active, and the **primitive topology** is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with an **Offset** decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable **must** be written at an offset aligned to the size of the component. The size of each component of an output variable **must** be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is `NULL`, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. 

Valid Usage

- VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  firstBinding must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  The sum of firstBinding and bindingCount must be less than or equal to
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  All elements of pOffsets must be a multiple of 4

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  All elements of pBuffers must have been created with the
  VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT flag

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  If the optional pSize array is specified, each element of pSizes must either be
  VK_WHOLE_SIZE, or be less than or equal to
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferSize

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  All elements of pSizes must be either VK_WHOLE_SIZE, or less than or equal to the size of the
  corresponding buffer in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  All elements of pOffsets plus pSizes, where the pSizes, element is not VK_WHOLE_SIZE, must
  be less than or equal to the size of the corresponding buffer in pBuffers

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  Each element of pBuffers that is non-sparse must be bound completely and contiguously
  to a single VkDeviceMemory object

- VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  Transform feedback must not be active when the vkCmdBindTransformFeedbackBuffersEXT
  command is recorded

Valid Usage (Implicit)

- VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid VkBuffer handles
- **VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter**
  `pOffsets` **must** be a valid pointer to an array of `bindingCount VkDeviceSize` values.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording**
  `commandBuffer` **must** be in the **recording** state.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-vidocoding**
  This command **must** only be called outside of a video coding scope.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength**
  `bindingCount` **must** be greater than 0.

- **VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent**
  Both of `commandBuffer`, and the elements of `pBuffers` **must** have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`. 
counterBufferCount is the size of the pCounterBuffers and pCounterBufferOffsets arrays.

pCounterBuffers is NULL or a pointer to an array of VkBuffer handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using vkCmdEndTransformFeedbackEXT it can be used to resume transform feedback from the previous location. If pCounterBuffers is NULL, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of pCounterBuffers that is VK_NULL_HANDLE, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

pCounterBufferOffsets is NULL or a pointer to an array of VkDeviceSize values specifying offsets within each of the pCounterBuffers where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If pCounterBufferOffsets is NULL, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding XfbBuffer in the bound graphics pipeline. Any XfbBuffer emitted that does not output to an active transform feedback buffer will not be captured.

Valid Usage

- VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

- VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  Transform feedback must not be active

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

- VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  If counterBufferCount is not 0, and pCounterBuffers is not NULL, pCounterBuffers must be a valid pointer to an array of counterBufferCount VkBuffer handles that are either valid or VK_NULL_HANDLE

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  For each buffer handle in the array, if it is not VK_NULL_HANDLE it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the pCounterBufferOffsets array

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  If pCounterBuffer is NULL, then pCounterBufferOffsets must also be NULL

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  For each buffer handle in the pCounterBuffers array that is not VK_NULL_HANDLE it must
have been created with a `usage` value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`.

- VUID-vkCmdBeginTransformFeedbackEXT-None-06233
  A valid graphics pipeline must be bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  The last pre-rasterization shader stage of the bound graphics pipeline must have been declared with the Xfb execution mode.

- VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  Transform feedback must not be made active in a render pass instance with multiview enabled.

### Valid Usage (Implicit)

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferSize-parameters
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount VkDeviceSize` values.

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
  `commandBuffer must` be in the recording state.

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdBeginTransformFeedbackEXT-renderpass
  This command must only be called inside of a render pass instance.

- VUID-vkCmdBeginTransformFeedbackEXT-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBeginTransformFeedbackEXT-commonparent
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,   // The index of the first transform feedback buffer
    uint32_t counterBufferCount,   // Size of the pCounterBuffers and pCounterBufferOffsets arrays.
    const VkBuffer* pCounterBuffers,  // Pointer to an array of VkBuffer handles to counter buffers.
    const VkDeviceSize* pCounterBufferOffsets);  // Pointer to an array of VkDeviceSize values specifying offsets within each of the pCounterBuffers where the counter values can be written.
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0]`.
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is NULL or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is NULL or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is NULL, then it is assumed the offsets are zero.

### Valid Usage

- VUID-vkCmdEndTransformFeedbackEXT-None-02375 Transform feedback must be active.
- VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376 `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`.

---

**Table: Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The sum of \texttt{firstCounterBuffer} and \texttt{counterBufferCount} \textbf{must} be less than or equal to \texttt{VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers}.

If \texttt{counterBufferCount} is not 0, and \texttt{pCounterBuffers} is not NULL, \texttt{pCounterBuffers} \textbf{must} be a valid pointer to an array of \texttt{counterBufferCount} \texttt{VkBuffer} handles that are either valid or \texttt{VK_NULL_HANDLE}.

For each buffer handle in the array, if it is not \texttt{VK_NULL_HANDLE} it \textbf{must} reference a buffer large enough to hold 4 bytes at the corresponding offset from the \texttt{pCounterBufferOffsets} array.

If \texttt{pCounterBuffer} is NULL, then \texttt{pCounterBufferOffsets} \textbf{must} also be NULL.

For each buffer handle in the \texttt{pCounterBuffers} array that is not \texttt{VK_NULL_HANDLE} it \textbf{must} have been created with a \texttt{usage} value containing \texttt{VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT}.

- **Valid Usage (Implicit)**
  - \textbf{commandBuffer} \texttt{must} be a valid \texttt{VkCommandBuffer} handle
  - \texttt{pCounterBufferOffsets} \texttt{must} be a valid pointer to an array of \texttt{counterBufferCount} \texttt{VkDeviceSize} values
  - \texttt{commandBuffer} \texttt{must} be in the \texttt{recording} state
  - The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations
  - This command \textbf{must} only be called inside of a render pass instance
  - This command \textbf{must} only be called outside of a video coding scope
  - Both of \texttt{commandBuffer}, and the elements of \texttt{pCounterBuffers} that are valid handles of non-ignored parameters \textbf{must} have been created, allocated, or retrieved from the same \texttt{VkDevice}

- **Host Synchronization**
  - Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### 26.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the `VkPipelineViewportSwizzleStateCreateInfoNV` pipeline state:

```c
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewport swizzles used by the pipeline.
- `pViewportSwizzles` is a pointer to an array of `VkViewportSwizzleNV` structures, defining the viewport swizzles.

**Valid Usage**

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215
  `viewportCount` must be greater than or equal to the `viewportCount` set in `VkPipelineViewportStateCreateInfo`.

**Valid Usage (Implicit)**

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  flags must be 0

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  pViewportSwizzles must be a valid pointer to an array of viewportCount valid
  VkViewportSwizzleNV structures

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  viewportCount must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

VkPipelineViewportSwizzleStateCreateFlagsNV is a bitmask type for setting a mask, but is currently
reserved for future use.

The VkPipelineViewportSwizzleStateCreateInfoNV state is set by adding this structure to the pNext
chain of a VkPipelineViewportStateCreateInfo structure and setting the graphics pipeline state with
vkCreateGraphicsPipelines.

Each viewport specified from 0 to viewportCount - 1 has its x,y,z,w swizzle state set to the
 corresponding x, y, z and w in the VkViewportSwizzleNV structure. Each component is of type
VkViewportCoordinateSwizzleNV, which determines the type of swizzle for that component. The
value of x computes the new x component of the position as:

```c
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV) x' = x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV) x' = -x;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV) x' = y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV) x' = -y;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV) x' = z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV) x' = -z;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV) x' = w;
if (x == VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV) x' = -w;
```

Similar selections are performed for the y, z, and w coordinates. This swizzling is applied before
clipping and perspective divide. If the swizzle for an active viewport index is not specified, the
swizzle for x is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV, y is
VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV, z is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV
and w is VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV.

Viewport swizzle parameters are specified by setting the pNext pointer of
VkGraphicsPipelineCreateInfo to point to a VkPipelineViewportSwizzleStateCreateInfoNV structure.
VkPipelineViewportSwizzleStateCreateInfoNV uses VkViewportSwizzleNV to set the viewport swizzle
parameters.

The VkViewportSwizzleNV structure is defined as:
// Provided by VK_NV_viewport_swizzle
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;

• x is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the x component of the primitive
• y is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the y component of the primitive
• z is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the z component of the primitive
• w is a VkViewportCoordinateSwizzleNV value specifying the swizzle operation to apply to the w component of the primitive

Valid Usage (Implicit)

• VUID-VkViewportSwizzleNV-x-parameter
  x must be a valid VkViewportCoordinateSwizzleNV value
• VUID-VkViewportSwizzleNV-y-parameter
  y must be a valid VkViewportCoordinateSwizzleNV value
• VUID-VkViewportSwizzleNV-z-parameter
  z must be a valid VkViewportCoordinateSwizzleNV value
• VUID-VkViewportSwizzleNV-w-parameter
  w must be a valid VkViewportCoordinateSwizzleNV value

Possible values of the VkViewportSwizzleNV::x, y, z, and w members, specifying swizzling of the corresponding components of primitives, are:

// Provided by VK_NV_viewport_swizzle
typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;

These values are described in detail in Viewport Swizzle.
26.3. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the provoking vertex of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as Flat.

If neither mesh, geometry nor tessellation shading is active, the provoking vertex is determined by the primitive topology defined by VkPipelineInputAssemblyStateCreateInfo:topology used to execute the drawing command.

If a shader using MeshNV Execution Model is active, the provoking vertex is determined by the primitive topology defined by the OutputPoints, OutputLinesNV, or OutputTrianglesNV execution mode.

If a shader using MeshEXT Execution Model is active, the provoking vertex is determined by the primitive topology defined by the OutputPoints, OutputLinesEXT, or OutputTrianglesEXT execution mode.

If geometry shading is active, the provoking vertex is determined by the primitive topology defined by the OutputPoints, OutputLineStrips, or OutputTriangleStrips execution mode.

If tessellation shading is active but geometry shading is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a VkPipelineRasterizationProvokingVertexStateCreateInfoEXT structure in the VkPipelineRasterizationStateCreateInfo::pNext chain when creating the pipeline.

The VkPipelineRasterizationProvokingVertexStateCreateInfoEXT structure is defined as:

```
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType       sType;
    const void*           pNext;
    VkProvokingVertexModeEXT  provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **provokingVertexMode** is a VkProvokingVertexModeEXT value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT mode.

If the provokingVertexModePerPipeline limit is VK_FALSE, then all pipelines bound within a render
pass instance **must** have the same `provokingVertexMode`.

**Valid Usage**

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the `provokingVertexLast` feature **must** be enabled.

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter `provokingVertexMode` **must** be a valid `VkProvokingVertexModeEXT` value.

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` are:

```c
// Provided by VK_EXT_provoking_vertex
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT` specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in **Primitive Topologies**.

### 26.4. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[-W_c \leq x_c \leq W_c\]
\[-W_c \leq y_c \leq W_c\]
\[-z_m \leq z_c \leq W_c\]

where if `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` is `VK_TRUE` `z_m` is equal to `-W_c` otherwise `z_m` is equal to zero.
This view volume can be further restricted by as many as VkPhysicalDeviceLimits::maxClipDistances client-defined half-spaces.

The cull volume is the intersection of up to VkPhysicalDeviceLimits::maxCullDistances client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).

A shader must write a single cull distance for each enabled cull half-space to elements of the CullDistance array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to VkPhysicalDeviceLimits::maxClipDistances client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader must write a single clip distance for each enabled clip half-space to elements of the ClipDistance array. Clip half-space i is then given by the set of points satisfying the inequality

\[ c_i(P) \geq 0 \]

where \( c_i(P) \) is the clip distance i at point P. For point primitives, \( c_i(P) \) is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections Basic Line Segment Rasterization and Basic Polygon Rasterization, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays ClipDistance and CullDistance, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If VkPipelineRasterizationDepthClipStateCreateInfoEXT is present in the graphics pipeline state then depth clipping is disabled if VkPipelineRasterizationDepthClipStateCreateInfoEXT ::depthClipEnable is VK_FALSE. Otherwise, if VkPipelineRasterizationDepthClipStateCreateInfoEXT is not present, depth clipping is disabled when VkPipelineRasterizationStateCreateInfo ::depthClampEnable is VK_TRUE. When depth clipping is disabled, the plane equation

\[ z_m \leq z_c \leq w_c \]

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of VkPhysicalDevicePointClippingProperties::pointClippingBehavior, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;
```

- `VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES` specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.
- `VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY` specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment’s vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume. This clipping produces a value, \( 0 \leq t \leq 1 \), for each clipped vertex. If the coordinates of a clipped vertex are \( P \) and the unclipped line segment’s vertex coordinates are \( P_1 \) and \( P_2 \), then \( t \) satisfies the following equation

\[
P = tP_1 + (1-t)P_2.
\]

\( t \) is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex \( i \) has a single specified clip distance \( d_i \) (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose
that the same series of primitives are drawn again with each such clip distance replaced by \(-d\), (and\) the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels,\ and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

The \texttt{VkPipelineViewportDepthClipControlCreateInfoEXT} structure is defined as:

```c
// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{negativeOneToOne} sets the \(z_m\) in the \textit{view volume} to \(-w_c\).

### Valid Usage

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470

  If \texttt{depthClipControl} is not enabled, \texttt{negativeOneToOne} must be \texttt{VK_FALSE}

### Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType

  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT}

## 26.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \(\mathbf{P}_1\) and \(\mathbf{P}_2\) of an unclipped edge be \(c_1\) and \(c_2\). The value of \(t\) (see \textit{Primitive Clipping}) for a clipped point \(\mathbf{P}\) is used to obtain the output value associated with \(\mathbf{P}\) as

\[
c = t \cdot c_1 + (1-t) \cdot c_2.
\]

(Multiplying an output value by a scalar means multiplying each of \(x, y, z,\) and \(w\) by the scalar.)

Since this computation is performed in clip space before division by \(w_c\), clipped output values are perspective-correct.
Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with `NoPerspective`, the value of \( t \) used to obtain the output value associated with \( \mathbf{P} \) will be adjusted to produce results that vary linearly in framebuffer space.

Output attributes of integer or unsigned integer type must always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see Basic Line Segment Rasterization and Basic Polygon Rasterization), and no interpolation is performed. The output value \( \mathbf{c} \) is taken from either \( \mathbf{c}_1 \) or \( \mathbf{c}_2 \), since flat shading has already occurred and the two values are identical.

### 26.6. Controlling Viewport W Scaling

If viewport \( \mathbf{W} \) scaling is enabled, the \( \mathbf{W} \) component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
\mathbf{w}_c' = x_{\text{coeff}} \mathbf{x}_c + y_{\text{coeff}} \mathbf{y}_c + \mathbf{w}_c
\]

The `VkPipelineViewportWScalingStateCreateInfoNV` structure is defined as:

```c
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `viewportWScalingEnable` controls whether viewport \( \mathbf{W} \) scaling is enabled.
- `viewportCount` is the number of viewports used by \( \mathbf{W} \) scaling, and must match the number of viewports in the pipeline if viewport \( \mathbf{W} \) scaling is enabled.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures defining the \( \mathbf{W} \) scaling parameters for the corresponding viewports. If the viewport \( \mathbf{W} \) scaling state is dynamic, this member is ignored.

### Valid Usage (Implicit)

- VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`
The `VkPipelineViewportWScalingStateCreateInfoNV` state is set by adding this structure to the `pNext` chain of a `VkPipelineViewportStateCreateInfo` structure and setting the graphics pipeline state with `vkCreateGraphicsPipelines`.

To dynamically set the viewport W scaling parameters, call:

```c
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
    VkCommandBuffer commandBuffer,         // Provided by VK_NV_clip_space_w_scaling
    uint32_t firstViewport,                // Provided by VK_NV_clip_space_w_scaling
    uint32_t viewportCount,                // Provided by VK_NV_clip_space_w_scaling
    const VkViewportWScalingNV* pViewportWScalings);  // Provided by VK_NV_clip_space_w_scaling
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewportWScalings` is a pointer to an array of `VkViewportWScalingNV` structures specifying viewport parameters.

The viewport parameters taken from element i of `pViewportWScalings` replace the current state for the viewport index `firstViewport + i`, for i in [0, `viewportCount`).

This command sets the viewport W scaling for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportWScalingStateCreateInfoNV::pViewportWScalings` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWScalingNV-firstViewport-01324
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter
  `pViewportWScalings` must be a valid pointer to an array of `viewportCount` `VkViewportWScalingNV` structures
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both `VkPipelineViewportWScalingStateCreateInfoNV` and `vkCmdSetViewportWScalingNV` use `VkViewportWScalingNV` to set the viewport transformation parameters.

The `VkViewportWScalingNV` structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
    float xcoeff;
    float ycoeff;
} VkViewportWScalingNV;
```

- `xcoeff` and `ycoeff` are the viewport’s W scaling factor for x and y respectively.

26.7. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a
viewport transformation (see Controlling the Viewport) to convert these coordinates into framebuffer coordinates.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_c \\
  y_c \\
  z_c \\
  w_c
\end{pmatrix}
\]

then the vertex's normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \frac{1}{w_c} \begin{pmatrix}
  x_c \\
  y_c \\
  z_c
\end{pmatrix}
\]

### 26.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When Render pass transform is enabled, the transform applies to all primitives for all subpasses of the render pass. The transformed vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
  x_{c_{\text{trans}}} \\
  y_{c_{\text{trans}}} \\
  z_{c_{\text{trans}}}
\end{pmatrix} = \begin{pmatrix}
  x_c \cos \theta - y_c \sin \theta \\
  x_c \sin \theta + y_c \cos \theta \\
  z_c
\end{pmatrix}
\]

where

- \(\theta\) is 0 degrees for \texttt{VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR}
- \(\theta\) is 90 degrees for \texttt{VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR}
- \(\theta\) is 180 degrees for \texttt{VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR}
- \(\theta\) is 270 degrees for \texttt{VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR}

The transformed vertex's normalized device coordinates are

\[
\begin{pmatrix}
  x_d \\
  y_d \\
  z_d
\end{pmatrix} = \frac{1}{w_c} \begin{pmatrix}
  x_{c_{\text{trans}}} \\
  y_{c_{\text{trans}}} \\
  z_{c_{\text{trans}}}
\end{pmatrix}
\]

When render pass transform is enabled for a render pass instance, the following additional
features are enabled:

- Each `VkViewport` specified by either `VkPipelineViewportStateCreateInfo::pViewports` or `vkCmdSetViewport` will have its width/height (`px`, `py`) and its center (`ox`, `oy`) similarly transformed by the implementation.

- Each scissor specified by `VkPipelineViewportStateCreateInfo::pScissors` or `vkCmdSetScissor` will have its (offset, offset,) and (extent, extent,) similarly transformed by the implementation.

- The `renderArea` specified in `VkCommandBufferInheritanceRenderPassTransformInfoQCOM` and `VkRenderPassBeginInfo` will be similarly transformed by the implementation.

- The (x, y) components of shader variables with built-in decorations `FragCoord`, `SamplePosition`, or `PointCoord` will be similarly transformed by the implementation.

- The (x,y) components of the offset operand of the `InterpolateAtOffset` extended instruction will be similarly transformed by the implementation.

- The values returned by SPIR-V derivative instructions `OpDPdx`, `OpDPdy`, `OpDPdxCourse`, `OpDPdyCourse`, `OpDPdxFine`, `OpDPdyFine` will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the `VkSurfaceCapabilitiesKHR::currentTransform`. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

### 26.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport’s width and height in pixels, `px` and `py`, respectively, and its center (`ox`, `oy`) (also in pixels), as well as its depth range min and max determining a depth range scale value `pz` and a depth range bias value `oz` (defined below). The vertex’s framebuffer coordinates `(xf, yf, zf)` are given by

\[
x_f = (p_x / 2) \times_d + o_x
\]

\[
y_f = (p_y / 2) \times_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to `VkPhysicalDeviceLimits::maxViewports` minus one. The number of viewports used by a pipeline is controlled by the `viewportCount` member of the `VkPipelineViewportStateCreateInfo` structure used in pipeline creation.

`xf` and `yf` have limited precision, where the number of fractional bits retained is specified by `VkPhysicalDeviceLimits::subPixelPrecisionBits`. When rasterizing line segments, the number of fractional bits is specified by `VkPhysicalDeviceLineRasterizationPropertiesEXT::lineSubPixelPrecisionBits`. 

---

1727
The `VkPipelineViewportStateCreateInfo` structure is defined as:

```c
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
    const VkViewport* pViewports;
    uint32_t scissorCount;
    const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `viewportCount` is the number of viewports used by the pipeline.
- `pViewports` is a pointer to an array of `VkViewport` structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- `scissorCount` is the number of `scissors` and must match the number of viewports.
- `pScissors` is a pointer to an array of `VkRect2D` structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

### Valid Usage

- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216
  If the `multiViewport` feature is not enabled, `viewportCount` must not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217
  If the `multiViewport` feature is not enabled, `scissorCount` must not be greater than 1
- VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218
  `viewportCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219
  `scissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`
- VUID-VkPipelineViewportStateCreateInfo-x-02821
  The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- VUID-VkPipelineViewportStateCreateInfo-offset-02822
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`
- VUID-VkPipelineViewportStateCreateInfo-offset-02823
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`
If the graphics pipeline is being created without `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` and `viewportCount` must be identical.

If the graphics pipeline is being created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set then `viewportCount` must be 0, otherwise it must be greater than 0.

If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` must be 0, otherwise it must be greater than 0.

If the member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure included in the `pNext` chain is `VK_TRUE`, the `viewportCount` member of the `VkPipelineViewportWScalingStateCreateInfoNV` structure must be greater than or equal to `VkPipelineViewportStateCreateInfo::viewportCount`.

### Valid Usage (Implicit)

- **sType** must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`.
- Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of
  - `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV`,
  - `VkPipelineViewportDepthClipControlCreateInfoEXT`,
  - `VkPipelineViewportExclusiveScissorStateCreateInfoNV`,
  - `VkPipelineViewportShadingRateImageStateCreateInfoNV`,
  - `VkPipelineViewportSwizzleStateCreateInfoNV`,
  - `VkPipelineViewportWScalingStateCreateInfoNV`.
- The `sType` value of each struct in the `pNext` chain must be unique.
- `flags` must be 0.

To **dynamically set** the viewport count and viewports, call:

```c
void vkCmdSetViewportWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t              viewportCount,
    const VkViewport*     pViewports);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `viewportCount` specifies the viewport count.
- `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWithCount-viewportCount-03394
  
  `viewportCount must be` between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetViewportWithCount-viewportCount-03395
  
  If the `multiViewport` feature is not enabled, `viewportCount must be` 1

- VUID-vkCmdSetViewportWithCount-commandBuffer-04819
  
  `commandBuffer must not have` `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled`

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  
  `commandBuffer must be` a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  
  `pViewports must be` a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  
  `commandBuffer must be` in the `recording state`

- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- VUID-vkCmdSetViewportWithCount-viewport-withcount-videocoding
  
  This command `must` only be called outside of a video coding scope
VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
<th>Command Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
<td>State</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
define vCmdSetScissorWithCount:
    VkCommandBuffer
    uint32_t
    const VkRect2D* commandBuffer, scissorCount, pScissors);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
define vCmdSetScissorWithCountEXT:
    VkCommandBuffer
    uint32_t
    const VkRect2D* commandBuffer, scissorCount, pScissors);
```

- commandBuffer is the command buffer into which the command will be recorded.
- scissorCount specifies the scissor count.
- pScissors specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the corresponding VkPipelineViewportStateCreateInfo::scissorCount and pScissors values used to create the currently active pipeline.
Valid Usage

• VUID-vkCmdSetScissorWithCount-scissorCount-03397
  `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

• VUID-vkCmdSetScissorWithCount-scissorCount-03398
  If the `multiViewport` feature is not enabled, `scissorCount` must be 1

• VUID-vkCmdSetScissorWithCount-x-03399
  The x and y members of `offset` member of any element of `pScissors` must be greater than or equal to 0

• VUID-vkCmdSetScissorWithCount-offset-03400
  Evaluation of `(offset.x + extent.width)` must not cause a signed integer addition overflow for any element of `pScissors`

• VUID-vkCmdSetScissorWithCount-offset-03401
  Evaluation of `(offset.y + extent.height)` must not cause a signed integer addition overflow for any element of `pScissors`

• VUID-vkCmdSetScissorWithCount-commandBuffer-04820
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

Valid Usage (Implicit)

• VUID-vkCmdSetScissorWithCount-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdSetScissorWithCount-pScissors-parameter
  `pScissors` must be a valid pointer to an array of `scissorCount` `VkRect2D` structures

• VUID-vkCmdSetScissorWithCount-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

• VUID-vkCmdSetScissorWithCount-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
  `scissorCount` must be greater than 0

Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Command Properties

// Provided by VK_VERSION_1_0

typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A pre-rasterization shader stage can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex (selecting a single viewport) or ViewportMaskNV (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to ViewportIndex or one of the bits set in ViewportMaskNV, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex or any of the bits in ViewportMaskNV are outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to either ViewportIndex or ViewportMaskNV for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex or ViewportMaskNV, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To dynamically set the viewport transformation parameters, call:

// Provided by VK_VERSION_1_0

void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewport* pViewports);

- commandBuffer is the command buffer into which the command will be recorded.
- firstViewport is the index of the first viewport whose parameters are updated by the command.
- viewportCount is the number of viewports whose parameters are updated by the command.
- pViewports is a pointer to an array of VkViewport structures specifying viewport parameters.
This command sets the viewport transformation parameters state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pViewports` values used to create the currently active pipeline.

The viewport parameters taken from element $i$ of `pViewports` replace the current state for the viewport index $firstViewport + i$, for $i$ in $[0, viewportCount)$.

**Valid Usage**

- VUID-vkCmdSetViewport-firstViewport-01223
  The sum of `firstViewport` and `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetViewport-firstViewport-01224
  If the `multiViewport` feature is not enabled, `firstViewport` must be 0

- VUID-vkCmdSetViewport-viewportCount-01225
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1

- VUID-vkCmdSetViewport-commandBuffer-04821
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetViewport-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetViewport-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures

- VUID-vkCmdSetViewport-commandBuffer-recording
  `commandBuffer` must be in the `recording state`

- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetViewport-videcoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewport-viewportCount-arraylength
  `viewportCount` must be greater than 0

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Both VkPipelineViewportStateCreateInfo and vkCmdSetViewport use VkViewport to set the viewport transformation parameters.

The VkViewport structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- \(x\) and \(y\) are the viewport’s upper left corner \((x,y)\).
- \(\text{width}\) and \(\text{height}\) are the viewport’s width and height, respectively.
- \(\text{minDepth}\) and \(\text{maxDepth}\) are the depth range for the viewport.

**Note**

Despite their names, \(\text{minDepth}\) can be less than, equal to, or greater than \(\text{maxDepth}\).

The framebuffer depth coordinate \(z\) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an m-bit fixed-point representation is used, we assume that it represents each value \(\frac{k}{2^m - 1}\), where \(k \in \{0, 1, ..., 2^m - 1\}\), as \(k\) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = x + \text{width} / 2
\]

\[
o_y = y + \text{height} / 2
\]

\[ o_z = \minDepth \text{ (or } (\maxDepth + \minDepth) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT}::\text{negativeOneToOne} \text{ is VK_TRUE}) \]

\[ p_x = \text{width} \]

\[ p_y = \text{height} \]

\[ p_z = \maxDepth - \minDepth \text{ (or } (\maxDepth - \minDepth) / 2 \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT}::\text{negativeOneToOne} \text{ is VK_TRUE}) \]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_y)\) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.

The application can specify a negative term for height, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative height, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative height allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

## Valid Usage

- **VUID-VkViewport-width-01770**
  \( \text{width must be greater than } 0.0 \)

- **VUID-VkViewport-width-01771**
  \( \text{width must be less than or equal to } \text{VkPhysicalDeviceLimits}::\text{maxViewportDimensions}[0] \)

- **VUID-VkViewport-height-01773**
  The absolute value of height must be less than or equal to \( \text{VkPhysicalDeviceLimits}::\text{maxViewportDimensions}[1] \)

- **VUID-VkViewport-x-01774**
  \( x \text{ must be greater than or equal to } \text{viewportBoundsRange}[0] \)

- **VUID-VkViewport-x-01232**
  \( (x + \text{width}) \text{ must be less than or equal to } \text{viewportBoundsRange}[1] \)

- **VUID-VkViewport-y-01775**
  \( y \text{ must be greater than or equal to } \text{viewportBoundsRange}[0] \)

- **VUID-VkViewport-y-01776**
  \( y \text{ must be less than or equal to } \text{viewportBoundsRange}[1] \)
• VUID-VkViewport-y-01777
  \((y + \text{height})\) must be greater than or equal to \(\text{viewportBoundsRange}[0]\)

• VUID-VkViewport-y-01233
  \((y + \text{height})\) must be less than or equal to \(\text{viewportBoundsRange}[1]\)

• VUID-VkViewport-minDepth-01234
  Unless \text{VK_EXT_depth_range_unrestricted} extension is enabled \(\minDepth\) must be between \(0.0\) and \(1.0\), inclusive

• VUID-VkViewport-maxDepth-01235
  Unless \text{VK_EXT_depth_range_unrestricted} extension is enabled \(\maxDepth\) must be between \(0.0\) and \(1.0\), inclusive
Chapter 27. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its \((x, y)\) framebuffer coordinates, \(z\) (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of `VkPipelineRasterizationStateCreateInfo` and `VkPipelineMultisampleStateCreateInfo`.

The `VkPipelineRasterizationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float depthBiasConstantFactor;
    float depthBiasSlopeFactor;
    float lineWidth;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in **Depth Test**. If the pipeline is not created with **VkPipelineRasterizationDepthClipStateCreateInfoEXT** present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in **Primitive Clipping**. Otherwise depth clipping is controlled by the state set in **VkPipelineRasterizationDepthClipStateCreateInfoEXT**.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See **VkPolygonMode**.

• **cullMode** is the triangle facing direction used for primitive culling. See **VkCullModeFlagBits**.

• **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

The application can also add a **VkPipelineRasterizationStateRasterizationOrderAMD** structure to the **pNext** chain of a **VkPipelineRasterizationStateCreateInfo** structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in **Rasterization Order**.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the **depthClamp** feature is not enabled, **depthClampEnable must be **VK_FALSE**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the **fillModeNonSolid** feature is not enabled, **polygonMode must be **VK_POLYGON_MODE_FILL** or **VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  If the **VK_NV_fill_rectangle** extension is not enabled, **polygonMode must not be**
  **VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the **VK_KHR_portability_subset** extension is enabled, and
  **VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons** is **VK_FALSE**, and
  **rasterizerDiscardEnable** is **VK_FALSE**, **polygonMode must not be**
  **VK_POLYGON_MODE_POINT**

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  **sType must be **VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO**
Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of

- `VkPipelineRasterizationConservativeStateCreateInfoEXT`,
- `VkPipelineRasterizationDepthClipStateCreateInfoEXT`,
- `VkPipelineRasterizationLineStateCreateInfoEXT`,
- `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`,
- `VkPipelineRasterizationStateRasterizationOrderAMD`,
- `VkPipelineRasterizationStateStreamCreateInfoEXT`

or

- `VkPipelineRasterizationStateCreateInfo-pNext-pNext`

Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of

- `VkPipelineRasterizationConservativeStateCreateInfoEXT`,
- `VkPipelineRasterizationDepthClipStateCreateInfoEXT`,
- `VkPipelineRasterizationLineStateCreateInfoEXT`,
- `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT`,
- `VkPipelineRasterizationStateRasterizationOrderAMD`,
- `VkPipelineRasterizationStateStreamCreateInfoEXT`

- `VkPipelineRasterizationStateCreateInfo-sType-unique`

The `sType` value of each struct in the `pNext` chain must be unique

- `VkPipelineRasterizationStateCreateInfo-flags-zerobitmask`

flags must be 0

- `VkPipelineRasterizationStateCreateInfo-polygonMode-parameter`

polygonMode must be a valid `VkPolygonMode` value

- ` VkPipelineRasterizationStateCreateInfo-cullMode-parameter`

cullMode must be a valid combination of `VkCullModeFlagBits` values

- `VkPipelineRasterizationStateCreateInfo-frontFace-parameter`

frontFace must be a valid `VkFrontFace` value

```c
typedef VkFlags VkPipelineRasterizationStateCreateFlags;
```

`VkPipelineRasterizationStateCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo` includes a `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure, then that structure controls whether depth clipping is enabled or disabled.

The `VkPipelineRasterizationDepthClipStateCreateInfoEXT` structure is defined as:

```c
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateInfoFlagsEXT flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• `depthClipEnable` controls whether depth clipping is enabled as described in Primitive Clipping.

Valid Usage (Implicit)

- `VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`.
- `VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask flags must be 0`.

```c
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

`VkPipelineRasterizationDepthClipStateCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkPipelineMultisampleStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

• `sType` is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.
• `flags` is reserved for future use.
• `rasterizationSamples` is a `VkSampleCountFlagBits` value specifying the number of samples used in rasterization.
• `sampleShadingEnable` can be used to enable Sample Shading.
• `minSampleShading` specifies a minimum fraction of sample shading if `sampleShadingEnable` is set to `VK_TRUE`.
• `pSampleMask` is a pointer to an array of `VkSampleMask` values used in the sample mask test.
• `alphaToCoverageEnable` controls whether a temporary coverage value is generated based on the alpha component of the fragment’s first color output as specified in the Multisample Coverage section.
• **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in *Multisample Coverage*.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit \( b \) for mask word \( w \) in the sample mask corresponds to sample index \( i \), where \( i = 32 \times w + b \). \( pSampleMask \) has a length equal to \( \lceil \frac{rasterizationSamples}{32} \rceil \) words.

If \( pSampleMask \) is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  - If the sampleRateShading feature is not enabled, sampleShadingEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  - If the alphaToOne feature is not enabled, alphaToOneEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  - minSampleShading must be in the range \([0,1]\)

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  - If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the subpass has any color attachments and rasterizationSamples is greater than the number of color samples, then sampleShadingEnable must be VK_FALSE

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  - The sType value of each struct in the pNext chain must be unique

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  - flags must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  - rasterizationSamples must be a valid VkSampleCountFlagBits value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  - If pSampleMask is not NULL, pSampleMask must be a valid pointer to an array of \( \lceil \frac{rasterizationSamples}{32} \rceil \) VkSampleMask values
VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

27.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the rasterizerDiscardEnable member of VkPipelineRasterizationStateCreateInfo is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically enable whether primitives are discarded before the rasterization stage, call:

```c
void vkCmdSetRasterizerDiscardEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

or the equivalent command

```c
void vkCmdSetRasterizerDiscardEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.
This command sets the discard enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
  
  `commandBuffer must be a valid VkCommandBuffer handle`

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
  
  `commandBuffer must be in the recording state`

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations

- VUID-vkCmdSetRasterizerDiscardEnable-videocoding
  
  This command `must` only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer must be externally synchronized`

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must be externally synchronized`

### 27.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions `OpEndPrimitive` and `OpEndStreamPrimitive` can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to
VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams streams, which is at least 1. The individual streams are numbered 0 through maxTransformFeedbackStreams minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize and VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader’s XfbBuffer, XfbStride, and Offsets decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the GeometryStreams capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the OutputPoints output primitive type. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles property it is possible to emit OutputLineStrip or OutputTriangleStrip in addition to OutputPoints.

The vertex stream used for rasterization is specified by adding a VkPipelineRasterizationStateStreamCreateInfoEXT structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure.

The VkPipelineRasterizationStateStreamCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateStreamCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationStream** is the vertex stream selected for rasterization.

If this structure is not present, **rasterizationStream** is assumed to be zero.

**Valid Usage**

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324
- VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams must be enabled
• **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325**
  
  `rasterizationStream` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`

• **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326**
  
  `rasterizationStream` must be zero if `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect` is `VK_FALSE`

---

**Valid Usage (Implicit)**

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_STREAM_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-flags-zerobitmask**
  
  `flags` must be `0`

---

```c
// Provided by VK_EXT_transform_feedback
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;
```

`VkPipelineRasterizationStateStreamCreateFlagsEXT` is a bitmask type for setting a mask, but is currently reserved for future use.

### 27.3. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. **Fragment operations**, in the order defined
2. **Blending, logic operations**, and color writes

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a `VkPipelineRasterizationStateRasterizationOrderAMD` structure to the `pNext` chain of a `VkPipelineRasterizationStateCreateInfo` structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
// Provided by VK_AMD_rasterization_order
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```
• **sType** is the type of this structure.

• **pNext** is `NULL` or a pointer to a structure extending this structure.

• **rasterizationOrder** is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.

## Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`

- **VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter**  
  `rasterizationOrder` must be a valid `VkRasterizationOrderAMD` value

If the `VK_AMD_rasterization_order` device extension is not enabled or the application does not request a particular rasterization order through specifying a `VkPipelineRasterizationStateRasterizationOrderAMD` structure then the rasterization order used by the graphics pipeline defaults to `VK_RASTERIZATION_ORDER_STRICT_AMD`.

Possible values of `VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder`, specifying the primitive rasterization order, are:

```c
// Provided by VK_AMD_rasterization_order
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- **VK_RASTERIZATION_ORDER_STRICT_AMD** specifies that operations for each primitive in a subpass must occur in **primitive order**.

- **VK_RASTERIZATION_ORDER_RELAXED_AMD** specifies that operations for each primitive in a subpass may not occur in **primitive order**.

## 27.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see Resolving Multisample Images and the Render Pass chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a **coverage mask** with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.
It is understood that each pixel has \textit{rasterizationSamples} locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel \textbf{must} be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points \textbf{may} be identical for each pixel in the framebuffer, or they \textbf{may} differ.

If the render pass has a fragment density map attachment, each fragment only has \textit{rasterizationSamples} locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points \textbf{must} be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment’s sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with \texttt{Sample} and \texttt{Input}, the data associated with those variables will be assigned independently for each sample. The values for each sample \textbf{must} be evaluated at the location of the sample. The data associated with any other variables not decorated with \texttt{Sample} and \texttt{Input} need not be evaluated independently for each sample.

A \textit{coverage mask} is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a fragment density map have one set of samples. Multi-pixel fragments defined by a shading rate image have one set of samples per pixel. Multi-pixel fragments defined by setting the fragment shading rate have one set of samples per pixel. Each set of samples has a number of samples determined by \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}. Each sample in a set is assigned a unique \textit{sample index} \(i\) in the range \([0, \text{rasterizationSamples})\). Each sample in a fragment is also assigned a unique \textit{coverage index} \(j\) in the range \([0, n \times \text{rasterizationSamples})\), where \(n\) is the number of sets in the fragment. If the fragment contains a single set of samples, the \textit{coverage index} is always equal to the \textit{sample index}. If a shading rate image is used and a fragment covers multiple pixels, the coverage index is determined as defined by \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} or \texttt{vkCmdSetCoarseSampleOrderNV}.

If the \textit{fragment shading rate} is set, the coverage index \(j\) is determined as a function of the \textit{pixel index} \(p\), the \textit{sample index} \(i\), and the number of rasterization samples \(r\) as:

\[
    j = i + r \times ((f_w \times f_h) - 1 - p)
\]

where the pixel index \(p\) is determined as a function of the pixel's framebuffer location \((x, y)\) and the fragment size \((f_w, f_h)\):

\[
    p_x = x \% f_w
\]
\[ p_y = y \mod f_y \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 33. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![1x1 diagram]</td>
<td>![1x2 diagram]</td>
<td>![1x4 diagram]</td>
</tr>
</tbody>
</table>

**Table 34. Pixel indices - 2 wide**

<table>
<thead>
<tr>
<th>2x1</th>
<th>2x2</th>
<th>2x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![2x1 diagram]</td>
<td>![2x2 diagram]</td>
<td>![2x4 diagram]</td>
</tr>
</tbody>
</table>

**Table 35. Pixel indices - 4 wide**

<table>
<thead>
<tr>
<th>4x1</th>
<th>4x2</th>
<th>4x4</th>
</tr>
</thead>
<tbody>
<tr>
<td>![4x1 diagram]</td>
<td>![4x2 diagram]</td>
<td>![4x4 diagram]</td>
</tr>
</tbody>
</table>
The coverage mask includes \( B \) bits packed into \( W \) words, defined as:

\[
B = n \times \text{rasterizationSamples}
\]

\[
W = \lceil B/32 \rceil
\]

Bit \( b \) in coverage mask word \( w \) is 1 if the sample with coverage index \( j = 32 \times w + b \) is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the \( i \)th entry in the table corresponding to sample index \( i \). `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.

</tbody>
</table>

Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the *fragment mask* of the pixel. The second array contains one element per *color fragment* and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask *may* have two samples referring to the same color fragment. The number of color fragments is determined by the `samples` member of the `VkImageCreateInfo` structure used to create the image. The `VK_AMD_shader_fragment_mask` device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Fragment Mask](image)

*Figure 19. Fragment Mask*

### 27.5. Custom Sample Locations

Applications *can* also control the sample locations used for rasterization.

If the `pNext` chain of the `VkPipelineMultisampleStateCreateInfo` structure specified at pipeline creation time includes a `VkPipelineSampleLocationsStateCreateInfoEXT` structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The `VkPipelineSampleLocationsStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `sampleLocationsEnable` controls whether custom sample locations are used. If `sampleLocationsEnable` is `VK_FALSE`, the default sample locations are used and the values specified in `sampleLocationsInfo` are ignored.
- `sampleLocationsInfo` is the sample locations to use during rasterization if `sampleLocationsEnable` is `VK_TRUE` and the graphics pipeline is not created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT`. 
Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  *sType* must be `VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  *sampleLocationsInfo* must be a valid `VkSampleLocationsInfoEXT` structure

The `VkSampleLocationsInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- *sampleLocationsPerPixel* is a `VkSampleCountFlagBits` value specifying the number of sample locations per pixel.
- *sampleLocationGridSize* is the size of the sample location grid to select custom sample locations for.
- *sampleLocationsCount* is the number of sample locations in *pSampleLocations*.
- *pSampleLocations* is a pointer to an array of *sampleLocationsCount* `VkSampleLocationEXT` structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT`.

The sample locations in *pSampleLocations* specify *sampleLocationsPerPixel* number of sample locations for each pixel in the grid of the size specified in *sampleLocationGridSize*. The sample location for sample *i* at the pixel grid location (*x*,*y*) is taken from `pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i]`.

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of *pSampleLocations* may be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  
  `sampleLocationsPerPixel` must be a bit value that is set in `VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts`

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  
  `sampleLocationsCount` must equal `sampleLocationsPerPixel × sampleLocationGridSize.width × sampleLocationGridSize.height`

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT`

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  
  If `sampleLocationsCount` is not 0, `pSampleLocations` must be a valid pointer to an array of `sampleLocationsCount` `VkSampleLocationEXT` structures

The `VkSampleLocationEXT` structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

- `x` is the horizontal coordinate of the sample's location.
- `y` is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a `VkSampleLocationEXT` structure are always clamped to the implementation-dependent sample location coordinate range `[sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]]` that can be queried using `VkPhysicalDeviceSampleLocationsPropertiesEXT`.

To dynamically set the sample locations used for rasterization, call:

```c
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **pSampleLocationsInfo** is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**, and when the **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** property of the bound graphics pipeline is **VK_TRUE**. Otherwise, this state is specified by the **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsInfo** values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetSampleLocationsEXT-sampleLocationsPerPixel-01529**
  
  The **sampleLocationsPerPixel** member of **pSampleLocationsInfo** must equal the **rasterizationSamples** member of the **VkPipelineMultisampleStateCreateInfo** structure the bound graphics pipeline has been created with.

- **VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530**
  
  If **VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations** is **VK_FALSE** then the current render pass must have been begun by specifying a **VkRenderPassSampleLocationsBeginInfoEXT** structure whose **pPostSubpassSampleLocations** member contains an element with a **subpassIndex** matching the current subpass index and the **sampleLocationsInfo** member of that element must match the sample locations state pointed to by **pSampleLocationsInfo**.

### Valid Usage (Implicit)

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter**
  
  **commandBuffer** must be a valid **VkCommandBuffer** handle.

- **VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter**
  
  **pSampleLocationsInfo** must be a valid pointer to a valid **VkSampleLocationsInfoEXT** structure.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording**
  
  **commandBuffer** must be in the **recording state**.

- **VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool**
  
  The **VkCommandPool** that **commandBuffer** was allocated from must support graphics operations.

- **VUID-vkCmdSetSampleLocationsEXT-videocoding**
  
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to **commandBuffer** must be externally synchronized.

- Host access to the **VkCommandPool** that **commandBuffer** was allocated from must be externally synchronized.

27.6. Fragment Shading Rates

The features advertised by `VkPhysicalDeviceFragmentShadingRateFeaturesKHR` allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice,
    uint32_t* pFragmentShadingRateCount,
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of `VkPhysicalDeviceFragmentShadingRateKHR` structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:
• The value of `fragmentSize.width` **must** be less than or equal to `maxFragmentSize.width`.
• The value of `fragmentSize.width` **must** be greater than or equal to 1.
• The value of `fragmentSize.width` **must** be a power-of-two.
• The value of `fragmentSize.height` **must** be less than or equal to `maxFragmentSize.height`.
• The value of `fragmentSize.height` **must** be greater than or equal to 1.
• The value of `fragmentSize.height` **must** be a power-of-two.
• The highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
• The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` **must** be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations **must** support at least the following shading rates:

<table>
<thead>
<tr>
<th>sampleCounts</th>
<th>fragmentSize</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>{2,2}</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>{2,1}</td>
</tr>
<tr>
<td>~0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts`, includes `VK_SAMPLE_COUNT_2_BIT`, the required rates **must** also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates **must** be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application **must** transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

**Note**
For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an unsupported rate.

---

**Valid Usage (Implicit)**

- `VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter`  
  `physicalDevice` **must** be a valid `VkPhysicalDevice` handle
• VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  pFragmentShadingRateCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount VkPhysicalDeviceFragmentShadingRateKHR structures

Return Codes

Success
• VK_SUCCESS
• VK_INCOMPLETE

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY

The VkPhysicalDeviceFragmentShadingRateKHR structure is defined as

```
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType sType;
    void* pNext;
    VkSampleCountFlags sampleCounts;
    VkExtent2D fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• sampleCounts is a bitmask of sample counts for which the shading rate described by fragmentSize is supported.
• fragmentSize is a VkExtent2D describing the width and height of a supported shading rate.

Valid Usage ( Implicit)

• VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR

• VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
  pNext must be NULL

Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.
27.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType          sType;
    const void*              pNext;
    VkExtent2D               fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `fragmentSize` specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to `(1,1)`, and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

### Valid Usage (Implicit)

- `VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType`  
  `sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
