Image layout is per-image subresource. Separate image subresources of the same image can be in different layouts at the same time, with the exception that depth and stencil aspects of a given image subresource can only be in different layouts if the \text{separateDepthStencilLayouts} feature is enabled.

\[\text{Note}\]

Each layout may offer optimal performance for a specific usage of image memory. For example, an image with a layout of \( \text{VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL} \) may provide optimal performance for use as a color attachment, but be unsupported for use in transfer commands. Applications can transition an image

\[893\]
subresource from one layout to another in order to achieve optimal performance when the image subresource is used for multiple kinds of operations. After initialization, applications need not use any layout other than the general layout, though this may produce suboptimal performance on some implementations.

Upon creation, all image subresources of an image are initially in the same layout, where that layout is selected by the VkImageCreateInfo::initialLayout member. The initialLayout must be either VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED. If it is VK_IMAGE_LAYOUT_PREINITIALIZED, then the image data can be preinitialized by the host while using this layout, and the transition away from this layout will preserve that data. If it is VK_IMAGE_LAYOUT_UNDEFINED, then the contents of the data are considered to be undefined, and the transition away from this layout is not guaranteed to preserve that data. For either of these initial layouts, any image subresources must be transitioned to another layout before they are accessed by the device.

Host access to image memory is only well-defined for linear images and for image subresources of those images which are currently in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layout. Calling vkGetImageSubresourceLayout for a linear image returns a subresource layout mapping that is valid for either of those image layouts.

The set of image layouts consists of:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageLayout {
    VK_IMAGE_LAYOUT_UNDEFINED = 0,
    VK_IMAGE_LAYOUT_GENERAL = 1,
    VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL = 2,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL = 3,
    VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL = 4,
    VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL = 5,
    VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL = 6,
    VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL = 7,
    VK_IMAGE_LAYOUT_PREINITIALIZED = 8,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL = 1000117000,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL = 1000117001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL = 1000241000,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL = 1000241001,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL = 1000241002,
    // Provided by VK_VERSION_1_2
    VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL = 1000241003,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL = 1000314000,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL = 1000314001,
};
```

894
// Provided by VK_KHR_swapchain
VK_IMAGE_LAYOUT_PRESENT_SRC_KHR = 1000001002,
#endif

// Provided by VK_KHR_video_decode_queue
VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR = 1000024000,
#endif

// Provided by VK_KHR_video_decode_queue
VK_IMAGE_LAYOUT_VIDEO_DECODE_SRC_KHR = 1000024001,
#endif

// Provided by VK_KHR_video_decode_queue

#endif

// Provided by VK_KHR_video_encode_queue
VK_IMAGE_LAYOUT_VIDEO_ENCODE_DPB_KHR = 1000299002,
#endif

// Provided by VK_EXT_attachment_feedback_loop_layout
VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT = 1000339000,

// Provided by VK_KHR_maintenance2
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL,

// Provided by VK_KHR_maintenance2
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL,

// Provided by VK_KHR_separate_depth_stencil_layouts
VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL,

// Provided by VK_KHR_separate_depth_stencil_layouts
VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL_KHR = VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL,

// Provided by VK_KHR_separate_depth_stencil_layouts
VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL_KHR = 895
The type(s) of device access supported by each layout are:

- **VK_IMAGE_LAYOUT_UNDEFINED** specifies that the layout is unknown. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout can be used in place of the current image layout in a layout transition, but doing so will cause the contents of the image’s memory to be undefined.

- **VK_IMAGE_LAYOUT_PREINITIALIZED** specifies that an image’s memory is in a defined layout and can be populated by data, but that it has not yet been initialized by the driver. Image memory cannot be transitioned into this layout. This layout can be used as the initialLayout member of VkImageCreateInfo. This layout is intended to be used as the initial layout for an image whose contents are written by the host, and hence the data can be written to memory immediately, without first executing a layout transition. Currently, VK_IMAGE_LAYOUT_PREINITIALIZED is only useful with linear images because there is not a standard layout defined for VK_IMAGE_TILING_OPTIMAL images.

- **VK_IMAGE_LAYOUT_GENERAL** supports all types of device access.

- **VK_IMAGE_LAYOUT_ATTACHMENT_OPTIMAL** specifies a layout that must only be used with attachment accesses in the graphics pipeline.

- **VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL** specifies a layout allowing read only access as an attachment, or in shaders as a sampled image, combined image/sampler, or input attachment.

- **VK_IMAGE_LAYOUT_COLOR_ATTACHMENT_OPTIMAL** must only be used as a color or resolve attachment in a VkFramebuffer. This layout is valid only for image subresources of images created with the VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT usage bit enabled.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read and write access as a depth/stencil attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for both the depth and stencil aspects of a depth/stencil format image allowing read only access as a depth/stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL and VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL.

- **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the stencil aspect as a stencil attachment, and read only access to the depth aspect as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to
• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for depth/stencil format images allowing read and write access to the depth aspect as a depth attachment, and read only access to the stencil aspect as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment. It is equivalent to **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** and **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL**.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read and write access as a depth attachment.

• **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL** specifies a layout for the depth aspect of a depth/stencil format image allowing read-only access as a depth attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_STENCIL_ATTACHMENT_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read and write access as a stencil attachment.

• **VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL** specifies a layout for the stencil aspect of a depth/stencil format image allowing read-only access as a stencil attachment or in shaders as a sampled image, combined image/sampler, or input attachment.

• **VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL** specifies a layout allowing read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_SAMPLED_BIT** or **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** usage bits enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL** must only be used as a source image of a transfer command (see the definition of **VK_PIPELINE_STAGE_TRANSFER_BIT**). This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_SRC_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL** must only be used as a destination image of a transfer command. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_TRANSFER_DST_BIT** usage bit enabled.

• **VK_IMAGE_LAYOUT_PRESENT_SRC_KHR** must only be used for presenting a presentable image for display. A swapchain’s image must be transitioned to this layout before calling **vkQueuePresentKHR**, and must be transitioned away from this layout after calling **vkAcquireNextImageKHR**.

• **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR** is valid only for shared presentable images, and must be used for any usage the image supports.

• **VK_IMAGE_LAYOUT_FRAGMENT_SHADING_RATE_ATTACHMENT_OPTIMAL_KHR** must only be used as a fragment shading rate attachment or shading rate image. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_FRAGMENT_DENSITY_MAP_OPTIMAL_EXT** must only be used as a fragment density map attachment in a **VkRenderPass**. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_DECODE_DST_KHR** must only be used as a decode output image of a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODE_DST_BIT_KHR** usage bit enabled.
• **VK_IMAGE_LAYOUT_VIDEO_DECODER_SRC_KHR** is reserved for future use.

• **VK_IMAGE_LAYOUT_VIDEO_DECODER_DPB_KHR** must only be used as a decode source or destination image of a video decode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_DECODER_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_DST_KHR** is reserved for future use.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_SRC_KHR** must only be used as an encode source image of a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODER_SRC_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_VIDEO_ENCODER_DPB_KHR** must only be used as a encode source or destination image of a video encode operation. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_VIDEO_ENCODER_DPB_BIT_KHR** usage bit enabled.

• **VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT** must only be used as either a color attachment or depth/stencil attachment in a VkFramebuffer and/or read-only access in a shader as a sampled image, combined image/sampler, or input attachment. This layout is valid only for image subresources of images created with the **VK_IMAGE_USAGE_ATTACHMENT_FEEDBACK_LOOP_BIT_EXT** usage bit enabled and either the **VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT** and either the **VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT** or **VK_IMAGE_USAGE_SAMPLED_BIT** usage bits enabled.

The layout of each image subresource is not a state of the image subresource itself, but is rather a property of how the data in memory is organized, and thus for each mechanism of accessing an image in the API the application must specify a parameter or structure member that indicates which image layout the image subresource(s) are considered to be in when the image will be accessed. For transfer commands, this is a parameter to the command (see Clear Commands and Copy Commands). For use as a framebuffer attachment, this is a member in the substructures of the VkFramebufferCreateInfo (see Render Pass). For use in a descriptor set, this is a member in the VkDescriptorImageInfo structure (see Descriptor Set Updates).

### 12.4.1. Image Layout Matching Rules

At the time that any command buffer command accessing an image executes on any queue, the layouts of the image subresources that are accessed must all match exactly the layout specified via the API controlling those accesses, except in case of accesses to an image with a depth/stencil format performed through descriptors referring to only a single aspect of the image, where the following relaxed matching rules apply:

• Descriptors referring just to the depth aspect of a depth/stencil image only need to match in the image layout of the depth aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL** are considered to match.

• Descriptors referring just to the stencil aspect of a depth/stencil image only need to match in the image layout of the stencil aspect, thus **VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL** and **VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL** are considered to match.

When performing a layout transition on an image subresource, the old layout value must either equal the current layout of the image subresource (at the time the transition executes), or else be **VK_IMAGE_LAYOUT_UNDEFINED** (implying that the contents of the image subresource need not be
preserved). The new layout used in a transition must not be VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED.

The image layout of each image subresource of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT is dependent on the last sample locations used to render to the image subresource as a depth/stencil attachment, thus applications must provide the same sample locations that were last used to render to the given image subresource whenever a layout transition of the image subresource happens, otherwise the contents of the depth aspect of the image subresource become undefined.

In addition, depth reads from a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range return undefined values.

Similarly, depth writes to a depth/stencil attachment referring to an image subresource range of a depth/stencil image created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT using different sample locations than what have been last used to perform depth writes to the image subresources of the same image subresource range make the contents of the depth aspect of those image subresources undefined.

12.5. Image Views

Image objects are not directly accessed by pipeline shaders for reading or writing image data. Instead, image views representing contiguous ranges of the image subresources and containing additional metadata are used for that purpose. Views must be created on images of compatible types, and must represent a valid subset of image subresources.

Image views are represented by VkImageView handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkImageView)
```

VK_REMAINING_ARRAY_LAYERS is a special constant value used for image views to indicate that all remaining array layers in an image after the base layer should be included in the view.

```c
#define VK_REMAINING_ARRAY_LAYERS (~0U)
```

VK_REMAINING_MIP_LEVELS is a special constant value used for image views to indicate that all remaining mipmap levels in an image after the base level should be included in the view.

```c
#define VK_REMAINING_MIP_LEVELS (~0U)
```

The types of image views that can be created are:
typedef enum VkImageViewType {
    VK_IMAGE_VIEW_TYPE_1D = 0,
    VK_IMAGE_VIEW_TYPE_2D = 1,
    VK_IMAGE_VIEW_TYPE_3D = 2,
    VK_IMAGE_VIEW_TYPE_CUBE = 3,
    VK_IMAGE_VIEW_TYPE_1D_ARRAY = 4,
    VK_IMAGE_VIEW_TYPE_2D_ARRAY = 5,
    VK_IMAGE_VIEW_TYPE_CUBE_ARRAY = 6,
} VkImageViewType;

To create an image view, call:

// Provided by VK_VERSION_1_0
VkResult vkCreateImageView(
    VkDevice device,
    const VkImageViewCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkImageView* pView);

- `device` is the logical device that creates the image view.
- `pCreateInfo` is a pointer to a `VkImageViewCreateInfo` structure containing parameters to be used to create the image view.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pView` is a pointer to a `VkImageView` handle in which the resulting image view object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateImageView-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkCreateImageView-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkImageViewCreateInfo` structure
- VUID-vkCreateImageView-pAllocator-parameter
  - If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateImageView-pView-parameter
  - `pView` must be a valid pointer to a `VkImageView` handle

### Return Codes

**Success**
- VK_SUCCESS
The `VkImageViewCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageViewCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageViewCreateFlags flags;
    VkImage image;
    VkImageViewType viewType;
    VkFormat format;
    VkComponentMapping components;
    VkImageSubresourceRange subresourceRange;
} VkImageViewCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkImageViewCreateFlagBits` describing additional parameters of the image view.
- `image` is a `VkImage` on which the view will be created.
- `viewType` is a `VkImageViewType` value specifying the type of the image view.
- `format` is a `VkFormat` describing the format and type used to interpret texel blocks in the image.
- `components` is a `VkComponentMapping` structure specifying a remapping of color components (or of depth or stencil components after they have been converted into color components).
- `subresourceRange` is a `VkImageSubresourceRange` structure selecting the set of mipmap levels and array layers to be accessible to the view.

Some of the `image` creation parameters are inherited by the view. In particular, image view creation inherits the implicit parameter `usage` specifying the allowed usages of the image view that, by default, takes the value of the corresponding `usage` parameter specified in `VkImageCreateInfo` at image creation time. The implicit `usage` can be overridden by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain, but the view usage must be a subset of the image usage. If `image` has a depth-stencil format and was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, the usage is calculated based on the `subresource.aspectMask` provided:

- If `aspectMask` includes only `VK_IMAGE_ASPECT_STENCIL_BIT`, the implicit `usage` is equal to `VkImageStencilUsageCreateInfo::stencilUsage`.
- If `aspectMask` includes only `VK_IMAGE_ASPECT_DEPTH_BIT`, the implicit `usage` is equal to `VkImageCreateInfo::usage`.
• If both aspects are included in `aspectMask`, the implicit `usage` is equal to the intersection of `VkImageCreateInfo::usage` and `VkImageStencilUsageCreateInfo::stencilUsage`.

If `image` was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` flag, and if the `format` of the image is not multi-planar, `format` can be different from the image’s format, but if `image` was created without the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag and they are not equal they **must** be **compatible**. Image format compatibility is defined in the **Format Compatibility Classes** section. Views of compatible formats will have the same mapping between texel coordinates and memory locations irrespective of the `format`, with only the interpretation of the bit pattern changing.

**Note**

Values intended to be used with one view format **may** not be exactly preserved when written or read through a different format. For example, an integer value that happens to have the bit pattern of a floating point denorm or NaN **may** be flushed or canonicalized when written or read through a view with a floating point format. Similarly, a value written through a signed normalized format that has a bit pattern exactly equal to \(-2^b\) **may** be changed to \(-2^b + 1\) as described in Conversion from Normalized Fixed-Point to Floating-Point.

If `image` was created with the `VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT` flag, `format` **must** be compatible with the image’s format as described above, or **must** be an uncompressed format in which case it **must** be size-compatible with the image’s format, as defined for copying data between images. In this case, the resulting image view’s texel dimensions equal the dimensions of the selected mip level divided by the compressed texel block size and rounded up.

The `VkComponentMapping` components member describes a remapping from components of the image to components of the vector returned by shader image instructions. This remapping **must** be the identity swizzle for storage image descriptors, input attachment descriptors, framebuffer attachments, and any `VkImageView` used with a combined image sampler that enables sampler Y’C\_bC\_r conversion.

If the image view is to be used with a sampler which supports sampler Y’C\_bC\_r conversion, an **identically defined object** of type `VkSamplerYcbcrConversion` to that used to create the sampler **must** be passed to `vkCreateImageView` in a `VkSamplerYcbcrConversionInfo` included in the `pNext` chain of `VkImageViewCreateInfo`. Conversely, if a `VkSamplerYcbcrConversion` object is passed to `vkCreateImageView`, an identically defined `VkSamplerYcbcrConversion` object **must** be used when sampling the image.

If the image has a multi-planar format and `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_COLOR_BIT`, and it was created with `usage` value containing flags other than `VK_IMAGE_USAGE_VIDEO DECODE_DST_KHR`, `VK_IMAGE_USAGE_VIDEO DECODE_DPB_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR`, then the `format` **must** be identical to the image `format`, and the sampler to be used with the image view **must** enable sampler Y’C\_bC\_r conversion.

If the image has a multi-planar format and the `image` has been created with a `usage` value containing any of the `VK_IMAGE_USAGE_VIDEO DECODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO DECODE_SRC_BIT_KHR`, and `VK_IMAGE_USAGE_VIDEO DECODE_DPB_BIT_KHR` flags, then all of the video decode operations would ignore the `VkSamplerYcbcrConversionInfo` structure and/or sampler Y’C\_bC\_r conversion object,
associated with the image view. If the image has a multi-planar format and the image has been created with a usage value containing any of the `VK_IMAGE_USAGE_VIDEO_ENCODE_DST_BIT_KHR`, `VK_IMAGE_USAGE_VIDEO_ENCODE_SRC_BIT_KHR`, and `VK_IMAGE_USAGE_VIDEO_ENCODE_DPB_BIT_KHR` flags, then all of the video encode operations would ignore the `VkSamplerYcbcrConversionInfo` structure and/or sampler Y′CbCr conversion object, associated with the image view.

If image was created with the `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT` and the image has a multi-planar format, and if `subresourceRange.aspectMask` is `VK_IMAGE_ASPECT_PLANES_0_BIT`, `VK_IMAGE_ASPECT_PLANES_1_BIT`, or `VK_IMAGE_ASPECT_PLANES_2_BIT`, format must be compatible with the corresponding plane of the image, and the sampler to be used with the image view must not enable sampler Y′CbCr conversion. The width and height of the single-plane image view must be derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the plane.

Any view of an image plane will have the same mapping between texel coordinates and memory locations as used by the components of the color aspect, subject to the formulae relating texel coordinates to lower-resolution planes as described in Chroma Reconstruction. That is, if an R or B plane has a reduced resolution relative to the G plane of the multi-planar image, the image view operates using the \((u_{\text{plane}}, v_{\text{plane}})\) unnormalized coordinates of the reduced-resolution plane, and these coordinates access the same memory locations as the \((u_{\text{color}}, v_{\text{color}})\) unnormalized coordinates of the color aspect for which chroma reconstruction operations operate on the same \((u_{\text{plane}}, v_{\text{plane}})\) or \((i_{\text{plane}}, j_{\text{plane}})\) coordinates.

**Valid Usage**

- **VUID-VkImageViewCreateInfo-image-01003**
  If image was not created with `VK_IMAGE_CREATE_CUBE_COMPATIBLE_BIT` then `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- **VUID-VkImageViewCreateInfo-viewType-01004**
  If the imageCubeArray feature is not enabled, `viewType` must not be `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`

- **VUID-VkImageViewCreateInfo-image-06723**
  If image was created with `VK_IMAGE_TYPE_3D` but without `VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT` set then `viewType` must not be `VK_IMAGE_VIEW_TYPE_2D_ARRAY`
If image was created with VK_IMAGE_TYPE_3D but without VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, then viewType must not be VK_IMAGE_VIEW_TYPE_2D.

If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then subresourceRange.levelCount must be 1.

If image was created with VK_IMAGE_TYPE_3D and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY then VkImageCreateInfo::flags must not contain any of VK_IMAGE_CREATE_SPARSE_BINDING_BIT, VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT, and VK_IMAGE_CREATE_SPARSE_ALIASED_BIT.

If image was created with a samples value not equal to VK_SAMPLE_COUNT_1_BIT then viewType must be either VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.

Image must have been created with a usage value containing at least one of the usages defined in the valid image usage list for image views.

The format features of the resultant image view must contain at least one bit.

If usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then the format features of the resultant image view must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

If usage contains VK_IMAGE_USAGE_STORAGE_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

If usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

If usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then the image view's format features must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV, if the image is created with VK_IMAGE_TILING_LINEAR and the linearColorAttachment feature is enabled.

If usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then the image view's format features must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.
VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT

- **VUID-VkImageViewCreateInfo-subresourceRange-01478**
  - subresourceRange.baseMipLevel must be less than the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageViewCreateInfo-subresourceRange-01718**
  - If subresourceRange.levelCount is not VK_REMAINING_MIP_LEVELS, subresourceRange.baseMipLevel + subresourceRange.levelCount must be less than or equal to the mipLevels specified in VkImageCreateInfo when image was created

- **VUID-VkImageViewCreateInfo-image-02571**
  - If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT, subresourceRange.levelCount must be 1

- **VUID-VkImageViewCreateInfo-image-06724**
  - If image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the arrayLayers specified in VkImageCreateInfo when image was created

- **VUID-VkImageViewCreateInfo-subresourceRange-06725**
  - If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is not a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT or VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set, or viewType is not VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be non-zero and subresourceRange.baseArrayLayer + subresourceRange.layerCount must be less than or equal to the arrayLayers specified in VkImageCreateInfo when image was created

- **VUID-VkImageViewCreateInfo-image-02724**
  - If viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.baseArrayLayer must be less than the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing

- **VUID-VkImageViewCreateInfo-subresourceRange-02725**
  - If subresourceRange.layerCount is not VK_REMAINING_ARRAY_LAYERS, image is a 3D image created with VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT set, and viewType is VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY, subresourceRange.layerCount must be less than or equal to the depth computed from baseMipLevel and extent.depth specified in VkImageCreateInfo when image was created, according to the formula defined in Image Miplevel Sizing

- **VUID-VkImageViewCreateInfo-image-01761**
  - If image was created with the VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT flag, but without the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag, format must be compatible with the format used to create image, as defined in Format Compatibility Classes

- **VUID-VkImageViewCreateInfo-image-01583**
  - If image was created with the VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT flag,
**format** must be compatible with, or **must** be an uncompressed format that is size-compatible with, the **format** used to create **image**

- **VUID-VkImageViewCreateInfo-image-01584**
  If **image** was created with the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag, the **levelCount** and **layerCount** members of **subresourceRange** must both be 1

- **VUID-VkImageViewCreateInfo-image-04739**
  If **image** was created with the **VK_IMAGE_CREATE_BLOCK_TEXEL_VIEW_COMPATIBLE_BIT** flag and **format** is a non-compressed format, **viewType** must not be **VK_IMAGE_VIEW_TYPE_3D**

- **VUID-VkImageViewCreateInfo-pNext-01585**
  If a **VkImageFormatListCreateInfo** structure was included in the **pNext** chain of the **VkImageCreateInfo** structure used when creating **image** and **VkImageFormatListCreateInfo::viewFormatCount** is not zero then **format** must be one of the formats in **VkImageFormatListCreateInfo::pViewFormats**

- **VUID-VkImageViewCreateInfo-image-01586**
  If **image** was created with the **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** flag, if the **format** of the **image** is a multi-planar format, and if **subresourceRange.aspectMask** is one of **VK_IMAGE_ASPECT_PLANE_0_BIT**, **VK_IMAGE_ASPECT_PLANE_1_BIT**, or **VK_IMAGE_ASPECT_PLANE_2_BIT**, then **format** must be compatible with the **VkFormat** for the plane of the **image** format indicated by **subresourceRange.aspectMask**, as defined in **Compatible formats of planes of multi-planar formats**

- **VUID-VkImageViewCreateInfo-image-01762**
  If **image** was not created with the **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT** flag, or if the **format** of the **image** is a multi-planar format and if **subresourceRange.aspectMask** is **VK_IMAGE_ASPECT_COLOR_BIT**, **format** must be identical to the **format** used to create **image**

- **VUID-VkImageViewCreateInfo-format-04714**
  If **format** has a _422 or _420 suffix then **image** must have been created with a width that is a multiple of 2

- **VUID-VkImageViewCreateInfo-format-04715**
  If **format** has a _420 suffix then **image** must have been created with a height that is a multiple of 2

- **VUID-VkImageViewCreateInfo-pNext-01970**
  If the **pNext** chain includes a **VkSamplerYcbcrConversionInfo** structure with a conversion value other than **VK_NULL_HANDLE**, all members of **components** must have the identity swizzle

- **VUID-VkImageViewCreateInfo-pNext-06658**
  If the **pNext** chain includes a **VkSamplerYcbcrConversionInfo** structure with a conversion value other than **VK_NULL_HANDLE**, **format** must be the same used in **VkSamplerYcbcrConversionCreateInfo::format**
If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

viewType must be compatible with the type of image as shown in the view type compatibility table.

If image has an external format, format must be VK_FORMAT_UNDEFINED.

If image has an external format, the pNext chain must include a VkSamplerYcbcrConversionInfo structure with a conversion object created with the same external format as image.

If image has an external format, all members of components must be the identity swizzle.

If image was created with usage containing VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY.

If the shadingRateImage feature is enabled, and if image was created with usage containing VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV, format must be VK_FORMAT_R8_UINT.

If the attachmentFragmentShadingRate feature is enabled, and the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then the image view's format features must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

If the attachmentFragmentShadingRate feature is enabled, the usage for the image view includes VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, and layeredShadingRateAttachments is VK_FALSE, subresourceRange.layerCount must be 1.

If the fragmentDensityMapDynamic feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT.

If the fragmentDensityMapDeferred feature is not enabled, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT.

If flags contains VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT, flags must not contain VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT.

If image was created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT and usage containing VK_IMAGE_USAGE_SAMPLED_BIT, subresourceRange.layerCount must be less than or equal to VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxSubsampledArrayLayers.
If the `invocationMask` feature is enabled, and if `image` was created with `usage` containing `VK_IMAGE_USAGE_INVOCATION_MASK_BIT_HUAWEI`, `format` must be `VK_FORMAT_R8_UINT`.

If `flags` does not contain `VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT` and `image` was created with `usage` containing `VK_IMAGE_USAGE_FRAGMENT_DENSITY_MAP_BIT_EXT`, its `flags` must not contain any of `VK_IMAGE_CREATE_PROTECTED_BIT`, `VK_IMAGE_CREATE_SPARSE_BINDING_BIT`, `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT`, or `VK_IMAGE_CREATE_SPARSE_ALIASED_BIT`.

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, and `image` was not created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, its `usage` member must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

If the `pNext` chain includes a `VkImageViewUsageCreateInfo` structure, `image` was created with a `VkImageStencilUsageCreateInfo` structure included in the `pNext` chain of `VkImageCreateInfo`, and `subresourceRange.aspectMask` includes bits other than `VK_IMAGE_ASPECT_STENCIL_BIT`, the `usage` member of the `VkImageViewUsageCreateInfo` structure must not include any bits that were not set in the `usage` member of the `VkImageCreateInfo` structure used to create `image`.

If `viewType` is `VK_IMAGE_VIEW_TYPE_1D`, `VK_IMAGE_VIEW_TYPE_2D`, or `VK_IMAGE_VIEW_TYPE_3D`; and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, then `subresourceRange.layerCount` must be 1.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is `VK_REMAINING_ARRAY_LAYERS`, then the remaining number of layers must be 1.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be 6.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` and `subresourceRange.layerCount` is not `VK_REMAINING_ARRAY_LAYERS`, `subresourceRange.layerCount` must be a multiple of 6.

If `viewType` is `VK_IMAGE_VIEW_TYPE_CUBE` and `subresourceRange.layerCount` is
VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be 6

- VUID-VkImageViewCreateInfo-viewType-02963
  If viewType is VK_IMAGE_VIEW_TYPE_CUBE_ARRAY and subresourceRange.layerCount is VK_REMAINING_ARRAY_LAYERS, the remaining number of layers must be a multiple of 6

- VUID-VkImageViewCreateInfo-imageViewFormatSwizzle-04465
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatSwizzle is VK_FALSE, all elements of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-imageViewFormatReinterpretation-04466
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::imageViewFormatReinterpretation is VK_FALSE, the VkFormat in format must not contain a different number of components, or a different number of bits in each component, than the format of the VkImage in image

- VUID-VkImageViewCreateInfo-image-04817
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO DECODE DST BIT_KHR, VK_IMAGE_USAGE_VIDEO DECODE SRC BIT_KHR, VK_IMAGE_USAGE_VIDEO DECODE DPB BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D ARRAY and all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-image-04818
  If image was created with usage containing VK_IMAGE_USAGE_VIDEO_ENCODE DST BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE SRC BIT_KHR, VK_IMAGE_USAGE_VIDEO_ENCODE DPB BIT_KHR, then the viewType must be VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D ARRAY and all members of components must have the identity swizzle

- VUID-VkImageViewCreateInfo-pNext-06787
  If the pNext chain includes a VkExportMetalObjectCreateInfoEXT structure, its exportObjectType member must be VK_EXPORT_METAL_OBJECT_TYPE_METAL_TEXTURE_BIT_EXT.

- VUID-VkImageViewCreateInfo-pNext-06944
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then textureSampleWeighted feature must be enabled

- VUID-VkImageViewCreateInfo-pNext-06945
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then image must have been created with usage containing VK_IMAGE_USAGE_SAMPLE WEIGHT BIT_QCOM

- VUID-VkImageViewCreateInfo-pNext-06946
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then components must be VK_COMPONENT_SWIZZLE_IDENTITY for all components

- VUID-VkImageViewCreateInfo-pNext-06947
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT

- VUID-VkImageViewCreateInfo-pNext-06948
  If the pNext chain includes VkImageViewSampleWeightCreateInfoQCOM structure, then subresourceRange.levelCount must be 1

- VUID-VkImageViewCreateInfo-pNext-06949
If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure, then `viewType` must be `VK_IMAGE_VIEW_TYPE_1D_ARRAY` or `VK_IMAGE_VIEW_TYPE_2D_ARRAY`.

- VUID-VkImageViewCreateInfo-pNext-06950
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `imageType` `VK_IMAGE_TYPE_1D`.

- VUID-VkImageViewCreateInfo-pNext-06951
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `subresourceRange.layerCount` must be equal to 2.

- VUID-VkImageViewCreateInfo-pNext-06952
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, then `image` must have been created with `width` equal to or greater than \( \text{align}(\text{filterSize.width}, 4) \times \text{filterSize.height} \).

- VUID-VkImageViewCreateInfo-pNext-06953
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `imageType` `VK_IMAGE_TYPE_2D`.

- VUID-VkImageViewCreateInfo-pNext-06954
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `subresourceRange.layerCount` must be equal or greater than `numPhases`.

- VUID-VkImageViewCreateInfo-pNext-06955
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `width` equal to or greater than `filterSize.width`.

- VUID-VkImageViewCreateInfo-pNext-06956
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure and `viewType` is `VK_IMAGE_VIEW_TYPE_2D_ARRAY`, then `image` must have been created with `height` equal to or greater than `filterSize.height`.

- VUID-VkImageViewCreateInfo-pNext-06957
  If the `pNext` chain includes `VkImageViewSampleWeightCreateInfoQCOM` structure then `VkImageViewSampleWeightCreateInfoQCOM::filterSize.height` must be less than or equal to `VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height`.

---

**Valid Usage (Implicit)**

- VUID-VkImageViewCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_CREATE_INFO`.

- VUID-VkImageViewCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkExportMetalObjectCreateInfoEXT`, `VkExportMetalObjectCreateInfoEXT::handle`.
VkImageViewASTCDecodeModeEXT, VkImageViewMinLodCreateInfoEXT, VkImageViewSampleWeightCreateInfoQCOM, VkImageViewUsageCreateInfo, or VkSamplerYcbcrConversionInfo

- VUID-VkImageViewCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique, with the exception of structures of type VkExportMetalObjectCreateInfoEXT

- VUID-VkImageViewCreateInfo-flags-parameter
  flags must be a valid combination of VkImageViewCreateFlagBits values

- VUID-VkImageViewCreateInfo-image-parameter
  image must be a valid VkImage handle

- VUID-VkImageViewCreateInfo-viewType-parameter
  viewType must be a valid VkImageViewType value

- VUID-VkImageViewCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkImageViewCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkImageViewCreateInfo-subresourceRange-parameter
  subresourceRange must be a valid VkImageSubresourceRange structure

Bits which can be set in VkImageViewCreateInfo::flags, specifying additional parameters of an image view, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageViewCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map2
    VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT = 0x00000002,
} VkImageViewCreateFlagBits;
```

- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DYNAMIC_BIT_EXT specifies that the fragment density map will be read by device during VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT
- VK_IMAGE_VIEW_CREATE_FRAGMENT_DENSITY_MAP_DEFERRED_BIT_EXT specifies that the fragment density map will be read by the host during vkEndCommandBuffer for the primary command buffer that the render pass is recorded into

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkImageViewCreateFlags;
```

VkImageViewCreateFlags is a bitmask type for setting a mask of zero or more VkImageViewCreateFlagBits.

The set of usages for the created image view can be restricted compared to the parent image’s usage.
flags by adding a `VkImageViewUsageCreateInfo` structure to the `pNext` chain of `VkImageViewCreateInfo`.

The `VkImageViewUsageCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageViewUsageCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkImageUsageFlags usage;
} VkImageViewUsageCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkImageViewUsageCreateInfo VkImageViewUsageCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `usage` is a bitmask of `VkImageUsageFlagBits` specifying allowed usages of the image view.

When this structure is chained to `VkImageViewCreateInfo` the `usage` field overrides the implicit `usage` parameter inherited from image creation time and its value is used instead for the purposes of determining the valid usage conditions of `VkImageViewCreateInfo`.

### Valid Usage (Implicit)

- VUID-VkImageViewUsageCreateInfo-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_USAGE_CREATE_INFO`
- VUID-VkImageViewUsageCreateInfo-usage-parameter
  - `usage` must be a valid combination of `VkImageUsageFlagBits` values
- VUID-VkImageViewUsageCreateInfo-usage-requiredbitmask
  - `usage` must not be `0`

The `VkImageSubresourceRange` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceRange {
    VkImageAspectFlags aspectMask;
    uint32_t baseMipLevel;
    uint32_t levelCount;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceRange;
```
• **aspectMask** is a bitmask of **VkImageAspectFlagBits** specifying which aspect(s) of the image are included in the view.

• **baseMipLevel** is the first mipmap level accessible to the view.

• **levelCount** is the number of mipmap levels (starting from **baseMipLevel**) accessible to the view.

• **baseArrayLayer** is the first array layer accessible to the view.

• **layerCount** is the number of array layers (starting from **baseArrayLayer**) accessible to the view.

The number of mipmap levels and array layers **must** be a subset of the image subresources in the image. If an application wants to use all mip levels or layers in an image after the **baseMipLevel** or **baseArrayLayer**, it can set **levelCount** and **layerCount** to the special values **VK_REMAINING_MIP_LEVELS** and **VK_REMAINING_ARRAY_LAYERS** without knowing the exact number of mip levels or layers.

For cube and cube array image views, the layers of the image view starting at **baseArrayLayer** correspond to faces in the order +X, -X, +Y, -Y, +Z, -Z. For cube arrays, each set of six sequential layers is a single cube, so the number of cube maps in a cube map array view is **layerCount / 6**, and image array layer (**baseArrayLayer** + **i**) is face index (**i** mod 6) of cube **i / 6**. If the number of layers in the view, whether set explicitly in **layerCount** or implied by **VK_REMAINING_ARRAY_LAYERS**, is not a multiple of 6, the last cube map in the array **must** not be accessed.

**aspectMask** **must** be only **VK_IMAGE_ASPECT_COLOR_BIT**, **VK_IMAGE_ASPECT_DEPTH_BIT** or **VK_IMAGE_ASPECT_STENCIL_BIT** if **format** is a color, depth-only or stencil-only format, respectively, except if **format** is a multi-planar format. If using a depth/stencil format with both depth and stencil components, **aspectMask** **must** include at least one of **VK_IMAGE_ASPECT_DEPTH_BIT** and **VK_IMAGE_ASPECT_STENCIL_BIT**, and **can** include both.

When the **VkImageSubresourceRange** structure is used to select a subset of the slices of a 3D image’s mip level in order to create a 2D or 2D array image view of a 3D image created with **VK_IMAGE_CREATE_2D_ARRAY_COMPATIBLE_BIT**, **baseArrayLayer** and **layerCount** specify the first slice index and the number of slices to include in the created image view. Such an image view **can** be used as a framebuffer attachment that refers only to the specified range of slices of the selected mip level. However, any layout transitions performed on such an attachment view during a render pass instance still apply to the entire subresource referenced which includes all the slices of the selected mip level.

When using an image view of a depth/stencil image to populate a descriptor set (e.g. for sampling in the shader, or for use as an input attachment), the **aspectMask** **must** only include one bit, which selects whether the image view is used for depth reads (i.e. using a floating-point sampler or input attachment in the shader) or stencil reads (i.e. using an unsigned integer sampler or input attachment in the shader). When an image view of a depth/stencil image is used as a depth/stencil framebuffer attachment, the **aspectMask** is ignored and both depth and stencil image subresources are used.

When creating a **VkImageView**, if sampler **Y’C_bC_r** conversion is enabled in the sampler, the **aspectMask** of a **subresourceRange** used by the **VkImageView** **must** be **VK_IMAGE_ASPECT_COLOR_BIT**.

When creating a **VkImageView**, if sampler **Y’C_bC_r** conversion is not enabled in the sampler and the image **format** is multi-planar, the image **must** have been created with **VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT**, and the **aspectMask** of the **VkImageView**’s **subresourceRange** **must**
be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT.

Valid Usage

• VUID-VkImageSubresourceRange-levelCount-01720
  If levelCount is not VK_REMAINING_MIP_LEVELS, it must be greater than 0

• VUID-VkImageSubresourceRange-layerCount-01721
  If layerCount is not VK_REMAINING_ARRAY_LAYERS, it must be greater than 0

• VUID-VkImageSubresourceRange-aspectMask-01670
  If aspectMask includes VK_IMAGE_ASPECT_COLOR_BIT, then it must not include any of
  VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT

• VUID-VkImageSubresourceRange-aspectMask-02278
  aspectMask must not include VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT for any index i

Valid Usage (Implicit)

• VUID-VkImageSubresourceRange-aspectMask-parameter
  aspectMask must be a valid combination of VkImageAspectFlagBits values

• VUID-VkImageSubresourceRange-aspectMask-required bitmask
  aspectMask must not be 0

Bits which can be set in an aspect mask to specify aspects of an image for purposes such as identifying a subresource, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkImageAspectFlagBits {
    VK_IMAGE_ASPECT_COLOR_BIT = 0x00000001,
    VK_IMAGE_ASPECT_DEPTH_BIT = 0x00000002,
    VK_IMAGE_ASPECT_STENCIL_BIT = 0x00000004,
    VK_IMAGE_ASPECT_METADATA_BIT = 0x00000008,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_0_BIT = 0x00000010,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_1_BIT = 0x00000020,
    // Provided by VK_VERSION_1_1
    VK_IMAGE_ASPECT_PLANE_2_BIT = 0x00000040,
    // Provided by VK_VERSION_1_3
    VK_IMAGE_ASPECT_NONE = 0,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT = 0x00000080,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT = 0x00000100,
    // Provided by VK_EXT_image_drm_format_modifier
    VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT = 0x00000200,
    // Provided by VK_EXT_image_drm_format_modifier
};
```
VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT = 0x00000400,
// Provided by VK_KHR_sampler_yccbc_conversion
VK_IMAGE_ASPECT_PLANE_0_BIT_KHR = VK_IMAGE_ASPECT_PLANE_0_BIT,
// Provided by VK_KHR_sampler_yccbc_conversion
VK_IMAGE_ASPECT_PLANE_1_BIT_KHR = VK_IMAGE_ASPECT_PLANE_1_BIT,
// Provided by VK_KHR_sampler_yccbc_conversion
VK_IMAGE_ASPECT_PLANE_2_BIT_KHR = VK_IMAGE_ASPECT_PLANE_2_BIT,
// Provided by VK_KHR_maintenance4
VK_IMAGE_ASPECT_NONE_KHR = VK_IMAGE_ASPECT_NONE,
} VkImageAspectFlagBits;

- **VK_IMAGE_ASPECT_NONE** specifies no image aspect, or the image aspect is not applicable.
- **VK_IMAGE_ASPECT_COLOR_BIT** specifies the color aspect.
- **VK_IMAGE_ASPECT_DEPTH_BIT** specifies the depth aspect.
- **VK_IMAGE_ASPECT_STENCIL_BIT** specifies the stencil aspect.
- **VK_IMAGE_ASPECT_METADATA_BIT** specifies the metadata aspect, used for sparse resource operations.
- **VK_IMAGE_ASPECT_PLANE_0_BIT** specifies plane 0 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_1_BIT** specifies plane 1 of a multi-planar image format.
- **VK_IMAGE_ASPECT_PLANE_2_BIT** specifies plane 2 of a multi-planar image format.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_0_BIT_EXT** specifies memory plane 0.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_1_BIT_EXT** specifies memory plane 1.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_2_BIT_EXT** specifies memory plane 2.
- **VK_IMAGE_ASPECT_MEMORY_PLANE_3_BIT_EXT** specifies memory plane 3.

// Provided by VK_VERSION_1_0
typedef VkFlags VkImageAspectFlags;

**VkImageAspectFlags** is a bitmask type for setting a mask of zero or more **VkImageAspectFlagBits**.

The **VkComponentMapping** structure is defined as:

// Provided by VK_VERSION_1_0
typedef struct VkComponentMapping {
    VkComponentSwizzle r;
    VkComponentSwizzle g;
    VkComponentSwizzle b;
    VkComponentSwizzle a;
} VkComponentMapping;

- **r** is a **VkComponentSwizzle** specifying the component value placed in the R component of the output vector.
• \( g \) is a \texttt{VkComponentSwizzle} specifying the component value placed in the G component of the output vector.

• \( b \) is a \texttt{VkComponentSwizzle} specifying the component value placed in the B component of the output vector.

• \( a \) is a \texttt{VkComponentSwizzle} specifying the component value placed in the A component of the output vector.

### Valid Usage (Implicit)

- \texttt{VUID-VkComponentMapping-r-parameter} \( r \) must be a valid \texttt{VkComponentSwizzle} value
- \texttt{VUID-VkComponentMapping-g-parameter} \( g \) must be a valid \texttt{VkComponentSwizzle} value
- \texttt{VUID-VkComponentMapping-b-parameter} \( b \) must be a valid \texttt{VkComponentSwizzle} value
- \texttt{VUID-VkComponentMapping-a-parameter} \( a \) must be a valid \texttt{VkComponentSwizzle} value

Possible values of the members of \texttt{VkComponentMapping}, specifying the component values placed in each component of the output vector, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkComponentSwizzle {
    VK_COMPONENT_SWIZZLE_IDENTITY = 0,
    VK_COMPONENT_SWIZZLE_ZERO = 1,
    VK_COMPONENT_SWIZZLE_ONE = 2,
    VK_COMPONENT_SWIZZLE_R = 3,
    VK_COMPONENT_SWIZZLE_G = 4,
    VK_COMPONENT_SWIZZLE_B = 5,
    VK_COMPONENT_SWIZZLE_A = 6,
} VkComponentSwizzle;
```

- \texttt{VK_COMPONENT_SWIZZLE_IDENTITY} specifies that the component is set to the identity swizzle.
- \texttt{VK_COMPONENT_SWIZZLE_ZERO} specifies that the component is set to zero.
- \texttt{VK_COMPONENT_SWIZZLE_ONE} specifies that the component is set to either 1 or 1.0, depending on whether the type of the image view format is integer or floating-point respectively, as determined by the \textit{Format Definition} section for each \texttt{VkFormat}.
- \texttt{VK_COMPONENT_SWIZZLE_R} specifies that the component is set to the value of the R component of the image.
- \texttt{VK_COMPONENT_SWIZZLE_G} specifies that the component is set to the value of the G component of the image.
- \texttt{VK_COMPONENT_SWIZZLE_B} specifies that the component is set to the value of the B component of the image.
- **VK_COMPONENT_SWIZZLE_A** specifies that the component is set to the value of the A component of the image.

Setting the identity swizzle on a component is equivalent to setting the identity mapping on that component. That is:

**Table 16. Component Mappings Equivalent To VK_COMPONENT_SWIZZLE_IDENTITY**

<table>
<thead>
<tr>
<th>Component</th>
<th>Identity Mapping</th>
</tr>
</thead>
<tbody>
<tr>
<td>components.r</td>
<td>VK_COMPONENT_SWIZZLE_R</td>
</tr>
<tr>
<td>components.g</td>
<td>VK_COMPONENT_SWIZZLE_G</td>
</tr>
<tr>
<td>components.b</td>
<td>VK_COMPONENT_SWIZZLE_B</td>
</tr>
<tr>
<td>components.a</td>
<td>VK_COMPONENT_SWIZZLE_A</td>
</tr>
</tbody>
</table>

If the `pNext` chain includes a `VkImageViewASTCDecodeModeEXT` structure, then that structure includes a parameter specifying the decode mode for image views using ASTC compressed formats.

The `VkImageViewASTCDecodeModeEXT` structure is defined as:

```c
// Provided by VK_EXT_astc_decode_mode
typedef struct VkImageViewASTCDecodeModeEXT {
    VkStructureType sType;
    const void* pNext;
    VkFormat decodeMode;
} VkImageViewASTCDecodeModeEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `decodeMode` is the intermediate format used to decode ASTC compressed formats.

**Valid Usage**

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02230
  decodeMode must be one of `VK_FORMAT_R16G16B16A16_SFLOAT`, `VK_FORMAT_R8G8B8A8_UNORM`, or `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02231
  If the `decodeModeSharedExponent` feature is not enabled, `decodeMode` must not be `VK_FORMAT_E5B9G9R9_UFLOAT_PACK32`

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-02232
  If `decodeMode` is `VK_FORMAT_R8G8B8A8_UNORM` the image view must not include blocks using any of the ASTC HDR modes

- VUID-VkImageViewASTCDecodeModeEXT-format-04084
  format of the image view must be one of the ASTC Compressed Image Formats

If `format` uses sRGB encoding then the `decodeMode` has no effect.
Valid Usage (Implicit)

- VUID-VkImageViewASTCDecodeModeEXT-sType-sType
  
sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_ASTC_DECODE_MODE_EXT

- VUID-VkImageViewASTCDecodeModeEXT-decodeMode-parameter
  
decodeMode must be a valid VkFormat value

If the pNext chain includes a VkImageViewSampleWeightCreateInfoQCOM structure, then that structure includes a parameter specifying the parameters for weight image views used in weight image sampling.

The VkImageViewSampleWeightCreateInfoQCOM structure is defined as:

```cpp
// Provided by VK_QCOM_image_processing
typedef struct VkImageViewSampleWeightCreateInfoQCOM {
    VkStructureType sType;
    const void* pNext;
    VkOffset2D filterCenter;
    VkExtent2D filterSize;
    uint32_t numPhases;
} VkImageViewSampleWeightCreateInfoQCOM;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **filterCenter** is a VkOffset2D describing the location of the weight filter origin.
- **filterSize** is a VkExtent2D specifying weight filter dimensions.
- **numPhases** is number of sub-pixel filter phases.

The **filterCenter** specifies the origin or center of the filter kernel, as described in Weight Sampling Operation. The **numPhases** describes the number of sub-pixel filter phases as described in Weight Sampling Phases.

Valid Usage

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06958
  
  filterSize.width must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.width

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterSize-06959
  
  filterSize.height must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterDimension.height

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06960
  
  filterCenter.x must be less than or equal to (filterSize.width - 1)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-filterCenter-06961
  
  filterCenter.y must be less than or equal to (filterSize.height - 1)
**filterCenter.y** must be less than or equal to (filterSize.height - 1)

- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06962
  numPhases must be a power of two squared value (i.e., 1, 4, 16, 64, 256, etc.)
- VUID-VkImageViewSampleWeightCreateInfoQCOM-numPhases-06963
  numPhases must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases

**Valid Usage (Implicit)**

- VUID-VkImageViewSampleWeightCreateInfoQCOM-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_SAMPLE_WEIGHT_CREATE_INFO_QCOM

To destroy an image view, call:

```c
void vkDestroyImageView(
    VkDevice device,
    VkImageView imageView,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the image view.
- `imageView` is the image view to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

**Valid Usage**

- VUID-vkDestroyImageView-imageView-01026
  All submitted commands that refer to `imageView` must have completed execution
- VUID-vkDestroyImageView-imageView-01027
  If VkAllocationCallbacks were provided when `imageView` was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyImageView-imageView-01028
  If no VkAllocationCallbacks were provided when `imageView` was created, `pAllocator` must be NULL

**Valid Usage (Implicit)**

- VUID-vkDestroyImageView-device-parameter
  device must be a valid VkDevice handle
- VUID-vkDestroyImageView-imageView-parameter
  If `imageView` is not VK_NULL_HANDLE, `imageView` must be a valid VkImageView handle
If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

If `imageView` is a valid handle, it must have been created, allocated, or retrieved from `device`.

---

**Host Synchronization**

- Host access to `imageView` must be externally synchronized.

To get the handle for an image view, call:

```c
uint32_t vkGetImageViewHandleNVX(
    VkDevice device,
    const VkImageViewHandleInfoNVX* pInfo);
```

- `device` is the logical device that owns the image view.
- `pInfo` describes the image view to query and type of handle.

---

**Valid Usage (Implicit)**

- `device` must be a valid `VkDevice` handle.
- `pInfo` must be a valid pointer to a valid `VkImageViewHandleInfoNVX` structure.

The `VkImageViewHandleInfoNVX` structure is defined as:

```c
typedef struct VkImageViewHandleInfoNVX {
    VkStructureType sType;
    const void* pNext;
    VkImageView imageView;
    VkDescriptorType descriptorType;
    VkSampler sampler;
} VkImageViewHandleInfoNVX;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `imageView` is the image view to query.
• descriptorType is the type of descriptor for which to query a handle.
• sampler is the sampler to combine with the image view when generating the handle.

Valid Usage

• VUID-VkImageViewHandleInfoNVX-descriptorType-02654
descriptorType must be VK_FORMATTED_FLOAT_IMAGE, VK_FORMATTED_UINT8_IMAGE, or VK_FORMATTED_UINT16_IMAGE

• VUID-VkImageViewHandleInfoNVX-sampler-02655
sampler must be a valid VkSampler if descriptorType is VK_FORMATTED_FLOAT_IMAGE

• VUID-VkImageViewHandleInfoNVX-imageView-02656
If descriptorType is VK_FORMATTED_FLOAT_IMAGE or VK_FORMATTED_UINT8_IMAGE or VK_FORMATTED_UINT16_IMAGE, the image that imageView was created from must have been created with the VK_IMAGE_USAGE_FLOAT_IMAGE_BIT usage bit set

• VUID-VkImageViewHandleInfoNVX-imageView-02657
If descriptorType is VK_FORMATTED_UINT8_IMAGE, the image that imageView was created from must have been created with the VK_IMAGE_USAGE_UINT8_IMAGE_BIT usage bit set

Valid Usage (Implicit)

• VUID-VkImageViewHandleInfoNVX-sType-sType
sType must be VK_STRUCTURE_TYPE_IMAGE_VIEW_HANDLE_INFO_NVX

• VUID-VkImageViewHandleInfoNVX-pNext-pNext
pNext must be NULL

• VUID-VkImageViewHandleInfoNVX-imageView-parameter
imageView must be a valid VkImageView handle

• VUID-VkImageViewHandleInfoNVX-descriptorType-parameter
descriptorType must be a valid VkDescriptorType value

• VUID-VkImageViewHandleInfoNVX-sampler-parameter
If sampler is not VK_NULL_HANDLE, sampler must be a valid VkSampler handle

• VUID-VkImageViewHandleInfoNVX-commonparent
Both of imageView, and sampler that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

To get the device address for an image view, call:

```c
// Provided by VK_NVX_image_view_handle
VkResult vkGetImageViewAddressNVX(  
    VkDevice device,  
    VkImageView imageView,  
);```
VkImageViewAddressPropertiesNVX* pProperties);

- **device** is the logical device that owns the image view.
- **imageView** is a handle to the image view.
- **pProperties** contains the device address and size when the call returns.

## Valid Usage (Implicit)

- VUID-vkGetImageViewAddressNVX-device-parameter
  
  **device** must be a valid *VkDevice* handle

- VUID-vkGetImageViewAddressNVX-imageView-parameter
  
  **imageView** must be a valid *VkImageView* handle

- VUID-vkGetImageViewAddressNVX-pProperties-parameter
  
  **pProperties** must be a valid pointer to a *VkImageViewAddressPropertiesNVX* structure

- VUID-vkGetImageViewAddressNVX-imageView-parent
  
  **imageView** must have been created, allocated, or retrieved from **device**

## Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_UNKNOWN

The *VkImageViewAddressPropertiesNVX* structure is defined as:

```c
// Provided by VK_NVX_image_view_handle
typedef struct VkImageViewAddressPropertiesNVX {
  VkStructureType sType;
  void* pNext;
  VkDeviceAddress deviceAddress;
  VkDeviceSize size;
} VkImageViewAddressPropertiesNVX;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **deviceAddress** is the device address of the image view.
- **size** is the size in bytes of the image view device memory.
Valid Usage (Implicit)

- **VUID-VkImageViewAddressPropertiesNVX-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_VIEW_ADDRESS_PROPERTIES_NVX`
- **VUID-VkImageViewAddressPropertiesNVX-pNext-pNext**
  - `pNext` must be `NULL`

### 12.5.1. Image View Format Features

Valid uses of a `VkImageView` may depend on the image view’s *format features*, defined below. Such constraints are documented in the affected valid usage statement.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is enabled, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view’s set of *format features* is the value of `VkFormatProperties3::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties2` on the same `format` as `VkImageViewCreateInfo::format`.

- If Vulkan 1.3 is not supported and the `VK_KHR_format_feature_flags2` extension is not enabled, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_LINEAR`, then the image view’s set of *format features* is the union of the value of `VkFormatProperties::linearTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`, with:
  - `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` if the format is a depth/stencil format and the image view features also contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`.
  - `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageReadWithoutFormat` is enabled on the device.
  - `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT` if the format is one of the extended storage formats and `shaderStorageImageWriteWithoutFormat` is enabled on the device.

- If Vulkan 1.3 is supported or the `VK_KHR_format_feature_flags2` extension is enabled, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, but without an Android hardware buffer external format, then the image view’s set of *format features* is the value of `VkFormatProperties::optimalTilingFeatures` or `VkFormatProperties3::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` or `vkGetPhysicalDeviceImageFormatProperties2` on the same `format` as `VkImageViewCreateInfo::format`.

- If Vulkan 1.3 is not supported and the `VK_KHR_format_feature_flags2` extension is not enabled, and `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_OPTIMAL`, but without an Android hardware buffer external format, then the image view’s set of *format features* is the union of the value of `VkFormatProperties::optimalTilingFeatures` found by calling `vkGetPhysicalDeviceFormatProperties` on the same `format` as `VkImageViewCreateInfo::format`, with:
  - `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT` if the format is a depth/stencil format and the image view features also contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_BIT`. 

923
- **VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT** if the format is one of the extended storage formats and `shaderStorageImageReadWithoutFormat` is enabled on the device.
- **VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT** if the format is one of the extended storage formats and `shaderStorageImageWriteWithoutFormat` is enabled on the device.

- If `VkImageViewCreateInfo::image` was created with an Android hardware buffer external format, then the image view's set of format features is the value of `VkAndroidHardwareBufferFormatPropertiesANDROID::formatFeatures` found by calling `vkGetAndroidHardwareBufferPropertiesANDROID` on the Android hardware buffer that was imported to the `VkDeviceMemory` to which the `VkImageViewCreateInfo::image` is bound.

- If `VkImageViewCreateInfo::image` was created with a chained `VkBufferCollectionImageCreateInfoFUCHSIA`, then the image view's set of format features is the value of `VkBufferCollectionPropertiesFUCHSIA::formatFeatures` found by calling `vkGetBufferCollectionPropertiesFUCHSIA` on the buffer collection passed as `VkBufferCollectionImageCreateInfoFUCHSIA::collection` when the image was created.

- If `VkImageViewCreateInfo::image` was created with `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then:
  - The image's DRM format modifier is the value of `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier` found by calling `vkGetImageDrmFormatModifierPropertiesEXT`.
  - Let `VkDrmFormatModifierPropertiesListEXT::pDrmFormatModifierProperties` be the array found by calling `vkGetPhysicalDeviceFormatProperties2` on the same format as `VkImageViewCreateInfo::format`.
  - Let `VkDrmFormatModifierPropertiesEXT prop` be the array element whose `drmFormatModifier` member is the value of the image's DRM format modifier.
  - Then the image view's set of format features is `prop::drmFormatModifierTilingFeatures`.

If the `pNext` chain includes a `VkImageViewMinLodCreateInfoEXT` structure, then that structure includes a parameter specifying a value to clamp the minimum LOD value during Image Level(s) Selection and Integer Texel Coordinate Operations.

The `VkImageViewMinLodCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_image_view_min_lod
typedef struct VkImageViewMinLodCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    float minLod;
} VkImageViewMinLodCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `minLod` is the value to clamp the minimum LOD accessible by this `VkImageView`. 

924
12.6. Acceleration Structures

Acceleration structures are opaque data structures that are built by the implementation to more efficiently perform spatial queries on the provided geometric data. For this extension, an acceleration structure is either a top-level acceleration structure containing a set of bottom-level acceleration structures or a bottom-level acceleration structure containing either a set of axis-aligned bounding boxes for custom geometry or a set of triangles.

Each instance in the top-level acceleration structure contains a reference to a bottom-level acceleration structure as well as an instance transform plus information required to index into the shader bindings. The top-level acceleration structure is what is bound to the acceleration descriptor, for example to trace inside the shader in the ray tracing pipeline.

Acceleration structures are represented by VkAccelerationStructureKHR handles:

```c
// Provided by VK_KHR_acceleration_structure
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureKHR)
```

Acceleration structures for the VK_NV_ray_tracing extension are represented by the similar VkAccelerationStructureNV handles:

```c
// Provided by VK_NV_ray_tracing
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkAccelerationStructureNV)
```

To create acceleration structures, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkCreateAccelerationStructureNV(
    VkDevice device,
    const VkAccelerationStructureCreateInfoNV* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
)
```
VkAccelerationStructureNV* pAccelerationStructure);

- **device** is the logical device that creates the buffer object.
- **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoNV` structure containing parameters affecting creation of the acceleration structure.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pAccelerationStructure** is a pointer to a `VkAccelerationStructureNV` handle in which the resulting acceleration structure object is returned.

Similarly to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape” as specified by the information in `VkAccelerationStructureInfoNV` and `compactedSize` in `pCreateInfo`. Populating the data in the object after allocating and binding memory is done with `vkCmdBuildAccelerationStructureNV` and `vkCmdCopyAccelerationStructureNV`.

Acceleration structure creation uses the count and type information from the geometries, but does not use the data references in the structures.

**Valid Usage (Implicit)**

- VUID-vkCreateAccelerationStructureNV-device-parameter
  - **device** must be a valid `VkDevice` handle
- VUID-vkCreateAccelerationStructureNV-pCreateInfo-parameter
  - **pCreateInfo** must be a valid pointer to a valid `VkAccelerationStructureCreateInfoNV` structure
- VUID-vkCreateAccelerationStructureNV-pAllocator-parameter
  - If **pAllocator** is not NULL, **pAllocator** must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateAccelerationStructureNV-pAccelerationStructure-parameter
  - **pAccelerationStructure** must be a valid pointer to a `VkAccelerationStructureNV` handle

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The `VkAccelerationStructureCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    // Other members
} VkAccelerationStructureCreateInfoNV;
```
VkDeviceSize compactedSize;
VkAccelerationStructureInfoNV info;
} VkAccelerationStructureCreateInfoNV;

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **compactedSize** is the size from the result of `vkCmdWriteAccelerationStructuresPropertiesNV` if this acceleration structure is going to be the target of a compacting copy.
- **info** is the `VkAccelerationStructureInfoNV` structure specifying further parameters of the created acceleration structure.

### Valid Usage

- **VUID-VkAccelerationStructureCreateInfoNV-compactedSize-02421**
  
  If `compactedSize` is not 0 then both `info.geometryCount` and `info.instanceCount` must be 0

### Valid Usage (Implicit)

- **VUID-VkAccelerationStructureCreateInfoNV-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_NV`

- **VUID-VkAccelerationStructureCreateInfoNV-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkAccelerationStructureCreateInfoNV-info-parameter**
  
  `info` must be a valid `VkAccelerationStructureInfoNV` structure

The `VkAccelerationStructureInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureTypeNV type;
    VkBuildAccelerationStructureFlagsNV flags;
    uint32_t instanceCount;
    uint32_t geometryCount;
    const VkGeometryNV* pGeometries;
} VkAccelerationStructureInfoNV;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **type** is a `VkAccelerationStructureTypeNV` value specifying the type of acceleration structure that will be created.
• **flags** is a bitmask of `VkBuildAccelerationStructureFlagBitsNV` specifying additional parameters of the acceleration structure.

• **instanceCount** specifies the number of instances that will be in the new acceleration structure.

• **geometryCount** specifies the number of geometries that will be in the new acceleration structure.

• **pGeometries** is a pointer to an array of `geometryCount` `VkGeometryNV` structures containing the scene data being passed into the acceleration structure.

`VkAccelerationStructureInfoNV` contains information that is used both for acceleration structure creation with `vkCreateAccelerationStructureNV` and in combination with the actual geometric data to build the acceleration structure with `vkCmdBuildAccelerationStructureNV`.

---

### Valid Usage

- **VUID-VkAccelerationStructureInfoNV-geometryCount-02422**
  geometryCount must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxGeometryCount`

- **VUID-VkAccelerationStructureInfoNV-instanceCount-02423**
  instanceCount must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxInstanceCount`

- **VUID-VkAccelerationStructureInfoNV-maxTriangleCount-02424**
  The total number of triangles in all geometries must be less than or equal to `VkPhysicalDeviceRayTracingPropertiesNV::maxTriangleCount`

- **VUID-VkAccelerationStructureInfoNV-type-02425**
  If type is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_NV` then geometryCount must be 0

- **VUID-VkAccelerationStructureInfoNV-type-02426**
  If type is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then instanceCount must be 0

- **VUID-VkAccelerationStructureInfoNV-type-02786**
  If type is `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_NV` then the geometryType member of each geometry in pGeometries must be the same

- **VUID-VkAccelerationStructureInfoNV-type-04623**
  type must not be `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`

- **VUID-VkAccelerationStructureInfoNV-flags-02592**
  If flags has the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_NV` bit set, then it must not have the `VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_NV` bit set

- **VUID-VkAccelerationStructureInfoNV-scratch-02781**
  scratch must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag

- **VUID-VkAccelerationStructureInfoNV-instanceData-02782**
  If instanceData is not `VK_NULL_HANDLE`, instanceData must have been created with `VK_BUFFER_USAGE_RAY_TRACING_BIT_NV` usage flag
Valid Usage (Implicit)

- **VUID-VkAccelerationStructureInfoNV-sType-sType**
  
sType **must** be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_INFO_NV`

- **VUID-VkAccelerationStructureInfoNV-pNext-pNext**
  
pNext **must** be `NULL`

- **VUID-VkAccelerationStructureInfoNV-type-parameter**
  
type **must** be a valid `VkAccelerationStructureTypeNV` value

- **VUID-VkAccelerationStructureInfoNV-flags-parameter**
  
flags **must** be a valid combination of `VkBuildAccelerationStructureFlagBitsNV` values

- **VUID-VkAccelerationStructureInfoNV-pGeometries-parameter**
  
If `geometryCount` is not 0, pGeometries **must** be a valid pointer to an array of `geometryCount` valid `VkGeometryNV` structures

To create an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkResult vkCreateAccelerationStructureKHR(
    VkDevice device,
    const VkAccelerationStructureCreateInfoKHR* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkAccelerationStructureKHR* pAccelerationStructure);
```

- **device** is the logical device that creates the acceleration structure object.

- **pCreateInfo** is a pointer to a `VkAccelerationStructureCreateInfoKHR` structure containing parameters affecting creation of the acceleration structure.

- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

- **pAccelerationStructure** is a pointer to a `VkAccelerationStructureKHR` handle in which the resulting acceleration structure object is returned.

Similar to other objects in Vulkan, the acceleration structure creation merely creates an object with a specific “shape”. The type and quantity of geometry that can be built into an acceleration structure is determined by the parameters of `VkAccelerationStructureCreateInfoKHR`.

Populating the data in the object after allocating and binding memory is done with commands such as `vkCmdBuildAccelerationStructuresKHR`, `vkBuildAccelerationStructuresKHR`, `vkCmdCopyAccelerationStructureKHR`, and `vkCopyAccelerationStructureKHR`.

The input buffers passed to acceleration structure build commands will be referenced by the implementation for the duration of the command. After the command completes, the acceleration structure **may** hold a reference to any acceleration structure specified by an active instance contained therein. Apart from this referencing, acceleration structures **must** be fully self-contained. The application **may** re-use or free any memory which was used by the command as an input or as scratch without affecting the results of ray traversal.
Valid Usage

• VUID-vkCreateAccelerationStructureKHR-accelerationStructure-03611
  The accelerationStructure feature must be enabled

• VUID-vkCreateAccelerationStructureKHR-deviceAddress-03488
  If VkAccelerationStructureCreateInfoKHR::deviceAddress is not zero, the accelerationStructureCaptureReplay feature must be enabled

• VUID-vkCreateAccelerationStructureKHR-device-03489
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

• VUID-vkCreateAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle

• VUID-vkCreateAccelerationStructureKHR-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkAccelerationStructureCreateInfoKHR structure

• VUID-vkCreateAccelerationStructureKHR-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkCreateAccelerationStructureKHR-pAccelerationStructure-parameter
  pAccelerationStructure must be a valid pointer to a VkAccelerationStructureKHR handle

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_OUT_OF_HOST_MEMORY
• VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR

The VkAccelerationStructureCreateInfoKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureCreateInfoKHR {
  VkStructureType sType;
  const void* pNext;
  VkAccelerationStructureCreateFlagsKHR createFlags;
  VkBuffer buffer;
  VkDeviceSize offset;
} VkAccelerationStructureCreateInfoKHR;
```
VkDeviceSize size;
VkAccelerationStructureTypeKHR type;
VkDeviceAddress deviceAddress;
}
VkAccelerationStructureCreateInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **createFlags** is a bitmask of `VkAccelerationStructureCreateFlagBitsKHR` specifying additional creation parameters of the acceleration structure.
• **buffer** is the buffer on which the acceleration structure will be stored.
• **offset** is an offset in bytes from the base address of the buffer at which the acceleration structure will be stored, and **must** be a multiple of 256.
• **size** is the size required for the acceleration structure.
• **type** is a `VkAccelerationStructureTypeKHR` value specifying the type of acceleration structure that will be created.
• **deviceAddress** is the device address requested for the acceleration structure if the `accelerationStructureCaptureReplay` feature is being used.

If **deviceAddress** is zero, no specific address is requested.

If **deviceAddress** is not zero, **deviceAddress** **must** be an address retrieved from an identically created acceleration structure on the same implementation. The acceleration structure **must** also be placed on an identically created **buffer** and at the same **offset**.

Applications **should** avoid creating acceleration structures with application-provided addresses and implementation-provided addresses in the same process, to reduce the likelihood of `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR` errors.

---

**Note**

The expected usage for this is that a trace capture/replay tool will add the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag to all buffers that use `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`, and will add `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` to all buffers used as storage for an acceleration structure where **deviceAddress** is not zero. This also means that the tool will need to add `VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT` to memory allocations to allow the flag to be set where the application may not have otherwise required it. During capture the tool will save the queried opaque device addresses in the trace. During replay, the buffers will be created specifying the original address so any address values stored in the trace data will remain valid.

Implementations are expected to separate such buffers in the GPU address space so normal allocations will avoid using these addresses. Apps/tools should avoid mixing app-provided and implementation-provided addresses for buffers created with `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT`, to avoid address space allocation conflicts.
Applications **should** create an acceleration structure with a specific `VkAccelerationStructureTypeKHR` other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

If the acceleration structure will be the target of a build operation, the required size for an acceleration structure **can** be queried with `vkGetAccelerationStructureBuildSizesKHR`. If the acceleration structure is going to be the target of a compacting copy, `vkCmdWriteAccelerationStructuresPropertiesKHR` or `vkWriteAccelerationStructuresPropertiesKHR` can be used to obtain the compacted size required.

If the acceleration structure will be the target of a build operation with `VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV` it **must** include `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` in `flags` and include `VkAccelerationStructureMotionInfoNV` as an extension structure in `pNext` with the number of instances as metadata for the object.

---

**Valid Usage**

- **VUID-VkAccelerationStructureCreateInfoKHR-deviceAddress-03612**
  If `deviceAddress` is not zero, `createFlags` **must** include `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-createFlags-03613**
  If `createFlags` includes `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR`, `VkPhysicalDeviceAccelerationStructureFeaturesKHR::accelerationStructureCaptureReplay` **must** be `VK_TRUE`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03614**
  `buffer` **must** have been created with a usage value containing `VK_BUFFER_USAGE_ACCELERATION_STRUCTURE_STORAGE_BIT_KHR`

- **VUID-VkAccelerationStructureCreateInfoKHR-buffer-03615**
  `buffer` **must** not have been created with `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03616**
  The sum of `offset` and `size` **must** be less than the size of `buffer`

- **VUID-VkAccelerationStructureCreateInfoKHR-offset-03734**
  `offset` **must** be a multiple of 256 bytes

- **VUID-VkAccelerationStructureCreateInfoKHR-flags-04954**
  If `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV` is set in `flags` and type is `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`, one member of the `pNext` chain **must** be a pointer to a valid instance of `VkAccelerationStructureMotionInfoNV`

- **VUID-VkAccelerationStructureCreateInfoKHR-flags-04955**
  If any geometry includes `VkAccelerationStructureGeometryMotionTrianglesDataNV` then `flags` **must** contain `VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV`
Valid Usage (Implicit)

- VUID-VkAccelerationStructureCreateInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_CREATE_INFO_KHR

- VUID-VkAccelerationStructureCreateInfoKHR-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkAccelerationStructureMotionInfoNV

- VUID-VkAccelerationStructureCreateInfoKHR-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkAccelerationStructureCreateInfoKHR-createFlags-parameter
  createFlags must be a valid combination of VkAccelerationStructureCreateFlagBitsKHR values

- VUID-VkAccelerationStructureCreateInfoKHR-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkAccelerationStructureCreateInfoKHR-type-parameter
  type must be a valid VkAccelerationStructureTypeKHR value

The VkAccelerationStructureMotionInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing_motion_blur
typedef struct VkAccelerationStructureMotionInfoNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInstances;
    VkAccelerationStructureMotionInfoFlagsNV flags;
} VkAccelerationStructureMotionInfoNV;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxInstances is the maximum number of instances that may be used in the motion top-level acceleration structure.
- flags is 0 and reserved for future use.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureMotionInfoNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MOTION_INFO_NV

- VUID-VkAccelerationStructureMotionInfoNV-flags-zerobitmask
  flags must be 0

// Provided by VK_NV_ray_tracing_motion_blur
typedef VkFlags VkAccelerationStructureMotionInfoFlagsNV;

VkAccelerationStructureMotionInfoFlagsNV is a bitmask type for setting a mask, but is currently reserved for future use.

To get the build sizes for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkGetAccelerationStructureBuildSizesKHR(
    VkDevice device,
    VkAccelerationStructureBuildTypeKHR buildType,
    const VkAccelerationStructureBuildGeometryInfoKHR* pBuildInfo,
    const uint32_t* pMaxPrimitiveCounts,
    VkAccelerationStructureBuildSizesInfoKHR* pSizeInfo);
```

- `device` is the logical device that will be used for creating the acceleration structure.
- `buildType` defines whether host or device operations (or both) are being queried for.
- `pBuildInfo` is a pointer to a `VkAccelerationStructureBuildGeometryInfoKHR` structure describing parameters of a build operation.
- `pMaxPrimitiveCounts` is a pointer to an array of `pBuildInfo->geometryCount` `uint32_t` values defining the number of primitives built into each geometry.
- `pSizeInfo` is a pointer to a `VkAccelerationStructureBuildSizesInfoKHR` structure which returns the size required for an acceleration structure and the sizes required for the scratch buffers, given the build parameters.

The `srcAccelerationStructure`, `dstAccelerationStructure`, and `mode` members of `pBuildInfo` are ignored. Any `VkDeviceOrHostAddressKHR` members of `pBuildInfo` are ignored by this command, except that the `hostAddress` member of `VkAccelerationStructureGeometryTrianglesDataKHR::transformData` will be examined to check if it is `NULL`.

An acceleration structure created with the `accelerationStructureSize` returned by this command supports any build or update with a `VkAccelerationStructureBuildGeometryInfoKHR` structure and array of `VkAccelerationStructureBuildRangeInfoKHR` structures subject to the following properties:

- The build command is a host build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- The build command is a device build command, and `buildType` is `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR` or `VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR`.
- For `VkAccelerationStructureBuildGeometryInfoKHR`:
  - Its `type`, and `flags` members are equal to `pBuildInfo->type` and `pBuildInfo->flags`, respectively.
  - `geometryCount` is less than or equal to `pBuildInfo->geometryCount`.
For each element of either pGeometries or ppGeometries at a given index, its geometryType member is equal to pBuildInfo->geometryType.

For each element of either pGeometries or ppGeometries at a given index, its flags member is equal to the corresponding member of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the vertexFormat and indexType members of geometry.triangles are equal to the corresponding members of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, the maxVertex member of geometry.triangles is less than or equal to the corresponding member of the same element in pBuildInfo.

For each element of either pGeometries or ppGeometries at a given index, with a geometryType member equal to VK_GEOMETRY_TYPE_TRIANGLES_KHR, if the applicable address in the transformData member of geometry.triangles is not NULL, the corresponding transformData.hostAddress parameter in pBuildInfo is not NULL.

For each VkAccelerationStructureBuildRangeInfoKHR corresponding to the VkAccelerationStructureBuildGeometryInfoKHR:

- Its primitiveCount member is less than or equal to the corresponding element of pMaxPrimitiveCounts.

Similarly, the updateScratchSize value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR mode under the above conditions, and the buildScratchSize value will support any build command specifying the VK_BUILD_ACCELERATION_STRUCTURE_MODE_BUILD_KHR mode under the above conditions.

---

**Valid Usage**

- VUID-vkGetAccelerationStructureBuildSizesKHR-rayTracingPipeline-03617
  The rayTracingPipeline or rayQuery feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-03618
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice feature must be enabled

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03619
  If pBuildInfo->geometryCount is not 0, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-03785
  If pBuildInfo->pGeometries or pBuildInfo->ppGeometries has a geometryType of VK_GEOMETRY_TYPE_INSTANCES_KHR, each pMaxPrimitiveCounts[i] must be less than or equal to VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxInstanceCount
Valid Usage (Implicit)

- VUID-vkGetAccelerationStructureBuildSizesKHR-device-parameter
device must be a valid VkDevice handle

- VUID-vkGetAccelerationStructureBuildSizesKHR-buildType-parameter
buildType must be a valid VkAccelerationStructureBuildTypeKHR value

- VUID-vkGetAccelerationStructureBuildSizesKHR-pBuildInfo-parameter
pBuildInfo must be a valid pointer to a valid VkAccelerationStructureBuildGeometryInfoKHR structure

- VUID-vkGetAccelerationStructureBuildSizesKHR-pMaxPrimitiveCounts-parameter
If pMaxPrimitiveCounts is not NULL, pMaxPrimitiveCounts must be a valid pointer to an array of pBuildInfo->geometryCount uint32_t values

- VUID-vkGetAccelerationStructureBuildSizesKHR-pSizeInfo-parameter
pSizeInfo must be a valid pointer to a VkAccelerationStructureBuildSizesInfoKHR structure

The VkAccelerationStructureBuildSizesInfoKHR structure describes the required build sizes for an acceleration structure and scratch buffers and is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureBuildSizesInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize accelerationStructureSize;
    VkDeviceSize updateScratchSize;
    VkDeviceSize buildScratchSize;
} VkAccelerationStructureBuildSizesInfoKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructureSize is the size in bytes required in a VkAccelerationStructureKHR for a build or update operation.
- updateScratchSize is the size in bytes required in a scratch buffer for an update operation.
- buildScratchSize is the size in bytes required in a scratch buffer for a build operation.

Valid Usage (Implicit)

- VUID-VkAccelerationStructureBuildSizesInfoKHR-sType-sType
sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_BUILD_SIZES_INFO_KHR

- VUID-VkAccelerationStructureBuildSizesInfoKHR-pNext-pNext
pNext must be NULL
Values which can be set in `VkAccelerationStructureCreateInfoKHR::type` or `VkAccelerationStructureInfoNV::type` specifying the type of acceleration structure, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureTypeKHR {
    VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR = 0,
    VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR = 1,
    VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR = 2,
} VkAccelerationStructureTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkAccelerationStructureTypeKHR VkAccelerationStructureTypeNV;
```

- `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR` is a top-level acceleration structure containing instance data referring to bottom-level acceleration structures.
- `VK_ACCELERATION_STRUCTURE_TYPE_BOTTOM_LEVEL_KHR` is a bottom-level acceleration structure containing the AABBs or geometry to be intersected.
- `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` is an acceleration structure whose type is determined at build time used for special circumstances.

Bits which can be set in `VkAccelerationStructureCreateInfoKHR::createFlags`, specifying additional creation parameters for acceleration structures, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureCreateFlagBitsKHR {
    VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR = 0x00000001,
    // Provided by VK_NV_ray_tracing_motion_blur
    VK_ACCELERATION_STRUCTURE_CREATE_MOTION_BIT_NV = 0x00000004,
} VkAccelerationStructureCreateFlagBitsKHR;
```

- `VK_ACCELERATION_STRUCTURE_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT_KHR` specifies that the acceleration structure’s address can be saved and reused on a subsequent run.

```c
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkAccelerationStructureCreateFlagsKHR;
```
VkAccelerationStructureCreateFlagsKHR is a bitmask type for setting a mask of zero or more VkAccelerationStructureCreateFlagBitsKHR. 

Bits which can be set in VkAccelerationStructureBuildGeometryInfoKHR::flags or VkAccelerationStructureInfoNV::flags specifying additional parameters for acceleration structure builds, are:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkBuildAccelerationStructureFlagBitsKHR {
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR = 0x00000001,
    VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR = 0x00000002,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR = 0x00000004,
    VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR = 0x00000008,
    VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR = 0x00000010,
} VkBuildAccelerationStructureFlagBitsKHR;

// Provided by VK_NV_ray_tracing_motion_blur
VK_BUILD_ACCELERATION_STRUCTURE_MOTION_BIT_NV = 0x00000020;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagBitsKHR VkBuildAccelerationStructureFlagBitsNV;
```

- **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** indicates that the specified acceleration structure can be updated with a mode of `VK_BUILD_ACCELERATION_STRUCTURE_MODE_UPDATE_KHR` in VkAccelerationStructureBuildGeometryInfoKHR or an update of `VK_TRUE` in vkCmdBuildAccelerationStructureNV.

- **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** indicates that the specified acceleration structure can act as the source for a copy acceleration structure command with mode of `VK_COPY_ACCELERATION_STRUCTURE_MODE_COMPACT_KHR` to produce a compacted acceleration structure.
• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_TRACE_BIT_KHR** indicates that the given acceleration structure build should prioritize trace performance over build time.

• **VK_BUILD_ACCELERATION_STRUCTURE_PREFER_FAST_BUILD_BIT_KHR** indicates that the given acceleration structure build should prioritize build time over trace performance.

• **VK_BUILD_ACCELERATION_STRUCTURE_LOW_MEMORY_BIT_KHR** indicates that this acceleration structure should minimize the size of the scratch memory and the final result acceleration structure, potentially at the expense of build time or trace performance.

  *Note*

  **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_UPDATE_BIT_KHR** and **VK_BUILD_ACCELERATION_STRUCTURE_ALLOW_COMPACTION_BIT_KHR** may take more time and memory than a normal build, and so should only be used when those features are needed.

```
// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkBuildAccelerationStructureFlagsKHR;
```

or the equivalent

```
// Provided by VK_NV_ray_tracing
typedef VkBuildAccelerationStructureFlagsKHR VkBuildAccelerationStructureFlagsNV;
```

**VkBuildAccelerationStructureFlagsKHR** is a bitmask type for setting a mask of zero or more **VkBuildAccelerationStructureFlagBitsKHR**.

The **VkGeometryNV** structure describes geometry in a bottom-level acceleration structure and is defined as:

```
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryNV {
    VkStructureType sType;
    const void* pNext;
    VkGeometryTypeKHR geometryType;
    VkGeometryDataNV geometry;
    VkGeometryFlagsKHR flags;
} VkGeometryNV;
```

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **geometryType** specifies the **VkGeometryTypeKHR** which this geometry refers to.

• **geometry** contains the geometry data as described in **VkGeometryDataNV**.

• **flags** has **VkGeometryFlagBitsKHR** describing options for this geometry.
Valid Usage

• VUID-VkGeometryNV-geometryType-03503

  \textit{geometryType} must be \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_NV} or \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_NV}.

Valid Usage (Implicit)

• VUID-VkGeometryNV-sType-sType

  \textit{sType} must be \texttt{VK\_STRUCTURE\_TYPE\_GEOMETRY\_NV}.

• VUID-VkGeometryNV-pNext-pNext

  \textit{pNext} must be \texttt{NULL}.

• VUID-VkGeometryNV-geometryType-parameter

  \textit{geometryType} must be a valid \texttt{VkGeometryTypeKHR} value.

• VUID-VkGeometryNV-geometry-parameter

  \textit{geometry} must be a valid \texttt{VkGeometryDataNV} structure.

• VUID-VkGeometryNV-flags-parameter

  \textit{flags} must be a valid combination of \texttt{VkGeometryFlagBitsKHR} values.

Geometry types are specified by \texttt{VkGeometryTypeKHR}, which takes values:

```c
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryTypeKHR {
    VK_GEOMETRY_TYPE_TRIANGLES_KHR = 0,
    VK_GEOMETRY_TYPE_AABBS_KHR = 1,
    VK_GEOMETRY_TYPE_INSTANCES_KHR = 2,
// Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_TRIANGLES_NV = VK_GEOMETRY_TYPE_TRIANGLES_KHR,
// Provided by VK_NV_ray_tracing
    VK_GEOMETRY_TYPE_AABBS_NV = VK_GEOMETRY_TYPE_AABBS_KHR,
} VkGeometryTypeKHR;
```

or the equivalent

```c
// Provided by VK_NV_ray_tracing
typedef VkGeometryTypeKHR VkGeometryTypeNV;
```

• \texttt{VK\_GEOMETRY\_TYPE\_TRIANGLES\_KHR} specifies a geometry type consisting of triangles.

• \texttt{VK\_GEOMETRY\_TYPE\_AABBS\_KHR} specifies a geometry type consisting of axis-aligned bounding boxes.

• \texttt{VK\_GEOMETRY\_TYPE\_INSTANCES\_KHR} specifies a geometry type consisting of acceleration structure instances.

Bits specifying additional parameters for geometries in acceleration structure builds, are:
// Provided by VK_KHR_acceleration_structure
typedef enum VkGeometryFlagBitsKHR {
    VK_GEOMETRY_OPAQUE_BIT_KHR = 0x00000001,
    VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR = 0x00000002,
} VkGeometryFlagBitsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryFlagBitsKHR VkGeometryFlagBitsNV;

• VK_GEOMETRY_OPAQUE_BIT_KHR indicates that this geometry does not invoke the any-hit shaders even if present in a hit group.

• VK_GEOMETRY_NO_DUPLICATE_ANY_HIT_INVOCATION_BIT_KHR indicates that the implementation must only call the any-hit shader a single time for each primitive in this geometry. If this bit is absent an implementation may invoke the any-hit shader more than once for this geometry.

// Provided by VK_KHR_acceleration_structure
typedef VkFlags VkGeometryFlagsKHR;

or the equivalent

// Provided by VK_NV_ray_tracing
typedef VkGeometryFlagsKHR VkGeometryFlagsNV;

VkGeometryFlagsKHR is a bitmask type for setting a mask of zero or more VkGeometryFlagBitsKHR.

The VkGeometryDataNV structure specifies geometry in a bottom-level acceleration structure and is defined as:

// Provided by VK_NV_ray_tracing
typedef struct VkGeometryDataNV {
    VkGeometryTrianglesNV triangles;
    VkGeometryAABB NV aabbs;
} VkGeometryDataNV;

• triangles contains triangle data if VkGeometryNV::geometryType is VK_GEOMETRY_TYPE_TRIANGLES_NV.

• aabbs contains axis-aligned bounding box data if VkGeometryNV::geometryType is
Valid Usage (Implicit)

- VUID-VkGeometryDataNV-triangles-parameter
  *triangles* must be a valid *VkGeometryTrianglesNV* structure
- VUID-VkGeometryDataNV-aabbs-parameter
  *aabbs* must be a valid *VkGeometryAABBNV* structure

The *VkGeometryTrianglesNV* structure specifies triangle geometry in a bottom-level acceleration structure and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryTrianglesNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer vertexData;
    VkDeviceSize vertexOffset;
    uint32_t vertexCount;
    VkDeviceSize vertexStride;
    VkFormat vertexFormat;
    VkBuffer indexData;
    VkDeviceSize indexOffset;
    uint32_t indexCount;
    VkIndexType indexType;
    VkBuffer transformData;
    VkDeviceSize transformOffset;
} VkGeometryTrianglesNV;
```

- *sType* is the type of this structure.
- *pNext* is *NULL* or a pointer to a structure extending this structure.
- *vertexData* is the buffer containing vertex data for this geometry.
- *vertexOffset* is the offset in bytes within *vertexData* containing vertex data for this geometry.
- *vertexCount* is the number of valid vertices.
- *vertexStride* is the stride in bytes between each vertex.
- *vertexFormat* is a *VkFormat* describing the format of each vertex element.
- *indexData* is the buffer containing index data for this geometry.
- *indexOffset* is the offset in bytes within *indexData* containing index data for this geometry.
- *indexCount* is the number of indices to include in this geometry.
- *indexType* is a *VkIndexType* describing the format of each index.
- *transformData* is an optional buffer containing a *VkTransformMatrixNV* structure defining a transformation to be applied to this geometry.
• `transformOffset` is the offset in bytes in `transformData` of the transform information described above.

If `indexType` is `VK_INDEX_TYPE_NONE_NV`, then this structure describes a set of triangles determined by `vertexCount`. Otherwise, this structure describes a set of indexed triangles determined by `indexCount`.

### Valid Usage

- **VUID-VkGeometryTrianglesNV-vertexOffset-02428**
  
  `vertexOffset` **must** be less than the size of `vertexData`

- **VUID-VkGeometryTrianglesNV-vertexOffset-02429**
  
  `vertexOffset` **must** be a multiple of the component size of `vertexFormat`

- **VUID-VkGeometryTrianglesNV-vertexFormat-02430**
  
  `vertexFormat` **must** be one of `VK_FORMAT_R32G32B32_SFLOAT`, `VK_FORMAT_R32G32_SFLOAT`, `VK_FORMAT_R16G16B16_SFLOAT`, `VK_FORMAT_R16G16_SFLOAT`, `VK_FORMAT_R16G16_SNORM`, or `VK_FORMAT_R16G16B16_SNORM`

- **VUID-VkGeometryTrianglesNV-vertexStride-03818**
  
  `vertexStride` **must** be less than or equal to $2^{32}-1$

- **VUID-VkGeometryTrianglesNV-indexOffset-02431**
  
  `indexOffset` **must** be less than the size of `indexData`

- **VUID-VkGeometryTrianglesNV-indexOffset-02432**
  
  `indexOffset` **must** be a multiple of the element size of `indexType`

- **VUID-VkGeometryTrianglesNV-indexType-02433**
  
  `indexType` **must** be `VK_INDEX_TYPE_UINT16`, `VK_INDEX_TYPE_UINT32`, or `VK_INDEX_TYPE_NONE_NV`

- **VUID-VkGeometryTrianglesNV-indexData-02434**
  
  `indexData` **must** be `VK_NULL_HANDLE` if `indexType` is `VK_INDEX_TYPE_NONE_NV`

- **VUID-VkGeometryTrianglesNV-indexData-02435**
  
  `indexData` **must** be a valid `VkBuffer` handle if `indexType` is not `VK_INDEX_TYPE_NONE_NV`

- **VUID-VkGeometryTrianglesNV-indexCount-02436**
  
  `indexCount` **must** be 0 if `indexType` is `VK_INDEX_TYPE_NONE_NV`

- **VUID-VkGeometryTrianglesNV-transformOffset-02437**
  
  `transformOffset` **must** be less than the size of `transformData`

- **VUID-VkGeometryTrianglesNV-transformOffset-02438**
  
  `transformOffset` **must** be a multiple of 16

### Valid Usage (Implicit)

- **VUID-VkGeometryTrianglesNV-sType-sType**
  
  `sType` **must** be `VK_STRUCTURE_TYPE_GEOMETRY_TRIANGLES_NV`

- **VUID-VkGeometryTrianglesNV-pNext-pNext**
  
  `pNext` **must** be `NULL`
• VUID-VkGeometryTrianglesNV-vertexData-parameter
  If `vertexData` is not `VK_NULL_HANDLE`, `vertexData must` be a valid `VkBuffer` handle

• VUID-VkGeometryTrianglesNV-vertexFormat-parameter
  `vertexFormat must` be a valid `VkFormat` value

• VUID-VkGeometryTrianglesNV-indexData-parameter
  If `indexData` is not `VK_NULL_HANDLE`, `indexData must` be a valid `VkBuffer` handle

• VUID-VkGeometryTrianglesNV-indexType-parameter
  `indexType must` be a valid `VkIndexType` value

• VUID-VkGeometryTrianglesNV-transformData-parameter
  If `transformData` is not `VK_NULL_HANDLE`, `transformData must` be a valid `VkBuffer` handle

• VUID-VkGeometryTrianglesNV-commonparent
  Each of `indexData`, `transformData`, and `vertexData` that are valid handles of non-ignored parameters `must` have been created, allocated, or retrieved from the same `VkDevice`

The `VkGeometryAABBNV` structure specifies axis-aligned bounding box geometry in a bottom-level acceleration structure, and is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkGeometryAABBNV {
    VkStructureType sType;
    const void* pNext;
    VkBuffer aabbData;
    uint32_t numAABBs;
    uint32_t stride;
    VkDeviceSize offset;
} VkGeometryAABBNV;
```

• `sType` is the type of this structure.

• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `aabbData` is the buffer containing axis-aligned bounding box data.

• `numAABBs` is the number of AABBs in this geometry.

• `stride` is the stride in bytes between AABBs in `aabbData`.

• `offset` is the offset in bytes of the first AABB in `aabbData`.

The AABB data in memory is six 32-bit floats consisting of the minimum x, y, and z values followed by the maximum x, y, and z values.

**Valid Usage**

• VUID-VkGeometryAABBNV-offset-02439
  `offset must` be less than the size of `aabbData`

• VUID-VkGeometryAABBNV-offset-02440
offset must be a multiple of 8
- VUID-VkGeometryAABBNV-stride-02441
  stride must be a multiple of 8

Valid Usage (Implicit)
- VUID-VkGeometryAABBNV-sType-sType
  sType must be VK_STRUCTURE_TYPE_GEOMETRY_AABB_NV
- VUID-VkGeometryAABBNV-pNext-pNext
  pNext must be NULL
- VUID-VkGeometryAABBNV-aabbData-parameter
  If aabbData is not VK_NULL_HANDLE, aabbData must be a valid VkBuffer handle

To destroy an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
void vkDestroyAccelerationStructureKHR(
    VkDevice device,
    VkAccelerationStructureKHR accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that destroys the acceleration structure.
- accelerationStructure is the acceleration structure to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.

Valid Usage
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02442
  All submitted commands that refer to accelerationStructure must have completed execution
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02443
  If VkAllocationCallbacks were provided when accelerationStructure was created, a compatible set of callbacks must be provided here
- VUID-vkDestroyAccelerationStructureKHR-accelerationStructure-02444
  If no VkAllocationCallbacks were provided when accelerationStructure was created, pAllocator must be NULL

Valid Usage (Implicit)
- VUID-vkDestroyAccelerationStructureKHR-device-parameter
  device must be a valid VkDevice handle
To destroy an acceleration structure, call:

```c
// Provided by VK_NV_ray_tracing
void vkDestroyAccelerationStructureNV(
    VkDevice device,
    VkAccelerationStructureNV accelerationStructure,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the buffer.
- `accelerationStructure` is the acceleration structure to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03752**
  All submitted commands that refer to `accelerationStructure` must have completed execution.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03753**
  If `VkAllocationCallbacks` were provided when `accelerationStructure` was created, a compatible set of callbacks must be provided here.

- **VUID-vkDestroyAccelerationStructureNV-accelerationStructure-03754**
  If no `VkAllocationCallbacks` were provided when `accelerationStructure` was created, `pAllocator` must be NULL.

### Valid Usage (Implicit)

- **VUID-vkDestroyAccelerationStructureNV-device-parameter**
  `device` must be a valid `VkDevice` handle.
If `accelerationStructure` is not `VK_NULL_HANDLE`, `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle.

If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

If `accelerationStructure` is a valid handle, it must have been created, allocated, or retrieved from `device`.

---

**Host Synchronization**

Host access to `accelerationStructure` must be externally synchronized.

An acceleration structure has memory requirements for the structure object itself, scratch space for the build, and scratch space for the update.

Scratch space is allocated as a `VkBuffer`, so for `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV` and `VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV` the `pMemoryRequirements->alignment` and `pMemoryRequirements->memoryTypeBits` values returned by this call must be filled with zero, and should be ignored by the application.

To query the memory requirements, call:

```c
// Provided by VK_NV_ray_tracing
void vkGetAccelerationStructureMemoryRequirementsNV(
    VkDevice device,
    const VkAccelerationStructureMemoryRequirementsInfoNV* pInfo,
    VkMemoryRequirements2KHR* pMemoryRequirements);
```

- `device` is the logical device on which the acceleration structure was created.
- `pInfo` is a pointer to a `VkAccelerationStructureMemoryRequirementsInfoNV` structure specifying the acceleration structure to get memory requirements for.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2KHR` structure in which the requested acceleration structure memory requirements are returned.

---

**Valid Usage (Implicit)**

- `VUID-vkGetAccelerationStructureMemoryRequirementsNV-device-parameter`  
  `device` must be a valid `VkDevice` handle

- `VUID-vkGetAccelerationStructureMemoryRequirementsNV-pInfo-parameter`  
  `pInfo` must be a valid pointer to a valid `VkAccelerationStructureMemoryRequirementsInfoNV` structure
• VUID-vkGetAccelerationStructureMemoryRequirementsNV-pMemoryRequirements-parameter
pMemoryRequirements must be a valid pointer to a VkMemoryRequirements2KHR structure

The VkAccelerationStructureMemoryRequirementsInfoNV structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkAccelerationStructureMemoryRequirementsInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureMemoryRequirementsTypeNV type;
    VkAccelerationStructureNV accelerationStructure;
} VkAccelerationStructureMemoryRequirementsInfoNV;
```

• sType is the type of this structure.

• pNext is NULL or a pointer to a structure extending this structure.

• type selects the type of memory requirement being queried. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV returns the memory requirements for the object itself. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV returns the memory requirements for the scratch memory when doing a build. VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV returns the memory requirements for the scratch memory when doing an update.

• accelerationStructure is the acceleration structure to be queried for memory requirements.

Valid Usage (Implicit)

• VUID-VkAccelerationStructureMemoryRequirementsInfoNV-sType-sType
sType must be VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_INFO_NV

• VUID-VkAccelerationStructureMemoryRequirementsInfoNV-pNext-pNext
pNext must be NULL

• VUID-VkAccelerationStructureMemoryRequirementsInfoNV-type-parameter
type must be a valid VkAccelerationStructureMemoryRequirementsTypeNV value

• VUID-VkAccelerationStructureMemoryRequirementsInfoNV-accelerationStructure-parameter
accelerationStructure must be a valid VkAccelerationStructureNV handle

Possible values of type in VkAccelerationStructureMemoryRequirementsInfoNV are:

```c
// Provided by VK_NV_ray_tracing
typedef enum VkAccelerationStructureMemoryRequirementsTypeNV {
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV = 0,
    VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV = 1,
};
```
VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV = 2,
} VkAccelerationStructureMemoryRequirementsTypeNV;

- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV requests the memory requirement for the VkAccelerationStructureNV backing store.
- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_BUILD_SCRATCH_NV requests the memory requirement for scratch space during the initial build.
- VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_UPDATE_SCRATCH_NV requests the memory requirement for scratch space during an update.

Possible values of buildType in vkGetAccelerationStructureBuildSizesKHR are:

// Provided by VK_KHR_acceleration_structure
typedef enum VkAccelerationStructureBuildTypeKHR {
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR = 0,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR = 1,
    VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR = 2,
} VkAccelerationStructureBuildTypeKHR;

- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_KHR requests the memory requirement for operations performed by the host.
- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_DEVICE_KHR requests the memory requirement for operations performed by the device.
- VK_ACCELERATION_STRUCTURE_BUILD_TYPE_HOST_OR_DEVICE_KHR requests the memory requirement for operations performed by either the host, or the device.

To attach memory to one or more acceleration structures at a time, call:

// Provided by VK_NV_ray_tracing
VkResult vkBindAccelerationStructureMemoryNV(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindAccelerationStructureMemoryInfoNV* pBindInfos);

- device is the logical device that owns the acceleration structures and memory.
- bindInfoCount is the number of elements in pBindInfos.
- pBindInfos is a pointer to an array of VkBindAccelerationStructureMemoryInfoNV structures describing acceleration structures and memory to bind.

Valid Usage (Implicit)

- VUID-vkBindAccelerationStructureMemoryNV-device-parameter device must be a valid VkDevice handle
- VUID-vkBindAccelerationStructureMemoryNV-pBindInfos-parameter
**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkBindAccelerationStructureMemoryInfoNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkBindAccelerationStructureMemoryInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkAccelerationStructureNV accelerationStructure;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindAccelerationStructureMemoryInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `accelerationStructure` is the acceleration structure to be attached to memory.
- `memory` is a `VkDeviceMemory` object describing the device memory to attach.
- `memoryOffset` is the start offset of the region of memory that is to be bound to the acceleration structure. The number of bytes returned in the `VkMemoryRequirements::size` member in `memory`, starting from `memoryOffset` bytes, will be bound to the specified acceleration structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.

**Valid Usage**

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-03620
  `accelerationStructure` must not already be backed by a memory object

- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03621
  `memoryOffset` must be greater than 0
**memoryOffset** must be less than the size of **memory**

- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-03622
  **memory** must have been allocated using one of the memory types allowed in the **memoryTypeBits** member of the **VkMemoryRequirements** structure returned from a call to **vkGetAccelerationStructureMemoryRequirementsNV** with **accelerationStructure** and type of **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV**

- VUID-VkBindAccelerationStructureMemoryInfoNV-memoryOffset-03623
  **memoryOffset** must be an integer multiple of the **alignment** member of the **VkMemoryRequirements** structure returned from a call to **vkGetAccelerationStructureMemoryRequirementsNV** with **accelerationStructure** and type of **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV**

- VUID-VkBindAccelerationStructureMemoryInfoNV-size-03624
  The **size** member of the **VkMemoryRequirements** structure returned from a call to **vkGetAccelerationStructureMemoryRequirementsNV** with **accelerationStructure** and type of **VK_ACCELERATION_STRUCTURE_MEMORY_REQUIREMENTS_TYPE_OBJECT_NV** must be less than or equal to the size of **memory** minus **memoryOffset**

---

**Valid Usage (Implicit)**

- VUID-VkBindAccelerationStructureMemoryInfoNV-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_BIND_ACCELERATION_STRUCTURE_MEMORY_INFO_NV**

- VUID-VkBindAccelerationStructureMemoryInfoNV-pNext-pNext
  **pNext** must be **NULL**

- VUID-VkBindAccelerationStructureMemoryInfoNV-accelerationStructure-parameter
  **accelerationStructure** must be a valid **VkAccelerationStructureNV** handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-memory-parameter
  **memory** must be a valid **VkDeviceMemory** handle

- VUID-VkBindAccelerationStructureMemoryInfoNV-pDeviceIndices-parameter
  If **deviceIndexCount** is not 0, **pDeviceIndices** must be a valid pointer to an array of **deviceIndexCount** **uint32_t** values

- VUID-VkBindAccelerationStructureMemoryInfoNV-commonparent
  Both of **accelerationStructure**, and **memory** must have been created, allocated, or retrieved from the same **VkDevice**

---

To allow constructing geometry instances with device code if desired, we need to be able to query a opaque handle for an acceleration structure. This handle is a value of 8 bytes. To get this handle, call:

```c
// Provided by VK_NV_ray_tracing
VkResult vkGetAccelerationStructureHandleNV(
    VkDevice device,        // Device
    VkAccelerationStructureNV accelerationStructure,     // Acceleration structure
    size_t dataSize,        // Data size
    void* handle)           // Output handle
```

951
void* pData);

- `device` is the logical device that owns the acceleration structures.
- `accelerationStructure` is the acceleration structure.
- `dataSize` is the size in bytes of the buffer pointed to by `pData`.
- `pData` is a pointer to a user-allocated buffer where the results will be written.

### Valid Usage

- **VUID-vkGetAccelerationStructureHandleNV-dataSize-02240**
  `dataSize` must be large enough to contain the result of the query, as described above.

- **VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-02787**
  `accelerationStructure` must be bound completely and contiguously to a single `VkDeviceMemory` object via `vkBindAccelerationStructureMemoryNV`.

### Valid Usage (Implicit)

- **VUID-vkGetAccelerationStructureHandleNV-device-parameter**
  `device` must be a valid `VkDevice` handle.

- **VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parameter**
  `accelerationStructure` must be a valid `VkAccelerationStructureNV` handle.

- **VUID-vkGetAccelerationStructureHandleNV-pData-parameter**
  `pData` must be a valid pointer to an array of `dataSize` bytes.

- **VUID-vkGetAccelerationStructureHandleNV-dataSize-arraylength**
  `dataSize` must be greater than 0.

- **VUID-vkGetAccelerationStructureHandleNV-accelerationStructure-parent**
  `accelerationStructure` must have been created, allocated, or retrieved from `device`.

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

To query the 64-bit device address for an acceleration structure, call:

```c
// Provided by VK_KHR_acceleration_structure
VkDeviceAddress vkGetAccelerationStructureDeviceAddressKHR(
```
VkDevice device,
const VkAccelerationStructureDeviceAddressInfoKHR* pInfo);

- **device** is the logical device that the acceleration structure was created on.
- **pInfo** is a pointer to a `VkAccelerationStructureDeviceAddressInfoKHR` structure specifying the acceleration structure to retrieve an address for.

The 64-bit return value is an address of the acceleration structure, which can be used for device and shader operations that involve acceleration structures, such as ray traversal and acceleration structure building.

If the acceleration structure was created with a non-zero value of `VkAccelerationStructureCreateInfoKHR::deviceAddress`, the return value will be the same address.

If the acceleration structure was created with a type of `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`, the returned address must be consistent with the relative offset to other acceleration structures with type `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR` allocated with the same `VkBuffer`. That is, the difference in returned addresses between the two must be the same as the difference in offsets provided at acceleration structure creation.

---

**Note**

The acceleration structure device address may be different from the buffer device address corresponding to the acceleration structure's start offset in its storage buffer for acceleration structure types other than `VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR`.

---

### Valid Usage

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-device-03504**
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature must be enabled

---

### Valid Usage (Implicit)

- **VUID-vkGetAccelerationStructureDeviceAddressKHR-device-parameter**
  `device` must be a valid `VkDevice` handle
- **VUID-vkGetAccelerationStructureDeviceAddressKHR-pInfo-parameter**
  `pInfo` must be a valid pointer to a valid `VkAccelerationStructureDeviceAddressInfoKHR` structure

The `VkAccelerationStructureDeviceAddressInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkAccelerationStructureDeviceAddressInfoKHR {
    VkStructureType          sType;
```
const void* pNext;
VkAccelerationStructureKHR accelerationStructure;
} VkAccelerationStructureDeviceAddressInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **accelerationStructure** specifies the acceleration structure whose address is being queried.

### Valid Usage (Implicit)

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_ACCELERATION_STRUCTURE_DEVICE_ADDRESS_INFO_KHR`

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-pNext-pNext
  
  **pNext** must be NULL

- VUID-VkAccelerationStructureDeviceAddressInfoKHR-accelerationStructure-parameter
  
  **accelerationStructure** must be a valid `VkAccelerationStructureKHR` handle

## 12.7. Resource Memory Association

Resources are initially created as virtual allocations with no backing memory. Device memory is allocated separately (see Device Memory) and then associated with the resource. This association is done differently for sparse and non-sparse resources.

Resources created with any of the sparse creation flags are considered sparse resources. Resources created without these flags are non-sparse. The details on resource memory association for sparse resources is described in Sparse Resources.

Non-sparse resources **must** be bound completely and contiguously to a single `VkDeviceMemory` object before the resource is passed as a parameter to any of the following operations:

- creating image or buffer views
- updating descriptor sets
- recording commands in a command buffer

Once bound, the memory binding is immutable for the lifetime of the resource.

In a logical device representing more than one physical device, buffer and image resources exist on all physical devices but **can** be bound to memory differently on each. Each such replicated resource is an instance of the resource. For sparse resources, each instance **can** be bound to memory arbitrarily differently. For non-sparse resources, each instance **can** either be bound to the local or a peer instance of the memory, or for images **can** be bound to rectangular regions from the local and/or peer instances. When a resource is used in a descriptor set, each physical device interprets the descriptor according to its own instance’s binding to memory.
There are no new copy commands to transfer data between physical devices. Instead, an application can create a resource with a peer mapping and use it as the source or destination of a transfer command executed by a single physical device to copy the data from one physical device to another.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_0
void vkGetBufferMemoryRequirements(
    VkDevice device,
    VkBuffer buffer,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `buffer` is the buffer to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the buffer object are returned.

**Valid Usage (Implicit)**

- VUID-vkGetBufferMemoryRequirements-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetBufferMemoryRequirements-buffer-parameter `buffer` must be a valid `VkBuffer` handle
- VUID-vkGetBufferMemoryRequirements-pMemoryRequirements-parameter `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements` structure
- VUID-vkGetBufferMemoryRequirements-buffer-parent `buffer` must have been created, allocated, or retrieved from `device`

To determine the memory requirements for an image resource which is not created with the `VK_IMAGE_CREATE_DISJOINT_BIT` flag set, call:

```c
// Provided by VK_VERSION_1_0
void vkGetImageMemoryRequirements(
    VkDevice device,
    VkImage image,
    VkMemoryRequirements* pMemoryRequirements);
```

- `device` is the logical device that owns the image.
- `image` is the image to query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements` structure in which the memory requirements of the image object are returned.
Valid Usage

- VUID-vkGetImageMemoryRequirements-image-01588
  *image* must not have been created with the *VK_IMAGE_CREATE_DISJOINT_BIT* flag set

- VUID-vkGetImageMemoryRequirements-image-04004
  If *image* was created with the *VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID* external memory handle type, then *image* must be bound to memory

Valid Usage (Implicit)

- VUID-vkGetImageMemoryRequirements-device-parameter
  *device* must be a valid *VkDevice* handle

- VUID-vkGetImageMemoryRequirements-image-parameter
  *image* must be a valid *VkImage* handle

- VUID-vkGetImageMemoryRequirements-pMemoryRequirements-parameter
  *pMemoryRequirements* must be a valid pointer to a *VkMemoryRequirements* structure

- VUID-vkGetImageMemoryRequirements-image-parent
  *image* must have been created, allocated, or retrieved from *device*

The *VkMemoryRequirements* structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkMemoryRequirements {
    VkDeviceSize size;
    VkDeviceSize alignment;
    uint32_t memoryTypeBits;
} VkMemoryRequirements;
```

- *size* is the size, in bytes, of the memory allocation required for the resource.
- *alignment* is the alignment, in bytes, of the offset within the allocation required for the resource.
- *memoryTypeBits* is a bitmask and contains one bit set for every supported memory type for the resource. Bit *i* is set if and only if the memory type *i* in the *VkPhysicalDeviceMemoryProperties* structure for the physical device is supported for the resource.

The precise size of images that will be bound to external Android hardware buffer memory is unknown until the memory has been imported or allocated, so applications must not call *vkGetImageMemoryRequirements* or *vkGetImageMemoryRequirements2* with such an *VkImage* before it has been bound to memory. For this reason, applications also must not call *vkGetDeviceImageMemoryRequirements* with a *VkImageCreateInfo* describing an external Android hardware buffer. When importing Android hardware buffer memory, the allocationSize can be determined by calling *vkGetAndroidHardwareBufferPropertiesANDROID*. When allocating
new memory for a `VkImage` that can be exported to an Android hardware buffer, the memory’s allocationSize must be zero; the actual size will be determined by the dedicated image’s parameters. After the memory has been allocated, the amount of space allocated from the memory’s heap can be obtained by getting the image’s memory requirements or by calling `vkGetAndroidHardwareBufferPropertiesANDROID` with the Android hardware buffer exported from the memory.

When allocating new memory for a `VkBuffer` that can be exported to an Android hardware buffer an application may still call `vkGetBufferMemoryRequirements` or `vkGetBufferMemoryRequirements2` with `VkBuffer` before it has been bound to memory.

If the resource being queried was created with the `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_BIT`, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D11_TEXTURE_KMT_BIT`, or `VK_EXTERNAL_MEMORY_HANDLE_TYPE_D3D12_RESOURCE_BIT` external memory handle type, the value of size has no meaning and should be ignored.

The implementation guarantees certain properties about the memory requirements returned by `vkGetBufferMemoryRequirements2`, `vkGetImageMemoryRequirements2`, `vkGetDeviceBufferMemoryRequirements`, `vkGetDeviceImageMemoryRequirements`, `vkGetBufferMemoryRequirements` and `vkGetImageMemoryRequirements`:

- The `memoryTypeBits` member always contains at least one bit set.
- If `buffer` is a `VkBuffer` not created with the `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` bit set, or if `image` is linear image, then the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has both the `VK_MEMORY_PROPERTY_HOST_VISIBLE_BIT` bit and the `VK_MEMORY_PROPERTY_HOST_COHERENT_BIT` bit set. In other words, mappable coherent memory can always be attached to these objects.
- If `buffer` was created with `VkExternalMemoryBufferCreateInfo::handleTypes` set to 0 or `image` was created with `VkExternalMemoryImageCreateInfo::handleTypes` set to 0, the `memoryTypeBits` member always contains at least one bit set corresponding to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_DEVICE_LOCAL_BIT` bit set.
- The `memoryTypeBits` member is identical for all `VkBuffer` objects created with the same value for the `flags` and `usage` members in the `VkBufferCreateInfo` structure and the `handleTypes` member of the `VkExternalMemoryBufferCreateInfo` structure passed to `vkCreateBuffer`. Further, if `usage1` and `usage2` of type `VkBufferUsageFlags` are such that the bits set in `usage2` are a subset of the bits set in `usage1`, and they have the same `flags` and `VkExternalMemoryBufferCreateInfo::handleTypes`, then the bits set in `memoryTypeBits` returned for `usage1` must be a subset of the bits set in `memoryTypeBits` returned for `usage2`, for all values of `flags`.
- The `alignment` member is a power of two.
- The `alignment` member is identical for all `VkBuffer` objects created with the same combination of values for the `usage` and `flags` members in the `VkBufferCreateInfo` structure passed to `vkCreateBuffer`.
- If the `maintenance4` feature is enabled, then the `alignment` member is identical for all `VkImage` objects created with the same combination of values for the `flags`, `imageType`, `format`, `extent`, `mipLevels`, `arrayLayers`, `samples`, `tiling` and `usage` members in the `VkImageCreateInfo` structure
passed to `vkCreateImage`.

- The alignment member satisfies the buffer descriptor offset alignment requirements associated with the VkBuffer's usage:
  
  - If `usage` included `VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT` or `VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT`, alignment **must** be an integer multiple of `VkPhysicalDeviceLimits::minTexelBufferOffsetAlignment`.
  
  - If `usage` included `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT`, alignment **must** be an integer multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.
  
  - If `usage` included `VK_BUFFER_USAGE_STORAGE_BUFFER_BIT`, alignment **must** be an integer multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

- For images created with a color format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the tiling member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the flags member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the flags member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the usage member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.

- For images created with a depth/stencil format, the `memoryTypeBits` member is identical for all `VkImage` objects created with the same combination of values for the format member, the tiling member, the `VK_IMAGE_CREATE_SPARSE_BINDING_BIT` bit of the flags member, the `VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT` bit of the flags member, `handleTypes` member of `VkExternalMemoryImageCreateInfo`, and the `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` of the usage member in the `VkImageCreateInfo` structure passed to `vkCreateImage`.

- If the memory requirements are for a `VkImage`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set if the image did not have `VK_IMAGE_USAGE_TRANSIENT_ATTACHMENT_BIT` bit set in the usage member of the `VkImageCreateInfo` structure passed to `vkCreateImage`.

- If the memory requirements are for a `VkBuffer`, the `memoryTypeBits` member **must** not refer to a `VkMemoryType` with a `propertyFlags` that has the `VK_MEMORY_PROPERTY_LAZILY_ALLOCATED_BIT` bit set.

  **Note**
  The implication of this requirement is that lazily allocated memory is disallowed for buffers in all cases.

- The `size` member is identical for all `VkBuffer` objects created with the same combination of creation parameters specified in `VkBufferCreateInfo` and its `pNext` chain.

- The `size` member is identical for all `VkImage` objects created with the same combination of creation parameters specified in `VkImageCreateInfo` and its `pNext` chain.

  **Note**
  This, however, does not imply that they interpret the contents of the bound memory identically with each other. That additional guarantee, however, can be explicitly requested using `VK_IMAGE_CREATE_ALIAS_BIT`.

- If the `maintenance4` feature is enabled, these additional guarantees apply:
For a VkBuffer, the size memory requirement is never greater than that of another VkBuffer created with a greater or equal size specified in VkBufferCreateInfo, all other creation parameters being identical.

For a VkBuffer, the size memory requirement is never greater than the result of aligning VkBufferCreateInfo::size with the alignment memory requirement.

For a VkImage, the size memory requirement is never greater than that of another VkImage created with a greater or equal value in each of extent.width, extent.height, and extent.depth; all other creation parameters being identical.

The memory requirements returned by vkGetDeviceBufferMemoryRequirements are identical to those that would be returned by vkGetBufferMemoryRequirements2 if it were called with a VkBuffer created with the same VkBufferCreateInfo values.

The memory requirements returned by vkGetDeviceImageMemoryRequirements are identical to those that would be returned by vkGetImageMemoryRequirements2 if it were called with a VkImage created with the same VkImageCreateInfo values.

To determine the memory requirements for a buffer resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetBufferMemoryRequirements2(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetBufferMemoryRequirements2KHR(
    VkDevice device,
    const VkBufferMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device that owns the buffer.
- `pInfo` is a pointer to a VkBufferMemoryRequirementsInfo2 structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a VkMemoryRequirements2 structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- VUID-vkGetBufferMemoryRequirements2-device-parameter
  `device` must be a valid VkDevice handle
- VUID-vkGetBufferMemoryRequirements2-pInfo-parameter
  `pInfo` must be a valid pointer to a valid VkBufferMemoryRequirementsInfo2 structure
To determine the memory requirements for a buffer resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceBufferMemoryRequirements(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```
or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceBufferMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceBufferMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device intended to own the buffer.
- **pInfo** is a pointer to a `VkDeviceBufferMemoryRequirements` structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the buffer object are returned.

### Valid Usage (Implicit)

- **VUID-vkGetDeviceBufferMemoryRequirements-device-parameter**
  
  **device** must be a valid `VkDevice` handle

- **VUID-vkGetDeviceBufferMemoryRequirements-pInfo-parameter**
  
  **pInfo** must be a valid pointer to a valid `VkDeviceBufferMemoryRequirements` structure

- **VUID-vkGetDeviceBufferMemoryRequirements-pMemoryRequirements-parameter**
  
  **pMemoryRequirements** must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkBufferMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBufferMemoryRequirementsInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferMemoryRequirementsInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkBufferMemoryRequirementsInfo2 VkBufferMemoryRequirementsInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `buffer` is the buffer to query.

### Valid Usage (Implicit)

- VUID-VkBufferMemoryRequirementsInfo2-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_MEMORY_REQUIREMENTS_INFO_2`

- VUID-VkBufferMemoryRequirementsInfo2-pNext-pNext
  
  `pNext` must be NULL

- VUID-VkBufferMemoryRequirementsInfo2-buffer-parameter
  
  `buffer` must be a valid `VkBuffer` handle

The `VkDeviceBufferMemoryRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceBufferMemoryRequirements {
    VkStructureType sType;
    const void* pNext;
    const VkBufferCreateInfo* pCreateInfo;
} VkDeviceBufferMemoryRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_maintenance4
typedef VkDeviceBufferMemoryRequirements VkDeviceBufferMemoryRequirementsKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `pCreateInfo` is a pointer to a `VkBufferCreateInfo` structure containing parameters affecting creation of the buffer to query.

### Valid Usage (Implicit)

- VUID-VkDeviceBufferMemoryRequirements-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_DEVICE_BUFFER_MEMORY_REQUIREMENTS`

- VUID-VkDeviceBufferMemoryRequirements-pNext-pNext
pNext **must be** NULL

- **VUID-VkDeviceBufferMemoryRequirements-pCreateInfo-parameter**
  pCreateInfo **must be** a valid pointer to a valid [VkBufferCreateInfo](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkBufferCreateInfo.html) structure

To determine the memory requirements for an image resource, call:

```c
// Provided by VK_VERSION_1_1
void vkGetImageMemoryRequirements2(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

or the equivalent command

```c
// Provided by VK_KHR_get_memory_requirements2
void vkGetImageMemoryRequirements2KHR(
    VkDevice device,
    const VkImageMemoryRequirementsInfo2* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- **device** is the logical device that owns the image.
- **pInfo** is a pointer to a [VkImageMemoryRequirementsInfo2](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkImageMemoryRequirementsInfo2.html) structure containing parameters required for the memory requirements query.
- **pMemoryRequirements** is a pointer to a [VkMemoryRequirements2](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkMemoryRequirements2.html) structure in which the memory requirements of the image object are returned.

**Valid Usage (Implicit)**

- **VUID-vkGetImageMemoryRequirements2-device-parameter**
  device **must be** a valid [VkDevice](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkDevice.html) handle
- **VUID-vkGetImageMemoryRequirements2-pInfo-parameter**
  pInfo **must be** a valid pointer to a valid [VkImageMemoryRequirementsInfo2](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkImageMemoryRequirementsInfo2.html) structure
- **VUID-vkGetImageMemoryRequirements2-pMemoryRequirements-parameter**
  pMemoryRequirements **must be** a valid pointer to a [VkMemoryRequirements2](https://www.khronos.org/registry/vulkan/specs/1.3-extensions/man/vulkan-VkMemoryRequirements2.html) structure

To determine the memory requirements for an image resource without creating an object, call:

```c
// Provided by VK_VERSION_1_3
void vkGetDeviceImageMemoryRequirements(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```
or the equivalent command

```c
// Provided by VK_KHR_maintenance4
void vkGetDeviceImageMemoryRequirementsKHR(
    VkDevice device,
    const VkDeviceImageMemoryRequirements* pInfo,
    VkMemoryRequirements2* pMemoryRequirements);
```

- `device` is the logical device intended to own the image.
- `pInfo` is a pointer to a `VkDeviceImageMemoryRequirements` structure containing parameters required for the memory requirements query.
- `pMemoryRequirements` is a pointer to a `VkMemoryRequirements2` structure in which the memory requirements of the image object are returned.

### Valid Usage (Implicit)

- VUID-vkGetDeviceImageMemoryRequirements-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkGetDeviceImageMemoryRequirements-pInfo-parameter `pInfo` must be a valid pointer to a valid `VkDeviceImageMemoryRequirements` structure
- VUID-vkGetDeviceImageMemoryRequirements-pMemoryRequirements-parameter `pMemoryRequirements` must be a valid pointer to a `VkMemoryRequirements2` structure

The `VkImageMemoryRequirementsInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkImageMemoryRequirementsInfo2 {    VkStructureType sType;
    const void* pNext;
    VkImage image;
} VkImageMemoryRequirementsInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2
typedef VkImageMemoryRequirementsInfo2 VkImageMemoryRequirementsInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `image` is the image to query.
Valid Usage

• VUID-VkImageMemoryRequirementsInfo2-image-01589
  If image was created with a multi-planar format and the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure

• VUID-VkImageMemoryRequirementsInfo2-image-02279
  If image was created with VK_IMAGE_CREATE_DISJOINT_BIT and with VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there must be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure

• VUID-VkImageMemoryRequirementsInfo2-image-01590
  If image was not created with the VK_IMAGE_CREATE_DISJOINT_BIT flag, there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure

• VUID-VkImageMemoryRequirementsInfo2-image-02280
  If image was created with a single-plane format and with any tiling other than VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then there must not be a VkImagePlaneMemoryRequirementsInfo included in the pNext chain of the VkImageMemoryRequirementsInfo2 structure

• VUID-VkImageMemoryRequirementsInfo2-image-01897
  If image was created with the VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID external memory handle type, then image must be bound to memory

Valid Usage (Implicit)

• VUID-VkImageMemoryRequirementsInfo2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_MEMORY_REQUIREMENTS_INFO_2

• VUID-VkImageMemoryRequirementsInfo2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkImagePlaneMemoryRequirementsInfo

• VUID-VkImageMemoryRequirementsInfo2-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkImageMemoryRequirementsInfo2-image-parameter
  image must be a valid VkImage handle

The VkDeviceImageMemoryRequirements structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkDeviceImageMemoryRequirements {
  VkStructureType sType;
  const void* pNext;
}...
```
const VkImageCreateInfo* pCreateInfo;
VkImageAspectFlagBits planeAspect;
} VkDeviceImageMemoryRequirements;

or the equivalent

// Provided by VK_KHR_maintenance4
typedef VkDeviceImageMemoryRequirements VkDeviceImageMemoryRequirementsKHR;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- pCreateInfo is a pointer to a VkImageCreateInfo structure containing parameters affecting creation of the image to query.
- planeAspect is a VkImageAspectFlagBits value specifying the aspect corresponding to the image plane to query. This parameter is ignored unless pCreateInfo::tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, or pCreateInfo::flags has VK_IMAGE_CREATE_DISJOINT_BIT set.

**Valid Usage**

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06416
  The pCreateInfo::pNext chain must not contain a VkImageSwapchainCreateInfoKHR structure

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-06776
  The pCreateInfo::pNext chain must not contain a VkImageDrmFormatModifierExplicitCreateInfoEXT structure

- VUID-VkDeviceImageMemoryRequirements-pNext-06996
  Applications also must not call vkGetDeviceImageMemoryRequirements with a VkImageCreateInfo whose pNext chain includes a VkExternalFormatANDROID structure with non-zero externalFormat.

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06417
  If pCreateInfo::format specifies a multi-planar format and pCreateInfo::flags has VK_IMAGE_CREATE_DISJOINT_BIT set then planeAspect must not be VK_IMAGE_ASPECT_NONE_KHR

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06419
  If pCreateInfo::flags has VK_IMAGE_CREATE_DISJOINT_BIT set and if the pCreateInfo::tiling is VK_IMAGE_TILING_LINEAR or VK_IMAGE_TILING_OPTIMAL, then planeAspect must be a single valid format plane for the image (that is, for a two-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT, and for a three-plane image planeAspect must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT or VK_IMAGE_ASPECT_PLANE_2_BIT)

- VUID-VkDeviceImageMemoryRequirementsKHR-pCreateInfo-06420
  If pCreateInfo::tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then planeAspect must be a single valid memory plane for the image (that is, aspectMask must specify a plane
Valid Usage (Implicit)

- VUID-VkDeviceImageMemoryRequirements-sType-sType
  
  **sType** must be `VK_STRUCTURE_TYPE_DEVICE_IMAGE_MEMORY_REQUIREMENTS`

- VUID-VkDeviceImageMemoryRequirements-pNext-pNext
  
  **pNext** must be `NULL`

- VUID-VkDeviceImageMemoryRequirements-pCreateInfo-parameter
  
  **pCreateInfo** must be a valid pointer to a valid `VkImageCreateInfo` structure

- VUID-VkDeviceImageMemoryRequirements-planeAspect-parameter
  
  If **planeAspect** is not `0`, **planeAspect** must be a valid `VkImageAspectFlagBits` value

Valid Usage

- VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02281
  
  If the image’s tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then **planeAspect** must be a single valid format plane for the image (that is, for a two-plane
image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`, and for a three-plane image `planeAspect` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`.

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-02282**
  If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then `planeAspect` must be a single valid memory plane for the image (that is, `aspectMask` must specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's format and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`).

**Valid Usage (Implicit)**

- **VUID-VkImagePlaneMemoryRequirementsInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_PLANE_MEMORY_REQUIREMENTS_INFO`

- **VUID-VkImagePlaneMemoryRequirementsInfo-planeAspect-parameter**
  `planeAspect` must be a valid `VkImageAspectFlagBits` value.

The `VkMemoryRequirements2` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryRequirements2 {
    VkStructureType     sType;
    void*               pNext;
    VkMemoryRequirements memoryRequirements;
} VkMemoryRequirements2;
```

or the equivalent

```c
// Provided by VK_KHR_get_memory_requirements2, VK_NV_ray_tracing
typedef VkMemoryRequirements2 VkMemoryRequirements2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `memoryRequirements` is a `VkMemoryRequirements` structure describing the memory requirements of the resource.

**Valid Usage (Implicit)**

- **VUID-VkMemoryRequirements2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_MEMORY_REQUIREMENTS_2`

- **VUID-VkMemoryRequirements2-pNext-pNext**
  `pNext` must be `NULL` or a pointer to a valid instance of `VkMemoryDedicatedRequirements`
The `VkMemoryDedicatedRequirements` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkMemoryDedicatedRequirements {
    VkStructureType sType;
    void* pNext;
    VkBool32 prefersDedicatedAllocation;
    VkBool32 requiresDedicatedAllocation;
} VkMemoryDedicatedRequirements;
```

or the equivalent

```c
// Provided by VK_KHR_dedicated_allocation
typedef VkMemoryDedicatedRequirements VkMemoryDedicatedRequirementsKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `prefersDedicatedAllocation` specifies that the implementation would prefer a dedicated allocation for this resource. The application is still free to suballocate the resource but it may get better performance if a dedicated allocation is used.
- `requiresDedicatedAllocation` specifies that a dedicated allocation is required for this resource.

To determine the dedicated allocation requirements of a buffer or image resource, add a `VkMemoryDedicatedRequirements` structure to the `pNext` chain of the `VkMemoryRequirements2` structure passed as the `pMemoryRequirements` parameter of `vkGetBufferMemoryRequirements2` or `vkGetImageMemoryRequirements2`, respectively.

Constraints on the values returned for buffer resources are:

- `requiresDedicatedAllocation` may be `VK_TRUE` if the `pNext` chain of `VkBufferCreateInfo` for the call to `vkCreateBuffer` used to create the buffer being queried included a `VkExternalMemoryBufferCreateInfo` structure, and any of the handle types specified in `VkExternalMemoryBufferCreateInfo::handleTypes` requires dedicated allocation, as reported by `vkGetPhysicalDeviceExternalBufferProperties` in `VkExternalBufferProperties::externalMemoryProperties.externalMemoryFeatures`. Otherwise, `requiresDedicatedAllocation` will be `VK_FALSE`.
- When the implementation sets `requiresDedicatedAllocation` to `VK_TRUE`, it must also set `prefersDedicatedAllocation` to `VK_TRUE`.
- If `VK_BUFFER_CREATE_SPARSE_BINDING_BIT` was set in `VkBufferCreateInfo::flags` when buffer was created, then both `prefersDedicatedAllocation` and `requiresDedicatedAllocation` will be `VK_FALSE`.

Constraints on the values returned for image resources are:
• **requiresDedicatedAllocation** may be **VK_TRUE** if the **pNext** chain of **VkImageCreateInfo** for the call to **vkCreateImage** used to create the image being queried included a **VkExternalMemoryImageCreateInfo** structure, and any of the handle types specified in **VkExternalMemoryImageCreateInfo::handleTypes** requires dedicated allocation, as reported by **vkGetPhysicalDeviceImageFormatProperties2** in **VkExternalImageFormatProperties::externalMemoryProperties.externalMemoryFeatures**. Otherwise, **requiresDedicatedAllocation** will be **VK_FALSE**.

• If **VK_IMAGE_CREATE_SPARSE_BINDING_BIT** was set in **VkImageCreateInfo::flags** when image was created, then both **prefersDedicatedAllocation** and **requiresDedicatedAllocation** will be **VK_FALSE**.

### Valid Usage (Implicit)

- **VUID-VkMemoryDedicatedRequirements-sType-sType**
  
  * **sType** must be **VK_STRUCTURE_TYPE_MEMORY_DEDICATED_REQUIREMENTS**

To attach memory to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindBufferMemory(
    VkDevice device,  // device
    VkBuffer buffer,  // buffer
    VkDeviceMemory memory,  // memory
    VkDeviceSize memoryOffset);  // memoryOffset
```

- **device** is the logical device that owns the buffer and memory.
- **buffer** is the buffer to be attached to memory.
- **memory** is a **VkDeviceMemory** object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of **memory** which is to be bound to the buffer. The number of bytes returned in the **VkMemoryRequirements::size** member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified buffer.

**vkBindBufferMemory** is equivalent to passing the same parameters through **VkBindBufferMemoryInfo** to **vkBindBufferMemory2**.

### Valid Usage

- **VUID-vkBindBufferMemory-buffer-01029**
  
  * **buffer** must not already be backed by a memory object
- **VUID-vkBindBufferMemory-buffer-01030**
  
  * **buffer** must not have been created with any sparse memory binding flags
- **VUID-vkBindBufferMemory-memoryOffset-01031**
  
  * **memoryOffset** must be less than the size of **memory**
- **VUID-vkBindBufferMemory-memory-01035**
memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

- VUID-vkBindBufferMemory-memoryOffset-01036
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer.

- VUID-vkBindBufferMemory-size-01037
  The size member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer must be less than or equal to the size of memory minus memoryOffset.

- VUID-vkBindBufferMemory-buffer-01444
  If buffer requires a dedicated allocation (as reported by vkGetBufferMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for buffer), memory must have been allocated with VkMemoryDedicatedAllocateInfo::buffer equal to buffer.

- VUID-vkBindBufferMemory-memory-01508
  If the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::buffer was not VK_NULL_HANDLE, then buffer must equal VkMemoryDedicatedAllocateInfo::buffer, and memoryOffset must be zero.

- VUID-vkBindBufferMemory-None-01898
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit set, the buffer must be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

- VUID-vkBindBufferMemory-None-01899
  If buffer was created with the VK_BUFFER_CREATE_PROTECTED_BIT bit not set, the buffer must not be bound to a memory object allocated with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT.

- VUID-vkBindBufferMemory-buffer-01038
  If buffer was created with VkDedicatedAllocationBufferCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been allocated with VkDedicatedAllocationMemoryAllocateInfoNV::buffer equal to a buffer handle created with identical creation parameters to buffer and memoryOffset must be zero.

- VUID-vkBindBufferMemory-memory-02726
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

- VUID-vkBindBufferMemory-memory-02985
  If memory was allocated by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

- VUID-vkBindBufferMemory-memory-02986
If memory was allocated with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryBufferCreateInfo::handleTypes when buffer was created.

- VUID-vkBindBufferMemory-bufferDeviceAddress-03339
  If the VkPhysicalDeviceBufferDeviceAddressFeatures::bufferDeviceAddress feature is enabled and buffer was created with the VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT bit set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

- VUID-vkBindBufferMemory-memory-buffer-06408
  If buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext.

### Valid Usage (Implicit)

- VUID-vkBindBufferMemory-memory-device-parameter
device must be a valid VkDevice handle

- VUID-vkBindBufferMemory-memory-buffer-parameter
buffer must be a valid VkBuffer handle

- VUID-vkBindBufferMemory-memory-memory-parameter
memory must be a valid VkDeviceMemory handle

- VUID-vkBindBufferMemory-memory-parent
buffer must have been created, allocated, or retrieved from device

- VUID-vkBindBufferMemory-memory-memory-parent
memory must have been created, allocated, or retrieved from device

### Host Synchronization

- Host access to buffer must be externally synchronized

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR
To attach memory to buffer objects for one or more buffers at a time, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkBindBufferMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

or the equivalent command

```c
// Provided by VK_KHR_bind_memory2
VkResult vkBindBufferMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindBufferMemoryInfo* pBindInfos);
```

- `device` is the logical device that owns the buffers and memory.
- `bindInfoCount` is the number of elements in `pBindInfos`.
- `pBindInfos` is a pointer to an array of `bindInfoCount` `VkBindBufferMemoryInfo` structures describing buffers and memory to bind.

On some implementations, it may be more efficient to batch memory bindings into a single command.

**Valid Usage (Implicit)**
- VUID-vkBindBufferMemory2-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkBindBufferMemory2-pBindInfos-parameter `pBindInfos` must be a valid pointer to an array of `bindInfoCount` valid `VkBindBufferMemoryInfo` structures
- VUID-vkBindBufferMemory2-bindInfoCount-arraylength `bindInfoCount` must be greater than 0

**Return Codes**

- **Success**
  - `VK_SUCCESS`
- **Failure**
  - `VK_ERROR_OUT_OF_HOST_MEMORY`
  - `VK_ERROR_OUT_OF_DEVICE_MEMORY`
  - `VK_ERROR_INVALID_OPAQUE_CAPTURE_ADDRESS_KHR`
VkBindBufferMemoryInfo contains members corresponding to the parameters of vkBindBufferMemory.

The VkBindBufferMemoryInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryInfo {
    VkStructureType sType;
    const void*pNext;
    VkBuffer buffer;
    VkDeviceMemory memory;
    VkDeviceSize memoryOffset;
} VkBindBufferMemoryInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2
typedef VkBindBufferMemoryInfo VkBindBufferMemoryInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **buffer** is the buffer to be attached to memory.
- **memory** is a VkDeviceMemory object describing the device memory to attach.
- **memoryOffset** is the start offset of the region of memory which is to be bound to the buffer. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified buffer.

### Valid Usage

- **VUID-VkBindBufferMemoryInfo-buffer-01029**
  buffer must not already be backed by a memory object

- **VUID-VkBindBufferMemoryInfo-buffer-01030**
  buffer must not have been created with any sparse memory binding flags

- **VUID-VkBindBufferMemoryInfo-memoryOffset-01031**
  memoryOffset must be less than the size of memory

- **VUID-VkBindBufferMemoryInfo-memory-01035**
  memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer

- **VUID-VkBindBufferMemoryInfo-memoryOffset-01036**
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetBufferMemoryRequirements with buffer
The `size` member of the `VkMemoryRequirements` structure returned from a call to 
`vkGetBufferMemoryRequirements` with `buffer` must be less than or equal to the size of `memory` 
minus `memoryOffset`.

If `buffer` requires a dedicated allocation (as reported by 
`vkGetBufferMemoryRequirements2` in `VkMemoryDedicatedRequirements` 
::`requiresDedicatedAllocation` for `buffer`), `memory` must have been allocated with 
`VkMemoryDedicatedAllocateInfo`::`buffer` equal to `buffer`.

If the `VkMemoryAllocateInfo` provided when `memory` was allocated included a 
`VkMemoryDedicatedAllocateInfo` structure in its `pNext` chain, and 
`VkMemoryDedicatedAllocateInfo`::`buffer` was not `VK_NULL_HANDLE`, then `buffer` must 
equal `VkMemoryDedicatedAllocateInfo`::`buffer`, and `memoryOffset` must be zero.

If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit set, the buffer must be 
bound to a memory object allocated with a memory type that reports 
`VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If `buffer` was created with the `VK_BUFFER_CREATE_PROTECTED_BIT` bit not set, the buffer must 
not be bound to a memory object allocated with a memory type that reports 
`VK_MEMORY_PROPERTY_PROTECTED_BIT`.

If `buffer` was created with `VkDedicatedAllocationBufferCreateInfoNV`::`dedicatedAllocation` equal to `VK_TRUE`, `memory` must have been allocated with 
`VkDedicatedAllocationMemoryAllocateInfoNV`::`buffer` equal to a buffer handle created 
with identical creation parameters to `buffer` and `memoryOffset` must be zero.

If the value of `VkExportMemoryAllocateInfo`::`handleTypes` used to allocate `memory` is not `0`, it 
must include at least one of the handles set in `VkExternalMemoryBufferCreateInfo` 
::`handleTypes` when `buffer` was created.

If `memory` was allocated by a memory import operation, that is not 
`VkImportAndroidHardwareBufferInfoANDROID` with a non-NULL `buffer` value, the 
external handle type of the imported memory must also have been set in 
`VkExternalMemoryBufferCreateInfo`::`handleTypes` when `buffer` was created.

If `memory` was allocated with the `VkImportAndroidHardwareBufferInfoANDROID` memory 
import operation with a non-NULL `buffer` value, 
`VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID` must also have 
been set in `VkExternalMemoryBufferCreateInfo`::`handleTypes` when `buffer` was created.

If the `VkPhysicalDeviceBufferDeviceAddressFeatures`::`bufferDeviceAddress` feature is 
enabled and `buffer` was created with the `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT` bit.
set, memory must have been allocated with the VK_MEMORY_ALLOCATE_DEVICE_ADDRESS_BIT bit set.

- VUID-VkBindBufferMemoryInfo-buffer-06408
  If buffer was created with VkBufferCollectionBufferCreateInfoFUCHSIA chained to VkBufferCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext

- VUID-VkBindBufferMemoryInfo-pNext-01605
  If the pNext chain includes a VkBindBufferMemoryDeviceGroupInfo structure, all instances of memory specified by VkBindBufferMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

### Valid Usage (Implicit)

- VUID-VkBindBufferMemoryInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_INFO

- VUID-VkBindBufferMemoryInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkBindBufferMemoryDeviceGroupInfo

- VUID-VkBindBufferMemoryInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkBindBufferMemoryInfo-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkBindBufferMemoryInfo-memory-parameter
  memory must be a valid VkDeviceMemory handle

- VUID-VkBindBufferMemoryInfo-commonparent
  Both of buffer, and memory must have been created, allocated, or retrieved from the same VkDevice

The VkBindBufferMemoryDeviceGroupInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindBufferMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
} VkBindBufferMemoryDeviceGroupInfo;
```

or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindBufferMemoryDeviceGroupInfo VkBindBufferMemoryDeviceGroupInfoKHR;
```
• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• deviceIndexCount is the number of elements in pDeviceIndices.
• pDeviceIndices is a pointer to an array of device indices.

If the pNext chain of VkBindBufferMemoryInfo includes a VkBindBufferMemoryDeviceGroupInfo structure, then that structure determines how memory is bound to buffers across multiple devices in a device group.

If deviceIndexCount is greater than zero, then on device index i the buffer is attached to the instance of memory on the physical device with device index pDeviceIndices[i].

If deviceIndexCount is zero and memory comes from a memory heap with the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of memory.

If deviceIndexCount is zero and memory comes from a memory heap without the VK_MEMORY_HEAP_MULTI_INSTANCE_BIT bit set, then it is as if pDeviceIndices contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- VUID-VkBindBufferMemoryDeviceGroupInfo-deviceIndexCount-01606
  deviceIndexCount must either be zero or equal to the number of physical devices in the logical device

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-01607
  All elements of pDeviceIndices must be valid device indices

**Valid Usage (Implicit)**

- VUID-VkBindBufferMemoryDeviceGroupInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_BUFFER_MEMORY_DEVICE_GROUP_INFO

- VUID-VkBindBufferMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

To attach memory to a VkImage object created without the VK_IMAGE_CREATE_DISJOINT_BIT set, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkBindImageMemory(
    VkDevice       device,
    VkImage        image,
    VkDeviceMemory memory,
```
• **device** is the logical device that owns the image and memory.

• **image** is the image.

• **memory** is the **VkDeviceMemory** object describing the device memory to attach.

• **memoryOffset** is the start offset of the region of **memory** which is to be bound to the image. The number of bytes returned in the **VkMemoryRequirements::size** member in **memory**, starting from **memoryOffset** bytes, will be bound to the specified image.

**vkBindImageMemory** is equivalent to passing the same parameters through **VkBindImageMemoryInfo** to **vkBindImageMemory2**.

---

**Valid Usage**

- **VUID-vkBindImageMemory-image-01044**
  - **image** must not already be backed by a memory object

- **VUID-vkBindImageMemory-image-01045**
  - **image** must not have been created with any sparse memory binding flags

- **VUID-vkBindImageMemory-memoryOffset-01046**
  - **memoryOffset** must be less than the size of **memory**

- **VUID-vkBindImageMemory-image-01445**
  - If **image** requires a dedicated allocation (as reported by **vkGetImageMemoryRequirements2** in **VkMemoryDedicatedRequirements::requiresDedicatedAllocation** for **image**), **memory** must have been created with **VkMemoryDedicatedAllocateInfo::image** equal to **image**

- **VUID-vkBindImageMemory-memory-02628**
  - If the **dedicatedAllocationImageAliasing** feature is not enabled, and the **VkMemoryAllocateInfo** provided when **memory** was allocated included a **VkMemoryDedicatedAllocateInfo** structure in its **pNext** chain, and **VkMemoryDedicatedAllocateInfo::image** was not **VK_NULL_HANDLE**, then **image** must be either equal to **VkMemoryDedicatedAllocateInfo::image** or an image that was created using the same parameters in **VkImageCreateInfo**, with the exception that **extent** and **arrayLayers** may differ subject to the following restrictions: every dimension in the **extent** parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the **arrayLayers** parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created

- **VUID-vkBindImageMemory-None-01901**
  - If **image** was created with the **VK_IMAGE_CREATE_PROTECTED_BIT** bit set, the **image** must be
bound to a memory object allocated with a memory type that reports
VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-vkBindImageMemory-None-01902
  If image was created with the VK_IMAGE_CREATE_PROTECTED_BIT bit not set, the image must not be bound to a memory object created with a memory type that reports VK_MEMORY_PROPERTY_PROTECTED_BIT

• VUID-vkBindImageMemory-image-01050
  If image was created with VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation equal to VK_TRUE, memory must have been created with VkDedicatedAllocationMemoryAllocateInfoNV::image equal to an image handle created with identical creation parameters to image and memoryOffset must be zero

• VUID-vkBindImageMemory-memory-02728
  If the value of VkExportMemoryAllocateInfo::handleTypes used to allocate memory is not 0, it must include at least one of the handles set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-vkBindImageMemory-memory-02989
  If memory was created by a memory import operation, that is not VkImportAndroidHardwareBufferInfoANDROID with a non-NULL buffer value, the external handle type of the imported memory must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-vkBindImageMemory-memory-02990
  If memory was created with the VkImportAndroidHardwareBufferInfoANDROID memory import operation with a non-NULL buffer value, VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BIT_ANDROID must also have been set in VkExternalMemoryImageCreateInfo::handleTypes when image was created

• VUID-vkBindImageMemory-image-01608
  image must not have been created with the VK_IMAGE_CREATE_DISJOINT_BIT set

• VUID-vkBindImageMemory-memory-01047
  memory must have been allocated using one of the memory types allowed in the memoryTypeBits member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements with image

• VUID-vkBindImageMemory-memoryOffset-01048
  memoryOffset must be an integer multiple of the alignment member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements with image

• VUID-vkBindImageMemory-size-01049
  The difference of the size of memory and memoryOffset must be greater than or equal to the size member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements with the same image

• VUID-vkBindImageMemory-image-06392
  If image was created with VkBufferCollectionImageCreateInfoFUCHSIA chained to VkImageCreateInfo::pNext, memory must be allocated with a VkImportMemoryBufferCollectionFUCHSIA chained to VkMemoryAllocateInfo::pNext
Valid Usage (Implicit)

- VUID-vkBindImageMemory-device-parameter
  
  \texttt{device} \textbf{must} be a valid \texttt{VkDevice} handle

- VUID-vkBindImageMemory-image-parameter
  
  \texttt{image} \textbf{must} be a valid \texttt{VkImage} handle

- VUID-vkBindImageMemory-memory-parameter
  
  \texttt{memory} \textbf{must} be a valid \texttt{VkDeviceMemory} handle

- VUID-vkBindImageMemory-image-parent
  
  \texttt{image} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

- VUID-vkBindImageMemory-memory-parent
  
  \texttt{memory} \textbf{must} have been created, allocated, or retrieved from \texttt{device}

Host Synchronization

- Host access to \texttt{image} \textbf{must} be externally synchronized

Return Codes

\textbf{Success}

- \texttt{VK_SUCCESS}

\textbf{Failure}

- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}

To attach memory to image objects for one or more images at a time, call:

\begin{verbatim}
// Provided by VK_VERSION_1_1
VkResult vkBindImageMemory2(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
\end{verbatim}

or the equivalent command

\begin{verbatim}
// Provided by VK_KHR_bind_memory2
VkResult vkBindImageMemory2KHR(
    VkDevice device,
    uint32_t bindInfoCount,
    const VkBindImageMemoryInfo* pBindInfos);
\end{verbatim}
• **device** is the logical device that owns the images and memory.

• **bindInfoCount** is the number of elements in **pBindInfos**.

• **pBindInfos** is a pointer to an array of **VkBindImageMemoryInfo** structures, describing images and memory to bind.

On some implementations, it **may** be more efficient to batch memory bindings into a single command.

### Valid Usage

- VUID-vkBindImageMemory2-pBindInfos-02858
  If any **VkBindImageMemoryInfo::image** was created with **VK_IMAGE_CREATE_DISJOINT_BIT** then all planes of **VkBindImageMemoryInfo::image** must be bound individually in separate **pBindInfos**

- VUID-vkBindImageMemory2-pBindInfos-04006
  **pBindInfos** must not refer to the same image subresource more than once

### Valid Usage (Implicit)

- VUID-vkBindImageMemory2-device-parameter
  **device** must be a valid **VkDevice** handle

- VUID-vkBindImageMemory2-pBindInfos-parameter
  **pBindInfos** must be a valid pointer to an array of **bindInfoCount** valid **VkBindImageMemoryInfo** structures

- VUID-vkBindImageMemory2-bindInfoCount-arraylength
  **bindInfoCount** must be greater than 0

### Return Codes

#### Success
- **VK_SUCCESS**

#### Failure
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_OUT_OF_DEVICE_MEMORY**

**VkBindImageMemoryInfo** contains members corresponding to the parameters of **vkBindImageMemory**.

The **VkBindImageMemoryInfo** structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryInfo {
```
VkStructureType sType;
const void* pNext;
VkImage image;
VkDeviceMemory memory;
VkDeviceSize memoryOffset;
} VkBindImageMemoryInfo;

or the equivalent

// Provided by VK_KHR_bind_memory2
typedef VkBindImageMemoryInfo VkBindImageMemoryInfoKHR;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• image is the image to be attached to memory.
• memory is a VkDeviceMemory object describing the device memory to attach.
• memoryOffset is the start offset of the region of memory which is to be bound to the image. The number of bytes returned in the VkMemoryRequirements::size member in memory, starting from memoryOffset bytes, will be bound to the specified image.

Valid Usage

• VUID-VkBindImageMemoryInfo-image-01044
  image must not already be backed by a memory object

• VUID-VkBindImageMemoryInfo-image-01045
  image must not have been created with any sparse memory binding flags

• VUID-VkBindImageMemoryInfo-memoryOffset-01046
  memoryOffset must be less than the size of memory

• VUID-VkBindImageMemoryInfo-image-01445
  If image requires a dedicated allocation (as reported by vkGetImageMemoryRequirements2 in VkMemoryDedicatedRequirements::requiresDedicatedAllocation for image), memory must have been created with VkMemoryDedicatedAllocateInfo::image equal to image

• VUID-VkBindImageMemoryInfo-memory-02628
  If the dedicatedAllocationImageAliasing feature is not enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not VK_NULL_HANDLE, then image must equal VkMemoryDedicatedAllocateInfo::image and memoryOffset must be zero

• VUID-VkBindImageMemoryInfo-memory-02629
  If the dedicatedAllocationImageAliasing feature is enabled, and the VkMemoryAllocateInfo provided when memory was allocated included a VkMemoryDedicatedAllocateInfo structure in its pNext chain, and VkMemoryDedicatedAllocateInfo::image was not
VK_NULL_HANDLE, then `memoryOffset` must be zero, and `image` must be either equal to `VkMemoryDedicatedAllocateInfo::image` or an image that was created using the same parameters in `VkImageCreateInfo`, with the exception that `extent` and `arrayLayers` may differ subject to the following restrictions: every dimension in the `extent` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created; and the `arrayLayers` parameter of the image being bound must be equal to or smaller than the original image for which the allocation was created.

- VUID-VkBindImageMemoryInfo-None-01901
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit set, the image must be bound to a memory object allocated with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

- VUID-VkBindImageMemoryInfo-None-01902
  If image was created with the `VK_IMAGE_CREATE_PROTECTED_BIT` bit not set, the image must not be bound to a memory object created with a memory type that reports `VK_MEMORY_PROPERTY_PROTECTED_BIT`.

- VUID-VkBindImageMemoryInfo-image-01050
  If `image` was created with `VkDedicatedAllocationImageCreateInfoNV::dedicatedAllocation` equal to `VK_TRUE`, `memory` must have been created with `VkDedicatedAllocationMemoryAllocateInfoNV::image` equal to an image handle created with identical creation parameters to `image` and `memoryOffset` must be zero.

- VUID-VkBindImageMemoryInfo-memory-02728
  If the value of `VkExportMemoryAllocateInfo::handleTypes` used to allocate `memory` is not 0, it must include at least one of the handles set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- VUID-VkBindImageMemoryInfo-memory-02989
  If `memory` was created by a memory import operation, that is not `VkImportAndroidHardwareBufferInfoANDROID` with a non-`NULL` `buffer` value, the external handle type of the imported memory must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- VUID-VkBindImageMemoryInfo-memory-02990
  If `memory` was created with the `VkImportAndroidHardwareBufferInfoANDROID` memory import operation with a non-`NULL` `buffer` value, `VK_EXTERNAL_MEMORY_HANDLE_TYPE_ANDROID_HARDWARE_BUFFER_BITANDROID` must also have been set in `VkExternalMemoryImageCreateInfo::handleTypes` when `image` was created.

- VUID-VkBindImageMemoryInfo-pNext-01615
  If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memory` must have been allocated using one of the memory types allowed in the `memoryTypeBits` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`.

- VUID-VkBindImageMemoryInfo-pNext-01616
  If the `pNext` chain does not include a `VkBindImagePlaneMemoryInfo` structure, `memoryOffset` must be an integer multiple of the `alignment` member of the `VkMemoryRequirements` structure returned from a call to `vkGetImageMemoryRequirements2` with `image`.
• VUID-VkBindImageMemoryInfo-pNext-01617
   If the pNext chain does not include a VkBindImagePlaneMemoryInfo structure, the
difference of the size of memory and memoryOffset must be greater than or equal to the size
member of the VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image

• VUID-VkBindImageMemoryInfo-pNext-01618
   If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, image must have
been created with the VK_IMAGE_CREATE_DISJOINT_BIT bit set

• VUID-VkBindImageMemoryInfo-pNext-01619
   If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memory must have
been allocated using one of the memory types allowed in the memoryTypeBits member of the
VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image
   and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the
VkImagePlaneMemoryRequirementsInfo::planeAspect in the
VkImageMemoryRequirementsInfo2 structure's pNext chain

• VUID-VkBindImageMemoryInfo-pNext-01620
   If the pNext chain includes a VkBindImagePlaneMemoryInfo structure, memoryOffset must
be an integer multiple of the alignment member of the VkMemoryRequirements structure
returned from a call to vkGetImageMemoryRequirements2 with image and where
VkBindImagePlaneMemoryInfo::planeAspect corresponds to the
VkImagePlaneMemoryRequirementsInfo::planeAspect in the
VkImageMemoryRequirementsInfo2 structure's pNext chain

• VUID-VkBindImageMemoryInfo-pNext-01621
   If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, the difference of
the size of memory and memoryOffset must be greater than or equal to the size member of the
VkMemoryRequirements structure returned from a call to vkGetImageMemoryRequirements2 with the same image
   and where VkBindImagePlaneMemoryInfo::planeAspect corresponds to the
VkImagePlaneMemoryRequirementsInfo::planeAspect in the
VkImageMemoryRequirementsInfo2 structure's pNext chain

• VUID-VkBindImageMemoryInfo-pNext-01622
   If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all instances of memory specified by
VkBindImageMemoryDeviceGroupInfo::pDeviceIndices must have been allocated

• VUID-VkBindImageMemoryInfo-pNext-01623
   If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, and
VkBindImageMemoryDeviceGroupInfo::splitInstanceBindRegionCount is not zero, then
image must have been created with the VK_IMAGE_CREATE_SPLIT_INSTANCE_BIND_REGIONS_BIT bit set

• VUID-VkBindImageMemoryInfo-pNext-01624
   If the pNext chain includes a VkBindImageMemoryDeviceGroupInfo structure, all elements of
 VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions must be valid rectangles contained within the dimensions of image
If the `pNext` chain includes a `VkBindImageMemoryDeviceGroupInfo` structure, the union of the areas of all elements of `VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions` that correspond to the same instance of `image` must cover the entire image

- **VUID-VkBindImageMemoryInfo-image-01630**
  If `image` was created with a valid swapchain handle in `VkImageSwapchainCreateInfoKHR::swapchain`, then the `pNext` chain must include a `VkBindImageMemorySwapchainInfoKHR` structure containing the same swapchain handle

- **VUID-VkBindImageMemoryInfo-pNext-01631**
  If the `pNext` chain includes a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be `VK_NULL_HANDLE`

- **VUID-VkBindImageMemoryInfo-pNext-01632**
  If the `pNext` chain does not include a `VkBindImageMemorySwapchainInfoKHR` structure, `memory` must be a valid `VkDeviceMemory` handle

### Valid Usage (Implicit)

- **VUID-VkBindImageMemoryInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_INFO`

- **VUID-VkBindImageMemoryInfo-pNext-pNext**
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkBindImageMemoryDeviceGroupInfo`, `VkBindImageMemorySwapchainInfoKHR`, or `VkBindImagePlaneMemoryInfo`

- **VUID-VkBindImageMemoryInfo-sType-unique**
  The `sType` value of each struct in the `pNext` chain must be unique

- **VUID-VkBindImageMemoryInfo-image-parameter**
  `image` must be a valid `VkImage` handle

- **VUID-VkBindImageMemoryInfo-commonparent**
  Both of `image`, and `memory` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

The `VkBindImageMemoryDeviceGroupInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkBindImageMemoryDeviceGroupInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t deviceIndexCount;
    const uint32_t* pDeviceIndices;
    uint32_t splitInstanceBindRegionCount;
    const VkRect2D* pSplitInstanceBindRegions;
} VkBindImageMemoryDeviceGroupInfo;
```
or the equivalent

```c
// Provided by VK_KHR_bind_memory2 with VK_KHR_device_group
typedef VkBindImageMemoryDeviceGroupInfo VkBindImageMemoryDeviceGroupInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `deviceIndexCount` is the number of elements in `pDeviceIndices`.
- `pDeviceIndices` is a pointer to an array of device indices.
- `splitInstanceBindRegionCount` is the number of elements in `pSplitInstanceBindRegions`.
- `pSplitInstanceBindRegions` is a pointer to an array of `VkRect2D` structures describing which regions of the image are attached to each instance of memory.

If the `pNext` chain of `VkBindImageMemoryInfo` includes a `VkBindImageMemoryDeviceGroupInfo` structure, then that structure determines how memory is bound to images across multiple devices in a device group.

If `deviceIndexCount` is greater than zero, then on device index `i` image is attached to the instance of the memory on the physical device with device index `pDeviceIndices[i]`.

Let N be the number of physical devices in the logical device. If `splitInstanceBindRegionCount` is greater than zero, then `pSplitInstanceBindRegions` is a pointer to an array of $N^2$ rectangles, where the image region specified by the rectangle at element $i*N+j$ in resource instance $i$ is bound to the memory instance $j$. The blocks of the memory that are bound to each sparse image block region use an offset in memory, relative to `memoryOffset`, computed as if the whole image was being bound to a contiguous range of memory. In other words, horizontally adjacent image blocks use consecutive blocks of memory, vertically adjacent image blocks are separated by the number of bytes per block multiplied by the width in blocks of `image`, and the block at (0,0) corresponds to memory starting at `memoryOffset`.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap with the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains consecutive indices from zero to the number of physical devices in the logical device, minus one. In other words, by default each physical device attaches to its own instance of the memory.

If `splitInstanceBindRegionCount` and `deviceIndexCount` are zero and the memory comes from a memory heap without the `VK_MEMORY_HEAP_MULTI_INSTANCE_BIT` bit set, then it is as if `pDeviceIndices` contains an array of zeros. In other words, by default each physical device attaches to instance zero.

**Valid Usage**

- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01633
  At least one of `deviceIndexCount` and `splitInstanceBindRegionCount` must be zero
- VUID-VkBindImageMemoryDeviceGroupInfo-deviceIndexCount-01634
deviceIndexCount must either be zero or equal to the number of physical devices in the logical device

• VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-01635
  All elements of pDeviceIndices must be valid device indices

• VUID-VkBindImageMemoryDeviceGroupInfo-splitInstanceBindRegionCount-01636
  splitInstanceBindRegionCount must either be zero or equal to the number of physical devices in the logical device squared

• VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-01637
  Elements of pSplitInstanceBindRegions that correspond to the same instance of an image must not overlap

• VUID-VkBindImageMemoryDeviceGroupInfo-offset-01638
  The offset.x member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block width (VkSparseImageFormatProperties::imageGranularity.width) of all non-metadata aspects of the image

• VUID-VkBindImageMemoryDeviceGroupInfo-offset-01639
  The offset.y member of any element of pSplitInstanceBindRegions must be a multiple of the sparse image block height (VkSparseImageFormatProperties::imageGranularity.height) of all non-metadata aspects of the image

• VUID-VkBindImageMemoryDeviceGroupInfo-extent-01640
  The extent.width member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block width of all non-metadata aspects of the image, or else extent.width + offset.x must equal the width of the image subresource

• VUID-VkBindImageMemoryDeviceGroupInfo-extent-01641
  The extent.height member of any element of pSplitInstanceBindRegions must either be a multiple of the sparse image block height of all non-metadata aspects of the image, or else extent.height + offset.y must equal the height of the image subresource

Valid Usage (Implicit)

• VUID-VkBindImageMemoryDeviceGroupInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_DEVICE_GROUP_INFO

• VUID-VkBindImageMemoryDeviceGroupInfo-pDeviceIndices-parameter
  If deviceIndexCount is not 0, pDeviceIndices must be a valid pointer to an array of deviceIndexCount uint32_t values

• VUID-VkBindImageMemoryDeviceGroupInfo-pSplitInstanceBindRegions-parameter
  If splitInstanceBindRegionCount is not 0, pSplitInstanceBindRegions must be a valid pointer to an array of splitInstanceBindRegionCount VkRect2D structures

If the pNext chain of VkBindImageMemoryInfo includes a VkBindImageMemorySwapchainInfoKHR structure, then that structure includes a swapchain handle and image index indicating that the image will be bound to memory from that swapchain.

The VkBindImageMemorySwapchainInfoKHR structure is defined as:
typedef struct VkBindImageMemorySwapchainInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkSwapchainKHR swapchain;
    uint32_t imageIndex;
} VkBindImageMemorySwapchainInfoKHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **swapchain** is VK_NULL_HANDLE or a swapchain handle.
- **imageIndex** is an image index within swapchain.

If swapchain is not NULL, the swapchain and imageIndex are used to determine the memory that the image is bound to, instead of memory and memoryOffset.

Memory can be bound to a swapchain and use the pDeviceIndices or pSplitInstanceBindRegions members of VkBindImageMemoryDeviceGroupInfo.

### Valid Usage

- VUID-VkBindImageMemorySwapchainInfoKHR-imageIndex-01644
  - imageIndex must be less than the number of images in swapchain

### Valid Usage (Implicit)

- VUID-VkBindImageMemorySwapchainInfoKHR-sType-sType
  - sType must be VK_STRUCTURE_TYPE_BIND_IMAGE_MEMORY_SWAPCHAIN_INFO_KHR
- VUID-VkBindImageMemorySwapchainInfoKHR-swapchain-parameter
  - swapchain must be a valid VkSwapchainKHR handle

### Host Synchronization

- Host access to swapchain must be externally synchronized

In order to bind planes of a disjoint image, add a VkBindImagePlaneMemoryInfo structure to the pNext chain of VkBindImageMemoryInfo.

The VkBindImagePlaneMemoryInfo structure is defined as:

// Provided by VK_VERSION_1_1
typedef struct VkBindImagePlaneMemoryInfo {

VkStructureType sType;
const void* pNext;
VkImageAspectFlagBits planeAspect;
} VkBindImagePlaneMemoryInfo;

or the equivalent

// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkBindImagePlaneMemoryInfo VkBindImagePlaneMemoryInfoKHR;

• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **planeAspect** is a `VkImageAspectFlagBits` value specifying the aspect of the disjoint image plane to bind.

### Valid Usage

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02283**
  If the image's tiling is `VK_IMAGE_TILING_LINEAR` or `VK_IMAGE_TILING_OPTIMAL`, then **planeAspect must** be a single valid format plane for the image (that is, for a two-plane image **planeAspect must** be `VK_IMAGE_ASPECT_PLANE_0_BIT` or `VK_IMAGE_ASPECT_PLANE_1_BIT`, and for a three-plane image **planeAspect must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or `VK_IMAGE_ASPECT_PLANE_2_BIT`).

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-02284**
  If the image's tiling is `VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT`, then **planeAspect must** be a single valid memory plane for the image (that is, **aspectMask must** specify a plane index that is less than the `VkDrmFormatModifierPropertiesEXT::drmFormatModifierPlaneCount` associated with the image's format and `VkImageDrmFormatModifierPropertiesEXT::drmFormatModifier`).

### Valid Usage (Implicit)

- **VUID-VkBindImagePlaneMemoryInfo-sType-sType**
  **sType must** be `VK_STRUCTURE_TYPE_BIND_IMAGE_PLANE_MEMORY_INFO`

- **VUID-VkBindImagePlaneMemoryInfo-planeAspect-parameter**
  **planeAspect must** be a valid `VkImageAspectFlagBits` value

### Buffer-Image Granularity

The implementation-dependent limit `bufferImageGranularity` specifies a page-like granularity at which linear and non-linear resources **must** be placed in adjacent memory locations to avoid aliasing. Two resources which do not satisfy this granularity requirement are said to alias. `bufferImageGranularity` is specified in bytes, and **must** be a power of two. Implementations which do not impose a granularity restriction **may** report a `bufferImageGranularity` value of one.
Despite its name, `bufferImageGranularity` is really a granularity between “linear” and “non-linear” resources.

Given `resourceA` at the lower memory offset and `resourceB` at the higher memory offset in the same `VkDeviceMemory` object, where one resource is linear and the other is non-linear (as defined in the Glossary), and the following:

```
resourceA.end = resourceA.memoryOffset + resourceA.size - 1
resourceA.endPage = resourceA.end && ~(bufferImageGranularity - 1)
resourceB.start = resourceB.memoryOffset
resourceB.startPage = resourceB.start && ~(bufferImageGranularity - 1)
```

The following property must hold:

```
resourceA.endPage < resourceB.startPage
```

That is, the end of the first resource (A) and the beginning of the second resource (B) must be on separate “pages” of size `bufferImageGranularity`. `bufferImageGranularity` may be different than the physical page size of the memory heap. This restriction is only needed when a linear resource and a non-linear resource are adjacent in memory and will be used simultaneously. The memory ranges of adjacent resources can be closer than `bufferImageGranularity`, provided they meet the alignment requirement for the objects in question.

Sparse block size in bytes and sparse image and buffer memory alignments must all be multiples of the `bufferImageGranularity`. Therefore, memory bound to sparse resources naturally satisfies the `bufferImageGranularity`.

### 12.8. Resource Sharing Mode

Buffer and image objects are created with a sharing mode controlling how they can be accessed from queues. The supported sharing modes are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSharingMode {
    VK_SHARING_MODE_EXCLUSIVE = 0,
    VK_SHARING_MODE_CONCURRENT = 1,
} VkSharingMode;
```

- `VK_SHARING_MODE_EXCLUSIVE` specifies that access to any range or image subresource of the object will be exclusive to a single queue family at a time.
- `VK_SHARING_MODE_CONCURRENT` specifies that concurrent access to any range or image subresource of the object from multiple queue families is supported.
VK_SHARING_MODE_CONCURRENT may result in lower performance access to the buffer or image than VK_SHARING_MODE_EXCLUSIVE.

Ranges of buffers and image subresources of image objects created using VK_SHARING_MODE_EXCLUSIVE must only be accessed by queues in the queue family that has ownership of the resource. Upon creation, such resources are not owned by any queue family; ownership is implicitly acquired upon first use within a queue. Once a resource using VK_SHARING_MODE_EXCLUSIVE is owned by some queue family, the application must perform a queue family ownership transfer to make the memory contents of a range or image subresource accessible to a different queue family.

Note
Images still require a layout transition from VK_IMAGE_LAYOUT_UNDEFINED or VK_IMAGE_LAYOUT_PREINITIALIZED before being used on the first queue.

A queue family can take ownership of an image subresource or buffer range of a resource created with VK_SHARING_MODE_EXCLUSIVE, without an ownership transfer, in the same way as for a resource that was just created; however, taking ownership in this way has the effect that the contents of the image subresource or buffer range are undefined.

Ranges of buffers and image subresources of image objects created using VK_SHARING_MODE_CONCURRENT must only be accessed by queues from the queue families specified through the queueFamilyIndexCount and pQueueFamilyIndices members of the corresponding create info structures.

### 12.8.1. External Resource Sharing

Resources should only be accessed in the Vulkan instance that has exclusive ownership of their underlying memory. Only one Vulkan instance has exclusive ownership of a resource’s underlying memory at a given time, regardless of whether the resource was created using VK_SHARING_MODE_EXCLUSIVE or VK_SHARING_MODE_CONCURRENT. Applications can transfer ownership of a resource's underlying memory only if the memory has been imported from or exported to another instance or external API using external memory handles. The semantics for transferring ownership outside of the instance are similar to those used for transferring ownership of VK_SHARING_MODE_EXCLUSIVE resources between queues, and is also accomplished using VkBufferMemoryBarrier or VkImageMemoryBarrier operations. To make the contents of the underlying memory accessible in the destination instance or API, applications must

1. Release exclusive ownership from the source instance or API.
2. Ensure the release operation has completed using semaphores or fences.
3. Acquire exclusive ownership in the destination instance or API

Unlike queue ownership transfers, the destination instance or API is not specified explicitly when releasing ownership, nor is the source instance or API specified when acquiring ownership. Instead, the image or memory barrier's dstQueueFamilyIndex or srcQueueFamilyIndex parameters are set to the reserved queue family index VK_QUEUE_FAMILY_EXTERNAL or VK_QUEUE_FAMILY_FOREIGN_EXT to represent the external destination or source respectively.

Binding a resource to a memory object shared between multiple Vulkan instances or other APIs
does not change the ownership of the underlying memory. The first entity to access the resource implicitly acquires ownership. An entity can also implicitly take ownership from another entity in the same way without an explicit ownership transfer. However, taking ownership in this way has the effect that the contents of the underlying memory are undefined.

Accessing a resource backed by memory that is owned by a particular instance or API has the same semantics as accessing a VK_SHARING_MODE_EXCLUSIVE resource, with one exception: Implementations must ensure layout transitions performed on one member of a set of identical subresources of identical images that alias the same range of an underlying memory object affect the layout of all the subresources in the set.

As a corollary, writes to any image subresources in such a set must not make the contents of memory used by other subresources in the set undefined. An application can define the content of a subresource of one image by performing device writes to an identical subresource of another image provided both images are bound to the same region of external memory. Applications may also add resources to such a set after the content of the existing set members has been defined without making the content undefined by creating a new image with the initial layout VK_IMAGE_LAYOUT_UNDEFINED and binding it to the same region of external memory as the existing images.

Note
Because layout transitions apply to all identical images aliasing the same region of external memory, the actual layout of the memory backing a new image as well as an existing image with defined content will not be undefined. Such an image is not usable until it acquires ownership of its memory from the existing owner. Therefore, the layout specified as part of this transition will be the true initial layout of the image. The undefined layout specified when creating it is a placeholder to simplify valid usage requirements.

12.9. Memory Aliasing

A range of a VkDeviceMemory allocation is aliased if it is bound to multiple resources simultaneously, as described below, via vkBindImageMemory, vkBindBufferMemory, vkBindAccelerationStructureMemoryNV, via sparse memory bindings, or by binding the memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms.

Consider two resources, resource\textsubscript{a} and resource\textsubscript{b}, bound respectively to memory range\textsubscript{A} and range\textsubscript{B}. Let paddedRange\textsubscript{A} and paddedRange\textsubscript{B} be, respectively, range\textsubscript{A} and range\textsubscript{B} aligned to bufferImageGranularity. If the resources are both linear or both non-linear (as defined in the Glossary), then the resources alias the memory in the intersection of range\textsubscript{A} and range\textsubscript{B}. If one resource is linear and the other is non-linear, then the resources alias the memory in the intersection of paddedRange\textsubscript{A} and paddedRange\textsubscript{B}.

Applications can alias memory, but use of multiple aliases is subject to several constraints.

Note
Memory aliasing can be useful to reduce the total device memory footprint of an
When a non-linear, non-VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image is bound to an aliased range, all image subresources of the image overlap the range. When a linear image is bound to an aliased range, the image subresources that (according to the image’s advertised layout) include bytes from the aliased range overlap the range. When a VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT image has sparse image blocks bound to an aliased range, only image subresources including those sparse image blocks overlap the range, and when the memory bound to the image’s mip tail overlaps an aliased range all image subresources in the mip tail overlap the range.

Buffers, and linear image subresources in either the VK_IMAGE_LAYOUT_PREINITIALIZED or VK_IMAGE_LAYOUT_GENERAL layouts, are host-accessible subresources. That is, the host has a well-defined addressing scheme to interpret the contents, and thus the layout of the data in memory can be consistently interpreted across aliases if each of those aliases is a host-accessible subresource. Non-linear images, and linear image subresources in other layouts, are not host-accessible.

If two aliases are both host-accessible, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

If two aliases are both images that were created with identical creation parameters, both were created with the VK_IMAGE_CREATE_ALIAS_BIT flag set, and both are bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions, then they interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Additionally, if an individual plane of a multi-planar image and a single-plane image alias the same memory, then they also interpret the contents of the memory in consistent ways under the same conditions, but with the following modifications:

- Both must have been created with the VK_IMAGE_CREATE_DISJOINT_BIT flag.
- The single-plane image must have a VkFormat that is equivalent to that of the multi-planar image’s individual plane.
- The single-plane image and the individual plane of the multi-planar image must be bound identically to memory except for VkBindImageMemoryDeviceGroupInfo::pDeviceIndices and VkBindImageMemoryDeviceGroupInfo::pSplitInstanceBindRegions.
- The width and height of the single-plane image are derived from the multi-planar image’s dimensions in the manner listed for plane compatibility for the aliased plane.
- If either image’s tiling is VK_IMAGE_TILING_DRM_FORMAT_MODIFIER_EXT, then both images must be linear.
- All other creation parameters must be identical.

Aliases created by binding the same memory to resources in multiple Vulkan instances or external APIs using external memory handle export and import mechanisms interpret the contents of the memory in consistent ways, and data written to one alias can be read by the other alias.

Otherwise, the aliases interpret the contents of the memory differently, and writes via one alias make the contents of memory partially or completely undefined to the other alias. If the first alias is
a host-accessible subresource, then the bytes affected are those written by the memory operations according to its addressing scheme. If the first alias is not host-accessible, then the bytes affected are those overlapped by the image subresources that were written. If the second alias is a host-accessible subresource, the affected bytes become undefined. If the second alias is not host-accessible, all sparse image blocks (for sparse partially-resident images) or all image subresources (for non-sparse image and fully resident sparse images) that overlap the affected bytes become undefined.

If any image subresources are made undefined due to writes to an alias, then each of those image subresources **must** have its layout transitioned from `VK_IMAGE_LAYOUT_UNDEFINED` to a valid layout before it is used, or from `VK_IMAGE_LAYOUT_PREINITIALIZED` if the memory has been written by the host. If any sparse blocks of a sparse image have been made undefined, then only the image subresources containing them **must** be transitioned.

Use of an overlapping range by two aliases **must** be separated by a memory dependency using the appropriate access types if at least one of those uses performs writes, whether the aliases interpret memory consistently or not. If buffer or image memory barriers are used, the scope of the barrier **must** contain the entire range and/or set of image subresources that overlap.

If two aliasing image views are used in the same framebuffer, then the render pass **must** declare the attachments using the `VK_ATTACHMENT_DESCRIPTION_MAY_ALIAS_BIT`, and follow the other rules listed in that section.

---

**Note**

Memory recycled via an application suballocator (i.e. without freeing and reallocating the memory objects) is not substantially different from memory aliasing. However, a suballocator usually waits on a fence before recycling a region of memory, and signaling a fence involves sufficient implicit dependencies to satisfy all the above requirements.

### 12.10. Buffer Collections

Fuchsia’s FIDL-based Sysmem service interoperates with Vulkan via the `VK_FUCHSIA_buffer_collection` extension.

A buffer collection is a set of one or more buffers which were allocated together as a group and which all have the same properties. These properties describe the buffers’ internal representation, such as its dimensions and memory layout. This ensures that all of the buffers can be used interchangeably by tasks that require swapping among multiple buffers, such as double-buffered graphics rendering.

On Fuchsia, the Sysmem service uses buffer collections as a core construct in its design.

Buffer collections are represented by `VkBufferCollectionFUCHSIA` handles:

```c
// Provided by VK_FUCHSIA_buffer_collection
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkBufferCollectionFUCHSIA)
```
12.10.1. Definitions

• FIDL - Fuchsia Interface Definition Language. The declarative language used to define FIDL interprocess communication interfaces on Fuchsia. FIDL files use the `fidl` extension. FIDL is also used to refer to the services defined by interfaces declared in the FIDL language

• Sysmem - The FIDL service that facilitates optimal buffer sharing and reuse on Fuchsia

• client - Any participant of the buffer collection e.g. the Vulkan application

• token - A `zx_handle_t` Zircon channel object that allows participation in the buffer collection

12.10.2. Platform initialization for buffer collections

To initialize a buffer collection on Fuchsia:

• Connect to the Sysmem service to initialize a Sysmem allocator

• Create an initial buffer collection token using the Sysmem allocator

• Duplicate the token for each participant beyond the initiator

• See the Sysmem Overview and `fuchsia.sysmem` FIDL documentation on fuchsia.dev for more detailed information

12.10.3. Create the buffer collection

To create an `VkBufferCollectionFUCHSIA` for Vulkan to participate in the buffer collection:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkCreateBufferCollectionFUCHSIA(
    VkDevice device, const VkBufferCollectionCreateInfoFUCHSIA* pCreateInfo,
    const VkAllocationCallbacks* pAllocator, VkBufferCollectionFUCHSIA* pCollection);
```

• `device` is the logical device that creates the `VkBufferCollectionFUCHSIA`

• `pCreateInfo` is a pointer to a `VkBufferCollectionCreateInfoFUCHSIA` structure containing parameters affecting creation of the buffer collection

• `pAllocator` is a pointer to a `VkAllocationCallbacks` structure controlling host memory allocation as described in the Memory Allocation chapter

• `pBufferCollection` is a pointer to a `VkBufferCollectionFUCHSIA` handle in which the resulting buffer collection object is returned

Valid Usage (Implicit)

• VUID-vkCreateBufferCollectionFUCHSIA-device-parameter `device` must be a valid `VkDevice` handle

• VUID-vkCreateBufferCollectionFUCHSIA-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid `VkBufferCollectionCreateInfoFUCHSIA`
structure

- VUID-vkCreateBufferCollectionFUCHSIA-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateBufferCollectionFUCHSIA-pCollection-parameter
  `pCollection` must be a valid pointer to a `VkBufferCollectionFUCHSIA` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_INVALID_EXTERNAL_HANDLE`
- `VK_ERROR_INITIALIZATION_FAILED`

### Host Access

All functions referencing a `VkBufferCollectionFUCHSIA` must be externally synchronized with the exception of `vkCreateBufferCollectionFUCHSIA`.

The `VkBufferCollectionCreateInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionCreateInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    zx_handle_t collectionToken;
} VkBufferCollectionCreateInfoFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `collectionToken` is a `zx_handle_t` containing the Sysmem client’s buffer collection token

### Valid Usage

- VUID-VkBufferCollectionCreateInfoFUCHSIA-collectionToken-06393
  `collectionToken` must be a valid `zx_handle_t` to a Zircon channel allocated from Sysmem (`fuchsia.sysmem.Allocator/AllocateSharedCollection`) with `ZX_DEFAULT_CHANNEL_RIGHTS` rights
Valid Usage (Implicit)

- VUID-VkBufferCollectionCreateInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CREATE_INFO_FUCHSIA
- VUID-VkBufferCollectionCreateInfoFUCHSIA-pNext-pNext
  pNext must be NULL

12.10.4. Set the constraints

Buffer collections can be established for VkImage allocations or VkBuffer allocations.

Set image-based buffer collection constraints

Setting the constraints on the buffer collection initiates the format negotiation and allocation of the
buffer collection. To set the constraints on a VkImage buffer collection, call:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionImageConstraintsFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkImageConstraintsInfoFUCHSIA* pImageConstraintsInfo);
```

- `device` is the logical device
- `collection` is the VkBufferCollectionFUCHSIA handle
- `pImageConstraintsInfo` is a pointer to a VkImageConstraintsInfoFUCHSIA structure

`vkSetBufferCollectionImageConstraintsFUCHSIA` may fail if `pImageConstraintsInfo`
::formatConstraintsCount is larger than the implementation-defined limit. If that occurs,
`vkSetBufferCollectionImageConstraintsFUCHSIA` will return VK_ERROR_INITIALIZATION_FAILED.

`vkSetBufferCollectionImageConstraintsFUCHSIA` may fail if the implementation does not support any
of the formats described by the `pImageConstraintsInfo` structure. If that occurs,
`vkSetBufferCollectionImageConstraintsFUCHSIA` will return VK_ERROR_FORMAT_NOT_SUPPORTED.

Valid Usage

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-06394
  `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` must not have already been called on
  collection

Valid Usage (Implicit)

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-device-parameter
**Device** must be a valid **VkDevice** handle

- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parameter
collection **must** be a valid **VkBufferCollectionFUCHSIA** handle
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-pImageConstraintsInfo-parameter
*pImageConstraintsInfo** must be a valid pointer to a valid **VkImageConstraintsInfoFUCHSIA** structure
- VUID-vkSetBufferCollectionImageConstraintsFUCHSIA-collection-parent
collection **must** have been created, allocated, or retrieved from **device**

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_INITIALIZATION_FAILED**
- **VK_ERROR_OUT_OF_HOST_MEMORY**
- **VK_ERROR_FORMAT_NOT_SUPPORTED**

The **VkImageConstraintsInfoFUCHSIA** structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void*pNext;
    uint32_t formatConstraintsCount;
    const VkImageFormatConstraintsInfoFUCHSIA*pFormatConstraints;
    VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
    VkImageConstraintsInfoFlagsFUCHSIA flags;
} VkImageConstraintsInfoFUCHSIA;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **formatConstraintsCount** is the number of elements in **pFormatConstraints**.
- **pFormatConstraints** is a pointer to an array of **VkImageFormatConstraintsInfoFUCHSIA** structures of size **formatConstraintsCount** that is used to further constrain buffer collection format selection for image-based buffer collections.
- **bufferCollectionConstraints** is a **VkBufferCollectionConstraintsInfoFUCHSIA** structure used to supply parameters for the negotiation and allocation for buffer-based buffer collections.
- **flags** is a **VkImageConstraintsInfoFlagBitsFUCHSIA** value specifying hints about the type of memory **Sysmem** should allocate for the buffer collection.
Valid Usage

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06395
  All elements of pFormatConstraints must have at least one bit set in its VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06396
  If pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_SAMPLED_BIT, then pFormatConstraints::requiredFormatFeatures must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06397
  If pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_STORAGE_BIT, then pFormatConstraints::requiredFormatFeatures must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06398
  If pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_COLOR_ATTACHMENT_BIT, then pFormatConstraints::requiredFormatFeatures must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06399
  If pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_DEPTH_STENCIL_ATTACHMENT_BIT, then pFormatConstraints::requiredFormatFeatures must contain VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-06400
  If pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT, then pFormatConstraints::requiredFormatFeatures must contain at least one of VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT.

- VUID-VkImageConstraintsInfoFUCHSIA-attachmentFragmentShadingRate-06401
  If the attachmentFragmentShadingRate feature is enabled, and pFormatConstraints::imageCreateInfo::usage contains VK_IMAGE_USAGE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR, then pFormatConstraints::requiredFormatFeatures must contain VK_FORMAT_FEATURE_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR.

Valid Usage (Implicit)

- VUID-VkImageConstraintsInfoFUCHSIA-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_CONSTRAINTS_INFO_FUCHSIA.

- VUID-VkImageConstraintsInfoFUCHSIA-pNext-pNext
  pNext must be NULL.

- VUID-VkImageConstraintsInfoFUCHSIA-pFormatConstraints-parameter
  pFormatConstraints must be a valid pointer to an array of formatConstraintsCount valid VkImageFormatConstraintsInfoFUCHSIA structures.
• VUID-VkImageConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter
  bufferCollectionConstraints must be a valid VkBufferCollectionConstraintsInfoFUCHSIA structure

• VUID-VkImageConstraintsInfoFUCHSIA-flags-parameter
  flags must be a valid combination of VkImageConstraintsInfoFlagBitsFUCHSIA values

• VUID-VkImageConstraintsInfoFUCHSIA-formatConstraintsCount-arraylength
  formatConstraintsCount must be greater than 0

// Provided by VK_FUCHSIA_buffer_collection
typedef VkFlags VkImageConstraintsInfoFlagsFUCHSIA;

VkImageConstraintsInfoFlagsFUCHSIA is a bitmask type for setting a mask of zero or more
VkImageConstraintsInfoFlagBitsFUCHSIA bits.

Bits which can be set in VkImageConstraintsInfoFlagBitsFUCHSIA::flags include:

// Provided by VK_FUCHSIA_buffer_collection
typedef enum VkImageConstraintsInfoFlagBitsFUCHSIA {
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA = 0x00000001,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA = 0x00000002,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA = 0x00000004,
    VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA = 0x00000008,
    VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA = 0x00000010,
} VkImageConstraintsInfoFlagBitsFUCHSIA;

General hints about the type of memory that should be allocated by Sysmem based on the expected usage of the images in the buffer collection include:

• VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_RARELY_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_READ_OFTEN_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_RARELY_FUCHSIA
• VK_IMAGE_CONSTRAINTS_INFO_CPU_WRITE_OFTEN_FUCHSIA

For protected memory:

• VK_IMAGE_CONSTRAINTS_INFO_PROTECTED_OPTIONAL_FUCHSIA specifies that protected memory is optional for the buffer collection.

Note that if all participants in the buffer collection (Vulkan or otherwise) specify that protected memory is optional, Sysmem will not allocate protected memory.

The VkImageFormatConstraintsInfoFUCHSIA structure is defined as:

// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkImageFormatConstraintsInfoFUCHSIA {

```
VkStructureType
const void* sType;
const VkImageCreateInfo imageCreateInfo;
const VkFormatFeatureFlags requiredFormatFeatures;
const VkImageFormatConstraintsFlagsFUCHSIA flags;
uint64_t sysmemPixelFormat;
uint32_t colorSpaceCount;
const VkSysmemColorSpaceFUCHSIA* pColorSpaces;
} VkImageFormatConstraintsInfoFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `imageCreateInfo` is the `VkImageCreateInfo` used to create a `VkImage` that is to use memory from the `VkBufferCollectionFUCHSIA`
- `requiredFormatFeatures` is a bitmask of `VkFormatFeatureFlagBits` specifying required features of the buffers in the buffer collection
- `flags` is reserved for future use
- `sysmemPixelFormat` is a `PixelFormatType` value from the `fuchsia.sysmem/image_formats.fidl` FIDL interface
- `colorSpaceCount` the element count of `pColorSpaces`
- `pColorSpaces` is a pointer to an array of `VkSysmemColorSpaceFUCHSIA` structs of size `colorSpaceCount`

### Valid Usage (Implicit)

- VUID-VkImageFormatConstraintsInfoFUCHSIA-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_IMAGE_FORMAT_CONSTRAINTS_INFO_FUCHSIA`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-pNext-pNext
  - `pNext` must be `NULL`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-imageCreateInfo-parameter
  - `imageCreateInfo` must be a valid `VkImageCreateInfo` structure
- VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter
  - `requiredFormatFeatures` must be a valid combination of `VkFormatFeatureFlagBits` values
- VUID-VkImageFormatConstraintsInfoFUCHSIA-requiredFormatFeatures-requiredbitmask
  - `requiredFormatFeatures` must not be `0`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-flags-zerobitmask
  - `flags` must be `0`
- VUID-VkImageFormatConstraintsInfoFUCHSIA-pColorSpaces-parameter
  - `pColorSpaces` must be a valid pointer to an array of `colorSpaceCount` valid `VkSysmemColorSpaceFUCHSIA` structures
- VUID-VkImageFormatConstraintsInfoFUCHSIA-colorSpaceCount-arraylength
  - `colorSpaceCount` must be greater than `0`
VkImageFormatConstraintsFlagsFUCHSIA is a bitmask type for setting a mask, but is currently reserved for future use.

The VkBufferCollectionConstraintsInfoFUCHSIA structure is defined as:

```
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionConstraintsInfoFUCHSIA {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t           minBufferCount;
    uint32_t           maxBufferCount;
    uint32_t           minBufferCountForCamping;
    uint32_t           minBufferCountForDedicatedSlack;
    uint32_t           minBufferCountForSharedSlack;
} VkBufferCollectionConstraintsInfoFUCHSIA;
```

- **sType** is the type of this structure
- **pNext** is NULL or a pointer to a structure extending this structure
- **minBufferCount** is the minimum number of buffers available in the collection
- **maxBufferCount** is the maximum number of buffers allowed in the collection
- **minBufferCountForCamping** is the per-participant minimum buffers for camping
- **minBufferCountForDedicatedSlack** is the per-participant minimum buffers for dedicated slack
- **minBufferCountForSharedSlack** is the per-participant minimum buffers for shared slack

Sysmem uses all buffer count parameters in combination to determine the number of buffers it will allocate. Sysmem defines buffer count constraints in `fuchsia.sysmem/constraints.fidl`.

Camping as referred to by `minBufferCountForCamping`, is the number of buffers that should be available for the participant that are not for transient use. This number of buffers is required for the participant to logically operate.

Slack as referred to by `minBufferCountForDedicatedSlack` and `minBufferCountForSharedSlack`, refers to the number of buffers desired by participants for optimal performance. `minBufferCountForDedicatedSlack` refers to the current participant. `minBufferCountForSharedSlack` refers to buffer slack for all participants in the collection.

### Valid Usage (Implicit)

- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-sType-sType
  - **sType** must be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_CONSTRAINTS_INFO_FUCHSIA`
- VUID-VkBufferCollectionConstraintsInfoFUCHSIA-pNext-pNext
The `VkSysmemColorSpaceFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkSysmemColorSpaceFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    uint32_t colorSpace;
} VkSysmemColorSpaceFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `colorSpace` value of the Sysmem `ColorSpaceType`

**Valid Usage**

- VUID-VkSysmemColorSpaceFUCHSIA-colorSpace-06402
  - `colorSpace` must be a `ColorSpaceType` as defined in `fuchsia.sysmem/image Formats.fidl`

**Valid Usage (Implicit)**

- VUID-VkSysmemColorSpaceFUCHSIA-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_SYSMEM_COLOR_SPACE_FUCHSIA`
- VUID-VkSysmemColorSpaceFUCHSIA-pNext-pNext
  - `pNext` must be `NULL`

### Set buffer-based buffer collection constraints

To set the constraints on a `VkBuffer` buffer collection, call:

```c
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkSetBufferCollectionBufferConstraintsFUCHSIA(
    VkDevice device,
    VkBufferCollectionFUCHSIA collection,
    const VkBufferConstraintsInfoFUCHSIA* pBufferConstraintsInfo);
```

- `device` is the logical device
- `collection` is the `VkBufferCollectionFUCHSIA` handle
- `pBufferConstraintsInfo` is a pointer to a `VkBufferConstraintsInfoFUCHSIA` structure

`vkSetBufferCollectionBufferConstraintsFUCHSIA` may fail if the implementation does not support the
constraints specified in the `bufferCollectionConstraints` structure. If that occurs, `vkSetBufferCollectionBufferConstraintsFUCHSIA` will return `VK_ERROR_FORMAT_NOT_SUPPORTED`.

### Valid Usage

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-06403
  - `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA` must not have already been called on `collection`

### Valid Usage (Implicit)

- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parameter
  - `collection` must be a valid `VkBufferCollectionFUCHSIA` handle
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-pBufferConstraintsInfo-parameter
  - `pBufferConstraintsInfo` must be a valid pointer to a valid `VkBufferConstraintsInfoFUCHSIA` structure
- VUID-vkSetBufferCollectionBufferConstraintsFUCHSIA-collection-parent
  - `collection` must have been created, allocated, or retrieved from `device`

### Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_INITIALIZATION_FAILED`
- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_FORMAT_NOT_SUPPORTED`

The `VkBufferConstraintsInfoFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferConstraintsInfoFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCreateInfo createInfo;
    VkFormatFeatureFlags requiredFormatFeatures;
    VkBufferCollectionConstraintsInfoFUCHSIA bufferCollectionConstraints;
} VkBufferConstraintsInfoFUCHSIA;
```
• **sType** is the type of this structure

• **pNext** is NULL or a pointer to a structure extending this structure

• **pBufferCreateInfo** a pointer to a `VkBufferCreateInfo` struct describing the buffer attributes for the buffer collection

• **requiredFormatFeatures** bitmask of `VkFormatFeatureFlagBits` required features of the buffers in the buffer collection

• **bufferCollectionConstraints** is used to supply parameters for the negotiation and allocation of the buffer collection

---

**Valid Usage**

- **VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-06404**
  The `requiredFormatFeatures` bitmask of `VkFormatFeatureFlagBits` must be chosen from among the buffer compatible format features listed in buffer compatible format features

---

**Valid Usage (Implicit)**

- **VUID-VkBufferConstraintsInfoFUCHSIA-sType-sType**
  sType must be `VK_STRUCTURE_TYPE_BUFFER_CONSTRAINTS_INFO_FUCHSIA`

- **VUID-VkBufferConstraintsInfoFUCHSIA-pNext-pNext**
  pNext must be NULL

- **VUID-VkBufferConstraintsInfoFUCHSIA-createInfo-parameter**
  createInfo must be a valid `VkBufferCreateInfo` structure

- **VUID-VkBufferConstraintsInfoFUCHSIA-requiredFormatFeatures-parameter**
  requiredFormatFeatures must be a valid combination of `VkFormatFeatureFlagBits` values

- **VUID-VkBufferConstraintsInfoFUCHSIA-bufferCollectionConstraints-parameter**
  bufferCollectionConstraints must be a valid `VkBufferCollectionConstraintsInfoFUCHSIA` structure

---

**12.10.5. Retrieve buffer collection properties**

After constraints have been set on the buffer collection by calling `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA`, call `vkGetBufferCollectionPropertiesFUCHSIA` to retrieve the negotiated and finalized properties of the buffer collection.

The call to `vkGetBufferCollectionPropertiesFUCHSIA` is synchronous. It waits for the Sysmem format negotiation and buffer collection allocation to complete before returning.

```cpp
// Provided by VK_FUCHSIA_buffer_collection
VkResult vkGetBufferCollectionPropertiesFUCHSIA(
    VkDevice device, 
    VkBufferCollectionFUCHSIA collection,
);```
• `device` is the logical device handle
• `collection` is the `VkBufferCollectionFUCHSIA` handle
• `pProperties` is a pointer to the retrieved `VkBufferCollectionPropertiesFUCHSIA` struct

For image-based buffer collections, upon calling `vkGetBufferCollectionPropertiesFUCHSIA`, Sysmem will choose an element of the `VkImageConstraintsInfoFUCHSIA::pImageCreateInfos` established by the preceding call to `vkSetBufferCollectionImageConstraintsFUCHSIA`. The index of the element chosen is stored in and can be retrieved from `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex`.

For buffer-based buffer collections, a single `VkBufferCreateInfo` is specified as `VkBufferConstraintsInfoFUCHSIA::createInfo`. `VkBufferCollectionPropertiesFUCHSIA::createInfoIndex` will therefore always be zero.

`vkGetBufferCollectionPropertiesFUCHSIA` may fail if Sysmem is unable to resolve the constraints of all of the participants in the buffer collection. If that occurs, `vkGetBufferCollectionPropertiesFUCHSIA` will return `VK_ERROR_INITIALIZATION_FAILED`.

**Valid Usage**

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-None-06405
  Prior to calling `vkGetBufferCollectionPropertiesFUCHSIA`, the constraints on the buffer collection must have been set by either `vkSetBufferCollectionImageConstraintsFUCHSIA` or `vkSetBufferCollectionBufferConstraintsFUCHSIA`.

**Valid Usage (Implicit)**

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parameter
collection must be a valid `VkBufferCollectionFUCHSIA` handle

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-pProperties-parameter
  `pProperties` must be a valid pointer to a `VkBufferCollectionPropertiesFUCHSIA` structure

- VUID-vkGetBufferCollectionPropertiesFUCHSIA-collection-parent
collection must have been created, allocated, or retrieved from `device`

**Return Codes**

**Success**

- `VK_SUCCESS`
The `VkBufferCollectionPropertiesFUCHSIA` structure is defined as:

```c
// Provided by VK_FUCHSIA_buffer_collection
typedef struct VkBufferCollectionPropertiesFUCHSIA {
    VkStructureType sType;
    void* pNext;
    uint32_t memoryTypeBits;
    uint32_t bufferCount;
    uint32_t createInfoIndex;
    uint64_t sysmemPixelFormat;
    VkFormatFeatureFlags formatFeatures;
    VkSysmemColorSpaceFUCHSIA sysmemColorSpaceIndex;
    VkComponentMapping samplerYcbcrConversionComponents;
    VkSamplerYcbcrModelConversion suggestedYcbcrModel;
    VkSamplerYcbcrRange suggestedYcbcrRange;
    VkChromaLocation suggestedXChromaOffset;
    VkChromaLocation suggestedYChromaOffset;
} VkBufferCollectionPropertiesFUCHSIA;
```

- `sType` is the type of this structure
- `pNext` is `NULL` or a pointer to a structure extending this structure
- `memoryTypeBits` is a bitmask containing one bit set for every memory type which the buffer collection can be imported as buffer collection
- `bufferCount` is the number of buffers in the collection
- `createInfoIndex` as described in Sysmem chosen create infos
- `sysmemPixelFormat` is the Sysmem PixelFormatType as defined in fuchsia.sysmem/image_formats.fidl
- `formatFeatures` is a bitmask of `VkFormatFeatureFlagBits` shared by the buffer collection
- `sysmemColorSpaceIndex` is a `VkSysmemColorSpaceFUCHSIA` struct specifying the color space
- `samplerYcbcrConversionComponents` is a `VkComponentMapping` struct specifying the component mapping
- `suggestedYcbcrModel` is a `VkSamplerYcbcrModelConversion` value specifying the suggested Y’C₈C₉ model
- `suggestedYcbcrRange` is a `VkSamplerYcbcrRange` value specifying the suggested Y’C₈C₉ range
- `suggestedXChromaOffset` is a `VkChromaLocation` value specifying the suggested X chroma offset
- `suggestedYChromaOffset` is a `VkChromaLocation` value specifying the suggested Y chroma offset

`sysmemColorSpace` is only set for image-based buffer collections where the constraints were specified.
using `VkImageConstraintsInfoFUCHSIA` in a call to `vkSetBufferCollectionImageConstraintsFUCHSIA`.

For image-based buffer collections, `createInfoIndex` will identify both the `VkImageConstraintsInfoFUCHSIA::pImageCreateInfos` element and the `VkImageConstraintsInfoFUCHSIA::pFormatConstraints` element chosen by Sysmem when `vkSetBufferCollectionImageConstraintsFUCHSIA` was called. The value of `sysmemColorSpaceIndex` will be an index to one of the color spaces provided in the `VkImageFormatConstraintsInfoFUCHSIA::pColorSpaces` array.

The implementation must have `formatFeatures` with all bits set that were set in `VkImageFormatConstraintsInfoFUCHSIA::requiredFormatFeatures`, by the call to `vkSetBufferCollectionImageConstraintsFUCHSIA`, at `createInfoIndex` (other bits could be set as well).

### Valid Usage (Implicit)

- **VUID-VkBufferCollectionPropertiesFUCHSIA-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_COLLECTION_PROPERTIES_FUCHSIA`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-pNext-pNext**
  
  `pNext` must be `NULL`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-formatFeatures-parameter**
  
  `formatFeatures` must be a valid combination of `VkFormatFeatureFlagBits` values

- **VUID-VkBufferCollectionPropertiesFUCHSIA-formatFeatures-requiredbitmask**
  
  `formatFeatures` must not be `0`

- **VUID-VkBufferCollectionPropertiesFUCHSIA-sysmemColorSpaceIndex-parameter**
  
  `sysmemColorSpaceIndex` must be a valid `VkSysmemColorSpaceFUCHSIA` structure

- **VUID-VkBufferCollectionPropertiesFUCHSIA-samplerYcbcrConversionComponents-parameter**
  
  `samplerYcbcrConversionComponents` must be a valid `VkComponentMapping` structure

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYcbcrModel-parameter**
  
  `suggestedYcbcrModel` must be a valid `VkSamplerYcbcrModelConversion` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYcbcrRange-parameter**
  
  `suggestedYcbcrRange` must be a valid `VkSamplerYcbcrRange` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedXChromaOffset-parameter**
  
  `suggestedXChromaOffset` must be a valid `VkChromaLocation` value

- **VUID-VkBufferCollectionPropertiesFUCHSIA-suggestedYChromaOffset-parameter**
  
  `suggestedYChromaOffset` must be a valid `VkChromaLocation` value

### 12.10.6. Memory allocation

To import memory from a buffer collection into a `VkImage` or a `VkBuffer`, chain a `VkImportMemoryBufferCollectionFUCHSIA` structure to the `pNext` member of the `VkMemoryAllocateInfo` in the call to `vkAllocateMemory`.

The `VkImportMemoryBufferCollectionFUCHSIA` structure is defined as:
typedef struct VkImportMemoryBufferCollectionFUCHSIA {
    VkStructureType sType;
    const void* pNext;
    VkBufferCollectionFUCHSIA collection;
    uint32_t index;
} VkImportMemoryBufferCollectionFUCHSIA;

- **sType** is the type of this structure
- **pNext** is NULL or a pointer to a structure extending this structure
- **collection** is the VkBufferCollectionFUCHSIA handle
- **index** the index of the buffer to import from collection

### Valid Usage

- VUID-VkImportMemoryBufferCollectionFUCHSIA-index-06406
  
  \[\text{index must be less than the value retrieved as } \text{VkBufferCollectionPropertiesFUCHSIA:bufferCount}\]

### Valid Usage (Implicit)

- VUID-VkImportMemoryBufferCollectionFUCHSIA-sType-sType
  
  \[\text{sType must be } \text{VK_STRUCTURE_TYPE_IMPORT_MEMORY_BUFFER_COLLECTION_FUCHSIA}\]

- VUID-VkImportMemoryBufferCollectionFUCHSIA-collection-parameter
  
  \[\text{collection must be a valid } \text{VkBufferCollectionFUCHSIA handle}\]

To release a VkBufferCollectionFUCHSIA:

```c
void vkDestroyBufferCollectionFUCHSIA(
    VkDevice device,          
    VkBufferCollectionFUCHSIA collection,  
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that creates the VkBufferCollectionFUCHSIA
- **collection** is the VkBufferCollectionFUCHSIA handle
- **pAllocator** is a pointer to a VkAllocationCallbacks structure controlling host memory allocation as described in the Memory Allocation chapter

### Valid Usage

- VUID-vkDestroyBufferCollectionFUCHSIA-collection-06407
**VkImage** and **VkBuffer** objects that referenced collection upon creation by inclusion of a **VkBufferCollectionImageCreateInfoFUCHSIA** or **VkBufferCollectionBufferCreateInfoFUCHSIA** chained to their **VkImageCreateInfo** or **VkBufferCreateInfo** structures respectively, **may** outlive collection.

### Valid Usage (Implicit)

- **VUID-vkDestroyBufferCollectionFUCHSIA-device-parameter**
  
  *device* must be a valid **VkDevice** handle

- **VUID-vkDestroyBufferCollectionFUCHSIA-collection-parameter**
  
  *collection* must be a valid **VkBufferCollectionFUCHSIA** handle

- **VUID-vkDestroyBufferCollectionFUCHSIA-pAllocator-parameter**
  
  If *pAllocator* is not **NULL**, *pAllocator* must be a valid pointer to a valid **VkAllocationCallbacks** structure

- **VUID-vkDestroyBufferCollectionFUCHSIA-collection-parent**
  
  *collection* must have been created, allocated, or retrieved from **device**
Chapter 13. Samplers

VkSampler objects represent the state of an image sampler which is used by the implementation to read image data and apply filtering and other transformations for the shader.

Samplers are represented by VkSampler handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSampler)
```

To create a sampler object, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateSampler(
    VkDevice device,
    const VkSamplerCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSampler* pSampler);
```

- **device** is the logical device that creates the sampler.
- **pCreateInfo** is a pointer to a VkSamplerCreateInfo structure specifying the state of the sampler object.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.
- **pSampler** is a pointer to a VkSampler handle in which the resulting sampler object is returned.

**Valid Usage**

- VUID-vkCreateSampler-maxSamplerAllocationCount-04110
  There **must** be less than VkPhysicalDeviceLimits::maxSamplerAllocationCount VkSampler objects currently created on the device

**Valid Usage (Implicit)**

- VUID-vkCreateSampler-device-parameter
device **must** be a valid VkDevice handle
- VUID-vkCreateSampler-pCreateInfo-parameter
  pCreateInfo **must** be a valid pointer to a valid VkSamplerCreateInfo structure
- VUID-vkCreateSampler-pAllocator-parameter
  If pAllocator is not NULL, pAllocator **must** be a valid pointer to a valid VkAllocationCallbacks structure
- VUID-vkCreateSampler-pSampler-parameter
  pSampler **must** be a valid pointer to a VkSampler handle
Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkSamplerCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkSamplerCreateInfo {
    VkStructureType     sType;
    const void*         pNext;
    VkSamplerCreateFlags flags;
    VkFilter            magFilter;
    VkFilter            minFilter;
    VkSamplerMipmapMode mipmapMode;
    VkSamplerAddressMode addressModeU;
    VkSamplerAddressMode addressModeV;
    VkSamplerAddressMode addressModeW;
    float               mipLodBias;
    VkBool32            anisotropyEnable;
    float               maxAnisotropy;
    VkBool32            compareEnable;
    VkCompareOp         compareOp;
    float               minLod;
    float               maxLod;
    VkBorderColor      borderColor;
    VkBool32            unnormalizedCoordinates;
} VkSamplerCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkSamplerCreateFlagBits` describing additional parameters of the sampler.
- `magFilter` is a `VkFilter` value specifying the magnification filter to apply to lookups.
- `minFilter` is a `VkFilter` value specifying the minification filter to apply to lookups.
- `mipmapMode` is a `VkSamplerMipmapMode` value specifying the mipmap filter to apply to lookups.
- `addressModeU` is a `VkSamplerAddressMode` value specifying the addressing mode for U coordinates outside [0,1).
- `addressModeV` is a `VkSamplerAddressMode` value specifying the addressing mode for V coordinates outside [0,1).
- `addressModeW` is a `VkSamplerAddressMode` value specifying the addressing mode for W
coordinates outside \([0,1)\).

- **mipLodBias** is the bias to be added to mipmap LOD (level-of-detail) calculation and bias provided by image sampling functions in SPIR-V, as described in the Level-of-Detail Operation section.

- **anisotropyEnable** is **VK_TRUE** to enable anisotropic filtering, as described in the Texel Anisotropic Filtering section, or **VK_FALSE** otherwise.

- **maxAnisotropy** is the anisotropy value clamp used by the sampler when **anisotropyEnable** is **VK_TRUE**. If **anisotropyEnable** is **VK_FALSE**, **maxAnisotropy** is ignored.

- **compareEnable** is **VK_TRUE** to enable comparison against a reference value during lookups, or **VK_FALSE** otherwise.
  
  - Note: Some implementations will default to shader state if this member does not match.

- **compareOp** is a **VkCompareOp** value specifying the comparison operator to apply to fetched data before filtering as described in the Depth Compare Operation section.

- **minLod** is used to clamp the minimum of the computed LOD value.

- **maxLod** is used to clamp the maximum of the computed LOD value. To avoid clamping the maximum value, set **maxLod** to the constant **VK_LOD_CLAMP_NONE**.

- **borderColor** is a **VkBorderColor** value specifying the predefined border color to use.

- **unnormalizedCoordinates** controls whether to use unnormalized or normalized texel coordinates to address texels of the image. When set to **VK_TRUE**, the range of the image coordinates used to lookup the texel is in the range of zero to the image size in each dimension. When set to **VK_FALSE** the range of image coordinates is zero to one.

When **unnormalizedCoordinates** is **VK_TRUE**, images the sampler is used with in the shader have the following requirements:

- The **viewType** must be either **VK_IMAGE_VIEW_TYPE_1D** or **VK_IMAGE_VIEW_TYPE_2D**.
- The image view must have a single layer and a single mip level.

When **unnormalizedCoordinates** is **VK_TRUE**, image built-in functions in the shader that use the sampler have the following requirements:

- The functions must not use projection.
- The functions must not use offsets.

---

**Mapping of OpenGL to Vulkan filter modes**

**magFilter** values of **VK_FILTER_NEAREST** and **VK_FILTER_LINEAR** directly correspond to **GL_NEAREST** and **GL_LINEAR** magnification filters. **minFilter** and **mipmapMode** combine to correspond to the similarly named OpenGL minification filter of **GL_minFilter_MIPMAP_mipmapMode** (e.g. **minFilter** of **VK_FILTER_LINEAR** and **mipmapMode** of **VK_SAMPLER_MIPMAP_MODE_NEAREST** correspond to **GL_LINEAR_MIPMAP_NEAREST**). There are no Vulkan filter modes that directly correspond to OpenGL minification filters of **GL_LINEAR** or **GL_NEAREST**, but they can be emulated using **VK_SAMPLER_MIPMAP_MODE_NEAREST**, \(\text{minLod} = 0\), and \(\text{maxLod} = 0.25\), and using **minFilter** = **VK_FILTER_LINEAR** or **minFilter** = **VK_FILTER_NEAREST**, respectively.
Note that using a `maxLod` of zero would cause magnification to always be performed, and the `magFilter` to always be used. This is valid, just not an exact match for OpenGL behavior. Clamping the maximum LOD to 0.25 allows the λ value to be non-zero and minification to be performed, while still always rounding down to the base level. If the `minFilter` and `magFilter` are equal, then using a `maxLod` of zero also works.

The maximum number of sampler objects which can be simultaneously created on a device is implementation-dependent and specified by the `maxSamplerAllocationCount` member of the `VkPhysicalDeviceLimits` structure.

Note

For historical reasons, if `maxSamplerAllocationCount` is exceeded, some implementations may return `VK_ERROR_TOO_MANY_OBJECTS`. Exceeding this limit will result in undefined behavior, and an application should not rely on the use of the returned error code in order to identify when the limit is reached.

Since `VkSampler` is a non-dispatchable handle type, implementations may return the same handle for sampler state vectors that are identical. In such cases, all such objects would only count once against the `maxSamplerAllocationCount` limit.

**Valid Usage**

- **VUID-VkSamplerCreateInfo-mipLodBias-01069**
  The absolute value of `mipLodBias` must be less than or equal to `VkPhysicalDeviceLimits::maxSamplerLodBias`

- **VUID-VkSamplerCreateInfo-samplerMipLodBias-04467**
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::samplerMipLodBias` is `VK_FALSE`, `mipLodBias` must be zero

- **VUID-VkSamplerCreateInfo-maxLod-01973**
  `maxLod` must be greater than or equal to `minLod`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01070**
  If the `samplerAnisotropy` feature is not enabled, `anisotropyEnable` must be `VK_FALSE`

- **VUID-VkSamplerCreateInfo-anisotropyEnable-01071**
  If `anisotropyEnable` is `VK_TRUE`, `maxAnisotropy` must be between 1.0 and `VkPhysicalDeviceLimits::maxSamplerAnisotropy`, inclusive

- **VUID-VkSamplerCreateInfo-minFilter-01645**
  If `sampler Y'CbCr conversion` is enabled and the potential format features of the sampler `Y'CbCr` conversion do not support `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_SEPARATE_RECONSTRUCTION_FILTER_BIT`, `minFilter` and `magFilter` must be equal to the sampler `Y'CbCr conversion's chromaFilter`

- **VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01072**
  If `unnormalizedCoordinates` is `VK_TRUE`, `minFilter` and `magFilter` must be equal
• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01073
  If unnormalizedCoordinates is VK_TRUE, mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01074
  If unnormalizedCoordinates is VK_TRUE, minLod and maxLod must be zero

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01075
  If unnormalizedCoordinates is VK_TRUE, addressModeU and addressModeV must each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01076
  If unnormalizedCoordinates is VK_TRUE, anisotropyEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-unnormalizedCoordinates-01077
  If unnormalizedCoordinates is VK_TRUE, compareEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-addressModeU-01078
  If any of addressModeU, addressModeV or addressModeW are VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER, borderColor must be a valid VkBorderColor value

• VUID-VkSamplerCreateInfo-addressModeU-01646
  If sampler Y’CbCr conversion is enabled, addressModeU, addressModeV, and addressModeW must be VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, anisotropyEnable must be VK_FALSE, and unnormalizedCoordinates must be VK_FALSE

• VUID-VkSamplerCreateInfo-None-01647
  If sampler Y’CbCr conversion is enabled and the pNext chain includes a VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode must be set to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

• VUID-VkSamplerCreateInfo-pNext-06726
  If samplerFilterMinmax is not enabled and the pNext chain includes a VkSamplerReductionModeCreateInfo structure, then the sampler reduction mode must be set to VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

• VUID-VkSamplerCreateInfo-addressModeU-01079
  If samplerMirrorClampToEdge is not enabled, and if the VK_KHR_sampler_mirror_clamp_to_edge extension is not enabled, addressModeU, addressModeV and addressModeW must not be VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE

• VUID-VkSamplerCreateInfo-compareEnable-01080
  If compareEnable is VK_TRUE, compareOp must be a valid VkCompareOp value

• VUID-VkSamplerCreateInfo-compareEnable-01423
  If compareEnable is VK_TRUE, the reductionMode member of VkSamplerReductionModeCreateInfo must be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE

• VUID-VkSamplerCreateInfo-flags-02574
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minFilter and magFilter must be equal
• VUID-VkSamplerCreateInfo-flags-02575
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then mipmapMode must be VK_SAMPLER_MIPMAP_MODE_NEAREST

• VUID-VkSamplerCreateInfo-flags-02576
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then minLod and maxLod must be zero

• VUID-VkSamplerCreateInfo-flags-02577
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then addressModeU and addressModeV must each be either VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER

• VUID-VkSamplerCreateInfo-flags-02578
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then anisotropyEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-flags-02579
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then compareEnable must be VK_FALSE

• VUID-VkSamplerCreateInfo-flags-02580
  If flags includes VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT, then unnormalizedCoordinates must be VK_FALSE

• VUID-VkSamplerCreateInfo-nonSeamlessCubeMap-06788
  If the nonSeamlessCubeMap feature is not enabled, flags must not include VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT

• VUID-VkSamplerCreateInfo-borderColor-04011
  If borderColor is one of VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, then a VkSamplerCustomBorderColorCreateInfoEXT must be included in the pNext chain

• VUID-VkSamplerCreateInfo-customBorderColors-04085
  If the customBorderColors feature is not enabled, borderColor must not be VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT

• VUID-VkSamplerCreateInfo-borderColor-04442
  If borderColor is one of VK_BORDER_COLOR_FLOAT_CUSTOM_EXT or VK_BORDER_COLOR_INT_CUSTOM_EXT, and VkSamplerCustomBorderColorCreateInfoEXT::format is not VK_FORMAT_UNDEFINED, VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor must be within the range of values representable in format

• VUID-VkSamplerCreateInfo-None-04012
  The maximum number of samplers with custom border colors which can be simultaneously created on a device is implementation-dependent and specified by the maxCustomBorderColorSamplers member of the VkPhysicalDeviceCustomBorderColorPropertiesEXT structure

• VUID-VkSamplerCreateInfo-flags-06964
  If flags includes VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM, then minFilter and magFilter must be VK_FILTER_NEAREST.

• VUID-VkSamplerCreateInfo-flags-06965
If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `mipmapMode` must be `VK_SAMPLER_MIPMAP_MODE_NEAREST`

- VUID-VkSamplerCreateInfo-flags-06966
  If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `minLod` and `maxLod` must be zero.

- VUID-VkSamplerCreateInfo-flags-06967
  If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `addressModeU` and `addressModeV` must each be either `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE` or `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`.

- VUID-VkSamplerCreateInfo-flags-06968
  If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, and if `addressModeU` or `addressModeV` is `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER`, then `borderColor` must be `VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK`.

- VUID-VkSamplerCreateInfo-flags-06969
  If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `anisotropyEnable` must be `VK_FALSE`.

- VUID-VkSamplerCreateInfo-flags-06970
  If flags includes `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`, then `compareEnable` must be `VK_FALSE`.

### Valid Usage (Implicit)

- VUID-VkSamplerCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_SAMPLER_CREATE_INFO`.

- VUID-VkSamplerCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkSamplerBorderColorComponentMappingCreateInfoEXT`, `VkSamplerCustomBorderColorCreateInfoEXT`, `VkSamplerReductionModeCreateInfo`, or `VkSamplerYcbcrConversionInfo`.

- VUID-VkSamplerCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkSamplerCreateInfo-flags-parameter
  `flags` must be a valid combination of `VkSamplerCreateFlagBits` values.

- VUID-VkSamplerCreateInfo-magFilter-parameter
  `magFilter` must be a valid `VkFilter` value.

- VUID-VkSamplerCreateInfo-minFilter-parameter
  `minFilter` must be a valid `VkFilter` value.

- VUID-VkSamplerCreateInfo-mipmapMode-parameter
  `.mipmapMode` must be a valid `VkSamplerMipmapMode` value.

- VUID-VkSamplerCreateInfo-addressModeU-parameter
  `addressModeU` must be a valid `VkSamplerAddressMode` value.
**VUID-VkSamplerCreateInfo-addressModeV-parameter**

`addressModeV` must be a valid `VkSamplerAddressMode` value.

**VUID-VkSamplerCreateInfo-addressModeW-parameter**

`addressModeW` must be a valid `VkSamplerAddressMode` value.

**VK_LOD_CLAMP_NONE** is a special constant value used for `VkSamplerCreateInfo::maxLod` to indicate that maximum LOD clamping should not be performed.

```c
#define VK_LOD_CLAMP_NONE 1000.0F
```

Bits which can be set in `VkSamplerCreateInfo::flags`, specifying additional parameters of a sampler, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerCreateFlagBits {
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT = 0x00000001,
    // Provided by VK_EXT_fragment_density_map
    VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT = 0x00000002,
    // Provided by VK_EXT_non_seamless_cube_map
    VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT = 0x00000004,
    // Provided by VK_QCOM_image_processing
    VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM = 0x00000010,
} VkSamplerCreateFlagBits;
```

- **VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT** specifies that the sampler will read from an image created with `flags` containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
- **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** specifies that the implementation may use approximations when reconstructing a full color value for texture access from a subsampled image.
- **VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT** specifies that cube map edge handling is not performed.
- **VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM** specifies that the sampler will read from images using only `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM`.

**Note**

The approximations used when **VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT** is specified are implementation defined. Some implementations may interpolate between fragment density levels in a subsampled image. In that case, this bit may be used to decide whether the interpolation factors are calculated per fragment or at a coarser granularity.
typedef VkFlags VkSamplerCreateFlags;

VkSamplerCreateFlags is a bitmask type for setting a mask of zero or more VkSamplerCreateFlagBits.

The VkSamplerReductionModeCreateInfo structure is defined as:

// Provided by VK_VERSION_1_2
typedef struct VkSamplerReductionModeCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerReductionMode reductionMode;
} VkSamplerReductionModeCreateInfo;

or the equivalent

// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionModeCreateInfo VkSamplerReductionModeCreateInfoEXT;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- reductionMode is a VkSamplerReductionMode value controlling how texture filtering combines texel values.

If the pNext chain of VkSamplerCreateInfo includes a VkSamplerReductionModeCreateInfo structure, then that structure includes a mode controlling how texture filtering combines texel values.

If this structure is not present, reductionMode is considered to be VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE.

Valid Usage (Implicit)

- VUID-VkSamplerReductionModeCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_REDUCTION_MODE_CREATE_INFO
- VUID-VkSamplerReductionModeCreateInfo-reductionMode-parameter
  reductionMode must be a valid VkSamplerReductionMode value

Reduction modes are specified by VkSamplerReductionMode, which takes values:

// Provided by VK_VERSION_1_2
typedef enum VkSamplerReductionMode {
    VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE = 0,
    VK_SAMPLER_REDUCTION_MODE_MIN = 1,
    VK_SAMPLER_REDUCTION_MODE_MAX = 2,
} VkSamplerReductionMode,
// Provided by VK_EXT_sampler_filter_minmax
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE_EXT =
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE,
// Provided by VK_EXT_sampler_filter_minmax
VK_SAMPLER_REDUCTION_MODE_MIN_EXT = VK_SAMPLER_REDUCTION_MODE_MIN,
// Provided by VK_EXT_sampler_filter_minmax
VK_SAMPLER_REDUCTION_MODE_MAX_EXT = VK_SAMPLER_REDUCTION_MODE_MAX,
} VkSamplerReductionMode;

or the equivalent

// Provided by VK_EXT_sampler_filter_minmax
typedef VkSamplerReductionMode VkSamplerReductionModeEXT;

- **VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE** specifies that texel values are combined by computing a weighted average of values in the footprint, using weights as specified in the image operations chapter.
- **VK_SAMPLER_REDUCTION_MODE_MIN** specifies that texel values are combined by taking the component-wise minimum of values in the footprint with non-zero weights.
- **VK_SAMPLER_REDUCTION_MODE_MAX** specifies that texel values are combined by taking the component-wise maximum of values in the footprint with non-zero weights.

Possible values of the `VkSamplerCreateInfo::magFilter` and `minFilter` parameters, specifying filters used for texture lookups, are:

// Provided by VK_VERSION_1_0
typedef enum VkFilter {
    VK_FILTER_NEAREST = 0,
    VK_FILTER_LINEAR = 1,
    // Provided by VK_EXT_filter_cubic
    VK_FILTER_CUBIC_EXT = 1000015000,
    // Provided by VK_IMG_filter_cubic
    VK_FILTER_CUBIC_IMG = VK_FILTER_CUBIC_EXT,
} VkFilter;

- **VK_FILTER_NEAREST** specifies nearest filtering.
- **VK_FILTER_LINEAR** specifies linear filtering.
- **VK_FILTER_CUBIC_EXT** specifies cubic filtering.

These filters are described in detail in Texel Filtering.

Possible values of the `VkSamplerCreateInfo::mipmapMode`, specifying the mipmap mode used for texture lookups, are:

// Provided by VK_VERSION_1_0
typedef enum VkSamplerMipmapMode {
    VK_SAMPLER_MIPMAP_MODE_NEAREST = 0,
    VK_SAMPLER_MIPMAP_MODE_LINEAR = 1,
} VkSamplerMipmapMode;

- VK_SAMPLER_MIPMAP_MODE_NEAREST specifies nearest filtering.
- VK_SAMPLER_MIPMAP_MODE_LINEAR specifies linear filtering.

These modes are described in detail in Texel Filtering.

Possible values of the VkSamplerCreateInfo::addressMode* parameters, specifying the behavior of sampling with coordinates outside the range \([0,1]\) for the respective \(u\), \(v\), or \(w\) coordinate as defined in the Wrapping Operation section, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkSamplerAddressMode {
    VK_SAMPLER_ADDRESS_MODE_REPEAT = 0,
    VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT = 1,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE = 2,
    VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER = 3,
    // Provided by VK_VERSION_1_2, VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE = 4,
    // Provided by VK_KHR_sampler_mirror_clamp_to_edge
    VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE_KHR = VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE,
} VkSamplerAddressMode;
```

- VK_SAMPLER_ADDRESS_MODE_REPEAT specifies that the repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_MIRRORED_REPEAT specifies that the mirrored repeat wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE specifies that the clamp to edge wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER specifies that the clamp to border wrap mode will be used.
- VK_SAMPLER_ADDRESS_MODE_MIRROR_CLAMP_TO_EDGE specifies that the mirror clamp to edge wrap mode will be used. This is only valid if samplerMirrorClampToEdge is enabled, or if the VK_KHR_sampler_mirror_clamp_to_edge extension is enabled.

Comparison operators compare a reference and a test value, and return a true (“passed”) or false (“failed”) value depending on the comparison operator chosen. The supported operators are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCompareOp {
    VK_COMPARE_OP_NEVER = 0,
    VK_COMPARE_OP_LESS = 1,
    VK_COMPARE_OP_EQUAL = 2,
    VK_COMPARE_OP_LESS_OR_EQUAL = 3,
```
VK_COMPARE_OP_GREATER = 4,
VK_COMPARE_OP_NOT_EQUAL = 5,
VK_COMPARE_OP_GREATER_OR_EQUAL = 6,
VK_COMPARE_OP_ALWAYS = 7,
} VkCompareOp;

- **VK_COMPARE_OP_NEVER** specifies that the comparison always evaluates false.
- **VK_COMPARE_OP_LESS** specifies that the comparison evaluates reference < test.
- **VK_COMPARE_OP_EQUAL** specifies that the comparison evaluates reference = test.
- **VK_COMPARE_OP_LESS_OR_EQUAL** specifies that the comparison evaluates reference ≤ test.
- **VK_COMPARE_OP_GREATER** specifies that the comparison evaluates reference > test.
- **VK_COMPARE_OP_NOT_EQUAL** specifies that the comparison evaluates reference ≠ test.
- **VK_COMPARE_OP_GREATER_OR_EQUAL** specifies that the comparison evaluates reference ≥ test.
- **VK_COMPARE_OP_ALWAYS** specifies that the comparison always evaluates true.

Comparison operators are used for:

- The **Depth Compare Operation** operator for a sampler, specified by VkSamplerCreateInfo::compareOp.

- The stencil comparison operator for the **stencil test**, specified by vkCmdSetStencilOp::compareOp or VkStencilOpState::compareOp.

- The **Depth Comparison** operator for the **depth test**, specified by vkCmdSetDepthCompareOp::depthCompareOp or VkPipelineDepthStencilStateCreateInfo::depthCompareOp.

Each such use describes how the reference and test values for that comparison are determined.

Possible values of VkSamplerCreateInfo::borderColor, specifying the border color used for texture lookups, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkBorderColor {
    VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK = 0,
    VK_BORDER_COLOR_INT_TRANSPARENT_BLACK = 1,
    VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK = 2,
    VK_BORDER_COLOR_INT_OPAQUE_BLACK = 3,
    VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE = 4,
    VK_BORDER_COLOR_INT_OPAQUE_WHITE = 5,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_FLOAT_CUSTOM_EXT = 1000287003,
    // Provided by VK_EXT_custom_border_color
    VK_BORDER_COLOR_INT_CUSTOM_EXT = 1000287004,
} VkBorderColor;
```

- **VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK** specifies a transparent, floating-point format, black color.
• **VK_BORDER_COLOR_INT_TRANSPARENT_BLACK** specifies a transparent, integer format, black color.
• **VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK** specifies an opaque, floating-point format, black color.
• **VK_BORDER_COLOR_INT_OPAQUE_BLACK** specifies an opaque, integer format, black color.
• **VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE** specifies an opaque, floating-point format, white color.
• **VK_BORDER_COLOR_INT_OPAQUE_WHITE** specifies an opaque, integer format, white color.
• **VK_BORDER_COLOR_FLOAT_CUSTOM_EXT** indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in floating-point format.
• **VK_BORDER_COLOR_INT_CUSTOM_EXT** indicates that a `VkSamplerCustomBorderColorCreateInfoEXT` structure is included in the `VkSamplerCreateInfo::pNext` chain containing the color data in integer format.

These colors are described in detail in Texel Replacement.

To destroy a sampler, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroySampler(
    VkDevice device,
    VkSampler sampler,
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the sampler.
• **sampler** is the sampler to destroy.
• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

• VUID-vkDestroySampler-sampler-01082
  All submitted commands that refer to `sampler` must have completed execution

• VUID-vkDestroySampler-sampler-01083
  If `VkAllocationCallbacks` were provided when `sampler` was created, a compatible set of callbacks must be provided here

• VUID-vkDestroySampler-sampler-01084
  If no `VkAllocationCallbacks` were provided when `sampler` was created, `pAllocator` must be NULL

### Valid Usage (Implicit)

• VUID-vkDestroySampler-device-parameter
device must be a valid `VkDevice` handle
• VUID-vkDestroySampler-sampler-parameter
If `sampler` is not `VK_NULL_HANDLE`, `sampler` must be a valid `VkSampler` handle.

- VUID-vkDestroySampler-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure.

- VUID-vkDestroySampler-sampler-parent
  If `sampler` is a valid handle, it must have been created, allocated, or retrieved from device.

### Host Synchronization

- Host access to `sampler` must be externally synchronized.

---

## 13.1. Sampler $Y' C_B C_R$ conversion

To create a sampler with $Y' C_B C_R$ conversion enabled, add a `VkSamplerYcbcrConversionInfo` structure to the `pNext` chain of the `VkSamplerCreateInfo` structure. To create a sampler $Y' C_B C_R$ conversion, the `samplerYcbcrConversion` feature must be enabled. Conversion must be fixed at pipeline creation time, through use of a combined image sampler with an immutable sampler in `VkDescriptorSetLayoutBinding`.

A `VkSamplerYcbcrConversionInfo` must be provided for samplers to be used with image views that access `VK_IMAGE_ASPECT_COLOR_BIT` if the format is one of the formats that require a sampler $Y' C_B C_R$ conversion, or if the image view has an external format.

The `VkSamplerYcbcrConversionInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionInfo {
    VkStructureType sType;
    const void* pNext;
    VkSamplerYcbcrConversion conversion;
} VkSamplerYcbcrConversionInfo;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionInfo VkSamplerYcbcrConversionInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `conversion` is a `VkSamplerYcbcrConversion` handle created with `vkCreateSamplerYcbcrConversion`.

---

1023
A sampler \( Y'C_bC_R \) conversion is an opaque representation of a device-specific sampler \( Y'C_bC_R \) conversion description, represented as a \textit{VkSamplerYcbcrConversion} handle:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkSamplerYcbcrConversion)
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversion VkSamplerYcbcrConversionKHR;
```

To create a \textit{VkSamplerYcbcrConversion}, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateSamplerYcbcrConversion(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
VkResult vkCreateSamplerYcbcrConversionKHR(
    VkDevice device,
    const VkSamplerYcbcrConversionCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkSamplerYcbcrConversion* pYcbcrConversion);
```

- \textit{device} is the logical device that creates the sampler \( Y'C_bC_R \) conversion.
- \textit{pCreateInfo} is a pointer to a \textit{VkSamplerYcbcrConversionCreateInfo} structure specifying the requested sampler \( Y'C_bC_R \) conversion.
- \textit{pAllocator} controls host memory allocation as described in the \textit{Memory Allocation} chapter.
- \textit{pYcbcrConversion} is a pointer to a \textit{VkSamplerYcbcrConversion} handle in which the resulting sampler \( Y'C_bC_R \) conversion is returned.
The interpretation of the configured sampler \( Y' \overline{C}_b \overline{C}_r \) conversion is described in more detail in the description of sampler \( Y' \overline{C}_b \overline{C}_r \) conversion in the Image Operations chapter.

### Valid Usage

- VUID-vkCreateSamplerYcbcrConversion-None-01648
  The samplerYcbcrConversion feature must be enabled

### Valid Usage (Implicit)

- VUID-vkCreateSamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateSamplerYcbcrConversion-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkSamplerYcbcrConversionCreateInfo structure

- VUID-vkCreateSamplerYcbcrConversion-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateSamplerYcbcrConversion-pYcbcrConversion-parameter
  pYcbcrConversion must be a valid pointer to a VkSamplerYcbcrConversion handle

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkSamplerYcbcrConversionCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkSamplerYcbcrConversionCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkFormat format;
    VkSamplerYcbcrModelConversion ycbcrModel;
    VkSamplerYcbcrRange ycbcrRange;
    VkComponentMapping components;
    VkChromaLocation xChromaOffset;
    VkChromaLocation yChromaOffset;
    VkFilter chromaFilter;
    VkBool32 forceExplicitReconstruction;
} VkSamplerYcbcrConversionCreateInfo;
```
VkSamplerYcbcrConversionCreateInfo

or the equivalent

```cpp
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrConversionCreateInfo VkSamplerYcbcrConversionCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `format` is the format of the image from which color information will be retrieved.
- `ycbcrModel` describes the color matrix for conversion between color models.
- `ycbcrRange` describes whether the encoded values have headroom and foot room, or whether the encoding uses the full numerical range.
- `components` applies a swizzle based on `VkComponentSwizzle` enums prior to range expansion and color model conversion.
- `xChromaOffset` describes the sample location associated with downsampled chroma components in the x dimension. `xChromaOffset` has no effect for formats in which chroma components are not downsampled horizontally.
- `yChromaOffset` describes the sample location associated with downsampled chroma components in the y dimension. `yChromaOffset` has no effect for formats in which the chroma components are not downsampled vertically.
- `chromaFilter` is the filter for chroma reconstruction.
- `forceExplicitReconstruction` can be used to ensure that reconstruction is done explicitly, if supported.

```
Note
Setting `forceExplicitReconstruction` to `VK_TRUE` may have a performance penalty on implementations where explicit reconstruction is not the default mode of operation.
```

If the `pNext` chain includes a `VkExternalFormatANDROID` structure with non-zero `externalFormat` member, the sampler Y’C₆C₈ conversion object represents an external format conversion, and `format` must be `VK_FORMAT_UNDEFINED`. Such conversions must only be used to sample image views with a matching external format. When creating an external format conversion, the value of `components` is ignored.

```
Valid Usage
- VUID-VkSamplerYcbcrConversionCreateInfo-format-01904
```
If an external format conversion is being created, format must be VK_FORMAT_UNDEFINED

• VUID-VkSamplerYcbcrConversionCreateInfo-format-04061
  If an external format conversion is not being created, format must represent unsigned normalized values (i.e. the format must be a UNORM format)

• VUID-VkSamplerYcbcrConversionCreateInfo-format-01650
  The potential format features of the sampler Y′C_B_C_R conversion must support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT or VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01651
  If the potential format features of the sampler Y′C_B_C_R conversion do not support VK_FORMAT_FEATURE_COSITED_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be VK_CHROMA_LOCATION_COSITED_EVEN if the corresponding components are downsampled

• VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-01652
  If the potential format features of the sampler Y′C_B_C_R conversion do not support VK_FORMAT_FEATURE_MIDPOINT_CHROMA_SAMPLES_BIT, xChromaOffset and yChromaOffset must not be VK_CHROMA_LOCATION_MIDPOINT if the corresponding components are downsampled

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02581
  If the format has a _422 or _420 suffix, then components.g must be the identity swizzle

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02582
  If the format has a _422 or _420 suffix, then components.a must be the identity swizzle, VK_COMPONENT_SWIZZLE_ONE, or VK_COMPONENT_SWIZZLE_ZERO

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02583
  If the format has a _422 or _420 suffix, then components.r must be the identity swizzle or VK_COMPONENT_SWIZZLE_B

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02584
  If the format has a _422 or _420 suffix, then components.b must be the identity swizzle or VK_COMPONENT_SWIZZLE_R

• VUID-VkSamplerYcbcrConversionCreateInfo-components-02585
  If the format has a _422 or _420 suffix, and if either components.r or components.b is the identity swizzle, both values must be the identity swizzle

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-01655
  If ycbcrModel is not VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY, then components.r, components.g, and components.b must correspond to components of the format; that is, components.r, components.g, and components.b must not be VK_COMPONENT_SWIZZLE_ZERO or VK_COMPONENT_SWIZZLE_ONE, and must not correspond to a component containing zero or one as a consequence of conversion to RGBA

• VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-02748
  If ycbcrRange is VK_SAMPLER_YCBCR_RANGE_ITU_NARROW then the R, G and B components obtained by applying the component swizzle to format must each have a bit-depth greater than or equal to 8

• VUID-VkSamplerYcbcrConversionCreateInfo-forceExplicitReconstruction-01656
  If the potential format features of the sampler Y′C_B_C_R conversion do not support VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_FORCE
ABLE_BIT forceExplicitReconstruction must be VK_FALSE

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-01657
  If the potential format features of the sampler Y′C_B'C_R conversion do not support
  VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_LINEAR_FILTER_BIT, chromaFilter must not be VK_FILTER_LINEAR

Valid Usage (Implicit)

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_YCBCR_CONVERSION_CREATE_INFO

- VUID-VkSamplerYcbcrConversionCreateInfo-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkExternalFormatANDROID

- VUID-VkSamplerYcbcrConversionCreateInfo-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkSamplerYcbcrConversionCreateInfo-format-parameter
  format must be a valid VkFormat value

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrModel-parameter
  ycbcrModel must be a valid VkSamplerYcbcrModelConversion value

- VUID-VkSamplerYcbcrConversionCreateInfo-ycbcrRange-parameter
  ycbcrRange must be a valid VkSamplerYcbcrRange value

- VUID-VkSamplerYcbcrConversionCreateInfo-components-parameter
  components must be a valid VkComponentMapping structure

- VUID-VkSamplerYcbcrConversionCreateInfo-xChromaOffset-parameter
  xChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-yChromaOffset-parameter
  yChromaOffset must be a valid VkChromaLocation value

- VUID-VkSamplerYcbcrConversionCreateInfo-chromaFilter-parameter
  chromaFilter must be a valid VkFilter value

If chromaFilter is VK_FILTER_NEAREST, chroma samples are reconstructed to luma component resolution using nearest-neighbour sampling. Otherwise, chroma samples are reconstructed using interpolation. More details can be found in the description of sampler Y′C_B'C_R conversion in the Image Operations chapter.

VkSamplerYcbcrModelConversion defines the conversion from the source color model to the shader color model. Possible values are:

// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrModelConversion {
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY = 0,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY = 1,
    VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709 = 2,
};
or the equivalent

```
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrModelConversion VkSamplerYcbcrModelConversionKHR;
```

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY** specifies that the input values to the conversion are unmodified.

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY** specifies no model conversion but the inputs are range expanded as for Y’C_bC_r.

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.709 and described in the “BT.709 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.601 and described in the “BT.601 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

- **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020** specifies the color model conversion from Y’C_bC_r to R’G’B’ defined in BT.2020 and described in the “BT.2020 Y’C_bC_r conversion” section of the Khronos Data Format Specification.

In the **VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_*** color models, for the input to the sampler Y’C_bC_r range expansion and model conversion:

- the Y (Y’ luma) component corresponds to the G component of an RGB image.
- the CB (C_b or “U” blue color difference) component corresponds to the B component of an RGB image.
- the CR (C_r or “V” red color difference) component corresponds to the R component of an RGB image.
• the alpha component, if present, is not modified by color model conversion.

These rules reflect the mapping of components after the component swizzle operation (controlled by `VkSamplerYcbcrConversionCreateInfo::components`).

**Note**
For example, an “YUVA” 32-bit format comprising four 8-bit components can be implemented as `VK_FORMAT_R8G8B8A8_UNORM` with a component mapping:

- `components.a = VK_COMPONENT_SWIZZLE_IDENTITY`
- `components.r = VK_COMPONENT_SWIZZLE_B`
- `components.g = VK_COMPONENT_SWIZZLE_R`
- `components.b = VK_COMPONENT_SWIZZLE_G`

The `VkSamplerYcbcrRange` enum describes whether color components are encoded using the full range of numerical values or whether values are reserved for headroom and foot room. `VkSamplerYcbcrRange` is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkSamplerYcbcrRange {
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL = 0,
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW = 1,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_FULL_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_FULL,
    // Provided by VK_KHR_sampler_ycbcr_conversion
    VK_SAMPLER_YCBCR_RANGE_ITU_NARROW_KHR = VK_SAMPLER_YCBCR_RANGE_ITU_NARROW,
} VkSamplerYcbcrRange;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkSamplerYcbcrRange VkSamplerYcbcrRangeKHR;
```

- `VK_SAMPLER_YCBCR_RANGE_ITU_FULL` specifies that the full range of the encoded values are valid and interpreted according to the ITU “full range” quantization rules.
- `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW` specifies that headroom and foot room are reserved in the numerical range of encoded values, and the remaining values are expanded according to the ITU “narrow range” quantization rules.

The formulae for these conversions is described in the Sampler Y’C₉C₉ Range Expansion section of the Image Operations chapter.

No range modification takes place if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`; the `ycbcrRange` field of `VkSamplerYcbcrConversionCreateInfo` is ignored in this case.

The `VkChromaLocation` enum defines the location of downsampled chroma component samples.
relative to the luma samples, and is defined as:

```c
// Provided by VK_VERSION_1_1
typedef enum VkChromaLocation {
    VK_CHROMA_LOCATION_COSITED_EVEN = 0,
    VK_CHROMA_LOCATION_MIDPOINT = 1,
} VkChromaLocation;
```

or the equivalent

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
typedef VkChromaLocation VkChromaLocationKHR;
```

- `VK_CHROMA_LOCATION_COSITED_EVEN` specifies that downsampled chroma samples are aligned with luma samples with even coordinates.
- `VK_CHROMA_LOCATION_MIDPOINT` specifies that downsampled chroma samples are located half way between each even luma sample and the nearest higher odd luma sample.

To destroy a sampler $Y'C_bC_r$ conversion, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroySamplerYcbcrConversion(    VkDevice device,    VkSamplerYcbcrConversion ycbcrConversion,    const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_sampler_ycbcr_conversion
void vkDestroySamplerYcbcrConversionKHR(    VkDevice device,    VkSamplerYcbcrConversion ycbcrConversion,    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the $Y'C_bC_r$ conversion.
- `ycbcrConversion` is the conversion to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage (Implicit)

- VUID-vkDestroySamplerYcbcrConversion-device-parameter
device must be a valid VkDevice handle

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parameter
If ycbcrConversion is not VK_NULL_HANDLE, ycbcrConversion must be a valid VkSamplerYcbcrConversion handle

- VUID-vkDestroySamplerYcbcrConversion-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkDestroySamplerYcbcrConversion-ycbcrConversion-parent
If ycbcrConversion is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

- Host access to ycbcrConversion must be externally synchronized

In addition to the predefined border color values, applications can provide a custom border color value by including the VkSamplerCustomBorderColorCreateInfoEXT structure in the VkSamplerCreateInfo::pNext chain.

The VkSamplerCustomBorderColorCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_custom_border_color
typedef struct VkSamplerCustomBorderColorCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkClearColorValue customBorderColor;
    VkFormat format;
} VkSamplerCustomBorderColorCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- customBorderColor is a VkClearColorValue representing the desired custom sampler border color.
- format is a VkFormat representing the format of the sampled image view(s). This field may be VK_FORMAT_UNDEFINED if the customBorderColorWithoutFormat feature is enabled.

Valid Usage

- VUID-VkSamplerCustomBorderColorCreateInfoEXT-format-04013
If provided format is not VK_FORMAT_UNDEFINED then the VkSamplerCreateInfo::borderColor
type must match the sampled type of the provided format, as shown in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table.

- VUID-VkSamplerCustomBorderBorderColorCreateInfo_EXT-format-04014
  If the customBorderColorWithoutFormat feature is not enabled then format must not be VK_FORMAT_UNDEFINED.

- VUID-VkSamplerCustomBorderBorderColorCreateInfo_EXT-format-04015
  If the sampler is used to sample an image view of VK_FORMAT_B4G4R4A4_UNORM_PACK16, VK_FORMAT_B5G6R5_UNORM_PACK16, or VK_FORMAT_B5G5R5A1_UNORM_PACK16 format then format must not be VK_FORMAT_UNDEFINED.

## Valid Usage (Implicit)

- VUID-VkSamplerCustomBorderBorderColorCreateInfo_EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLER_CUSTOM_BORDER_COLOR_CREATE_INFO_EXT.

- VUID-VkSamplerCustomBorderBorderColorCreateInfo_EXT-format-parameter
  format must be a valid VkFormat value.

If the sampler is created with VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK, VK_BORDER_COLOR_INT_OPAQUE_BLACK, VK_BORDER_COLOR_FLOAT_CUSTOM_EXT, or VK_BORDER_COLOR_INT_CUSTOM_EXT borderColor, and that sampler will be combined with an image view that does not have an identity swizzle, and VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage is not enabled, then it is necessary to specify the component mapping of the border color, by including the VkSamplerBorderColorComponentMappingCreateInfo_EXT structure in the VkSamplerCreateInfo::pNext chain, to get defined results.

The VkSamplerBorderColorComponentMappingCreateInfo_EXT structure is defined as:

```c
// Provided by VK_EXT_border_color_swizzle
typedef struct VkSamplerBorderColorComponentMappingCreateInfo_EXT {
    VkStructureType sType;
    const void* pNext;
    VkComponentMapping components;
    VkBool32 srgb;
} VkSamplerBorderColorComponentMappingCreateInfo_EXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- components is a VkComponentMapping structure specifying a remapping of the border color components.
- srgb indicates that the sampler will be combined with an image view that has an image format which is sRGB encoded.

The VkComponentMapping components member describes a remapping from components of the border color to components of the vector returned by shader image instructions when the border...
color is used.

Valid Usage

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-borderColorSwizzle-06437
  The \texttt{borderColorSwizzle} feature \textbf{must} be enabled.

Valid Usage (Implicit)

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-sType-sType
  \texttt{sType} \textbf{must} be \texttt{VK_STRUCTURE_TYPE_SAMPLER_BORDER_COLOR_COMPONENT_MAPPING_CREATE_INFO_EXT}

- VUID-VkSamplerBorderColorComponentMappingCreateInfoEXT-components-parameter
  \texttt{components} \textbf{must} be a valid \texttt{VkComponentMapping} structure
Chapter 14. Resource Descriptors

A descriptor is an opaque data structure representing a shader resource such as a buffer, buffer view, image view, sampler, or combined image sampler. Descriptors are organized into descriptor sets, which are bound during command recording for use in subsequent drawing commands. The arrangement of content in each descriptor set is determined by a descriptor set layout, which determines what descriptors can be stored within it. The sequence of descriptor set layouts that can be used by a pipeline is specified in a pipeline layout. Each pipeline object can use up to maxBoundDescriptorSets (see Limits) descriptor sets.

Shaders access resources via variables decorated with a descriptor set and binding number that link them to a descriptor in a descriptor set. The shader interface mapping to bound descriptor sets is described in the Shader Resource Interface section.

Shaders can also access buffers without going through descriptors by using Physical Storage Buffer Access to access them through 64-bit addresses.

14.1. Descriptor Types

There are a number of different types of descriptor supported by Vulkan, corresponding to different resources or usage. The following sections describe the API definitions of each descriptor type. The mapping of each type to SPIR-V is listed in the Shader Resource and Descriptor Type Correspondence and Shader Resource and Storage Class Correspondence tables in the Shader Interfaces chapter.

14.1.1. Storage Image

A storage image (VK_DESCRIPTOR_TYPE_STORAGE_IMAGE) is a descriptor type associated with an image resource via an image view that load, store, and atomic operations can be performed on.

Storage image loads are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Stores to storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_BIT.

Atomic operations on storage images are supported in compute shaders for image views whose format features contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

When the fragmentStoresAndAtomics feature is enabled, stores and atomic operations are also supported for storage images in fragment shaders with the same set of image formats as supported in compute shaders. When the vertexPipelineStoresAndAtomics feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of image formats as supported in compute shaders.

The image subresources for a storage image must be in the VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.
14.1.2. Sampler

A sampler descriptor (VK_DESCRIPTOR_TYPE_SAMPLER) is a descriptor type associated with a sampler object, used to control the behavior of sampling operations performed on a sampled image.

14.1.3. Sampled Image

A sampled image (VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE) is a descriptor type associated with an image resource via an image view that sampling operations can be performed on.

Shaders combine a sampled image variable and a sampler variable to perform sampling operations.

Sampled images are supported in all shader stages for image views whose format features contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_BIT.

An image subresources for a sampled image must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
- VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
- VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

14.1.4. Combined Image Sampler

A combined image sampler (VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER) is a single descriptor type associated with both a sampler and an image resource, combining both a sampler and sampled image descriptor into a single descriptor.

If the descriptor refers to a sampler that performs Y’CBCR conversion or samples a subsampled image, the sampler must only be used to sample the image in the same descriptor. Otherwise, the sampler and image in this type of descriptor can be used freely with any other samplers and images.

An image subresources for a combined image sampler must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
On some implementations, it may be more efficient to sample from an image using a combination of sampler and sampled image that are stored together in the descriptor set in a combined descriptor.

### 14.1.5. Uniform Texel Buffer

A **uniform texel buffer** (VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER) is a descriptor type associated with a **buffer resource** via a **buffer view** that image sampling operations **can** be performed on.

Uniform texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image.

Load operations from uniform texel buffers are supported in all shader stages for image formats which report support for the **VK_FORMAT_FEATURE_UNIFORM_TEXEL_BUFFER_BIT** feature bit via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.

### 14.1.6. Storage Texel Buffer

A **storage texel buffer** (VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER) is a descriptor type associated with a **buffer resource** via a **buffer view** that image load, store, and atomic operations **can** be performed on.

Storage texel buffers define a tightly-packed 1-dimensional linear array of texels, with texels going through format conversion when read in a shader in the same way as they are for an image. Unlike uniform texel buffers, these buffers can also be written to in the same way as for **storage images**.

Storage texel buffer loads are supported in all shader stages for texel buffer formats which report support for the **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_BIT** feature bit via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.

Stores to storage texel buffers are supported in compute shaders for texel buffer formats which report support for the **VK_FORMAT_FEATURE_STORAGE_TEXEL_BUFFER_ATOMIC_BIT** feature via vkGetPhysicalDeviceFormatProperties in VkFormatProperties::bufferFeatures.
When the \texttt{fragmentStoresAndAtomics} feature is enabled, stores and atomic operations are also supported for storage texel buffers in fragment shaders with the same set of texel buffer formats as supported in compute shaders. When the \texttt{vertexPipelineStoresAndAtomics} feature is enabled, stores and atomic operations are also supported in vertex, tessellation, and geometry shaders with the same set of texel buffer formats as supported in compute shaders.

### 14.1.7. Storage Buffer

A \textit{storage buffer} (\texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER}) is a descriptor type associated with a \textit{buffer resource} directly, described in a shader as a structure with various members that load, store, and atomic operations \textbf{can} be performed on.

\begin{center}
\textbf{Note}
\end{center}

Atomic operations \textbf{can} only be performed on members of certain types as defined in the \textit{SPIR-V environment appendix}.

### 14.1.8. Uniform Buffer

A \textit{uniform buffer} (\texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER}) is a descriptor type associated with a \textit{buffer resource} directly, described in a shader as a structure with various members that load operations \textbf{can} be performed on.

### 14.1.9. Dynamic Uniform Buffer

A \textit{dynamic uniform buffer} (\texttt{VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC}) is almost identical to a \textit{uniform buffer}, and differs only in how the offset into the buffer is specified. The base offset calculated by the \texttt{VkDescriptorBufferInfo} when initially \textit{updating the descriptor set} is added to a \textit{dynamic offset} when binding the descriptor set.

### 14.1.10. Dynamic Storage Buffer

A \textit{dynamic storage buffer} (\texttt{VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC}) is almost identical to a \textit{storage buffer}, and differs only in how the offset into the buffer is specified. The base offset calculated by the \texttt{VkDescriptorBufferInfo} when initially \textit{updating the descriptor set} is added to a \textit{dynamic offset} when binding the descriptor set.

### 14.1.11. Inline Uniform Block

An \textit{inline uniform block} (\texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}) is almost identical to a \textit{uniform buffer}, and differs only in taking its storage directly from the encompassing descriptor set instead of being backed by buffer memory. It is typically used to access a small set of constant data that does not require the additional flexibility provided by the indirect access enabled when using a uniform buffer where the descriptor and the referenced buffer memory are decoupled. Compared to push constants, they allow reusing the same set of constant data across multiple disjoint sets of drawing and dispatching commands.

Inline uniform block descriptors \textbf{cannot} be aggregated into arrays. Instead, the array size specified for an inline uniform block descriptor binding specifies the binding’s capacity in bytes.
14.1.12. Sample Weight Image

A *sample weight image* (VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM) is a descriptor type associated with an *image resource* via an *image view* that can be used in *weight image sampling*. The image view must have been created with VkImageViewSampleWeightCreateInfoQCOM.

Shaders can combine a weight image variable, a sampled image variable, and a sampler variable to perform *weight image sampling*.

Weight image sampling is supported in all shader stages if the weight image view specifies a format that supports *format feature* VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM and the sampled image view specifies a format that supports *format feature* VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

The image subresources for the weight image must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

14.1.13. Block Matching Image

A *block matching image* (VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM) is a descriptor type associated with an *image resource* via an *image view* that can be used in *block matching*.

Shaders can combine a target image variable, a reference image variable, and a sampler variable to perform *block matching*.

Block matching is supported in all shader stages for if both the target view and reference view specifies a format that supports *format feature* VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

The image subresources for block matching must be in the VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL, or VK_IMAGE_LAYOUT_GENERAL layout in order to access its data in a shader.

An *input attachment* (VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT) is a descriptor type associated with an *image resource* via an *image view* that can be used for framebuffer local load operations in fragment shaders.

All image formats that are supported for color attachments (VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT or VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV) or depth/stencil attachments (VK_FORMAT_FEATURE_DEPTH_STENCIL_ATTACHMENT_BIT) for a given image tiling mode are also supported for input attachments.

An image view used as an input attachment must be in one of the following layouts:

- VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_SHADER_READ_ONLY_OPTIMAL
- VK_IMAGE_LAYOUT_GENERAL
• VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR
• VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL
• VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL
• VK_IMAGE_LAYOUT_READ_ONLY_OPTIMAL_KHR
• VK_IMAGE_LAYOUT_ATTACHMENT_FEEDBACK_LOOP_OPTIMAL_EXT

### 14.1.15. Acceleration Structure

An acceleration structure (VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR or VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV) is a descriptor type that is used to retrieve scene geometry from within shaders that are used for ray traversal. Shaders have read-only access to the memory.

### 14.1.16. Mutable

A descriptor of mutable (VK_DESCRIPTOR_TYPE_MUTABLE_VALVE) type indicates that this descriptor can mutate to any of the descriptor types given in the VkMutableDescriptorTypeCreateInfoVALVE::pDescriptorTypes list of descriptor types in the pNext chain of VkDescriptorSetLayoutCreateInfo for this binding. At any point, each individual descriptor of mutable type has an active descriptor type. The active descriptor type can be any one of the declared types in pDescriptorTypes. Additionally, a mutable descriptor's active descriptor type can be of the VK_DESCRIPTOR_TYPE_MUTABLE_VALVE type, which is the initial active descriptor type. The active descriptor type can change when the descriptor is updated. When a descriptor is consumed by binding a descriptor set, the active descriptor type is considered, not VK_DESCRIPTOR_TYPE_MUTABLE_VALVE.

An active descriptor type of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE is considered an undefined descriptor. If a descriptor is consumed where the active descriptor type does not match what the shader expects, the descriptor is considered an undefined descriptor.

---

**Note**

To find which descriptor types are supported as VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the application can use vkGetDescriptorSetLayoutSupport with an VK_DESCRIPTOR_TYPE_MUTABLE_VALVE binding, with the list of descriptor types to query in the VkMutableDescriptorTypeCreateInfoVALVE::pDescriptorTypes array for that binding.

---

**Note**

The intention of a mutable descriptor type is that implementations allocate N bytes per descriptor, where N is determined by the maximum descriptor size for a given descriptor binding. Implementations are not expected to keep track of the active descriptor type, and it should be considered a C-like union type.

A mutable descriptor type is not considered as efficient in terms of runtime performance as using a non-mutable descriptor type, and applications are not encouraged to use them outside API layering efforts. Mutable descriptor types can be more efficient if the alternative is using many different descriptors to emulate...
mutable descriptor types.

14.2. Descriptor Sets

Descriptors are grouped together into descriptor set objects. A descriptor set object is an opaque object containing storage for a set of descriptors, where the types and number of descriptors is defined by a descriptor set layout. The layout object may be used to define the association of each descriptor binding with memory or other implementation resources. The layout is used both for determining the resources that need to be associated with the descriptor set, and determining the interface between shader stages and shader resources.

14.2.1. Descriptor Set Layout

A descriptor set layout object is defined by an array of zero or more descriptor bindings. Each individual descriptor binding is specified by a descriptor type, a count (array size) of the number of descriptors in the binding, a set of shader stages that can access the binding, and (if using immutable samplers) an array of sampler descriptors.

Descriptor set layout objects are represented by VkDescriptorSetLayout handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSetLayout)
```

To create descriptor set layout objects, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorSetLayout(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorSetLayout* pSetLayout);
```

- device is the logical device that creates the descriptor set layout.
- pCreateInfo is a pointer to a VkDescriptorSetLayoutCreateInfo structure specifying the state of the descriptor set layout object.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
- pSetLayout is a pointer to a VkDescriptorSetLayout handle in which the resulting descriptor set layout object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDescriptorSetLayout-device-parameter device must be a valid VkDevice handle
- VUID-vkCreateDescriptorSetLayout-pCreateInfo-parameter
**pCreateInfo** must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure

- VUID-vkCreateDescriptorSetLayout-pAllocator-parameter
  If `pAllocator` is not NULL, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure
- VUID-vkCreateDescriptorSetLayout-pSetLayout-parameter
  `pSetLayout` must be a valid pointer to a `VkDescriptorSetLayout` handle

**Return Codes**

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

Information about the descriptor set layout is passed in a `VkDescriptorSetLayoutCreateInfo` structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorSetLayoutCreateFlags flags;
    uint32_t bindingCount;
    const VkDescriptorSetLayoutBinding* pBindings;
} VkDescriptorSetLayoutCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkDescriptorSetLayoutCreateFlagBits` specifying options for descriptor set layout creation.
- `bindingCount` is the number of elements in `pBindings`.
- `pBindings` is a pointer to an array of `VkDescriptorSetLayoutBinding` structures.

**Valid Usage**

- VUID-VkDescriptorSetLayoutCreateInfo-binding-00279
  The `VkDescriptorSetLayoutBinding::binding` members of the elements of the `pBindings` array must each have different values
- VUID-VkDescriptorSetLayoutCreateInfo-flags-00280
  If `flags` contains `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR`, then all
elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-02208**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-00281**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then the total number of elements of all bindings must be less than or equal to VkPhysicalDevicePushDescriptorPropertiesKHR::maxPushDescriptors

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04590**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04591**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, pBindings must not have a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-03000**
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, flags must include VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-03001**
  If any binding has the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT bit set, then all bindings must not have descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04592**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT, flags must not contain VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04593**
  If any binding has a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, then a VkMutableDescriptorTypeCreateInfoVALVE must be present in the pNext chain

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04594**
  If a binding has a descriptorType value of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, then pImmutableSamplers must be NULL

- **VUID-VkDescriptorSetLayoutCreateInfo-mutableDescriptorType-04595**
  If VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType is not enabled, pBindings must not contain a descriptorType of VK_DESCRIPTOR_TYPE_MUTABLE_VALVE

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-04596**
  If flags contains VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE, VkPhysicalDeviceMutableDescriptorTypeFeaturesVALVE::mutableDescriptorType must be enabled
Valid Usage (Implicit)

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-sType**
  
  The `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO`.

- **VUID-VkDescriptorSetLayoutCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkDescriptorSetLayoutBindingFlagsCreateInfo` or `VkMutableDescriptorTypeCreateInfoVALVE`.

- **VUID-VkDescriptorSetLayoutCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkDescriptorSetLayoutCreateInfo-flags-parameter**
  
  The `flags` must be a valid combination of `VkDescriptorSetLayoutCreateFlagBits` values.

- **VUID-VkDescriptorSetLayoutCreateInfo-pBindings-parameter**
  
  If `bindingCount` is not 0, `pBindings` must be a valid pointer to an array of `bindingCount` valid `VkDescriptorSetLayoutBinding` structures.

Information about the possible descriptor types for mutable descriptor types is passed in a `VkMutableDescriptorTypeCreateInfoVALVE` structure as a `pNext` to a `VkDescriptorSetLayoutCreateInfo` structure or a `VkDescriptorPoolCreateInfo` structure.

The `VkMutableDescriptorTypeCreateInfoVALVE` structure is defined as:

```cpp
// Provided by VK_VALVE_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeCreateInfoVALVE {
    VkStructureType sType;
    const void* pNext;
    uint32_t mutableDescriptorTypeListCount;
    const VkMutableDescriptorTypeListVALVE* pMutableDescriptorTypeLists;
} VkMutableDescriptorTypeCreateInfoVALVE;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `mutableDescriptorTypeListCount` is the number of elements in `pMutableDescriptorTypeLists`.
- `pMutableDescriptorTypeLists` is a pointer to an array of `VkMutableDescriptorTypeListVALVE` structures.

If `mutableDescriptorTypeListCount` is zero or if this structure is not included in the `pNext` chain, the `VkMutableDescriptorTypeListVALVE` for each element is considered to be zero or `NULL` for each member. Otherwise, the descriptor set layout binding at `VkDescriptorSetLayoutCreateInfo::pBindings[i]` uses the descriptor type lists in `VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i]`.
Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeCreateInfoVALVE-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_MUTABLE_DESCRIPTOR_TYPE_CREATE_INFO VALVE`
- VUID-VkMutableDescriptorTypeCreateInfoVALVE-pMutableDescriptorTypeLists-
  - If `mutableDescriptorTypeListCount` is not 0, `pMutableDescriptorTypeLists` must be a valid pointer to an array of `mutableDescriptorTypeListCount` valid `VkMutableDescriptorTypeListVALVE` structures

The list of potential descriptor types a given mutable descriptor can mutate to is passed in a `VkMutableDescriptorTypeListVALVE` structure.

The `VkMutableDescriptorTypeListVALVE` structure is defined as:

```c
// Provided by VK_VALVE_mutable_descriptor_type
typedef struct VkMutableDescriptorTypeListVALVE {
    uint32_t descriptorTypeCount;
    const VkDescriptorType* pDescriptorTypes;
} VkMutableDescriptorTypeListVALVE;
```

- `descriptorTypeCount` is the number of elements in `pDescriptorTypes`.
- `pDescriptorTypes` is NULL or a pointer to an array of `descriptorTypeCount` `VkDescriptorType` values defining which descriptor types a given binding may mutate to.

Valid Usage

- VUID-VkMutableDescriptorTypeListVALVE-descriptorTypeCount-04597
  - `descriptorTypeCount` must not be 0 if the corresponding binding is of `VK_DESCRIPTOR_TYPE_MUTABLE VALVE`
- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04598
  - `pDescriptorTypes` must be a valid pointer to an array of `descriptorTypeCount` valid, unique `VkDescriptorType` values if the given binding is of `VK_DESCRIPTOR_TYPE_MUTABLE VALVE` type
- VUID-VkMutableDescriptorTypeListVALVE-descriptorTypeCount-04599
  - `descriptorTypeCount` must be 0 if the corresponding binding is not of `VK_DESCRIPTOR_TYPE_MUTABLE VALVE`
- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04600
  - `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_MUTABLE VALVE`
- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04601
  - `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`
- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04602
  - `pDescriptorTypes` must not contain `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`
- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-04603
Valid Usage (Implicit)

- VUID-VkMutableDescriptorTypeListVALVE-pDescriptorTypes-parameter
  If descriptorTypeCount is not 0, pDescriptorTypes must be a valid pointer to an array of descriptorTypeCount valid VkDescriptorType values

Bits which can be set in VkDescriptorSetLayoutCreateInfo::flags, specifying options for descriptor set layout, are:

```
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorSetLayoutCreateFlagBits {
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT = 0x00000002,
    // Provided by VK_KHR_push_descriptor
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR = 0x00000001,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT_EXT = VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT
} VkDescriptorSetLayoutCreateFlagBits;
```

- 
  VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR specifies that descriptor sets must not be allocated using this layout, and descriptors are instead pushed by vkCmdPushDescriptorSetKHR.

- 
  VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set. Descriptor set layouts created with this bit set have alternate limits for the maximum number of descriptors per-stage and per-pipeline layout. The non-UpdateAfterBind limits only count descriptors in sets created without this flag. The UpdateAfterBind limits count all descriptors, but the limits may be higher than the non-UpdateAfterBind limits.

- 
  VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE specifies that descriptor sets using this layout must be allocated from a descriptor pool created with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_POOL_BIT_VALVE bit set. Descriptor set layouts created with this bit have no expressible limit for maximum number of descriptors per-stage. Host descriptor sets are limited only by available host memory, but may be limited for implementation specific reasons. Implementations may limit the number of supported descriptors to UpdateAfterBind limits or non-UpdateAfterBind limits, whichever is larger.
VkDescriptorSetLayoutCreateFlags is a bitmask type for setting a mask of zero or more VkDescriptorSetLayoutCreateFlagBits.

The VkDescriptorSetLayoutBinding structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetLayoutBinding {
  uint32_t binding;
  VkDescriptorType descriptorType;
  uint32_t descriptorCount;
  VkShaderStageFlags stageFlags;
  const VkSampler* pImmutableSamplers;
} VkDescriptorSetLayoutBinding;
```

- **binding** is the binding number of this entry and corresponds to a resource of the same binding number in the shader stages.
- **descriptorType** is a VkDescriptorType specifying which type of resource descriptors are used for this binding.
- **descriptorCount** is the number of descriptors contained in the binding, accessed in a shader as an array, except if descriptorType is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK in which case descriptorCount is the size in bytes of the inline uniform block. If descriptorCount is zero this binding entry is reserved and the resource must not be accessed from any stage via this binding within any pipeline using the set layout.
- **stageFlags** member is a bitmask of VkShaderStageFlagBits specifying which pipeline shader stages can access a resource for this binding. VK_SHADER_STAGE_ALL is a shorthand specifying that all defined shader stages, including any additional stages defined by extensions, can access the resource.

If a shader stage is not included in stageFlags, then a resource must not be accessed from that stage via this binding within any pipeline using the set layout. Other than input attachments which are limited to the fragment shader, there are no limitations on what combinations of stages can use a descriptor binding, and in particular a binding can be used by both graphics stages and the compute stage.

- **pImmutableSamplers** affects initialization of samplers. If descriptorType specifies a VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER type descriptor, then pImmutableSamplers can be used to initialize a set of immutable samplers. Immutable samplers are permanently bound into the set layout and must not be changed; updating a VK_DESCRIPTOR_TYPE_SAMPLER descriptor with immutable samplers is not allowed and updates to a VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER descriptor with immutable samplers does not modify the samplers (the image views are updated, but the sampler updates are ignored). If pImmutableSamplers is not NULL, then it is a pointer to an array of sampler handles that will be copied into the set layout and used for the corresponding binding. Only the sampler handles are copied; the sampler objects must not be destroyed before the final use of the set layout and any descriptor pools and sets created using it. If pImmutableSamplers is NULL, then the sampler slots are dynamic and sampler handles must be bound into descriptor sets using this layout. If descriptorType is not one of these descriptor types, then pImmutableSamplers is ignored.
The above layout definition allows the descriptor bindings to be specified sparsely such that not all binding numbers between 0 and the maximum binding number need to be specified in the `pBindings` array. Bindings that are not specified have a `descriptorCount` and `stageFlags` of zero, and the value of `descriptorType` is undefined. However, all binding numbers between 0 and the maximum binding number in the `VkDescriptorSetLayoutCreateInfo::pBindings` array may consume memory in the descriptor set layout even if not all descriptor bindings are used, though it should not consume additional memory from the descriptor pool.

**Note**
The maximum binding number specified should be as compact as possible to avoid wasted memory.

### Valid Usage

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-00282**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLER` or `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `descriptorCount` is not 0 and `pImmutableSamplers` is not NULL, `pImmutableSamplers` must be a valid pointer to an array of `descriptorCount` valid `VkSampler` handles.

- **VUID-VkDescriptorSetLayoutBinding-linearUniformBlockType-04604**
  If the `inlineUniformBlock` feature is not enabled, `descriptorType` must not be `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02209**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be a multiple of 4.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-02210**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `descriptorCount` must be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxInlineUniformBlockSize`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorCount-00283**
  If `descriptorCount` is not 0, `stageFlags` must be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-VkDescriptorSetLayoutBinding-linearUniformBlockCount-01510**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` and `descriptorCount` is not 0, then `stageFlags` must be 0 or `VK_SHADER_STAGE_FRAGMENT_BIT`.

- **VUID-VkDescriptorSetLayoutBinding-pImmutableSamplers-04009**
  The sampler objects indicated by `pImmutableSamplers` must not have a `borderColor` with one of the values `VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`.

- **VUID-VkDescriptorSetLayoutBinding-descriptorType-04605**
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_MUTABLE_VALVE`, then `pImmutableSamplers` must be NULL.
Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutBinding-descriptorType-parameter
designatorType must be a valid VkDescriptorType value

If the pNext chain of a VkDescriptorSetLayoutCreateInfo structure includes a VkDescriptorSetLayoutBindingFlagsCreateInfo structure, then that structure includes an array of flags, one for each descriptor set layout binding.

The VkDescriptorSetLayoutBindingFlagsCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetLayoutBindingFlagsCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t bindingCount;
    const VkDescriptorBindingFlags* pBindingFlags;
} VkDescriptorSetLayoutBindingFlagsCreateInfo;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetLayoutBindingFlagsCreateInfo
VkDescriptorSetLayoutBindingFlagsCreateInfoEXT;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- bindingCount is zero or the number of elements in pBindingFlags.
- pBindingFlags is a pointer to an array of VkDescriptorBindingFlags bitfields, one for each descriptor set layout binding.

If bindingCount is zero or if this structure is not included in the pNext chain, the VkDescriptorBindingFlags for each descriptor set layout binding is considered to be zero. Otherwise, the descriptor set layout binding at VkDescriptorSetLayoutCreateInfo::pBindings[i] uses the flags in pBindingFlags[i].

Valid Usage

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-bindingCount-03002
  If bindingCount is not zero, bindingCount must equal VkDescriptorSetLayoutCreateInfo::bindingCount

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-flags-03003
  If VkDescriptorSetLayoutCreateInfo::flags includes VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR, then all elements of
pBindingFlags must not include VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT, VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT, or VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03004
  If an element of pBindingFlags includes VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT, then all other elements of VkDescriptorSetLayoutCreateInfo::pBindings must have a smaller value of binding

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformBufferUpdateAfterBind-03005
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingSampledImageUpdateAfterBind-03006
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingSampledImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_SAMPLER, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, or VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageImageUpdateAfterBind-03007
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageImageUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_IMAGE must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageBufferUpdateAfterBind-03008
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUniformTexelBufferUpdateAfterBind-03009
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingUniformTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingStorageTexelBufferUpdateAfterBind-03010
  If VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingStorageTexelBufferUpdateAfterBind is not enabled, all bindings with descriptor type VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER must not use VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT

- VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-
If `VkPhysicalDeviceInlineUniformBlockFeatures`::`descriptorBindingInlineUniformBlockUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingAccelerationStructureUpdateAfterBind-03570**
  If `VkPhysicalDeviceAccelerationStructureFeaturesKHR`::`descriptorBindingAccelerationStructureUpdateAfterBind` is not enabled, all bindings with descriptor type `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` or `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-None-03011**
  All bindings with descriptor type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` must not use `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingUpdateUnusedWhilePending-03012**
  If `VkPhysicalDeviceDescriptorIndexingFeatures`::`descriptorBindingUpdateUnusedWhilePending` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingPartiallyBound-03013**
  If `VkPhysicalDeviceDescriptorIndexingFeatures`::`descriptorBindingPartiallyBound` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-descriptorBindingVariableDescriptorCount-03014**
  If `VkPhysicalDeviceDescriptorIndexingFeatures`::`descriptorBindingVariableDescriptorCount` is not enabled, all elements of `pBindingFlags` must not include `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-03015**
  If an element of `pBindingFlags` includes `VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT`, that element's descriptor type must not be `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`.

**Valid Usage (Implicit)**

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_BINDING_FLAGS_CREATE_INFO`.

- **VUID-VkDescriptorSetLayoutBindingFlagsCreateInfo-pBindingFlags-parameter**
  If `bindingCount` is not 0, `pBindingFlags` must be a valid pointer to an array of `bindingCount` valid combinations of `VkDescriptorBindingFlagBits` values.
Bits which can be set in each element of `VkDescriptorSetLayoutBindingFlagsCreateInfo`'s `pBindingFlags`, specifying options for the corresponding descriptor set layout binding, are:

```c
typedef enum VkDescriptorBindingFlagBits {
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT = 0x00000001,
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT = 0x00000002,
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT = 0x00000004,
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT = 0x00000008,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT_EXT = VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT_EXT = VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT_EXT = VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT_EXT = VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT,
} VkDescriptorBindingFlagBits;
```

or the equivalent

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlagBits VkDescriptorBindingFlagBitsEXT;
```

- **VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT** indicates that if descriptors in this binding are updated between when the descriptor set is bound in a command buffer and when that command buffer is submitted to a queue, then the submission will use the most recently set descriptors for this binding and the updates do not invalidate the command buffer. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in `vkUpdateDescriptorSetWithTemplateKHR` and `vkUpdateDescriptorSets`. Multiple descriptors with this flag set can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads. Descriptors with this flag set can be updated concurrently with the set being bound to a command buffer in another thread, but not concurrently with the set being reset or freed.

- **VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT** indicates that descriptors in this binding that are not *dynamically used* need not contain valid descriptors at the time the descriptors are consumed. A descriptor is dynamically used if any shader invocation executes an instruction that performs any memory access using the descriptor. If a descriptor is not dynamically used, any resource referenced by the descriptor is not considered to be referenced during command execution.

- **VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT** indicates that descriptors in this binding can be updated after a command buffer has bound this descriptor set, or while a
command buffer that uses this descriptor set is pending execution, as long as the descriptors that are updated are not used by those command buffers. Descriptor bindings created with this flag are also partially exempt from the external synchronization requirement in 
\texttt{vkUpdateDescriptorSetWithTemplateKHR} and \texttt{vkUpdateDescriptorSets} in the same way as for \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT}. If \texttt{VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT} is also set, then descriptors can be updated as long as they are not dynamically used by any shader invocations. If \texttt{VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT} is not set, then descriptors can be updated as long as they are not statically used by any shader invocations.

- \texttt{VK_DESCRIPTOR_BINDING_VARIABLE_DESCRIPTOR_COUNT_BIT} indicates that this is a variable-sized descriptor binding whose size will be specified when a descriptor set is allocated using this layout. The value of \texttt{descriptorCount} is treated as an upper bound on the size of the binding. This must only be used for the last binding in the descriptor set layout (i.e. the binding with the largest value of \texttt{binding}). For the purposes of counting against limits such as \texttt{maxDescriptorSet} and \texttt{maxPerStageDescriptor}, the full value of \texttt{descriptorCount} is counted, except for descriptor bindings with a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK}. In this case, \texttt{descriptorCount} specifies the upper bound on the byte size of the binding; thus it counts against the \texttt{maxInlineUniformBlockSize} and \texttt{maxInlineUniformTotalSize} limits instead.

\begin{quote}
\textbf{Note}

Note that while \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} and \texttt{VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT} both involve updates to descriptor sets after they are bound, \texttt{VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT} is a weaker requirement since it is only about descriptors that are not used, whereas \texttt{VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT} requires the implementation to observe updates to descriptors that are used.
\end{quote}

\begin{verbatim}
// Provided by VK_VERSION_1_2
typedef VkFlags VkDescriptorBindingFlags;
\end{verbatim}

or the equivalent

\begin{verbatim}
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorBindingFlags VkDescriptorBindingFlagsEXT;
\end{verbatim}

\texttt{VkDescriptorBindingFlags} is a bitmask type for setting a mask of zero or more \texttt{VkDescriptorBindingFlagBits}.

To query information about whether a descriptor set layout can be created, call:

\begin{verbatim}
// Provided by VK_VERSION_1_1
void vkGetDescriptorSetLayoutSupport(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
\end{verbatim}
or the equivalent command

```c
// Provided by VK_KHR_maintenance3
void vkGetDescriptorSetLayoutSupportKHR(
    VkDevice device,
    const VkDescriptorSetLayoutCreateInfo* pCreateInfo,
    VkDescriptorSetLayoutSupport* pSupport);
```

- **device** is the logical device that would create the descriptor set layout.
- **pCreateInfo** is a pointer to a `VkDescriptorSetLayoutCreateInfo` structure specifying the state of the descriptor set layout object.
- **pSupport** is a pointer to a `VkDescriptorSetLayoutSupport` structure, in which information about support for the descriptor set layout object is returned.

Some implementations have limitations on what fits in a descriptor set which are not easily expressible in terms of existing limits like `maxDescriptorSet*`, for example if all descriptor types share a limited space in memory but each descriptor is a different size or alignment. This command returns information about whether a descriptor set satisfies this limit. If the descriptor set layout satisfies the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, this command is guaranteed to return `VK_TRUE` in `VkDescriptorSetLayoutSupport::supported`. If the descriptor set layout exceeds the `VkPhysicalDeviceMaintenance3Properties::maxPerSetDescriptors` limit, whether the descriptor set layout is supported is implementation-dependent and may depend on whether the descriptor sizes and alignments cause the layout to exceed an internal limit.

This command does not consider other limits such as `maxPerStageDescriptor*`, and so a descriptor set layout that is supported according to this command must still satisfy the pipeline layout limits such as `maxPerStageDescriptor*` in order to be used in a pipeline layout.

> **Note**
> This is a `VkDevice` query rather than `VkPhysicalDevice` because the answer may depend on enabled features.

**Valid Usage (Implicit)**

- VUID-vkGetDescriptorSetLayoutSupport-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkGetDescriptorSetLayoutSupport-pCreateInfo-parameter
  - `pCreateInfo` must be a valid pointer to a valid `VkDescriptorSetLayoutCreateInfo` structure
- VUID-vkGetDescriptorSetLayoutSupport-pSupport-parameter
  - `pSupport` must be a valid pointer to a `VkDescriptorSetLayoutSupport` structure

Information about support for the descriptor set layout is returned in a `VkDescriptorSetLayoutSupport` structure:
typedef struct VkDescriptorSetLayoutSupport {
    VkStructureType sType;
    void* pNext;
    VkBool32 supported;
} VkDescriptorSetLayoutSupport;

or the equivalent

typedef VkDescriptorSetLayoutSupport VkDescriptorSetLayoutSupportKHR;

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `supported` specifies whether the descriptor set layout can be created.

`supported` is set to `VK_TRUE` if the descriptor set can be created, or else is set to `VK_FALSE`.

Valid Usage (Implicit)

- VUID-VkDescriptorSetLayoutSupport-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_SUPPORT`
- VUID-VkDescriptorSetLayoutSupport-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountLayoutSupport`
- VUID-VkDescriptorSetLayoutSupport-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

If the `pNext` chain of a `VkDescriptorSetLayoutSupport` structure includes a `VkDescriptorSetVariableDescriptorCountLayoutSupport` structure, then that structure returns additional information about whether the descriptor set layout is supported.

typedef struct VkDescriptorSetVariableDescriptorCountLayoutSupport {
    VkStructureType sType;
    void* pNext;
    uint32_t maxVariableDescriptorCount;
} VkDescriptorSetVariableDescriptorCountLayoutSupport;

or the equivalent

typedef VkDescriptorSetVariableDescriptorCountLayoutSupport

// Provided by VK_EXT_descriptor_indexing

VkDescriptorSetVariableDescriptorCountLayoutSupportEXT;

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- maxVariableDescriptorCount indicates the maximum number of descriptors supported in the highest numbered binding of the layout, if that binding is variable-sized. If the highest numbered binding of the layout has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then maxVariableDescriptorCount indicates the maximum byte size supported for the binding, if that binding is variable-sized.

If the VkDescriptorSetLayoutCreateInfo structure specified in vkGetDescriptorSetLayoutSupport::pCreateInfo includes a variable-sized descriptor, then supported is determined assuming the requested size of the variable-sized descriptor, and maxVariableDescriptorCount is set to the maximum size of that descriptor that can be successfully created (which is greater than or equal to the requested size passed in). If the VkDescriptorSetLayoutCreateInfo structure does not include a variable-sized descriptor, or if the VkPhysicalDeviceDescriptorIndexingFeatures::descriptorBindingVariableDescriptorCount feature is not enabled, then maxVariableDescriptorCount is set to zero. For the purposes of this command, a variable-sized descriptor binding with a descriptorCount of zero is treated as if the descriptorCount is one, and thus the binding is not ignored and the maximum descriptor count will be returned. If the layout is not supported, then the value written to maxVariableDescriptorCount is undefined.

Valid Usage (Implicit)

- VUID-VkDescriptorSetVariableDescriptorCountLayoutSupport-sType-sType

VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_LAYOUT_SUPPORT

The following examples show a shader snippet using two descriptor sets, and application code that creates corresponding descriptor set layouts.

GLSL example

```glsl
// binding to a single sampled image descriptor in set 0
//
layout (set=0, binding=0) uniform texture2D mySampledImage;

// binding to an array of sampled image descriptors in set 0
//
layout (set=0, binding=1) uniform texture2D myArrayOfSampledImages[12];

// binding to a single uniform buffer descriptor in set 1
//
layout (set=1, binding=0) uniform myUniformBuffer
```
```
vec4 myElement[32];
```

**SPIR-V example**

``` spir-v

```

**API example**

``` c
VkResult myResult;

const VkDescriptorSetLayoutBinding myDescriptorSetLayoutBinding[] =
{
    // binding to a single image descriptor
    {
```
0,            // binding
VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,  // descriptorType
1,            // descriptorCount
VK_SHADER_STAGE_FRAGMENT_BIT,     // stageFlags
NULL          // pImmutableSamplers
},

// binding to an array of image descriptors
{
  1,            // binding
  VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE,  // descriptorType
  12,           // descriptorCount
  VK_SHADER_STAGE_FRAGMENT_BIT,     // stageFlags
  NULL          // pImmutableSamplers
},

// binding to a single uniform buffer descriptor
{
  0,            // binding
  VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER,  // descriptorType
  1,            // descriptorCount
  VK_SHADER_STAGE_FRAGMENT_BIT,     // stageFlags
  NULL          // pImmutableSamplers
}
);

const VkDescriptorSetLayoutCreateInfo myDescriptorSetLayoutCreateInfo[] =
{
  // Information for first descriptor set with two descriptor bindings
  {
    VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,  // sType
    NULL,  // pNext
    2,      // flags
    &myDescriptorSetLayoutBinding[0]  // bindingCount
  },

  // Information for second descriptor set with one descriptor binding
  {
    VK_STRUCTURE_TYPE_DESCRIPTOR_SET_LAYOUT_CREATE_INFO,  // sType
    NULL,  // pNext
    1,      // flags
    &myDescriptorSetLayoutBinding[2]  // bindingCount
  }
};

VkDescriptorSetLayout myDescriptorSetLayout[2];
To destroy a descriptor set layout, call:

```c
void vkDestroyDescriptorSetLayout(
    VkDevice device,
    VkDescriptorSetLayout descriptorSetLayout,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor set layout.
- `descriptorSetLayout` is the descriptor set layout to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00284**
  If `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, a compatible set of callbacks **must** be provided here

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-00285**
  If no `VkAllocationCallbacks` were provided when `descriptorSetLayout` was created, `pAllocator` **must** be `NULL`

### Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorSetLayout-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorSetLayout-descriptorSetLayout-parameter**
  If `descriptorSetLayout` is not `VK_NULL_HANDLE`, `descriptorSetLayout` **must** be a valid `VkDescriptorSetLayout` handle
14.2.2. Pipeline Layouts

Access to descriptor sets from a pipeline is accomplished through a pipeline layout. Zero or more descriptor set layouts and zero or more push constant ranges are combined to form a pipeline layout object describing the complete set of resources that can be accessed by a pipeline. The pipeline layout represents a sequence of descriptor sets with each having a specific layout. This sequence of layouts is used to determine the interface between shader stages and shader resources. Each pipeline is created using a pipeline layout.

Pipeline layout objects are represented by VkPipelineLayout handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPipelineLayout)
```

To create a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreatePipelineLayout(
    VkDevice device,
    const VkPipelineLayoutCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkPipelineLayout* pPipelineLayout);
```

- `device` is the logical device that creates the pipeline layout.
- `pCreateInfo` is a pointer to a VkPipelineLayoutCreateInfo structure specifying the state of the pipeline layout object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pPipelineLayout` is a pointer to a VkPipelineLayout handle in which the resulting pipeline layout object is returned.
Valid Usage (Implicit)

- **VUID-vkCreatePipelineLayout-device-parameter**
  
  `device` must be a valid `VkDevice` handle

- **VUID-vkCreatePipelineLayout-pCreateInfo-parameter**
  
  `pCreateInfo` must be a valid pointer to a valid `VkPipelineLayoutCreateInfo` structure

- **VUID-vkCreatePipelineLayout-pAllocator-parameter**
  
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkCreatePipelineLayout-pPipelineLayout-parameter**
  
  `pPipelineLayout` must be a valid pointer to a `VkPipelineLayout` handle

Return Codes

**Success**

- `VK_SUCCESS`

**Failure**

- `VK_ERROR_OUT_OF_HOST_MEMORY`
- `VK_ERROR_OUT_OF_DEVICE_MEMORY`

The `VkPipelineLayoutCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineLayoutCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineLayoutCreateFlags flags;
    uint32_t setLayoutCount;
    const VkDescriptorSetLayout* pSetLayouts;
    uint32_t pushConstantRangeCount;
    const VkPushConstantRange* pPushConstantRanges;
} VkPipelineLayoutCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineLayoutCreateFlagBits` specifying options for pipeline layout creation.
- `setLayoutCount` is the number of descriptor sets included in the pipeline layout.
- `pSetLayouts` is a pointer to an array of `VkDescriptorSetLayout` objects.
- `pushConstantRangeCount` is the number of push constant ranges included in the pipeline layout.
- `pPushConstantRanges` is a pointer to an array of `VkPushConstantRange` structures defining a set of
push constant ranges for use in a single pipeline layout. In addition to descriptor set layouts, a pipeline layout also describes how many push constants can be accessed by each stage of the pipeline.

Note
Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

Valid Usage

- **VUID-VkPipelineLayoutCreateInfo-setLayoutCount-00286**
  
  `setLayoutCount` must be less than or equal to `VkPhysicalDeviceLimits::maxBoundDescriptorSets`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03016**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_SAMPLER` and `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSamplers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03017**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` and `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorUniformBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03018**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageBuffers`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-06939**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER`, `VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM`, and `VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorSampledImages`

- **VUID-VkPipelineLayoutCreateInfo-descriptorType-03020**
  
  The total number of descriptors in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible to any given shader stage across all elements of `pSetLayouts` must be less than or equal to `VkPhysicalDeviceLimits::maxPerStageDescriptorStorageImages`
• VUID-VkPipelineLayoutCreateInfo-descriptorType-03021
The total number of descriptors in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType
of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all
elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxPerStageDescriptorInputAttachments

• VUID-VkPipelineLayoutCreateInfo-descriptorType-02214
The total number of bindings in descriptor set layouts created without the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType
of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all
elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorInlineUniformBlocks

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03022
The total number of descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and
VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible to any given shader stage across all
elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSamplers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03023
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER and VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindUniformBuffers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03024
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER and VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageBuffers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03025
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and
VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindSampledImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03026
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindStorageImages

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03027
The total number of descriptors with a descriptorType of
VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxPerStageDescriptorUpdateAfterBindInputAttachments

• VUID-VkPipelineLayoutCreateInfo-descriptorType-02215
  The total number of bindings with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK accessible to any given shader stage across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceInlineUniformBlockProperties::maxPerStageDescriptorUpdateAfterBindInlineUniformBlocks

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03028
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSamplers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03029
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03030
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetUniformBuffersDynamic

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03031
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffers

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03032
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageBuffersDynamic

• VUID-VkPipelineLayoutCreateInfo-descriptorType-03033
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, and VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER accessible across all shader stages and across all
elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetSampledImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03034
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03035
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, and VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03036
  The total number of descriptors in descriptor set layouts created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT bit set with a descriptorType of VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceLimits::maxDescriptorSetStorageImages

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03037
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSamplers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03038
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03039
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03040
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindUniformBuffersDynamic

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03041
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffers

- VUID-VkPipelineLayoutCreateInfo-descriptorType-03042
  The total number of descriptors of the type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC accessible across all shader stages and across all elements of pSetLayouts must be less than or equal to VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageBuffersDynamic
The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, and `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindSampledImages`

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE`, and `VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER` accessible across all shader stages and across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindStorageImages`

The total number of descriptors of the type `VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT` accessible across all shader stages and across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceDescriptorIndexingProperties::maxDescriptorSetUpdateAfterBindInputAttachments`

The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` accessible across all shader stages and across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceInlineUniformBlockProperties::maxDescriptorSetUpdateAfterBindInlineUniformBlocks`

Any two elements of `pPushConstantRanges must` not include the same stage in `stageFlags`

`pSetLayouts must` not contain more than one descriptor set layout that was created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorAccelerationStructures`

The total number of bindings with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible to any given shader stage across all elements of `pSetLayouts must` be less than or equal to `VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxPerStageDescriptorUpdateAfterBindAccelerationStructures`

The total number of bindings in descriptor set layouts created without the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set with a `descriptorType` of `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR` accessible across all shader stages and
The total number of bindings with a descriptorType of
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR accessible across all shader stages and
across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceAccelerationStructurePropertiesKHR::maxDescriptorSetAccelerationStructures

The total number of bindings with a descriptorType of
VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV accessible across all shader stages and
across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceRayTracingPropertiesNV::maxDescriptorSetAccelerationStructures

The total number of pImmutableSamplers created with flags containing
VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT or
VK_SAMPLER_CREATE_SUBSAMPLED_COARSE_RECONSTRUCTION_BIT_EXT across all shader stages and
across all elements of pSetLayouts must be less than or equal to
VkPhysicalDeviceFragmentDensityMap2PropertiesEXT::maxDescriptorSetSubsampledSamplers

Any element of pSetLayouts must not have been created with the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE bit set

If graphicsPipelineLibrary is not enabled, elements of pSetLayouts must be valid
VkDescriptorsetLayout objects

Valid Usage (Implicit)

- VUID-VkPipelineLayoutCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO

- VUID-VkPipelineLayoutCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkPipelineLayoutCreateInfo-flags-parameter
  flags must be a valid combination of VkPipelineLayoutCreateFlagBits values

- VUID-VkPipelineLayoutCreateInfo-pSetLayouts-parameter
  If setLayoutCount is not 0, pSetLayouts must be a valid pointer to an array of
  setLayoutCount valid or VK_NULL_HANDLE VkDescriptorSetLayout handles

- VUID-VkPipelineLayoutCreateInfo-pPushConstantRanges-parameter
  If pushConstantRangeCount is not 0, pPushConstantRanges must be a valid pointer to an array
  of pushConstantRangeCount valid VkPushConstantRange structures
• **VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT** specifies that implementations **must** ensure that the properties and/or absence of a particular descriptor set do not influence any other properties of the pipeline layout. This allows pipelines libraries linked without **VK_PIPELINE_CREATE_LINK_TIME_OPTIMIZATION_BIT_EXT** to be created with a subset of the total descriptor sets.

**VkPipelineLayoutCreateFlagBits** is a bitmask type for setting a mask of **VkPipelineLayoutCreateFlagBits**.

The **VkPushConstantRange** structure is defined as:

• **stageFlags** is a set of stage flags describing the shader stages that will access a range of push constants. If a particular stage is not included in the range, then accessing members of that range of push constants from the corresponding shader stage will return undefined values.

• **offset** and **size** are the start offset and size, respectively, consumed by the range. Both **offset** and **size** are in units of bytes and **must** be a multiple of 4. The layout of the push constant variables is specified in the shader.

**Valid Usage**

• **VUID-VkPushConstantRange-offset-00294**
  
  **offset must** be less than **VkPhysicalDeviceLimits::maxPushConstantsSize**

• **VUID-VkPushConstantRange-offset-00295**
  
  **offset must** be a multiple of 4

• **VUID-VkPushConstantRange-size-00296**
  
  **size must** be greater than 0

• **VUID-VkPushConstantRange-size-00297**
  
  **size must** be a multiple of 4
Valid Usage (Implicit)

- VUID-VkPushConstantRange-stageFlags-parameter
  stageFlags must be a valid combination of VkShaderStageFlagBits values
- VUID-VkPushConstantRange-stageFlags-required bitmask
  stageFlags must not be 0

Once created, pipeline layouts are used as part of pipeline creation (see Pipelines), as part of binding descriptor sets (see Descriptor Set Binding), and as part of setting push constants (see Push Constant Updates). Pipeline creation accepts a pipeline layout as input, and the layout may be used to map (set, binding, arrayElement) tuples to implementation resources or memory locations within a descriptor set. The assignment of implementation resources depends only on the bindings defined in the descriptor sets that comprise the pipeline layout, and not on any shader source.

All resource variables statically used in all shaders in a pipeline must be declared with a (set, binding, arrayElement) that exists in the corresponding descriptor set layout and is of an appropriate descriptor type and includes the set of shader stages it is used by in stageFlags. The pipeline layout can include entries that are not used by a particular pipeline, or that are dead-code eliminated from any of the shaders. The pipeline layout allows the application to provide a consistent set of bindings across multiple pipeline compiles, which enables those pipelines to be compiled in a way that the implementation may cheaply switch pipelines without reprogramming the bindings.

Similarly, the push constant block declared in each shader (if present) must only place variables at offsets that are each included in a push constant range with stageFlags including the bit corresponding to the shader stage that uses it. The pipeline layout can include ranges or portions of ranges that are not used by a particular pipeline, or for which the variables have been dead-code eliminated from any of the shaders.

There is a limit on the total number of resources of each type that can be included in bindings in all descriptor set layouts in a pipeline layout as shown in Pipeline Layout Resource Limits. The “Total Resources Available” column gives the limit on the number of each type of resource that can be included in bindings in all descriptor sets in the pipeline layout. Some resource types count against multiple limits. Additionally, there are limits on the total number of each type of resource that can be used in any pipeline stage as described in Shader Resource Limits.

To destroy a pipeline layout, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyPipelineLayout(
    VkDevice device,
    VkPipelineLayout pipelineLayout,
    const VkAllocationCallbacks* pAllocator);
```

- **device** is the logical device that destroys the pipeline layout.
- **pipelineLayout** is the pipeline layout to destroy.
- **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyPipelineLayout-pipelineLayout-00299
  If `VkAllocationCallbacks` were provided when `pipelineLayout` was created, a compatible
set of callbacks **must** be provided here

- **VUID-vkDestroyPipelineLayout-pipelineLayout-00300**
  If no `VkAllocationCallbacks` were provided when `pipelineLayout` was created, `pAllocator` **must** be `NULL`

- **VUID-vkDestroyPipelineLayout-pipelineLayout-02004**
  `pipelineLayout` **must** not have been passed to any `vkCmd*` command for any command buffers that are still in the `recording state` when `vkDestroyPipelineLayout` is called

---

**Valid Usage (Implicit)**

- **VUID-vkDestroyPipelineLayout-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parameter**
  If `pipelineLayout` is not `VK_NULL_HANDLE`, `pipelineLayout` **must** be a valid `VkPipelineLayout` handle

- **VUID-vkDestroyPipelineLayout-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyPipelineLayout-pipelineLayout-parent**
  If `pipelineLayout` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

---

**Host Synchronization**

- Host access to `pipelineLayout` **must** be externally synchronized

---

**Pipeline Layout Compatibility**

Two pipeline layouts are defined to be “compatible for push constants” if they were created with identical push constant ranges. Two pipeline layouts are defined to be “compatible for set N” if they were created with *identically defined* descriptor set layouts for sets zero through N, if both of them either were or were not created with `VK_PIPELINE_LAYOUT_CREATE_INDEPENDENT_SETS_BIT_EXT`, and if they were created with identical push constant ranges.

When binding a descriptor set (see [Descriptor Set Binding](#)) to set number N, if the previously bound descriptor sets for sets zero through N-1 were all bound using compatible pipeline layouts, then performing this binding does not disturb any of the lower numbered sets. If, additionally, the previously bound descriptor set for set N was bound using a pipeline layout compatible for set N, then the bindings in sets numbered greater than N are also not disturbed.

Similarly, when binding a pipeline, the pipeline **can** correctly access any previously bound descriptor sets which were bound with compatible pipeline layouts, as long as all lower numbered sets were also bound with compatible layouts.
Layout compatibility means that descriptor sets can be bound to a command buffer for use by any pipeline created with a compatible pipeline layout, and without having bound a particular pipeline first. It also means that descriptor sets can remain valid across a pipeline change, and the same resources will be accessible to the newly bound pipeline.

**Implementor’s Note**

A consequence of layout compatibility is that when the implementation compiles a pipeline layout and maps pipeline resources to implementation resources, the mechanism for set N should only be a function of sets [0..N].

**Note**

Place the least frequently changing descriptor sets near the start of the pipeline layout, and place the descriptor sets representing the most frequently changing resources near the end. When pipelines are switched, only the descriptor set bindings that have been invalidated will need to be updated and the remainder of the descriptor set bindings will remain in place.

The maximum number of descriptor sets that can be bound to a pipeline layout is queried from physical device properties (see maxBoundDescriptorSets in Limits).

**API example**

```c
const VkDescriptorSetLayout layouts[] = { layout1, layout2 };;

const VkPushConstantRange ranges[] =
{
    {
        VK_SHADER_STAGE_VERTEX_BIT, // stageFlags
        0, // offset
        4 // size
    },
    {
        VK_SHADER_STAGE_FRAGMENT_BIT, // stageFlags
        4, // offset
        4 // size
    },
};

const VkPipelineLayoutCreateInfo createInfo =
{
    VK_STRUCTURE_TYPE_PIPELINE_LAYOUT_CREATE_INFO, // sType
    NULL, // pNext
    0, // flags
    2, // setLayoutCount
    layouts, // pSetLayouts
    2, // pushConstantRangeCount
};
```
14.2.3. Allocation of Descriptor Sets

A descriptor pool maintains a pool of descriptors, from which descriptor sets are allocated. Descriptor pools are externally synchronized, meaning that the application must not allocate and/or free descriptor sets from the same pool in multiple threads simultaneously.

Descriptor pools are represented by VkDescriptorPool handles:

```cpp
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorPool)
```

To create a descriptor pool object, call:

```cpp
// Provided by VK_VERSION_1_0
VkResult vkCreateDescriptorPool(
    VkDevice device,
    const VkDescriptorPoolCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorPool* pDescriptorPool);
```

- `device` is the logical device that creates the descriptor pool.
- `pCreateInfo` is a pointer to a VkDescriptorPoolCreateInfo structure specifying the state of the descriptor pool object.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pDescriptorPool` is a pointer to a VkDescriptorPool handle in which the resulting descriptor pool object is returned.

The created descriptor pool is returned in `pDescriptorPool`.

Valid Usage (Implicit)

- VUID-vkCreateDescriptorPool-device-parameter `device` must be a valid VkDevice handle
- VUID-vkCreateDescriptorPool-pCreateInfo-parameter `pCreateInfo` must be a valid pointer to a valid VkDescriptorPoolCreateInfo structure
If \texttt{pAllocator} is not \texttt{NULL}, \texttt{pAllocator} \textbf{must} be a valid pointer to a valid \texttt{VkAllocationCallbacks} structure.

\texttt{pDescriptorPool} \textbf{must} be a valid pointer to a \texttt{VkDescriptorPool} handle.

### Return Codes

**Success**
- \texttt{VK_SUCCESS}

**Failure**
- \texttt{VK_ERROR_OUT_OF_HOST_MEMORY}
- \texttt{VK_ERROR_OUT_OF_DEVICE_MEMORY}
- \texttt{VK_ERROR_FRAGMENTATION_EXT}

Additional information about the pool is passed in a \texttt{VkDescriptorPoolCreateInfo} structure:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPoolCreateFlags flags;
    uint32_t maxSets;
    uint32_t poolSizeCount;
    const VkDescriptorPoolSize* pPoolSizes;
} VkDescriptorPoolCreateInfo;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{flags} is a bitmask of \texttt{VkDescriptorPoolCreateFlagBits} specifying certain supported operations on the pool.
- \texttt{maxSets} is the maximum number of descriptor sets that \textbf{can} be allocated from the pool.
- \texttt{poolSizeCount} is the number of elements in \texttt{pPoolSizes}.
- \texttt{pPoolSizes} is a pointer to an array of \texttt{VkDescriptorPoolSize} structures, each containing a descriptor type and number of descriptors of that type to be allocated in the pool.

If multiple \texttt{VkDescriptorPoolSize} structures containing the same descriptor type appear in the \texttt{pPoolSizes} array then the pool will be created with enough storage for the total number of descriptors of each type.

Fragmentation of a descriptor pool is possible and \textbf{may} lead to descriptor set allocation failures. A failure due to fragmentation is defined as failing a descriptor set allocation despite the sum of all
outstanding descriptor set allocations from the pool plus the requested allocation requiring no more than the total number of descriptors requested at pool creation. Implementations provide certain guarantees of when fragmentation must not cause allocation failure, as described below.

If a descriptor pool has not had any descriptor sets freed since it was created or most recently reset then fragmentation must not cause an allocation failure (note that this is always the case for a pool created without the VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT bit set). Additionally, if all sets allocated from the pool since it was created or most recently reset use the same number of descriptors (of each type) and the requested allocation also uses that same number of descriptors (of each type), then fragmentation must not cause an allocation failure.

If an allocation failure occurs due to fragmentation, an application can create an additional descriptor pool to perform further descriptor set allocations.

If flags has the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT bit set, descriptor pool creation may fail with the error VK_ERROR_FRAGMENTATION if the total number of descriptors across all pools (including this one) created with this bit set exceeds maxUpdateAfterBindDescriptorsInAllPools, or if fragmentation of the underlying hardware resources occurs.

If a pPoolSizes[i].type is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, a VkMutableDescriptorTypeCreateInfoVALVE struct in the pNext chain can be used to specify which mutable descriptor types can be allocated from the pool. If present in the pNext chain, VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i] specifies which kind of VkMutableDescriptorTypeCreateInfoVALVE::pMutableDescriptorTypeLists[i] is out of range, the descriptor pool allocates enough memory to be able to allocate a VkMutableDescriptorTypeCreateInfoVALVE descriptor with any supported VkDescriptorType as a mutable descriptor. A mutable descriptor can be allocated from a pool entry if the type list in VkDescriptorSetLayoutCreateInfo is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple pPoolSizes entries with VkDescriptorTypeCreateInfo as a subset of the type list in VkDescriptorSetLayoutCreateInfo is a subset of the type list declared in the descriptor pool, or if the pool entry is created without a descriptor type list. Multiple such pool entries are present in pPoolSizes, they specify sets of supported descriptor types which either fully overlap, partially overlap, or are disjoint. Two sets fully overlap if the sets of supported descriptor types are equal. If the sets are not disjoint they partially overlap. A pool entry without a VkMutableDescriptorTypeListVALVE assigned to it is considered to partially overlap any other pool entry which has a VkMutableDescriptorTypeListVALVE assigned to it. The application must ensure that partial overlap does not exist in pPoolSizes.

Note
The requirement of no partial overlap is intended to resolve ambiguity for validation as there is no confusion which pPoolSizes entries will be allocated from. An implementation is not expected to depend on this requirement.

Valid Usage

- VUID-VkDescriptorPoolCreateInfo-maxSets-00301
  maxSets must be greater than 0
Valid Usage (Implicit)

- **VUID-VkDescriptorPoolCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_CREATE_INFO

- **VUID-VkDescriptorPoolCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkDescriptorPoolInlineUniformBlockCreateInfo or VkMutableDescriptorTypeCreateInfoVALVE

- **VUID-VkDescriptorPoolCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkDescriptorPoolCreateInfo-flags-parameter**
  flags must be a valid combination of VkDescriptorPoolCreateFlagBits values

- **VUID-VkDescriptorPoolCreateInfo-pPoolSizes-parameter**
  If poolSizeCount is not 0, pPoolSizes must be a valid pointer to an array of poolSizeCount valid VkDescriptorPoolSize structures

In order to be able to allocate descriptor sets having inline uniform block bindings the descriptor pool must be created with specifying the inline uniform block binding capacity of the descriptor pool, in addition to the total inline uniform data capacity in bytes which is specified through a VkDescriptorPoolSize structure with a descriptorType value of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK. This can be done by adding a VkDescriptorPoolInlineUniformBlockCreateInfo structure to the pNext chain of VkDescriptorPoolCreateInfo.

The VkDescriptorPoolInlineUniformBlockCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_3
```
typedef struct VkDescriptorPoolInlineUniformBlockCreateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t maxInlineUniformBlockBindings;
} VkDescriptorPoolInlineUniformBlockCreateInfo;

or the equivalent

// Provided by VK_EXT_inline_uniform_block
typedef VkDescriptorPoolInlineUniformBlockCreateInfo VkDescriptorPoolInlineUniformBlockCreateInfoEXT;

• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **maxInlineUniformBlockBindings** is the number of inline uniform block bindings to allocate.

### Valid Usage (Implicit)

• VUID-VkDescriptorPoolInlineUniformBlockCreateInfo-sType-sType
  
  **sType must be** VK_STRUCTURE_TYPE_DESCRIPTOR_POOL_INLINE_UNIFORM_BLOCK_CREATE_INFO

Bits which **can** be set in `VkDescriptorPoolCreateInfo::flags`, enabling operations on a descriptor pool, are:

// Provided by VK_VERSION_1_0
typedef enum VkDescriptorPoolCreateFlagBits {
    VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT = 0x00000001,
    // Provided by VK_VERSION_1_2
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT = 0x00000002,
    // Provided by VK_VALVE_mutable_descriptor_type
    VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE = 0x00000004,
    // Provided by VK_EXT_descriptor_indexing
    VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT_EXT = 
                VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT
} VkDescriptorPoolCreateFlagBits;

• **VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT** specifies that descriptor sets **can** return their individual allocations to the pool, i.e. all of `vkAllocateDescriptorSets`, `vkFreeDescriptorSets`, and `vkResetDescriptorPool` are allowed. Otherwise, descriptor sets allocated from the pool **must** not be individually freed back to the pool, i.e. only `vkAllocateDescriptorSets` and `vkResetDescriptorPool` are allowed.

• **VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT** specifies that descriptor sets allocated from this pool **can** include bindings with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set. It is valid to allocate descriptor sets that have bindings that do not set the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit from a pool that has
VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT set.

- VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE specifies that this descriptor pool and the descriptor sets allocated from it reside entirely in host memory and cannot be bound. Descriptor sets allocated from this pool are partially exempt from the external synchronization requirement in vkUpdateDescriptorSetWithTemplateKHR and vkUpdateDescriptorSets. Descriptor sets and their descriptors can be updated concurrently in different threads, though the same descriptor must not be updated concurrently by two threads.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkDescriptorPoolCreateFlags;
```

VkDescriptorPoolCreateFlags is a bitmask type for setting a mask of zero or more VkDescriptorPoolCreateFlagBits.

The VkDescriptorPoolSize structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorPoolSize {
    VkDescriptorType type;
    uint32_t descriptorCount;
} VkDescriptorPoolSize;
```

- type is the type of descriptor.
- descriptorCount is the number of descriptors of that type to allocate. If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount is the number of bytes to allocate for descriptors of this type.

**Note**

When creating a descriptor pool that will contain descriptors for combined image samplers of multi-planar formats, an application needs to account for non-trivial descriptor consumption when choosing the descriptorCount value, as indicated by VkSamplerYcbcrConversionImageFormatProperties::combinedImageSamplerDescriptorCount.

**Valid Usage**

- VUID-VkDescriptorPoolSize-descriptorCount-00302
  descriptorCount must be greater than 0

- VUID-VkDescriptorPoolSize-type-02218
  If type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount must be a multiple of 4
Valid Usage (Implicit)

- **VUID-VkDescriptorPoolSize-type-parameter**
  
  `type` must be a valid `VkDescriptorType` value

To destroy a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
void vkDestroyDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    const VkAllocationCallbacks* pAllocator);
```

- `device` is the logical device that destroys the descriptor pool.
- `descriptorPool` is the descriptor pool to destroy.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.

When a pool is destroyed, all descriptor sets allocated from the pool are implicitly freed and become invalid. Descriptor sets allocated from a given pool do not need to be freed before destroying that descriptor pool.

Valid Usage

- **VUID-vkDestroyDescriptorPool-descriptorPool-00303**
  All submitted commands that refer to `descriptorPool` (via any allocated descriptor sets) must have completed execution

- **VUID-vkDestroyDescriptorPool-descriptorPool-00304**
  If `VkAllocationCallbacks` were provided when `descriptorPool` was created, a compatible set of callbacks must be provided here

- **VUID-vkDestroyDescriptorPool-descriptorPool-00305**
  If no `VkAllocationCallbacks` were provided when `descriptorPool` was created, `pAllocator` must be `NULL`

Valid Usage (Implicit)

- **VUID-vkDestroyDescriptorPool-device-parameter**
  `device` must be a valid `VkDevice` handle

- **VUID-vkDestroyDescriptorPool-descriptorPool-parameter**
  If `descriptorPool` is not `VK_NULL_HANDLE`, `descriptorPool` must be a valid `VkDescriptorPool` handle

- **VUID-vkDestroy DescriptorPool-pAllocator-parameter**
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid
VkAllocationCallbacks structure

- VUID-vkDestroyDescriptorPool-descriptorPool-parent
  
  If descriptorPool is a valid handle, it must have been created, allocated, or retrieved from device

**Host Synchronization**

- Host access to descriptorPool must be externally synchronized

Descriptor sets are allocated from descriptor pool objects, and are represented by VkDescriptorSet handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorSet)
```

To allocate descriptor sets from a descriptor pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkAllocateDescriptorSets(
    VkDevice device,
    const VkDescriptorSetAllocateInfo* pAllocateInfo,
    VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `pAllocateInfo` is a pointer to a VkDescriptorSetAllocateInfo structure describing parameters of the allocation.
- `pDescriptorSets` is a pointer to an array of VkDescriptorSet handles in which the resulting descriptor set objects are returned.

The allocated descriptor sets are returned in `pDescriptorSets`.

When a descriptor set is allocated, the initial state is largely uninitialized and all descriptors are undefined. Descriptors also become undefined if the underlying resource is destroyed. Descriptor sets containing undefined descriptors can still be bound and used, subject to the following conditions:

- For descriptor set bindings created with the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are dynamically used must have been populated before the descriptor set is consumed.
- For descriptor set bindings created without the VK_DESCRIPTOR_BINDING_PARTIALLY_BOUND_BIT bit set, all descriptors in that binding that are statically used must have been populated before the descriptor set is consumed.
- Descriptor bindings with descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK can be
undefined when the descriptor set is consumed; though values in that block will be undefined.

- Entries that are not used by a pipeline can have undefined descriptors.

If a call to `vkAllocateDescriptorSets` would cause the total number of descriptor sets allocated from the pool to exceed the value of `VkDescriptorPoolCreateInfo::maxSets` used to create `pAllocateInfo->descriptorPool`, then the allocation may fail due to lack of space in the descriptor pool. Similarly, the allocation may fail due to lack of space if the call to `vkAllocateDescriptorSets` would cause the number of any given descriptor type to exceed the sum of all the `descriptorCount` members of each element of `VkDescriptorPoolCreateInfo::pPoolSizes` with a type equal to that type.

Additionally, the allocation may also fail if a call to `vkAllocateDescriptorSets` would cause the total number of inline uniform block bindings allocated from the pool to exceed the value of `VkDescriptorPoolInlineUniformBlockCreateInfo::maxInlineUniformBlockBindings` used to create the descriptor pool.

If the allocation fails due to no more space in the descriptor pool, and not because of system or device memory exhaustion, then `VK_ERROR_OUT_OF_POOL_MEMORY` must be returned.

`vkAllocateDescriptorSets` can be used to create multiple descriptor sets. If the creation of any of those descriptor sets fails, then the implementation must destroy all successfully created descriptor set objects from this command, set all entries of the `pDescriptorSets` array to `VK_NULL_HANDLE` and return the error.

### Valid Usage (Implicit)

- VUID-vkAllocateDescriptorSets-device-parameter
  
  `device` must be a valid `VkDevice` handle

- VUID-vkAllocateDescriptorSets-pAllocateInfo-parameter
  
  `pAllocateInfo` must be a valid pointer to a valid `VkDescriptorSetAllocateInfo` structure

- VUID-vkAllocateDescriptorSets-pDescriptorSets-parameter
  
  `pDescriptorSets` must be a valid pointer to an array of `pAllocateInfo->descriptorSetCount` `VkDescriptorSet` handles

- VUID-vkAllocateDescriptorSets-pAllocateInfo::descriptorSetCount-arraylength
  
  `pAllocateInfo->descriptorSetCount` must be greater than 0

### Host Synchronization

- Host access to `pAllocateInfo->descriptorPool` must be externally synchronized

### Return Codes

**Success**

- `VK_SUCCESS`
The `VkDescriptorSetAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorSetAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorPool descriptorPool;
    uint32_t descriptorSetCount;
    const VkDescriptorSetLayout* pSetLayouts;
} VkDescriptorSetAllocateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `descriptorPool` is the pool which the sets will be allocated from.
- `descriptorSetCount` determines the number of descriptor sets to be allocated from the pool.
- `pSetLayouts` is a pointer to an array of descriptor set layouts, with each member specifying how the corresponding descriptor set is allocated.

**Valid Usage**

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-00308**
  Each element of `pSetLayouts` must not have been created with `VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR` set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-03044**
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT` flag set

- **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-04610**
  If any element of `pSetLayouts` was created with the `VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_KHR` bit set, `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_KHR` flag set

**Valid Usage (Implicit)**

- **VUID-VkDescriptorSetAllocateInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_ALLOCATE_INFO`
• **VUID-VkDescriptorSetAllocateInfo-pNext-pNext**
  
  `pNext` **must** be **NULL** or a pointer to a valid instance of `VkDescriptorSetVariableDescriptorCountAllocateInfo`.

• **VUID-VkDescriptorSetAllocateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain **must** be unique.

• **VUID-VkDescriptorSetAllocateInfo-descriptorPool-parameter**
  
  `descriptorPool` **must** be a valid `VkDescriptorPool` handle.

• **VUID-VkDescriptorSetAllocateInfo-pSetLayouts-parameter**
  
  `pSetLayouts` **must** be a valid pointer to an array of `descriptorSetCount` valid `VkDescriptorSetLayout` handles.

• **VUID-VkDescriptorSetAllocateInfo-descriptorSetCount-arraylength**
  
  `descriptorSetCount` **must** be greater than 0.

• **VUID-VkDescriptorSetAllocateInfo-commonparent**
  
  Both of `descriptorPool`, and the elements of `pSetLayouts` **must** have been created, allocated, or retrieved from the same `VkDevice`.

If the `pNext` chain of a `VkDescriptorSetAllocateInfo` structure includes a `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure, then that structure includes an array of descriptor counts for variable-sized descriptor bindings, one for each descriptor set being allocated.

The `VkDescriptorSetVariableDescriptorCountAllocateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkDescriptorSetVariableDescriptorCountAllocateInfo {
    VkStructureType sType;
    const void* pNext;
    uint32_t descriptorSetCount;
    const uint32_t* pDescriptorCounts;
} VkDescriptorSetVariableDescriptorCountAllocateInfo;
```

or the equivalent:

```c
// Provided by VK_EXT_descriptor_indexing
typedef VkDescriptorSetVariableDescriptorCountAllocateInfo
VkDescriptorSetVariableDescriptorCountAllocateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **descriptorSetCount** is zero or the number of elements in `pDescriptorCounts`.
- **pDescriptorCounts** is a pointer to an array of descriptor counts, with each member specifying the number of descriptors in a variable-sized descriptor binding in the corresponding descriptor set being allocated.
If `descriptorSetCount` is zero or this structure is not included in the `pNext` chain, then the variable lengths are considered to be zero. Otherwise, `pDescriptorCounts[i]` is the number of descriptors in the variable-sized descriptor binding in the corresponding descriptor set layout. If the variable-sized descriptor binding in the corresponding descriptor set layout has a descriptor type of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then `pDescriptorCounts[i]` specifies the binding’s capacity in bytes. If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` does not include a variable-sized descriptor binding, then `pDescriptorCounts[i]` is ignored.

### Valid Usage

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-descriptorSetCount-03045**
  
  If `descriptorSetCount` is not zero, `descriptorSetCount` must equal `VkDescriptorSetAllocateInfo::descriptorSetCount`

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pSetLayouts-03046**

  If `VkDescriptorSetAllocateInfo::pSetLayouts[i]` has a variable-sized descriptor binding, then `pDescriptorCounts[i]` must be less than or equal to the descriptor count specified for that binding when the descriptor set layout was created

### Valid Usage (Implicit)

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-sType-sType**

  `sType` must be `VK_STRUCTURE_TYPE_DESCRIPTOR_SET_VARIABLE_DESCRIPTOR_COUNT_ALLOCATE_INFO`

- **VUID-VkDescriptorSetVariableDescriptorCountAllocateInfo-pDescriptorCounts-parameter**

  If `descriptorSetCount` is not 0, `pDescriptorCounts` must be a valid pointer to an array of `descriptorSetCount uint32_t` values

To free allocated descriptor sets, call:

```c
// Provided by VK_VERSION_1_0

VkResult vkFreeDescriptorSets(VkDevice device, VkDescriptorPool descriptorPool, uint32_t descriptorSetCount, const VkDescriptorSet* pDescriptorSets);
```

- `device` is the logical device that owns the descriptor pool.
- `descriptorPool` is the descriptor pool from which the descriptor sets were allocated.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
- `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects.

After calling `vkFreeDescriptorSets`, all descriptor sets in `pDescriptorSets` are invalid.
Valid Usage

- VUID-vkFreeDescriptorSets-pDescriptorSets-00309
  All submitted commands that refer to any element of `pDescriptorSets` must have completed execution.

- VUID-vkFreeDescriptorSets-pDescriptorSets-00310
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` `VkDescriptorSet` handles, each element of which must either be a valid handle or `VK_NULL_HANDLE`.

- VUID-vkFreeDescriptorSets-descriptorPool-00312
  `descriptorPool` must have been created with the `VK_DESCRIPTOR_POOL_CREATE_FREE_DESCRIPTOR_SET_BIT` flag.

Valid Usage (Implicit)

- VUID-vkFreeDescriptorSets-device-parameter
  `device` must be a valid `VkDevice` handle.

- VUID-vkFreeDescriptorSets-descriptorPool-parameter
  `descriptorPool` must be a valid `VkDescriptorPool` handle.

- VUID-vkFreeDescriptorSets-descriptorSetCount-arraylength
  `descriptorSetCount` must be greater than 0.

- VUID-vkFreeDescriptorSets-descriptorPool-parent
  `descriptorPool` must have been created, allocated, or retrieved from `device`.

- VUID-vkFreeDescriptorSets-pDescriptorSets-parent
  Each element of `pDescriptorSets` that is a valid handle must have been created, allocated, or retrieved from `descriptorPool`.

Host Synchronization

- Host access to `descriptorPool` must be externally synchronized.

- Host access to each member of `pDescriptorSets` must be externally synchronized.

Return Codes

Success

- `VK_SUCCESS`

To return all descriptor sets allocated from a given pool to the pool, rather than freeing individual descriptor sets, call:

```
// Provided by VK_VERSION_1_0
```
VkResult vkResetDescriptorPool(
    VkDevice device,
    VkDescriptorPool descriptorPool,
    VkDescriptorPoolResetFlags flags);

- **device** is the logical device that owns the descriptor pool.
- **descriptorPool** is the descriptor pool to be reset.
- **flags** is reserved for future use.

Resetting a descriptor pool recycles all of the resources from all of the descriptor sets allocated from the descriptor pool back to the descriptor pool, and the descriptor sets are implicitly freed.

**Valid Usage**

- VUID-vkResetDescriptorPool-descriptorPool-00313
  All uses of **descriptorPool** (via any allocated descriptor sets) **must** have completed execution

**Valid Usage (Implicit)**

- VUID-vkResetDescriptorPool-device-parameter
  **device** must be a valid **VkDevice** handle
- VUID-vkResetDescriptorPool-descriptorPool-parameter
  **descriptorPool** must be a valid **VkDescriptorPool** handle
- VUID-vkResetDescriptorPool-flags-zerobitmask
  **flags** must be 0
- VUID-vkResetDescriptorPool-descriptorPool-parent
  **descriptorPool** must have been created, allocated, or retrieved from **device**

**Host Synchronization**

- Host access to **descriptorPool** must be externally synchronized
- Host access to any **VkDescriptorSet** objects allocated from **descriptorPool** must be externally synchronized

**Return Codes**

**Success**

- **VK_SUCCESS**
typedef VkFlags VkDescriptorPoolResetFlags;

VkDescriptorPoolResetFlags is a bitmask type for setting a mask, but is currently reserved for future use.

### 14.2.4. Descriptor Set Updates

Once allocated, descriptor sets can be updated with a combination of write and copy operations. To update descriptor sets, call:

```c
// Provided by VK_VERSION_1_0
void vkUpdateDescriptorSets(
    VkDevice device,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites,
    uint32_t descriptorCopyCount,
    const VkCopyDescriptorSet* pDescriptorCopies);
```

- **device** is the logical device that updates the descriptor sets.
- **descriptorWriteCount** is the number of elements in the pDescriptorWrites array.
- **pDescriptorWrites** is a pointer to an array of VkWriteDescriptorSet structures describing the descriptor sets to write to.
- **descriptorCopyCount** is the number of elements in the pDescriptorCopies array.
- **pDescriptorCopies** is a pointer to an array of VkCopyDescriptorSet structures describing the descriptor sets to copy between.

The operations described by pDescriptorWrites are performed first, followed by the operations described by pDescriptorCopies. Within each array, the operations are performed in the order they appear in the array.

Each element in the pDescriptorWrites array describes an operation updating the descriptor set using descriptors for resources specified in the structure.

Each element in the pDescriptorCopies array is a VkCopyDescriptorSet structure describing an operation copying descriptors between sets.

If the dstSet member of any element of pDescriptorWrites or pDescriptorCopies is bound, accessed, or modified by any command that was recorded to a command buffer which is currently in the recording or executable state, and any of the descriptor bindings that are updated were not created with the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set, that command buffer becomes invalid.
Valid Usage

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06236
  For each element i where pDescriptorWrites[i].descriptorType is
  VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER,
  elements of the pTexelBufferView member of pDescriptorWrites[i] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06237
  For each element i where pDescriptorWrites[i].descriptorType is
  VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, or
  VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the buffer member of any element of the
  pBufferInfo member of pDescriptorWrites[i] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06238
  For each element i where pDescriptorWrites[i].descriptorType is
  VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER,
  and dstSet was not allocated with a layout that included immutable samplers for dstBinding with
  descriptorType, the sampler member of any element of the pImageInfo member of
  pDescriptorWrites[i] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06240
  For each element i where pDescriptorWrites[i].descriptorType is
  VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, elements of the
  pAccelerationStructures member of a VkWriteDescriptorSetAccelerationStructureKHR
  structure in the pNext chain of pDescriptorWrites[i] must have been created on device.

• VUID-vkUpdateDescriptorSets-pDescriptorWrites-06493
  For each element i where pDescriptorWrites[i].descriptorType is
  VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or
  VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the imageView member of any element of
  pDescriptorWrites[i] must have been created on device.
VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06941
  For each element i where pDescriptorWrites[i].descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM or VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, pDescriptorWrites[i].pImageInfo must be a valid pointer to an array of pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo structures

- VUID-vkUpdateDescriptorSets-None-03047
  Descriptor bindings updated by this command which were created without the VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT or VK_DESCRIPTOR_BINDING_UPDATE_UNUSED_WHILE_PENDING_BIT bits set must not be used by any command that was recorded to a command buffer which is in the pending state

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-06993
  Host access to pDescriptorWrites[i].dstSet and pDescriptorCopies[i].dstSet must be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSets-device-parameter
device must be a valid VkDevice handle

- VUID-vkUpdateDescriptorSets-pDescriptorWrites-parameter
  If descriptorWriteCount is not 0, pDescriptorWrites must be a valid pointer to an array of descriptorWriteCount valid VkWriteDescriptorSet structures

- VUID-vkUpdateDescriptorSets-pDescriptorCopies-parameter
  If descriptorCopyCount is not 0, pDescriptorCopies must be a valid pointer to an array of descriptorCopyCount valid VkCopyDescriptorSet structures

The VkWriteDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkWriteDescriptorSet {
    VkStructureType          sType;
    const void*              pNext;
    VkDescriptorSet          dstSet;
    uint32_t                 dstBinding;
    uint32_t                 dstArrayElement;
    uint32_t                 descriptorCount;
    VkDescriptorType         descriptorType;
    const VkDescriptorImageInfo* pImageInfo;
    const VkDescriptorBufferInfo* pBufferInfo;
    const VkBufferView*       pTexelBufferView;
} VkWriteDescriptorSet;
```
• **sType** is the type of this structure.
• **pNext** is NULL or a pointer to a structure extending this structure.
• **dstSet** is the destination descriptor set to update.
• **dstBinding** is the descriptor binding within that set.
• **dstArrayElement** is the starting element in that array. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK** then **dstArrayElement** specifies the starting byte offset within the binding.
• **descriptorCount** is the number of descriptors to update. If the descriptor binding identified by **dstSet** and **dstBinding** has a descriptor type of **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, then **descriptorCount** specifies the number of bytes to update. Otherwise, **descriptorCount** is one of
  - the number of elements in **pImageInfo**
  - the number of elements in **pBufferInfo**
  - the number of elements in **pTexelBufferView**
  - a value matching the **dataSize** member of a **VkWriteDescriptorSetInlineUniformBlock** structure in the **pNext** chain
  - a value matching the **accelerationStructureCount** of a **VkWriteDescriptorSetAccelerationStructureKHR** structure in the **pNext** chain
• **descriptorType** is a **VkDescriptorType** specifying the type of each descriptor in **pImageInfo**, **pBufferInfo**, or **pTexelBufferView**, as described below. If **VkDescriptorSetLayoutBinding** for **dstSet** at **dstBinding** is not equal to **VK_DESCRIPTOR_TYPE_MUTABLE_VALVE**, **descriptorType** must be the same type as the **descriptorType** specified in **VkDescriptorSetLayoutBinding** for **dstSet** at **dstBinding**. The type of the descriptor also controls which array the descriptors are taken from.

• **pImageInfo** is a pointer to an array of **VkDescriptorImageInfo** structures or is ignored, as described below.
• **pBufferInfo** is a pointer to an array of **VkDescriptorBufferInfo** structures or is ignored, as described below.
• **pTexelBufferView** is a pointer to an array of **VkBufferView** handles as described in the Buffers Views section or is ignored, as described below.

Only one of **pImageInfo**, **pBufferInfo**, or **pTexelBufferView** members is used according to the descriptor type specified in the **descriptorType** member of the containing **VkWriteDescriptorSet** structure, or none of them in case **descriptorType** is **VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK**, in which case the source data for the descriptor writes is taken from the **VkWriteDescriptorSetInlineUniformBlock** structure included in the **pNext** chain of **VkWriteDescriptorSet**, or if **descriptorType** is **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR**, in which case the source data for the descriptor writes is taken from the **VkWriteDescriptorSetAccelerationStructureKHR** structure in the **pNext** chain of **VkWriteDescriptorSet**, or if **descriptorType** is **VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV**, in which case the source data for the descriptor writes is taken from the **VkWriteDescriptorSetAccelerationStructureNV** structure in the **pNext** chain of **VkWriteDescriptorSet**, as specified below.

If the **nullDescriptor** feature is enabled, the buffer, acceleration structure, imageView, or
bufferView can be VK_NULL_HANDLE. Loads from a null descriptor return zero values and stores and atomics to a null descriptor are discarded. A null acceleration structure descriptor results in the miss shader being invoked.

If the destination descriptor is a mutable descriptor, the active descriptor type for the destination descriptor becomes descriptorType.

If the dstBinding has fewer than descriptorCount array elements remaining starting from dstArrayElement, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at array element zero. If a binding has a descriptorCount of zero, it is skipped. This behavior applies recursively, with the update affecting consecutive bindings as needed to update all descriptorCount descriptors. Consecutive bindings must have identical VkDescriptorType, VkShaderStageFlags, VkDescriptorBindingFlagBits, and immutable samplers references. In addition, if the VkDescriptorType is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the supported descriptor types in VkMutableDescriptorTypeCreateInfoVALVE must be equally defined.

**Note**
The same behavior applies to bindings with a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK where descriptorCount specifies the number of bytes to update while dstArrayElement specifies the starting byte offset, thus in this case if the dstBinding has a smaller byte size than the sum of dstArrayElement and descriptorCount, then the remainder will be used to update the subsequent binding - dstBinding+1 starting at offset zero. This falls out as a special case of the above rule.

**Valid Usage**

- **VUID-VkWriteDescriptorSet-dstBinding-00315**
  dstBinding must be less than or equal to the maximum value of binding of all VkDescriptorSetLayoutBinding structures specified when dstSet's descriptor set layout was created

- **VUID-VkWriteDescriptorSet-dstBinding-00316**
  dstBinding must be a binding with a non-zero descriptorCount

- **VUID-VkWriteDescriptorSet-descriptorCount-00317**
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must have identical descriptorType and stageFlags

- **VUID-VkWriteDescriptorSet-descriptorCount-00318**
  All consecutive bindings updated via a single VkWriteDescriptorSet structure, except those with a descriptorCount of zero, must all either use immutable samplers or must all not use immutable samplers

- **VUID-VkWriteDescriptorSet-descriptorType-00319**
  descriptorType must match the type of dstBinding within dstSet

- **VUID-VkWriteDescriptorSet-dstSet-00320**
  dstSet must be a valid VkDescriptorSet handle

- **VUID-VkWriteDescriptorSet-dstArrayElement-00321**
  dstArrayElement must be set to an array element greater than or equal to the number of bindings updated.
The sum of \( dstArrayElement \) and \( descriptorCount \) must be less than or equal to the number of array elements in the descriptor set binding specified by \( dstBinding \), and all applicable consecutive bindings, as described by consecutive binding updates.

- VUID-VkWriteDescriptorSet-descriptorType-02219
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, \( dstArrayElement \) must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02220
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, \( descriptorCount \) must be an integer multiple of 4

- VUID-VkWriteDescriptorSet-descriptorType-02994
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of \( pTexelBufferView \) must be either a valid \( VkBufferView \) handle or VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02995
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER and the nullDescriptor feature is not enabled, each element of \( pTexelBufferView \) must not be VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-00324
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, \( pBufferInfo \) must be a valid pointer to an array of \( descriptorCount \) valid \( VkDescriptorBufferInfo \) structures

- VUID-VkWriteDescriptorSet-descriptorType-00325
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_SAMPLER or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and \( dstSet \) was not allocated with a layout that included immutable samplers for \( dstBinding \) with \( descriptorType \), the \( sampler \) member of each element of \( pImageInfo \) must be a valid \( VkSampler \) object

- VUID-VkWriteDescriptorSet-descriptorType-02996
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the \( imageView \) member of each element of \( pImageInfo \) must be either a valid \( VkImageView \) handle or VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02997
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT and the nullDescriptor feature is not enabled, the \( imageView \) member of each element of \( pImageInfo \) must not be VK_NULL_HANDLE

- VUID-VkWriteDescriptorSet-descriptorType-02221
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, the \( pNext \) chain must include a \( VkWriteDescriptorSetInlineUniformBlock \) structure whose \( dataSize \) member equals \( descriptorCount \)

- VUID-VkWriteDescriptorSet-descriptorType-02382
  If \( descriptorType \) is VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, the \( pNext \) chain must include a \( VkWriteDescriptorSetAccelerationStructureKHR \) structure whose
• VUID-VkWriteDescriptorSet-descriptorType-03817
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV`, the `pNext` chain **must** include a `VkWriteDescriptorSetAccelerationStructureNV` structure whose `accelerationStructureCount` member equals `descriptorCount`.

• VUID-VkWriteDescriptorSet-descriptorType-01946
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE`, then the `imageView` member of each `pImageInfo` element **must** have been created without a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain.

• VUID-VkWriteDescriptorSet-descriptorType-02738
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and if any element of `pImageInfo` has an `imageView` member that was created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain, then `dstSet` **must** have been allocated with a layout that included immutable samplers for `dstBinding`, and the corresponding immutable sampler **must** have been created with an *identically defined* `VkSamplerYcbcrConversionInfo` object.

• VUID-VkWriteDescriptorSet-descriptorType-01948
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER`, and `dstSet` was allocated with a layout that included immutable samplers for `dstBinding`, then the `imageView` member of each element of `pImageInfo` which corresponds to an immutable sampler that enables sampler Y′C′B′C′R conversion **must** have been created with a `VkSamplerYcbcrConversionInfo` structure in its `pNext` chain with an *identically defined* `VkSamplerYcbcrConversionInfo` to the corresponding immutable sampler.

• VUID-VkWriteDescriptorSet-descriptorType-00327
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment`.

• VUID-VkWriteDescriptorSet-descriptorType-00328
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, the `offset` member of each element of `pBufferInfo` **must** be a multiple of `VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment`.

• VUID-VkWriteDescriptorSet-descriptorType-00329
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER`, `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER`, or `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC`, and the `buffer` member of any element of `pBufferInfo` is the handle of a non-sparse buffer, then that buffer **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

• VUID-VkWriteDescriptorSet-descriptorType-00330
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER` or `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC`, the `buffer` member of each element of `pBufferInfo` **must** have been created with `VK_BUFFER_USAGE_UNIFORM_BUFFER_BIT` set.

• VUID-VkWriteDescriptorSet-descriptorType-00331
  If `descriptorType` is `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER` or
VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the buffer member of each element of pBufferInfo must have been created with VK_BUFFER_USAGE_STORAGE_BUFFER_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-00332
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER or VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxUniformBufferRange.

- VUID-VkWriteDescriptorSet-descriptorType-00333
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, the range member of each element of pBufferInfo, or the effective range if range is VK_WHOLE_SIZE, must be less than or equal to VkPhysicalDeviceLimits::maxStorageBufferRange.

- VUID-VkWriteDescriptorSet-descriptorType-00334
  If descriptorType is VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_UNIFORM_TEXEL_BUFFER_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-00335
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, the VkBuffer that each element of pTexelBufferView was created from must have been created with VK_BUFFER_USAGE_STORAGE_TEXEL_BUFFER_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-00336
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have been created with the identity swizzle.

- VUID-VkWriteDescriptorSet-descriptorType-00337
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_SAMPLED_BIT set.

- VUID-VkWriteDescriptorSet-descriptorType-04149
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, the imageLayout member of each element of pImageInfo must be a member of the list given in Sampled Image.

- VUID-VkWriteDescriptorSet-descriptorType-04150
  If descriptorType is VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, the imageLayout member of each element of pImageInfo must be a member of the list given in Combined Image Sampler.

- VUID-VkWriteDescriptorSet-descriptorType-04151
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageLayout member of each element of pImageInfo must be a member of the list given in Input Attachment.

- VUID-VkWriteDescriptorSet-descriptorType-04152
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the imageLayout member of each element of pImageInfo must be a member of the list given in Storage Image.

- VUID-VkWriteDescriptorSet-descriptorType-00338
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each
element of pImageInfo must have been created with VK_IMAGE_USAGE_INPUT_ATTACHMENT_BIT set

- VUID-VkWriteDescriptorSet-descriptorType-00339
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, the imageView member of each element of pImageInfo must have been created with VK_IMAGE_USAGE_STORAGE_BIT set

- VUID-VkWriteDescriptorSet-descriptorType-06710
  If descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, each imageView member of each element of pImageInfo that is a 2D image view created from a 3D image must have been created from an image created with VK_IMAGE_CREATE_2D_VIEW_COMPATIBLE_BIT_EXT set

- VUID-VkWriteDescriptorSet-descriptorType-02752
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding

- VUID-VkWriteDescriptorSet-dstSet-04611
  If the VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALUE, the new active descriptor type descriptorType must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding

- VUID-VkWriteDescriptorSet-descriptorType-06450
  If descriptorType is VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, the imageView member of each element of pImageInfo must have either been created without a VkImageViewMinLodCreateInfoEXT present in the pNext chain or with a VkImageViewMinLodCreateInfoEXT::minLod of 0.0

- VUID-VkWriteDescriptorSet-descriptorType-06942
  If descriptorType is VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM, the imageView member of each element of pImageInfo must have been created with a view created with an image created with VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM

- VUID-VkWriteDescriptorSet-descriptorType-06943
  If descriptorType is VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM, the imageView member of each element of pImageInfo must have been created with a view created with an image created with VK_IMAGE_USAGE_SAMPLE_BLOCK_MATCH_BIT_QCOM

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET

- VUID-VkWriteDescriptorSet-pNext-pNext
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkWriteDescriptorSetAccelerationStructureKHR, VkWriteDescriptorSetAccelerationStructureNV, or VkWriteDescriptorSetInlineUniformBlock

- VUID-VkWriteDescriptorSet-sType-unique
  The sType value of each struct in the pNext chain must be unique

- VUID-VkWriteDescriptorSet-descriptorType-parameter
The type of descriptors in a descriptor set is specified by `VkWriteDescriptorSet::descriptorType`, which must be one of the values:

```c
// Provided by VK_VERSION_1_0
typedef enum VkDescriptorType {
    VK_DESCRIPTOR_TYPE_SAMPLER = 0,
    VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER = 1,
    VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE = 2,
    VK_DESCRIPTOR_TYPE_STORAGE_IMAGE = 3,
    VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER = 4,
    VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER = 5,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER = 6,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER = 7,
    VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC = 8,
    VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC = 9,
    VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT = 10,
    // Provided by VK_VERSION_1_3
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK = 1000138000,
    // Provided by VK_KHR.acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR = 1000150000,
    // Provided by VK_KHR.acceleration_structure
    VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV = 1000165000,
    // Provided by VK_KHR.mutable_descriptor_type
    VK_DESCRIPTOR_TYPE_MUTABLE_VALVE = 1000351000,
    // Provided by VK_QCOM.image_processing
    VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM = 1000440000,
    // Provided by VK_QCOM.image_processing
    VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM = 1000440001,
    // Provided by VK_KHR.acceleration_structure
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK_EXT = 1000138000,
    VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK
} VkDescriptorType;
```

- `VK_DESCRIPTOR_TYPE_SAMPLER` specifies a **sampler descriptor**.
- `VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER` specifies a **combined image sampler descriptor**.
- `VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE` specifies a **sampled image descriptor**.
- `VK_DESCRIPTOR_TYPE_STORAGE_IMAGE` specifies a **storage image descriptor**.
- `VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER` specifies a **uniform texel buffer descriptor**.
- VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER specifies a storage texel buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER specifies a uniform buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER specifies a storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC specifies a dynamic uniform buffer descriptor.
- VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC specifies a dynamic storage buffer descriptor.
- VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT specifies an input attachment descriptor.
- VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK specifies an inline uniform block.
- VK_DESCRIPTOR_TYPE_MUTABLE_VALUE specifies a descriptor of mutable type.
- VK_DESCRIPTOR_TYPE_SAMPLE_WEIGHT_IMAGE_QCOM specifies a sampled weight image descriptor.
- VK_DESCRIPTOR_TYPE_BLOCK_MATCH_IMAGE_QCOM specifies a block matching image descriptor.

When a descriptor set is updated via elements of VkWriteDescriptorSet, members of pImageInfo, pBufferInfo and pTexelBufferView are only accessed by the implementation when they correspond to descriptor type being defined - otherwise they are ignored. The members accessed are as follows for each descriptor type:

- For VK_DESCRIPTOR_TYPE_SAMPLER, only the sampler member of each element of VkWriteDescriptorSet::pImageInfo is accessed.
- For VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, or VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT, only the imageView and imageLayout members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
- For VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, all members of each element of VkWriteDescriptorSet::pImageInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER, VK_DESCRIPTOR_TYPE_STORAGE_BUFFER, VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC, or VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC, all members of each element of VkWriteDescriptorSet::pBufferInfo are accessed.
- For VK_DESCRIPTOR_TYPE_UNIFORM_TEXEL_BUFFER or VK_DESCRIPTOR_TYPE_STORAGE_TEXEL_BUFFER, each element of VkWriteDescriptorSet::pTexelBufferView is accessed.

When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetInlineUniformBlock structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_KHR, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureKHR structure in the pNext chain of VkWriteDescriptorSet. When updating descriptors with a descriptorType of VK_DESCRIPTOR_TYPE_ACCELERATION_STRUCTURE_NV, none of the pImageInfo, pBufferInfo, or pTexelBufferView members are accessed, instead the source data of the descriptor update operation is taken from the VkWriteDescriptorSetAccelerationStructureNV structure in the pNext chain of VkWriteDescriptorSet.

The VkDescriptorBufferInfo structure is defined as:
```c
// Provided by VK_VERSION_1_0

typedef struct VkDescriptorBufferInfo {
    VkBuffer buffer;
    VkDeviceSize offset;
    VkDeviceSize range;
} VkDescriptorBufferInfo;
```

- **buffer** is `VK_NULL_HANDLE` or the buffer resource.
- **offset** is the offset in bytes from the start of `buffer`. Access to buffer memory via this descriptor uses addressing that is relative to this starting offset.
- **range** is the size in bytes that is used for this descriptor update, or `VK_WHOLE_SIZE` to use the range from `offset` to the end of the buffer.

When setting `range` to `VK_WHOLE_SIZE`, the effective range **must** not be larger than the maximum range for the descriptor type (`maxUniformBufferRange` or `maxStorageBufferRange`). This means that `VK_WHOLE_SIZE` is not typically useful in the common case where uniform buffer descriptors are suballocated from a buffer that is much larger than `maxUniformBufferRange`.

For `VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC` and `VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC` descriptor types, `offset` is the base offset from which the dynamic offset is applied and `range` is the static size used for all dynamic offsets.

When `range` is `VK_WHOLE_SIZE` the effective range is calculated at `vkUpdateDescriptorSets` by taking the size of `buffer` minus the `offset`.

### Valid Usage

- VUID-VkDescriptorBufferInfo-offset-00340
  * **offset** must be less than the size of `buffer`
- VUID-VkDescriptorBufferInfo-range-00341
  * If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be greater than 0
- VUID-VkDescriptorBufferInfo-range-00342
  * If `range` is not equal to `VK_WHOLE_SIZE`, `range` **must** be less than or equal to the size of `buffer` minus `offset`
- VUID-VkDescriptorBufferInfo-buffer-02998
  * If the `nullDescriptor` feature is not enabled, `buffer` **must** not be `VK_NULL_HANDLE`
- VUID-VkDescriptorBufferInfo-buffer-02999
  * If `buffer` is `VK_NULL_HANDLE`, `offset` **must** be zero and `range` **must** be `VK_WHOLE_SIZE`

### Valid Usage (Implicit)

- VUID-VkDescriptorBufferInfo-buffer-parameter
If buffer is not VK_NULL_HANDLE, buffer must be a valid VkBuffer handle.

The VkDescriptorImageInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDescriptorImageInfo {
    VkSampler sampler;
    VkImageView imageView;
    VkImageLayout imageLayout;
} VkDescriptorImageInfo;
```

- **sampler** is a sampler handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLER and VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER if the binding being updated does not use immutable samplers.
- **imageView** is VK_NULL_HANDLE or an image view handle, and is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.
- **imageLayout** is the layout that the image subresources accessible from imageView will be in at the time this descriptor is accessed. imageView is used in descriptor updates for types VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE, VK_DESCRIPTOR_TYPE_STORAGE_IMAGE, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, and VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT.

Members of VkDescriptorImageInfo that are not used in an update (as described above) are ignored.

**Valid Usage**

- VUID-VkDescriptorImageInfo-imageView-06712
  imageView must not be a 2D array image view created from a 3D image

- VUID-VkDescriptorImageInfo-descriptorType-06713
  If the image2DViewOf3D feature is not enabled and descriptorType is VK_DESCRIPTOR_TYPE_STORAGE_IMAGE then imageView must not be a 2D view created from a 3D image

- VUID-VkDescriptorImageInfo-descriptorType-06714
  If the sampler2DViewOf3D feature is not enabled and descriptorType is VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE or VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER then imageView must not be a 2D view created from a 3D image

- VUID-VkDescriptorImageInfo-imageView-01976
  If imageView is created from a depth/stencil image, the aspectMask used to create the imageView must include either VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT but not both

- VUID-VkDescriptorImageInfo-imageLayout-00344
  imageView must match the actual VkImageLayout of each subresource accessible from imageView at the time this descriptor is accessed as defined by the image layout matching rules
If `sampler` is used and the `VkFormat` of the image is a multi-planar format, the image must have been created with `VK_IMAGE_CREATE_MUTABLE_FORMAT_BIT`, and the `aspectMask` of the `imageView` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT` or (for three-plane formats only) `VK_IMAGE_ASPECT_PLANE_2_BIT`.

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::mutableComparisonSamplers` is `VK_FALSE`, then `sampler` must have been created with `VkSamplerCreateInfo::compareEnable` set to `VK_FALSE`.

Valid Usage (Implicit)

Both of `imageView`, and `sampler` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

If the `descriptorType` member of `VkWriteDescriptorSet` is `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK` then the data to write to the descriptor set is specified through a `VkWriteDescriptorSetInlineUniformBlock` structure included in the `pNext` chain of `VkWriteDescriptorSet`.

The `VkWriteDescriptorSetInlineUniformBlock` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkWriteDescriptorSetInlineUniformBlock {
    VkStructureType    sType;
    const void*        pNext;
    uint32_t            dataSize;
    const void*        pData;
} VkWriteDescriptorSetInlineUniformBlock;
```

or the equivalent

```c
// Provided by VK_EXT_inline_uniform_block
typedef VkWriteDescriptorSetInlineUniformBlock
VkWriteDescriptorSetInlineUniformBlockEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `dataSize` is the number of bytes of inline uniform block data pointed to by `pData`.
- `pData` is a pointer to `dataSize` number of bytes of data to write to the inline uniform block.
Valid Usage

- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-02222
dataSize must be an integer multiple of 4

Valid Usage (Implicit)

- VUID-VkWriteDescriptorSetInlineUniformBlock-sType-sType
sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_INLINE_UNIFORM_BLOCK
- VUID-VkWriteDescriptorSetInlineUniformBlock-pData-parameter
pData must be a valid pointer to an array of dataSize bytes
- VUID-VkWriteDescriptorSetInlineUniformBlock-dataSize-arraylength
dataSize must be greater than 0

The VkWriteDescriptorSetAccelerationStructureKHR structure is defined as:

```c
// Provided by VK_KHR_acceleration_structure
typedef struct VkWriteDescriptorSetAccelerationStructureKHR {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureKHR* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureKHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- accelerationStructureCount is the number of elements in pAccelerationStructures.
- pAccelerationStructures is a pointer to an array of VkAccelerationStructureKHR structures specifying the acceleration structures to update.

Valid Usage

- VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-02236
accelerationStructureCount must be equal to descriptorCount in the extended structure
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03579
Each acceleration structure in pAccelerationStructures must have been created with a type of VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR or VK_ACCELERATION_STRUCTURE_TYPE_GENERIC_KHR
- VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-03580
If the nullDescriptor feature is not enabled, each element of pAccelerationStructures must not be VK_NULL_HANDLE
Valid Usage (Implicit)

- **VUID-VkWriteDescriptorSetAccelerationStructureKHR-sType-sType**
  
  *sType* must be `VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_KHR`

- **VUID-VkWriteDescriptorSetAccelerationStructureKHR-pAccelerationStructures-parameter**
  
  *pAccelerationStructures* must be a valid pointer to an array of accelerationStructureCount valid or `VK_NULL_HANDLE` VkAccelerationStructureKHR handles

- **VUID-VkWriteDescriptorSetAccelerationStructureKHR-accelerationStructureCount-arraylength**
  
  accelerationStructureCount must be greater than `0`

The `VkWriteDescriptorSetAccelerationStructureNV` structure is defined as:

```c
// Provided by VK_NV_ray_tracing
typedef struct VkWriteDescriptorSetAccelerationStructureNV {
    VkStructureType sType;
    const void* pNext;
    uint32_t accelerationStructureCount;
    const VkAccelerationStructureNV* pAccelerationStructures;
} VkWriteDescriptorSetAccelerationStructureNV;
```

- *sType* is the type of this structure.
- *pNext* is NULL or a pointer to a structure extending this structure.
- accelerationStructureCount is the number of elements in pAccelerationStructures.
- pAccelerationStructures is a pointer to an array of VkAccelerationStructureNV structures specifying the acceleration structures to update.

Valid Usage

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-03747**
  
  accelerationStructureCount must be equal to descriptorCount in the extended structure

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03748**
  
  Each acceleration structure in pAccelerationStructures must have been created with `VK_ACCELERATION_STRUCTURE_TYPE_TOP_LEVEL_KHR`

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-03749**
  
  If the nullDescriptor feature is not enabled, each member of pAccelerationStructures must not be `VK_NULL_HANDLE`

Valid Usage (Implicit)

- **VUID-VkWriteDescriptorSetAccelerationStructureNV-sType-sType**
sType must be VK_STRUCTURE_TYPE_WRITE_DESCRIPTOR_SET_ACCELERATION_STRUCTURE_NV

- VUID-VkWriteDescriptorSetAccelerationStructureNV-pAccelerationStructures-parameter
  pAccelerationStructures must be a valid pointer to an array of accelerationStructureCount
  valid or VK_NULL_HANDLE VkAccelerationStructureNV handles

- VUID-VkWriteDescriptorSetAccelerationStructureNV-accelerationStructureCount-arraylength
  accelerationStructureCount must be greater than 0

The VkCopyDescriptorSet structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkCopyDescriptorSet {
    VkStructureType     sType;
    const void*         pNext;
    VkDescriptorSet     srcSet;
    uint32_t             srcBinding;
    uint32_t             srcArrayElement;
    VkDescriptorSet     dstSet;
    uint32_t             dstBinding;
    uint32_t             dstArrayElement;
    uint32_t             descriptorCount;
} VkCopyDescriptorSet;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcSet**, **srcBinding**, and **srcArrayElement** are the source set, binding, and array element, respectively. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then srcArrayElement specifies the starting byte offset within the binding to copy from.
- **dstSet**, **dstBinding**, and **dstArrayElement** are the destination set, binding, and array element, respectively. If the descriptor binding identified by dstSet and dstBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then dstArrayElement specifies the starting byte offset within the binding to copy to.
- **descriptorCount** is the number of descriptors to copy from the source to destination. If descriptorCount is greater than the number of remaining array elements in the source or destination binding, those affect consecutive bindings in a manner similar to VkWriteDescriptorSet above. If the descriptor binding identified by srcSet and srcBinding has a descriptor type of VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK then descriptorCount specifies the number of bytes to copy and the remaining array elements in the source or destination binding refer to the remaining number of bytes in those.

If the VkDescriptorSetLayoutBinding for dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE and srcBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the new active descriptor type becomes the descriptor type of srcBinding. If both VkDescriptorSetLayoutBinding for srcBinding and dstBinding are VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the active descriptor type in each source descriptor is copied...
into the corresponding destination descriptor. The active descriptor type can be different for each source descriptor.

Note
The intention is that copies to and from mutable descriptors is a simple memcpy. Copies between non-mutable and mutable descriptors are expected to require one memcpy per descriptor to handle the difference in size, but this use case with more than one descriptorCount is considered rare.

Valid Usage

• VUID-VkCopyDescriptorSet-srcBinding-00345
  srcBinding must be a valid binding within srcSet

• VUID-VkCopyDescriptorSet-srcArrayElement-00346
  The sum of srcArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by srcBinding, and all applicable consecutive bindings, as described by consecutive binding updates

• VUID-VkCopyDescriptorSet-dstBinding-00347
  dstBinding must be a valid binding within dstSet

• VUID-VkCopyDescriptorSet-dstArrayElement-00348
  The sum of dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding specified by dstBinding, and all applicable consecutive bindings, as described by consecutive binding updates

• VUID-VkCopyDescriptorSet-dstBinding-02632
  The type of dstBinding within dstSet must be equal to the type of srcBinding within srcSet

• VUID-VkCopyDescriptorSet-srcSet-00349
  If srcSet is equal to dstSet, then the source and destination ranges of descriptors must not overlap, where the ranges may include array elements from consecutive bindings as described by consecutive binding updates

• VUID-VkCopyDescriptorSet-srcBinding-02223
  If the descriptor type of the descriptor set binding specified by srcBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, srcArrayElement must be an integer multiple of 4

• VUID-VkCopyDescriptorSet-dstBinding-02224
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

• VUID-VkCopyDescriptorSet-srcBinding-02225
  If the descriptor type of the descriptor set binding specified by either srcBinding or dstBinding is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

• VUID-VkCopyDescriptorSet-srcSet-01918
  If srcSet's layout was created with the
VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set, then dstSet’s layout must also have been created with the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04885
  If srcSet’s layout was created with neither VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT nor VK_DESCRIPTOR_SET_LAYOUT_CREATE_HOST_ONLY_POOL_BIT_VALVE flags set, then dstSet’s layout must have been created without the VK_DESCRIPTOR_SET_LAYOUT_CREATE_UPDATE_AFTER_BIND_POOL_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04887
  If the descriptor pool from which srcSet was allocated was created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set, then the descriptor pool from which dstSet was allocated must also have been created with the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-srcSet-04887
  If the descriptor pool from which srcSet was allocated was created with neither VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT nor VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_VALVE flags set, then the descriptor pool from which dstSet was allocated must have been created without the VK_DESCRIPTOR_POOL_CREATE_UPDATE_AFTER_BIND_BIT flag set

- VUID-VkCopyDescriptorSet-dstBinding-02753
  If the descriptor type of the descriptor set binding specified by dstBinding is VK_DESCRIPTOR_TYPE_SAMPLER, then dstSet must not have been allocated with a layout that included immutable samplers for dstBinding

- VUID-VkCopyDescriptorSet-dstSet-04612
  If VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the new active descriptor type must exist in the corresponding pMutableDescriptorTypeLists list for dstBinding if the new active descriptor type is not VK_DESCRIPTOR_TYPE_MUTABLE_VALVE

- VUID-VkCopyDescriptorSet-srcSet-04613
  If VkDescriptorSetLayoutBinding for srcSet at srcBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE and the VkDescriptorSetLayoutBinding for dstSet at dstBinding is not VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the active descriptor type for the source descriptor must match the descriptor type of dstBinding

- VUID-VkCopyDescriptorSet-dstSet-04614
  If VkDescriptorSetLayoutBinding for dstSet at dstBinding is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, and the new active descriptor type is VK_DESCRIPTOR_TYPE_MUTABLE_VALVE, the pMutableDescriptorTypeLists for srcBinding and dstBinding must match exactly

Valid Usage (Implicit)

- VUID-VkCopyDescriptorSet-sType-sType
  sType must be VK_STRUCTURE_TYPE_COPY_DESCRIPTOR_SET
14.2.5. Descriptor Update Templates

A descriptor update template specifies a mapping from descriptor update information in host memory to descriptors in a descriptor set. It is designed to avoid passing redundant information to the driver when frequently updating the same set of descriptors in descriptor sets.

Descriptor update template objects are represented by `VkDescriptorUpdateTemplate` handles:

```c
// Provided by VK_VERSION_1_1
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkDescriptorUpdateTemplate)
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplate VkDescriptorUpdateTemplateKHR;
```

14.2.6. Descriptor Set Updates with Templates

Updating a large `VkDescriptorSet` array can be an expensive operation since an application must specify one `VkWriteDescriptorSet` structure for each descriptor or descriptor array to update, each of which re-specified the same state when updating the same descriptor in multiple descriptor sets. For cases when an application wishes to update the same set of descriptors in multiple descriptor sets allocated using the same `VkDescriptorSetLayout`, `vkUpdateDescriptorSetWithTemplate` can be used as a replacement for `vkUpdateDescriptorSets`.

`VkDescriptorUpdateTemplate` allows implementations to convert a set of descriptor update operations on a single descriptor set to an internal format that, in conjunction with `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`, can be more efficient compared to calling `vkUpdateDescriptorSets` or `vkCmdPushDescriptorSetKHR`. The descriptors themselves are not specified in the `VkDescriptorUpdateTemplate`, rather, offsets into an application provided pointer to host memory are specified, which are combined with a pointer passed to `vkUpdateDescriptorSetWithTemplate` or `vkCmdPushDescriptorSetWithTemplateKHR`. This allows large batches of updates to be executed without having to convert application data structures into a strictly-defined Vulkan data structure.
To create a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
VkResult vkCreateDescriptorUpdateTemplate(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
VkResult vkCreateDescriptorUpdateTemplateKHR(
    VkDevice device,
    const VkDescriptorUpdateTemplateCreateInfo* pCreateInfo,
    const VkAllocationCallbacks* pAllocator,
    VkDescriptorUpdateTemplate* pDescriptorUpdateTemplate);
```

- `device` is the logical device that creates the descriptor update template.
- `pCreateInfo` is a pointer to a `VkDescriptorUpdateTemplateCreateInfo` structure specifying the set of descriptors to update with a single call to `vkCmdPushDescriptorSetWithTemplateKHR` or `vkUpdateDescriptorSetWithTemplate`.
- `pAllocator` controls host memory allocation as described in the `Memory Allocation` chapter.
- `pDescriptorUpdateTemplate` is a pointer to a `VkDescriptorUpdateTemplate` handle in which the resulting descriptor update template object is returned.

### Valid Usage (Implicit)

- VUID-vkCreateDescriptorUpdateTemplate-device-parameter
  `device` must be a valid `VkDevice` handle

- VUID-vkCreateDescriptorUpdateTemplate-pCreateInfo-parameter
  `pCreateInfo` must be a valid pointer to a valid `VkDescriptorUpdateTemplateCreateInfo` structure

- VUID-vkCreateDescriptorUpdateTemplate-pAllocator-parameter
  If `pAllocator` is not `NULL`, `pAllocator` must be a valid pointer to a valid `VkAllocationCallbacks` structure

- VUID-vkCreateDescriptorUpdateTemplate-pDescriptorUpdateTemplate-parameter
  `pDescriptorUpdateTemplate` must be a valid pointer to a `VkDescriptorUpdateTemplate` handle
Return Codes

**Success**
- VK_SUCCESS

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The `VkDescriptorUpdateTemplateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkDescriptorUpdateTemplateCreateFlags flags;
    uint32_t descriptorUpdateEntryCount;
    const VkDescriptorUpdateTemplateEntry* pDescriptorUpdateEntries;
    VkDescriptorUpdateTemplateType templateType;
    VkDescriptorSetLayout descriptorSetLayout;
    VkPipelineBindPoint pipelineBindPoint;
    VkPipelineLayout pipelineLayout;
    uint32_t set;
} VkDescriptorUpdateTemplateCreateInfo;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateInfo VkDescriptorUpdateTemplateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `descriptorUpdateEntryCount` is the number of elements in the `pDescriptorUpdateEntries` array.
- `pDescriptorUpdateEntries` is a pointer to an array of `VkDescriptorUpdateTemplateEntry` structures describing the descriptors to be updated by the descriptor update template.
- `templateType` specifies the type of the descriptor update template. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET` it can only be used to update descriptor sets with a fixed `descriptorSetLayout`. If set to `VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR` it can only be used to push descriptor sets using the provided `pipelineBindPoint`, `pipelineLayout`, and `set` number.
- `descriptorSetLayout` is the descriptor set layout used to build the descriptor update template. All descriptor sets which are going to be updated through the newly created descriptor update
template must be created with a layout that matches (is the same as, or defined identically to) this layout. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET.

- pipelineBindPoint is a VkPipelineBindPoint indicating the type of the pipeline that will use the descriptors. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- pipelineLayout is a VkPipelineLayout object used to program the bindings. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

- set is the set number of the descriptor set in the pipeline layout that will be updated. This parameter is ignored if templateType is not VK_DESCRIPTOR_UPDATE TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR

Valid Usage

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00350
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout must be a valid VkDescriptorSetLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00351
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineBindPoint must be a valid VkPipelineBindPoint value

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00352
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, pipelineLayout must be a valid VkPipelineLayout handle

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-00353
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, set must be the unique set number in the pipeline layout that uses a descriptor set layout that was created with VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR

- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-04615
  If templateType is VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, descriptorSetLayout must not contain a binding with type VK_DESCRIPTOR_TYPE_MUTABLE_VALVE

Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateCreateInfo-sType-sType
  sType must be VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO

- VUID-VkDescriptorUpdateTemplateCreateInfo-pNext-pNext
  pNext must be NULL

- VUID-VkDescriptorUpdateTemplateCreateInfo-flags-zero bitmask
  flags must be 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-pDescriptorUpdateEntries-parameter
  pDescriptorUpdateEntries must be a valid pointer to an array of descriptorUpdateEntryCount valid VkDescriptorUpdateTemplateEntry structures
- VUID-VkDescriptorUpdateTemplateCreateInfo-templateType-parameter
templateType must be a valid VkDescriptorUpdateTemplateType value

- VUID-VkDescriptorUpdateTemplateCreateInfo-descriptorUpdateEntryCount-arraylength
descriptorUpdateEntryCount must be greater than 0

- VUID-VkDescriptorUpdateTemplateCreateInfo-commonparent
Both of descriptorSetLayout, and pipelineLayout that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

```c
// Provided by VK_VERSION_1_1
typedef VkFlags VkDescriptorUpdateTemplateCreateFlags;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateCreateFlags VkDescriptorUpdateTemplateCreateFlagsKHR;
```

VkDescriptorUpdateTemplateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The descriptor update template type is determined by the VkDescriptorUpdateTemplateCreateInfo ::templateType property, which takes the following values:

```c
// Provided by VK_VERSION_1_1
typedef enum VkDescriptorUpdateTemplateType {
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET = 0,
    // Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor,
    VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR = 1,
    // Provided by VK_KHR_descriptor_update_template
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET_KHR =
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET,
} VkDescriptorUpdateTemplateType;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateType VkDescriptorUpdateTemplateTypeKHR;
```

- VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET specifies that the descriptor update template will be used for descriptor set updates only.
- VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR specifies that the descriptor update template will be used for push descriptor updates only.
The \texttt{VkDescriptorUpdateTemplateEntry} structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkDescriptorUpdateTemplateEntry {
    uint32_t dstBinding;
    uint32_t dstArrayElement;
    uint32_t descriptorCount;
    VkDescriptorType descriptorType;
    size_t offset;
    size_t stride;
} VkDescriptorUpdateTemplateEntry;
```

or the equivalent

```c
// Provided by VK_KHR_descriptor_update_template
typedef VkDescriptorUpdateTemplateEntry VkDescriptorUpdateTemplateEntryKHR;
```

- \texttt{dstBinding} is the descriptor binding to update when using this descriptor update template.
- \texttt{dstArrayElement} is the starting element in the array belonging to \texttt{dstBinding}. If the descriptor binding identified by \texttt{dstBinding} has a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} then \texttt{dstArrayElement} specifies the starting byte offset to update.
- \texttt{descriptorCount} is the number of descriptors to update. If \texttt{descriptorCount} is greater than the number of remaining array elements in the destination binding, those affect consecutive bindings in a manner similar to \texttt{VkWriteDescriptorSet} above. If the descriptor binding identified by \texttt{dstBinding} has a descriptor type of \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} then \texttt{descriptorCount} specifies the number of bytes to update and the remaining array elements in the destination binding refer to the remaining number of bytes in it.
- \texttt{descriptorType} is a \texttt{VkDescriptorType} specifying the type of the descriptor.
- \texttt{offset} is the offset in bytes of the first binding in the raw data structure.
- \texttt{stride} is the stride in bytes between two consecutive array elements of the descriptor update information in the raw data structure. The actual pointer \texttt{ptr} for each array element \texttt{j} of update entry \texttt{i} is computed using the following formula:

```c
const char *ptr = (const char *)pData + pDescriptorUpdateEntries[i].offset + j * pDescriptorUpdateEntries[i].stride
```

The stride is useful in case the bindings are stored in structs along with other data. If \texttt{descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK} then the value of \texttt{stride} is ignored and the stride is assumed to be 1, i.e. the descriptor update information for them is always specified as a contiguous range.
Valid Usage

- VUID-VkDescriptorUpdateTemplateEntry-dstBinding-00354
  dstBinding must be a valid binding in the descriptor set layout implicitly specified when using a descriptor update template to update descriptors

- VUID-VkDescriptorUpdateTemplateEntry-dstArrayElement-00355
  dstArrayElement and descriptorCount must be less than or equal to the number of array elements in the descriptor set binding implicitly specified when using a descriptor update template to update descriptors, and all applicable consecutive bindings, as described by consecutive binding updates

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02226
  If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, dstArrayElement must be an integer multiple of 4

- VUID-VkDescriptorUpdateTemplateEntry-descriptor-02227
  If descriptor type is VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK, descriptorCount must be an integer multiple of 4

Valid Usage (Implicit)

- VUID-VkDescriptorUpdateTemplateEntry-descriptorType-parameter
  descriptorType must be a valid VkDescriptorType value

To destroy a descriptor update template, call:

```c
// Provided by VK_VERSION_1_1
void vkDestroyDescriptorUpdateTemplate(
  VkDevice device,
  VkDescriptorUpdateTemplate descriptorUpdateTemplate,
  const VkAllocationCallbacks* pAllocator);
```

or the equivalent command

```c
// Provided by VK_KHR_descriptor_update_template
void vkDestroyDescriptorUpdateTemplateKHR(
  VkDevice device,
  VkDescriptorUpdateTemplate descriptorUpdateTemplate,
  const VkAllocationCallbacks* pAllocator);
```

- device is the logical device that has been used to create the descriptor update template
- descriptorUpdateTemplate is the descriptor update template to destroy.
- pAllocator controls host memory allocation as described in the Memory Allocation chapter.
Valid Usage

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00356
  If VkAllocationCallbacks were provided when descriptorUpdateTemplate was created, a compatible set of callbacks must be provided here

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorSetLayout-00357
  If no VkAllocationCallbacks were provided when descriptorUpdateTemplate was created, pAllocator must be NULL

Valid Usage (Implicit)

• VUID-vkDestroyDescriptorUpdateTemplate-device-parameter
device must be a valid VkDevice handle

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parameter
If descriptorUpdateTemplate is not VK_NULL_HANDLE, descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle

• VUID-vkDestroyDescriptorUpdateTemplate-pAllocator-parameter
If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

• VUID-vkDestroyDescriptorUpdateTemplate-descriptorUpdateTemplate-parent
If descriptorUpdateTemplate is a valid handle, it must have been created, allocated, or retrieved from device

Host Synchronization

• Host access to descriptorUpdateTemplate must be externally synchronized

Once a VkDescriptorUpdateTemplate has been created, descriptor sets can be updated by calling:

// Provided by VK_VERSION_1_1
void vkUpdateDescriptorSetWithTemplate(
    VkDevice device,            
    VkDescriptorSet descriptorSet,  
    VkDescriptorUpdateTemplate descriptorUpdateTemplate, 
    const void* pData);

or the equivalent command

// Provided by VK_KHR_descriptor_update_template
void vkUpdateDescriptorSetWithTemplateKHR(
    VkDevice device,            
    VkDescriptorSet descriptorSet,  
    VkDescriptorUpdateTemplate descriptorUpdateTemplate, 
    const void* pData);
VkDescriptorUpdateTemplate descriptorUpdateTemplate,
const void* pData);

- device is the logical device that updates the descriptor set.
- descriptorSet is the descriptor set to update
- descriptorUpdateTemplate is a VkDescriptorUpdateTemplate object specifying the update mapping between pData and the descriptor set to update.
- pData is a pointer to memory containing one or more VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView structures or VkAccelerationStructureKHR or VkAccelerationStructureNV handles used to write the descriptors.

Valid Usage

- VUID-vkUpdateDescriptorSetWithTemplate-pData-01685 pData must be a valid pointer to a memory containing one or more valid instances of VkDescriptorImageInfo, VkDescriptorBufferInfo, or VkBufferView in a layout defined by descriptorUpdateTemplate when it was created with vkCreateDescriptorUpdateTemplate
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-06995 Host access to descriptorSet must be externally synchronized unless explicitly denoted otherwise for specific flags

Valid Usage (Implicit)

- VUID-vkUpdateDescriptorSetWithTemplate-device-parameter device must be a valid VkDevice handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorSet-parameter descriptorSet must be a valid VkDescriptorSet handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parameter descriptorUpdateTemplate must be a valid VkDescriptorUpdateTemplate handle
- VUID-vkUpdateDescriptorSetWithTemplate-descriptorUpdateTemplate-parent descriptorUpdateTemplate must have been created, allocated, or retrieved from device

API example

```c
struct AppBufferView {
    VkBufferView bufferView;
    uint32_t    applicationRelatedInformation;
};

struct AppDataStructure {
    VkDescriptorImageInfo    imageInfo; // a single image info
    VkDescriptorBufferInfo   bufferInfoArray[3]; // 3 buffer infos in an array
```
AppBufferView bufferView[2];  // An application defined structure containing a bufferView
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    { 0, 0, 1, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, offsetof(AppDataStructure, imageInfo), 1 }
};

const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, 0, 3, descriptorUpdateEntryCount
};
pDescriptorUpdateEntries
  VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_DESCRIPTOR_SET, // templateType
  myLayout, // descriptorSetLayout
  0, // pipelineBindPoint,
  0, // pipelineLayout,
  0, // set, ignored by given templateType
  ignored by given templateType
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
myResult = vkCreateDescriptorUpdateTemplate(
  myDevice,
  &createInfo,
  NULL,
  &myDescriptorUpdateTemplate);

AppDataStructure appData;

// fill appData here or cache it in your engine
vkUpdateDescriptorSetWithTemplate(myDevice, myDescriptorSet, myDescriptorUpdateTemplate, &appData);

14.2.7. Descriptor Set Binding

To bind one or more descriptor sets to a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindDescriptorSets(
  VkCommandBuffer
  commandBuffer,
  VkPipelineBindPoint
  pipelineBindPoint,
  VkPipelineLayout
  layout,
  uint32_t
  firstSet,
  uint32_t
  descriptorSetCount,
  const VkDescriptorSet*
  pDescriptorSets,
  uint32_t
  dynamicOffsetCount,
  const uint32_t*
  pDynamicOffsets);
```

- `commandBuffer` is the command buffer that the descriptor sets will be bound to.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of bind points for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `firstSet` is the set number of the first descriptor set to be bound.
- `descriptorSetCount` is the number of elements in the `pDescriptorSets` array.
• `pDescriptorSets` is a pointer to an array of handles to `VkDescriptorSet` objects describing the descriptor sets to bind to.

• `dynamicOffsetCount` is the number of dynamic offsets in the `pDynamicOffsets` array.

• `pDynamicOffsets` is a pointer to an array of `uint32_t` values specifying dynamic offsets.

`vkCmdBindDescriptorSets` binds descriptor sets `pDescriptorSets[0..descriptorSetCount-1]` to set numbers `[firstSet..firstSet+descriptorSetCount-1]` for subsequent bound pipeline commands set by `pipelineBindPoint`. Any bindings that were previously applied via these sets are no longer valid.

Once bound, a descriptor set affects rendering of subsequent commands that interact with the given pipeline type in the command buffer until either a different set is bound to the same set number, or the set is disturbed as described in Pipeline Layout Compatibility.

A compatible descriptor set **must** be bound for all set numbers that any shaders in a pipeline access, at the time that a drawing or dispatching command is recorded to execute using that pipeline. However, if none of the shaders in a pipeline statically use any bindings with a particular set number, then no descriptor set need be bound for that set number, even if the pipeline layout includes a non-trivial descriptor set layout for that set number.

If any of the sets being bound include dynamic uniform or storage buffers, then `pDynamicOffsets` includes one element for each array element in each dynamic descriptor type binding in each set. Values are taken from `pDynamicOffsets` in an order such that all entries for set N come before set N+1; within a set, entries are ordered by the binding numbers in the descriptor set layouts; and within a binding array, elements are in order. `dynamicOffsetCount` **must** equal the total number of dynamic descriptors in the sets being bound.

The effective offset used for dynamic uniform and storage buffer bindings is the sum of the relative offset taken from `pDynamicOffsets`, and the base address of the buffer plus base offset in the descriptor set. The range of the dynamic uniform and storage buffer bindings is the buffer range as specified in the descriptor set.

Each of the `pDescriptorSets` **must** be compatible with the pipeline layout specified by `layout`. The layout used to program the bindings **must** also be compatible with the pipeline used in subsequent bound pipeline commands with that pipeline type, as defined in the Pipeline Layout Compatibility section.

The descriptor set contents bound by a call to `vkCmdBindDescriptorSets` **may** be consumed at the following times:

• For descriptor bindings created with the `VK_DESCRIPTOR_BINDING_UPDATE_AFTER_BIND_BIT` bit set, the contents **may** be consumed when the command buffer is submitted to a queue, or during shader execution of the resulting draws and dispatches, or any time in between. Otherwise,

• during host execution of the command, or during shader execution of the resulting draws and dispatches, or any time in between.

Thus, the contents of a descriptor set binding **must** not be altered (overwritten by an update command, or freed) between the first point in time that it **may** be consumed, and when the command completes executing on the queue.
The contents of pDynamicOffsets are consumed immediately during execution of vkCmdBindDescriptorSets. Once all pending uses have completed, it is legal to update and reuse a descriptor set.

Valid Usage

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-00358
  Each element of pDescriptorSets must have been allocated with a VkDescriptorSetLayout that matches (is the same as, or identically defined as) the VkDescriptorSetLayout at set n in layout, where n is the sum of firstSet and the index into pDescriptorSets

- VUID-vkCmdBindDescriptorSets-dynamicOffsetCount-00359
  dynamicOffsetCount must be equal to the total number of dynamic descriptors in pDescriptorSets

- VUID-vkCmdBindDescriptorSets-firstSet-00360
  The sum of firstSet and descriptorSetCount must be less than or equal to VkPipelineLayoutCreateInfo::setLayoutCount provided when layout was created

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-00361
  pipelineBindPoint must be supported by the commandBuffer’s parent VkCommandPool’s queue family

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01971
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_UNIFORM_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minUniformBufferOffsetAlignment

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-01972
  Each element of pDynamicOffsets which corresponds to a descriptor binding with type VK_DESCRIPTOR_TYPE_STORAGE_BUFFER_DYNAMIC must be a multiple of VkPhysicalDeviceLimits::minStorageBufferOffsetAlignment

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-01979
  For each dynamic uniform or storage buffer binding in pDescriptorSets, the sum of the effective offset and the range of the binding must be less than or equal to the size of the buffer

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-06715
  For each dynamic uniform or storage buffer binding in pDescriptorSets, if the range was set with VK_WHOLE_SIZE then pDynamicOffsets which corresponds to the descriptor binding must be 0

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-04616
  Each element of pDescriptorSets must not have been allocated from a VkDescriptorPool with the VK_DESCRIPTOR_POOL_CREATE_HOST_ONLY_BIT_FLAG set

- VUID-vkCmdBindDescriptorSets-graphicsPipelineLibrary-06754
  If graphicsPipelineLibrary is not enabled, each element of pDescriptorSets must be a valid VkDescriptorSet
Valid Usage (Implicit)

- VUID-vkCmdBindDescriptorSets-commandBuffer-parameter
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdBindDescriptorSets-pipelineBindPoint-parameter
  
  `pipelineBindPoint` must be a valid `VkPipelineBindPoint` value.

- VUID-vkCmdBindDescriptorSets-layout-parameter
  
  `layout` must be a valid `VkPipelineLayout` handle.

- VUID-vkCmdBindDescriptorSets-pDescriptorSets-parameter
  
  `pDescriptorSets` must be a valid pointer to an array of `descriptorSetCount` valid or `VK_NULL_HANDLE` `VkDescriptorSet` handles.

- VUID-vkCmdBindDescriptorSets-pDynamicOffsets-parameter
  
  If `dynamicOffsetCount` is not 0, `pDynamicOffsets` must be a valid pointer to an array of `dynamicOffsetCount` `uint32_t` values.

- VUID-vkCmdBindDescriptorSets-commandBuffer-recording
  
  `commandBuffer` must be in the recording state.

- VUID-vkCmdBindDescriptorSets-commandBuffer-cmdpool
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.

- VUID-vkCmdBindDescriptorSets-videocoding
  
  This command must only be called outside of a video coding scope.

- VUID-vkCmdBindDescriptorSets-descriptorSetCount-arraylength
  
  `descriptorSetCount` must be greater than 0.

- VUID-vkCmdBindDescriptorSets-commonparent
  
  Each of `commandBuffer`, `layout`, and the elements of `pDescriptorSets` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

14.2.8. Push Descriptor Updates

In addition to allocating descriptor sets and binding them to a command buffer, an application can record descriptor updates into the command buffer.

To push descriptor updates into a command buffer, call:

```c
void vkCmdPushDescriptorSetKHR(
    VkCommandBuffer commandBuffer,
    VkPipelineBindPoint pipelineBindPoint,
    VkPipelineLayout layout,
    uint32_t set,
    uint32_t descriptorWriteCount,
    const VkWriteDescriptorSet* pDescriptorWrites);
```

- `commandBuffer` is the command buffer that the descriptors will be recorded in.
- `pipelineBindPoint` is a `VkPipelineBindPoint` indicating the type of the pipeline that will use the descriptors. There is a separate set of push descriptor bindings for each pipeline type, so binding one does not disturb the others.
- `layout` is a `VkPipelineLayout` object used to program the bindings.
- `set` is the set number of the descriptor set in the pipeline layout that will be updated.
- `descriptorWriteCount` is the number of elements in the `pDescriptorWrites` array.
- `pDescriptorWrites` is a pointer to an array of `VkWriteDescriptorSet` structures describing the descriptors to be updated.

Push descriptors are a small bank of descriptors whose storage is internally managed by the command buffer rather than being written into a descriptor set and later bound to a command buffer. Push descriptors allow for incremental updates of descriptors without managing the lifetime of descriptor sets.

When a command buffer begins recording, all push descriptors are undefined. Push descriptors can be updated incrementally and cause shaders to use the updated descriptors for subsequent bound pipeline commands with the pipeline type set by `pipelineBindPoint` until the descriptor is overwritten, or else until the set is disturbed as described in Pipeline Layout Compatibility. When the set is disturbed or push descriptors with a different descriptor set layout are set, all push descriptors are undefined.

Push descriptors that are statically used by a pipeline must not be undefined at the time that a drawing or dispatching command is recorded to execute using that pipeline. This includes immutable sampler descriptors, which must be pushed before they are accessed by a pipeline (the immutable samplers are pushed, rather than the samplers in `pDescriptorWrites`). Push descriptors that are not statically used can remain undefined.

Push descriptors do not use dynamic offsets. Instead, the corresponding non-dynamic descriptor types can be used and the `offset` member of `VkDescriptorBufferInfo` can be changed each time the descriptor is written.
Each element of \texttt{pDescriptorWrites} is interpreted as in \texttt{VkWriteDescriptorSet}, except the \texttt{dstSet} member is ignored.

To push an immutable sampler, use a \texttt{VkWriteDescriptorSet} with \texttt{dstBinding} and \texttt{dstArrayElement} selecting the immutable sampler's binding. If the descriptor type is \texttt{VK_DESCRIPTOR_TYPE_SAMPLER}, the \texttt{pImageInfo} parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout. If the descriptor type is \texttt{VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER}, the \texttt{sampler} member of the \texttt{pImageInfo} parameter is ignored and the immutable sampler is taken from the push descriptor set layout in the pipeline layout.

Valid Usage

- \texttt{VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-00363}
  \texttt{pipelineBindPoint must} be supported by the \texttt{commandBuffer}'s parent \texttt{VkCommandPool}'s queue family

- \texttt{VUID-vkCmdPushDescriptorSetKHR-set-00364}
  \texttt{set must} be less than \texttt{VkPipelineLayoutCreateInfo::setLayoutCount} provided when \texttt{layout} was created

- \texttt{VUID-vkCmdPushDescriptorSetKHR-set-00365}
  \texttt{set must} be the unique set number in the pipeline layout that uses a descriptor set layout that was created with \texttt{VK_DESCRIPTOR_SET_LAYOUT_CREATE_PUSH_DESCRIPTOR_BIT_KHR}

- \texttt{VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-06494}
  For each element \texttt{i} where \texttt{pDescriptorWrites[i].descriptorType} is \texttt{VK_DESCRIPTOR_TYPE_SAMPLED_IMAGE}, \texttt{VK_DESCRIPTOR_TYPE_STORAGE_IMAGE}, or \texttt{VK_DESCRIPTOR_TYPE_INPUT_ATTACHMENT}, \texttt{pDescriptorWrites[i].pImageInfo must} be a valid pointer to an array of \texttt{pDescriptorWrites[i].descriptorCount valid VkDescriptorImageInfo} structures

Valid Usage (Implicit)

- \texttt{VUID-vkCmdPushDescriptorSetKHR-commandBuffer-parameter}
  \texttt{commandBuffer must} be a valid \texttt{VkCommandBuffer} handle

- \texttt{VUID-vkCmdPushDescriptorSetKHR-pipelineBindPoint-parameter}
  \texttt{pipelineBindPoint must} be a valid \texttt{VkPipelineBindPoint} value

- \texttt{VUID-vkCmdPushDescriptorSetKHR-layout-parameter}
  \texttt{layout must} be a valid \texttt{VkPipelineLayout} handle

- \texttt{VUID-vkCmdPushDescriptorSetKHR-pDescriptorWrites-parameter}
  \texttt{pDescriptorWrites must} be a valid pointer to an array of \texttt{descriptorWriteCount valid VkWriteDescriptorSet} structures

- \texttt{VUID-vkCmdPushDescriptorSetKHR-commandBuffer-recording}
  \texttt{commandBuffer must} be in the \texttt{recording state}

- \texttt{VUID-vkCmdPushDescriptorSetKHR-commandBuffer-cmdpool}
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \texttt{must} support graphics, or
compute operations

- **VUID-vkCmdPushDescriptorSetKHR-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdPushDescriptorSetKHR-descriptorWriteCount-arraylength descriptorWriteCount must be greater than 0**

- **VUID-vkCmdPushDescriptorSetKHR-commonparent**
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

### 14.2.9. Push Descriptor Updates with Descriptor Update Templates

It is also possible to use a descriptor update template to specify the push descriptors to update. To do so, call:

```c
// Provided by VK_VERSION_1_1 with VK_KHR_push_descriptor, VK_KHR_descriptor_update_template with VK_KHR_push_descriptor
void vkCmdPushDescriptorSetWithTemplateKHR(
    VkCommandBuffer commandBuffer,
    VkDescriptorUpdateTemplate descriptorUpdateTemplate,  
    VkPipelineLayout layout, 
    uint32_t set, 
    const void* pData);
```

- **commandBuffer** is the command buffer that the descriptors will be recorded in.
- **descriptorUpdateTemplate** is a descriptor update template defining how to interpret the descriptor information in pData.
- **layout** is a VkPipelineLayout object used to program the bindings. It must be compatible with the layout used to create the descriptorUpdateTemplate handle.
• `set` is the set number of the descriptor set in the pipeline layout that will be updated. This must be the same number used to create the `descriptorUpdateTemplate` handle.

• `pData` is a pointer to memory containing descriptors for the templated update.

## Valid Usage

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-00366
  The `pipelineBindPoint` specified during the creation of the descriptor update template must be supported by the `commandBuffer`'s parent `VkCommandPool`'s queue family

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-pData-01686
  `pData` must be a valid pointer to a memory containing one or more valid instances of `VkDescriptorImageInfo`, `VkDescriptorBufferInfo`, or `VkBufferView` in a layout defined by `descriptorUpdateTemplate` when it was created with `vkCreateDescriptorUpdateTemplate`

## Valid Usage (Implicit)

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-descriptorUpdateTemplate-parameter
  `descriptorUpdateTemplate` must be a valid `VkDescriptorUpdateTemplate` handle

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-layout-parameter
  `layout` must be a valid `VkPipelineLayout` handle

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-recording
  `commandBuffer` must be in the recording state

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdPushDescriptorSetWithTemplateKHR-commonparent
  Each of `commandBuffer`, `descriptorUpdateTemplate`, and `layout` must have been created, allocated, or retrieved from the same `VkDevice`

## Host Synchronization

• Host access to `commandBuffer` must be externally synchronized

• Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics, Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### API example

```c
struct AppDataStructure {
    VkDescriptorImageInfo imageInfo;  // a single image info
    // ... some more application related data
};

const VkDescriptorUpdateTemplateEntry descriptorUpdateTemplateEntries[] = {
    // binding to a single image descriptor
    { 0, 0, 1, VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER, offsetof(AppDataStructure, imageInfo), 0 },
    // offset
    0 // stride is not required if descriptorCount is 1
};

// create a descriptor update template for push descriptor set updates
const VkDescriptorUpdateTemplateCreateInfo createInfo = {
    VK_STRUCTURE_TYPE_DESCRIPTOR_UPDATE_TEMPLATE_CREATE_INFO, // sType
    NULL, // pNext
    1, // flags
    descriptorUpdateEntryCount, // descriptorUpdateTemplateEntries,
    descriptorUpdateEntries, // pDescriptorUpdateEntries
    VK_DESCRIPTOR_UPDATE_TEMPLATE_TYPE_PUSH_DESCRIPTORS_KHR, // templateType
    myPipelineLayout, // pipelineBindPoint
    0, // pipelineLayout
    0, // set
};

VkDescriptorUpdateTemplate myDescriptorUpdateTemplate;
```
myResult = vkCreateDescriptorUpdateTemplate(
    myDevice,
    &CreateInfo,
    NULL,
    &myDescriptorUpdateTemplate);

AppDataStructure appData;
// fill appData here or cache it in your engine
vkCmdPushDescriptorSetWithTemplateKHR(myCmdBuffer, myDescriptorUpdateTemplate, myPipelineLayout, 0, &appData);

### 14.2.10. Push Constant Updates

As described above in section Pipeline Layouts, the pipeline layout defines shader push constants which are updated via Vulkan commands rather than via writes to memory or copy commands.

---

**Note**

Push constants represent a high speed path to modify constant data in pipelines that is expected to outperform memory-backed resource updates.

---

To update push constants, call:

```c
void vkCmdPushConstants(VkCommandBuffer commandBuffer, VkPipelineLayout layout, VkShaderStageFlags stageFlags, uint32_t offset, uint32_t size, const void* pValues);
```

- **commandBuffer** is the command buffer in which the push constant update will be recorded.
- **layout** is the pipeline layout used to program the push constant updates.
- **stageFlags** is a bitmask of VkShaderStageFlagBits specifying the shader stages that will use the push constants in the updated range.
- **offset** is the start offset of the push constant range to update, in units of bytes.
- **size** is the size of the push constant range to update, in units of bytes.
- **pValues** is a pointer to an array of size bytes containing the new push constant values.

When a command buffer begins recording, all push constant values are undefined. Reads of undefined push constant values by the executing shader return undefined values.

Push constant values can be updated incrementally, causing shader stages in **stageFlags** to read the new data from **pValues** for push constants modified by this command, while still reading the previous data for push constants not modified by this command. When a bound pipeline command is issued, the bound pipeline’s layout must be compatible with the layouts used to set the values of...
all push constants in the pipeline layout's push constant ranges, as described in Pipeline Layout Compatibility. Binding a pipeline with a layout that is not compatible with the push constant layout does not disturb the push constant values.

**Note**

As `stageFlags` needs to include all flags the relevant push constant ranges were created with, any flags that are not supported by the queue family that the `VkCommandPool` used to allocate `commandBuffer` was created on are ignored.

### Valid Usage

- **VUID-vkCmdPushConstants-offset-01795**
  
  For each byte in the range specified by `offset` and `size` and for each shader stage in `stageFlags`, there **must** be a push constant range in `layout` that includes that byte and that stage.

- **VUID-vkCmdPushConstants-offset-01796**
  
  For each byte in the range specified by `offset` and `size` and for each push constant range that overlaps that byte, `stageFlags` **must** include all stages in that push constant range's `VkPushConstantRange::stageFlags`.

- **VUID-vkCmdPushConstants-offset-00368**
  
  `offset` **must** be a multiple of 4.

- **VUID-vkCmdPushConstants-size-00369**
  
  `size` **must** be a multiple of 4.

- **VUID-vkCmdPushConstants-offset-00370**
  
  `offset` **must** be less than `VkPhysicalDeviceLimits::maxPushConstantsSize`.

- **VUID-vkCmdPushConstants-size-00371**
  
  `size` **must** be less than or equal to `VkPhysicalDeviceLimits::maxPushConstantsSize` minus `offset`.

### Valid Usage (Implicit)

- **VUID-vkCmdPushConstants-commandBuffer-parameter**
  
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdPushConstants-layout-parameter**
  
  `layout` **must** be a valid `VkPipelineLayout` handle.

- **VUID-vkCmdPushConstants-stageFlags-parameter**
  
  `stageFlags` **must** be a valid combination of `VkShaderStageFlagBits` values.

- **VUID-vkCmdPushConstants-stageFlags-requiredbitmask**
  
  `stageFlags` **must** not be 0.

- **VUID-vkCmdPushConstants-pValues-parameter**
  
  `pValues` **must** be a valid pointer to an array of `size` bytes.

- **VUID-vkCmdPushConstants-commandBuffer-recording**
  
  1126
**commandBuffer** must be in the recording state

- VUID-vkCmdPushConstants-commandBuffer-cmdpool
  The **VkCommandPool** that commandBuffer was allocated from must support graphics, or compute operations

- VUID-vkCmdPushConstants-vidcoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdPushConstants-size-arraylength
  size must be greater than 0

- VUID-vkCmdPushConstants-commonparent
  Both of commandBuffer, and layout must have been created, allocated, or retrieved from the same **VkDevice**

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the **VkCommandPool** that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>

<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

---

**14.3. Physical Storage Buffer Access**

To query a 64-bit buffer device address value through which buffer memory can be accessed in a shader, call:

```c
// Provided by VK_VERSION_1_2
VkDeviceAddress vkGetBufferDeviceAddress(VkDevice device,
                                         const VkBufferDeviceAddressInfo* pInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_buffer_device_address
VkDeviceAddress vkGetBufferDeviceAddressKHR(VkDevice device,
                                          const VkBufferDeviceAddressInfo* pInfo);
```
The 64-bit return value is an address of the start of pInfo->buffer. The address range starting at this value and whose size is the size of the buffer can be used in a shader to access the memory bound to that buffer, using the SPV_KHR_physical_storage_buffer extension or the equivalent SPV_EXT_physical_storage_buffer extension and the PhysicalStorageBuffer storage class. For example, this value can be stored in a uniform buffer, and the shader can read the value from the uniform buffer and use it to do a dependent read/write to this buffer. A value of zero is reserved as a “null” pointer and must not be returned as a valid buffer device address. All loads, stores, and atomics in a shader through PhysicalStorageBuffer pointers must access addresses in the address range of some buffer.

If the buffer was created with a non-zero value of VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress or VkBufferDeviceAddressCreateInfoEXT::deviceAddress, the return value will be the same address that was returned at capture time.

Valid Usage

- VUID-vkGetBufferDeviceAddress-bufferDeviceAddress-03324
  The bufferDeviceAddress or VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddress feature must be enabled

- VUID-vkGetBufferDeviceAddress-device-03325
  If device was created with multiple physical devices, then the bufferDeviceAddressMultiDevice or VkPhysicalDeviceBufferDeviceAddressFeaturesEXT::bufferDeviceAddressMultiDevice feature must be enabled

Valid Usage (Implicit)

- VUID-vkGetBufferDeviceAddress-device-parameter
  device must be a valid VkDevice handle

- VUID-vkGetBufferDeviceAddress-pInfo-parameter
  pInfo must be a valid pointer to a valid VkBufferDeviceAddressInfo structure
The `VkBufferDeviceAddressInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_2
typedef struct VkBufferDeviceAddressInfo {
    VkStructureType sType;
    const void* pNext;
    VkBuffer buffer;
} VkBufferDeviceAddressInfo;
```

or the equivalent

```c
// Provided by VK_KHR_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoKHR;
```

or the equivalent

```c
// Provided by VK_EXT_buffer_device_address
typedef VkBufferDeviceAddressInfo VkBufferDeviceAddressInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` specifies the buffer whose address is being queried.

### Valid Usage

- **VUID-VkBufferDeviceAddressInfo-buffer-02600**
  If `buffer` is non-sparse and was not created with the `VK_BUFFER_CREATE_DEVICE_ADDRESS_CAPTURE_REPLAY_BIT` flag, then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-VkBufferDeviceAddressInfo-buffer-02601**
  `buffer` must have been created with `VK_BUFFER_USAGE_SHADER_DEVICE_ADDRESS_BIT`.

### Valid Usage (Implicit)

- **VUID-VkBufferDeviceAddressInfo-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_BUFFER_DEVICE_ADDRESS_INFO`.

- **VUID-VkBufferDeviceAddressInfo-pNext-pNext**
  `pNext` must be `NULL`.

- **VUID-VkBufferDeviceAddressInfo-buffer-parameter**
  `buffer` must be a valid `VkBuffer` handle.

To query a 64-bit buffer opaque capture address, call:
The 64-bit return value is an opaque capture address of the start of `pInfo->buffer`.

If the buffer was created with a non-zero value of `VkBufferOpaqueCaptureAddressCreateInfo::opaqueCaptureAddress` the return value **must** be the same address.

### Valid Usage

- VUID-vkGetBufferOpaqueCaptureAddress-None-03326
  The `bufferDeviceAddress` feature **must** be enabled

- VUID-vkGetBufferOpaqueCaptureAddress-device-03327
  If `device` was created with multiple physical devices, then the `bufferDeviceAddressMultiDevice` feature **must** be enabled

### Valid Usage (Implicit)

- VUID-vkGetBufferOpaqueCaptureAddress-device-parameter
  `device` **must** be a valid `VkDevice` handle

- VUID-vkGetBufferOpaqueCaptureAddress-pInfo-parameter
  `pInfo` **must** be a valid pointer to a valid `VkBufferDeviceAddressInfo` structure
Chapter 15. Shader Interfaces

When a pipeline is created, the set of shaders specified in the corresponding `Vk*PipelineCreateInfo` structure are implicitly linked at a number of different interfaces.

- Shader Input and Output Interface
- Vertex Input Interface
- Fragment Output Interface
- Fragment Input Attachment Interface
- Ray Tracing Pipeline Interface
- Shader Resource Interface
- Geometry Shader Passthrough

This chapter describes valid uses for a set of SPIR-V decorations. Any other use of one of these decorations is invalid, with the exception that, when using SPIR-V versions 1.4 and earlier: `Block`, `BufferBlock`, `Offset`, `ArrayStride`, and `MatrixStride` can also decorate types and type members used by variables in the `Private` and `Function` storage classes.

Note
In this chapter, there are references to SPIR-V terms such as the `MeshNV` execution model. These terms will appear even in a build of the specification which does not support any extensions. This is as intended, since these terms appear in the unified SPIR-V specification without such qualifiers.

15.1. Shader Input and Output Interfaces

When multiple stages are present in a pipeline, the outputs of one stage form an interface with the inputs of the next stage. When such an interface involves a shader, shader outputs are matched against the inputs of the next stage, and shader inputs are matched against the outputs of the previous stage.

All the variables forming the shader input and output interfaces are listed as operands to the `OpEntryPoint` instruction and are declared with the `Input` or `Output` storage classes, respectively, in the SPIR-V module. These generally form the interfaces between consecutive shader stages, regardless of any non-shader stages between the consecutive shader stages.

There are two classes of variables that can be matched between shader stages, built-in variables and user-defined variables. Each class has a different set of matching criteria.

Output variables of a shader stage have undefined values until the shader writes to them or uses the `Initializer` operand when declaring the variable.

15.1.1. Built-in Interface Block

Shader built-in variables meeting the following requirements define the built-in interface block.
They must

- be explicitly declared (there are no implicit built-ins),
- be identified with a BuiltIn decoration,
- form object types as described in the Built-in Variables section, and
- be declared in a block whose top-level members are the built-ins.

There must be no more than one built-in interface block per shader per interface.

Built-ins must not have any Location or Component decorations.

15.1.2. User-defined Variable Interface

The non-built-in variables listed by OpEntryPoint with the Input or Output storage class form the user-defined variable interface. These must have SPIR-V numerical types or, recursively, composite types of such types. By default, the components of such types have a width of 32 or 64 bits. If an implementation supports storageInputOutput16, components can also have a width of 16 bits. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

15.1.3. Interface Matching

An output variable, block, or structure member in a given shader stage has an interface match with an input variable, block, or structure member in a subsequent shader stage if they both adhere to the following conditions:

- They have equivalent decorations, other than:
  - XfbBuffer, XfbStride, Offset, and Stream
  - one is not decorated with Component and the other is declared with a Component of 0
  - Interpolation decorations
  - RelaxedPrecision if one is an input variable and the other an output variable

- Their types match as follows:
  - if the input is declared in a tessellation control or geometry shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither is a structure member; or
  - if the maintenance4 feature is enabled, they are declared as OpTypeVector variables, and the output has a Component Count value higher than that of the input but the same Component Type; or
  - if the output is declared in a mesh shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the input, and neither is a structure member; or
  - if the input is decorated with PerVertexKHR, and is declared in a fragment shader as an OpTypeArray with an Element Type equivalent to the OpType* declaration of the output, and neither the input nor the output is a structure member; or
  - if in any other case they are declared with an equivalent OpType* declaration.
• If both are structures and every member has an interface match.

**Note**
The word “structure” above refers to both variables that have an `OpTypeStruct` type and interface blocks (which are also declared as `OpTypeStruct`).

If the pipeline is compiled as separate graphics pipeline libraries and the `graphicsPipelineLibraryIndependentInterpolationDecoration` limit is not supported, matches are not found if the interpolation decorations differ between the last pre-rasterization shader stage and the fragment shader stage.

All input variables and blocks **must** have an interface match in the preceding shader stage, except for built-in variables in fragment shaders. Shaders **can** declare and write to output variables that are not declared or read by the subsequent stage.

Matching rules for *passthrough geometry shaders* are slightly different and are described in the *Passthrough Interface Matching* section.

The value of an input variable is undefined if the preceding stage does not write to a matching output variable, as described above.

### 15.1.4. Location Assignment

This section describes location assignments for user-defined variables and how many locations are consumed by a given user-variable type. As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This outer array level is removed from the type before considering how many locations the type consumes.

The **Location** value specifies an interface slot comprised of a 32-bit four-component vector conveyed between stages. The **Component** specifies components within these vector locations. Only types with widths of 16, 32 or 64 are supported in shader interfaces.

Inputs and outputs of the following types consume a single interface location:

- 16-bit scalar and vector types, and
- 32-bit scalar and vector types, and
- 64-bit scalar and 2-component vector types.

64-bit three- and four-component vectors consume two consecutive locations.

If a declared input or output is an array of size $n$ and each element takes $m$ locations, it will be assigned $m \times n$ consecutive locations starting with the location specified.

If the declared input or output is an $n \times m$ 16-, 32- or 64-bit matrix, it will be assigned multiple locations starting with the location specified. The number of locations assigned for each matrix will be the same as for an $n$-element array of $m$-component vectors.

An `OpVariable` with a structure type that is not a block **must** be decorated with a **Location**.
When an `OpVariable` with a structure type (either block or non-block) is decorated with a `Location`, the members in the structure type must not be decorated with a `Location`. The `OpVariable`'s members are assigned consecutive locations in declaration order, starting from the first member, which is assigned the location decoration from the `OpVariable`.

When a block-type `OpVariable` is declared without a `Location` decoration, each member in its structure type must be decorated with a `Location`. Types nested deeper than the top-level members must not have `Location` decorations.

The locations consumed by block and structure members are determined by applying the rules above in a depth-first traversal of the instantiated members as though the structure or block member were declared as an input or output variable of the same type.

Any two inputs listed as operands on the same `OpEntryPoint` must not be assigned the same location, either explicitly or implicitly. Any two outputs listed as operands on the same `OpEntryPoint` must not be assigned the same location, either explicitly or implicitly.

The number of input and output locations available for a shader input or output interface are limited, and dependent on the shader stage as described in **Shader Input and Output Locations**. All variables in both the built-in interface block and the user-defined variable interface count against these limits. Each effective `Location` must have a value less than the number of locations available for the given interface, as specified in the “Locations Available” column in **Shader Input and Output Locations**.

### 15.1.5. Component Assignment

The `Component` decoration allows the `Location` to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a
location are 0, 1, 2, and 3. A variable or block member starting at component N will consume components N, N+1, N+2, ... up through its size. For 16- and 32-bit types, it is invalid if this sequence of components gets larger than 3. A scalar 64-bit type will consume two of these components in sequence, and a two-component 64-bit vector type will consume all four components available within a location. A three- or four-component 64-bit vector type must not specify a Component decoration. A three-component 64-bit vector type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations.

A scalar or two-component 64-bit data type must not specify a Component decoration of 1 or 3. A Component decoration must not be specified for any type that is not a scalar or vector.

### 15.2. Vertex Input Interface

When the vertex stage is present in a pipeline, the vertex shader input variables form an interface with the vertex input attributes. The vertex shader input variables are matched by the Location and Component decorations to the vertex input attributes specified in the pVertexInputState member of the VkGraphicsPipelineCreateInfo structure.

The vertex shader input variables listed by OpEntryPoint with the Input storage class form the vertex input interface. These variables must be identified with a Location decoration and can also be identified with a Component decoration.

For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero. The number of available vertex input locations is given by the maxVertexInputAttributes member of the VkPhysicalDeviceLimits structure.

See Attribute Location and Component Assignment for details.

All vertex shader inputs declared as above must have a corresponding attribute and binding in the pipeline.

### 15.3. Fragment Output Interface

When the fragment stage is present in a pipeline, the fragment shader outputs form an interface with the output attachments defined by a render pass instance. The fragment shader output variables are matched by the Location and Component decorations to specified color attachments.

The fragment shader output variables listed by OpEntryPoint with the Output storage class form the fragment output interface. These variables must be identified with a Location decoration. They can also be identified with a Component decoration and/or an Index decoration. For the purposes of interface matching: variables declared without a Component decoration are considered to have a Component decoration of zero, and variables declared without an Index decoration are considered to have an Index decoration of zero.

A fragment shader output variable identified with a Location decoration of i is associated with the element of VkRenderingInfo::pColorAttachments with a location equal to i. When using render pass objects, it is associated with the color attachment indicated by pColorAttachments[i]. Values are written to those attachments after passing through the blending unit as described in Blending, if
enabled. Locations are consumed as described in Location Assignment. The number of available fragment output locations is given by the maxFragmentOutputAttachments member of the VkPhysicalDeviceLimits structure.

Components of the output variables are assigned as described in Component Assignment. Output components identified as 0, 1, 2, and 3 will be directed to the R, G, B, and A inputs to the blending unit, respectively, or to the output attachment if blending is disabled. If two variables are placed within the same location, they must have the same underlying type (floating-point or integer). The input values to blending or color attachment writes are undefined for components which do not correspond to a fragment shader output.

Fragment outputs identified with an Index of zero are directed to the first input of the blending unit associated with the corresponding Location. Outputs identified with an Index of one are directed to the second input of the corresponding blending unit.

No component aliasing of output variables is allowed, that is there must not be two output variables which have the same location, component, and index, either explicitly declared or implied.

Output values written by a fragment shader must be declared with either OpTypeFloat or OpTypeInt, and a Width of 32. If storageInputOutput16 is supported, output values written by a fragment shader can be also declared with either OpTypeFloat or OpTypeInt and a Width of 16. Composites of these types are also permitted. If the color attachment has a signed or unsigned normalized fixed-point format, color values are assumed to be floating-point and are converted to fixed-point as described in Conversion from Floating-Point to Normalized Fixed-Point; If the color attachment has an integer format, color values are assumed to be integers and converted to the bit-depth of the target. Any value that cannot be represented in the attachment’s format is undefined. For any other attachment format no conversion is performed. If the type of the values written by the fragment shader do not match the format of the corresponding color attachment, the resulting values are undefined for those components.

15.4. Fragment Input Attachment Interface

When a fragment stage is present in a pipeline, the fragment shader subpass inputs form an interface with the input attachments of the current subpass. The fragment shader subpass input variables are matched by InputAttachmentIndex decorations to the input attachments specified in the pInputAttachments array of the VkSubpassDescription structure describing the subpass that the fragment shader is executed in.

The fragment shader subpass input variables with the UniformConstant storage class and a decoration of InputAttachmentIndex that are statically used by OpEntryPoint form the fragment input attachment interface. These variables must be declared with a type of OpTypeImage, a Dim operand of SubpassData, an Arrayed operand of 0, and a Sampled operand of 2. The MS operand of the OpTypeImage must be 0 if the samples field of the corresponding VkAttachmentDescription is VK_SAMPLE_COUNT_1_BIT and 1 otherwise.

A subpass input variable identified with an InputAttachmentIndex decoration of i reads from the input attachment indicated by pInputAttachments[i] member of VkSubpassDescription. If the subpass input variable is declared as an array of size N, it consumes N consecutive input attachments, starting with the index specified. There must not be more than one input variable with the same
Variables identified with the `InputAttachmentIndex` must only be used by a fragment stage. The basic data type (floating-point, integer, unsigned integer) of the subpass input must match the basic format of the corresponding input attachment, or the values of subpass loads from these variables are undefined.

See `Input Attachment` for more details.

## 15.5. Ray Tracing Pipeline Interface

Ray tracing pipelines may have more stages than other pipelines with multiple instances of each stage and more dynamic interactions between the stages, but still have interface structures that obey the same general rules as interfaces between shader stages in other pipelines. The three types of inter-stage interface variables for ray tracing pipelines are:

- Ray payloads containing data tracked for the entire lifetime of the ray.
- Hit attributes containing data about a specific hit for the duration of its processing.
- Callable data for passing data into and out of a callable shader.

Ray payloads and callable data are used in explicit shader call instructions, so they have an incoming variant to distinguish the parameter passed to the invocation from any other payloads or data being used by subsequent shader call instructions.

An interface structure used between stages must match between the stages using it. Specifically:

- The hit attribute structure read in an any-hit or closest hit shader must be the same structure as the hit attribute structure written in the corresponding intersection shader in the same hit group.
- The incoming callable data for a callable shader must be the same structure as the callable data referenced by the execute callable instruction in the calling shader.
- The ray payload for a shader invoked by a ray tracing command must be the same structure for all shader stages using the payload for that ray.

Any shader with an incoming ray payload, incoming callable data, or hit attribute must only declare one variable of that type.

## 15.6. Shader Resource Interface

When a shader stage accesses buffer or image resources, as described in the [Resource Descriptors](#) section, the shader resource variables **must** be matched with the pipeline layout that is provided at pipeline creation time.

The set of shader variables that form the *shader resource interface* for a stage are the variables statically used by that stage's `OpEntryPoint` with a storage class of `Uniform`, `UniformConstant`, `StorageBuffer`, or `PushConstant`. For the fragment shader, this includes the *fragment input attachment interface*.

The shader resource interface consists of two sub-interfaces: the push constant interface and the descriptor set interface.

### 15.6.1. Push Constant Interface

The shader variables defined with a storage class of `PushConstant` that are statically used by the shader entry points for the pipeline define the *push constant interface*. They **must** be:

- typed as `OpTypeStruct`,
- identified with a `Block` decoration, and
- laid out explicitly using the `Offset`, `ArrayStride`, and `MatrixStride` decorations as specified in [Offset and Stride Assignment](#).

There **must** be no more than one push constant block statically used per shader entry point.

Each statically used member of a push constant block **must** be placed at an `Offset` such that the entire member is entirely contained within the `VkPushConstantRange` for each `OpEntryPoint` that uses it, and the `stageFlags` for that range **must** specify the appropriate `VkShaderStageFlagBits` for that stage. The `Offset` decoration for any member of a push constant block **must** not cause the space required for that member to extend outside the range \([0, \text{maxPushConstantsSize})\).

Any member of a push constant block that is declared as an array **must** only be accessed with *dynamically uniform* indices.

### 15.6.2. Descriptor Set Interface

The *descriptor set interface* is comprised of the shader variables with the storage class of

<table>

</tr>
</tbody>
</table>
StorageBuffer, Uniform or UniformConstant (including the variables in the fragment input attachment interface) that are statically used by the shader entry points for the pipeline.

These variables must have DescriptorSet and Binding decorations specified, which are assigned and matched with the VkDescriptorSetLayout objects in the pipeline layout as described in DescriptorSet and Binding Assignment.

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpImageRead, OpImageSparseRead, or OpImageWrite operations, except under the following conditions:

- For OpImageWrite, if the image format is listed in the storage without format list and if the shaderStorageImageWriteWithoutFormat feature is enabled and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageWrite, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageWriteWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format is listed in the storage without format list and if the shaderStorageImageReadWithoutFormat feature is enabled and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead or OpImageSparseRead, if the image format supports VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT and the shader module declares the StorageImageReadWithoutFormat capability.
- For OpImageRead, if Dim is SubpassData (indicating a read from an input attachment).

The Image Format of an OpTypeImage declaration must not be Unknown, for variables which are used for OpAtomic* operations.

Variables identified with the Uniform storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block or BufferBlock decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

Variables identified with the StorageBuffer storage class are used to access transparent buffer backed resources. Such variables must be:

- typed as OpTypeStruct, or an array of this type,
- identified with a Block decoration, and
- laid out explicitly using the Offset, ArrayStride, and MatrixStride decorations as specified in Offset and Stride Assignment.

The Offset decoration for any member of a Block-decorated variable in the Uniform storage class must not cause the space required for that variable to extend outside the range [0, maxUniformBufferRange). The Offset decoration for any member of a Block-decorated variable in the
StorageBuffer storage class **must** not cause the space required for that variable to extend outside the range \([0, \text{maxStorageBufferRange})\).

Variables identified with the **Uniform** storage class **can** also be used to access transparent descriptor set backed resources when the variable is assigned to a descriptor set layout binding with a `descriptorType` of `VK_DESCRIPTOR_TYPE_INLINE_UNIFORM_BLOCK`. In this case the variable **must** be typed as `OpTypeStruct` and **cannot** be aggregated into arrays of that type. Further, the `Offset` decoration for any member of such a variable **must** not cause the space required for that variable to extend outside the range \([0, \text{maxInlineUniformBlockSize})\).

Variables identified with a storage class of **UniformConstant** and a decoration of `InputAttachmentIndex` **must** be declared as described in Fragment Input Attachment Interface.

SPIR-V variables decorated with a descriptor set and binding that identify a combined image sampler descriptor **can** have a type of `OpTypeImage`, `OpTypeSampler` (sampled=1), or `OpTypeSampledImage`. Arrays of any of these types **can** be indexed with *constant integral expressions*. The following features **must** be enabled and capabilities **must** be declared in order to index such arrays with dynamically uniform or non-uniform indices:

- **Storage images** (except storage texel buffers and input attachments):
  - Dynamically uniform: `shaderStorageImageArrayDynamicIndexing` and `StorageImageArrayDynamicIndexing`
  - Non-uniform: `shaderStorageImageArrayNonUniformIndexing` and `StorageImageArrayNonUniformIndexing`

- **Storage texel buffers**:
  - Dynamically uniform: `shaderStorageTexelBufferArrayDynamicIndexing` and `StorageTexelBufferArrayDynamicIndexing`
  - Non-uniform: `shaderStorageTexelBufferArrayNonUniformIndexing` and `StorageTexelBufferArrayNonUniformIndexing`

- **Input attachments**:
  - Dynamically uniform: `shaderInputAttachmentArrayDynamicIndexing` and `InputAttachmentArrayDynamicIndexing`
  - Non-uniform: `shaderInputAttachmentArrayNonUniformIndexing` and `InputAttachmentArrayNonUniformIndexing`

- **Sampled images** (except uniform texel buffers), samplers and combined image samplers:
  - Dynamically uniform: `shaderSampledImageArrayDynamicIndexing` and `SampledImageArrayDynamicIndexing`
  - Non-uniform: `shaderSampledImageArrayNonUniformIndexing` and `SampledImageArrayNonUniformIndexing`

- **Uniform texel buffers**:
  - Dynamically uniform: `shaderUniformTexelBufferArrayDynamicIndexing` and `UniformTexelBufferArrayDynamicIndexing`
• Non-uniform: `shaderUniformTexelBufferArrayNonUniformIndexing` and `UniformTexelBufferArrayNonUniformIndexing`

<table>
<thead>
<tr>
<th>Uniform buffers:</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Dynamically uniform: <code>shaderUniformBufferArrayDynamicIndexing</code> and <code>UniformBufferArrayDynamicIndexing</code></td>

<tr>
<td>• Non-uniform: <code>shaderStorageBufferArrayNonUniformIndexing</code> and <code>StorageBufferArrayNonUniformIndexing</code></td>
</tr>
</tbody>
</table>

• Acceleration structures:
  • Dynamically uniform: Always supported.
  • Non-uniform: Always supported.

• weight image:
  • Dynamically uniform: Always supported.
  • Non-uniform: Never supported.

• Block matching image:
  • Dynamically uniform: Always supported.
  • Non-uniform: Never supported.

If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is not dynamically uniform, then the corresponding non-uniform indexing feature must be enabled and the capability must be declared. If an instruction loads from or stores to a resource (including atomics and image instructions) and the resource descriptor being accessed is loaded from an array element with a non-constant index, then the corresponding dynamic or non-uniform indexing feature must be enabled and the capability must be declared.

If the combined image sampler enables sampler Y’C_bC_r conversion or samples a subsampled image, it must be indexed only by constant integral expressions when aggregated into arrays in shader code, irrespective of the `shaderSampledImageArrayDynamicIndexing` feature.

1

Where \texttt{OpTypeImage} is referenced, the \texttt{Dim} values \texttt{Buffer} and \texttt{SubpassData} are only accepted where they are specifically referenced. They do not correspond to resource types where a generic \texttt{OpTypeImage} is specified.

2

In addition to \texttt{DescriptorSet} and \texttt{Binding}.

### 15.6.3. DescriptorSet and Binding Assignment

A variable decorated with a \texttt{DescriptorSet} decoration of \texttt{s} and a \texttt{Binding} decoration of \texttt{b} indicates that this variable is associated with the \texttt{VkDescriptorSetLayoutBinding} that has a \texttt{binding} equal to \texttt{b} in \texttt{pSetLayouts[\texttt{s}]} that was specified in \texttt{VkPipelineLayoutCreateInfo}.

\texttt{DescriptorSet} decoration values \textbf{must} be between zero and \texttt{maxBoundDescriptorSets} minus one, inclusive. \texttt{Binding} decoration values \textbf{can} be any 32-bit unsigned integer value, as described in \texttt{Descriptor Set Layout}. Each descriptor set has its own binding name space.

If the \texttt{Binding} decoration is used with an array, the entire array is assigned that binding value. The array \textbf{must} be a single-dimensional array and size of the array \textbf{must} be no larger than the number of descriptors in the binding. If the array is runtime-sized, then array elements greater than or equal to the size of that binding in the bound descriptor set \textbf{must} not be used. If the array is runtime-sized, the \texttt{runtimeDescriptorArray} feature \textbf{must} be enabled and the \texttt{RuntimeDescriptorArray} capability \textbf{must} be declared. The index of each element of the array is referred to as the \texttt{arrayElement}. For the purposes of interface matching and descriptor set \texttt{operations}, if a resource variable is not an array, it is treated as if it has an \texttt{arrayElement} of zero.

There is a limit on the number of resources of each type that \textbf{can} be accessed by a pipeline stage as shown in \texttt{Shader Resource Limits}. The “Resources Per Stage” column gives the limit on the number each type of resource that \textbf{can} be statically used for an entry point in any given stage in a pipeline. The “Resource Types” column lists which resource types are counted against the limit. Some resource types count against multiple limits. The \texttt{VK_DESCRIPTOR_TYPE_MUTABLE_VALUE} descriptor type counts as one individual resource and one for every unique resource limit per descriptor set type that is present in the associated binding’s \texttt{VkMutableDescriptorTypeListVALVE}. If multiple descriptor types in \texttt{VkMutableDescriptorTypeListVALVE} map to the same resource limit, only one descriptor is consumed for purposes of computing resource limits.

The pipeline layout \textbf{may} include descriptor sets and bindings which are not referenced by any
variables statically used by the entry points for the shader stages in the binding’s stageFlags.

However, if a variable assigned to a given DescriptorSet and Binding is statically used by the entry point for a shader stage, the pipeline layout must contain a descriptor set layout binding in that descriptor set layout and for that binding number, and that binding’s stageFlags must include the appropriate VkShaderStageFlagBits for that stage. The variable must be of a valid resource type determined by its SPIR-V type and storage class, as defined in Shader Resource and Storage Class Correspondence. The descriptor set layout binding must be of a corresponding descriptor type, as defined in Shader Resource and Descriptor Type Correspondence.

Note
There are no limits on the number of shader variables that can have overlapping set and binding values in a shader; but which resources are statically used has an impact. If any shader variable identifying a resource is statically used in a shader, then the underlying descriptor bound at the declared set and binding must support the declared type in the shader when the shader executes.

If multiple shader variables are declared with the same set and binding values, and with the same underlying descriptor type, they can all be statically used within the same shader. However, accesses are not automatically synchronized, and Aliased decorations should be used to avoid data hazards (see section 2.18.2 Aliasing in the SPIR-V specification).

If multiple shader variables with the same set and binding values are declared in a single shader, but with different declared types, where any of those are not supported by the relevant bound descriptor, that shader can only be executed if the variables with the unsupported type are not statically used.

A noteworthy example of using multiple statically-used shader variables sharing the same descriptor set and binding values is a descriptor of type VK_DESCRIPTOR_TYPE_COMBINED_IMAGE_SAMPLER that has multiple corresponding shader variables in the UniformConstant storage class, where some could be OpTypeImage (Sampled=1), some could be OpTypeSampler, and some could be OpTypeSampledImage.

Input attachments can only be used in the fragment shader stage

### 15.6.4. Offset and Stride Assignment

Certain objects must be explicitly laid out using the Offset, ArrayStride, and MatrixStride, as described in SPIR-V explicit layout validation rules. All such layouts also must conform to the following requirements.

---

**Note**

The numeric order of Offset decorations does not need to follow member declaration order.

---

### Alignment Requirements

There are different alignment requirements depending on the specific resources and on the features enabled on the device.

Matrix types are defined in terms of arrays as follows:

- A column-major matrix with C columns and R rows is equivalent to a C element array of vectors with R components.
- A row-major matrix with C columns and R rows is equivalent to an R element array of vectors with C components.
The scalar alignment of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar of size N has a scalar alignment of N.
- A vector type has a scalar alignment equal to that of its component type.
- An array type has a scalar alignment equal to that of its element type.
- A structure has a scalar alignment equal to the largest scalar alignment of any of its members.
- A matrix type inherits scalar alignment from the equivalent array declaration.

The base alignment of the type of an `OpTypeStruct` member is defined recursively as follows:

- A scalar has a base alignment equal to its scalar alignment.
- A two-component vector has a base alignment equal to twice its scalar alignment.
- A three- or four-component vector has a base alignment equal to four times its scalar alignment.
- An array has a base alignment equal to the base alignment of its element type.
- A structure has a base alignment equal to the largest base alignment of any of its members. An empty structure has a base alignment equal to the size of the smallest scalar type permitted by the capabilities declared in the SPIR-V module. (e.g., for a 1 byte aligned empty struct in the `StorageBuffer` storage class, `StorageBuffer8BitAccess` or `UniformAndStorageBuffer8BitAccess` must be declared in the SPIR-V module.)
- A matrix type inherits base alignment from the equivalent array declaration.

The extended alignment of the type of an `OpTypeStruct` member is similarly defined as follows:

- A scalar or vector type has an extended alignment equal to its base alignment.
- An array or structure type has an extended alignment equal to the largest extended alignment of any of its members, rounded up to a multiple of 16.
- A matrix type inherits extended alignment from the equivalent array declaration.

A member is defined to improperly straddle if either of the following are true:

- It is a vector with total size less than or equal to 16 bytes, and has Offset decorations placing its first byte at F and its last byte at L, where floor(F / 16) != floor(L / 16).
- It is a vector with total size greater than 16 bytes and has its Offset decorations placing its first byte at a non-integer multiple of 16.

Standard Buffer Layout

Every member of an `OpTypeStruct` that is required to be explicitly laid out must be aligned according to the first matching rule as follows. If the struct is contained in pointer types of multiple storage classes, it must satisfy the requirements for every storage class used to reference it.

1. If the `scalarBlockLayout` feature is enabled on the device and the storage class is Uniform, `StorageBuffer`, PhysicalStorageBuffer, `ShaderRecordBufferKHR`, or PushConstant then every member must be aligned according to its scalar alignment.

2. If the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is enabled on the device and the
storage class is **Workgroup** then every member **must** be aligned according to its scalar alignment.

3. All vectors **must** be aligned according to their scalar alignment.

4. If the `uniformBufferStandardLayout` feature is not enabled on the device, then any member of an `OpTypeStruct` with a storage class of `Uniform` and a decoration of `Block` **must** be aligned according to its extended alignment.

5. Every other member **must** be aligned according to its base alignment.

**Note**

Even if scalar alignment is supported, it is generally more performant to use the **base alignment**.

The memory layout **must** obey the following rules:

- The `Offset` decoration of any member **must** be a multiple of its alignment.
- Any `ArrayStride` or `MatrixStride` decoration **must** be a multiple of the alignment of the array or matrix as defined above.

If one of the conditions below applies

- The storage class is `Uniform, StorageBuffer, PhysicalStorageBuffer, ShaderRecordBufferKHR, or PushConstant`, and the `scalarBlockLayout` feature is not enabled on the device.
- The storage class is `Workgroup`, and either the struct member is not part of a `Block` or the `workgroupMemoryExplicitLayoutScalarBlockLayout` feature is not enabled on the device.
- The storage class is any other storage class.

the memory layout **must** also obey the following rules:

- Vectors **must** not improperly straddle, as defined above.
- The `Offset` decoration of a member **must** not place it between the end of a structure, an array or a matrix and the next multiple of the alignment of that structure, array or matrix.

**Note**

The **std430 layout** in GLSL satisfies these rules for types using the base alignment. The **std140 layout** satisfies the rules for types using the extended alignment.

### 15.7. Built-In Variables

Built-in variables are accessed in shaders by declaring a variable decorated with a `BuiltIn` SPIR-V decoration. The meaning of each `BuiltIn` decoration is as follows. In the remainder of this section, the name of a built-in is used interchangeably with a term equivalent to a variable decorated with that particular built-in. Built-ins that represent integer values **can** be declared as either signed or unsigned 32-bit integers.

As mentioned above, some inputs and outputs have an additional level of arrayness relative to other shader inputs and outputs. This level of arrayness is not included in the type descriptions.

1147
below, but must be included when declaring the built-in.

**BaryCoordKHR**

The *BaryCoordKHR* decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using perspective interpolation.

### Valid Usage

- VUID-BaryCoordKHR-BaryCoordKHR-04154
  The *BaryCoordKHR* decoration **must** be used only within the **Fragment Execution Model**

- VUID-BaryCoordKHR-BaryCoordKHR-04155
  The variable decorated with *BaryCoordKHR* **must** be declared using the **Input Storage Class**

- VUID-BaryCoordKHR-BaryCoordKHR-04156
  The variable decorated with *BaryCoordKHR* **must** be declared as a three-component vector of 32-bit floating-point values

**BaryCoordNoPerspAMD**

The *BaryCoordNoPerspAMD* decoration **can** be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the fragment's center. The K coordinate of the barycentric coordinates **can** be derived given the identity I + J + K = 1.0.

### Valid Usage

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04157
  The *BaryCoordNoPerspAMD* decoration **must** be used only within the **Fragment Execution Model**

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04158
  The variable decorated with *BaryCoordNoPerspAMD* **must** be declared using the **Input Storage Class**

- VUID-BaryCoordNoPerspAMD-BaryCoordNoPerspAMD-04159
  The variable decorated with *BaryCoordNoPerspAMD* **must** be declared as a two-component vector of 32-bit floating-point values

**BaryCoordNoPerspKHR**

The *BaryCoordNoPerspKHR* decoration **can** be used to decorate a fragment shader input variable. This variable will contain a three-component floating-point vector with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive, obtained using linear interpolation.

### Valid Usage

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04160
The BaryCoordNoPerspKHR decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04161
  The variable decorated with BaryCoordNoPerspKHR must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspKHR-BaryCoordNoPerspKHR-04162
  The variable decorated with BaryCoordNoPerspKHR must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspCentroidAMD

The BaryCoordNoPerspCentroidAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at the centroid. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04163
  The BaryCoordNoPerspCentroidAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04164
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspCentroidAMD-BaryCoordNoPerspCentroidAMD-04165
  The variable decorated with BaryCoordNoPerspCentroidAMD must be declared as a three-component vector of 32-bit floating-point values

BaryCoordNoPerspSampleAMD

The BaryCoordNoPerspSampleAMD decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using linear interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity I + J + K = 1.0.

Valid Usage

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04166
  The BaryCoordNoPerspSampleAMD decoration must be used only within the Fragment Execution Model

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04167
  The variable decorated with BaryCoordNoPerspSampleAMD must be declared using the Input Storage Class

- VUID-BaryCoordNoPerspSampleAMD-BaryCoordNoPerspSampleAMD-04168
  The variable decorated with BaryCoordNoPerspSampleAMD must be declared as a two-component vector of 32-bit floating-point values
**BaryCoordPullModelAMD**

The **BaryCoordPullModelAMD** decoration *can* be used to decorate a fragment shader input variable. This variable will contain \((1/W, 1/I, 1/J)\) evaluated at the fragment center and *can* be used to calculate gradients and then interpolate \(I, J,\) and \(W\) at any desired sample location.

**Valid Usage**

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04169**
  The **BaryCoordPullModelAMD** decoration **must** be used only within the Fragment Execution Model

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04170**
  The variable decorated with **BaryCoordPullModelAMD** **must** be declared using the Input Storage Class

- **VUID-BaryCoordPullModelAMD-BaryCoordPullModelAMD-04171**
  The variable decorated with **BaryCoordPullModelAMD** **must** be declared as a three-component vector of 32-bit floating-point values

**BaryCoordSmoothAMD**

The **BaryCoordSmoothAMD** decoration *can* be used to decorate a fragment shader input variable. This variable will contain the \((I,J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the fragment’s center. The \(K\) coordinate of the barycentric coordinates *can* be derived given the identity \(I + J + K = 1.0.\)

**Valid Usage**

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04172**
  The **BaryCoordSmoothAMD** decoration **must** be used only within the Fragment Execution Model

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04173**
  The variable decorated with **BaryCoordSmoothAMD** **must** be declared using the Input Storage Class

- **VUID-BaryCoordSmoothAMD-BaryCoordSmoothAMD-04174**
  The variable decorated with **BaryCoordSmoothAMD** **must** be declared as a two-component vector of 32-bit floating-point values

**BaryCoordSmoothCentroidAMD**

The **BaryCoordSmoothCentroidAMD** decoration *can* be used to decorate a fragment shader input variable. This variable will contain the \((I,J)\) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at the centroid. The \(K\) coordinate of the barycentric coordinates **can** be derived given the identity \(I + J + K = 1.0.\)

**Valid Usage**

- **VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04175**
The `BaryCoordSmoothCentroidAMD` decoration must be used only within the *Fragment Execution Model*.

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04176
  The variable decorated with `BaryCoordSmoothCentroidAMD` must be declared using the *Input Storage Class*.

- VUID-BaryCoordSmoothCentroidAMD-BaryCoordSmoothCentroidAMD-04177
  The variable decorated with `BaryCoordSmoothCentroidAMD` must be declared as a two-component vector of 32-bit floating-point values.

---

**BaryCoordSmoothSampleAMD**

The `BaryCoordSmoothSampleAMD` decoration can be used to decorate a fragment shader input variable. This variable will contain the (I,J) pair of the barycentric coordinates corresponding to the fragment evaluated using perspective interpolation at each covered sample. The K coordinate of the barycentric coordinates can be derived given the identity $I + J + K = 1.0$.

---

**Valid Usage**

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04178
  The `BaryCoordSmoothSampleAMD` decoration must be used only within the *Fragment Execution Model*.

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04179
  The variable decorated with `BaryCoordSmoothSampleAMD` must be declared using the *Input Storage Class*.

- VUID-BaryCoordSmoothSampleAMD-BaryCoordSmoothSampleAMD-04180
  The variable decorated with `BaryCoordSmoothSampleAMD` must be declared as a two-component vector of 32-bit floating-point values.

---

**BaseInstance**

Decorating a variable with the `BaseInstance` built-in will make that variable contain the integer value corresponding to the first instance that was passed to the command that invoked the current vertex shader invocation. `BaseInstance` is the firstInstance parameter to a *direct drawing command* or the firstInstance member of a structure consumed by an *indirect drawing command*.

---

**Valid Usage**

- VUID-BaseInstance-BaseInstance-04181
  The `BaseInstance` decoration must be used only within the *Vertex Execution Model*.

- VUID-BaseInstance-BaseInstance-04182
  The variable decorated with `BaseInstance` must be declared using the *Input Storage Class*.

- VUID-BaseInstance-BaseInstance-04183
  The variable decorated with `BaseInstance` must be declared as a scalar 32-bit integer value.
BaseVertex

Decorating a variable with the `BaseVertex` built-in will make that variable contain the integer value corresponding to the first vertex or vertex offset that was passed to the command that invoked the current vertex shader invocation. For non-indexed drawing commands, this variable is the firstVertex parameter to a direct drawing command or the firstVertex member of the structure consumed by an indirect drawing command. For indexed drawing commands, this variable is the vertexOffset parameter to a direct drawing command or the vertexOffset member of the structure consumed by an indirect drawing command.

Valid Usage

- VUID-BaseVertex-BaseVertex-04184
  The `BaseVertex` decoration must be used only within the Vertex Execution Model
- VUID-BaseVertex-BaseVertex-04185
  The variable decorated with `BaseVertex` must be declared using the Input Storage Class
- VUID-BaseVertex-BaseVertex-04186
  The variable decorated with `BaseVertex` must be declared as a scalar 32-bit integer value

ClipDistance

Decorating a variable with the `ClipDistance` built-in decoration will make that variable contain the mechanism for controlling user clipping. `ClipDistance` is an array such that the i-th element of the array specifies the clip distance for plane i. A clip distance of 0 means the vertex is on the plane, a positive distance means the vertex is inside the clip half-space, and a negative distance means the vertex is outside the clip half-space.

Note

The array variable decorated with `ClipDistance` is explicitly sized by the shader.

Note

In the last pre-rasterization shader stage, these values will be linearly interpolated across the primitive and the portion of the primitive with interpolated distances less than 0 will be considered outside the clip volume. If `ClipDistance` is then used by a fragment shader, `ClipDistance` contains these linearly interpolated values.

Valid Usage

- VUID-ClipDistance-ClipDistance-04187
  The `ClipDistance` decoration must be used only within the MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model
- VUID-ClipDistance-ClipDistance-04188
  The variable decorated with `ClipDistance` within the MeshNV or Vertex Execution Model must be declared using the Output Storage Class
- VUID-ClipDistance-ClipDistance-04189
  The variable decorated with `ClipDistance` within the Fragment Execution Model must be
declared using the **Input Storage Class**

- **VUID-ClipDistance-ClipDistance-04190**
  The variable decorated with `ClipDistance` within the `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model` must not be declared in a `Storage Class` other than `Input` or `Output`

- **VUID-ClipDistance-ClipDistance-04191**
  The variable decorated with `ClipDistance` must be declared as an array of 32-bit floating-point values

**ClipDistancePerViewNV**

Decorating a variable with the `ClipDistancePerViewNV` built-in decoration will make that variable contain the per-view clip distances. The per-view clip distances have the same semantics as `ClipDistance`.

**Valid Usage**

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04192**
  The `ClipDistancePerViewNV` decoration must be used only within the `MeshNV Execution Model`

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04193**
  The variable decorated with `ClipDistancePerViewNV` must be declared using the `Output Storage Class`

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04194**
  The variable decorated with `ClipDistancePerViewNV` must also be decorated with the `PerViewNV` decoration

- **VUID-ClipDistancePerViewNV-ClipDistancePerViewNV-04195**
  The variable decorated with `ClipDistancePerViewNV` must be declared as a two-dimensional array of 32-bit floating-point values

**CullDistance**

Decorating a variable with the `CullDistance` built-in decoration will make that variable contain the mechanism for controlling user culling. If any member of this array is assigned a negative value for all vertices belonging to a primitive, then the primitive is discarded before rasterization.

**Note**

In fragment shaders, the values of the `CullDistance` array are linearly interpolated across each primitive.

**Note**

If `CullDistance` decorates an input variable, that variable will contain the corresponding value from the `CullDistance` decorated output variable from the previous shader stage.
Valid Usage

- **VUID-CullDistance-CullDistance-04196**
  The CullDistance decoration **must** be used only within the MeshNV, Vertex, Fragment, TessellationControl, TessellationEvaluation, or Geometry Execution Model.

- **VUID-CullDistance-CullDistance-04197**
  The variable decorated with CullDistance within the MeshNV or Vertex Execution Model **must** be declared using the Output Storage Class.

- **VUID-CullDistance-CullDistance-04198**
  The variable decorated with CullDistance within the Fragment Execution Model **must** be declared using the Input Storage Class.

- **VUID-CullDistance-CullDistance-04199**
  The variable decorated with CullDistance within the TessellationControl, TessellationEvaluation, or Geometry Execution Model **must** not be declared using a Storage Class other than Input or Output.

- **VUID-CullDistance-CullDistance-04200**
  The variable decorated with CullDistance **must** be declared as an array of 32-bit floating-point values.

---

CullDistancePerViewNV

Decorating a variable with the CullDistancePerViewNV built-in decoration will make that variable contain the per-view cull distances. The per-view cull distances have the same semantics as CullDistance.

Valid Usage

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04201**
  The CullDistancePerViewNV decoration **must** be used only within the MeshNV Execution Model.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04202**
  The variable decorated with CullDistancePerViewNV **must** be declared using the Output Storage Class.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04203**
  The variable decorated with CullDistancePerViewNV **must** also be decorated with the PerViewNV decoration.

- **VUID-CullDistancePerViewNV-CullDistancePerViewNV-04204**
  The variable decorated with CullDistancePerViewNV **must** be declared as a two-dimensional array of 32-bit floating-point values.

---

CullMaskKHR

A variable decorated with the CullMaskKHR decoration will specify the cull mask of the ray being processed. The value is given by the Cull Mask parameter passed into one of the OpTrace* instructions.
Valid Usage

- VUID-CullMaskKHR-CullMaskKHR-06735
  The CullMaskKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- VUID-CullMaskKHR-CullMaskKHR-06736
  The variable decorated with CullMaskKHR must be declared using the Input Storage Class.

- VUID-CullMaskKHR-CullMaskKHR-06737
  The variable decorated with CullMaskKHR must be declared as a scalar 32-bit integer value.

CurrentRayTimeNV

A variable decorated with the CurrentRayTimeNV decoration contains the time value passed in to OpTraceRayMotionNV which called this shader.

Valid Usage

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04942
  The CurrentRayTimeNV decoration must be used only within the IntersectionKHR, AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04943
  The variable decorated with CurrentRayTimeNV must be declared using the Input Storage Class.

- VUID-CurrentRayTimeNV-CurrentRayTimeNV-04944
  The variable decorated with CurrentRayTimeNV must be declared as a scalar 32-bit floating-point value.

DeviceIndex

The DeviceIndex decoration can be applied to a shader input which will be filled with the device index of the physical device that is executing the current shader invocation. This value will be in the range \(0, \max(1, \text{physicalDeviceCount})\), where physicalDeviceCount is the physicalDeviceCount member of VkDeviceGroupDeviceCreateInfo.

Valid Usage

- VUID-DeviceIndex-DeviceIndex-04205
  The variable decorated with DeviceIndex must be declared using the Input Storage Class.

- VUID-DeviceIndex-DeviceIndex-04206
  The variable decorated with DeviceIndex must be declared as a scalar 32-bit integer value.

DrawIndex

Decorating a variable with the DrawIndex built-in will make that variable contain the integer value corresponding to the zero-based index of the drawing command that invoked the current...
task, mesh, or vertex shader invocation. For indirect drawing commands, DrawIndex begins at zero and increments by one for each drawing command executed. The number of drawing commands is given by the drawCount parameter. For direct drawing commands, if \( \text{vkCmdDrawMultiEXT} \) or \( \text{vkCmdDrawMultiIndexedEXT} \) is used, this variable contains the integer value corresponding to the zero-based index of the draw command. Otherwise DrawIndex is always zero. DrawIndex is dynamically uniform.

When task or mesh shaders are used, only the first active stage will have proper access to the variable. The value read by other stages is undefined.

**Valid Usage**

- VUID-DrawIndex-DrawIndex-04207
  The \text{DrawIndex} decoration must be used only within the \text{Vertex, MeshNV, or TaskNV Execution Model}

- VUID-DrawIndex-DrawIndex-04208
  The variable decorated with \text{DrawIndex} must be declared using the \text{Input Storage Class}

- VUID-DrawIndex-DrawIndex-04209
  The variable decorated with \text{DrawIndex} must be declared as a scalar 32-bit integer value

**FragCoord**

Decorating a variable with the \text{FragCoord} built-in decoration will make that variable contain the framebuffer coordinate \((x, y, z, \frac{1}{z})\) of the fragment being processed. The \((0,0)\) coordinate is the upper left corner of the upper left pixel in the framebuffer.

When Sample Shading is enabled, the x and y components of \text{FragCoord} reflect the location of one of the samples corresponding to the shader invocation.

Otherwise, the x and y components of \text{FragCoord} reflect the location of the center of the fragment.

The z component of \text{FragCoord} is the interpolated depth value of the primitive.

The w component is the interpolated \( \frac{1}{z} \).

The \text{Centroid} interpolation decoration is ignored, but allowed, on \text{FragCoord}.

**Valid Usage**

- VUID-FragCoord-FragCoord-04210
  The \text{FragCoord} decoration must be used only within the \text{Fragment Execution Model}

- VUID-FragCoord-FragCoord-04211
  The variable decorated with \text{FragCoord} must be declared using the \text{Input Storage Class}

- VUID-FragCoord-FragCoord-04212
  The variable decorated with \text{FragCoord} must be declared as a four-component vector of 32-bit floating-point values
**FragDepth**

To have a shader supply a fragment-depth value, the shader **must** declare the `DepthReplacing` execution mode. Such a shader's fragment-depth value will come from the variable decorated with the `FragDepth` built-in decoration.

This value will be used for any subsequent depth testing performed by the implementation or writes to the depth attachment. See fragment shader depth replacement for details.

### Valid Usage

- **VUID-FragDepth-FragDepth-04213**
  The `FragDepth` decoration **must** be used only within the Fragment Execution Model

- **VUID-FragDepth-FragDepth-04214**
  The variable decorated with `FragDepth` **must** be declared using the Output Storage Class

- **VUID-FragDepth-FragDepth-04215**
  The variable decorated with `FragDepth` **must** be declared as a scalar 32-bit floating-point value

- **VUID-FragDepth-FragDepth-04216**
  If the shader dynamically writes to the variable decorated with `FragDepth`, the DepthReplacing Execution Mode **must** be declared

**FragInvocationCountEXT**

Decorating a variable with the `FragInvocationCountEXT` built-in decoration will make that variable contain the maximum number of fragment shader invocations for the fragment, as determined by `minSampleShading`.

If Sample Shading is not enabled, `FragInvocationCountEXT` will be filled with a value of 1.

### Valid Usage

- **VUID-FragInvocationCountEXT-FragInvocationCountEXT-04217**
  The `FragInvocationCountEXT` decoration **must** be used only within the Fragment Execution Model

- **VUID-FragInvocationCountEXT-FragInvocationCountEXT-04218**
  The variable decorated with `FragInvocationCountEXT` **must** be declared using the Input Storage Class

- **VUID-FragInvocationCountEXT-FragInvocationCountEXT-04219**
  The variable decorated with `FragInvocationCountEXT` **must** be declared as a scalar 32-bit integer value

**FragSizeEXT**

Decorating a variable with the `FragSizeEXT` built-in decoration will make that variable contain the dimensions in pixels of the area that the fragment covers for that invocation.
If fragment density map is not enabled, \texttt{FragSizeEXT} will be filled with a value of (1,1).

### Valid Usage

- **VUID-FragSizeEXT-FragSizeEXT-04220**
  The \texttt{FragSizeEXT} decoration \textbf{must} be used only within the Fragment Execution Model.

- **VUID-FragSizeEXT-FragSizeEXT-04221**
  The variable decorated with \texttt{FragSizeEXT} \textbf{must} be declared using the Input Storage Class.

- **VUID-FragSizeEXT-FragSizeEXT-04222**
  The variable decorated with \texttt{FragSizeEXT} \textbf{must} be declared as a two-component vector of 32-bit integer values.

### \texttt{FragStencilRefEXT}

Decorating a variable with the \texttt{FragStencilRefEXT} built-in decoration will make that variable contain the new stencil reference value for all samples covered by the fragment. This value will be used as the stencil reference value used in stencil testing.

To write to \texttt{FragStencilRefEXT}, a shader \textbf{must} declare the \texttt{StencilRefReplacingEXT} execution mode. If a shader declares the \texttt{StencilRefReplacingEXT} execution mode and there is an execution path through the shader that does not set \texttt{FragStencilRefEXT}, then the fragment's stencil reference value is undefined for executions of the shader that take that path.

Only the least significant \(s\) bits of the integer value of the variable decorated with \texttt{FragStencilRefEXT} are considered for stencil testing, where \(s\) is the number of bits in the stencil framebuffer attachment, and higher order bits are discarded.

See \texttt{fragment shader stencil reference replacement} for more details.

### Valid Usage

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04223**
  The \texttt{FragStencilRefEXT} decoration \textbf{must} be used only within the Fragment Execution Model.

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04224**
  The variable decorated with \texttt{FragStencilRefEXT} \textbf{must} be declared using the Output Storage Class.

- **VUID-FragStencilRefEXT-FragStencilRefEXT-04225**
  The variable decorated with \texttt{FragStencilRefEXT} \textbf{must} be declared as a scalar integer value.

### \texttt{FragmentSizeNV}

Decorating a variable with the \texttt{FragmentSizeNV} built-in decoration will make that variable contain the width and height of the fragment.
Valid Usage

- VUID-FragmentSizeNV-FragmentSizeNV-04226
  The FragmentSizeNV decoration must be used only within the Fragment Execution Model

- VUID-FragmentSizeNV-FragmentSizeNV-04227
  The variable decorated with FragmentSizeNV must be declared using the Input Storage Class

- VUID-FragmentSizeNV-FragmentSizeNV-04228
  The variable decorated with FragmentSizeNV must be declared as a two-component vector of 32-bit integer values

FrontFacing

Decorating a variable with the FrontFacing built-in decoration will make that variable contain whether the fragment is front or back facing. This variable is non-zero if the current fragment is considered to be part of a front-facing polygon primitive or of a non-polygon primitive and is zero if the fragment is considered to be part of a back-facing polygon primitive.

Valid Usage

- VUID-FrontFacing-FrontFacing-04229
  The FrontFacing decoration must be used only within the Fragment Execution Model

- VUID-FrontFacing-FrontFacing-04230
  The variable decorated with FrontFacing must be declared using the Input Storage Class

- VUID-FrontFacing-FrontFacing-04231
  The variable decorated with FrontFacing must be declared as a boolean value

FullyCoveredEXT

Decorating a variable with the FullyCoveredEXT built-in decoration will make that variable indicate whether the fragment area is fully covered by the generating primitive. This variable is non-zero if conservative rasterization is enabled and the current fragment area is fully covered by the generating primitive, and is zero if the fragment is not covered or partially covered, or conservative rasterization is disabled.

Valid Usage

- VUID-FullyCoveredEXT-FullyCoveredEXT-04232
  The FullyCoveredEXT decoration must be used only within the Fragment Execution Model

- VUID-FullyCoveredEXT-FullyCoveredEXT-04233
  The variable decorated with FullyCoveredEXT must be declared using the Input Storage Class

- VUID-FullyCoveredEXT-FullyCoveredEXT-04234
  The variable decorated with FullyCoveredEXT must be declared as a boolean value
If \( \text{VkPhysicalDeviceConservativeRasterizationPropertiesEXT} :: \text{conservativeRasterizationPostDepthCoverage} \) is not supported the PostDepthCoverage Execution Mode must not be declared, when a variable with the FullyCoveredEXT decoration is declared.

**GlobalInvocationId**

Decorating a variable with the GlobalInvocationId built-in decoration will make that variable contain the location of the current invocation within the global workgroup. Each component is equal to the index of the local workgroup multiplied by the size of the local workgroup plus LocalInvocationId.

**Valid Usage**

- VUID-GlobalInvocationId-GlobalInvocationId-04236
  The GlobalInvocationId decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- VUID-GlobalInvocationId-GlobalInvocationId-04237
  The variable decorated with GlobalInvocationId must be declared using the Input Storage Class

- VUID-GlobalInvocationId-GlobalInvocationId-04238
  The variable decorated with GlobalInvocationId must be declared as a three-component vector of 32-bit integer values

**HelperInvocation**

Decorating a variable with the HelperInvocation built-in decoration will make that variable contain whether the current invocation is a helper invocation. This variable is non-zero if the current fragment being shaded is a helper invocation and zero otherwise. A helper invocation is an invocation of the shader that is produced to satisfy internal requirements such as the generation of derivatives.

*Note*

It is very likely that a helper invocation will have a value of SampleMask fragment shader input value that is zero.

**Valid Usage**

- VUID-HelperInvocation-HelperInvocation-04239
  The HelperInvocation decoration must be used only within the Fragment Execution Model

- VUID-HelperInvocation-HelperInvocation-04240
  The variable decorated with HelperInvocation must be declared using the Input Storage Class

- VUID-HelperInvocation-HelperInvocation-04241
The variable decorated with `HelperInvocation` must be declared as a boolean value.

**HitKindKHR**

A variable decorated with the `HitKindKHR` decoration will describe the intersection that triggered the execution of the current shader. The values are determined by the intersection shader. For user-defined intersection shaders this is the value that was passed to the “Hit Kind” operand of `OpReportIntersectionKHR`. For triangle intersection candidates, this will be one of `HitKindFrontFacingTriangleKHR` or `HitKindBackFacingTriangleKHR`.

**Valid Usage**

- VUID-HitKindKHR-HitKindKHR-04242
  The `HitKindKHR` decoration must be used only within the `AnyHitKHR` or `ClosestHitKHR` Execution Model
- VUID-HitKindKHR-HitKindKHR-04243
  The variable decorated with `HitKindKHR` must be declared using the Input Storage Class
- VUID-HitKindKHR-HitKindKHR-04244
  The variable decorated with `HitKindKHR` must be declared as a scalar 32-bit integer value

**HitTNV**

A variable decorated with the `HitTNV` decoration is equivalent to a variable decorated with the `RayTmaxKHR` decoration.

**Valid Usage**

- VUID-HitTNV-HitTNV-04245
  The `HitTNV` decoration must be used only within the `AnyHitNV` or `ClosestHitNV` Execution Model
- VUID-HitTNV-HitTNV-04246
  The variable decorated with `HitTNV` must be declared using the Input Storage Class
- VUID-HitTNV-HitTNV-04247
  The variable decorated with `HitTNV` must be declared as a scalar 32-bit floating-point value

**IncomingRayFlagsKHR**

A variable with the `IncomingRayFlagsKHR` decoration will contain the ray flags passed in to the trace call that invoked this particular shader. Setting pipeline flags on the raytracing pipeline must not cause any corresponding flags to be set in variables with this decoration.

**Valid Usage**

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04248
  The `IncomingRayFlagsKHR` decoration must be used only within the `IntersectionKHR`,
AnyHitKHR, ClosestHitKHR, or MissKHR Execution Model

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04249
  The variable decorated with `IncomingRayFlagsKHR` must be declared using the Input Storage Class.

- VUID-IncomingRayFlagsKHR-IncomingRayFlagsKHR-04250
  The variable decorated with `IncomingRayFlagsKHR` must be declared as a scalar 32-bit integer value.

InstanceCustomIndexKHR

A variable decorated with the `InstanceCustomIndexKHR` decoration will contain the application-defined value of the instance that intersects the current ray. This variable contains the value that was specified in `VkAccelerationStructureInstanceKHR::instanceCustomIndex` for the current acceleration structure instance in the lower 24 bits and the upper 8 bits will be zero.

Valid Usage

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04251
  The `InstanceCustomIndexKHR` decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model.

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04252
  The variable decorated with `InstanceCustomIndexKHR` must be declared using the Input Storage Class.

- VUID-InstanceCustomIndexKHR-InstanceCustomIndexKHR-04253
  The variable decorated with `InstanceCustomIndexKHR` must be declared as a scalar 32-bit integer value.

InstanceId

Decorating a variable in an intersection, any-hit, or closest hit shader with the `InstanceId` decoration will make that variable contain the index of the instance that intersects the current ray.

Valid Usage

- VUID-InstanceId-InstanceId-04254
  The `InstanceId` decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model.

- VUID-InstanceId-InstanceId-04255
  The variable decorated with `InstanceId` must be declared using the Input Storage Class.

- VUID-InstanceId-InstanceId-04256
  The variable decorated with `InstanceId` must be declared as a scalar 32-bit integer value.
**InvocationId**

Decorating a variable with the `InvocationId` built-in decoration will make that variable contain the index of the current shader invocation in a geometry shader, or the index of the output patch vertex in a tessellation control shader.

In a geometry shader, the index of the current shader invocation ranges from zero to the number of instances declared in the shader minus one. If the instance count of the geometry shader is one or is not specified, then `InvocationId` will be zero.

### Valid Usage

- **VUID-InvocationId-InvocationId-04257**
  The `InvocationId` decoration **must** be used only within the TessellationControl or Geometry Execution Model.

- **VUID-InvocationId-InvocationId-04258**
  The variable decorated with `InvocationId` **must** be declared using the Input Storage Class.

- **VUID-InvocationId-InvocationId-04259**
  The variable decorated with `InvocationId` **must** be declared as a scalar 32-bit integer value.

**InvocationsPerPixelNV**

Decorating a variable with the `InvocationsPerPixelNV` built-in decoration will make that variable contain the maximum number of fragment shader invocations per pixel, as derived from the effective shading rate for the fragment. If a primitive does not fully cover a pixel, the number of fragment shader invocations for that pixel **may** be less than the value of `InvocationsPerPixelNV`. If the shading rate indicates a fragment covering multiple pixels, then `InvocationsPerPixelNV` will be one.

### Valid Usage

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04260**
  The `InvocationsPerPixelNV` decoration **must** be used only within the Fragment Execution Model.

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04261**
  The variable decorated with `InvocationsPerPixelNV` **must** be declared using the Input Storage Class.

- **VUID-InvocationsPerPixelNV-InvocationsPerPixelNV-04262**
  The variable decorated with `InvocationsPerPixelNV` **must** be declared as a scalar 32-bit integer value.

**InstanceIndex**

Decorating a variable in a vertex shader with the `InstanceIndex` built-in decoration will make that variable contain the index of the instance that is being processed by the current vertex shader invocation. `InstanceIndex` begins at the `firstInstance` parameter to `vkCmdDraw` or
vkCmdDrawIndexed or at the firstInstance member of a structure consumed by vkCmdDrawIndirect or vkCmdDrawIndexedIndirect.

Valid Usage

- VUID-InstanceIndex-InstanceIndex-04263
  The InstanceIndex decoration must be used only within the Vertex Execution Model
- VUID-InstanceIndex-InstanceIndex-04264
  The variable decorated with InstanceIndex must be declared using the Input Storage Class
- VUID-InstanceIndex-InstanceIndex-04265
  The variable decorated with InstanceIndex must be declared as a scalar 32-bit integer value

LaunchIdKHR

A variable decorated with the LaunchIdKHR decoration will specify the index of the work item being processed. One work item is generated for each of the width × height × depth items dispatched by a vkCmdTraceRaysKHR command. All shader invocations inherit the same value for variables decorated with LaunchIdKHR.

Valid Usage

- VUID-LaunchIdKHR-LaunchIdKHR-04266
  The LaunchIdKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model
- VUID-LaunchIdKHR-LaunchIdKHR-04267
  The variable decorated with LaunchIdKHR must be declared using the Input Storage Class
- VUID-LaunchIdKHR-LaunchIdKHR-04268
  The variable decorated with LaunchIdKHR must be declared as a three-component vector of 32-bit integer values

LaunchSizeKHR

A variable decorated with the LaunchSizeKHR decoration will contain the width, height, and depth dimensions passed to the vkCmdTraceRaysKHR command that initiated this shader execution. The width is in the first component, the height is in the second component, and the depth is in the third component.

Valid Usage

- VUID-LaunchSizeKHR-LaunchSizeKHR-04269
  The LaunchSizeKHR decoration must be used only within the RayGenerationKHR, IntersectionKHR, AnyHitKHR, ClosestHitKHR, MissKHR, or CallableKHR Execution Model
- VUID-LaunchSizeKHR-LaunchSizeKHR-042670
  The variable decorated with LaunchSizeKHR must be declared using the Input Storage Class
The variable decorated with `LaunchSizeKHR must` be declared as a three-component vector of 32-bit integer values.

Layer
Decorating a variable with the `Layer` built-in decoration will make that variable contain the select layer of a multi-layer framebuffer attachment.

In a mesh, vertex, tessellation evaluation, or geometry shader, any variable decorated with `Layer` can be written with the framebuffer layer index to which the primitive produced by that shader will be directed.

The last active pre-rasterization shader stage (in pipeline order) controls the `Layer` that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the `Layer`.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with `Layer`, then the first layer is used. If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with `Layer`, it `must` write the same value to `Layer` for all output vertices of a given primitive. If the `Layer` value is less than 0 or greater than or equal to the number of layers in the framebuffer, then primitives `may` still be rasterized, fragment shaders `may` be executed, and the framebuffer values for all layers are undefined.

If a variable with the `Layer` decoration is also decorated with `ViewportRelativeNV`, then the `ViewportIndex` is added to the layer that is used for rendering and that is made available in the fragment shader. If the shader writes to a variable decorated with `ViewportMaskNV`, then the layer selected has a different value for each viewport a primitive is rendered to.

In a fragment shader, a variable decorated with `Layer` contains the layer index of the primitive that the fragment invocation belongs to.

Valid Usage

- `VUID-Layer-Layer-04272`
  The `Layer` decoration `must` be used only within the `MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model`

- `VUID-Layer-Layer-04273`
  If the `shaderOutputLayer` feature is not enabled then the `Layer` decoration `must` be used only within the `Geometry or Fragment Execution Model`

- `VUID-Layer-Layer-04274`
  The variable decorated with `Layer` within the `MeshNV, Vertex, TessellationEvaluation, or Geometry Execution Model` `must` be declared using the `Output Storage Class`

- `VUID-Layer-Layer-04275`
  The variable decorated with `Layer` within the `Fragment Execution Model` must be declared using the `Input Storage Class`
The variable decorated with Layer must be declared as a scalar 32-bit integer value

LayerPerViewNV

Decorating a variable with the LayerPerViewNV built-in decoration will make that variable contain the per-view layer information. The per-view layer has the same semantics as Layer, for each view.

### Valid Usage

- **VUID-LayerPerViewNV-LayerPerViewNV-04277**
  The LayerPerViewNV decoration must be used only within the MeshNV Execution Model

- **VUID-LayerPerViewNV-LayerPerViewNV-04278**
  The variable decorated with LayerPerViewNV must be declared using the Output Storage Class

- **VUID-LayerPerViewNV-LayerPerViewNV-04279**
  The variable decorated with LayerPerViewNV must also be decorated with the PerViewNV decoration

- **VUID-LayerPerViewNV-LayerPerViewNV-04280**
  The variable decorated with LayerPerViewNV must be declared as an array of scalar 32-bit integer values

LocalInvocationId

Decorating a variable with the LocalInvocationId built-in decoration will make that variable contain the location of the current task, mesh, or compute shader invocation within the local workgroup. Each component ranges from zero through to the size of the workgroup in that dimension minus one.

#### Note

If the size of the workgroup in a particular dimension is one, then the LocalInvocationId in that dimension will be zero. If the workgroup is effectively two-dimensional, then LocalInvocationId.z will be zero. If the workgroup is effectively one-dimensional, then both LocalInvocationId.y and LocalInvocationId.z will be zero.

### Valid Usage

- **VUID-LocalInvocationId-LocalInvocationId-04281**
  The LocalInvocationId decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

- **VUID-LocalInvocationId-LocalInvocationId-04282**
  The variable decorated with LocalInvocationId must be declared using the Input Storage Class

- **VUID-LocalInvocationId-LocalInvocationId-04283**
The variable decorated with `LocalInvocationId` must be declared as a three-component vector of 32-bit integer values.

**LocalInvocationIndex**

Decorating a variable with the `LocalInvocationIndex` built-in decoration will make that variable contain a one-dimensional representation of `LocalInvocationId`. This is computed as:

```cpp
LocalInvocationIndex = LocalInvocationId.z * WorkgroupSize.x * WorkgroupSize.y + LocalInvocationId.y * WorkgroupSize.x + LocalInvocationId.x;
```

**Valid Usage**

- VUID-LocalInvocationIndex-LocalInvocationIndex-04284
  The `LocalInvocationIndex` decoration **must** be used only within the `GLCompute`, `MeshNV`, or `TaskNV` Execution Model.

- VUID-LocalInvocationIndex-LocalInvocationIndex-04285
  The variable decorated with `LocalInvocationIndex` **must** be declared using the `Input Storage Class`.

- VUID-LocalInvocationIndex-LocalInvocationIndex-04286
  The variable decorated with `LocalInvocationIndex` **must** be declared as a scalar 32-bit integer value.

**MeshViewCountNV**

Decorating a variable with the `MeshViewCountNV` built-in decoration will make that variable contain the number of views processed by the current mesh or task shader invocations.

**Valid Usage**

- VUID-MeshViewCountNV-MeshViewCountNV-04287
  The `MeshViewCountNV` decoration **must** be used only within the `MeshNV` or `TaskNV` Execution Model.

- VUID-MeshViewCountNV-MeshViewCountNV-04288
  The variable decorated with `MeshViewCountNV` **must** be declared using the `Input Storage Class`.

- VUID-MeshViewCountNV-MeshViewCountNV-04289
  The variable decorated with `MeshViewCountNV` **must** be declared as a scalar 32-bit integer value.

**MeshViewIndicesNV**

Decorating a variable with the `MeshViewIndicesNV` built-in decoration will make that variable...
contain the mesh view indices. The mesh view indices is an array of values where each element holds the view number of one of the views being processed by the current mesh or task shader invocations. The values of array elements with indices greater than or equal to `MeshViewCountNV` are undefined. If the value of `MeshViewIndicesNV[i]` is `j`, then any outputs decorated with `PerViewNV` will take on the value of array element `i` when processing primitives for view index `j`.

### Valid Usage

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04290**
  The `MeshViewIndicesNV` decoration **must** be used only within the `MeshNV` or `TaskNV` Execution Model

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04291**
  The variable decorated with `MeshViewIndicesNV` **must** be declared using the Input Storage Class

- **VUID-MeshViewIndicesNV-MeshViewIndicesNV-04292**
  The variable decorated with `MeshViewIndicesNV` **must** be declared as an array of scalar 32-bit integer values

#### NumSubgroups

Decorating a variable with the `NumSubgroups` built-in decoration will make that variable contain the number of subgroups in the local workgroup.

### Valid Usage

- **VUID-NumSubgroups-NumSubgroups-04293**
  The `NumSubgroups` decoration **must** be used only within the `GLCompute`, `MeshNV`, or `TaskNV` Execution Model

- **VUID-NumSubgroups-NumSubgroups-04294**
  The variable decorated with `NumSubgroups` **must** be declared using the Input Storage Class

- **VUID-NumSubgroups-NumSubgroups-04295**
  The variable decorated with `NumSubgroups` **must** be declared as a scalar 32-bit integer value

#### NumWorkgroups

Decorating a variable with the `NumWorkgroups` built-in decoration will make that variable contain the number of local workgroups that are part of the dispatch that the invocation belongs to. Each component is equal to the values of the workgroup count parameters passed into the dispatching commands.

### Valid Usage

- **VUID-NumWorkgroups-NumWorkgroups-04296**
  The `NumWorkgroups` decoration **must** be used only within the `GLCompute Execution Model`
ObjectRayDirectionKHR

A variable decorated with the ObjectRayDirectionKHR decoration will specify the direction of the ray being processed, in object space.

Valid Usage

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04299
  The ObjectRayDirectionKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04300
  The variable decorated with ObjectRayDirectionKHR must be declared using the Input Storage Class

- VUID-ObjectRayDirectionKHR-ObjectRayDirectionKHR-04301
  The variable decorated with ObjectRayDirectionKHR must be declared as a three-component vector of 32-bit floating-point values

ObjectRayOriginKHR

A variable decorated with the ObjectRayOriginKHR decoration will specify the origin of the ray being processed, in object space.

Valid Usage

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04302
  The ObjectRayOriginKHR decoration must be used only within the IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04303
  The variable decorated with ObjectRayOriginKHR must be declared using the Input Storage Class

- VUID-ObjectRayOriginKHR-ObjectRayOriginKHR-04304
  The variable decorated with ObjectRayOriginKHR must be declared as a three-component vector of 32-bit floating-point values

ObjectToWorldKHR

A variable decorated with the ObjectToWorldKHR decoration will contain the current object-to-world transformation matrix, which is determined by the instance of the current intersection.
Valid Usage

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04305
  The `ObjectToWorldKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model.

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04306
  The variable decorated with `ObjectToWorldKHR` must be declared using the `Input Storage Class`.

- VUID-ObjectToWorldKHR-ObjectToWorldKHR-04307
  The variable decorated with `ObjectToWorldKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values.

PatchVertices

Decorating a variable with the `PatchVertices` built-in decoration will make that variable contain the number of vertices in the input patch being processed by the shader. In a Tessellation Control Shader, this is the same as the name:`patchControlPoints` member of `VkPipelineTessellationStateCreateInfo`. In a Tessellation Evaluation Shader, `PatchVertices` is equal to the tessellation control output patch size. When the same shader is used in different pipelines where the patch sizes are configured differently, the value of the `PatchVertices` variable will also differ.

Valid Usage

- VUID-PatchVertices-PatchVertices-04308
  The `PatchVertices` decoration must be used only within the `TessellationControl` or `TessellationEvaluation` Execution Model.

- VUID-PatchVertices-PatchVertices-04309
  The variable decorated with `PatchVertices` must be declared using the `Input Storage Class`.

- VUID-PatchVertices-PatchVertices-04310
  The variable decorated with `PatchVertices` must be declared as a scalar 32-bit integer value.

PointCoord

Decorating a variable with the `PointCoord` built-in decoration will make that variable contain the coordinate of the current fragment within the point being rasterized, normalized to the size of the point with origin in the upper left corner of the point, as described in Basic Point Rasterization. If the primitive the fragment shader invocation belongs to is not a point, then the variable decorated with `PointCoord` contains an undefined value.

Note

Depending on how the point is rasterized, `PointCoord` may never reach (0,0) or (1,1).
Valid Usage

- VUID-PointCoord-PointCoord-04311
  The PointCoord decoration must be used only within the Fragment Execution Model

- VUID-PointCoord-PointCoord-04312
  The variable decorated with PointCoord must be declared using the Input Storage Class

- VUID-PointCoord-PointCoord-04313
  The variable decorated with PointCoord must be declared as a two-component vector of 32-bit floating-point values

PointSize

Decorating a variable with the PointSize built-in decoration will make that variable contain the size of point primitives. The value written to the variable decorated with PointSize by the last pre-rasterization shader stage in the pipeline is used as the framebuffer-space size of points produced by rasterization.

Note
When PointSize decorates a variable in the Input Storage Class, it contains the data written to the output variable decorated with PointSize from the previous shader stage.

Valid Usage

- VUID-PointSize-PointSize-04314
  The PointSize decoration must be used only within the MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model

- VUID-PointSize-PointSize-04315
  The variable decorated with PointSize within the MeshNV or Vertex Execution Model must be declared using the Output Storage Class

- VUID-PointSize-PointSize-04316
  The variable decorated with PointSize within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output

- VUID-PointSize-PointSize-04317
  The variable decorated with PointSize must be declared as a scalar 32-bit floating-point value

Position

Decorating a variable with the Position built-in decoration will make that variable contain the position of the current vertex. In the last pre-rasterization shader stage, the value of the variable decorated with Position is used in subsequent primitive assembly, clipping, and rasterization operations.
**Note**

When `Position` decorates a variable in the **Input Storage Class**, it contains the data written to the output variable decorated with `Position` from the previous shader stage.

---

**Valid Usage**

- **VUID-Position-Position-04318**
  
The `Position` decoration **must** be used only within the **MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model**

- **VUID-Position-Position-04319**
  
The variable decorated with `Position` within **MeshNV or Vertex Execution Model** **must** be declared using the **Output Storage Class**

- **VUID-Position-Position-04320**
  
The variable decorated with `Position` within **TessellationControl, TessellationEvaluation, or Geometry Execution Model** **must** not be declared using a **Storage Class** other than **Input or Output**

- **VUID-Position-Position-04321**
  
The variable decorated with `Position` **must** be declared as a four-component vector of 32-bit floating-point values

**PositionPerViewNV**

Decorating a variable with the `PositionPerViewNV` built-in decoration will make that variable contain the position of the current vertex, for each view.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the position value for those views. For the final pre-rasterization shader stage in the pipeline, values written to an output variable decorated with `PositionPerViewNV` are used in subsequent primitive assembly, clipping, and rasterization operations, as with `Position`. `PositionPerViewNV` output in an earlier pre-rasterization shader stage is available as an input in the subsequent pre-rasterization shader stage.

If a shader is compiled against a subpass that has the `VK_SUBPASS_DESCRIPTION_PER_VIEW_POSITION_X_ONLY_BIT_NVX` bit set, then the position values for each view **must** not differ in any component other than the X component. If the values do differ, one will be chosen in an implementation-dependent manner.

---

**Valid Usage**

- **VUID-PositionPerViewNV-PositionPerViewNV-04322**
  
The `PositionPerViewNV` decoration **must** be used only within the **MeshNV, Vertex, TessellationControl, TessellationEvaluation, or Geometry Execution Model**

- **VUID-PositionPerViewNV-PositionPerViewNV-04323**
The variable decorated with `PositionPerViewNV` within the Vertex, or MeshNV Execution Model must be declared using the Output Storage Class.

- **VUID-PositionPerViewNV-PositionPerViewNV-04324**
  The variable decorated with `PositionPerViewNV` within the TessellationControl, TessellationEvaluation, or Geometry Execution Model must not be declared using a Storage Class other than Input or Output.

- **VUID-PositionPerViewNV-PositionPerViewNV-04325**
  The variable decorated with `PositionPerViewNV` must be declared as an array of four-component vector of 32-bit floating-point values with at least as many elements as the maximum view in the subpass's view mask plus one.

- **VUID-PositionPerViewNV-PositionPerViewNV-04326**
  The array variable decorated with `PositionPerViewNV` must only be indexed by a constant or specialization constant.

**PrimitiveCountNV**

Decorating a variable with the `PrimitiveCountNV` decoration will make that variable contain the primitive count. The primitive count specifies the number of primitives in the output mesh produced by the mesh shader that will be processed by subsequent pipeline stages.

**Valid Usage**

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04327**
  The `PrimitiveCountNV` decoration must be used only within the MeshNV Execution Model.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04328**
  The variable decorated with `PrimitiveCountNV` must be declared using the Output Storage Class.

- **VUID-PrimitiveCountNV-PrimitiveCountNV-04329**
  The variable decorated with `PrimitiveCountNV` must be declared as a scalar 32-bit integer value.

**PrimitiveId**

Decorating a variable with the `PrimitiveId` built-in decoration will make that variable contain the index of the current primitive.

The index of the first primitive generated by a drawing command is zero, and the index is incremented after every individual point, line, or triangle primitive is processed.

For triangles drawn as points or line segments (see Polygon Mode), the primitive index is incremented only once, even if multiple points or lines are eventually drawn.

Variables decorated with `PrimitiveId` are reset to zero between each instance drawn.

Restarting a primitive topology using primitive restart has no effect on the value of variables decorated with `PrimitiveId`. 
In tessellation control and tessellation evaluation shaders, it will contain the index of the patch within the current set of rendering primitives that corresponds to the shader invocation.

In a geometry shader, it will contain the number of primitives presented as input to the shader since the current set of rendering primitives was started.

In a fragment shader, it will contain the primitive index written by the mesh shader if a mesh shader is present, or the primitive index written by the geometry shader if a geometry shader is present, or with the value that would have been presented as input to the geometry shader had it been present.

In an intersection, any-hit, or closest hit shader, it will contain the index within the geometry of the triangle or bounding box being processed.

Note

When the `PrimitiveId` decoration is applied to an output variable in the mesh shader or geometry shader, the resulting value is seen through the `PrimitiveId` decorated input variable in the fragment shader.

The fragment shader using `PrimitiveId` will need to declare either the `MeshShadingNV`, `Geometry` or `Tessellation` capability to satisfy the requirement SPIRV has to use `PrimitiveId`.

Valid Usage

- **VUID-PrimitiveId-PrimitiveId-04330**
  The `PrimitiveId` decoration **must** be used only within the `MeshNV`, `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, `TessellationControl`, `TessellationEvaluation`, `Geometry`, or `Fragment Execution Model`.

- **VUID-PrimitiveId-Fragment-04331**
  If pipeline contains both the `Fragment` and `Geometry Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `Geometry` shader **must** write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04332**
  If pipeline contains both the `Fragment` and `MeshNV Execution Model` and a variable decorated with `PrimitiveId` is read from `Fragment` shader, then the `MeshNV` shader **must** write to the output variables decorated with `PrimitiveId` in all execution paths.

- **VUID-PrimitiveId-Fragment-04333**
  If `Fragment Execution Model` contains a variable decorated with `PrimitiveId`, then either the `MeshShadingNV`, `Geometry` or `Tessellation` capability **must** also be declared.

- **VUID-PrimitiveId-PrimitiveId-04334**
  The variable decorated with `PrimitiveId` within the `TessellationControl`, `TessellationEvaluation`, `Fragment`, `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR Execution Model` **must** be declared using the `Input Storage Class`.

- **VUID-PrimitiveId-PrimitiveId-04335**
  The variable decorated with `PrimitiveId` within the `Geometry Execution Model` **must** be
declared using the Input or Output Storage Class

- VUID-PrimitiveId-PrimitiveId-04336
  The variable decorated with PrimitiveId within the MeshNV Execution Model must be declared using the Output Storage Class

- VUID-PrimitiveId-PrimitiveId-04337
  The variable decorated with PrimitiveId must be declared as a scalar 32-bit integer value

**PrimitiveIndicesNV**

Decorating a variable with the PrimitiveIndicesNV decoration will make that variable contain the output array of vertex index values. Depending on the output primitive type declared using the execution mode, the indices are split into groups of one (OutputPoints), two (OutputLinesNV), or three (OutputTriangles) indices and each group generates a primitive.

**Valid Usage**

- VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04338
  The PrimitiveIndicesNV decoration must be used only within the MeshNV Execution Model

- VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04339
  The variable decorated with PrimitiveIndicesNV must be declared using the Output Storage Class

- VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04340
  The variable decorated with PrimitiveIndicesNV must be declared as an array of scalar 32-bit integer values

- VUID-PrimitiveIndicesNV-PrimitiveIndicesNV-04341
  All index values of the array decorated with PrimitiveIndicesNV must be in the range [0, N-1], where N is the value specified by the OutputVertices Execution Mode

- VUID-PrimitiveIndicesNV-OutputPoints-04342
  If the Execution Mode is OutputPoints, then the array decorated with PrimitiveIndicesNV must be the size of the value specified by OutputPrimitivesNV

- VUID-PrimitiveIndicesNV-OutputLinesNV-04343
  If the Execution Mode is OutputLinesNV, then the array decorated with PrimitiveIndicesNV must be the size of two times the value specified by OutputPrimitivesNV

- VUID-PrimitiveIndicesNV-OutputTrianglesNV-04344
  If the Execution Mode is OutputTrianglesNV, then the array decorated with PrimitiveIndicesNV must be the size of three times the value specified by OutputPrimitivesNV

**PrimitiveShadingRateKHR**

Decorating a variable with the PrimitiveShadingRateKHR built-in decoration will make that variable contain the primitive fragment shading rate.

The value written to the variable decorated with PrimitiveShadingRateKHR by the last pre-rasterization shader stage in the pipeline is used as the primitive fragment shading rate. Outputs
in previous shader stages are ignored.

If the last active pre-rasterization shader stage shader entry point’s interface does not include a variable decorated with `PrimitiveShadingRateKHR`, then it is as if the shader specified a fragment shading rate value of 0, indicating a horizontal and vertical rate of 1 pixel.

If a shader has `PrimitiveShadingRateKHR` in the output interface and there is an execution path through the shader that does not write to it, its value is undefined for executions of the shader that take that path.

### Valid Usage

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04484**
  The `PrimitiveShadingRateKHR` decoration **must** be used only within the `MeshNV, Vertex, or Geometry Execution Model`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04485**
  The variable decorated with `PrimitiveShadingRateKHR` **must** be declared using the `Output Storage Class`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04486**
  The variable decorated with `PrimitiveShadingRateKHR` **must** be declared as a scalar 32-bit integer value.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04487**
  The value written to `PrimitiveShadingRateKHR` **must** include no more than one of `Vertical2Pixels` and `Vertical4Pixels`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04488**
  The value written to `PrimitiveShadingRateKHR` **must** include no more than one of `Horizontal2Pixels` and `Horizontal4Pixels`.

- **VUID-PrimitiveShadingRateKHR-PrimitiveShadingRateKHR-04489**
  The value written to `PrimitiveShadingRateKHR` **must** not have any bits set other than those defined by `Fragment Shading Rate Flags` enumerants in the SPIR-V specification.

### RayGeometryIndexKHR

A variable decorated with the `RayGeometryIndexKHR` decoration will contain the `geometry index` for the acceleration structure geometry currently being shaded.

### Valid Usage

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04345**
  The `RayGeometryIndexKHR` decoration **must** be used only within the `IntersectionKHR, AnyHitKHR, or ClosestHitKHR Execution Model`.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04346**
  The variable decorated with `RayGeometryIndexKHR` **must** be declared using the `Input Storage Class`.

- **VUID-RayGeometryIndexKHR-RayGeometryIndexKHR-04347**
The variable decorated with `RayGeometryIndexKHR` must be declared as a scalar 32-bit integer value.

**RayTmaxKHR**

A variable decorated with the `RayTmaxKHR` decoration will contain the parametric $t_{\text{max}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is initialized to the parameter passed into `OpTraceRayKHR`.

The $t_{\text{max}}$ value changes throughout the lifetime of the ray that produced the intersection. In the closest hit shader, the value reflects the closest distance to the intersected primitive. In the any-hit shader, it reflects the distance to the primitive currently being intersected. In the intersection shader, it reflects the distance to the closest primitive intersected so far or the initial value. The value can change in the intersection shader after calling `OpReportIntersectionKHR` if the corresponding any-hit shader does not ignore the intersection. In a miss shader, the value is identical to the parameter passed into `OpTraceRayKHR`.

**Valid Usage**

- VUID-RayTmaxKHR-RayTmaxKHR-04348
  The `RayTmaxKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- VUID-RayTmaxKHR-RayTmaxKHR-04349
  The variable decorated with `RayTmaxKHR` must be declared using the Input Storage Class.

- VUID-RayTmaxKHR-RayTmaxKHR-04350
  The variable decorated with `RayTmaxKHR` must be declared as a scalar 32-bit floating-point value.

**RayTminKHR**

A variable decorated with the `RayTminKHR` decoration will contain the parametric $t_{\text{min}}$ value of the ray being processed. The value is independent of the space in which the ray origin and direction exist. The value is the parameter passed into `OpTraceRayKHR`.

The $t_{\text{min}}$ value remains constant for the duration of the ray query.

**Valid Usage**

- VUID-RayTminKHR-RayTminKHR-04351
  The `RayTminKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model.

- VUID-RayTminKHR-RayTminKHR-04352
  The variable decorated with `RayTminKHR` must be declared using the Input Storage Class.

- VUID-RayTminKHR-RayTminKHR-04353
  The variable decorated with `RayTminKHR` must be declared as a scalar 32-bit floating-point value.
**SampleId**

Decorating a variable with the SampleId built-in decoration will make that variable contain the coverage index for the current fragment shader invocation. SampleId ranges from zero to the number of samples in the framebuffer minus one. If a fragment shader entry point's interface includes an input variable decorated with SampleId, Sample Shading is considered enabled with a minSampleShading value of 1.0.

**Valid Usage**

- VUID-SampleId-SampleId-04354
  The SampleId decoration must be used only within the Fragment Execution Model

- VUID-SampleId-SampleId-04355
  The variable decorated with SampleId must be declared using the Input Storage Class

- VUID-SampleId-SampleId-04356
  The variable decorated with SampleId must be declared as a scalar 32-bit integer value

---

**SampleMask**

Decorating a variable with the SampleMask built-in decoration will make any variable contain the sample mask for the current fragment shader invocation.

A variable in the Input storage class decorated with SampleMask will contain a bitmask of the set of samples covered by the primitive generating the fragment during rasterization. It has a sample bit set if and only if the sample is considered covered for this fragment shader invocation. SampleMask[] is an array of integers. Bits are mapped to samples in a manner where bit B of mask M (SampleMask[M]) corresponds to sample $32 \times M + B$.

A variable in the Output storage class decorated with SampleMask is an array of integers forming a bit array in a manner similar to an input variable decorated with SampleMask, but where each bit represents coverage as computed by the shader. This computed SampleMask is combined with the generated coverage mask in the multisample coverage operation.

Variables decorated with SampleMask must be either an unsized array, or explicitly sized to be no larger than the implementation-dependent maximum sample-mask (as an array of 32-bit elements), determined by the maximum number of samples.

If a fragment shader entry point's interface includes an output variable decorated with SampleMask, the sample mask will be undefined for any array elements of any fragment shader invocations that fail to assign a value. If a fragment shader entry point's interface does not include an output variable decorated with SampleMask, the sample mask has no effect on the processing of a fragment.

**Valid Usage**

- VUID-SampleMask-SampleMask-04357
  The SampleMask decoration must be used only within the Fragment Execution Model

- VUID-SampleMask-SampleMask-04358
The variable decorated with `SampleMask` must be declared using the Input or Output Storage Class.

- VUID-SampleMask-SampleMask-04359
  The variable decorated with `SampleMask` must be declared as an array of 32-bit integer values.

**SamplePosition**

Decorating a variable with the `SamplePosition` built-in decoration will make that variable contain the sub-pixel position of the sample being shaded. The top left of the pixel is considered to be at coordinate (0,0) and the bottom right of the pixel is considered to be at coordinate (1,1).

If the render pass has a fragment density map attachment, the variable will instead contain the sub-fragment position of the sample being shaded. The top left of the fragment is considered to be at coordinate (0,0) and the bottom right of the fragment is considered to be at coordinate (1,1) for any fragment area.

If a fragment shader entry point's interface includes an input variable decorated with `SamplePosition`, Sample Shading is considered enabled with a `minSampleShading` value of 1.0.

If the current pipeline uses custom sample locations the value of any variable decorated with the `SamplePosition` built-in decoration is undefined.

**Valid Usage**

- VUID-SamplePosition-SamplePosition-04360
  The `SamplePosition` decoration must be used only within the Fragment Execution Model.

- VUID-SamplePosition-SamplePosition-04361
  The variable decorated with `SamplePosition` must be declared using the Input Storage Class.

- VUID-SamplePosition-SamplePosition-04362
  The variable decorated with `SamplePosition` must be declared as a two-component vector of 32-bit floating-point values.

**ShadingRateKHR**

Decorating a variable with the `ShadingRateKHR` built-in decoration will make that variable contain the fragment shading rate for the current fragment invocation.

**Valid Usage**

- VUID-ShadingRateKHR-ShadingRateKHR-04490
  The `ShadingRateKHR` decoration must be used only within the Fragment Execution Model.

- VUID-ShadingRateKHR-ShadingRateKHR-04491
  The variable decorated with `ShadingRateKHR` must be declared using the Input Storage Class.
The variable decorated with `ShadingRateKHR` must be declared as a scalar 32-bit integer value.

**SMCountNV**

Decorating a variable with the `SMCountNV` built-in decoration will make that variable contain the number of SMs on the device.

**Valid Usage**

- VUID-SMCountNV-SMCountNV-04363
  The variable decorated with `SMCountNV` must be declared using the Input Storage Class
- VUID-SMCountNV-SMCountNV-04364
  The variable decorated with `SMCountNV` must be declared as a scalar 32-bit integer value

**SMIDNV**

Decorating a variable with the `SMIDNV` built-in decoration will make that variable contain the ID of the SM on which the current shader invocation is running. This variable is in the range [0, `SMCountNV`-1].

**Valid Usage**

- VUID-SMIDNV-SMIDNV-04365
  The variable decorated with `SMIDNV` must be declared using the Input Storage Class
- VUID-SMIDNV-SMIDNV-04366
  The variable decorated with `SMIDNV` must be declared as a scalar 32-bit integer value

**SubgroupId**

Decorating a variable with the `SubgroupId` built-in decoration will make that variable contain the index of the subgroup within the local workgroup. This variable is in range [0, `NumSubgroups`-1].

**Valid Usage**

- VUID-SubgroupId-SubgroupId-04367
  The `SubgroupId` decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model
- VUID-SubgroupId-SubgroupId-04368
  The variable decorated with `SubgroupId` must be declared using the Input Storage Class
- VUID-SubgroupId-SubgroupId-04369
  The variable decorated with `SubgroupId` must be declared as a scalar 32-bit integer value
SubgroupEqMask

Decorating a variable with the `SubgroupEqMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bit corresponding to the `SubgroupLocalInvocationId` is set in the variable decorated with `SubgroupEqMask`. All other bits are set to zero.

`SubgroupEqMaskKHR` is an alias of `SubgroupEqMask`.

Valid Usage

- VUID-SubgroupEqMask-SubgroupEqMask-04370
  The variable decorated with `SubgroupEqMask` **must** be declared using the Input Storage Class
- VUID-SubgroupEqMask-SubgroupEqMask-04371
  The variable decorated with `SubgroupEqMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupGeMask

Decorating a variable with the `SubgroupGeMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than or equal to `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGeMask`. All other bits are set to zero.

`SubgroupGeMaskKHR` is an alias of `SubgroupGeMask`.

Valid Usage

- VUID-SubgroupGeMask-SubgroupGeMask-04372
  The variable decorated with `SubgroupGeMask` **must** be declared using the Input Storage Class
- VUID-SubgroupGeMask-SubgroupGeMask-04373
  The variable decorated with `SubgroupGeMask` **must** be declared as a four-component vector of 32-bit integer values

SubgroupGtMask

Decorating a variable with the `SubgroupGtMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations greater than `SubgroupLocalInvocationId` through `SubgroupSize-1` are set in the variable decorated with `SubgroupGtMask`. All other bits are set to zero.

`SubgroupGtMaskKHR` is an alias of `SubgroupGtMask`.

Valid Usage

- VUID-SubgroupGtMask-SubgroupGtMask-04374
The variable decorated with `SubgroupGtMask` must be declared using the Input Storage Class

- VUID-SubgroupGtMask-SubgroupGtMask-04375
  The variable decorated with `SubgroupGtMask` must be declared as a four-component vector of 32-bit integer values

### SubgroupLeMask

Decorating a variable with the `SubgroupLeMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations less than or equal to `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLeMask`. All other bits are set to zero.

`SubgroupLeMaskKHR` is an alias of `SubgroupLeMask`.

#### Valid Usage

- VUID-SubgroupLeMask-SubgroupLeMask-04376
  The variable decorated with `SubgroupLeMask` must be declared using the Input Storage Class

- VUID-SubgroupLeMask-SubgroupLeMask-04377
  The variable decorated with `SubgroupLeMask` must be declared as a four-component vector of 32-bit integer values

### SubgroupLtMask

Decorating a variable with the `SubgroupLtMask` builtin decoration will make that variable contain the subgroup mask of the current subgroup invocation. The bits corresponding to the invocations less than `SubgroupLocalInvocationId` are set in the variable decorated with `SubgroupLtMask`. All other bits are set to zero.

`SubgroupLtMaskKHR` is an alias of `SubgroupLtMask`.

#### Valid Usage

- VUID-SubgroupLtMask-SubgroupLtMask-04378
  The variable decorated with `SubgroupLtMask` must be declared using the Input Storage Class

- VUID-SubgroupLtMask-SubgroupLtMask-04379
  The variable decorated with `SubgroupLtMask` must be declared as a four-component vector of 32-bit integer values

### SubgroupLocalInvocationId

Decorating a variable with the `SubgroupLocalInvocationId` builtin decoration will make that variable contain the index of the invocation within the subgroup. This variable is in range `[0, SubgroupSize-1]`.
If VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT is specified, or if module declares SPIR-V version 1.6 or higher, and the local workgroup size in the X dimension of the stage is a multiple of SubgroupSize, full subgroups are enabled for that pipeline stage. When full subgroups are enabled, subgroups must be launched with all invocations active, i.e., there is an active invocation with SubgroupLocalInvocationId for each value in range [0,SubgroupSize-1].

**Note**
There is no direct relationship between SubgroupLocalInvocationId and LocalInvocationId or LocalInvocationIndex. If the pipeline was created with full subgroups applications can compute their own local invocation index to serve the same purpose:

\[
\text{index} = \text{SubgroupLocalInvocationId} + \text{SubgroupId} \times \text{SubgroupSize}
\]

If full subgroups are not enabled, some subgroups may be dispatched with inactive invocations that do not correspond to a local workgroup invocation, making the value of index unreliable.

**Note**
VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT is effectively deprecated when compiling SPIR-V 1.6 shaders, as this behavior is the default for Vulkan with SPIR-V 1.6. This is more aligned with developer expectations, and avoids applications unexpectedly breaking in the future.

### Valid Usage

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04380**
  The variable decorated with SubgroupLocalInvocationId must be declared using the Input Storage Class

- **VUID-SubgroupLocalInvocationId-SubgroupLocalInvocationId-04381**
  The variable decorated with SubgroupLocalInvocationId must be declared as a scalar 32-bit integer value

### SubgroupSize

Decorating a variable with the SubgroupSize builtin decoration will make that variable contain the implementation-dependent number of invocations in a subgroup. This value must be a power-of-two integer.

If the pipeline was created with the VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT flag set, or the SPIR-V module is at least version 1.6, the SubgroupSize decorated variable will contain the subgroup size for each subgroup that gets dispatched. This value must be between minSubgroupSize and maxSubgroupSize and must be uniform with subgroup scope. The value may vary across a single draw call, and for fragment shaders may vary across a single primitive. In compute dispatches, SubgroupSize must be uniform with command scope.
If the pipeline was created with a chained `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure, the `SubgroupSize` decorated variable will match `requiredSubgroupSize`.

If the pipeline stage SPIR-V module is less than version 1.6 and was not created with the `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` flag set and no `VkPipelineShaderStageRequiredSubgroupSizeCreateInfo` structure was chained, the variable decorated with `SubgroupSize` will match `subgroupSize`.

The maximum number of invocations that an implementation can support per subgroup is 128.

**Note**
The old behavior for `SubgroupSize` is considered deprecated as certain compute algorithms cannot be easily implemented without the guarantees of `VK_PIPELINE_SHADER_STAGE_CREATE_ALLOW_VARYING_SUBGROUP_SIZE_BIT` and `VK_PIPELINE_SHADER_STAGE_CREATE_REQUIRE_FULL_SUBGROUPS_BIT`.

**Valid Usage**
- VUID-SubgroupSize-SubgroupSize-04382
  The variable decorated with `SubgroupSize` must be declared using the Input Storage Class
- VUID-SubgroupSize-SubgroupSize-04383
  The variable decorated with `SubgroupSize` must be declared as a scalar 32-bit integer value

**TaskCountNV**
Decorating a variable with the `TaskCountNV` decoration will make that variable contain the task count. The task count specifies the number of subsequent mesh shader workgroups that get generated upon completion of the task shader.

**Valid Usage**
- VUID-TaskCountNV-TaskCountNV-04384
  The `TaskCountNV` decoration must be used only within the TaskNV Execution Model
- VUID-TaskCountNV-TaskCountNV-04385
  The variable decorated with `TaskCountNV` must be declared using the Output Storage Class
- VUID-TaskCountNV-TaskCountNV-04386
  The variable decorated with `TaskCountNV` must be declared as a scalar 32-bit integer value

**TessCoord**
Decorating a variable with the `TessCoord` built-in decoration will make that variable contain the three-dimensional (u,v,w) barycentric coordinate of the tessellated vertex within the patch. u, v, and w are in the range [0,1] and vary linearly across the primitive being subdivided. For the tessellation modes of `Quads` or `IsoLines`, the third component is always zero.
**Valid Usage**

- **VUID-TessCoord-TessCoord-04387**
  The **TessCoord** decoration **must** be used only within the **TessellationEvaluation Execution Model**

- **VUID-TessCoord-TessCoord-04388**
  The variable decorated with **TessCoord** **must** be declared using the **Input Storage Class**

- **VUID-TessCoord-TessCoord-04389**
  The variable decorated with **TessCoord** **must** be declared as a three-component vector of 32-bit floating-point values

**TessLevelOuter**

Decorating a variable with the **TessLevelOuter** built-in decoration will make that variable contain the outer tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelOuter** **can** be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.

In tessellation evaluation shaders, the variable decorated with **TessLevelOuter** **can** read the values written by the tessellation control shader.

---

**Valid Usage**

- **VUID-TessLevelOuter-TessLevelOuter-04390**
  The **TessLevelOuter** decoration **must** be used only within the **TessellationControl or TessellationEvaluation Execution Model**

- **VUID-TessLevelOuter-TessLevelOuter-04391**
  The variable decorated with **TessLevelOuter** within the **TessellationControl Execution Model** **must** be declared using the **Output Storage Class**

- **VUID-TessLevelOuter-TessLevelOuter-04392**
  The variable decorated with **TessLevelOuter** within the **TessellationEvaluation Execution Model** **must** be declared using the **Input Storage Class**

- **VUID-TessLevelOuter-TessLevelOuter-04393**
  The variable decorated with **TessLevelOuter** **must** be declared as an array of size four, containing 32-bit floating-point values

**TessLevelInner**

Decorating a variable with the **TessLevelInner** built-in decoration will make that variable contain the inner tessellation levels for the current patch.

In tessellation control shaders, the variable decorated with **TessLevelInner** **can** be written to, controlling the tessellation factors for the resulting patch. These values are used by the tessellator to control primitive tessellation and **can** be read by tessellation evaluation shaders.
In tessellation evaluation shaders, the variable decorated with `TessLevelInner` can read the values written by the tessellation control shader.

**Valid Usage**

- **VUID-TessLevelInner-TessLevelInner-04394**
  The `TessLevelInner` decoration **must** be used only within the `TessellationControl` or `TessellationEvaluation Execution Model`.

- **VUID-TessLevelInner-TessLevelInner-04395**
  The variable decorated with `TessLevelInner` within the `TessellationControl Execution Model` **must** be declared using the `Output Storage Class`.

- **VUID-TessLevelInner-TessLevelInner-04396**
  The variable decorated with `TessLevelInner` within the `TessellationEvaluation Execution Model` **must** be declared using the `Input Storage Class`.

- **VUID-TessLevelInner-TessLevelInner-04397**
  The variable decorated with `TessLevelInner` **must** be declared as an array of size two, containing 32-bit floating-point values.

**VertexIndex**

Decorating a variable with the `VertexIndex` built-in decoration will make that variable contain the index of the vertex that is being processed by the current vertex shader invocation. For non-indexed draws, this variable begins at the `firstVertex` parameter to `vkCmdDraw` or the `firstVertex` member of a structure consumed by `vkCmdDrawIndirect` and increments by one for each vertex in the draw. For indexed draws, its value is the content of the index buffer for the vertex plus the `vertexOffset` parameter to `vkCmdDrawIndexed` or the `vertexOffset` member of the structure consumed by `vkCmdDrawIndexedIndirect`.

**Note**

`VertexIndex` starts at the same starting value for each instance.

**Valid Usage**

- **VUID-VertexIndex-VertexIndex-04398**
  The `VertexIndex` decoration **must** be used only within the `Vertex Execution Model`.

- **VUID-VertexIndex-VertexIndex-04399**
  The variable decorated with `VertexIndex` **must** be declared using the `Input Storage Class`.

- **VUID-VertexIndex-VertexIndex-04400**
  The variable decorated with `VertexIndex` **must** be declared as a scalar 32-bit integer value.

**ViewIndex**

The `ViewIndex` decoration **can** be applied to a shader input which will be filled with the index of the view that is being processed by the current shader invocation.
If multiview is enabled in the render pass, this value will be one of the bits set in the view mask of the subpass the pipeline is compiled against. If multiview is not enabled in the render pass, this value will be zero.

Valid Usage

- VUID-ViewIndex-ViewIndex-04401
  The ViewIndex decoration must not be used within the GLCompute Execution Model

- VUID-ViewIndex-ViewIndex-04402
  The variable decorated with ViewIndex must be declared using the Input Storage Class

- VUID-ViewIndex-ViewIndex-04403
  The variable decorated with ViewIndex must be declared as a scalar 32-bit integer value

ViewportIndex

Decorating a variable with the ViewportIndex built-in decoration will make that variable contain the index of the viewport.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with ViewportIndex can be written to with the viewport index to which the primitive produced by that shader will be directed.

The selected viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle.

The last active pre-rasterization shader stage (in pipeline order) controls the ViewportIndex that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the ViewportIndex.

If the last active pre-rasterization shader stage shader entry point's interface does not include a variable decorated with ViewportIndex, then the first viewport is used. If a pre-rasterization shader stage shader entry point's interface includes a variable decorated with ViewportIndex, it must write the same value to ViewportIndex for all output vertices of a given primitive.

In a fragment shader, the variable decorated with ViewportIndex contains the viewport index of the primitive that the fragment invocation belongs to.

Valid Usage

- VUID-ViewportIndex-ViewportIndex-04404
  The ViewportIndex decoration must be used only within the MeshNV, Vertex, TessellationEvaluation, Geometry, or Fragment Execution Model

- VUID-ViewportIndex-ViewportIndex-04405
  If the shaderOutputViewportIndex feature is not enabled then the ViewportIndex decoration must be used only within the Geometry or Fragment Execution Model

- VUID-ViewportIndex-ViewportIndex-04406
  The variable decorated with ViewportIndex within the MeshNV, Vertex,
Tessellation Evaluation, or Geometry Execution Model must be declared using the Output Storage Class

- VUID-ViewportIndex-ViewportIndex-04407
  The variable decorated with ViewportIndex within the Fragment Execution Model must be declared using the Input Storage Class

- VUID-ViewportIndex-ViewportIndex-04408
  The variable decorated with ViewportIndex must be declared as a scalar 32-bit integer value

ViewportMaskNV

Decorating a variable with the ViewportMaskNV built-in decoration will make that variable contain the viewport mask.

In a mesh, vertex, tessellation evaluation, or geometry shader, the variable decorated with ViewportMaskNV can be written to with the mask of which viewports the primitive produced by that shader will directed.

The ViewportMaskNV variable must be an array that has ⌈(VkPhysicalDeviceLimits::maxViewports / 32)⌉ elements. When a shader writes to this variable, bit B of element M controls whether a primitive is emitted to viewport $32 \times M + B$. The viewports indicated by the mask are used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle that a primitive will be transformed by.

The last active pre-rasterization shader stage (in pipeline order) controls the ViewportMaskNV that is used. Outputs in previous shader stages are not used, even if the last stage fails to write the ViewportMaskNV. When ViewportMaskNV is written by the final pre-rasterization shader stage, any variable decorated with ViewportIndex in the fragment shader will have the index of the viewport that was used in generating that fragment.

If a pre-rasterization shader stage shader entry point’s interface includes a variable decorated with ViewportMaskNV, it must write the same value to ViewportMaskNV for all output vertices of a given primitive.

**Valid Usage**

- VUID-ViewportMaskNV-ViewportIndex-04409
  The ViewportMaskNV decoration must be used only within the Vertex, MeshNV, Tessellation Evaluation, or Geometry Execution Model

- VUID-ViewportMaskNV-ViewportIndex-04410
  The variable decorated with ViewportMaskNV must be declared using the Output Storage Class

- VUID-ViewportMaskNV-ViewportIndex-04411
  The variable decorated with ViewportMaskNV must be declared as an array of 32-bit integer values
**ViewportMaskPerViewNV**

Decorating a variable with the `ViewportMaskPerViewNV` built-in decoration will make that variable contain the mask of viewports primitives are broadcast to, for each view.

The value written to an element of `ViewportMaskPerViewNV` in the last pre-rasterization shader stage is a bitmask indicating which viewports the primitive will be directed to. The primitive will be broadcast to the viewport corresponding to each non-zero bit of the bitmask, and that viewport index is used to select the viewport transform, scissor rectangle, and exclusive scissor rectangle, for each view. The same values must be written to all vertices in a given primitive, or else the set of viewports used for that primitive is undefined.

Elements of the array correspond to views in a multiview subpass, and those elements corresponding to views in the view mask of the subpass the shader is compiled against will be used as the viewport mask value for those views. `ViewportMaskPerViewNV` output in an earlier pre-rasterization shader stage is not available as an input in the subsequent pre-rasterization shader stage.

Although `ViewportMaskNV` is an array, `ViewportMaskPerViewNV` is not a two-dimensional array. Instead, `ViewportMaskPerViewNV` is limited to 32 viewports.

---

**Valid Usage**

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04412**
  The `ViewportMaskPerViewNV` decoration must be used only within the `Vertex`, `MeshNV`, `TessellationControl`, `TessellationEvaluation`, or `Geometry Execution Model`

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04413**
  The variable decorated with `ViewportMaskPerViewNV` must be declared using the Output Storage Class

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04414**
  The variable decorated with `ViewportMaskPerViewNV` must be declared as an array of 32-bit integer values

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04415**
  The array decorated with `ViewportMaskPerViewNV` must be a size less than or equal to 32

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04416**
  The array decorated with `ViewportMaskPerViewNV` must be a size greater than the maximum view in the subpass's view mask

- **VUID-ViewportMaskPerViewNV-ViewportMaskPerViewNV-04417**
  The array variable decorated with `ViewportMaskPerViewNV` must only be indexed by a constant or specialization constant

---

**WarpsPerSMNV**

Decorating a variable with the `WarpsPerSMNV` built-in decoration will make that variable contain the maximum number of warps executing on a SM.
Valid Usage

• VUID-WarpsPerSMNV-WarpsPerSMNV-04418
  The variable decorated with WarpsPerSMNV must be declared using the Input Storage Class

• VUID-WarpsPerSMNV-WarpsPerSMNV-04419
  The variable decorated with WarpsPerSMNV must be declared as a scalar 32-bit integer value

WarpIDNV

Decorating a variable with the WarpIDNV built-in decoration will make that variable contain the ID of the warp on a SM on which the current shader invocation is running. This variable is in the range [0, WarpsPerSMNV-1].

Valid Usage

• VUID-WarpIDNV-WarpIDNV-04420
  The variable decorated with WarpIDNV must be declared using the Input Storage Class

• VUID-WarpIDNV-WarpIDNV-04421
  The variable decorated with WarpIDNV must be declared as a scalar 32-bit integer value

WorkgroupId

Decorating a variable with the WorkgroupId built-in decoration will make that variable contain the global workgroup that the current invocation is a member of. Each component ranges from a base value to a base + count value, based on the parameters passed into the dispatching commands.

Valid Usage

• VUID-WorkgroupId-WorkgroupId-04422
  The WorkgroupId decoration must be used only within the GLCompute, MeshNV, or TaskNV Execution Model

• VUID-WorkgroupId-WorkgroupId-04423
  The variable decorated with WorkgroupId must be declared using the Input Storage Class

• VUID-WorkgroupId-WorkgroupId-04424
  The variable decorated with WorkgroupId must be declared as a three-component vector of 32-bit integer values

WorkgroupSize

Note

SPIR-V 1.6 deprecated WorkgroupSize in favor of using the LocalSizeId Execution Mode instead. Support for LocalSizeId was added with VK_KHR_maintenance4 and
Decorating an object with the `WorkgroupSize` built-in decoration will make that object contain the dimensions of a local workgroup. If an object is decorated with the `WorkgroupSize` decoration, this takes precedence over any `LocalSize` or `LocalSizeId` execution mode.

**Valid Usage**

- VUID-WorkgroupSize-WorkgroupSize-04425
  The `WorkgroupSize` decoration **must** be used only within the `GLCompute`, `MeshNV`, or `TaskNV` Execution Model

- VUID-WorkgroupSize-WorkgroupSize-04426
  The variable decorated with `WorkgroupSize` **must** be a specialization constant or a constant

- VUID-WorkgroupSize-WorkgroupSize-04427
  The variable decorated with `WorkgroupSize` **must** be declared as a three-component vector of 32-bit integer values

**WorldRayDirectionKHR**

A variable decorated with the `WorldRayDirectionKHR` decoration will specify the direction of the ray being processed, in world space. The value is the parameter passed into `OpTraceRayKHR`.

**Valid Usage**

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04428
  The `WorldRayDirectionKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04429
  The variable decorated with `WorldRayDirectionKHR` **must** be declared using the `Input Storage Class`

- VUID-WorldRayDirectionKHR-WorldRayDirectionKHR-04430
  The variable decorated with `WorldRayDirectionKHR` **must** be declared as a three-component vector of 32-bit floating-point values

**WorldRayOriginKHR**

A variable decorated with the `WorldRayOriginKHR` decoration will specify the origin of the ray being processed, in world space. The value is the parameter passed into `OpTraceRayKHR`.

**Valid Usage**

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04431
  The `WorldRayOriginKHR` decoration **must** be used only within the `IntersectionKHR`, `AnyHitKHR`, `ClosestHitKHR`, or `MissKHR` Execution Model

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04432
  The variable decorated with `WorldRayOriginKHR` **must** be declared as a three-component vector of 32-bit integer values
The variable decorated with `WorldRayOriginKHR` must be declared using the `Input Storage Class`

- VUID-WorldRayOriginKHR-WorldRayOriginKHR-04433
  The variable decorated with `WorldRayOriginKHR` must be declared as a three-component vector of 32-bit floating-point values

---

**WorldToObjectKHR**

A variable decorated with the `WorldToObjectKHR` decoration will contain the current world-to-object transformation matrix, which is determined by the instance of the current intersection.

---

**Valid Usage**

- VUID-WorldToObjectKHR-WorldToObjectKHR-04434
  The `WorldToObjectKHR` decoration must be used only within the `IntersectionKHR`, `AnyHitKHR`, or `ClosestHitKHR` Execution Model

- VUID-WorldToObjectKHR-WorldToObjectKHR-04435
  The variable decorated with `WorldToObjectKHR` must be declared using the `Input Storage Class`

- VUID-WorldToObjectKHR-WorldToObjectKHR-04436
  The variable decorated with `WorldToObjectKHR` must be declared as a matrix with four columns of three-component vectors of 32-bit floating-point values
Chapter 16. Image Operations

16.1. Image Operations Overview

Vulkan Image Operations are operations performed by those SPIR-V Image Instructions which take an OpTypeImage (representing a VkImageView) or OpTypeSampledImage (representing a (VkImageView, VkSampler) pair). Read, write, and atomic operations also take texel coordinates as operands, and return a value based on a neighborhood of texture elements (texels) within the image. Query operations return properties of the bound image or of the lookup itself. The “Depth” operand of OpTypeImage is ignored.

Note
Texel is a term which is a combination of the words texture and element. Early interactive computer graphics supported texture operations on textures, a small subset of the image operations on images described here. The discrete samples remain essentially equivalent, however, so we retain the historical term texel to refer to them.

Image Operations include the functionality of the following SPIR-V Image Instructions:

- OpImageSample* and OpImageSparseSample* read one or more neighboring texels of the image, and filter the texel values based on the state of the sampler.
  - Instructions with ImplicitLod in the name determine the LOD used in the sampling operation based on the coordinates used in neighboring fragments.
  - Instructions with ExplicitLod in the name determine the LOD used in the sampling operation based on additional coordinates.
  - Instructions with Proj in the name apply homogeneous projection to the coordinates.
- OpImageFetch and OpImageSparseFetch return a single texel of the image. No sampler is used.
- OpImage*Gather and OpImageSparse*Gather read neighboring texels and return a single component of each.
- OpImageRead (and OpImageSparseRead) and OpImageWrite read and write, respectively, a texel in the image. No sampler is used.
- OpImageSampleFootprintNV identifies and returns information about the set of texels in the image that would be accessed by an equivalent OpImageSample* instruction.
- OpImage*Dref* instructions apply depth comparison on the texel values.
- OpImageSparse* instructions additionally return a sparse residency code.
- OpImageQueryLod returns the lod parameters that would be used in a sample operation. The actual operation is not performed.
- OpImageOpImageWeightedSampleQCOM reads a 2D neighborhood of texels and computes a weighted average using weight values from a separate weight texture.
• opTextureBlockMatchSAD and opTextureBlockMatchSSD compare 2D neighborhoods of texels from two textures.

• OpImageBoxFilterQCOM reads a 2D neighborhood of texels and computes a weighted average of the texels.

16.1.1. Texel Coordinate Systems

Images are addressed by texel coordinates. There are three texel coordinate systems:

• normalized texel coordinates [0.0, 1.0]
• unnormalized texel coordinates [0.0, width / height / depth)
• integer texel coordinates [0, width / height / depth)

Other image instructions can use either normalized or unnormalized texel coordinates (selected by the unnormalizedCoordinates state of the sampler used in the instruction), but there are limitations on what operations, image state, and sampler state is supported. Normalized coordinates are logically converted to unnormalized as part of image operations, and certain steps are only performed on normalized coordinates. The array layer coordinate is always treated as unnormalized even when other coordinates are normalized.

Normalized texel coordinates are referred to as (s,t,r,q,a), with the coordinates having the following meanings:

• s: Coordinate in the first dimension of an image.
• t: Coordinate in the second dimension of an image.
• r: Coordinate in the third dimension of an image.
  ◦ (s,t,r) are interpreted as a direction vector for Cube images.
• q: Fourth coordinate, for homogeneous (projective) coordinates.
• a: Coordinate for array layer.

The coordinates are extracted from the SPIR-V operand based on the dimensionality of the image variable and type of instruction. For Proj instructions, the components are in order (s, [t], [r,] q), with t and r being conditionally present based on the Dim of the image. For non-Proj instructions, the coordinates are (s [,t] [,r] [,a]), with t and r being conditionally present based on the Dim of the image and a being conditionally present based on the Arrayed property of the image. Projective image instructions are not supported on Arrayed images.

Unnormalized texel coordinates are referred to as (u,v,w,a), with the coordinates having the following meanings:

• u: Coordinate in the first dimension of an image.
• v: Coordinate in the second dimension of an image.
• w: Coordinate in the third dimension of an image.
• a: Coordinate for array layer.

Only the u and v coordinates are directly extracted from the SPIR-V operand, because only 1D and 2D (non-Arrayed) dimensionalities support unnormalized coordinates. The components are in order (u [,v]), with v being conditionally present when the dimensionality is 2D. When normalized coordinates are converted to unnormalized coordinates, all four coordinates are used.

Integer texel coordinates are referred to as (i,j,k,l,n), with the coordinates having the following meanings:

• i: Coordinate in the first dimension of an image.
• j: Coordinate in the second dimension of an image.
• k: Coordinate in the third dimension of an image.
• l: Coordinate for array layer.
• n: Index of the sample within the texel.

They are extracted from the SPIR-V operand in order (i [,j] [,k] [,l] [,n]), with j and k conditionally present based on the Dim of the image, and l conditionally present based on the Arrayed property of the image. n is conditionally present and is taken from the Sample image operand.

For all coordinate types, unused coordinates are assigned a value of zero.

Figure 3. Texel Coordinate Systems, Linear Filtering

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

• Normalized texel coordinates:
  ◦ The s coordinate goes from 0.0 to 1.0.
  ◦ The t coordinate goes from 0.0 to 1.0.
• Unnormalized texel coordinates:
  ◦ The u coordinate within the range 0.0 to 8.0 is within the image, otherwise it is outside the image.
  ◦ The v coordinate within the range 0.0 to 4.0 is within the image, otherwise it is outside the image.

• Integer texel coordinates:
  ◦ The i coordinate within the range 0 to 7 addresses texels within the image, otherwise it is outside the image.
  ◦ The j coordinate within the range 0 to 3 addresses texels within the image, otherwise it is outside the image.

• Also shown for linear filtering:
  ◦ Given the unnormalized coordinates \((u,v)\), the four texels selected are \(i_0 j_0\), \(i_1 j_0\), \(i_0 j_1\), and \(i_1 j_1\).
  ◦ The fractions \(\alpha\) and \(\beta\).
  ◦ Given the offset \(\Delta_i\) and \(\Delta_j\), the four texels selected by the offset are \(i_0 j_0'\), \(i_1 j_0'\), \(i_0 j_1'\), and \(i_1 j_1'\).

Note
For formats with reduced-resolution components, \(\Delta_i\) and \(\Delta_j\) are relative to the resolution of the highest-resolution component, and therefore may be divided by two relative to the unnormalized coordinate space of the lower-resolution components.

Figure 4. Texel Coordinate Systems, Nearest Filtering

The Texel Coordinate Systems - For the example shown of an 8×4 texel two dimensional image.

• Texel coordinates as above. Also shown for nearest filtering:
  ◦ Given the unnormalized coordinates \((u,v)\), the texel selected is \(ij\).
Given the offset $\Delta_i$ and $\Delta_j$, the texel selected by the offset is $ij'$.

For corner-sampled images, the texel samples are located at the grid intersections instead of the texel centers.

**Figure 5. Texel Coordinate Systems, Corner Sampling**

### 16.2. Conversion Formulas

#### 16.2.1. RGB to Shared Exponent Conversion

An RGB color (red, green, blue) is transformed to a shared exponent color $(\text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \text{exp}_{\text{shared}})$ as follows:

First, the components (red, green, blue) are clamped to $(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}})$ as:

$$\text{red}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{red}))$$

$$\text{green}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{green}))$$

$$\text{blue}_{\text{clamped}} = \max(0, \min(\text{sharedexp}_{\text{max}}, \text{blue}))$$

where:
\[ \begin{align*}
N &= 9 \\
B &= 15 \\
E_{\text{max}} &= 31
\end{align*} \]

number of mantissa bits per component
exponent bias
maximum possible biased exponent value

\[ \text{sharedexp}_{\text{max}} = \frac{(2^N - 1)}{2^N} \times 2^{(E_{\text{max}} - B)} \]

Note
NaN, if supported, is handled as in IEEE 754-2008 \( \text{minNum()} \) and \( \text{maxNum()} \). This results in any NaN being mapped to zero.

The largest clamped component, \( \text{max}_{\text{clamped}} \) is determined:

\[ \text{max}_{\text{clamped}} = \max(\text{red}_{\text{clamped}}, \text{green}_{\text{clamped}}, \text{blue}_{\text{clamped}}) \]

A preliminary shared exponent \( \text{exp}' \) is computed:

\[ \text{exp}' = \begin{cases} 
\log_2(\text{max}_{\text{clamped}}) + (B + 1) & \text{for } \text{max}_{\text{clamped}} > 2^{-(B + 1)} \\
0 & \text{for } \text{max}_{\text{clamped}} \leq 2^{-(B + 1)} 
\end{cases} \]

The shared exponent \( \text{exp}_{\text{shared}} \) is computed:

\[ \text{max}_{\text{shared}} = \left\lfloor \frac{\text{max}_{\text{clamped}}}{2^{(\text{exp}' - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{exp}_{\text{shared}} = \begin{cases} 
\text{exp}' & \text{for } 0 \leq \text{max}_{\text{shared}} < 2^N \\
\text{exp}' + 1 & \text{for } \text{max}_{\text{shared}} = 2^N 
\end{cases} \]

Finally, three integer values in the range 0 to \( 2^N \) are computed:

\[ \text{red}_{\text{shared}} = \left\lfloor \frac{\text{red}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{green}_{\text{shared}} = \left\lfloor \frac{\text{green}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

\[ \text{blue}_{\text{shared}} = \left\lfloor \frac{\text{blue}_{\text{clamped}}}{2^{(\text{exp}_{\text{shared}} - B - N)}} + \frac{1}{2} \right\rfloor \]

### 16.2.2. Shared Exponent to RGB

A shared exponent color (\( \text{red}_{\text{shared}}, \text{green}_{\text{shared}}, \text{blue}_{\text{shared}}, \text{exp}_{\text{shared}} \)) is transformed to an RGB color (red, green, blue) as follows:

\[ \text{red} = \text{red}_{\text{shared}} \times 2^{(\text{exp}_{\text{shared}} - B - N)} \]
\[ \text{green} = \text{green}_{\text{shared}} \times 2^{(\text{exp}_{\text{shared}} - B - N)} \]

\[ \text{blue} = \text{blue}_{\text{shared}} \times 2^{(\text{exp}_{\text{shared}} - B - N)} \]

where:

N = 9 (number of mantissa bits per component)

B = 15 (exponent bias)

### 16.3. Texel Input Operations

**Texel input instructions** are SPIR-V image instructions that read from an image. **Texel input operations** are a set of steps that are performed on state, coordinates, and texel values while processing a texel input instruction, and which are common to some or all texel input instructions. They include the following steps, which are performed in the listed order:

- **Validation operations**
  - Instruction/Sampler/Image validation
  - Coordinate validation
  - Sparse validation
  - Layout validation
- **Format conversion**
- **Texel replacement**
- **Depth comparison**
- **Conversion to RGBA**
- **Component swizzle**
- **Chroma reconstruction**
- **Y'CbCr conversion**

For texel input instructions involving multiple texels (for sampling or gathering), these steps are applied for each texel that is used in the instruction. Depending on the type of image instruction, other steps are conditionally performed between these steps or involving multiple coordinate or texel values.

If **Chroma Reconstruction** is implicit, **Texel Filtering** instead takes place during chroma reconstruction, before sampler Y'CbCr conversion occurs.

The operations described in **block matching** and **weight image sampling** are performed before **Conversion to RGBA** and **Component swizzle**.
16.3.1. Texel Input Validation Operations

Texel input validation operations inspect instruction/image/sampler state or coordinates, and in certain circumstances cause the texel value to be replaced or become undefined. There are a series of validations that the texel undergoes.

Instruction/Sampler/Image View Validation

There are a number of cases where a SPIR-V instruction can mismatch with the sampler, the image view, or both, and a number of further cases where the sampler can mismatch with the image view. In such cases the value of the texel returned is undefined.

These cases include:

- The sampler `borderColor` is an integer type and the image view `format` is not one of the `VkFormat` integer types or a stencil component of a depth/stencil format.
- The sampler `borderColor` is a float type and the image view `format` is not one of the `VkFormat` float types or a depth component of a depth/stencil format.
- The sampler `borderColor` is one of the opaque black colors (`VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK` or `VK_BORDER_COLOR_INT_OPAQUE_BLACK`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle, and `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage` feature is not enabled, and `VkSamplerBorderColorComponentMappingCreateInfoEXT` is not specified.
- `VkSamplerBorderColorComponentMappingCreateInfoEXT::components`, if specified, has a component swizzle that does not match the component swizzle of the image view, and either component swizzle is not a form of identity swizzle.
- `VkSamplerBorderColorComponentMappingCreateInfoEXT::srgb`, if specified, does not match the sRGB encoding of the image view.
- The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the supplied `VkSamplerCustomBorderColorCreateInfoEXT::customBorderColor` is outside the bounds of the values representable in the image view's `format`.
- The sampler `borderColor` is a custom color (`VK_BORDER_COLOR_FLOAT_CUSTOM_EXT` or `VK_BORDER_COLOR_INT_CUSTOM_EXT`) and the image view `VkComponentSwizzle` for any of the `VkComponentMapping` components is not the identity swizzle, and `VkPhysicalDeviceBorderColorSwizzleFeaturesEXT::borderColorSwizzleFromImage` feature is not enabled, and `VkSamplerBorderColorComponentMappingCreateInfoEXT` is not specified.
- The `VkImageLayout` of any subresource in the image view does not match the `VkDescriptorImageInfo::imageLayout` used to write the image descriptor.
- The SPIR-V Image Format is not compatible with the image view's `format`.
- The sampler `unnormalizedCoordinates` is `VK_TRUE` and any of the limitations of unnormalized coordinates are violated.
- The sampler was created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was not created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.
The sampler was not created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and the image was created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

The sampler was created with flags containing `VK_SAMPLER_CREATE_SUBSAMPLED_BIT_EXT` and is used with a function that is not `OpImageSampleImplicitLod` or `OpImageSampleExplicitLod`, or is used with operands `Offset` or `ConstOffsets`.

The SPIR-V instruction is one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_FALSE`.

The SPIR-V instruction is not one of the `OpImage*Dref*` instructions and the sampler `compareEnable` is `VK_TRUE`.

The SPIR-V instruction is one of the `OpImage*Dref*` instructions, the image view format is one of the depth/stencil formats, and the image view aspect is not `VK_IMAGE_ASPECT_DEPTH_BIT`.

The SPIR-V instruction's image variable's properties are not compatible with the image view:

- Rules for `viewType`:
  - `VK_IMAGE_VIEW_TYPE_1D` must have `Dim = 1D`, `Arrayed = 0`, `MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_2D` must have `Dim = 2D`, `Arrayed = 0`.
  - `VK_IMAGE_VIEW_TYPE_3D` must have `Dim = 3D`, `Arrayed = 0`, `MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_CUBE` must have `Dim = Cube`, `Arrayed = 0`, `MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_1D_ARRAY` must have `Dim = 1D`, `Arrayed = 1`, `MS = 0`.
  - `VK_IMAGE_VIEW_TYPE_2D_ARRAY` must have `Dim = 2D`, `Arrayed = 1`.
  - `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY` must have `Dim = Cube`, `Arrayed = 1`, `MS = 0`.

- If the image was created with `VkImageCreateInfo::samples` equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 0`.

- If the image was created with `VkImageCreateInfo::samples` not equal to `VK_SAMPLE_COUNT_1_BIT`, the instruction must have `MS = 1`.

- If the Sampled Type of the `OpTypeImage` does not match the numeric format of the image, as shown in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table.

- If the signedness of any read or sample operation does not match the signedness of the image's format.

- If the image was created with `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV`, the sampler addressing modes must only use a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 2D` and `addressModeU` or `addressModeV` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

The SPIR-V instruction is `OpImageSampleFootprintNV` with `Dim = 3D` and `addressModeU`, `addressModeV`, or `addressModeW` in the sampler is not `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

The sampler was created with a specified `VkSamplerCustomBorderColorCreateInfoEXT::format` which does not match the `VkFormat` of the image view(s) it is sampling.

The sampler is sampling an image view of `VK_FORMAT_B4G4R4A4_UNORM_PACK16`, `VK_FORMAT_B5G6R5_UNORM_PACK16`, or `VK_FORMAT_B5G5R5A1_UNORM_PACK16` format without a specified
Only `OpImageSample*` and `OpImageSparseSample*` can be used with a sampler or image view that enables `sampler Y’C_bC_a` conversion.

`OpImageFetch`, `OpImageSparseFetch`, `OpImage*Gather`, and `OpImageSparse*Gather` must not be used with a sampler or image view that enables `sampler Y’C_bC_a` conversion.

The `ConstOffset` and `Offset` operands must not be used with a sampler or image view that enables `sampler Y’C_bC_a` conversion.

### Integer Texel Coordinate Validation

Integer texel coordinates are validated against the size of the image level, and the number of layers and number of samples in the image. For SPIR-V instructions that use integer texel coordinates, this is performed directly on the integer coordinates. For instructions that use normalized or unnormalized texel coordinates, this is performed on the coordinates that result after conversion to integer texel coordinates.

If the integer texel coordinates do not satisfy all of the conditions

\[
0 \leq i < w_s
\]

\[
0 \leq j < h_s
\]

\[
0 \leq k < d_s
\]

\[
0 \leq l < \text{layers}
\]

\[
0 \leq n < \text{samples}
\]

where:

\[
w_s = \text{width of the image level}
\]

\[
h_s = \text{height of the image level}
\]

\[
d_s = \text{depth of the image level}
\]

\[
\text{layers} = \text{number of layers in the image}
\]
samples = number of samples per texel in the image

then the texel fails integer texel coordinate validation.

There are four cases to consider:

1. Valid Texel Coordinates
   ◦ If the texel coordinates pass validation (that is, the coordinates lie within the image), then the texel value comes from the value in image memory.

2. Border Texel
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image sample instruction or image gather instruction, and
   ◦ If the image is not a cube image, or if a sampler created with `VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT` is used,

   then the texel is a border texel and texel replacement is performed.

3. Invalid Texel
   ◦ If the texel coordinates fail validation, and
   ◦ If the read is the result of an image fetch instruction, image read instruction, or atomic instruction,

   then the texel is an invalid texel and texel replacement is performed.

4. Cube Map Edge or Corner

   Otherwise the texel coordinates lie beyond the edges or corners of the selected cube map face, and Cube map edge handling is performed.

**Cube Map Edge Handling**

If the texel coordinates lie beyond the edges or corners of the selected cube map face (as described in the prior section), the following steps are performed. Note that this does not occur when using `VK_FILTER_NEAREST` filtering within a mip level, since `VK_FILTER_NEAREST` is treated as using `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- Cube Map Edge Texel
  ◦ If the texel lies beyond the selected cube map face in either only i or only j, then the coordinates (i,j) and the array layer l are transformed to select the adjacent texel from the appropriate neighboring face.

- Cube Map Corner Texel
  ◦ If the texel lies beyond the selected cube map face in both i and j, then there is no unique neighboring face from which to read that texel. The texel should be replaced by the average of the three values of the adjacent texels in each incident face. However, implementations
may replace the cube map corner texel by other methods. The methods are subject to the constraint that for linear filtering if the three available texels have the same value, the resulting filtered texel must have that value, and for cubic filtering if the twelve available samples have the same value, the resulting filtered texel must have that value.

**Sparse Validation**

If the texel reads from an unbound region of a sparse image, the texel is a *sparse unbound texel*, and processing continues with texel replacement.

**Layout Validation**

If all planes of a disjoint multi-planar image are not in the same image layout, the image must not be sampled with sampler Y’C_bC_a conversion enabled.

### 16.3.2. Format Conversion

Texels undergo a format conversion from the VkFormat of the image view to a vector of either floating point or signed or unsigned integer components, with the number of components based on the number of components present in the format.

- Color formats have one, two, three, or four components, according to the format.
- Depth/stencil formats are one component. The depth or stencil component is selected by the aspectMask of the image view.

Each component is converted based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended.

If the image view format is sRGB, the color components are first converted as if they are UNORM, and then sRGB to linear conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

If the image view format is block-compressed, then the texel value is first decoded, then converted based on the type and number of components defined by the compressed format.

### 16.3.3. Texel Replacement

A texel is replaced if it is one (and only one) of:

- a border texel,
- an invalid texel, or
- a sparse unbound texel.

Border texels are replaced with a value based on the image format and the borderColor of the sampler. The border color is:
Table 23. Border Color B, Custom Border Color \textbf{VkSamplerCustomBorderColorCreateInfoEXT} ::customBorderColor U

<table>
<thead>
<tr>
<th>Sampler borderColor</th>
<th>Corresponding Border Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 0.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0.0, 0.0, 0.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1.0, 1.0, 1.0, 1.0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_TRANSPARENT_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 0])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_BLACK</td>
<td>([B_r, B_g, B_b, B_a] = [0, 0, 0, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_OPAQUE_WHITE</td>
<td>([B_r, B_g, B_b, B_a] = [1, 1, 1, 1])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_FLOAT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
<tr>
<td>VK_BORDER_COLOR_INT_CUSTOM_EXT</td>
<td>([B_r, B_g, B_b, B_a] = [U_r, U_g, U_b, U_a])</td>
</tr>
</tbody>
</table>

The custom border color (U) may be rounded by implementations prior to texel replacement, but the error introduced by such a rounding must not exceed one ULP of the image’s format.

The names \texttt{VK\_BORDER\_COLOR\_*\_TRANSPARENT\_BLACK}, \texttt{VK\_BORDER\_COLOR\_*\_OPAQUE\_BLACK}, and \texttt{VK\_BORDER\_COLOR\_*\_OPAQUE\_WHITE} are meant to describe which components are zeros and ones in the vocabulary of compositing, and are not meant to imply that the numerical value of \texttt{VK\_BORDER\_COLOR\_INT\_OPAQUE\_WHITE} is a saturating value for integers.

This is substituted for the texel value by replacing the number of components in the image format

Table 24. Border Texel Components After Replacement

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>Component Assignment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>(D = B_r)</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>(S = B_r)</td>
</tr>
<tr>
<td>One component color format</td>
<td>(\text{Color}_r = B_r)</td>
</tr>
<tr>
<td>Two component color format</td>
<td>([\text{Color}_r, \text{Color}_g] = [B_r, B_g])</td>
</tr>
<tr>
<td>Three component color format</td>
<td>([\text{Color}_r, \text{Color}_g, \text{Color}_b] = [B_r, B_g, B_b])</td>
</tr>
<tr>
<td>Four component color format</td>
<td>([\text{Color}_r, \text{Color}_g, \text{Color}_b, \text{Color}_a] = [B_r, B_g, B_b, B_a])</td>
</tr>
</tbody>
</table>

The value returned by a read of an invalid texel is undefined, unless that read operation is from a buffer resource and the \texttt{robustBufferAccess} feature is enabled. In that case, an invalid texel is replaced as described by the \texttt{robustBufferAccess} feature. If the access is to an image resource and the \(x, y, z,\) or layer coordinate validation fails and the \texttt{robustImageAccess} feature is enabled, then zero must be returned for the R, G, and B components, if present. Either zero or one must be returned for the A component, if present. If the \texttt{robustImageAccess2} feature is enabled, zero values must be returned. If only the sample index was invalid, the values returned are undefined.

Additionally, if the \texttt{robustImageAccess} feature is enabled, but the \texttt{robustImageAccess2} feature is not,
any invalid texels may be expanded to four components prior to texel replacement. This means that components not present in the image format may be replaced with 0 or may undergo conversion to RGBA as normal.

Loads from a null descriptor return a four component color value of all zeros. However, for storage images and storage texel buffers using an explicit SPIR-V Image Format, loads from a null descriptor may return an alpha value of 1 (float or integer, depending on format) if the format does not include alpha.

If the VkPhysicalDeviceSparseProperties::residencyNonResidentStrict property is VK_TRUE, a sparse unbound texel is replaced with 0 or 0.0 values for integer and floating-point components of the image format, respectively.

If residencyNonResidentStrict is VK_FALSE, the value of the sparse unbound texel is undefined.

16.3.4. Depth Compare Operation

If the image view has a depth/stencil format, the depth component is selected by the aspectMask, and the operation is an OpImage*Dref* instruction, a depth comparison is performed. The result is 1.0 if the comparison evaluates to true, and 0.0 otherwise. This value replaces the depth component D.

The compare operation is selected by the VkCompareOp value set by VkSamplerCreateInfo::compareOp. The reference value from the SPIR-V operand D_ref and the texel depth value D_tex are used as the reference and test values, respectively, in that operation.

If the image being sampled has an unsigned normalized fixed-point format, then D_ref is clamped to [0,1] before the compare operation.

16.3.5. Conversion to RGBA

The texel is expanded from one, two, or three components to four components based on the image base color:

Table 25. Texel Color After Conversion To RGBA

<table>
<thead>
<tr>
<th>Texel Aspect or Format</th>
<th>RGBA Color</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth aspect</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [D,0,0,one]</td>
</tr>
<tr>
<td>Stencil aspect</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [S,0,0,one]</td>
</tr>
<tr>
<td>One component color format</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [Color_r,0,0,one]</td>
</tr>
<tr>
<td>Two component color format</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [Color_r,Color_g,0,one]</td>
</tr>
<tr>
<td>Three component color format</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [Color_r,Color_g,Color_b,one]</td>
</tr>
<tr>
<td>Four component color format</td>
<td>[Color_r,Color_g,Color_b, Color_a] = [Color_r,Color_g,Color_b,Color_a]</td>
</tr>
</tbody>
</table>

where one = 1.0f for floating-point formats and depth aspects, and one = 1 for integer formats and stencil aspects.
16.3.6. Component Swizzle

All texel input instructions apply a swizzle based on:

- the `VkComponentSwizzle` enums in the `components` member of the `VkImageViewCreateInfo` structure for the image being read if `sampler Y'CbCr conversion` is not enabled, and
- the `VkComponentSwizzle` enums in the `components` member of the `VkSamplerYcbcrConversionCreateInfo` structure for the `sampler Y'CbCr conversion` if sampler `Y'CbCr conversion` is enabled.

The swizzle can rearrange the components of the texel, or substitute zero or one for any components. It is defined as follows for each color component:

\[
\text{Color}'_{\text{component}} = \begin{cases} 
\text{Color}_r & \text{for RED swizzle} \\
\text{Color}_g & \text{for GREEN swizzle} \\
\text{Color}_b & \text{for BLUE swizzle} \\
\text{Color}_a & \text{for ALPHA swizzle} \\
0 & \text{for ZERO swizzle} \\
\text{one} & \text{for ONE swizzle} \\
\text{identity} & \text{for IDENTITY swizzle}
\end{cases}
\]

where:

\[
\text{one} = \begin{cases} 
1.0f & \text{for floating point components} \\
1 & \text{for integer components}
\end{cases}
\]

\[
\text{identity} = \begin{cases} 
\text{Color}_r & \text{for component} = r \\
\text{Color}_g & \text{for component} = g \\
\text{Color}_b & \text{for component} = b \\
\text{Color}_a & \text{for component} = a
\end{cases}
\]

If the border color is one of the `VK_BORDER_COLOR_*_OPAQUE_BLACK` enums and the `VkComponentSwizzle` is not the identity swizzle for all components, the value of the texel after swizzle is undefined.

16.3.7. Sparse Residency

`OpImageSparse*` instructions return a structure which includes a residency code indicating whether any texels accessed by the instruction are sparse unbound texels. This code can be interpreted by the `OpImageSparseTexelsResident` instruction which converts the residency code to a boolean value.

16.3.8. Chroma Reconstruction

In some color models, the color representation is defined in terms of monochromatic light intensity (often called “luma”) and color differences relative to this intensity, often called “chroma”. It is common for color models other than RGB to represent the chroma components at lower spatial resolution than the luma component. This approach is used to take advantage of the eye’s lower spatial sensitivity to color compared with its sensitivity to brightness. Less commonly, the same
The approach is used with additive color, since the green component dominates the eye's sensitivity to light intensity and the spatial sensitivity to color introduced by red and blue is lower.

Lower-resolution components are “downsampled” by resizing them to a lower spatial resolution than the component representing luminance. This process is also commonly known as “chroma subsampling”. There is one luminance sample in each texture texel, but each chrominance sample may be shared among several texels in one or both texture dimensions.

- “.444” formats do not spatially downsample chroma values compared with luma: there are unique chroma samples for each texel.
- “.422” formats have downsampling in the x dimension (corresponding to $u$ or $s$ coordinates): they are sampled at half the resolution of luma in that dimension.
- “.420” formats have downsampling in the x dimension (corresponding to $u$ or $s$ coordinates) and the y dimension (corresponding to $v$ or $t$ coordinates): they are sampled at half the resolution of luma in both dimensions.

The process of reconstructing a full color value for texture access involves accessing both chroma and luma values at the same location. To generate the color accurately, the values of the lower-resolution components at the location of the luma samples must be reconstructed from the lower-resolution sample locations, an operation known here as “chroma reconstruction” irrespective of the actual color model.

The location of the chroma samples relative to the luma coordinates is determined by the xChromaOffset and yChromaOffset members of the VkSamplerYcbcrConversionCreateInfo structure used to create the sampler Y’C$_b$C$_r$ conversion.

The following diagrams show the relationship between unnormalized ($u$, $v$) coordinates and ($i$, $j$) integer texel positions in the luma component (shown in black, with circles showing integer sample positions) and the texel coordinates of reduced-resolution chroma components, shown as crosses in red.

---

**Note**

If the chroma values are reconstructed at the locations of the luma samples by means of interpolation, chroma samples from outside the image bounds are needed; these are determined according to Wrapping Operation. These diagrams represent this by showing the bounds of the “chroma texel” extending beyond the image bounds, and including additional chroma sample positions where required for interpolation. The limits of a sample for NEAREST sampling is shown as a grid.
Figure 6. 422 downsampling, xChromaOffset=COSITED_EVEN

Figure 7. 422 downsampling, xChromaOffset=MIDPOINT
Figure 8. 420 downsampling, xChromaOffset=COSITED_EVEN, yChromaOffset=COSITED_EVEN

Figure 9. 420 downsampling, xChromaOffset=MIDPOINT, yChromaOffset=COSITED_EVEN
Reconstruction is implemented in one of two ways:

If the format of the image that is to be sampled sets `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT`, or the `VkSamplerYcbcrConversionCreateInfo`'s `forceExplicitReconstruction` is set to `VK_TRUE`, reconstruction is performed as an explicit step independent of filtering, described in the Explicit Reconstruction section.

If the format of the image that is to be sampled does not set `VK_FORMAT_FEATURE_SAMPLED_IMAGE_YCBCR_CONVERSION_CHROMA_RECONSTRUCTION_EXPLICIT_BIT` and if the
VkSamplerYcbcrConversionCreateInfo’s forceExplicitReconstruction is set to VK_FALSE, reconstruction is performed as an implicit part of filtering prior to color model conversion, with no separate post-conversion texel filtering step, as described in the Implicit Reconstruction section.

Explicit Reconstruction

- If the chromaFilter member of the VkSamplerYcbcrConversionCreateInfo structure is VK_FILTER_NEAREST:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format), the $\tau_{ijk}[level]$ values accessed by texel filtering are reconstructed as follows:
    
    $$
    \tau_R'(i, j) = \tau_R(i \times 0.5, j)[level] \\
    \tau_B'(i, j) = \tau_B(i \times 0.5, j)[level]
    $$

  - If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), the $\tau_{ijk}[level]$ values accessed by texel filtering are reconstructed as follows:
    
    $$
    \tau_R'(i, j) = \tau_R(i \times 0.5, j \times 0.5)[level] \\
    \tau_B'(i, j) = \tau_B(i \times 0.5, j \times 0.5)[level]
    $$

- Note: xChromaOffset and yChromaOffset have no effect if chromaFilter is VK_FILTER_NEAREST for explicit reconstruction.

- If the chromaFilter member of the VkSamplerYcbcrConversionCreateInfo structure is VK_FILTER_LINEAR:
  - If the format’s R and B components are reduced in resolution in just width by a factor of two relative to the G component (i.e. this is a “_422” format):
    - If xChromaOffset is VK_CHROMA_LOCATION_COSITED_EVEN:
      
      $$
      \tau_{RB}'(i, j) = \begin{cases}
      \tau_{RB}(i \times 0.5, j)[level], & 0.5 \times i = [0.5 \times i] \\
      0.5 \times \tau_{RB}(i \times 0.5, j)[level] + \\
      0.5 \times \tau_{RB}(i \times 0.5 + 1, j)[level], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      $$

    - If xChromaOffset is VK_CHROMA_LOCATION_MIDPOINT:
      
      $$
      \tau_{RB}'(i, j) = \begin{cases}
      0.25 \times \tau_{RB}(i \times 0.5 - 1, j)[level] + \\
      0.75 \times \tau_{RB}(i \times 0.5, j)[level], & 0.5 \times i = [0.5 \times i] \\
      0.75 \times \tau_{RB}(i \times 0.5, j)[level] + \\
      0.25 \times \tau_{RB}(i \times 0.5 + 1, j)[level], & 0.5 \times i \neq [0.5 \times i]
      \end{cases}
      $$

- If the format’s R and B components are reduced in resolution in width and height by a factor of two relative to the G component (i.e. this is a “_420” format), a similar relationship applies. Due to the number of options, these formulae are expressed more concisely as follows:
In the case where the texture itself is bilinearly interpolated as described in Texel Filtering, thus requiring four full-color samples for the filtering operation, and where the reconstruction of these samples uses bilinear interpolation in the chroma components due to `chromaFilter=VK_FILTER_LINEAR`, up to nine chroma samples may be required, depending on the sample location.

Implicit Reconstruction

Implicit reconstruction takes place by the samples being interpolated, as required by the filter settings of the sampler, except that `chromaFilter` takes precedence for the chroma samples.

If `chromaFilter` is `VK_FILTER_NEAREST`, an implementation may behave as if `xChromaOffset` and `yChromaOffset` were both `VK_CHROMA_LOCATION_MIDPOINT`, irrespective of the values set.

This will not have any visible effect if the locations of the luma samples coincide with the location of the samples used for rasterization.

The sample coordinates are adjusted by the downsample factor of the component (such that, for example, the sample coordinates are divided by two if the component has a downsample factor of two relative to the luma component):

\[
\begin{align*}
  i_{RB} &= \begin{cases} 
    0.5 \times (i) & \text{xChromaOffset=COSITED_EVEN} \\
    0.5 \times (i - 0.5) & \text{xChromaOffset=MIDPOINT} 
  \end{cases} \\
  j_{RB} &= \begin{cases} 
    0.5 \times (j) & \text{yChromaOffset=COSITED_EVEN} \\
    0.5 \times (j - 0.5) & \text{yChromaOffset=MIDPOINT} 
  \end{cases}
\end{align*}
\]

\[
\begin{align*}
  i_{\text{floor}} &= \lfloor i_{RB} \rfloor \\
  j_{\text{floor}} &= \lfloor j_{RB} \rfloor \\
  i_{\text{frac}} &= i_{RB} - i_{\text{floor}} \\
  j_{\text{frac}} &= j_{RB} - j_{\text{floor}}
\end{align*}
\]

\[
\begin{align*}
  \tau_{RB}^\prime(i, j) &= \tau_{RB}(i_{\text{floor}}, j_{\text{floor}})[\text{level}] \\
  &\quad \times (1 - i_{\text{frac}}) \times (1 - j_{\text{frac}}) + \\
  &\quad \times (i_{\text{frac}}) \times (1 - j_{\text{frac}}) + \\
  &\quad \times (1 - i_{\text{frac}}) \times (j_{\text{frac}}) + \\
  &\quad \times (i_{\text{frac}}) \times (j_{\text{frac}})
\end{align*}
\]

16.3.9. Sampler Y'C_bC_r Conversion

Sampler Y'C_bC_r conversion performs the following operations, which an implementation may
combine into a single mathematical operation:

- **Sampler Y’C₈C₉ Range Expansion**
- **Sampler Y’C₈C₉ Model Conversion**

**Sampler Y’C₈C₉ Range Expansion**

Sampler Y’C₈C₉ range expansion is applied to color component values after all texel input operations which are not specific to sampler Y’C₈C₉ conversion. For example, the input values to this stage have been converted using the normal format conversion rules.

Sampler Y’C₈C₉ range expansion is not applied if `ycbcrModel` is `VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY`. That is, the shader receives the vector C’ rgba as output by the Component Swizzle stage without further modification.

For other values of `ycbcrModel`, range expansion is applied to the texel component values output by the Component Swizzle defined by the components member of `VkSamplerYcbcrConversionCreateInfo`. Range expansion applies independently to each component of the image. For the purposes of range expansion and Y’C₈C₉ model conversion, the R and B components contain color difference (chroma) values and the G component contains luma. The A component is not modified by sampler Y’C₈C₉ range expansion.

The range expansion to be applied is defined by the `ycbcrRange` member of the `VkSamplerYcbcrConversionCreateInfo` structure:

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_FULL`, the following transformations are applied:

  \[
  Y' = C'_{rgba}[G] \\
  C_B = C'_{rgba}[B] - \frac{2^{(n-1)}}{(2^n) - 1} \\
  C_R = C'_{rgba}[R] - \frac{2^{(n-1)}}{(2^n) - 1}
  \]

  **Note**
  
  These formulae correspond to the “full range” encoding in the “Quantization schemes” chapter of the *Khronos Data Format Specification*.

  Should any future amendments be made to the ITU specifications from which these equations are derived, the formulae used by Vulkan may also be updated to maintain parity.

- If `ycbcrRange` is `VK_SAMPLER_YCBCR_RANGE_ITU_NARROW`, the following transformations are applied:
$Y' = \frac{C'_{rgba}\ [G] \times (2^n - 1) - 16 \times 2^n - 8}{219 \times 2^n - 8}$
$C_B = \frac{C'_{rgba}\ [B] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}$
$C_R = \frac{C'_{rgba}\ [R] \times (2^n - 1) - 128 \times 2^n - 8}{224 \times 2^n - 8}$

**Note**

These formulae correspond to the “narrow range” encoding in the “Quantization schemes” chapter of the [Khronos Data Format Specification](#).

- $n$ is the bit-depth of the components in the format.

The precision of the operations performed during range expansion *must* be at least that of the source format.

An implementation *may* clamp the results of these range expansion operations such that $Y'$ falls in the range $[0,1]$, and/or such that $C_B$ and $C_R$ fall in the range $[-0.5,0.5]$.

**Sampler Y’CbCr Model Conversion**

The range-expanded values are converted between color models, according to the color model conversion specified in the `ycbcrModel` member:

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_RGB_IDENTITY**

The color components are not modified by the color model conversion since they are assumed already to represent the desired color model in which the shader is operating; $Y’C_bC_r$ range expansion is also ignored.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_IDENTITY**

The color components are not modified by the color model conversion and are assumed to be treated as though in $Y’C_bC_r$ form both in memory and in the shader; $Y’C_bC_r$ range expansion is applied to the components as for other $Y’C_bC_r$ models, with the vector $(C_b,Y',C_r,A)$ provided to the shader.

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_709**

The color components are transformed from a $Y’C_bC_r$ representation to an R'G'B' representation as described in the “BT.709 $Y’C_bC_r$ conversion” section of the [Khronos Data Format Specification](#).

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_601**

The color components are transformed from a $Y’C_bC_r$ representation to an R'G'B' representation as described in the “BT.601 $Y’C_bC_r$ conversion” section of the [Khronos Data Format Specification](#).

**VK_SAMPLER_YCBCR_MODEL_CONVERSION_YCBCR_2020**

The color components are transformed from a $Y’C_bC_r$ representation to an R'G'B' representation as described in the “BT.2020 $Y’C_bC_r$ conversion” section of the [Khronos Data Format Specification](#).
In this operation, each output component is dependent on each input component.

An implementation may clamp the R′G′B′ results of these conversions to the range [0,1].

The precision of the operations performed during model conversion must be at least that of the source format.

The alpha component is not modified by these model conversions.

**Note**

Sampling operations in a non-linear color space can introduce color and intensity shifts at sharp transition boundaries. To avoid this issue, the technically precise color correction sequence described in the “Introduction to Color Conversions” chapter of the Khronos Data Format Specification may be performed as follows:

- Calculate the unnormalized texel coordinates corresponding to the desired sample position.

- For a minFilter or magFilter of VK_FILTER_NEAREST:
  1. Calculate \((i,j)\) for the sample location as described under the “nearest filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using \(\text{sampler } Y'C_b'C_r\) conversion at this location.

- For a minFilter or magFilter of VK_FILTER_LINEAR:
  1. Calculate \((i_{[0,1]},j_{[0,1]})\) for the sample location as described under the “linear filtering” formulae in \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection
  2. Calculate the normalized texel coordinates corresponding to these integer coordinates.
  3. Sample using \(\text{sampler } Y'C_b'C_r\) conversion at each of these locations.
  4. Convert the non-linear A'R'G'B' outputs of the \(Y'C_b'C_r\) conversions to linear ARGB values as described in the “Transfer Functions” chapter of the Khronos Data Format Specification.
  5. Interpolate the linear ARGB values using the \(\alpha\) and \(\beta\) values described in the “linear filtering” section of \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection and the equations in Texel Filtering.

The additional calculations and, especially, additional number of sampling operations in the VK_FILTER_LINEAR case can be expected to have a performance impact compared with using the outputs directly. Since the variations from “correct” results are subtle for most content, the application author should determine whether a more costly implementation is strictly necessary.

If chromaFilter, and minFilter or magFilter are both VK_FILTER_NEAREST, these
operations are redundant and sampling using sampler Y’CbCr conversion at the desired sample coordinates will produce the “correct” results without further processing.

16.4. Texel Output Operations

Texel output instructions are SPIR-V image instructions that write to an image. Texel output operations are a set of steps that are performed on state, coordinates, and texel values while processing a texel output instruction, and which are common to some or all texel output instructions. They include the following steps, which are performed in the listed order:

- Validation operations
  - Format validation
  - Type validation
  - Coordinate validation
  - Sparse validation
- Texel output format conversion

16.4.1. Texel Output Validation Operations

Texel output validation operations inspect instruction/image state or coordinates, and in certain circumstances cause the write to have no effect. There are a series of validations that the texel undergoes.

Texel Format Validation

If the image format of the OpTypeImage is not compatible with the VkImageView’s format, the write causes the contents of the image’s memory to become undefined.

Texel Type Validation

If the Sampled Type of the OpTypeImage does not match the type defined for the format, as specified in the SPIR-V Sampled Type column of the Interpretation of Numeric Format table, the write causes the value of the texel to become undefined. For integer types, if the signedness of the access does not match the signedness of the accessed resource, the write causes the value of the texel to become undefined.

16.4.2. Integer Texel Coordinate Validation

The integer texel coordinates are validated according to the same rules as for texel input coordinate validation.

If the texel fails integer texel coordinate validation, then the write has no effect.
16.4.3. Sparse Texel Operation

If the texel attempts to write to an unbound region of a sparse image, the texel is a sparse unbound texel. In such a case, if the `VkPhysicalDeviceSparseProperties::residencyNonResidentStrict` property is `VK_TRUE`, the sparse unbound texel write has no effect. If `residencyNonResidentStrict` is `VK_FALSE`, the write may have a side effect that becomes visible to other accesses to unbound texels in any resource, but will not be visible to any device memory allocated by the application.

16.4.4. Texel Output Format Conversion

If the image format is sRGB, a linear to sRGB conversion is applied to the R, G, and B components as described in the “sRGB EOTF” section of the Khronos Data Format Specification. The A component, if present, is unchanged.

Texels then undergo a format conversion from the floating point, signed, or unsigned integer type of the texel data to the `VkFormat` of the image view. If the number of components in the texel data is larger than the number of components in the format, additional components are discarded.

Each component is converted based on its type and size (as defined in the Format Definition section for each `VkFormat`). Floating-point outputs are converted as described in Floating-Point Format Conversions and Fixed-Point Data Conversion. Integer outputs are converted such that their value is preserved. The converted value of any integer that cannot be represented in the target format is undefined.

16.5. Normalized Texel Coordinate Operations

If the image sampler instruction provides normalized texel coordinates, some of the following operations are performed.

16.5.1. Projection Operation

For `Proj` image operations, the normalized texel coordinates \((s,t,r,q,a)\) and (if present) the \(D_{ref}\) coordinate are transformed as follows:

\[
\begin{align*}
    s &= \frac{s}{q}, & \text{for 1D, 2D, or 3D image} \\
    t &= \frac{t}{q}, & \text{for 2D or 3D image} \\
    r &= \frac{r}{q}, & \text{for 3D image} \\
    D_{ref} &= \frac{D_{ref}}{q}, & \text{if provided}
\end{align*}
\]

16.5.2. Derivative Image Operations

Derivatives are used for LOD selection. These derivatives are either implicit (in an `ImplicitLod` image instruction in a fragment shader) or explicit (provided explicitly by shader to the image
For implicit derivatives image instructions, the derivatives of texel coordinates are calculated in the same manner as derivative operations. That is:

\[
\frac{\partial s}{\partial x} = dPd_x(s), \quad \frac{\partial s}{\partial y} = dPd_y(s), \quad \text{for 1D, 2D, Cube, or 3D image}
\]

\[
\frac{\partial t}{\partial x} = dPd_x(t), \quad \frac{\partial t}{\partial y} = dPd_y(t), \quad \text{for 2D, Cube, or 3D image}
\]

\[
\frac{\partial r}{\partial x} = dPd_x(r), \quad \frac{\partial r}{\partial y} = dPd_y(r), \quad \text{for Cube or 3D image}
\]

Partial derivatives not defined above for certain image dimensionalities are set to zero.

For explicit LOD image instructions, if the optional SPIR-V operand `Grad` is provided, then the operand values are used for the derivatives. The number of components present in each derivative for a given image dimensionality matches the number of partial derivatives computed above.

If the optional SPIR-V operand `Lod` is provided, then derivatives are set to zero, the cube map derivative transformation is skipped, and the scale factor operation is skipped. Instead, the floating point scalar coordinate is directly assigned to \( \lambda_{\text{base}} \) as described in Level-of-Detail Operation.

If the image or sampler object used by an implicit derivative image instruction is not uniform across the quad and `quadDivergentImplicitLod` is not supported, then the derivative and LOD values are undefined. Implicit derivatives are well-defined when the image and sampler and control flow are uniform across the quad, even if they diverge between different quads.

If `quadDivergentImplicitLod` is supported, then derivatives and implicit LOD values are well-defined even if the image or sampler object are not uniform within a quad. The derivatives are computed as specified above, and the implicit LOD calculation proceeds for each shader invocation using its respective image and sampler object.

### 16.5.3. Cube Map Face Selection and Transformations

For cube map image instructions, the (s,t,r) coordinates are treated as a direction vector \((r_x, r_y, r_z)\). The direction vector is used to select a cube map face. The direction vector is transformed to a per-face texel coordinate system \((s_{\text{face}}, t_{\text{face}})\). The direction vector is also used to transform the derivatives to per-face derivatives.

### 16.5.4. Cube Map Face Selection

The direction vector selects one of the cube map’s faces based on the largest magnitude coordinate direction (the major axis direction). Since two or more coordinates can have identical magnitude, the implementation must have rules to disambiguate this situation.

The rules should have as the first rule that \( r_z \) wins over \( r_y \) and \( r_x \), and the second rule that \( r_y \) wins over \( r_x \). An implementation may choose other rules, but the rules must be deterministic and depend only on \((r_x, r_y, r_z)\).

The layer number (corresponding to a cube map face), the coordinate selections for \( s_c, t_c, r_c \), and the selection of derivatives, are determined by the major axis direction as specified in the following two tables.
Table 26. Cube map face and coordinate selection

16.5.5. Cube Map Coordinate Transformation

\[
s_{\text{face}} = \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2}
\]
\[
t_{\text{face}} = \frac{1}{2} \times \frac{t_c}{|r_c|} + \frac{1}{2}
\]

16.5.6. Cube Map Derivative Transformation

\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{\partial}{\partial x} \left( \frac{1}{2} \times \frac{s_c}{|r_c|} + \frac{1}{2} \right)
\]
\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{1}{2} \times \frac{\partial}{\partial x} \left( \frac{s_c}{|r_c|} \right)
\]
\[
\frac{\partial s_{\text{face}}}{\partial x} = \frac{1}{2} \times \left( \frac{|r_c| \times \partial s_c / \partial x - s_c \times \partial r_c / \partial x}{(r_c)^2} \right)
\]
16.5.7. Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection

LOD selection can be either explicit (provided explicitly by the image instruction) or implicit (determined from a scale factor calculated from the derivatives). The LOD must be computed with mipmapPrecisionBits of accuracy.

Scale Factor Operation

The magnitude of the derivatives are calculated by:

\[
\begin{align*}
\frac{\partial s_{\text{face}}}{\partial y} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial s / \partial y - s_c \times \partial r_c / \partial y}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial x} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial x - t_c \times \partial r_c / \partial x}{(r_c)^2} \right) \\
\frac{\partial t_{\text{face}}}{\partial y} &= \frac{1}{2} \times \left( \frac{|r_c| \times \partial t_c / \partial y - t_c \times \partial r_c / \partial y}{(r_c)^2} \right)
\end{align*}
\]

where:

\[
\frac{\partial t}{\partial x} = \frac{\partial t}{\partial y} = 0 \text{ (for 1D images)}
\]

\[
\frac{\partial r}{\partial x} = \frac{\partial r}{\partial y} = 0 \text{ (for 1D, 2D or Cube images)}
\]

and:

\[w_{\text{base}} = \text{image} \cdot w\]
\[ h_{\text{base}} = \text{image.h} \]
\[ d_{\text{base}} = \text{image.d} \]

(for the baseMipLevel, from the image descriptor).

For corner-sampled images, the \( w_{\text{base}}, h_{\text{base}}, \) and \( d_{\text{base}} \) are instead:

\[ w_{\text{base}} = \text{image.w} - 1 \]
\[ h_{\text{base}} = \text{image.h} - 1 \]
\[ d_{\text{base}} = \text{image.d} - 1 \]

A point sampled in screen space has an elliptical footprint in texture space. The minimum and maximum scale factors \((\rho_{\text{min}}, \rho_{\text{max}})\) should be the minor and major axes of this ellipse.

The scale factors \(\rho_x\) and \(\rho_y\), calculated from the magnitude of the derivatives in x and y, are used to compute the minimum and maximum scale factors.

\(\rho_x\) and \(\rho_y\) may be approximated with functions \(f_x\) and \(f_y\), subject to the following constraints:

- \(f_x\) is continuous and monotonically increasing in each of \(m_{ux}, m_{vx}, \) and \(m_{wx}\)
- \(f_y\) is continuous and monotonically increasing in each of \(m_{uy}, m_{vy},\) and \(m_{wy}\)

\[
\begin{align*}
\max(|m_{ux}|, |m_{vx}|, |m_{wx}|) & \leq f_x \leq \sqrt{2}(|m_{ux}| + |m_{vx}| + |m_{wx}|) \\
\max(|m_{uy}|, |m_{vy}|, |m_{wy}|) & \leq f_y \leq \sqrt{2}(|m_{uy}| + |m_{vy}| + |m_{wy}|)
\end{align*}
\]

The minimum and maximum scale factors \((\rho_{\text{min}},\rho_{\text{max}})\) are determined by:

\[ \rho_{\text{max}} = \max(\rho_x, \rho_y) \]
\[ \rho_{\text{min}} = \min(\rho_x, \rho_y) \]

The ratio of anisotropy is determined by:

\[ \eta = \min(\rho_{\text{max}}/\rho_{\text{min}}, \text{maxAniso}) \]

where:
sampler.max\textsubscript{Aniso} = max\textsubscript{Anisotropy} (from sampler descriptor)

limits.max\textsubscript{Aniso} = max\textsubscript{SamplerAnisotropy} (from physical device limits)

\[ \text{max}\textsubscript{Aniso} = \min(\text{sampler.max}\textsubscript{Aniso}, \text{limits.max}\textsubscript{Aniso}) \]

If \( \rho_{\text{max}} = \rho_{\text{min}} = 0 \), then all the partial derivatives are zero, the fragment’s footprint in texel space is a point, and \( \eta \) should be treated as 1. If \( \rho_{\text{max}} \neq 0 \) and \( \rho_{\text{min}} = 0 \) then all partial derivatives along one axis are zero, the fragment’s footprint in texel space is a line segment, and \( \eta \) should be treated as max\textsubscript{Aniso}. However, anytime the footprint is small in texel space the implementation may use a smaller value of \( \eta \), even when \( \rho_{\text{min}} \) is zero or close to zero. If either \text{VkPhysicalDeviceFeatures::samplerAnisotropy} or \text{VkSamplerCreateInfo::anisotropyEnable} are \text{VK_FALSE}, max\textsubscript{Aniso} is set to 1.

If \( \eta = 1 \), sampling is isotropic. If \( \eta > 1 \), sampling is anisotropic.

The sampling rate (N) is derived as:

\[ N = \lceil \eta \rceil \]

An implementation may round N up to the nearest supported sampling rate. An implementation may use the value of N as an approximation of \( \eta \).

**Level-of-Detail Operation**

The LOD parameter \( \lambda \) is computed as follows:

\[ \lambda_{\text{base}}(x, y) = \begin{cases} \text{shaderOp.Lod} & \text{(from optional SPIR-V operand)} \\ \log_2 \left( \frac{P_{\text{max}}}{\eta} \right) & \text{otherwise} \end{cases} \]

\[ \lambda'(x, y) = \lambda_{\text{base}} + \text{clamp}(\text{sampler.bias} + \text{shaderOp.bias}, -\text{maxSamplerLodBias}, \text{maxSamplerLodBias}) \]

\[ \lambda = \begin{cases} \text{lod}_{\text{max}}, & \lambda' > \text{lod}_{\text{max}} \\ \lambda', & \text{lod}_{\text{min}} \leq \lambda' \leq \text{lod}_{\text{max}} \\ \text{lod}_{\text{min}}, & \lambda' < \text{lod}_{\text{min}} \\ \text{undefined}, & \text{lod}_{\text{min}} > \text{lod}_{\text{max}} \end{cases} \]

where:

\[ \text{sampler.bias} = \text{mipLodBias} \] (from sampler descriptor)

\[ \text{shaderOp.bias} = \begin{cases} \text{Bias} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases} \]

\[ \text{sampler.lod}_{\text{min}} = \text{minLod} \] (from sampler descriptor)

\[ \text{shaderOp.lod}_{\text{min}} = \begin{cases} \text{MinLod} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases} \]

\[ \text{lod}_{\text{min}} = \max(\text{sampler.lod}_{\text{min}}, \text{shaderOp.lod}_{\text{min}}) \]

\[ \text{lod}_{\text{max}} = \text{maxLod} \] (from sampler descriptor)

and maxSamplerLodBias is the value of the \text{VkPhysicalDeviceLimits} feature \text{maxSamplerLodBias}.
Image Level(s) Selection

The image level(s) \( d, \ d_{hi}, \) and \( d_{lo} \) which texels are read from are determined by an image-level parameter \( d_l \), which is computed based on the LOD parameter, as follows:

\[
d_l = \begin{cases} \text{nearest}(d'), & \text{mipmapMode is VK_SAMPLER_MIPMAP_MODE_NEAREST} \\ d', & \text{otherwise} \end{cases}
\]

where:

\[
d' = \max(\text{level}_{base} + \text{clamp}(\lambda, 0, q), \text{minLod}_{imageView})
\]

\[
\text{nearest}(d') = \begin{cases} [d' + 0.5] - 1, & \text{preferred} \\ [d' + 0.5], & \text{alternative} \end{cases}
\]

and:

\[
\text{minLod}_{imageView} = \begin{cases} \text{minLod}, & \text{preferred} \\ |\text{minLod}|, & \text{alternative} \end{cases}
\]

\[
\text{level}_{base} = \text{baseMipLevel} \\
q = \text{levelCount} - 1
\]

\( \text{baseMipLevel} \) and \( \text{levelCount} \) are taken from the \text{subresourceRange} of the image view.

\( \text{minLod} \) is taken from the \text{VkImageViewMinLodCreateInfoEXT::minLod} of the image view if present and the selection is part of the result of a sampling operation, otherwise it is 0.0. \( \text{minLod} \) must be less or equal to \( \text{level}_{base} + q \).

If the sampler’s \text{mipmapMode} is VK_SAMPLER_MIPMAP_MODE_NEAREST, then the level selected is \( d = d_l \).

If the sampler’s \text{mipmapMode} is VK_SAMPLER_MIPMAP_MODE_LINEAR, two neighboring levels are selected:

\[
d_{hi} = [d_l] \\
d_{lo} = \min(d_{hi} + 1, \text{level}_{base} + q) \\
\delta = d_l - d_{hi}
\]

\( \delta \) is the fractional value, quantized to the number of mipmap precision bits, used for linear filtering between levels.

16.5.8. \((s,t,r,q,a)\) to \((u,v,w,a)\) Transformation

The normalized texel coordinates are scaled by the image level dimensions and the array layer is selected.

This transformation is performed once for each level used in filtering (either \( d \), or \( d_{hi} \) and \( d_{lo} \)).
\[ u(x, y) = s(x, y) \times width_{scale} + \Delta_i \]

\[ v(x, y) = \begin{cases} 
0 & \text{for 1D images} \\
 t(x, y) \times height_{scale} + \Delta_j & \text{otherwise} 
\end{cases} \]

\[ w(x, y) = \begin{cases} 
0 & \text{for 2D or Cube images} \\
 r(x, y) \times depth_{scale} + \Delta_k & \text{otherwise} 
\end{cases} \]

\[ a(x, y) = \begin{cases} 
a(x, y) & \text{for array images} \\
0 & \text{otherwise} 
\end{cases} \]

where:

\[ width_{scale} = width_{level} \]

\[ height_{scale} = height_{level} \]

\[ depth_{scale} = depth_{level} \]

for conventional images, and:

\[ width_{scale} = width_{level} - 1 \]

\[ height_{scale} = height_{level} - 1 \]

\[ depth_{scale} = depth_{level} - 1 \]

for corner-sampled images.

and where \((\Delta_i, \Delta_j, \Delta_k)\) are taken from the image instruction if it includes a ConstOffset or Offset operand, otherwise they are taken to be zero.

Operations then proceed to Unnormalized Texel Coordinate Operations.

**16.6. Unnormalized Texel Coordinate Operations**

**16.6.1. \((u,v,w,a)\) to \((i,j,k,l,n)\) Transformation And Array Layer Selection**

The unnormalized texel coordinates are transformed to integer texel coordinates relative to the selected mipmap level.

The layer index \(l\) is computed as:
\[ l = \text{clamp}(RNE(a), 0, \text{layerCount} - 1) + \text{baseArrayLayer} \]

where \text{layerCount} is the number of layers in the image subresource range of the image view, \text{baseArrayLayer} is the first layer from the subresource range, and where:

\[
RNE(a) = \begin{cases} 
\text{roundTiesToEven}(a) & \text{preferred, from IEEE Std 754-2008 Floating-Point Arithmetic} \\
[a + 0.5] & \text{alternative}
\end{cases}
\]

The sample index \( n \) is assigned the value 0.

Nearest filtering (VK_FILTER_NEAREST) computes the integer texel coordinates that the unnormalized coordinates lie within:

\[
i = \lfloor u + shift \rfloor \\
j = \lfloor v + shift \rfloor \\
k = \lfloor w + shift \rfloor
\]

where:

\[
\text{shift} = 0.0
\]

for conventional images, and:

\[
\text{shift} = 0.5
\]

for corner-sampled images.

Linear filtering (VK_FILTER_LINEAR) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \( i_0 \) or \( i_1 \), \( j_0 \) or \( j_1 \), \( k_0 \) or \( k_1 \), as well as weights \( \alpha \), \( \beta \), and \( \gamma \).

\[
i_0 = \lfloor u - shift \rfloor \\
i_1 = i_0 + 1 \\
j_0 = \lfloor v - shift \rfloor \\
j_1 = j_0 + 1 \\
k_0 = \lfloor w - shift \rfloor \\
k_1 = k_0 + 1
\]

\[
\alpha = \text{frac}(u - shift) \\
\beta = \text{frac}(v - shift) \\
\gamma = \text{frac}(w - shift)
\]

where:
shift = 0.5
for conventional images, and:

shift = 0.0
for corner-sampled images, and where:

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

Cubic filtering (`VK_FILTER_CUBIC_EXT`) computes a set of neighboring coordinates which bound the unnormalized coordinates. The integer texel coordinates are combinations of \(i_0, i_1, i_2\) or \(i_3, j_0, j_1, j_2\) or \(j_3, k_0, k_1, k_2\) or \(k_3\), as well as weights \(\alpha, \beta, \text{ and } \gamma\).

\[
\begin{align*}
    i_0 &= \lfloor u - \frac{3}{2} \rfloor \\
    i_1 &= i_0 + 1 \\
    i_2 &= i_1 + 1 \\
    i_3 &= i_2 + 1 \\
    j_0 &= \lfloor v - \frac{3}{2} \rfloor \\
    j_1 &= j_0 + 1 \\
    j_2 &= j_1 + 1 \\
    j_3 &= j_2 + 1 \\
    k_0 &= \lfloor w - \frac{3}{2} \rfloor \\
    k_1 &= k_0 + 1 \\
    k_2 &= k_1 + 1 \\
    k_3 &= k_2 + 1
\end{align*}
\]

\[
\begin{align*}
    \alpha &= \text{frac}\left(u - \frac{1}{2}\right) \\
    \beta &= \text{frac}\left(v - \frac{1}{2}\right) \\
    \gamma &= \text{frac}\left(w - \frac{1}{2}\right)
\end{align*}
\]

where:

\[
\text{frac}(x) = x - \lfloor x \rfloor
\]

where the number of fraction bits retained is specified by `VkPhysicalDeviceLimits::subTexelPrecisionBits`.

### 16.7. Integer Texel Coordinate Operations

Integer texel coordinate operations may supply a LOD which texels are to be read from or written to using the optional SPIR-V operand `Lod`. If the `Lod` is provided then it must be an integer.

The image level selected is:
\[
d = level_{base} + \begin{cases} \text{Lod} & \text{(from optional SPIR-V operand)} \\ 0 & \text{otherwise} \end{cases}
\]

If \(d\) does not lie in the range \([\text{baseMipLevel}, \text{baseMipLevel} + \text{levelCount})\) or \(d\) is less than \(\minLod\) of the image view \(\text{imageView}\), then any values fetched are zero if the \(\text{robustImageAccess2}\) feature is enabled, otherwise are undefined, and any writes (if supported) are discarded.

where:

\[
\minLod_{\text{imageView}} = \lfloor \minLod \rfloor
\]

\(\minLod\) is taken from the \(\text{VkImageViewMinLodCreateInfoEXT::minLod}\) of the image view if present and the selection is part of the result of a sampling operation, otherwise it is 0.0. If the integer texel operation is not a sampling operation, the image view parameter is ignored, and \(\minLod\) is 0.0.

### 16.8. Image Sample Operations

#### 16.8.1. Wrapping Operation

If the used sampler was created without \(\text{VK_SAMPLER_CREATE_NON_SEAMLESS_CUBE_MAP_BIT_EXT}\), Cube images ignore the wrap modes specified in the sampler. Instead, if \(\text{VK_FILTER_NEAREST}\) is used within a mip level then \(\text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}\) is used, and if \(\text{VK_FILTER_LINEAR}\) is used within a mip level then sampling at the edges is performed as described earlier in the Cube map edge handling section.

The first integer texel coordinate \(i\) is transformed based on the \(\text{addressModeU}\) parameter of the sampler.

\[
i = \begin{cases} 
\text{\(i \mod size\)} & \text{for repeat} \\
(size - 1) - \text{mirror}((i \mod (2 \times size)) - size) & \text{for mirrored repeat} \\
\text{clamp}(i, 0, size - 1) & \text{for clamp to edge} \\
\text{clamp}(i, -1, size) & \text{for clamp to border} \\
\text{clamp}(\text{mirror}(i), 0, size - 1) & \text{for mirror clamp to edge}
\end{cases}
\]

where:

\[
\text{mirror}(n) = \begin{cases} 
n & \text{for } n \geq 0 \\
-(1 + n) & \text{otherwise}
\end{cases}
\]

\(j\) (for 2D and Cube image) and \(k\) (for 3D image) are similarly transformed based on the \(\text{addressModeV}\) and \(\text{addressModeW}\) parameters of the sampler, respectively.

#### 16.8.2. Texel Gathering

SPIR-V instructions with \(\text{Gather}\) in the name return a vector derived from 4 texels in the base level of the image view. The rules for the \(\text{VK_FILTER_LINEAR}\) minification filter are applied to identify the four selected texels. Each texel is then converted to an RGBA value according to \(\text{conversion to RGBA}\).
and then swizzled. A four-component vector is then assembled by taking the component indicated by the Component value in the instruction from the swizzled color value of the four texels. If the operation does not use the ConstOffsets image operand then the four texels form the $2 \times 2$ rectangle used for texture filtering:

$$
\begin{align*}
\tau[R] &= \tau[i_0j_1][level_base][comp], \\
\tau[G] &= \tau[i_1j_1][level_base][comp], \\
\tau[B] &= \tau[i_1j_0][level_base][comp], \\
\tau[A] &= \tau[i_0j_0][level_base][comp].
\end{align*}
$$

If the operation does use the ConstOffsets image operand then the offsets allow a custom filter to be defined:

$$
\begin{align*}
\tau[R] &= \tau[i_0j_0] + \Delta_0[level_base][comp], \\
\tau[G] &= \tau[i_0j_0] + \Delta_1[level_base][comp], \\
\tau[B] &= \tau[i_0j_0] + \Delta_2[level_base][comp], \\
\tau[A] &= \tau[i_0j_0] + \Delta_3[level_base][comp].
\end{align*}
$$

where:

$$
\tau[level_base][comp] = \begin{cases} 
\tau[level_base][R], & \text{for } comp = 0 \\
\tau[level_base][G], & \text{for } comp = 1 \\
\tau[level_base][B], & \text{for } comp = 2 \\
\tau[level_base][A], & \text{for } comp = 3
\end{cases}
$$

where Comp from SPIR-V operand Component

OpImage*Gather must not be used on a sampled image with sampler Y'CbCr conversion enabled.

16.8.3. Texel Filtering

Texel filtering is first performed for each level (either $d$ or $d_{hi}$ and $d_{lo}$).

If $\lambda$ is less than or equal to zero, the texture is said to be magnified, and the filter mode within a mip level is selected by the magFilter in the sampler. If $\lambda$ is greater than zero, the texture is said to be minified, and the filter mode within a mip level is selected by the minFilter in the sampler.

Texel Nearest Filtering

Within a mip level, VK_FILTER_NEAREST filtering selects a single value using the $(i, j, k)$ texel coordinates, with all texels taken from layer $l$.

$$
\tau[level] = \begin{cases} 
\tau[ijk][level], & \text{for 3D image} \\
\tau[ij][level], & \text{for 2D or Cube image} \\
\tau[i][level], & \text{for 1D image}
\end{cases}
$$
Texel Linear Filtering

Within a mip level, `VK_FILTER_LINEAR` filtering combines 8 (for 3D), 4 (for 2D or Cube), or 2 (for 1D) texel values, together with their linear weights. The linear weights are derived from the fractions computed earlier:

\[ w_{i_0} = (1 - \alpha) \]
\[ w_{i_1} = (\alpha) \]
\[ w_{j_0} = (1 - \beta) \]
\[ w_{j_1} = (\beta) \]
\[ w_{k_0} = (1 - \gamma) \]
\[ w_{k_1} = (\gamma) \]

The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[ \tau_{3D} = \sum_{k = k_0}^{k_1} \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_i)(w_j)(w_k)\tau_{ijk} \]
\[ \tau_{2D} = \sum_{j = j_0}^{j_1} \sum_{i = i_0}^{i_1} (w_i)(w_j)\tau_{ij} \]
\[ \tau_{1D} = \sum_{i = i_0}^{i_1} (w_i)\tau_i \]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

Texel Cubic Filtering

Within a mip level, `VK_FILTER_CUBIC_EXT`, filtering computes a weighted average of 64 (for 3D), 16 (for 2D), or 4 (for 1D) texel values, together with their Catmull-Rom weights.

Catmull-Rom weights are derived from the fractions computed earlier.
The values of multiple texels, together with their weights, are combined to produce a filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[
\begin{align*}
\tau_{3D} &= \sum_{k=j_0}^{k_3} \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)(w_k)\tau_{i,j,k} \\
\tau_{2D} &= \sum_{j=j_0}^{j_3} \sum_{i=i_0}^{i_3} (w_i)(w_j)\tau_{i,j} \\
\tau_{1D} &= \sum_{i=i_0}^{i_3} (w_i)\tau_{i}
\end{align*}
\]

However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above set of multiple texels, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the set of texels with non-zero weights.

**Texel Mipmap Filtering**

`VK_SAMPLER_MIPMAP_MODE_NEAREST` filtering returns the value of a single mipmap level, \( \tau = \tau[d] \).

`VK_SAMPLER_MIPMAP_MODE_LINEAR` filtering combines the values of multiple mipmap levels (\( \tau[hi] \) and \( \tau[lo] \)), together with their linear weights.

The linear weights are derived from the fraction computed earlier:

\[
\begin{align*}
w_{hi} &= (1 - \delta) \\
w_{lo} &= \delta
\end{align*}
\]
The values of multiple mipmap levels, together with their weights, are combined to produce a final filtered value.

The `VkSamplerReductionModeCreateInfo::reductionMode` can control the process by which multiple texels, together with their weights, are combined to produce a filtered texture value.

When the `reductionMode` is set (explicitly or implicitly) to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, a weighted average is computed:

\[ \tau = (w_h)\tau[h] + (w_l)\tau[l] \]

**Texel Anisotropic Filtering**

Anisotropic filtering is enabled by the `anisotropyEnable` in the sampler. When enabled, the image filtering scheme accounts for a degree of anisotropy.

The particular scheme for anisotropic texture filtering is implementation-dependent. Implementations should consider the `magFilter`, `minFilter` and `mipmapMode` of the sampler to control the specifics of the anisotropic filtering scheme used. In addition, implementations should consider `minLod` and `maxLod` of the sampler.

The following describes one particular approach to implementing anisotropic filtering for the 2D Image case, implementations may choose other methods:

Given a `magFilter`, `minFilter` of `VK_FILTER_LINEAR` and a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_NEAREST`:

Instead of a single isotropic sample, \( N \) isotropic samples are sampled within the image footprint of the image level \( d \) to approximate an anisotropic filter. The sum \( \tau_{2aniso} \) is defined using the single isotropic \( \tau_{2d}(u,v) \) at level \( d \).

\[
\tau_{2aniso} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2d}\left( u\left( x - \frac{1}{2} + \frac{i}{N+1}, y \right), v\left( x - \frac{1}{2} + \frac{i}{N+1}, y \right) \right), \quad \text{when } \rho_x > \rho_y
\]

\[
\tau_{2aniso} = \frac{1}{N} \sum_{i=1}^{N} \tau_{2d}\left( u\left( x, y - \frac{1}{2} + \frac{i}{N+1} \right), v\left( x, y - \frac{1}{2} + \frac{i}{N+1} \right) \right), \quad \text{when } \rho_y \geq \rho_x
\]

When `VkSamplerReductionModeCreateInfo::reductionMode` is set to `VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE`, the above summation is used. However, if the reduction mode is `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX`, the process operates on the above values, together with their weights, computing a component-wise minimum or maximum, respectively, of the components of the values with non-zero weights.

**16.9. Texel Footprint Evaluation**

The SPIR-V instruction `OpImageSampleFootprintNV` evaluates the set of texels from a single mip level that would be accessed during a texel filtering operation. In addition to the inputs that would be accepted by an equivalent `OpImageSample*` instruction, `OpImageSampleFootprintNV` accepts two additional inputs. The `Granularity` input is an integer identifying the size of texel groups used to
evaluate the footprint. Each bit in the returned footprint mask corresponds to an aligned block of
texels whose size is given by the following table:

Table 28. Texel footprint granularity values

<table>
<thead>
<tr>
<th>Granularity</th>
<th>Dim = 2D</th>
<th>Dim = 3D</th>

</tbody>
</table>

The `Coarse` input is used to select between the two mip levels that may be accessed during texel
filtering when using a `mipmapMode` of `VK_SAMPLER_MIPMAP_MODE_LINEAR`. When filtering between two
mip levels, a `Coarse` value of `true` requests the footprint in the lower-resolution mip level (higher
level number), while `false` requests the footprint in the higher-resolution mip level. If texel filtering
would access only a single mip level, the footprint in that level would be returned when `Coarse` is
set to `false`; an empty footprint would be returned when `Coarse` is set to `true`.

The footprint for `OpImageSampleFootprintNV` is returned in a structure with six members:

- The first member is a boolean value that is true if the texel filtering operation would access only
  a single mip level.
- The second member is a two- or three-component integer vector holding the footprint anchor
  location. For two-dimensional images, the returned components are in units of eight texel
  groups. For three-dimensional images, the returned components are in units of four texel
  groups.
- The third member is a two- or three-component integer vector holding a footprint offset relative
  to the anchor. All returned components are in units of texel groups.
- The fourth member is a two-component integer vector mask, which holds a bitfield identifying
  the set of texel groups in an 8x8 or 4x4x4 neighborhood relative to the anchor and offset.
The fifth member is an integer identifying the mip level containing the footprint identified by
the anchor, offset, and mask.

The sixth member is an integer identifying the granularity of the returned footprint.

For footprints in two-dimensional images (Dim2D), the mask returned by `OpImageSampleFootprintNV`
indicates whether each texel group in a 8x8 local neighborhood of texel groups would have one or
more texels accessed during texel filtering. In the mask, the texel group with local group coordinates (`lgx`, `lgy`) is considered covered if and only if

$$0 \neq ((mask.x + (mask.y<<32))&(1<<(lg y \times 8+lg x )))$$

where:

- $0 \leq lgx < 8$ and $0 \leq lgy < 8$; and
- `mask` is the returned two-component mask.

The local group with coordinates (`lgx`, `lgy`) in the mask is considered covered if and only if the
texel filtering operation would access one or more texels in the returned mipmap level where:

- $0 \leq i \leq i_1$ and $0 \leq j \leq j_1$;
- `gran` is a two-component vector holding the width and height of the texel group identified by
  the granularity;
- `anchor` is the returned two-component anchor vector; and
- `offset` is the returned two-component offset vector.

For footprints in three-dimensional images (Dim3D), the mask returned by `OpImageSampleFootprintNV`
indicates whether each texel group in a 4x4x4 local neighborhood of texel groups would have one or
more texels accessed during texel filtering. In the mask, the texel group with local group coordinates (`lgx`, `lgy`, `lgz`), is considered covered if and only if:

$$0 \neq ((mask.x + (mask.y<<32))&(1<<(lg z \times 16+lgy \times 4+lg x )))$$

where:

- $0 \leq lgx < 4$, $0 \leq lgy < 4$, and $0 \leq lgz < 4$; and
- `mask` is the returned two-component mask.
The local group with coordinates \((lgx, lgy, lgz)\) in the mask is considered covered if and only if the texel filtering operation would access one or more texels \(t_{ijk}\) in the returned mipmap level where:

\[
i_0 = \begin{cases} \frac{gran.x \times (4 \times anchor.x + lgx)}{gran.x}, & \text{if } lgx + offset.x < 4 \\ \frac{gran.x \times (4 \times (anchor.x - 1) + lgx)}{gran.x}, & \text{otherwise} \end{cases}
\]

\[
i_1 = i_0 + \frac{gran.x - 1}{gran.x - 1}
\]

\[
j_0 = \begin{cases} \frac{gran.y \times (4 \times anchor.y + lgy)}{gran.y}, & \text{if } lgy + offset.y < 4 \\ \frac{gran.y \times (4 \times (anchor.y - 1) + lgy)}{gran.y}, & \text{otherwise} \end{cases}
\]

\[
j_1 = j_0 + \frac{gran.y - 1}{gran.y - 1}
\]

\[
k_0 = \begin{cases} \frac{gran.z \times (4 \times anchor.z + lgz)}{gran.z}, & \text{if } lgz + offset.z < 4 \\ \frac{gran.z \times (4 \times (anchor.z - 1) + lgz)}{gran.z}, & \text{otherwise} \end{cases}
\]

\[
k_1 = k_0 + \frac{gran.z - 1}{gran.z - 1}
\]

and

- \(i_0 \leq i \leq i_1, j_0 \leq j \leq j_1, k_0 \leq k \leq k_1\);
- \(gran\) is a three-component vector holding the width, height, and depth of the texel group identified by the granularity;
- \(anchor\) is the returned three-component anchor vector; and
- \(offset\) is the returned three-component offset vector.

If the sampler used by \text{OpImageSampleFootprintNV} enables anisotropic texel filtering via \text{anisotropyEnable}, it is possible that the set of texel groups accessed in a mipmap level may be too large to be expressed using an 8x8 or 4x4x4 mask using the granularity requested in the instruction. In this case, the implementation uses a texel group larger than the requested granularity. When a larger texel group size is used, \text{OpImageSampleFootprintNV} returns an integer granularity value that can be interpreted in the same manner as the granularity value provided to the instruction to determine the texel group size used. If anisotropic texel filtering is disabled in the sampler, or if an anisotropic footprint can be represented as an 8x8 or 4x4x4 mask with the requested granularity, \text{OpImageSampleFootprintNV} will use the requested granularity as-is and return a granularity value of zero.

\text{OpImageSampleFootprintNV} supports only two- and three-dimensional image accesses (\text{Dim2D} and \text{Dim3D}), and the footprint returned is undefined if a sampler uses an addressing mode other than \text{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}.

### 16.10. Weight Image Sampling

The SPIR-V instruction \text{OpImageWeightedSampleQCOM} specifies a texture sampling operation involving two images: the \textit{sampled image} and the \textit{weight image}. It is similar to bilinear filtering except more than 2x2 texels may participate in the filter and the filter weights are user-specified rather than computed by fixed-function hardware. The weight image view defines a 2D kernel weights used during sampling.

The \text{OpImageWeightedSampleQCOM} supports normalized or unnormalized texel coordinates. In addition to the inputs that would be accepted by an equivalent \text{OpImageSample*} instruction,
OpImageWeightedSampleQCOM accepts a weight input that specifies the view of a sample weight image. The input weight must be a view of a 2D or 1D image with miplevels equal to 1, samples equal to VK_SAMPLE_COUNT_1_BIT, created with an identity swizzle, and created with usage that includes VK_IMAGE_USAGE_SAMPLE_WEIGHT_BIT_QCOM. The VkImageViewSampleWeightCreateInfoQCOM specifies additional parameters of the view: filterCenter, filterSize, and numPhases, described in more detail below.

The weight input must be bound using a sample weight image descriptor type. The weight view defines a filtering kernel that is a region of view's subresource range. The kernel spans a region from integer texel coordinate (0,0) to (filterSize.x-1, filterSize.y-1). It is valid for the view's subresource to have dimensions larger than the kernel but the texels with integer coordinates greater than filterSize.width-1,filterSize.height-1 are ignored by weight sampling. The value returned by queries OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples return for a weight image is undefined.

filterCenter designates an integer texel coordinate within the filter kernel as being the 'center' of the kernel. The center must be in the range (0,0) to (filterSize.x-1, filterSize.y-1). numPhases describes the number of filter phases used to provide sub-pixel filtering. Both are described in more detail below.

### 16.10.1. Weight Image Layout

The weight image specifies filtering kernel weight values. A 2D image view can be used to specify a 2D matrix of filter weights. For separable filers, a 1D image view can be used to specify the horizontal and vertical weights.

#### 2D Non-Separable Weight Filters

A 2D image view defined with VkImageViewSampleWeightCreateInfoQCOM describes a 2D matrix (filterSize.width × filterSize.height) of weight elements with filter's center point at filterCenter. Note that filterSize can be smaller than the view's subresource, but the filter will always be located starting at integer texel coordinate (0,0).

The following figure illustrates a 2D convolution filter having filterSize of (4,3) and filterCenter at (1, 1).
For a 2D weight filter, the phases are stored as layers of a 2D array image. The width and height of the view’s subresource range must be less than or equal to \( \text{VkPhysicalDeviceImageProcessingPropertiesQCOM}::\text{maxWeightFilterDimension} \). The layers are stored in horizontal phase major order. Expressed as a formula, the layer index for each filter phase is computed as:

\[
\text{layerIndex}(\text{horizPhase}, \text{vertPhase}, \text{horizPhaseCount}) = (\text{vertPhase} \times \text{horizPhaseCount}) + \text{horizPhase}
\]

### 1D Separable Weight Filters

A separable weight filter is a 2D filter that can be specified by two 1D filters in the x and y directions such that their product yields the 2D filter. The following example shows a 2D filter and its associated separable 1D horizontal and vertical filters.
A 1D array image view defined with VkImageViewSampleWeightCreateInfoQCOM and with layerCount equal to '2' describes a separable weight filter. The horizontal weights are specified in slice '0' and the vertical weights in slice '1'. The filterSize and filterCenter specify the size and origin of the of the horizontal and vertical filters. For many use cases, 1D separable filters can offer a performance advantage over 2D filters.

For a 1D separable weight filter, the phases are arranged into a 1D array image with two layers. The horizontal weights are stored in layer 0 and the vertical weights in layer 1. Within each layer of the 1D array image, the weights are arranged into groups of 4, and then arranged by phase. Expressed as a formula, the 1D texel offset for each weight within each layer is computed as:

```
// Let horizontal weights have a weightIndex of [0, filterSize.width - 1]
// Let vertical weights have a weightIndex of [0, filterSize.height - 1]
// Let phaseCount be the number of phases in either the vertical or horizontal direction.

texelOffset(phaseIndex, weightIndex, phaseCount) = (phaseCount * 4 * (weightIndex / 4)) + (phaseIndex * 4) + (weightIndex % 4)
```

16.10.2. Weight Sampling Phases

When using weight image sampling, the texture coordinates may not align with a texel center in the sampled image. In this case, the filter weights can be adjusted based on the subpixel location. This is termed “subpixel filtering” to indicate that the origin of the filter lies at a subpixel location other than the texel center. Conceptually, this means that the weight filter is positioned such that filter taps do not align with sampled texels exactly. In such a case, modified filter weights may be needed to adjust for the off-center filter taps. Unlike bilinear filtering where the subpixel weights are computed by the implementation, subpixel weight image sampling requires that the per-phase filter weights are pre-computed by the application and stored in an array where each slice of the array is a “filter phase”. The array is indexed by the implementation based on subpixel positioning. Rather than a single 2D kernel of filter weights, the application provides an array of kernels, one set of filter weights per phase.

The number of phases are restricted by following requirements, which apply to both separable and non-separable filters:

- The number of phases in the vertical direction, phaseCount\textsubscript{vert}, must be a power of two (i.e., 1, 2, 4, etc.).
- The number of phases in the horizontal direction phaseCount\textsubscript{horiz}, must equal phaseCount\textsubscript{vert}.
- The total number of phases, phaseCount\textsubscript{vert} × phaseCount\textsubscript{horiz}, must be less than or equal to VkPhysicalDeviceImageProcessingPropertiesQCOM::maxWeightFilterPhases.

16.10.3. Weight Sampler Parameters

Weight sampling requires VkSamplerCreateInfo addressModeU and addressModeV must be set to VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER. If VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER is used, then the border color must be set to transparent.
16.10.4. Weight Sampling Operation

The 2D unnormalized texel coordinates \((u, v)\) are transformed by \(\text{filterCenter}\) to specify coordinates \(i_0, j_0\).

\[
i_0 = [u - \text{filterCenter}_x]
\]
\[
j_0 = [v - \text{filterCenter}_y]
\]

where \(\text{filterCenter}\) is specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM::filterCenter}\).

Two sets of neighboring integer 2D texel coordinates are generated. The first set is used for selecting texels from the sampled image \(\tau\) and the second set used for selecting texels from the weight image \(w\). The first set of neighboring coordinates are combinations of \(i_0\) to \(i_{\text{filterWidth} - 1}\) and \(j_0\) to \(j_{\text{filterHeight} - 1}\). The second set of neighboring coordinates are combinations of \(k_0\) to \(k_{\text{filterWidth} - 1}\) and \(l_0\) to \(l_{\text{filterHeight} - 1}\). The first and second sets each contain \((\text{filterWidth} \times \text{filterHeight})\) of pairs of \((i, j)\) and \((k, l)\) coordinates respectively.

\[
\begin{align*}
\{i_q\}_q & = \text{filterWidth} - 1 = i_0 + q \\
\{j_q\}_q & = \text{filterHeight} - 1 = j_0 + q \\
\{k_q\}_q & = \text{filterWidth} - 1 = q \\
\{l_q\}_q & = \text{filterHeight} - 1 = q
\end{align*}
\]

where \(\text{filterWidth}\) and \(\text{filterHeight}\) are specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM::filterSize}\).

Each of the generated integer coordinates \((i_q, j_q)\) is transformed by texture wrapping operation, followed by integer texel coordinate validation. If any coordinate fails coordinate validation, it is a Border Texel and texel replacement is performed.

The phase index \(\psi\) is computed from the fraction bits of the unnormalized 2D texel coordinates:

\[
\begin{align*}
\text{phaseCount}_h & = \text{phaseCount}_v = \sqrt{\text{numPhases}} \\
\text{hPhase} & = \lfloor \text{frac}(u) \times \text{phaseCount}_h \rfloor \\
\text{vPhase} & = \lfloor \text{frac}(v) \times \text{phaseCount}_v \rfloor \\
\psi & = (\text{vPhase} \times \text{phaseCount}_h) + \text{hPhase}
\end{align*}
\]

where the number of fraction bits retained is \(\log_2(\text{numPhases})\) specified by \(\text{VkImageViewSampleWeightCreateInfoQCOM::numPhases}\).

Each pair of texel coordinates \((i, j)\) in the first set selects a single texel value \(\tau_{ij}\) from the sampled image. Each pair of texel coordinates \((k, l)\) in the second set, combined with phaseIndex \(\psi\), selects a
single weight from the weight image \( w(k, l, \psi) \).

\[
w(k, l, \psi) = \begin{cases} 
  w_{k_j}[\psi], & \text{(\psi as layer index) for 2D array view (non-separable filter)} \\
  \text{weight}_h \times \text{weight}_v, & \text{for 1D array view (separable filter)}
\end{cases}
\]

If \( w \) is a 2D array view, then non-separable filtering is specified, and integer coordinates \((k, l)\) are used to select texels from layer \( \psi \) of \( (w) \). If \( w \) is a 1D array view, then separable filtering is specified and integer coordinates \((k, l)\) are transformed to \((k_{\text{packed}}, l_{\text{packed}})\), and used to select horizontal weight \( \text{weight}_h \) and vertical weight \( \text{weight}_v \) texels from layer 0 and layer 1 of \( (w) \) respectively.

\[
k_{\text{packed}} = (\text{phaseCount}_h \times 4 \times k / 4) + (\text{phase}_h \times 4) + (k \% 4)
\]

\[
l_{\text{packed}} = (\text{phaseCount}_v \times 4 \times l / 4) + (\text{phase}_v \times 4) + (l \% 4)
\]

\[
\text{weight}_h = w_{k_{\text{packed}}}[0] \quad \text{(horizontal weights packed in layer 0)}
\]

\[
\text{weight}_v = w_{l_{\text{packed}}}[1] \quad \text{(vertical weights packed in layer 1)}
\]

Where \% refers to the integer modulo operator.

The values of multiple texels, together with their weights, are combined to produce a filtered value.

\[
\tau_{\text{weightSampling}} = \sum_{j = j_0}^{j_{\text{blockHeight} - 1}} \sum_{l = l_0}^{l_{\text{blockHeight} - 1}} \sum_{k = k_0}^{k_{\text{blockWidth} - 1}} w(k, l, \psi) \tau_{ij}
\]

When \( \text{VkSamplerReductionModeCreateInfo}::\text{reductionMode} \) is set to \( \text{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE} \), the above summation is used. However, if the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), the process operates on the above values, computing a component-wise minimum or maximum of the texels with non-zero weights. If the reduction mode is \( \text{VK_SAMPLER_REDUCTION_MODE_MIN} \) or \( \text{VK_SAMPLER_REDUCTION_MODE_MAX} \), each \( w(k, l, \psi) \) weight must be equal to 0.0 or 1.0, otherwise the undefined values are returned.

Finally, the operations described in Conversion to RGBA and Component swizzle are performed and the final result is returned to the shader.

### 16.11. Block Matching

The SPIR-V instruction \( \text{opTextureBlockMatchSAD} \) and \( \text{opTextureBlockMatchSSD} \) specify texture block matching operations where a block or region of texels within a target image is compared with a same-sized region a reference image. The instructions make use of two image views: the target view and the reference view. The target view and reference view can be the same view, allowing block matching of two blocks within a single image.

Similar to an equivalent \( \text{OpImageFetch} \) instruction, \( \text{textureBlockMatchSAD} \) and \( \text{textureBlockMatchSSD} \) specify a image and an integer texel coordinate which which describes the bottom-left texel of the target block. There are three additional inputs. The reference and \( \text{refCoodinate} \) specifies bottom-left
texel of the reference block. The \texttt{blockSize} specifies the integer width and height of the target and reference blocks to be compared, and \textbf{must not be greater than \texttt{VkPhysicalDeviceImageProcessingPropertiesQCOM.maxBlockMatchRegion}}.

16.11.1. Block Matching Sampler Parameters

The input \texttt{sampler} \textbf{must} be created with \texttt{addressModeU} and \texttt{addressModeV}, equal to \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE}, or \texttt{VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER} with \texttt{VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK}. The input \texttt{sampler} \textbf{must} be create with \texttt{unnormalizedCoordinates} equal to \texttt{VK_FALSE}.

Other sampler states are ignored.

16.11.2. Block Matching Operation

Block matching SPIR-V instructions \texttt{opTextureBlockMatchSAD} and \texttt{opTextureBlockMatchSSD} specify two sets of 2D integer texel coordinates: target coordinates \((u, v)\) and reference coordinates \((s, t)\).

The coordinates define the bottom-left texel of the target block \((i_0, j_0)\) and the reference block \((k_0, l_0)\).

\[
i_0 = u \\
j_0 = v \\
k_0 = s \\
l_0 = t
\]

For the target block, a set of neighboring integer texel coordinates are generated. The neighboring coordinates are combinations of \(i_0\) to \(i_{blockWidth - 1}\) and \(j_0\) to \(j_{blockHeight - 1}\). The set is of size \(blockWidth \times blockHeight\).

\[
\{i_q\}_{q=0}^{q=blockWidth-1} = i_0 + q \\
\{j_q\}_{q=0}^{q=blockHeight-1} = j_0 + q
\]

where \(blockWidth\) and \(blockHeight\) is specified by the \texttt{blockSize} operand.

If any target integer texel coordinate \((i, j)\) in the set fails \texttt{integer texel coordinate validation}, then the texel is an invalid texel and \texttt{texel replacement} is performed.

Similarly for the reference block, a set of neighboring integer texel coordinates are generated.

\[
\{k_q\}_{q=0}^{q=blockWidth-1} = k_0 + q \\
\{l_q\}_{q=0}^{q=blockHeight-1} = l_0 + q
\]

Each reference texel coordinate \((k, l)\) in the set \textbf{must not fail \texttt{integer texel coordinate validation}}. To avoid undefined behavior, application shader should guarantee that the reference block is fully
within the bounds of the reference image.

Each pair of texel coordinates \((i, j)\) in the set selects a single texel value from the target image \(\tau_{ij}\). Each pair of texel coordinates \((k, l)\) in the set selects a single texel value from the reference image \(v_{kl}\).

The difference between target and reference texel values is summed to compute a difference metric. The \texttt{opTextureBlockMatchSAD} computes the sum of absolute differences.

\[
\tau_{SAD} = \sum_{j = j_0}^{j_{\text{blockHeight}} - 1} \sum_{l = l_0}^{l_{\text{blockHeight}} - 1} \sum_{i = i_0}^{i_{\text{blockWidth}} - 1} \sum_{k = k_0}^{k_{\text{blockWidth}} - 1} |v_{kl} - \tau_{ij}|
\]

The \texttt{opTextureBlockMatchSSD} computes the sum of the squared differences.

\[
\tau_{SSD} = \sum_{j = j_0}^{j_{\text{blockHeight}} - 1} \sum_{l = l_0}^{l_{\text{blockHeight}} - 1} \sum_{i = i_0}^{i_{\text{blockWidth}} - 1} \sum_{k = k_0}^{k_{\text{blockWidth}} - 1} (v_{kl} - \tau_{ij})^2
\]

When \texttt{VkSamplerReductionModeCreateInfo::reductionMode} is set to \texttt{VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE}, the above summation is used. However, if the reduction mode is \texttt{VK_SAMPLER_REDUCTION_MODE_MIN} or \texttt{VK_SAMPLER_REDUCTION_MODE_MAX}, the process operates on the above values, computing a component-wise minimum or maximum of \(v_{kl} - \tau_{ij}\), respectively. For \(\tau_{SAD}\), the minimum or maximum difference is computed and for \(\tau_{SSD}\), the square of the minimum or maximum is computed.

Finally, the operations described in \texttt{Conversion to RGBA} and \texttt{Component swizzle} are performed and the final result is returned to the shader. The component swizzle is specified by the \textit{target image} descriptor; any swizzle specified by the \textit{reference image} descriptor is ignored.

### 16.12. Box Filter Sampling

The SPIR-V instruction \texttt{OpImageBoxFilterQCOM} specifies texture box filtering operation where a weighted average of a region of texels is computed, with the weights proportional to the coverage of each of the texels.

In addition to the inputs that would be accepted by an equivalent \texttt{OpImageSample*} instruction, \texttt{OpImageBoxFilterQCOM} accepts one additional input, \texttt{boxSize} which specifies the width and height in texels of the region to be averaged.

The figure below shows an example of using \texttt{OpImageBoxFilterQCOM} to sample from a \(8 \times 4\) texel two-dimensional image, with unnormalized texture coordinates \((4.125, 2.625)\) and \texttt{boxSize} of \((2.75, 2.25)\). The filter will read 12 texel values and compute a weights based portion of of each texel covered by the box.
If boxSize has height and width both equal to 1.0, then this instruction will behave as traditional bilinear filtering. The boxSize parameter must be greater than or equal to 1.0 and must not be greater than VkPhysicalDeviceImageProcessingPropertiesQCOM::maxBoxFilterBlockSize.

### 16.12.1. Box Filter Sampler Parameters

The input sampler must be created with addressModeU and addressModeV, equal to VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE, or VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_BORDER with VK_BORDER_COLOR_FLOAT_TRANSPARENT_BLACK.

### 16.12.2. Box Filter Operation

The 2D unnormalized texel coordinates \((u, v)\) are transformed by boxSize to specify integer texel coordinates \((i_0, j_0)\) of the bottom left texel for the filter:

\[
\begin{align*}
i_0 &= \lfloor u - \frac{boxWidth}{2} \rfloor \\
\end{align*}
\]

\[
\begin{align*}
j_0 &= \lfloor v - \frac{boxHeight}{2} \rfloor \\
\end{align*}
\]

where boxWidth and boxHeight are specified by the code:(x,y) components of the boxSize operand.

The filter dimensions \((filterWidth \times filterHeight)\) are computed from the fractional portion of the \((u, v)\) coordinates and the boxSize.
where the number of fraction bits retained by \( \text{frac()} \) is specified by \( \text{VkPhysicalDeviceLimits} :: \text{subTexelPrecisionBits} \).

A set of neighboring integer texel coordinates are generated. The neighboring coordinates are combinations of \( i_0 \) to \( i_{\text{filterWidth}-1} \) and \( j_0 \) to \( j_{\text{filterHeight}-1} \), with \( i_0, j_0 \) being the top-left coordinate of this set. The set is of size \( (\text{filterWidth} \times \text{filterHeight}) \).

\[
{i_q}^q = \text{filterWidth} - 1 = i_0 + q
\]

\[
{j_q}^q = \text{filterHeight} - 1 = j_0 + q
\]

Each of the generated integer coordinates \( (i_q, j_q) \) is transformed by texture wrapping operation, followed by integer texel coordinate validation. If any coordinate fails coordinate validation, it is a Border Texel and texel replacement is performed.

Horizontal weights \( \text{horizWeight}_0 \) to \( \text{horizWeight}_{\text{filterWidth}-1} \) and vertical weights \( \text{vertWeight}_0 \) to \( \text{vertWeight}_{\text{filterHeight}-1} \) are computed. Texels that are fully covered by the box will have a horizontal and vertical weight of 1. Texels partially covered by the box will have will have a reduced weights proportional to the coverage.

\[
\text{horizWeight}_i = \begin{cases} 
(1 - \text{startFracU}), & \text{for}(i = 0) \\
(\text{endFracU}), & \text{for}(i = \text{filterWidth} - 1)\text{and}(\text{endFracU}! = 0) \\
(1), & \text{otherwise}
\end{cases}
\]

\[
\text{vertWeight}_j = \begin{cases} 
(1 - \text{startFracV}), & \text{for}(j = 0) \\
(\text{endFracV}), & \text{for}(j = \text{filterHeight} - 1)\text{and}(\text{endFracV}! = 0) \\
(1), & \text{otherwise}
\end{cases}
\]

The values of multiple texels, together with their horizontal and vertical weights, are combined to produce a box filtered value.

\[
\tau_{\text{boxFilter}} = \frac{1}{\text{boxHeight} \times \text{boxWidth}} \sum_{j = j_0}^{\text{filterHeight} - 1} \sum_{i = i_0}^{\text{filterWidth} - 1} (\text{horizWeight}_i)(\text{vertWeight}_j)\tau_{ij}
\]

When \( \text{VkSamplerReductionModeCreateInfo} :: \text{reductionMode} \) is set to
VK_SAMPLER_REDUCTION_MODE_WEIGHTED_AVERAGE, the above summation is used. However, if the reduction mode is VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX, the process operates on the above values, computing a component-wise minimum or maximum of the texels.

16.13. Image Operation Steps

Each step described in this chapter is performed by a subset of the image instructions:

- Texel Input Validation Operations, Format Conversion, Texel Replacement, Conversion to RGBA, and Component Swizzle: Performed by all instructions except OpImageWrite.
- Depth Comparison: Performed by OpImage*Dref instructions.
- All Texel output operations: Performed by OpImageWrite.
- Projection: Performed by all OpImage*Proj instructions.
- Derivative Image Operations, Cube Map Operations, Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection, and Texel Anisotropic Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and (u,v,w,a) to (i,j,k,l,n) Transformation And Array Layer Selection: Performed by all OpImageSample, OpImageSparseSample, and OpImage*Gather instructions.
- Texel Filtering: Performed by all OpImageSample* and OpImageSparseSample* instructions.
- Sparse Residency: Performed by all OpImageSparse* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Weight Image Sampling: Performed by OpImageWeightedSample* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Block Matching: Performed by opImageBlockMatch* instructions.
- (s,t,r,q,a) to (u,v,w,a) Transformation, Wrapping, and Box Filter Sampling: Performed by OpImageBoxFilter* instructions.

16.14.1. Image Property Queries

OpImageQuerySize, OpImageQuerySizeLod, OpImageQueryLevels, and OpImageQuerySamples query properties of the image descriptor that would be accessed by a shader image operation. They return 0 if the bound descriptor is a null descriptor.

OpImageQuerySizeLod returns the size of the image level identified by the Level of Detail operand. If that level does not exist in the image, and the descriptor is not null, then the value returned is undefined.
16.14.2. Lod Query

OpImageQueryLod returns the Lod parameters that would be used in an image operation with the given image and coordinates. If the descriptor that would be accessed is a null descriptor then (0,0) is returned. Otherwise, the steps described in this chapter are performed as if for OpImageSampleImplicitLod, up to Scale Factor Operation, Level-of-Detail Operation and Image Level(s) Selection. The return value is the vector (λ', d'). These values may be subject to implementation-specific maxima and minima for very large, out-of-range values.
Chapter 17. Fragment Density Map Operations

17.1. Fragment Density Map Operations Overview

When a fragment is generated in a render pass that has a fragment density map attachment, its area is determined by the properties of the local framebuffer region that the fragment occupies. The framebuffer is divided into a uniform grid of these local regions, and their fragment area property is derived from the density map with the following operations:

- Fetch density value
  - Component swizzle
  - Component mapping
- Fragment area conversion
  - Fragment area filter
  - Fragment area clamp

17.2. Fetch Density Value

Each local framebuffer region at center coordinate \((x, y)\) fetches a texel from the fragment density map.

First, the local framebuffer region center coordinate \((x, y)\) is offset by the value specified in \(\text{VkSubpassFragmentDensityMapOffsetEndInfoQCOM}\). If no offset is specified, then the default offset \((0, 0)\) is used. The offsetted coordinate \((x', y')\) is computed as follows:

\[
\begin{align*}
x' &= \text{clamp} (x + p\text{FragmentDensityOffsets[layer]}_x, 0, \text{framebuffer width} - 1) \\
y' &= \text{clamp} (y + p\text{FragmentDensityOffsets[layer]}_y, 0, \text{framebuffer height} - 1)
\end{align*}
\]

The offsetted coordinate \((x', y')\) fetches a texel from the fragment density map at integer coordinates:

\[
\begin{align*}
i &= \lfloor \frac{x'}{\text{Fragment Density Texel Size width}} \rfloor \\
j &= \lfloor \frac{y'}{\text{Fragment Density Texel Size height}} \rfloor
\end{align*}
\]

Where the size of each region in the framebuffer is:

\[
\text{fragment Density Texel Size width} = 2^{\lfloor \log_2(\text{framebuffer width}) \rfloor}
\]
This region is subject to the limits in \texttt{VkPhysicalDeviceFragmentDensityMapPropertiesEXT} and therefore the final region size is clamped:

\[
\text{\texttt{fragmentDensityTexelSize}} / \text{\texttt{height}} = \frac{\text{\texttt{framebuffer}}}{\text{\texttt{height}}} \frac{\text{\texttt{densityMap}}}{\text{\texttt{height}}}
\]

When multiview is enabled for the render pass and the fragment density map attachment view was created with \texttt{layerCount} greater than 1, the layer used for offsets and for fetching from the fragment density map is:

\[
\text{\texttt{layer}} = \text{\texttt{baseArrayLayer}} + \text{\texttt{ViewIndex}}
\]

Otherwise:

\[
\text{\texttt{layer}} = \text{\texttt{baseArrayLayer}}
\]

The texel fetched from the density map at (i,j,layer) is next converted to density with the following operations.

### 17.2.1. Component Swizzle

The \texttt{components} member of \texttt{VkImageViewCreateInfo} is applied to the fetched texel as defined in \texttt{Image component swizzle}.

### 17.2.2. Component Mapping

The swizzled texel’s components are mapped to a density value:

\[
\text{\texttt{densityValue}}_{xy} = (C' r, C' y)
\]

### 17.3. Fragment Area Conversion

Fragment area for the framebuffer region is undefined if the density fetched is not a normalized floating-point value greater than 0.0. Otherwise, the fetched fragment area for that region is derived as:

\[
\text{\texttt{fragmentArea}}_{\text{wh}} = \frac{1.0}{\text{\texttt{densityValue}}_{xy}}
\]
17.3.1. Fragment Area Filter

Optionally, the implementation may fetch additional density map texels in an implementation defined window around \((i,j)\). The texels follow the standard conversion steps up to and including fragment area conversion.

A single fetched fragment area for the framebuffer region is chosen by the implementation and must have an area between the min and max areas of the fetched set.

17.3.2. Fragment Area Clamp

The implementation may clamp the fetched fragment area to one that it supports. The clamped fragment area must have a size less than or equal to the original fetched value. Implementations may vary the supported set of fragment areas per framebuffer region. Fragment area \((1,1)\) must always be in the supported set.

Note

For example, if the fetched fragment area is \((1,4)\) but the implementation only supports areas of \{(1,1),(2,2)\}, it could choose to clamp the area to \((2,2)\) since it has the same size as \((1,4)\). While this would produce fragments that have lower quality strictly in the x-axis, the overall density is maintained.

The clamped fragment area is assigned to the corresponding framebuffer region.
Chapter 18. Queries

Queries provide a mechanism to return information about the processing of a sequence of Vulkan commands. Query operations are asynchronous, and as such, their results are not returned immediately. Instead, their results, and their availability status are stored in a Query Pool. The state of these queries can be read back on the host, or copied to a buffer object on the device.

The supported query types are Occlusion Queries, Pipeline Statistics Queries, Result Status Queries, Video Encode Bitstream Queries, and Timestamp Queries. Performance Queries are supported if the associated extension is available. Transform Feedback Queries are supported if the associated extension is available. Intel performance queries are supported if the associated extension is available.

Several additional queries with specific purposes associated with ray tracing are available if the corresponding extensions are supported, as described for VkQueryType.

18.1. Query Pools

Queries are managed using query pool objects. Each query pool is a collection of a specific number of queries of a particular type.

Query pools are represented by VkQueryPool handles:

```c
// Provided by VK_VERSION_1_0
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkQueryPool)
```

To create a query pool, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkCreateQueryPool( 
    VkDevice device, 
    const VkQueryPoolCreateInfo* pCreateInfo, 
    const VkAllocationCallbacks* pAllocator, 
    VkQueryPool* pQueryPool);
```

- `device` is the logical device that creates the query pool.
- `pCreateInfo` is a pointer to a VkQueryPoolCreateInfo structure containing the number and type of queries to be managed by the pool.
- `pAllocator` controls host memory allocation as described in the Memory Allocation chapter.
- `pQueryPool` is a pointer to a VkQueryPool handle in which the resulting query pool object is returned.

Valid Usage (Implicit)

- VUID-vkCreateQueryPool-device-parameter
device must be a valid VkDevice handle

- VUID-vkCreateQueryPool-pCreateInfo-parameter
  pCreateInfo must be a valid pointer to a valid VkQueryPoolCreateInfo structure

- VUID-vkCreateQueryPool-pAllocator-parameter
  If pAllocator is not NULL, pAllocator must be a valid pointer to a valid VkAllocationCallbacks structure

- VUID-vkCreateQueryPool-pQueryPool-parameter
  pQueryPool must be a valid pointer to a VkQueryPool handle

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY

The VkQueryPoolCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkQueryPoolCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkQueryPoolCreateFlags flags;
    VkQueryType queryType;
    uint32_t queryCount;
    VkQueryPipelineStatisticFlags pipelineStatistics;
} VkQueryPoolCreateInfo;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- flags is reserved for future use.
- queryType is a VkQueryType value specifying the type of queries managed by the pool.
- queryCount is the number of queries managed by the pool.
- pipelineStatistics is a bitmask of VkQueryPipelineStatisticFlagBits specifying which counters will be returned in queries on the new pool, as described below in Pipeline Statistics Queries.

pipelineStatistics is ignored if queryType is not VK_QUERY_TYPE_PIPELINE_STATISTICS.
Valid Usage

- VUID-VkQueryPoolCreateInfo-queryType-00791
  If the `pipelineStatisticsQuery` feature is not enabled, `queryType` must not be `VK_QUERY_TYPE_PIPELINE_STATISTICS`.

- VUID-VkQueryPoolCreateInfo-queryType-00792
  If `queryType` is `VK_QUERY_TYPE_PIPELINE_STATISTICS`, `pipelineStatistics` must be a valid combination of `VkQueryPipelineStatisticFlagBits` values.

- VUID-VkQueryPoolCreateInfo-queryType-03222
  If `queryType` is `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `pNext` chain must include a `VkQueryPoolPerformanceCreateInfoKHR` structure.

- VUID-VkQueryPoolCreateInfo-queryCount-02763
  `queryCount` must be greater than 0.

Valid Usage (Implicit)

- VUID-VkQueryPoolCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_CREATE_INFO`.

- VUID-VkQueryPoolCreateInfo-pNext-pNext
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkQueryPoolPerformanceCreateInfoKHR`, `VkQueryPoolPerformanceQueryCreateInfoINTEL`, `VkVideoDecodeH264ProfileEXT`, `VkVideoEncodeH264ProfileEXT`, `VkVideoEncodeH265ProfileEXT`, or `VkVideoProfileKHR`.

- VUID-VkQueryPoolCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique.

- VUID-VkQueryPoolCreateInfo-flags-zerobitmask
  `flags` must be 0.

- VUID-VkQueryPoolCreateInfo-queryType-parameter
  `queryType` must be a valid `VkQueryType` value.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPoolCreateFlags;
```

`VkQueryPoolCreateFlags` is a bitmask type for setting a mask, but is currently reserved for future use.

The `VkQueryPoolPerformanceCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkQueryPoolPerformanceCreateInfoKHR {
    VkStructureType   sType;
    const void*       pNext;
} VkQueryPoolPerformanceCreateInfoKHR;
```
```c
uint32_t queueFamilyIndex;
uint32_t counterIndexCount;
const uint32_t* pCounterIndices;
} VkQueryPoolPerformanceCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queueFamilyIndex` is the queue family index to create this performance query pool for.
- `counterIndexCount` is the length of the `pCounterIndices` array.
- `pCounterIndices` is a pointer to an array of indices into the `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR::pCounters` to enable in this performance query pool.

### Valid Usage

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-queueFamilyIndex-03236**
  
  `queueFamilyIndex` must be a valid queue family index of the device

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-performanceCounterQueryPools-03237**
  
  The `performanceCounterQueryPools` feature must be enabled

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-03321**
  
  Each element of `pCounterIndices` must be in the range of counters reported by `vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR` for the queue family specified in `queueFamilyIndex`

### Valid Usage (Implicit)

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_CREATE_INFO_KHR`

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-pCounterIndices-parameter**
  
  `pCounterIndices` must be a valid pointer to an array of `counterIndexCount` `uint32_t` values

- **VUID-VkQueryPoolPerformanceCreateInfoKHR-counterIndexCount-arraylength**
  
  `counterIndexCount` must be greater than 0

To query the number of passes required to query a performance query pool on a physical device, call:

```c
// Provided by VK_KHR_performance_query
void vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR(
    VkPhysicalDevice physicalDevice,
    const VkQueryPoolPerformanceCreateInfoKHR* pPerformanceQueryCreateInfo,
    uint32_t* pNumPasses);
```
• **physicalDevice** is the handle to the physical device whose queue family performance query counter properties will be queried.

• **pPerformanceQueryCreateInfo** is a pointer to a `VkQueryPoolPerformanceCreateInfoKHR` of the performance query that is to be created.

• **pNumPasses** is a pointer to an integer related to the number of passes required to query the performance query pool, as described below.

The **pPerformanceQueryCreateInfo** member `VkQueryPoolPerformanceCreateInfoKHR::queueFamilyIndex` **must** be a queue family of **physicalDevice**. The number of passes required to capture the counters specified in the **pPerformanceQueryCreateInfo** member `VkQueryPoolPerformanceCreateInfoKHR::pCounters` is returned in **pNumPasses**.

### Valid Usage (Implicit)

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-physicalDevice-parameter
  **physicalDevice** **must** be a valid `VkPhysicalDevice` handle

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pPerformanceQueryCreateInfo-parameter
  **pPerformanceQueryCreateInfo** **must** be a valid pointer to a valid `VkQueryPoolPerformanceCreateInfoKHR` structure

- VUID-vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR-pNumPasses-parameter
  **pNumPasses** **must** be a valid pointer to a `uint32_t` value

To destroy a query pool, call:

```c
// Provided by VK_VERSION_1_0
define vkDestroyQueryPool(  
    VkDevice device,  
    VkQueryPool queryPool,  
    const VkAllocationCallbacks* pAllocator);
```

• **device** is the logical device that destroys the query pool.

• **queryPool** is the query pool to destroy.

• **pAllocator** controls host memory allocation as described in the Memory Allocation chapter.

### Valid Usage

- VUID-vkDestroyQueryPool-queryPool-00793
  All submitted commands that refer to **queryPool** **must** have completed execution

- VUID-vkDestroyQueryPool-queryPool-00794
  If `VkAllocationCallbacks` were provided when **queryPool** was created, a compatible set of
callbacks **must** be provided here

- **VUID-vkDestroyQueryPool-queryPool-00795**
  If no `VkAllocationCallbacks` were provided when `queryPool` was created, `pAllocator` **must** be **NULL**

**Note**

Applications **can** verify that `queryPool` **can** be destroyed by checking that `vkGetQueryPoolResults()` without the `VK_QUERY_RESULT_PARTIAL_BIT` flag returns `VK_SUCCESS` for all queries that are used in command buffers submitted for execution.

### Valid Usage (Implicit)

- **VUID-vkDestroyQueryPool-device-parameter**
  `device` **must** be a valid `VkDevice` handle

- **VUID-vkDestroyQueryPool-queryPool-parameter**
  If `queryPool` is not `VK_NULL_HANDLE`, `queryPool` **must** be a valid `VkQueryPool` handle

- **VUID-vkDestroyQueryPool-pAllocator-parameter**
  If `pAllocator` is not **NULL**, `pAllocator` **must** be a valid pointer to a valid `VkAllocationCallbacks` structure

- **VUID-vkDestroyQueryPool-queryPool-parent**
  If `queryPool` is a valid handle, it **must** have been created, allocated, or retrieved from `device`

### Host Synchronization

- Host access to `queryPool` **must** be externally synchronized

Possible values of `VkQueryPoolCreateInfo::queryType`, specifying the type of queries managed by the pool, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryType {
    VK_QUERY_TYPE_OCCLUSION = 0,
    VK_QUERY_TYPE_PIPELINE_STATISTICS = 1,
    VK_QUERY_TYPE_TIMESTAMP = 2,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    // Provided by VK_KHR_video_queue
    VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR = 1000023000,
    #endif
    // Provided by VK_EXT_transform_feedback
    VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT = 1000028004,
    // Provided by VK_KHR_performance_query
};
```
• **VK_QUERY_TYPE_OCCLUSION** specifies an **occlusion query**.

• **VK_QUERY_TYPE_PIPELINE_STATISTICS** specifies a **pipeline statistics query**.

• **VK_QUERY_TYPE_TIMESTAMP** specifies a **timestamp query**.

• **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** specifies a **performance query**.

• **VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT** specifies a **transform feedback query**.

• **VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT** specifies a **primitives generated query**.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR** specifies a **acceleration structure size query** for use with **vkCmdWriteAccelerationStructuresPropertiesKHR** or **vkWriteAccelerationStructuresPropertiesKHR**.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_SIZE_KHR** specifies a **serialization acceleration structure size query**.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR** specifies an **acceleration structure size query** for use with **vkCmdWriteAccelerationStructuresPropertiesKHR** or **vkWriteAccelerationStructuresPropertiesKHR**.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZATION_BOTTOM_LEVEL_POINTERS_KHR** specifies a **serialization acceleration structure pointer count query**.

• **VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV** specifies an **acceleration structure size query** for use with **vkCmdWriteAccelerationStructuresPropertiesNV**.

• **VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL** specifies a **Intel performance query**.

• **VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR** specifies a **result status query**.

• **VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR** specifies a **video encode bitstream range query**.

1256
18.2. Query Operation

The operation of queries is controlled by the commands \texttt{vkCmdBeginQuery}, \texttt{vkCmdEndQuery}, \texttt{vkCmdBeginQueryIndexedEXT}, \texttt{vkCmdEndQueryIndexedEXT}, \texttt{vkCmdResetQueryPool}, \texttt{vkCmdCopyQueryPoolResults}, \texttt{vkCmdWriteTimestamp2}, and \texttt{vkCmdWriteTimestamp}.

In order for a \texttt{VkCommandBuffer} to record query management commands, the queue family for which its \texttt{VkCommandPool} was created must support the appropriate type of operations (graphics, compute) suitable for the query type of a given query pool.

Each query in a query pool has a status that is either \textit{unavailable} or \textit{available}, and also has state to store the numerical results of a query operation of the type requested when the query pool was created. Resetting a query via \texttt{vkCmdResetQueryPool} or \texttt{vkResetQueryPool} sets the status to unavailable and makes the numerical results undefined. A query is made available by the operation of \texttt{vkCmdEndQuery}, \texttt{vkCmdEndQueryIndexedEXT}, \texttt{vkCmdWriteTimestamp2}, or \texttt{vkCmdWriteTimestamp}. Both the availability status and numerical results can be retrieved by calling either \texttt{vkGetQueryPoolResults} or \texttt{vkCmdCopyQueryPoolResults}.

After query pool creation, each query must be reset before it is used. Queries must also be reset between uses.

If a logical device includes multiple physical devices, then each command that writes a query must execute on a single physical device, and any call to \texttt{vkCmdBeginQuery} must execute the corresponding \texttt{vkCmdEndQuery} command on the same physical device.

To reset a range of queries in a query pool on a queue, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdResetQueryPool(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- \texttt{commandBuffer} is the command buffer into which this command will be recorded.
- \texttt{queryPool} is the handle of the query pool managing the queries being reset.
- \texttt{firstQuery} is the initial query index to reset.
- \texttt{queryCount} is the number of queries to reset.

When executed on a queue, this command sets the status of query indices \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\) to unavailable.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in \texttt{queryPool} indicated by \texttt{firstQuery} and \texttt{queryCount} that occur earlier in submission order.
The second synchronization scope includes all commands which reference the queries in `queryPool` indicated by `firstQuery` and `queryCount` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command sets the status of query indices `[firstQuery, firstQuery + queryCount - 1]` to unavailable for each pass of `queryPool`, as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

**Note**

Because `vkCmdResetQueryPool` resets all the passes of the indicated queries, applications must not record a `vkCmdResetQueryPool` command for a `queryPool` created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` in a command buffer that needs to be submitted multiple times as indicated by a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`. Otherwise applications will never be able to complete the recorded queries.

### Valid Usage

- **VUID-vkCmdResetQueryPool-firstQuery-00796**
  
  `firstQuery` must be less than the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-firstQuery-00797**
  
  The sum of `firstQuery` and `queryCount` must be less than or equal to the number of queries in `queryPool`

- **VUID-vkCmdResetQueryPool-None-02841**
  
  All queries used by the command must not be active

- **VUID-vkCmdResetQueryPool-firstQuery-02862**
  
  If `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains begin commands for a query from the set of queries `[firstQuery, firstQuery + queryCount - 1]`

### Valid Usage (Implicit)

- **VUID-vkCmdResetQueryPool-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdResetQueryPool-queryPool-parameter**
  
  `queryPool` must be a valid `VkQueryPool` handle

- **VUID-vkCmdResetQueryPool-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdResetQueryPool-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

To reset a range of queries in a query pool on the host, call:

```c
// Provided by VK_VERSION_1_2
void vkResetQueryPool(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

or the equivalent command

```c
// Provided by VK_EXT_host_query_reset
void vkResetQueryPoolEXT(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount);
```

- `device` is the logical device that owns the query pool.
• **queryPool** is the handle of the query pool managing the queries being reset.
• **firstQuery** is the initial query index to reset.
• **queryCount** is the number of queries to reset.

This command sets the status of query indices \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\) to unavailable.

If **queryPool** is **VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR** this command sets the status of query indices \([\text{firstQuery}, \text{firstQuery} + \text{queryCount} - 1]\) to unavailable for each pass.

### Valid Usage

- VUID-vkResetQueryPool-None-02665
  The hostQueryReset feature **must** be enabled

- VUID-vkResetQueryPool-firstQuery-02666
  \textbf{firstQuery} **must** be less than the number of queries in **queryPool**

- VUID-vkResetQueryPool-firstQuery-02667
  The sum of \textbf{firstQuery} and \textbf{queryCount} **must** be less than or equal to the number of queries in **queryPool**

- VUID-vkResetQueryPool-firstQuery-02741
  Submitted commands that refer to the range specified by \textbf{firstQuery} and \textbf{queryCount} in **queryPool** **must** have completed execution

- VUID-vkResetQueryPool-firstQuery-02742
  The range of queries specified by \textbf{firstQuery} and \textbf{queryCount} in **queryPool** **must** not be in use by calls to \texttt{vkGetQueryPoolResults} or \texttt{vkResetQueryPool} in other threads

### Valid Usage (Implicit)

- VUID-vkResetQueryPool-device-parameter
  \texttt{device} **must** be a valid \texttt{VkDevice} handle

- VUID-vkResetQueryPool-queryPool-parameter
  \texttt{queryPool} **must** be a valid \texttt{VkQueryPool} handle

- VUID-vkResetQueryPool-queryPool-parent
  \texttt{queryPool} **must** have been created, allocated, or retrieved from \texttt{device}

Once queries are reset and ready for use, query commands **can** be issued to a command buffer. Occlusion queries and pipeline statistics queries count events - drawn samples and pipeline stage invocations, respectively - resulting from commands that are recorded between a \texttt{vkCmdBeginQuery} command and a \texttt{vkCmdEndQuery} command within a specified command buffer, effectively scoping a set of drawing and/or dispatching commands. Timestamp queries write timestamps to a query pool. Performance queries record performance counters to a query pool.

A query **must** begin and end in the same command buffer, although if it is a primary command
buffer, and the `inheritedQueries` feature is enabled, it can execute secondary command buffers during the query operation. For a secondary command buffer to be executed while a query is active, it must set the `occlusionQueryEnable`, `queryFlags`, and/or `pipelineStatistics` members of `VkCommandBufferInheritanceInfo` to conservative values, as described in the Command Buffer Recording section. A query must either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

If queries are used while executing a render pass instance that has multiview enabled, the query uses N consecutive query indices in the query pool (starting at `query`) where N is the number of bits set in the view mask in the subpass the query is used in. How the numerical results of the query are distributed among the queries is implementation-dependent. For example, some implementations may write each view's results to a distinct query, while other implementations may write the total result to the first query and write zero to the other queries. However, the sum of the results in all the queries must accurately reflect the total result of the query summed over all views. Applications can sum the results from all the queries to compute the total result.

Queries used with multiview rendering must not span subpasses, i.e. they must begin and end in the same subpass.

To begin a query, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBeginQuery(
    VkCommandBuffer commandBuffer,        
    VkQueryPool queryPool,                
    uint32_t query,                       
    VkQueryControlFlags flags);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.

If the `queryType` of the pool is `VK_QUERY_TYPE_OCCLUSION` and `flags` contains `VK_QUERY_CONTROL_PRECISE_BIT`, an implementation must return a result that matches the actual number of samples passed. This is described in more detail in Occlusion Queries.

Calling `vkCmdBeginQuery` is equivalent to calling `vkCmdBeginQueryIndexedEXT` with the `index` parameter set to zero.

After beginning a query, that query is considered active within the command buffer it was called in until that same query is ended. Queries active in a primary command buffer when secondary command buffers are executed are considered active for those secondary command buffers.

This command defines an execution dependency between other query commands that reference the same query.
The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in **submission order**.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` that occur later in **submission order**.

The operation of this command happens after the first scope and happens before the second scope.

---

### Valid Usage

- **VUID-vkCmdBeginQuery-None-00807**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdBeginQuery-queryType-02804**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQuery-queryType-04728**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZE_SIZE_KHR`

- **VUID-vkCmdBeginQuery-queryType-06741**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR` or `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALIZE_BOTTOM_LEVEL_POINTERS_KHR`

- **VUID-vkCmdBeginQuery-queryType-04729**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`

- **VUID-vkCmdBeginQuery-queryType-00800**
  If the `occlusionQueryPrecise` feature is not enabled, or the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_OCCLUSION`, flags **must** not contain `VK_QUERY_CONTROL_PRECISE_BIT`

- **VUID-vkCmdBeginQuery-query-00802**
  `query` **must** be less than the number of queries in `queryPool`

- **VUID-vkCmdBeginQuery-queryType-00803**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate graphics operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdBeginQuery-queryType-00804**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdBeginQuery-queryType-00805**
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PIPELINE_STATISTICS` and any of the `pipelineStatistics` indicate compute operations, the `VkCommandPool` that `commandBuffer` was allocated from **must** support compute operations

- **VUID-vkCmdBeginQuery-commandBuffer-01885**
  `commandBuffer` **must** not be a protected command buffer
If called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR`, the `VkCommandPool` that `commandBuffer` was allocated from must support video encode operations.

If the `queryPool` was created with a `queryType` that differs from that of any queries that are active within `commandBuffer`.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` must be supported.

If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` then `primitivesGeneratedQuery` must be enabled.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin must be the first recorded command in `commandBuffer`.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the begin command must not be recorded within a render pass instance.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another query pool with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer...
recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled

- **VUID-vkCmdBeginQuery-None-02863**
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query.

### Valid Usage (Implicit)

- **VUID-vkCmdBeginQuery-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdBeginQuery-queryPool-parameter**
  `queryPool` must be a valid `VkQueryPool` handle.

- **VUID-vkCmdBeginQuery-flags-parameter**
  `flags` must be a valid combination of `VkQueryControlFlagBits` values.

- **VUID-vkCmdBeginQuery-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdBeginQuery-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.

- **VUID-vkCmdBeginQuery-commonparent**
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Levels</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Both</td>
<td>Graphics, Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Decode, Encode</td>
</tr>
</tbody>
</table>
To begin an indexed query, call:

```c
void vkCmdBeginQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    VkQueryControlFlags flags,
    uint32_t index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that will manage the results of the query.
- `query` is the query index within the query pool that will contain the results.
- `flags` is a bitmask of `VkQueryControlFlagBits` specifying constraints on the types of queries that can be performed.
- `index` is the query type specific index. When the query type is `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` or `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the index represents the vertex stream.

The `vkCmdBeginQueryIndexedEXT` command operates the same as the `vkCmdBeginQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur earlier in submission order.

The second **synchronization scope** includes all commands which reference the queries in `queryPool` indicated by `query` and `index` that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

### Valid Usage

- **VUID-vkCmdBeginQueryIndexedEXT-None-00807**
  All queries used by the command **must** be unavailable

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-02804**
  The `queryType` used to create `queryPool` **must** not be `VK_QUERY_TYPE_TIMESTAMP`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-04728**
  The `queryType` used to create `queryPool` **must** not be
  - `VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_KHR`
  - `VK_QUERY_TYPE_ACCELERATION_STRUCTURE.Serialization_SIZE_KHR`

- **VUID-vkCmdBeginQueryIndexedEXT-queryType-06741**
  The `queryType` used to create `queryPool` **must** not be
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SIZE_KHR or
VK_QUERY_TYPE_ACCELERATION_STRUCTURE_SERIALORIZATION_BOTTOM_LEVEL_POINTERS_KHR

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04729
  The queryType used to create queryPool must not be
  VK_QUERY_TYPE_ACCELERATION_STRUCTURE_COMPACTED_SIZE_NV

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00800
  If the occlusionQueryPrecise feature is not enabled, or the queryType used to create
  queryPool was not VK_QUERY_TYPE_OCCLUSION, flags must not contain
  VKgetQueryControlPreciseBit

- VUID-vkCmdBeginQueryIndexedEXT-query-00802
  query must be less than the number of queries in queryPool

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00803
  If the queryType used to create queryPool was VK_QUERY_TYPE_OCCLUSION, the VkCommandPool
  that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00804
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the pipelineStatistics indicate graphics operations, the VkCommandPool that
  commandBuffer was allocated from must support graphics operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-00805
  If the queryType used to create queryPool was VK_QUERY_TYPE_PIPELINE_STATISTICS and any
  of the pipelineStatistics indicate compute operations, the VkCommandPool that
  commandBuffer was allocated from must support compute operations

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-01885
  commandBuffer must not be a protected command buffer

- VUID-vkCmdBeginQueryIndexedEXT-query-00808
  If called within a render pass instance, the sum of query and the number of bits set in the
  current subpass's view mask must be less than or equal to the number of queries in
  queryPool

- VUID-vkCmdBeginQueryIndexedEXT-queryType-04862
  If the queryType used to create queryPool was
  VK_QUERY_TYPE_VIDEO_ENCODE_BITSTREAM_BUFFER_RANGE_KHR the VkCommandPool that
  commandBuffer was allocated from must support video encode operations

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-04753
  If the queryPool was created with the same queryType as that of another active query
  within commandBuffer, then index must not match the index used for the active query

- VUID-vkCmdBeginQueryIndexedEXT-queryType-02338
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  the VkCommandPool that commandBuffer was allocated from must support graphics
  operations

- VUID-vkCmdBeginQueryIndexedEXT-queryType-02339
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  the index parameter must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams
• VUID-vkCmdBeginQueryIndexedEXT-queryType-06689
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` the `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

• VUID-vkCmdBeginQueryIndexedEXT-queryType-06690
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` the `index` parameter must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams`.

• VUID-vkCmdBeginQueryIndexedEXT-queryType-06691
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` and the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled, the `index` parameter must be zero.

• VUID-vkCmdBeginQueryIndexedEXT-queryType-06692
  If the `queryType` used to create `queryPool` was not `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` and not `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT`, the `index` must be zero.

• VUID-vkCmdBeginQueryIndexedEXT-queryType-06693
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` then `primitivesGeneratedQuery` must be enabled.

• VUID-vkCmdBeginQueryIndexedEXT-queryType-02341
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` then `VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackQueries` must be supported.

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03223
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the profiling lock must have been held before `vkBeginCommandBuffer` was called on `commandBuffer`.

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03224
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the query begin must be the first recorded command in `commandBuffer`.

• VUID-vkCmdBeginQueryIndexedEXT-queryPool-03225
  If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and another `queryPool` with a `queryType` `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` has been used within `commandBuffer`, its parent primary command buffer or secondary command buffer recorded within the same parent primary command buffer as `commandBuffer`, the `performanceCounterMultipleQueryPools` feature must be enabled.

• VUID-vkCmdBeginQueryIndexedEXT-None-02863
If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, this command must not be recorded in a command buffer that, either directly or through secondary command buffers, also contains a `vkCmdResetQueryPool` command affecting the same query.

### Valid Usage (Implicit)

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-parameter 
  `commandBuffer must` be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginQueryIndexedEXT-queryPool-parameter 
  `queryPool must` be a valid `VkQueryPool` handle

- VUID-vkCmdBeginQueryIndexedEXT-flags-parameter 
  `flags must` be a valid combination of `VkQueryControlFlagBits` values

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-recording 
  `commandBuffer must` be in the `recording state`

- VUID-vkCmdBeginQueryIndexedEXT-commandBuffer-cmdpool 
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- VUID-vkCmdBeginQueryIndexedEXT-videocoding 
  This command must only be called outside of a video coding scope

- VUID-vkCmdBeginQueryIndexedEXT-commonparent 
  Both of `commandBuffer`, and `queryPool must` have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer must` be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics Compute</td>
</tr>
</tbody>
</table>

Bits which can be set in `vkCmdBeginQuery::flags`, specifying constraints on the types of queries that can be performed, are:
// Provided by VK_VERSION_1_0
typedef enum VkQueryControlFlagBits {
    VK_QUERY_CONTROL_PRECISE_BIT = 0x00000001,
} VkQueryControlFlagBits;

- **VK_QUERY_CONTROL_PRECISE_BIT** specifies the precision of occlusion queries.

// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryControlFlags;

VkQueryControlFlags is a bitmask type for setting a mask of zero or more VkQueryControlFlagBits.

To end a query after the set of desired drawing or dispatching commands is executed, call:

// Provided by VK_VERSION_1_0
void vkCmdEndQuery(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query);

- **commandBuffer** is the command buffer into which this command will be recorded.
- **queryPool** is the query pool that is managing the results of the query.
- **query** is the query index within the query pool where the result is stored.

The command completes the query in **queryPool** identified by **query**, and marks it as available.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in **queryPool** indicated by **query** that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

Calling **vkCmdEndQuery** is equivalent to calling **vkCmdEndQueryIndexedEXT** with the index parameter set to zero.

Valid Usage

- VUID-vkCmdEndQuery-None-01923
  All queries used by the command must be active

- VUID-vkCmdEndQuery-query-00810
  query must be less than the number of queries in queryPool

- VUID-vkCmdEndQuery-commandBuffer-01886
  commandBuffer must not be a protected command buffer
If `vkCmdEndQuery` is called within a render pass instance, the sum of `query` and the number of bits set in the current subpass's view mask must be less than or equal to the number of queries in `queryPool`.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_COMMAND_BUFFER_KHR`, the `vkCmdEndQuery` must be the last recorded command in `commandBuffer`.

If `queryPool` was created with a `queryType` of `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR` and one or more of the counters used to create `queryPool` was `VK_PERFORMANCE_COUNTER_SCOPE_RENDER_PASS_KHR`, the `vkCmdEndQuery` must not be recorded within a render pass instance.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `queryPool` must be a valid `VkQueryPool` handle.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, decode, or encode operations.
- Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
To end an indexed query after the set of desired drawing or dispatching commands is recorded, call:

```cpp
// Provided by VK_EXT_transform_feedback
void vkCmdEndQueryIndexedEXT(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t query,
    uint32_t index);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `queryPool` is the query pool that is managing the results of the query.
- `query` is the query index within the query pool where the result is stored.
- `index` is the query type specific index.

The command completes the query in `queryPool` identified by `query` and `index`, and marks it as available.

The `vkCmdEndQueryIndexedEXT` command operates the same as the `vkCmdEndQuery` command, except that it also accepts a query type specific `index` parameter.

This command defines an execution dependency between other query commands that reference the same query index.

The first synchronization scope includes all commands which reference the queries in `queryPool` indicated by `query` that occur earlier in submission order.

The second synchronization scope includes only the operation of this command.

### Valid Usage

- VUID-vkCmdEndQueryIndexedEXT-None-02342
  All queries used by the command must be active
- VUID-vkCmdEndQueryIndexedEXT-query-02343
  `query` must be less than the number of queries in `queryPool`
• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-02344
  commandBuffer must not be a protected command buffer

• VUID-vkCmdEndQueryIndexedEXT-query-02345
  If vkCmdEndQueryIndexedEXT is called within a render pass instance, the sum of query and
  the number of bits set in the current subpass’s view mask must be less than or equal to
  the number of queries in queryPool

• VUID-vkCmdEndQueryIndexedEXT-queryType-06694
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  or VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, the index parameter must be less than
  VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

• VUID-vkCmdEndQueryIndexedEXT-queryType-06695
  If the queryType used to create queryPool was not VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  and not VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, the index must be zero

• VUID-vkCmdEndQueryIndexedEXT-queryType-06696
  If the queryType used to create queryPool was VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT
  or VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT, index must equal the index used to begin the
  query

• VUID-vkCmdBeginQueryIndexedEXT-None-07007
  If called within a subpass of a render pass instance, the corresponding vkCmdBeginQuery*
  command must have been called previously within the same subpass

• VUID-vkCmdBeginQueryIndexedEXT-None-07008
  If called outside of a render pass instance, the corresponding vkCmdBeginQuery* command
  must have been called outside of a render pass instance

Valid Usage (Implicit)

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdEndQueryIndexedEXT-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdEndQueryIndexedEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or
  compute operations

• VUID-vkCmdEndQueryIndexedEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdEndQueryIndexedEXT-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from
  the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

An application can retrieve results either by requesting they be written into application-provided memory, or by requesting they be copied into a `VkBuffer`. In either case, the layout in memory is defined as follows:

- The first query's result is written starting at the first byte requested by the command, and each subsequent query's result begins \textit{stride} bytes later.
- Occlusion queries, pipeline statistics queries, transform feedback queries, primitives generated queries, and timestamp queries store results in a tightly packed array of unsigned integers, either 32- or 64-bits as requested by the command, storing the numerical results and, if requested, the availability status.
- Performance queries store results in a tightly packed array whose type is determined by the \texttt{unit} member of the corresponding `VkPerformanceCounterKHR`.
- If \texttt{VK_QUERY_RESULT_WITH_AVAILABILITY_BIT} is used, the final element of each query's result is an integer indicating whether the query's result is available, with any non-zero value indicating that it is available.
- If \texttt{VK_QUERY_RESULT_WITH_STATUS_BIT_KHR} is used, the final element of each query's result is an integer value indicating that status of the query result. Positive values indicate success, negative values indicate failure, and 0 indicates that the result is not yet available. Specific error codes are encoded in the `VkQueryResultStatusKHR` enumeration.
- Occlusion queries write one integer value - the number of samples passed. Pipeline statistics queries write one integer value for each bit that is enabled in the `pipelineStatistics` when the pool is created, and the statistics values are written in bit order starting from the least significant bit. Timestamp queries write one integer value. Performance queries write one `VkPerformanceCounterResultKHR` value for each `VkPerformanceCounterKHR` in the query. Transform feedback queries write two integers; the first integer is the number of primitives successfully written to the corresponding transform feedback buffer and the second is the number of primitives output to the vertex stream, regardless of whether they were successfully captured or not. In other words, if the transform feedback buffer was sized too small for the number of primitives output by the vertex stream, the first integer represents the number of primitives actually written and the second is the number that would have been written if all the
transform feedback buffers associated with that vertex stream were large enough. Primitives generated queries write the number of primitives output to the vertex stream, regardless of whether transform feedback is active or not, or whether they were successfully captured by transform feedback or not. This is identical to the second integer of the transform feedback queries if transform feedback is active.

• If more than one query is retrieved and stride is not at least as large as the size of the array of values corresponding to a single query, the values written to memory are undefined.

To retrieve status and results for a set of queries, call:

```c
// Provided by VK_VERSION_1_0
VkResult vkGetQueryPoolResults(
    VkDevice device,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    size_t dataSize,
    void* pData,
    VkDeviceSize stride,
    VkQueryResultFlags flags);
```

• device is the logical device that owns the query pool.
• queryPool is the query pool managing the queries containing the desired results.
• firstQuery is the initial query index.
• queryCount is the number of queries to read.
• dataSize is the size in bytes of the buffer pointed to by pData.
• pData is a pointer to a user-allocated buffer where the results will be written
• stride is the stride in bytes between results for individual queries within pData.
• flags is a bitmask of VkQueryResultFlagBits specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

Results for any query in queryPool identified by firstQuery and queryCount that is available are copied to pData.

If VK_QUERY_RESULT_WITH_AVAILABILITY_BIT is set, results for all queries in queryPool identified by firstQuery and queryCount are copied to pData, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If VK_QUERY_RESULT_WITH_STATUS_BIT_KHR is set, results for all queries in queryPool identified by firstQuery and queryCount are copied to pData, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query
completed successfully, and the query results are valid. Negative values indicate that the operations
within the query completed unsuccessfully.

`VkQueryResultStatusKHR` defines specific meaning for values returned here, though
implementations are free to return other values.

Results for any available query written by this command are final and represent the final result of
the query. If `VK_QUERY_RESULT_PARTIAL_BIT` is set, then for any query that is unavailable, an
intermediate result between zero and the final result value is written for that query. Otherwise, any
result written by this command is undefined.

If `VK_QUERY_RESULT_64_BIT` is set, results and availability or status values for all queries are written
as an array of 64-bit values. If the `queryPool` was created with `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`,
results for each query are written as an array of the type indicated by `VkPerformanceCounterKHR
::storage` for the counter being queried. Otherwise, results and availability or status values are
written as an array of 32-bit values. If an unsigned integer query’s value overflows the result type,
the value may either wrap or saturate. If a signed integer query’s value overflows the result type,
the value is undefined. If a floating point query’s value is not representable as the result type, the
value is undefined.

If `VK_QUERY_RESULT_WAIT_BIT` is set, this command defines an execution dependency with any earlier
commands that writes one of the identified queries. The first synchronization scope includes all
instances of `vkCmdEndQuery`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, and
`vkCmdWriteTimestamp` that reference any query in `queryPool` indicated by `firstQuery` and
`queryCount`. The second synchronization scope includes the host operations of this command.

If `VK_QUERY_RESULT_WAIT_BIT` is not set, `vkGetQueryPoolResults` may return `VK_NOT_READY` if there are
queries in the unavailable state.

**Note**

Applications must take care to ensure that use of the `VK_QUERY_RESULT_WAIT_BIT` bit
has the desired effect.

For example, if a query has been used previously and a command buffer records
the commands `vkCmdResetQueryPool`, `vkCmdBeginQuery`, and `vkCmdEndQuery` for that
query, then the query will remain in the available state until `vkResetQueryPool` is
called or the `vkCmdResetQueryPool` command executes on a queue. Applications can
use fences or events to ensure that a query has already been reset before checking
for its results or availability status. Otherwise, a stale value could be returned
from a previous use of the query.

The above also applies when `VK_QUERY_RESULT_WAIT_BIT` is used in combination with
`VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`. In this case, the returned availability
status may reflect the result of a previous use of the query unless `vkResetQueryPool`
is called or the `vkCmdResetQueryPool` command has been executed since the last use
of the query.

A similar situation can arise with the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.
Applications can double-buffer query pool usage, with a pool per frame, and reset queries at the end of the frame in which they are read.

Valid Usage

- **VUID-vkGetQueryPoolResults-firstQuery-00813**
  firstQuery **must** be less than the number of queries in queryPool

- **VUID-vkGetQueryPoolResults-flags-02828**
  If VK_QUERY_RESULT_64_BIT is not set in flags and the queryType used to create queryPool was not VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then pData and stride **must** be multiples of 4

- **VUID-vkGetQueryPoolResults-flags-00815**
  If VK_QUERY_RESULT_64_BIT is set in flags then pData and stride **must** be multiples of 8

- **VUID-vkGetQueryPoolResults-queryType-03229**
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then pData and stride **must** be multiples of the size of VkPerformanceCounterResultKHR

- **VUID-vkGetQueryPoolResults-queryType-04519**
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, then stride **must** be large enough to contain VkQueryPoolPerformanceCreateInfoKHR : :counterIndexCount used to create queryPool times the size of VkPerformanceCounterResultKHR

- **VUID-vkGetQueryPoolResults-firstQuery-00816**
  The sum of firstQuery and queryCount **must** be less than or equal to the number of queries in queryPool

- **VUID-vkGetQueryPoolResults-dataSize-00817**
  dataSize **must** be large enough to contain the result of each query, as described [here](#)

- **VUID-vkGetQueryPoolResults-queryType-00818**
  If the queryType used to create queryPool was VK_QUERY_TYPE_TIMESTAMP, flags **must** not contain VK_QUERY_RESULT_PARTIAL_BIT

- **VUID-vkGetQueryPoolResults-queryType-03230**
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, flags **must** not contain VK_QUERY_RESULT_WITH_AVAILABILITY_BIT, VK_QUERY_RESULT_PARTIAL_BIT or VK_QUERY_RESULT_64_BIT

- **VUID-vkGetQueryPoolResults-queryType-03231**
  If the queryType used to create queryPool was VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR, the queryPool **must** have been recorded once for each pass as retrieved via a call to vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR

- **VUID-vkGetQueryPoolResults-queryType-04810**
  If the queryType used to create queryPool was VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR, flags **must** include VK_QUERY_RESULT_WITH_STATUS_BIT_KHR

- **VUID-vkGetQueryPoolResults-flags-04811**
  If flags includes VK_QUERY_RESULT_WITH_STATUS_BIT_KHR, it **must** not include
VK_QUERY_RESULT_WITH_AVAILABILITY_BIT

- VUID-vkGetQueryPoolResults-queryType-06900
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, flags must not contain `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`

Valid Usage (Implicit)

- VUID-vkGetQueryPoolResults-device-parameter
device must be a valid `VkDevice` handle

- VUID-vkGetQueryPoolResults-queryPool-parameter
queryPool must be a valid `VkQueryPool` handle

- VUID-vkGetQueryPoolResults-pData-parameter
pData must be a valid pointer to an array of `dataSize` bytes

- VUID-vkGetQueryPoolResults-flags-parameter
flags must be a valid combination of `VkQueryResultFlagBits` values

- VUID-vkGetQueryPoolResults-dataSize-arraylength
dataSize must be greater than 0

- VUID-vkGetQueryPoolResults-queryPool-parent
queryPool must have been created, allocated, or retrieved from device

Return Codes

Success

- VK_SUCCESS
- VK_NOT_READY

Failure

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_ERROR_OUT_OF_DEVICE_MEMORY
- VK_ERROR_DEVICE_LOST

Bits which can be set in `vkGetQueryPoolResults::flags` and `vkCmdCopyQueryPoolResults::flags`, specifying how and when results are returned, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryResultFlagBits {
    VK_QUERY_RESULT_64_BIT = 0x00000001,
    VK_QUERY_RESULT_WAIT_BIT = 0x00000002,
    VK_QUERY_RESULT_WITH_AVAILABILITY_BIT = 0x00000004,
    VK_QUERY_RESULT_PARTIAL_BIT = 0x00000008,
    #ifdef VK_ENABLE_BETA_EXTENSIONS
    VK_QUERY_RESULT_128_BIT = 0x00000010,
    VK_QUERY_RESULT_256_BIT = 0x00000020,
    VK_QUERY_RESULT_512_BIT = 0x00000040,
    VK_QUERY_RESULT_1024_BIT = 0x00000080,
    #endif
} VkQueryResultFlagBits;
// Provided by VK_KHR_video_queue
```
VK_QUERY_RESULT_WITH_STATUS_BIT_KHR = 0x00000010,
#endif
} VkQueryResultFlagBits;

- **VK_QUERY_RESULT_64_BIT** specifies the results will be written as an array of 64-bit unsigned integer values. If this bit is not set, the results will be written as an array of 32-bit unsigned integer values.
- **VK_QUERY_RESULT_WAIT_BIT** specifies that Vulkan will wait for each query’s status to become available before retrieving its results.
- **VK_QUERY_RESULT_WITH_AVAILABILITY_BIT** specifies that the availability status accompanies the results.
- **VK_QUERY_RESULT_PARTIAL_BIT** specifies that returning partial results is acceptable.
- **VK_QUERY_RESULT_WITH_STATUS_BIT_KHR** specifies that the last value returned in the query is a VkQueryResultStatusKHR value. See result status query for information on how an application can determine whether the use of this flag bit is supported.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryResultFlags;
```

**VkQueryResultFlags** is a bitmask type for setting a mask of zero or more VkQueryResultFlagBits.

Specific status codes that can be returned from a query are:

```c
// Provided by VK_KHR_video_queue
typedef enum VkQueryResultStatusKHR {
    VK_QUERY_RESULT_STATUS_ERROR_KHR = -1,
    VK_QUERY_RESULT_STATUS_NOT_READY_KHR = 0,
    VK_QUERY_RESULT_STATUS_COMPLETE_KHR = 1,
} VkQueryResultStatusKHR;
```

- **VK_QUERY_RESULT_STATUS_NOT_READY_KHR** specifies that the query result is not yet available.
- **VK_QUERY_RESULT_STATUS_ERROR_KHR** specifies that operations did not complete successfully.
- **VK_QUERY_RESULT_STATUS_COMPLETE_KHR** specifies that operations completed successfully and the query result is available.

To copy query statuses and numerical results directly to buffer memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyQueryPoolResults(
    VkCommandBuffer commandBuffer,
    VkQueryPool queryPool,
    uint32_t firstQuery,
    uint32_t queryCount,
    VkBuffer dstBuffer,
```
VkDeviceSize dstOffset,
VkDeviceSize stride,
VkQueryResultFlags flags);

- *commandBuffer* is the command buffer into which this command will be recorded.
- *queryPool* is the query pool managing the queries containing the desired results.
- *firstQuery* is the initial query index.
- *queryCount* is the number of queries. *firstQuery* and *queryCount* together define a range of queries.
- *dstBuffer* is a *VkBuffer* object that will receive the results of the copy command.
- *dstOffset* is an offset into *dstBuffer*.
- *stride* is the stride in bytes between results for individual queries within *dstBuffer*. The required size of the backing memory for *dstBuffer* is determined as described above for *vkGetQueryPoolResults*.
- *flags* is a bitmask of *VkQueryResultFlagBits* specifying how and when results are returned.

Any results written for a query are written according to a layout dependent on the query type.

Results for any query in *queryPool* identified by *firstQuery* and *queryCount* that is available are copied to *dstBuffer*.

If *VK_QUERY_RESULT_WITH_AVAILABILITY_BIT* is set, results for all queries in *queryPool* identified by *firstQuery* and *queryCount* are copied to *dstBuffer*, along with an extra availability value written directly after the results of each query and interpreted as an unsigned integer. A value of zero indicates that the results are not yet available, otherwise the query is complete and results are available.

If *VK_QUERY_RESULT_WITH_STATUS_BIT_KHR* is set, results for all queries in *queryPool* identified by *firstQuery* and *queryCount* are copied to *dstBuffer*, along with an extra status value written directly after the results of each query and interpreted as a signed integer. A value of zero indicates that the results are not yet available. Positive values indicate that the operations within the query completed successfully, and the query results are valid. Negative values indicate that the operations within the query completed unsuccessfully.

*VkQueryResultStatusKHR* defines specific meaning for values returned here, though implementations are free to return other values.

Results for any available query written by this command are final and represent the final result of the query. If *VK_QUERY_RESULT_PARTIAL_BIT* is set, then for any query that is unavailable, an intermediate result between zero and the final result value is written for that query. Otherwise, any result written by this command is undefined.

If *VK_QUERY_RESULT_64_BIT* is set, results and availability or status values for all queries are written as an array of 64-bit values. If the *queryPool* was created with *VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR*, results for each query are written as an array of the type indicated by *VkPerformanceCounterKHR::storage* for the counter being queried. Otherwise, results and availability or status values are
written as an array of 32-bit values. If an unsigned integer query’s value overflows the result type, the value may either wrap or saturate. If a signed integer query’s value overflows the result type, the value is undefined. If a floating point query’s value is not representable as the result type, the value is undefined.

This command defines an execution dependency between other query commands that reference the same query.

The first synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur earlier in submission order. If flags does not include `VK_QUERY_RESULT_WAIT_BIT`, `vkCmdEndQueryIndexedEXT`, `vkCmdWriteTimestamp2`, `vkCmdEndQuery`, and `vkCmdWriteTimestamp` are excluded from this scope.

The second synchronization scope includes all commands which reference the queries in queryPool indicated by query that occur later in submission order.

The operation of this command happens after the first scope and happens before the second scope.

`vkCmdCopyQueryPoolResults` is considered to be a transfer operation, and its writes to buffer memory must be synchronized using `VK_PIPELINE_STAGE_TRANSFER_BIT` and `VK_ACCESS_TRANSFER_WRITE_BIT` before using the results.

### Valid Usage

- **VUID-vkCmdCopyQueryPoolResults-dstOffset-00819**
  dstOffset must be less than the size of dstBuffer

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-00820**
  firstQuery must be less than the number of queries in queryPool

- **VUID-vkCmdCopyQueryPoolResults-firstQuery-00821**
  The sum of firstQuery and queryCount must be less than or equal to the number of queries in queryPool

- **VUID-vkCmdCopyQueryPoolResults-flags-00822**
  If `VK_QUERY_RESULT_64_BIT` is not set in flags then dstOffset and stride must be multiples of 4

- **VUID-vkCmdCopyQueryPoolResults-flags-00823**
  If `VK_QUERY_RESULT_64_BIT` is set in flags then dstOffset and stride must be multiples of 8

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00824**
  dstBuffer must have enough storage, from dstOffset, to contain the result of each query, as described here

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00825**
  dstBuffer must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdCopyQueryPoolResults-dstBuffer-00826**
  If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdCopyQueryPoolResults-queryType-00827**
If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_TIMESTAMP`, `flags` must not contain `VK_QUERY_RESULT_PARTIAL_BIT`.

- VUID-vkCmdCopyQueryPoolResults-queryType-03232
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `VkPhysicalDevicePerformanceQueryPropertiesKHR::allowCommandBufferQueryCopies` must be `VK_TRUE`.

- VUID-vkCmdCopyQueryPoolResults-queryType-03233
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` must not contain `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`, `VK_QUERY_RESULT_PARTIAL_BIT` or `VK_QUERY_RESULT_64_BIT`.

- VUID-vkCmdCopyQueryPoolResults-queryType-03234
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, the `queryPool` must have been submitted once for each pass as retrieved via a call to `vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR`.

- VUID-vkCmdCopyQueryPoolResults-queryType-02734
  `vkCmdCopyQueryPoolResults` must not be called if the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL`.

- VUID-vkCmdCopyQueryPoolResults-queryType-06901
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR`, `flags` must include `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`.

- VUID-vkCmdCopyQueryPoolResults-flags-06902
  If `flags` includes `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`, it must not include `VK_QUERY_RESULT_WITH_AVAILABILITY_BIT`.

- VUID-vkCmdCopyQueryPoolResults-queryType-06903
  If the `queryType` used to create `queryPool` was `VK_QUERY_TYPE_PERFORMANCE_QUERY_KHR`, `flags` must not contain `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR`.

### Valid Usage (Implicit)

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdCopyQueryPoolResults-queryPool-parameter
  `queryPool` must be a valid `VkQueryPool` handle.

- VUID-vkCmdCopyQueryPoolResults-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle.

- VUID-vkCmdCopyQueryPoolResults-flags-parameter
  `flags` must be a valid combination of `VkQueryResultFlagBits` values.

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-recording
  `commandBuffer` must be in the `recording` state.

- VUID-vkCmdCopyQueryPoolResults-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations.
- VUID-vkCmdCopyQueryPoolResults-renderpass
  This command **must** only be called outside of a render pass instance
- VUID-vkCmdCopyQueryPoolResults-videocoding
  This command **must** only be called outside of a video coding scope
- VUID-vkCmdCopyQueryPoolResults-commonparent
  Each of `commandBuffer`, `dstBuffer`, and `queryPool` **must** have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Rendering operations such as clears, MSAA resolves, attachment load/store operations, and blits **may** count towards the results of queries. This behavior is implementation-dependent and **may** vary depending on the path used within an implementation. For example, some implementations have several types of clears, some of which **may** include vertices and some not.

### 18.3. Occlusion Queries

Occlusion queries track the number of samples that pass the per-fragment tests for a set of drawing commands. As such, occlusion queries are only available on queue families supporting graphics operations. The application **can** then use these results to inform future rendering decisions. An occlusion query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When an occlusion query begins, the count of passing samples always starts at zero. For each drawing command, the count is incremented as described in Sample Counting. If `flags` does not contain `VK_QUERY_CONTROL_PRECISE_BIT` an implementation **may** generate any non-zero result value for the query if the count of passing samples is non-zero.

**Note**

Not setting `VK_QUERY_CONTROL_PRECISE_BIT` mode **may** be more efficient on some implementations, and **should** be used where it is sufficient to know a boolean result on whether any samples passed the per-fragment tests. In this case, some implementations **may** only return zero or one, indifferent to the actual number of
samples passing the per-fragment tests.

When an occlusion query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**

If occluding geometry is not drawn first, samples can pass the depth test, but still not be visible in a final image.

### 18.4. Pipeline Statistics Queries

Pipeline statistics queries allow the application to sample a specified set of `VkPipeline` counters. These counters are accumulated by Vulkan for a set of either drawing or dispatching commands while a pipeline statistics query is active. As such, pipeline statistics queries are available on queue families supporting either graphics or compute operations. The availability of pipeline statistics queries is indicated by the `pipelineStatisticsQuery` member of the `VkPhysicalDeviceFeatures` object (see `vkGetPhysicalDeviceFeatures` and `vkCreateDevice` for detecting and requesting this query type on a `VkDevice`).

A pipeline statistics query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively. When a pipeline statistics query begins, all statistics counters are set to zero. While the query is active, the pipeline type determines which set of statistics are available, but these must be configured on the query pool when it is created. If a statistic counter is issued on a command buffer that does not support the corresponding operation, the value of that counter is undefined after the query has been made available. At least one statistic counter relevant to the operations supported on the recording command buffer must be enabled.

Bits which can be set in `VkQueryPoolCreateInfo::pipelineStatistics` for query pools and in `VkCommandBufferInheritanceInfo::pipelineStatistics` for secondary command buffers, individually enabling pipeline statistics counters, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkQueryPipelineStatisticFlagBits {
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT = 0x00000001,
    VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT = 0x00000002,
    VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT = 0x00000004,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT = 0x00000008,
    VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT = 0x00000010,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT = 0x00000020,
    VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT = 0x00000040,
    VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT = 0x00000080,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT = 0x00000100,
    VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT = 0x00000200,
    VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT = 0x00000400,
} VkQueryPipelineStatisticFlagBits;
```
• **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_VERTICES_BIT** specifies that queries managed by the pool will count the number of vertices processed by the input assembly stage. Vertices corresponding to incomplete primitives may contribute to the count.

• **VK_QUERY_PIPELINE_STATISTIC_INPUT_ASSEMBLY_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives processed by the input assembly stage. If primitive restart is enabled, restarting the primitive topology has no effect on the count. Incomplete primitives may be counted.

• **VK_QUERY_PIPELINE_STATISTIC_VERTEX_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of vertex shader invocations. This counter's value is incremented each time a vertex shader is invoked.

• **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of geometry shader invocations. This counter's value is incremented each time a geometry shader is invoked. In the case of instanced geometry shaders, the geometry shader invocations count is incremented for each separate instanced invocation.

• **VK_QUERY_PIPELINE_STATISTIC_GEOMETRY_SHADER_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives generated by geometry shader invocations. The counter's value is incremented each time the geometry shader emits a primitive. Restarting primitive topology using the SPIR-V instructions `OpEndPrimitive` or `OpEndStreamPrimitive` has no effect on the geometry shader output primitives count.

• **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of primitives processed by the Primitive Clipping stage of the pipeline. The counter's value is incremented each time a primitive reaches the primitive clipping stage.

• **VK_QUERY_PIPELINE_STATISTIC_CLIPPING_PRIMITIVES_BIT** specifies that queries managed by the pool will count the number of primitives output by the Primitive Clipping stage of the pipeline. The actual number of primitives output by the primitive clipping stage for a particular input primitive is implementation-dependent but must satisfy the following conditions:

  ◦ If at least one vertex of the input primitive lies inside the clipping volume, the counter is incremented by one or more.

  ◦ Otherwise, the counter is incremented by zero or more.

• **VK_QUERY_PIPELINE_STATISTIC_FRAGMENT_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of fragment shader invocations. The counter's value is incremented each time the fragment shader is invoked.

• **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_CONTROL_SHADER_PATCHES_BIT** specifies that queries managed by the pool will count the number of patches processed by the tessellation control shader. The counter's value is incremented once for each patch for which a tessellation control shader is invoked.

• **VK_QUERY_PIPELINE_STATISTIC_TESSELLATION_EVALUATION_SHADER_INVOCATIONS_BIT** specifies that queries managed by the pool will count the number of invocations of the tessellation evaluation shader. The counter's value is incremented each time the tessellation evaluation shader is invoked.
VK_QUERY_PIPELINE_STATISTIC_COMPUTE_SHADER_INVOCATIONS_BIT specifies that queries managed by the pool will count the number of compute shader invocations. The counter's value is incremented every time the compute shader is invoked. Implementations may skip the execution of certain compute shader invocations or execute additional compute shader invocations for implementation-dependent reasons as long as the results of rendering otherwise remain unchanged.

These values are intended to measure relative statistics on one implementation. Various device architectures will count these values differently. Any or all counters may be affected by the issues described in Query Operation.

Note
For example, tile-based rendering devices may need to replay the scene multiple times, affecting some of the counts.

If a pipeline has rasterizerDiscardEnable enabled, implementations may discard primitives after the final pre-rasterization shader stage. As a result, if rasterizerDiscardEnable is enabled, the clipping input and output primitives counters may not be incremented.

When a pipeline statistics query finishes, the result for that query is marked as available. The application can copy the result to a buffer (via vkCmdCopyQueryPoolResults), or request it be put into host memory (via vkGetQueryPoolResults).

```
// Provided by VK_VERSION_1_0
typedef VkFlags VkQueryPipelineStatisticFlags;
```

VkQueryPipelineStatisticFlags is a bitmask type for setting a mask of zero or more VkQueryPipelineStatisticFlagBits.

### 18.5. Timestamp Queries

Timestamps provide applications with a mechanism for timing the execution of commands. A timestamp is an integer value generated by the VkPhysicalDevice. Unlike other queries, timestamps do not operate over a range, and so do not use vkCmdBeginQuery or vkCmdEndQuery. The mechanism is built around a set of commands that allow the application to tell the VkPhysicalDevice to write timestamp values to a query pool and then either read timestamp values on the host (using vkGetQueryPoolResults) or copy timestamp values to a VkBuffer (using vkCmdCopyQueryPoolResults). The application can then compute differences between timestamps to determine execution time.

The number of valid bits in a timestamp value is determined by the VkQueueFamilyProperties::timestampValidBits property of the queue on which the timestamp is written. Timestamps are supported on any queue which reports a non-zero value for timestampValidBits via vkGetPhysicalDeviceQueueFamilyProperties. If the timestampComputeAndGraphics limit is VK_TRUE, timestamps are supported by every queue family that supports either graphics or compute operations (see VkQueueFamilyProperties).
The number of nanoseconds it takes for a timestamp value to be incremented by 1 can be obtained from `VkPhysicalDeviceLimits::timestampPeriod` after a call to `vkGetPhysicalDeviceProperties`.

To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdWriteTimestamp2(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

or the equivalent command

```c
// Provided by VK_KHR_synchronization2
void vkCmdWriteTimestamp2KHR(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlags2 stage,
    VkQueryPool queryPool,
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stage` specifies a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp2` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `stage`.

The second synchronization scope includes only the timestamp write operation.

When the timestamp value is written, the availability status of the query is set to available.

**Note**

If an implementation is unable to detect completion and latch the timer immediately after `stage` has completed, it may instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

**Note**

An example of such a comparison is subtracting an older timestamp from a newer
one to determine the execution time of a sequence of commands.

If \texttt{vkCmdWriteTimestamp2} is called while executing a render pass instance that has multiview enabled, the timestamp uses \(N\) consecutive query indices in the query pool (starting at \texttt{query}) where \(N\) is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

\begin{itemize}
  \item The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.
  \item All \(N\) queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries \texttt{may} be the execution time of a single view.
\end{itemize}

In either case, the application \texttt{can} sum the differences between all \(N\) queries to determine the total execution time.

\begin{table}

If the \texttt{shadingRateImage} feature is not enabled, \texttt{stage must} not contain \\
\hline
\end{tabular}
\end{table}
VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV

- VUID-vkCmdWriteTimestamp2-stage-04957
  If the subpassShading feature is not enabled, stage must not contain
  VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI

- VUID-vkCmdWriteTimestamp2-stage-04995
  If the invocationMask feature is not enabled, stage must not contain
  VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI

- VUID-vkCmdWriteTimestamp2-synchronization2-03858
  The synchronization2 feature must be enabled

- VUID-vkCmdWriteTimestamp2-stage-03859
  stage must only include a single pipeline stage

- VUID-vkCmdWriteTimestamp2-stage-03860
  stage must only include stages valid for the queue family that was used to create the
  command pool that commandBuffer was allocated from

- VUID-vkCmdWriteTimestamp2-queryPool-03861
  queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

- VUID-vkCmdWriteTimestamp2-queryPool-03862
  The query identified by queryPool and query must be unavailable

- VUID-vkCmdWriteTimestamp2-timestampValidBits-03863
  The command pool's queue family must support a non-zero timestampValidBits

- VUID-vkCmdWriteTimestamp2-query-04903
  query must be less than the number of queries in queryPool

- VUID-vkCmdWriteTimestamp2-None-03864
  All queries used by the command must be unavailable

- VUID-vkCmdWriteTimestamp2-query-03865
  If vkCmdWriteTimestamp2 is called within a render pass instance, the sum of query and the
  number of bits set in the current subpass's view mask must be less than or equal to the
  number of queries in queryPool

Valid Usage (Implicit)

- VUID-vkCmdWriteTimestamp2-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdWriteTimestamp2-stage-parameter
  stage must be a valid combination of VkPipelineStageFlagBits2 values

- VUID-vkCmdWriteTimestamp2-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

- VUID-vkCmdWriteTimestamp2-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdWriteTimestamp2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics,
compute, decode, or encode operations

- VUID-vkCmdWriteTimestamp2-commonparent
  Both of `commandBuffer`, and `queryPool` must have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>

</tbody>
</table>

To request a timestamp and write the value to memory, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdWriteTimestamp(
    VkCommandBuffer commandBuffer,  
    VkPipelineStageFlagBits pipelineStage,  
    VkQueryPool queryPool,  
    uint32_t query);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pipelineStage` is a `VkPipelineStageFlagBits` value, specifying a stage of the pipeline.
- `queryPool` is the query pool that will manage the timestamp.
- `query` is the query within the query pool that will contain the timestamp.

When `vkCmdWriteTimestamp` is submitted to a queue, it defines an execution dependency on commands that were submitted before it, and writes a timestamp to a query pool.

The first synchronization scope includes all commands that occur earlier in submission order. The synchronization scope is limited to operations on the pipeline stage specified by `pipelineStage`.

The second synchronization scope includes only the timestamp write operation.
When the timestamp value is written, the availability status of the query is set to available.

**Note**

If an implementation is unable to detect completion and latch the timer immediately after `stage` has completed, it *may* instead do so at any logically later stage.

Comparisons between timestamps are not meaningful if the timestamps are written by commands submitted to different queues.

**Note**

An example of such a comparison is subtracting an older timestamp from a newer one to determine the execution time of a sequence of commands.

If `vkCmdWriteTimestamp` is called while executing a render pass instance that has multiview enabled, the timestamp uses `N` consecutive query indices in the query pool (starting at `query`) where `N` is the number of bits set in the view mask of the subpass the command is executed in. The resulting query values are determined by an implementation-dependent choice of one of the following behaviors:

- The first query is a timestamp value and (if more than one bit is set in the view mask) zero is written to the remaining queries. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the difference between the first query written by each command.

- All `N` queries are timestamp values. If two timestamps are written in the same subpass, the sum of the execution time of all views between those commands is the sum of the difference between corresponding queries written by each command. The difference between corresponding queries *may* be the execution time of a single view.

In either case, the application *can* sum the differences between all `N` queries to determine the total execution time.

### Valid Usage

- **VUID-vkCmdWriteTimestamp-pipelineStage-04074**  
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from

- **VUID-vkCmdWriteTimestamp-pipelineStage-04075**  
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04076**  
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`

- **VUID-vkCmdWriteTimestamp-pipelineStage-04077**  
  If the `conditionalRendering` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`
• VUID-vkCmdWriteTimestamp-pipelineStage-04078
  If the fragmentDensityMap feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT

• VUID-vkCmdWriteTimestamp-pipelineStage-04079
  If the transformFeedback feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT

• VUID-vkCmdWriteTimestamp-pipelineStage-04080
  If the meshShader feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV or VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV

• VUID-vkCmdWriteTimestamp-pipelineStage-04081
  If the shadingRateImage feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV

• VUID-vkCmdWriteTimestamp-synchronization2-06489
  If the synchronization2 feature is not enabled, pipelineStage must not be
  VK_PIPELINE_STAGE_NONE

• VUID-vkCmdWriteTimestamp-queryPool-01416
  queryPool must have been created with a queryType of VK_QUERY_TYPE_TIMESTAMP

• VUID-vkCmdWriteTimestamp-queryPool-00828
  The query identified by queryPool and query must be unavailable

• VUID-vkCmdWriteTimestamp-timestampValidBits-00829
  The command pool's queue family must support a non-zero timestampValidBits

• VUID-vkCmdWriteTimestamp-query-04904
  query must be less than the number of queries in queryPool

• VUID-vkCmdWriteTimestamp-None-00830
  All queries used by the command must be unavailable

• VUID-vkCmdWriteTimestamp-query-00831
  If vkCmdWriteTimestamp is called within a render pass instance, the sum of query and the
  number of bits set in the current subpass's view mask must be less than or equal to the
  number of queries in queryPool

---

**Valid Usage (Implicit)**

• VUID-vkCmdWriteTimestamp-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdWriteTimestamp-pipelineStage-parameter
  pipelineStage must be a valid VkPipelineStageFlagBits value

• VUID-vkCmdWriteTimestamp-queryPool-parameter
  queryPool must be a valid VkQueryPool handle

• VUID-vkCmdWriteTimestamp-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdWriteTimestamp-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, compute, decode, or encode operations.

- VUID-vkCmdWriteTimestamp-commonparent
  Both of commandBuffer, and queryPool must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### 18.6. Performance Queries

Performance queries provide applications with a mechanism for getting performance counter information about the execution of command buffers, render passes, and commands.

Each queue family advertises the performance counters that can be queried on a queue of that family via a call to vkEnumeratePhysicalDeviceQueueFamilyPerformanceQueryCountersKHR. Implementations may limit access to performance counters based on platform requirements or only to specialized drivers for development purposes.

**Note**

This may include no performance counters being enumerated, or a reduced set. Please refer to platform-specific documentation for guidance on any such restrictions.

Performance queries use the existing vkCmdBeginQuery and vkCmdEndQuery to control what command buffers, render passes, or commands to get performance information for.

Implementations may require multiple passes where the command buffer, render passes, or commands being recorded are the same and are executed on the same queue to record performance counter data. This is achieved by submitting the same batch and providing a
The \texttt{VkPerformanceQuerySubmitInfoKHR} structure containing a counter pass index. The number of passes required for a given performance query pool can be queried via a call to \texttt{vkGetPhysicalDeviceQueueFamilyPerformanceQueryPassesKHR}.

\begin{quote}
\textbf{Note}
Command buffers created with \texttt{VK\_COMMAND\_BUFFER\_USAGE\_ONE\_TIME\_SUBMIT\_BIT} must not be re-submitted. Changing command buffer usage bits may affect performance. To avoid this, the application should re-record any command buffers with the \texttt{VK\_COMMAND\_BUFFER\_USAGE\_ONE\_TIME\_SUBMIT\_BIT} when multiple counter passes are required.
\end{quote}

Performance counter results from a performance query pool can be obtained with the command \texttt{vkGetQueryPoolResults}.

The \texttt{VkPerformanceCounterResultKHR} union is defined as:

- \texttt{int32} is a 32-bit signed integer value.
- \texttt{int64} is a 64-bit signed integer value.
- \texttt{uint32} is a 32-bit unsigned integer value.
- \texttt{uint64} is a 64-bit unsigned integer value.
- \texttt{float32} is a 32-bit floating-point value.
- \texttt{float64} is a 64-bit floating-point value.

Performance query results are returned in an array of \texttt{VkPerformanceCounterResultKHR} unions containing the data associated with each counter in the query, stored in the same order as the counters supplied in \texttt{pCounterIndices} when creating the performance query. The \texttt{VkPerformanceCounterKHR::unit} enumeration specifies how to parse the counter data.

```c
// Provided by VK_KHR_performance_query
typedef union VkPerformanceCounterResultKHR {
    int32_t       int32;
    int64_t       int64;
    uint32_t      uint32;
    uint64_t      uint64;
    float         float32;
    double        float64;
} VkPerformanceCounterResultKHR;
```

\subsection{18.6.1. Profiling Lock}

To record and submit a command buffer containing a performance query pool the profiling lock must be held. The profiling lock must be acquired prior to any call to \texttt{vkBeginCommandBuffer} that will be using a performance query pool. The profiling lock must be held while any command buffer containing a performance query pool is in the \textit{recording}, \textit{executable}, or \textit{pending state}. To acquire the profiling lock, call:
// Provided by VK_KHR_performance_query
VkResult vkAcquireProfilingLockKHR(
    VkDevice device,
    const VkAcquireProfilingLockInfoKHR* pInfo);

- **device** is the logical device to profile.
- **pInfo** is a pointer to a `VkAcquireProfilingLockInfoKHR` structure containing information about how the profiling is to be acquired.

Implementations may allow multiple actors to hold the profiling lock concurrently.

### Valid Usage (Implicit)

- VUID-vkAcquireProfilingLockKHR-device-parameter
  
  **device** must be a valid `VkDevice` handle

- VUID-vkAcquireProfilingLockKHR-pInfo-parameter
  
  **pInfo** must be a valid pointer to a valid `VkAcquireProfilingLockInfoKHR` structure

### Return Codes

**Success**

- VK_SUCCESS

**Failure**

- VK_ERROR_OUT_OF_HOST_MEMORY
- VK_TIMEOUT

The `VkAcquireProfilingLockInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_performance_query
typedef struct VkAcquireProfilingLockInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkAcquireProfilingLockFlagsKHR flags;
    uint64_t timeout;
} VkAcquireProfilingLockInfoKHR;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **timeout** indicates how long the function waits, in nanoseconds, if the profiling lock is not available.
Valid Usage (Implicit)

- VUID-VkAcquireProfilingLockInfoKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_ACQUIRE_PROFILING_LOCK_INFO_KHR

- VUID-VkAcquireProfilingLockInfoKHR-pNext-pNext
  pNext must be NULL

- VUID-VkAcquireProfilingLockInfoKHR-flags-zerobitmask
  flags must be 0

If `timeout` is 0, `vkAcquireProfilingLockKHR` will not block while attempting to acquire the profiling lock. If `timeout` is `UINT64_MAX`, the function will not return until the profiling lock was acquired.

```c
// Provided by VK_KHR_performance_query
typedef enum VkAcquireProfilingLockFlagBitsKHR {
} VkAcquireProfilingLockFlagBitsKHR;

// Provided by VK_KHR_performance_query
typedef VkFlags VkAcquireProfilingLockFlagsKHR;
```

`VkAcquireProfilingLockFlagsKHR` is a bitmask type for setting a mask, but is currently reserved for future use.

To release the profiling lock, call:

```c
// Provided by VK_KHR_performance_query
void vkReleaseProfilingLockKHR(
    VkDevice device);
```

- `device` is the logical device to cease profiling on.

Valid Usage

- VUID-vkReleaseProfilingLockKHR-device-03235
  The profiling lock of `device` must have been held via a previous successful call to `vkAcquireProfilingLockKHR`

Valid Usage (Implicit)

- VUID-vkReleaseProfilingLockKHR-device-parameter
  `device` must be a valid `VkDevice` handle
18.7. Transform Feedback Queries

Transform feedback queries track the number of primitives attempted to be written and actually written, by the vertex stream being captured, to a transform feedback buffer. This query is updated during drawing commands while transform feedback is active. The number of primitives actually written will be less than the number attempted to be written if the bound transform feedback buffer size was too small for the number of primitives actually drawn. Primitives are not written beyond the bound range of the transform feedback buffer. A transform feedback query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end transform feedback queries for any supported vertex stream. When a transform feedback query begins, the count of primitives written and primitives needed starts from zero. For each drawing command, the count is incremented as vertex attribute outputs are captured to the transform feedback buffers while transform feedback is active.

When a transform feedback query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

18.8. Primitives Generated Queries

When a generated primitive query for a vertex stream is active, the primitives-generated count is incremented every time a primitive emitted to that stream reaches the transform feedback stage, whether or not transform feedback is active. A primitives generated query is begun and ended by calling `vkCmdBeginQuery` and `vkCmdEndQuery`, respectively to query for vertex stream zero. `vkCmdBeginQueryIndexedEXT` and `vkCmdEndQueryIndexedEXT` can be used to begin and end primitives generated queries for any supported vertex stream. When a primitives generated query begins, the count of primitives generated starts from zero.

When a primitives generated query finishes, the result for that query is marked as available. The application can then either copy the result to a buffer (via `vkCmdCopyQueryPoolResults`) or request it be put into host memory (via `vkGetQueryPoolResults`).

**Note**
The result of this query is typically identical to `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT`, but the primitives generated query is deterministic, i.e. it must be identical to the number of primitives processed. `VK_QUERY_PIPELINE_STATISTIC_CLIPPING_INVOCATIONS_BIT` may vary for implementation dependent reasons, e.g. the same primitive may be processed multiple times for purposes of clipping.

18.9. Intel performance queries

Intel performance queries allow an application to capture performance data for a set of commands. Performance queries are used in a similar way than other types of queries. A main difference with existing queries is that the resulting data should be handed over to a library capable to produce human readable results rather than being read directly by an application.
Prior to creating a performance query pool, initialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkInitializePerformanceApiINTEL(
    VkDevice device,
    const VkInitializePerformanceApiInfoINTEL* pInitializeInfo);
```

- `device` is the logical device used for the queries.
- `pInitializeInfo` is a pointer to a `VkInitializePerformanceApiInfoINTEL` structure specifying initialization parameters.

**Valid Usage (Implicit)**

- VUID-vkInitializePerformanceApiINTEL-device-parameter `device` must be a valid `VkDevice` handle
- VUID-vkInitializePerformanceApiINTEL-pInitializeInfo-parameter `pInitializeInfo` must be a valid pointer to a valid `VkInitializePerformanceApiInfoINTEL` structure

**Return Codes**

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkInitializePerformanceApiInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkInitializePerformanceApiInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    void* pUserData;
} VkInitializePerformanceApiInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `pUserData` is a pointer for application data.
Valid Usage (Implicit)

- VUID-VkInitializePerformanceApiInfoINTEL-sType-sType
  sType must be VK_STRUCTURE_TYPE_INITIALIZE_PERFORMANCE_API_INFO_INTEL

- VUID-VkInitializePerformanceApiInfoINTEL-pNext-pNext
  pNext must be NULL

Once performance query operations have completed, uninitialize the device for performance queries with the call:

```c
// Provided by VK_INTEL_performance_query
void vkUninitializePerformanceApiINTEL(VkDevice device);
```

- `device` is the logical device used for the queries.

Valid Usage (Implicit)

- device must be a valid VkDevice handle

Some performance query features of a device can be discovered with the call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkGetPerformanceParameterINTEL(VkDevice device,
                                       VkPerformanceParameterTypeINTEL parameter,
                                       VkPerformanceValueINTEL* pValue);
```

- `device` is the logical device to query.
- `parameter` is the parameter to query.
- `pValue` is a pointer to a VkPerformanceValueINTEL structure in which the type and value of the parameter are returned.

Valid Usage (Implicit)

- device must be a valid VkDevice handle
- parameter must be a valid VkPerformanceParameterTypeINTEL value
- pValue must be a valid pointer to a VkPerformanceValueINTEL structure

1298
Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

Possible values of `vkGetPerformanceParameterINTEL::parameter`, specifying a performance query feature, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceParameterTypeINTEL {
    VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL = 0,
    VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL = 1,
} VkPerformanceParameterTypeINTEL;
```

• `VK_PERFORMANCE_PARAMETER_TYPE_HW_COUNTERS_SUPPORTED_INTEL` has a boolean result which tells whether hardware counters can be captured.

• `VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL` has a 32 bits integer result which tells how many bits can be written into the `VkPerformanceValueINTEL` value.

The `VkPerformanceValueINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceValueINTEL {
    VkPerformanceValueTypeINTEL type;
    VkPerformanceValueDataINTEL data;
} VkPerformanceValueINTEL;
```

• `type` is a `VkPerformanceValueTypeINTEL` value specifying the type of the returned data.

• `data` is a `VkPerformanceValueDataINTEL` union specifying the value of the returned data.

Valid Usage (Implicit)

• VUID-VkPerformanceValueINTEL-type-parameter
  `type` must be a valid `VkPerformanceValueTypeINTEL` value

• VUID-VkPerformanceValueINTEL-valueString-parameter
  If `type` is `VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL`, the `valueString` member of `data` must be a null-terminated UTF-8 string

Possible values of `VkPerformanceValueINTEL::type`, specifying the type of the data returned in
VkPerformanceValueINTEL::data, are:

- **VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL** specifies that unsigned 32-bit integer data is returned in `data.value32`.
- **VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL** specifies that unsigned 64-bit integer data is returned in `data.value64`.
- **VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL** specifies that floating-point data is returned in `data.valueFloat`.
- **VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL** specifies that `Bool32` data is returned in `data.valueBool`.
- **VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL** specifies that a pointer to a null-terminated UTF-8 string is returned in `data.valueString`. The pointer is valid for the lifetime of the device parameter passed to `vkGetPerformanceParameterINTEL`.

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceValueTypeINTEL {
    VK_PERFORMANCE_VALUE_TYPE_UINT32_INTEL = 0,
    VK_PERFORMANCE_VALUE_TYPE_UINT64_INTEL = 1,
    VK_PERFORMANCE_VALUE_TYPE_FLOAT_INTEL = 2,
    VK_PERFORMANCE_VALUE_TYPE_BOOL_INTEL = 3,
    VK_PERFORMANCE_VALUE_TYPE_STRING_INTEL = 4,
} VkPerformanceValueTypeINTEL;
```

The `VkPerformanceValueDataINTEL` union is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef union VkPerformanceValueDataINTEL {
    uint32_t value32;
    uint64_t value64;
    float valueFloat;
    VkBool32 valueBool;
    const char* valueString;
} VkPerformanceValueDataINTEL;
```

- `data.value32` represents 32-bit integer data.
- `data.value64` represents 64-bit integer data.
- `data.valueFloat` represents floating-point data.
- `data.valueBool` represents `Bool32` data.
- `data.valueString` represents a pointer to a null-terminated UTF-8 string.

The correct member of the union is determined by the associated `VkPerformanceValueTypeINTEL` value.

The `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure is defined as:
To create a pool for Intel performance queries, set `VkQueryPoolCreateInfo::queryType` to `VK_QUERY_TYPE_PERFORMANCE_QUERY_INTEL` and add a `VkQueryPoolPerformanceQueryCreateInfoINTEL` structure to the `pNext` chain of the `VkQueryPoolCreateInfo` structure.

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `performanceCountersSampling` describe how performance queries should be captured.

**Valid Usage (Implicit)**

- `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_QUERY_POOL_PERFORMANCE_QUERY_CREATE_INFO_INTEL`  
- `VUID-VkQueryPoolPerformanceQueryCreateInfoINTEL-performanceCountersSampling-performanceCountersSampling`  
  `performanceCountersSampling` must be a valid `VkQueryPoolSamplingModeINTEL` value

Possible values of `VkQueryPoolPerformanceQueryCreateInfoINTEL::performanceCountersSampling` are:

- `VK_QUERY_POOL_SAMPLING_MODE_MANUAL_INTEL` is the default mode in which the application calls `vkCmdBeginQuery` and `vkCmdEndQuery` to record performance data.

To help associate query results with a particular point at which an application emitted commands, markers can be set into the command buffers with the call:

```c
VkResult vkCmdSetPerformanceMarkerINTEL(  
    VkCommandBuffer commandBuffer,  
    VkPerformanceMarkerINTEL marker,  
    VkQueryPool pool,  
    VkQueryId id)  
```
const VkPerformanceMarkerInfoINTEL* pMarkerInfo);  

The last marker set onto a command buffer before the end of a query will be part of the query result.

Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-parameter
  commandBuffer **must** be a valid VkCommandBuffer handle
- VUID-vkCmdSetPerformanceMarkerINTEL-pMarkerInfo-parameter
  pMarkerInfo **must** be a valid pointer to a valid VkPerformanceMarkerInfoINTEL structure
- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetPerformanceMarkerINTEL-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer is allocated from **must** support graphics, compute, or transfer operations
- VUID-vkCmdSetPerformanceMarkerINTEL-videocoding
  This command **must** only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
<tr>

<td></td>
<td></td>
<td>Transfer</td>
</tr>
</tbody>
</table>

Return Codes

Success
- VK_SUCCESS

Failure
- VK_ERROR_TOO_MANY_OBJECTS
- VK_ERROR_OUT_OF_HOST_MEMORY
The `VkPerformanceMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceMarkerInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    uint64_t marker;
} VkPerformanceMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the opaque query results.

### Valid Usage (Implicit)

- VUID-VkPerformanceMarkerInfoINTEL-sType-sType `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_MARKER_INFO_INTEL`
- VUID-VkPerformanceMarkerInfoINTEL-pNext-pNext `pNext` must be `NULL`

When monitoring the behavior of an application within the dataset generated by the entire set of applications running on the system, it is useful to identify draw calls within a potentially huge amount of performance data. To do so, application can generate stream markers that will be used to trace back a particular draw call with a particular performance data item.

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceStreamMarkerINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceStreamMarkerInfoINTEL* pMarkerInfo);
```

### Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-pMarkerInfo-parameter `pMarkerInfo` must be a valid pointer to a valid `VkPerformanceStreamMarkerInfoINTEL` structure
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetPerformanceStreamMarkerINTEL-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, compute, or transfer operations
Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Transfer</td>
</tr>
</tbody>
</table>

Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceStreamMarkerInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceStreamMarkerInfoINTEL {
    VkStructureType   sType;
    const void*       pNext;
    uint32_t           marker;
} VkPerformanceStreamMarkerInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `marker` is the marker value that will be recorded into the reports consumed by an external application.
Valid Usage

- VUID-VkPerformanceStreamMarkerInfoINTEL-marker-02735
  The value written by the application into marker must only use the valid bits as reported by vkGetPerformanceParameterINTEL with the VK_PERFORMANCE_PARAMETER_TYPE_STREAM_MARKER_VALID_BITS_INTEL.

Valid Usage (Implicit)

- VUID-VkPerformanceStreamMarkerInfoINTEL-sType-sType
  sType must be VK_STRUCTURE_TYPE_PERFORMANCE_STREAM_MARKER_INFO_INTEL.

- VUID-VkPerformanceStreamMarkerInfoINTEL-pNext-pNext
  pNext must be NULL.

Some applications might want to measure the effect of a set of commands with different settings. It is possible to override a particular setting using:

```c
// Provided by VK_INTEL_performance_query
VkResult vkCmdSetPerformanceOverrideINTEL(
    VkCommandBuffer commandBuffer,
    const VkPerformanceOverrideInfoINTEL* pOverrideInfo);
```

- commandBuffer is the command buffer where the override takes place.
- pOverrideInfo is a pointer to a VkPerformanceOverrideInfoINTEL structure selecting the parameter to override.

Valid Usage

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-02736
  pOverrideInfo must not be used with a VkPerformanceOverrideTypeINTEL that is not reported available by vkGetPerformanceParameterINTEL.

Valid Usage (Implicit)

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle.

- VUID-vkCmdSetPerformanceOverrideINTEL-pOverrideInfo-parameter
  pOverrideInfo must be a valid pointer to a valid VkPerformanceOverrideInfoINTEL structure.

- VUID-vkCmdSetPerformanceOverrideINTEL-commandBuffer-recording
  commandBuffer must be in the recording state.
The **VkCommandPool** that **commandBuffer** was allocated from **must** support graphics, compute, or transfer operations.

This command **must** only be called outside of a video coding scope.

**Host Synchronization**

- Host access to **commandBuffer** **must** be externally synchronized.
- Host access to the **VkCommandPool** that **commandBuffer** was allocated from **must** be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Transfer</td>
</tr>
</tbody>
</table>

**Return Codes**

**Success**
- **VK_SUCCESS**

**Failure**
- **VK_ERROR_TOO_MANY_OBJECTS**
- **VK_ERROR_OUT_OF_HOST_MEMORY**

The **VkPerformanceOverrideInfoINTEL** structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceOverrideInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceOverrideTypeINTEL type;
    VkBool32 enable;
    uint64_t parameter;
} VkPerformanceOverrideInfoINTEL;
```

- **type** is the particular **VkPerformanceOverrideTypeINTEL** to set.
• **enable** defines whether the override is enabled.

• **parameter** is a potential required parameter for the override.

### Valid Usage (Implicit)

- **VUID-VkPerformanceOverrideInfoINTEL-sType-sType**
  - `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_OVERRIDE_INFO_INTEL`

- **VUID-VkPerformanceOverrideInfoINTEL-pNext-pNext**
  - `pNext` must be `NULL`

- **VUID-VkPerformanceOverrideInfoINTEL-type-parameter**
  - `type` must be a valid `VkPerformanceOverrideTypeINTEL` value

Possible values of `VkPerformanceOverrideInfoINTEL::type`, specifying performance override types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceOverrideTypeINTEL {
    VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL = 0,
    VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL = 1,
} VkPerformanceOverrideTypeINTEL;
```

- `VK_PERFORMANCE_OVERRIDE_TYPE_NULL_HARDWARE_INTEL` turns all rendering operations into noop.

- `VK_PERFORMANCE_OVERRIDE_TYPE_FLUSH_GPU_CACHES_INTEL` stalls the stream of commands until all previously emitted commands have completed and all caches been flushed and invalidated.

Before submitting command buffers containing performance queries commands to a device queue, the application must acquire and set a performance query configuration. The configuration can be released once all command buffers containing performance query commands are not in a pending state.

```c
// Provided by VK_INTEL_performance_query
VK_DEFINE_NON_DISPATCHABLE_HANDLE(VkPerformanceConfigurationINTEL)
```

To acquire a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkAcquirePerformanceConfigurationINTEL(
    VkDevice device,
    const VkPerformanceConfigurationAcquireInfoINTEL* pAcquireInfo,
    VkPerformanceConfigurationINTEL* pConfiguration);
```

- **device** is the logical device that the performance query commands will be submitted to.

- **pAcquireInfo** is a pointer to a `VkPerformanceConfigurationAcquireInfoINTEL` structure,
specifying the performance configuration to acquire.

- `pConfiguration` is a pointer to a `VkPerformanceConfigurationINTEL` handle in which the resulting configuration object is returned.

### Valid Usage (Implicit)

- VUID-vkAcquirePerformanceConfigurationINTEL-device-parameter
  - `device` must be a valid `VkDevice` handle
- VUID-vkAcquirePerformanceConfigurationINTEL-pAcquireInfo-parameter
  - `pAcquireInfo` must be a valid pointer to a valid `VkPerformanceConfigurationAcquireInfoINTEL` structure
- VUID-vkAcquirePerformanceConfigurationINTEL-pConfiguration-parameter
  - `pConfiguration` must be a valid pointer to a `VkPerformanceConfigurationINTEL` handle

### Return Codes

**Success**
- `VK_SUCCESS`

**Failure**
- `VK_ERROR_TOO_MANY_OBJECTS`
- `VK_ERROR_OUT_OF_HOST_MEMORY`

The `VkPerformanceConfigurationAcquireInfoINTEL` structure is defined as:

```c
// Provided by VK_INTEL_performance_query
typedef struct VkPerformanceConfigurationAcquireInfoINTEL {
    VkStructureType sType;
    const void* pNext;
    VkPerformanceConfigurationTypeINTEL type;
} VkPerformanceConfigurationAcquireInfoINTEL;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `type` is one of the `VkPerformanceConfigurationTypeINTEL` type of performance configuration that will be acquired.

### Valid Usage (Implicit)

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-sType-sType
  - `sType` must be `VK_STRUCTURE_TYPE_PERFORMANCE_CONFIGURATION_ACQUIRE_INFO_INTEL`
- VUID-VkPerformanceConfigurationAcquireInfoINTEL-pNext-pNext
pNext must be NULL

- VUID-VkPerformanceConfigurationAcquireInfoINTEL-type-parameter
type must be a valid VkPerformanceConfigurationTypeINTEL value

Possible values of VkPerformanceConfigurationAcquireInfoINTEL::type, specifying performance configuration types, are:

```c
// Provided by VK_INTEL_performance_query
typedef enum VkPerformanceConfigurationTypeINTEL {
    VK_PERFORMANCE_CONFIGURATION_TYPE_COMMAND_QUEUE_METRICS_DISCOVERY_ACTIVATED_INTEL = 0,
} VkPerformanceConfigurationTypeINTEL;
```

To set a performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkQueueSetPerformanceConfigurationINTEL(
    VkQueue queue,
    VkPerformanceConfigurationINTEL configuration);
```

- queue is the queue on which the configuration will be used.
- configuration is the configuration to use.

**Valid Usage (Implicit)**

- VUID-vkQueueSetPerformanceConfigurationINTEL-queue-parameter
queue must be a valid VkQueue handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-configuration-parameter
configuration must be a valid VkPerformanceConfigurationINTEL handle

- VUID-vkQueueSetPerformanceConfigurationINTEL-commonparent
Both of configuration, and queue must have been created, allocated, or retrieved from the same VkDevice

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

Return Codes

Success
• VK_SUCCESS

Failure
• VK_ERROR_TOO_MANY_OBJECTS
• VK_ERROR_OUT_OF_HOST_MEMORY

To release a device performance configuration, call:

```c
// Provided by VK_INTEL_performance_query
VkResult vkReleasePerformanceConfigurationINTEL(
    VkDevice device, 
    VkPerformanceConfigurationINTEL configuration);
```

• `device` is the device associated to the configuration object to release.
• `configuration` is the configuration object to release.

Valid Usage

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-02737  
  `configuration` must not be released before all command buffers submitted while the configuration was set are in pending state

Valid Usage (Implicit)

• VUID-vkReleasePerformanceConfigurationINTEL-device-parameter 
  `device` must be a valid `VkDevice` handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parameter 
  If `configuration` is not `VK_NULL_HANDLE`, `configuration` must be a valid `VkPerformanceConfigurationINTEL` handle

• VUID-vkReleasePerformanceConfigurationINTEL-configuration-parent 
  If `configuration` is a valid handle, it must have been created, allocated, or retrieved from `device`

Host Synchronization

• Host access to `configuration` must be externally synchronized
## 18.10. Result Status Queries

Result status queries are used for a single purpose - to check whether a set of operations has completed successfully or not, using the `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag.

No other data is written to such a query.

In order to determine if a queue family supports result status queries and use of `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` flag, add a `VkQueueFamilyQueryResultStatusProperties2KHR` structure to the `pNext` chain of `VkQueueFamilyProperties2` when calling `vkGetPhysicalDeviceQueueFamilyProperties2`.

The `VkQueueFamilyQueryResultStatusProperties2KHR` structure is defined as:

```c
// Provided by VK_KHR_video_queue
typedef struct VkQueueFamilyQueryResultStatusProperties2KHR {
    VkStructureType sType;
    void* pNext;
    VkBool32 queryResultStatusSupport;
} VkQueueFamilyQueryResultStatusProperties2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `queryResultStatusSupport` reports `VK_TRUE` if query type `VK_QUERY_TYPE_RESULT_STATUS_ONLY_KHR` and use of `VK_QUERY_RESULT_WITH_STATUS_BIT_KHR` are supported.

### Valid Usage (Implicit)

- `VUID-VkQueueFamilyQueryResultStatusProperties2KHR-sType-sType`  
  `sType` must be `VK_STRUCTURE_TYPE_QUEUE_FAMILY_QUERY_RESULT_STATUS_PROPERTIES_2_KHR`.

## 18.11. Video Encode Bitstream Buffer Range

Bitstream buffer range queries describe the range of bytes written in the bitstream buffer by video encode commands.
When an encode command is recorded within a bitstream buffer range query, two values are written to the query slot. The first value is an offset into the bitstream buffer where the encoded video data was written. This offset is an additional offset from the start of the range specified by the application. The second value is a size value describing the number of bytes written to the bitstream buffer beyond the offset.

One slot is consumed for each slice in each command recorded between a begin and end query pair.
Chapter 19. Clear Commands

19.1. Clearing Images Outside A Render Pass Instance

Color and depth/stencil images can be cleared outside a render pass instance using `vkCmdClearColorImage` or `vkCmdClearDepthStencilImage`, respectively. These commands are only allowed outside of a render pass instance.

To clear one or more subranges of a color image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pColor,
    uint32_t rangeCount,
    const VkImageSubresourceRange* pRanges);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `image` is the image to be cleared.
- `imageLayout` specifies the current layout of the image subresource ranges to be cleared, and must be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_GENERAL` or `VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL`.
- `pColor` is a pointer to a `VkClearColorValue` structure containing the values that the image subresource ranges will be cleared to (see Clear Values below).
- `rangeCount` is the number of image subresource range structures in `pRanges`.
- `pRanges` is a pointer to an array of `VkImageSubresourceRange` structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Each specified range in `pRanges` is cleared to the value specified by `pColor`.

Valid Usage

- VUID-vkCmdClearColorImage-image-01993
  The format features of `image` must contain `VK_FORMAT_FEATURE_TRANSFER_DST_BIT`

- VUID-vkCmdClearColorImage-image-00002
  `image` must have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdClearColorImage-image-01545
  `image` must not use any of the formats that require a sampler Y’CbCr conversion

- VUID-vkCmdClearColorImage-image-00003
  If `image` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice.

imageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR.

The VkImageSubresourceRange::aspectMask members of the elements of the pRanges array must each only include VK_IMAGE_ASPECT_COLOR_BIT.

The VkImageSubresourceRange::baseMipLevel members of the elements of the pRanges array must each be less than the mipLevels specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the levelCount member is not VK_REMAINING_MIP_LEVELS, then baseMipLevel + levelCount must be less than the mipLevels specified in VkImageCreateInfo when image was created.

The VkImageSubresourceRange::baseArrayLayer members of the elements of the pRanges array must each be less than the arrayLayers specified in VkImageCreateInfo when image was created.

For each VkImageSubresourceRange element of pRanges, if the layerCount member is not VK_REMAINING_ARRAY_LAYERS, then baseArrayLayer + layerCount must be less than the arrayLayers specified in VkImageCreateInfo when image was created.

image must not have a compressed or depth/stencil format.

pColor must be a valid pointer to a VkClearColorValue union.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, image must not be a protected image.

If commandBuffer is a protected command buffer and protectedNoFault is not supported, must not be an unprotected image.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

image must be a valid VkImage handle.
• VUID-vkCmdClearColorImage-imageLayout-parameter
  imageLayout must be a valid VkImageLayout value

• VUID-vkCmdClearColorImage-pRanges-parameter
  pRanges must be a valid pointer to an array of rangeCount valid VkImageSubresourceRange structures

• VUID-vkCmdClearColorImage-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdClearColorImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics, or compute operations

• VUID-vkCmdClearColorImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdClearColorImage-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdClearColorImage-rangeCount-arraylength
  rangeCount must be greater than 0

• VUID-vkCmdClearColorImage-commonparent
  Both of commandBuffer, and image must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

</tbody>
</table>

To clear one or more subranges of a depth/stencil image, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdClearColorImage(
    VkCommandBuffer commandBuffer,
    VkImage image,
    VkImageLayout imageLayout,
    const VkClearColorValue* pDepthStencil,
```
uint32_t
const VkImageSubresourceRange* rangeCount,
*pRanges);

• commandBuffer is the command buffer into which the command will be recorded.
• image is the image to be cleared.
• imageLayout specifies the current layout of the image subresource ranges to be cleared, and must be VK_IMAGE_LAYOUT_GENERAL or VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL.
• pDepthStencil is a pointer to a VkClearDepthStencilValue structure containing the values that the depth and stencil image subresource ranges will be cleared to (see Clear Values below).
• rangeCount is the number of image subresource range structures in pRanges.
• pRanges is a pointer to an array of VkImageSubresourceRange structures describing a range of mipmap levels, array layers, and aspects to be cleared, as described in Image Views.

Valid Usage

• VUID-vkCmdClearDepthStencilImage-image-01994
  The format features of image must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-vkCmdClearDepthStencilImage-pRanges-02658
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02659
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_STENCIL_BIT, and image was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-pRanges-02660
  If the aspect member of any element of pRanges includes VK_IMAGE_ASPECT_DEPTH_BIT, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo::usage used to create image

• VUID-vkCmdClearDepthStencilImage-image-00010
  If image is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdClearDepthStencilImage-imageLayout-00011
  imageLayout must specify the layout of the image subresource ranges of image specified in pRanges at the time this command is executed on a VkDevice

• VUID-vkCmdClearDepthStencilImage-imageLayout-00012
  imageLayout must be either of VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-vkCmdClearDepthStencilImage-aspectMask-02824
  The VkImageSubresourceRange::aspectMask member of each element of the pRanges array must not include bits other than VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT
If the image's format does not have a stencil component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_STENCIL_BIT` bit.

If the image's format does not have a depth component, then the `VkImageSubresourceRange::aspectMask` member of each element of the `pRanges` array must not include the `VK_IMAGE_ASPECT_DEPTH_BIT` bit.

The `VkImageSubresourceRange::baseMipLevel` members of the elements of the `pRanges` array must each be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `levelCount` member is not `VK_REMAINING_MIP_LEVELS`, then `baseMipLevel + levelCount` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `image` was created.

The `VkImageSubresourceRange::baseArrayLayer` members of the elements of the `pRanges` array must each be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

For each `VkImageSubresourceRange` element of `pRanges`, if the `layerCount` member is not `VK_REMAINING_ARRAY_LAYERS`, then `baseArrayLayer + layerCount` must be less than the `arrayLayers` specified in `VkImageCreateInfo` when `image` was created.

image must have a depth/stencil format.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, image must not be a protected image.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, image must not be an unprotected image.

Valid Usage (Implicit)

- commandBuffer must be a valid `VkCommandBuffer` handle
- image must be a valid `VkImage` handle
- imageLayout must be a valid `VkImageLayout` value
- pDepthStencil-parameter
**pDepthStencil must** be a valid pointer to a valid `VkClearDepthStencilValue` structure

- **VUID-vkCmdClearDepthStencilImage-pRanges-parameter**
  - **pRanges must** be a valid pointer to an array of `rangeCount` valid `VkImageSubresourceRange` structures

- **VUID-vkCmdClearDepthStencilImage-commandBuffer-recording**
  - **commandBuffer must** be in the **recording state**

- **VUID-vkCmdClearDepthStencilImage-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- **VUID-vkCmdClearDepthStencilImage-renderpass**
  - This command **must** only be called outside of a render pass instance

- **VUID-vkCmdClearDepthStencilImage-videoencoding**
  - This command **must** only be called outside of a video coding scope

- **VUID-vkCmdClearDepthStencilImage-rangeCount-arraylength**
  - **rangeCount must** be greater than 0

- **VUID-vkCmdClearDepthStencilImage-commonparent**
  - Both of `commandBuffer`, and `image` **must** have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

---

Clears outside render pass instances are treated as transfer operations for the purposes of memory barriers.

### 19.2. Clearing Images Inside A Render Pass Instance

To clear one or more regions of color and depth/stencil attachments inside a render pass instance, call:
void vkCmdClearAttachments(
    VkCommandBuffer commandBuffer,
    uint32_t attachmentCount,
    const VkClearAttachment* pAttachments,
    uint32_t rectCount,
    const VkClearRect* pRects);

• commandBuffer is the command buffer into which the command will be recorded.
• attachmentCount is the number of entries in the pAttachments array.
• pAttachments is a pointer to an array of VkClearAttachment structures defining the attachments to clear and the clear values to use. If any attachment index to be cleared is not backed by an image view, then the clear has no effect.
• rectCount is the number of entries in the pRects array.
• pRects is a pointer to an array of VkClearRect structures defining regions within each selected attachment to clear.

If the render pass has a fragment density map attachment, clears follow the operations of fragment density maps as if each clear region was a primitive which generates fragments. The clear color is applied to all pixels inside each fragment's area regardless if the pixels lie outside of the clear region. Clears may have a different set of supported fragment areas than draws.

Unlike other clear commands, vkCmdClearAttachments is not a transfer command. It performs its operations in rasterization order. For color attachments, the operations are executed as color attachment writes, by the VK_PIPELINE_STAGE_COLOR_ATTACHMENT_OUTPUT_BIT stage. For depth/stencil attachments, the operations are executed as depth writes and stencil writes by the VK_PIPELINE_STAGE_EARLY_FRAGMENT_TESTS_BIT and VK_PIPELINE_STAGE_LATE_FRAGMENT_TESTS_BIT stages.

vkCmdClearAttachments is not affected by the bound pipeline state.

Note
It is generally preferable to clear attachments by using the VK_ATTACHMENT_LOAD_OP_CLEAR load operation at the start of rendering, as it is more efficient on some implementations.

Valid Usage

• VUID-vkCmdClearAttachments-aspectMask-02501
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_COLOR_BIT, then the colorAttachment member of that element must either refer to a color attachment which is VK_ATTACHMENT_UNUSED, or must be a valid color attachment.

• VUID-vkCmdClearAttachments-aspectMask-02502
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_DEPTH_BIT, then the current subpass' depth/stencil attachment must...
either be VK_ATTACHMENT_UNUSED, or must have a depth component

- VUID-vkCmdClearAttachments-aspectMask-02503
  If the aspectMask member of any element of pAttachments contains VK_IMAGE_ASPECT_STENCIL_BIT, then the current subpass’ depth/stencil attachment must either be VK_ATTACHMENT_UNUSED, or must have a stencil component

- VUID-vkCmdClearAttachments-rect-02682
  The rect member of each element of pRects must have an extent.width greater than 0

- VUID-vkCmdClearAttachments-rect-02683
  The rect member of each element of pRects must have an extent.height greater than 0

- VUID-vkCmdClearAttachments-pRects-00016
  The rectangular region specified by each element of pRects must be contained within the render area of the current render pass instance

- VUID-vkCmdClearAttachments-pRects-06937
  The layers specified by each element of pRects must be contained within every attachment that pAttachments refers to, i.e. for each element of pRects, VkClearRect::baseArrayLayer VkClearRect::layerCount must be less than or equal to the number of layers rendered to in the current render pass instance

- VUID-vkCmdClearAttachments-layerCount-01934
  The layerCount member of each element of pRects must not be 0

- VUID-vkCmdClearAttachments-commandBuffer-02504
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be a protected image

- VUID-vkCmdClearAttachments-commandBuffer-02505
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, each attachment to be cleared must not be an unprotected image

- VUID-vkCmdClearAttachments-baseArrayLayer-00018
  If the render pass instance this is recorded in uses multiview, then baseArrayLayer must be zero and layerCount must be one

Valid Usage (Implicit)

- VUID-vkCmdClearAttachments-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdClearAttachments-pAttachments-parameter
  pAttachments must be a valid pointer to an array of attachmentCount valid VkClearAttachment structures

- VUID-vkCmdClearAttachments-pRects-parameter
  pRects must be a valid pointer to an array of rectCount VkClearRect structures

- VUID-vkCmdClearAttachments-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdClearAttachments-commandBuffer-cmdpool
The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdClearAttachments-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdClearAttachments-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdClearAttachments-attachmentCount-arraylength
  `attachmentCount` must be greater than 0

- VUID-vkCmdClearAttachments-rectCount-arraylength
  `rectCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Inside</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkClearRect` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearRect {
    VkRect2D rect;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkClearRect;
```

- `rect` is the two-dimensional region to be cleared.
- `baseArrayLayer` is the first layer to be cleared.
- `layerCount` is the number of layers to clear.

The layers `[baseArrayLayer, baseArrayLayer + layerCount)` counting from the base layer of the attachment image view are cleared.

The `VkClearAttachment` structure is defined as:
typedef struct VkClearAttachment {
    VkImageAspectFlags aspectMask;
    uint32_t colorAttachment;
    VkClearValue clearValue;
} VkClearAttachment;

• \textit{aspectMask} is a mask selecting the color, depth and/or stencil aspects of the attachment to be cleared.

• \textit{colorAttachment} is only meaningful if VK\_IMAGE\_ASPECT\_COLOR\_BIT is set in \textit{aspectMask}, in which case it is an index into the currently bound color attachments.

• \textit{clearValue} is the color or depth/stencil value to clear the attachment to, as described in \textit{Clear Values} below.

\textbf{Valid Usage}

• VUID-VkClearAttachment-aspectMask-00019
  If \textit{aspectMask} includes VK\_IMAGE\_ASPECT\_COLOR\_BIT, it \textbf{must} not include VK\_IMAGE\_ASPECT\_DEPTH\_BIT or VK\_IMAGE\_ASPECT\_STENCIL\_BIT

• VUID-VkClearAttachment-aspectMask-00020
  \textit{aspectMask} \textbf{must} not include VK\_IMAGE\_ASPECT\_METADATA\_BIT

• VUID-VkClearAttachment-aspectMask-02246
  \textit{aspectMask} \textbf{must} not include VK\_IMAGE\_ASPECT\_MEMORY\_PLANE\_i\_BIT\_EXT for any index \textit{i}

• VUID-VkClearAttachment-clearValue-00021
  \textit{clearValue} \textbf{must} be a valid VkClearValue union

\textbf{Valid Usage (Implicit)}

• VUID-VkClearAttachment-aspectMask-parameter
  \textit{aspectMask} \textbf{must} be a valid combination of VkImageAspectFlagBits values

• VUID-VkClearAttachment-aspectMask-requiredbitmask
  \textit{aspectMask} \textbf{must} not be 0

19.3. Clear Values

The \textit{VkClearColorValue} structure is defined as:

```c
// Provided by VK\_VERSION\_1\_0
typedef union VkClearColorValue {
    float float32[4];
    int32_t int32[4];
    uint32_t uint32[4];
} VkClearColorValue;
```

- `float32` are the color clear values when the format of the image or attachment is one of the formats in the "Interpretation of Numeric Format" table other than signed integer (SINT) or unsigned integer (UINT). Floating point values are automatically converted to the format of the image, with the clear value being treated as linear if the image is sRGB.

- `int32` are the color clear values when the format of the image or attachment is signed integer (SINT). Signed integer values are converted to the format of the image by casting to the smaller type (with negative 32-bit values mapping to negative values in the smaller type). If the integer clear value is not representable in the target type (e.g. would overflow in conversion to that type), the clear value is undefined.

- `uint32` are the color clear values when the format of the image or attachment is unsigned integer (UINT). Unsigned integer values are converted to the format of the image by casting to the integer type with fewer bits.

The four array elements of the clear color map to R, G, B, and A components of image formats, in order.

If the image has more than one sample, the same value is written to all samples for any pixels being cleared.

The `VkClearDepthStencilValue` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkClearDepthStencilValue {
    float depth;
    uint32_t stencil;
} VkClearDepthStencilValue;
```

- `depth` is the clear value for the depth aspect of the depth/stencil attachment. It is a floating-point value which is automatically converted to the attachment's format.

- `stencil` is the clear value for the stencil aspect of the depth/stencil attachment. It is a 32-bit integer value which is converted to the attachment’s format by taking the appropriate number of LSBs.

### Valid Usage

- **VUID-VkClearDepthStencilValue-depth-00022**
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `depth` must be between 0.0 and 1.0, inclusive.

The `VkClearValue` union is defined as:

```c
// Provided by VK_VERSION_1_0
typedef union VkClearValue {
```
• `color` specifies the color image clear values to use when clearing a color image or attachment.
• `depthStencil` specifies the depth and stencil clear values to use when clearing a depth/stencil image or attachment.

This union is used where part of the API requires either color or depth/stencil clear values, depending on the attachment, and defines the initial clear values in the `VkRenderPassBeginInfo` structure.

### 19.4. Filling Buffers

To clear buffer data, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdFillBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize size,
    uint32_t data);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `dstBuffer` is the buffer to be filled.
• `dstOffset` is the byte offset into the buffer at which to start filling, and must be a multiple of 4.
• `size` is the number of bytes to fill, and must be either a multiple of 4, or `VK_WHOLE_SIZE` to fill the range from offset to the end of the buffer. If `VK_WHOLE_SIZE` is used and the remaining size of the buffer is not a multiple of 4, then the nearest smaller multiple is used.
• `data` is the 4-byte word written repeatedly to the buffer to fill `size` bytes of data. The data word is written to memory according to the host endianness.

`vkCmdFillBuffer` is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in `usage` of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdFillBuffer`.

### Valid Usage

- VUID-vkCmdFillBuffer-dstOffset-00024
dstOffset must be less than the size of dstBuffer
- VUID-vkCmdFillBuffer-dstOffset-00025
dstOffset must be a multiple of 4
- VUID-vkCmdFillBuffer-size-00026
If \( \text{size} \) is not equal to \( \text{VK\_WHOLE\_SIZE} \), \( \text{size} \) must be greater than \( 0 \)

- VUID-vkCmdFillBuffer-size-00027
  If \( \text{size} \) is not equal to \( \text{VK\_WHOLE\_SIZE} \), \( \text{size} \) must be less than or equal to the size of \( \text{dstBuffer} \) minus \( \text{dstOffset} \)

- VUID-vkCmdFillBuffer-size-00028
  If \( \text{size} \) is not equal to \( \text{VK\_WHOLE\_SIZE} \), \( \text{size} \) must be a multiple of \( 4 \)

- VUID-vkCmdFillBuffer-dstBuffer-00029
  \( \text{dstBuffer} \) must have been created with \( \text{VK\_BUFFER\_USAGE\_TRANSFER\_DST\_BIT} \) usage flag

- VUID-vkCmdFillBuffer-dstBuffer-00031
  If \( \text{dstBuffer} \) is non-sparse then \( \text{dstBuffer} \) must be bound completely and contiguously to a single \( \text{VkDeviceMemory} \) object

- VUID-vkCmdFillBuffer-commandBuffer-01811
  If \( \text{commandBuffer} \) is an unprotected command buffer and \( \text{protectedNoFault} \) is not supported, \( \text{dstBuffer} \) must not be a protected buffer

- VUID-vkCmdFillBuffer-commandBuffer-01812
  If \( \text{commandBuffer} \) is a protected command buffer and \( \text{protectedNoFault} \) is not supported, \( \text{dstBuffer} \) must not be an unprotected buffer

**Valid Usage (Implicit)**

- VUID-vkCmdFillBuffer-commandBuffer-parameter
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- VUID-vkCmdFillBuffer-dstBuffer-parameter
  \( \text{dstBuffer} \) must be a valid \( \text{VkBuffer} \) handle

- VUID-vkCmdFillBuffer-commandBuffer-recording
  \( \text{commandBuffer} \) must be in the \( \text{recording state} \)

- VUID-vkCmdFillBuffer-commandBuffer-cmdpool
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support transfer, graphics or compute operations

- VUID-vkCmdFillBuffer-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdFillBuffer-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdFillBuffer-commonparent
  Both of \( \text{commandBuffer} \), and \( \text{dstBuffer} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)

**Host Synchronization**

- Host access to \( \text{commandBuffer} \) must be externally synchronized
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

**Command Properties**

</table>

**19.5. Updating Buffers**

To update buffer data inline in a command buffer, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdUpdateBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    VkDeviceSize dataSize,
    const void* pData);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `dstBuffer` is a handle to the buffer to be updated.
- `dstOffset` is the byte offset into the buffer to start updating, and **must** be a multiple of 4.
- `dataSize` is the number of bytes to update, and **must** be a multiple of 4.
- `pData` is a pointer to the source data for the buffer update, and **must** be at least `dataSize` bytes in size.

`dataSize` **must** be less than or equal to 65536 bytes. For larger updates, applications can use buffer to buffer copies.

**Note**

Buffer updates performed with `vkCmdUpdateBuffer` first copy the data into command buffer memory when the command is recorded (which requires additional storage and may incur an additional allocation), and then copy the data from the command buffer into `dstBuffer` when the command is executed on a device.

The additional cost of this functionality compared to buffer to buffer copies means it is only recommended for very small amounts of data, and is why it is limited to only 65536 bytes.
Applications can work around this by issuing multiple `vkCmdUpdateBuffer` commands to different ranges of the same buffer, but it is strongly recommended that they should not.

The source data is copied from the user pointer to the command buffer when the command is called.

`vkCmdUpdateBuffer` is only allowed outside of a render pass. This command is treated as a “transfer” operation for the purposes of synchronization barriers. The `VK_BUFFER_USAGE_TRANSFER_DST_BIT` must be specified in usage of `VkBufferCreateInfo` in order for the buffer to be compatible with `vkCmdUpdateBuffer`.

### Valid Usage

- **VUID-vkCmdUpdateBuffer-dstOffset-00032**
  - `dstOffset` must be less than the size of `dstBuffer`

- **VUID-vkCmdUpdateBuffer-dataSize-00033**
  - `dataSize` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- **VUID-vkCmdUpdateBuffer-dstBuffer-00034**
  - `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdUpdateBuffer-dstBuffer-00035**
  - If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdUpdateBuffer-dstOffset-00036**
  - `dstOffset` must be a multiple of 4

- **VUID-vkCmdUpdateBuffer-dataSize-00037**
  - `dataSize` must be less than or equal to 65536

- **VUID-vkCmdUpdateBuffer-dataSize-00038**
  - `dataSize` must be a multiple of 4

- **VUID-vkCmdUpdateBuffer-commandBuffer-01813**
  - If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- **VUID-vkCmdUpdateBuffer-commandBuffer-01814**
  - If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

### Valid Usage (Implicit)

- **VUID-vkCmdUpdateBuffer-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdUpdateBuffer-dstBuffer-parameter**
  - `dstBuffer` must be a valid `VkBuffer` handle

- **VUID-vkCmdUpdateBuffer-pData-parameter**
pData must be a valid pointer to an array of dataSize bytes

- VUID-vkCmdUpdateBuffer-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdUpdateBuffer-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdUpdateBuffer-renderpass
This command must only be called outside of a render pass instance

- VUID-vkCmdUpdateBuffer-videocoding
This command must only be called outside of a video coding scope

- VUID-vkCmdUpdateBuffer-dataSize-arraylength
dataSize must be greater than 0

- VUID-vkCmdUpdateBuffer-commonparent
Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Graphics</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

---

**Note**

The pData parameter was of type uint32_t* instead of void* prior to version 1.0.19 of the Specification and VK_HEADER_VERSION 19 of the Vulkan Header Files. This was a historical anomaly, as the source data may be of other types.
Chapter 20. Copy Commands

An application can copy buffer and image data using several methods depending on the type of data transfer. Data can be copied between buffer objects with `vkCmdCopyBuffer2` and `vkCmdCopyBuffer` and a portion of an image can be copied to another image with `vkCmdCopyImage2` and `vkCmdCopyImage`. Image data can also be copied to and from buffer memory using `vkCmdCopyImageToBuffer2`, `vkCmdCopyImageToBuffer`, `vkCmdCopyBufferToImage2`, and `vkCmdCopyBufferToImage`. Image data can be blitted (with or without scaling and filtering) with `vkCmdBlitImage2` and `vkCmdBlitImage`. Multisampled images can be resolved to a non-multisampled image with `vkCmdResolveImage2` and `vkCmdResolveImage`.

All copy commands are treated as “transfer” operations for the purposes of synchronization barriers.

All copy commands that have a source format with an X component in its format description read undefined values from those bits.

All copy commands that have a destination format with an X component in its format description write undefined values to those bits.

20.1. Copying Data Between Buffers

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBuffer(
    VkCommandBuffer commandBuffer,
    VkBuffer srcBuffer,      
    VkBuffer dstBuffer,      
    uint32_t regionCount,    
    const VkBufferCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source buffer to the same region of the destination buffer. `srcBuffer` and `dstBuffer` can be the same buffer or alias the same memory, but the resulting values are undefined if the copy regions overlap in memory.

Valid Usage

- VUID-vkCmdCopyBuffer-commandBuffer-01822
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01823
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyBuffer-commandBuffer-01824
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- VUID-vkCmdCopyBuffer-srcOffset-00113
  The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- VUID-vkCmdCopyBuffer-dstOffset-00114
  The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- VUID-vkCmdCopyBuffer-size-00115
  The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- VUID-vkCmdCopyBuffer-size-00116
  The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- VUID-vkCmdCopyBuffer-pRegions-00117
  The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- VUID-vkCmdCopyBuffer-srcBuffer-00118
  `srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-vkCmdCopyBuffer-srcBuffer-00119
  If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-vkCmdCopyBuffer-dstBuffer-00120
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- VUID-vkCmdCopyBuffer-dstBuffer-00121
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

---

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBuffer-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBuffer-srcBuffer-parameter
  `srcBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdCopyBuffer-pRegions-parameter
*Regions must* be a valid pointer to an array of `regionCount` valid `VkBufferCopy` structures

- VUID-vkCmdCopyBuffer-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdCopyBuffer-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations
- VUID-vkCmdCopyBuffer-renderpass
  This command must only be called outside of a render pass instance
- VUID-vkCmdCopyBuffer-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdCopyBuffer-regionCount-arraylength
  `regionCount` must be greater than 0
- VUID-vkCmdCopyBuffer-commonparent
  Each of `commandBuffer`, `dstBuffer`, and `srcBuffer` must have been created, allocated, or retrieved from the same `VkDevice`
• size is the number of bytes to copy.

Valid Usage

• VUID-VkBufferCopy-size-01988
  The size must be greater than 0

A more extensible version of the copy buffer command is defined below.

To copy data between buffer objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferInfo2* pCopyBufferInfo);
```

• commandBuffer is the command buffer into which the command will be recorded.
• pCopyBufferInfo is a pointer to a VkCopyBufferInfo2 structure describing the copy parameters.

This command is functionally identical to vkCmdCopyBuffer, but includes extensible sub-structures that include sType and pNext parameters, allowing them to be more easily extended.

Valid Usage

• VUID-vkCmdCopyBuffer2-commandBuffer-01822
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcBuffer must not be a protected buffer

• VUID-vkCmdCopyBuffer2-commandBuffer-01823
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstBuffer must not be a protected buffer

• VUID-vkCmdCopyBuffer2-commandBuffer-01824
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstBuffer must not be an unprotected buffer
Valid Usage (Implicit)

- **VUID-vkCmdCopyBuffer2-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyBuffer2-pCopyBufferInfo-parameter**
  
  `pCopyBufferInfo` must be a valid pointer to a valid `VkCopyBufferInfo2` structure

- **VUID-vkCmdCopyBuffer2-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdCopyBuffer2-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyBuffer2-renderpass**
  
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyBuffer2-videocoding**
  
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Transfer, Graphics, Compute</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkCopyBufferInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkBuffer dstBuffer;
    uint32_t regionCount;
    const VkBufferCopy2* pRegions;
} VkCopyBufferInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferInfo2 VkCopyBufferInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `srcBuffer` is the source buffer.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferCopy2` structures specifying the regions to copy.

Members defined by this structure with the same name as parameters in `vkCmdCopyBuffer` have the identical effect to those parameters; the child structure `VkBufferCopy2` is a variant of `VkBufferCopy` which includes `sType` and `pNext` parameters, allowing it to be extended.

### Valid Usage

- **VUID-VkCopyBufferInfo2-srcOffset-00113**  
The `srcOffset` member of each element of `pRegions` must be less than the size of `srcBuffer`

- **VUID-VkCopyBufferInfo2-dstOffset-00114**  
The `dstOffset` member of each element of `pRegions` must be less than the size of `dstBuffer`

- **VUID-VkCopyBufferInfo2-size-00115**  
The `size` member of each element of `pRegions` must be less than or equal to the size of `srcBuffer` minus `srcOffset`

- **VUID-VkCopyBufferInfo2-size-00116**  
The `size` member of each element of `pRegions` must be less than or equal to the size of `dstBuffer` minus `dstOffset`

- **VUID-VkCopyBufferInfo2-pRegions-00117**  
The union of the source regions, and the union of the destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-VkCopyBufferInfo2-srcBuffer-00118**  
`srcBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-VkCopyBufferInfo2-srcBuffer-00119**  
If `srcBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-VkCopyBufferInfo2-dstBuffer-00120**  
`dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-VkCopyBufferInfo2-dstBuffer-00121**  
If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
Valid Usage (Implicit)

- **VUID-VkCopyBufferInfo2-sType-sType**
  
  *sType* **must** be `VK_STRUCTURE_TYPE_COPY_BUFFER_INFO_2`

- **VUID-VkCopyBufferInfo2-pNext-pNext**
  
  *pNext* **must** be `NULL`

- **VUID-VkCopyBufferInfo2-srcBuffer-parameter**
  
  *srcBuffer* **must** be a valid `VkBuffer` handle

- **VUID-VkCopyBufferInfo2-dstBuffer-parameter**
  
  *dstBuffer* **must** be a valid `VkBuffer` handle

- **VUID-VkCopyBufferInfo2-pRegions-parameter**
  
  *pRegions* **must** be a valid pointer to an array of `regionCount` valid `VkBufferCopy2` structures

- **VUID-VkCopyBufferInfo2-regionCount-arraylength**
  
  *regionCount* **must** be greater than 0

- **VUID-VkCopyBufferInfo2-commonparent**
  
  Both of *dstBuffer*, and *srcBuffer* **must** have been created, allocated, or retrieved from the same `VkDevice`

The `VkBufferCopy2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBufferCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize srcOffset;
    VkDeviceSize dstOffset;
    VkDeviceSize size;
} VkBufferCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBufferCopy2 VkBufferCopy2KHR;
```

- **sType** is the type of this structure.
- **pNext** is `NULL` or a pointer to a structure extending this structure.
- **srcOffset** is the starting offset in bytes from the start of *srcBuffer*.
- **dstOffset** is the starting offset in bytes from the start of *dstBuffer*.
- **size** is the number of bytes to copy.
Valid Usage

- VUID-VkBufferCopy2-size-01988
  The size must be greater than 0

Valid Usage (Implicit)

- VUID-VkBufferCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_COPY_2
- VUID-VkBufferCopy2-pNext-pNext
  pNext must be NULL

20.2. Copying Data Between Images

vkCmdCopyImage performs image copies in a similar manner to a host memcpy. It does not perform general-purpose conversions such as scaling, resizing, blending, color-space conversion, or format conversions. Rather, it simply copies raw image data. vkCmdCopyImage can copy between images with different formats, provided the formats are compatible as defined below.

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkImage dstImage,
    VkImageLayout dstImageLayout,
    uint32_t regionCount,
    const VkImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the source image to the same region of the destination image. `srcImage` and `dstImage` can be the same image or alias the same memory.

The formats of `srcImage` and `dstImage` must be compatible. Formats are compatible if they share the
same class, as shown in the Compatible Formats table. Depth/stencil formats must match exactly.

If either srcImage or dstImage has a multi-planar format, regions of each plane to be copied must be specified separately using the srcSubresource and dstSubresource members of the VkImageCopy structure. In this case, the aspectMask of the srcSubresource or dstSubresource that refers to the multi-planar image must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT. For the purposes of vkCmdCopyImage, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the aspectMask of the corresponding subresource. This applies both to VkFormat and to coordinates used in the copy, which correspond to texels in the plane rather than how these texels map to coordinates in the image as a whole.

*Note*

For example, the VK_IMAGE_ASPECT_PLANE_1_BIT plane of a VK_FORMAT_G8_B8R8_2PLANE_420_UNORM image is compatible with an image of format VK_FORMAT_R8G8_UNORM and (less usefully) with the VK_IMAGE_ASPECT_PLANE_0_BIT plane of an image of format VK_FORMAT_G10X6_B10X6_R10X6_3PLANE_420_UNORM_3PACK16, as each texel is 2 bytes in size.

vkCmdCopyImage allows copying between size-compatible compressed and uncompressed internal formats. Formats are size-compatible if the texel block size of the uncompressed format is equal to the texel block size of the compressed format. Such a copy does not perform on-the-fly compression or decompression. When copying from an uncompressed format to a compressed format, each texel of uncompressed data of the source image is copied as a raw value to the corresponding compressed texel block of the destination image. When copying from a compressed format to an uncompressed format, each compressed texel block of the source image is copied as a raw value to the corresponding texel of uncompressed data in the destination image. Thus, for example, it is legal to copy between a 128-bit uncompressed format and a compressed format which has a 128-bit sized compressed texel block representing 4×4 texels (using 8 bits per texel), or between a 64-bit uncompressed format and a compressed format which has a 64-bit sized compressed texel block representing 4×4 texels (using 4 bits per texel).

When copying between compressed and uncompressed formats the extent members represent the texel dimensions of the source image and not the destination. When copying from a compressed image to an uncompressed image the image texel dimensions written to the uncompressed image will be source extent divided by the compressed texel block dimensions. When copying from an uncompressed image to a compressed image the image texel dimensions written to the compressed image will be the source extent multiplied by the compressed texel block dimensions. In both cases the number of bytes read and the number of bytes written will be identical.

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the extent must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions: if the srcImage is compressed, then:

- If extent.width is not a multiple of the compressed texel block width, then (extent.width +
srcOffset.x) must equal the image subresource width.

- If extent.height is not a multiple of the compressed texel block height, then (extent.height + srcOffset.y) must equal the image subresource height.

- If extent.depth is not a multiple of the compressed texel block depth, then (extent.depth + srcOffset.z) must equal the image subresource depth.

Similarly, if the dstImage is compressed, then:

- If extent.width is not a multiple of the compressed texel block width, then (extent.width + dstOffset.x) must equal the image subresource width.

- If extent.height is not a multiple of the compressed texel block height, then (extent.height + dstOffset.y) must equal the image subresource height.

- If extent.depth is not a multiple of the compressed texel block depth, then (extent.depth + dstOffset.z) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

“422” image formats that are not multi-planar are treated as having a 2×1 compressed texel block for the purposes of these rules.

vkCmdCopyImage can be used to copy image data between multisample images, but both images must have the same number of samples.

### Valid Usage

- VUID-vkCmdCopyImage-commandBuffer-01825
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcImage must not be a protected image

- VUID-vkCmdCopyImage-commandBuffer-01826
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- VUID-vkCmdCopyImage-commandBuffer-01827
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image

- VUID-vkCmdCopyImage-pRegions-00124
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- VUID-vkCmdCopyImage-srcImage-01995
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

- VUID-vkCmdCopyImage-srcImage-01546
  If srcImage is non-sparse then the image or disjoint plane to be copied must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdCopyImage-srcImageLayout-00128
**srcImageLayout** must specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- VUID-vkCmdCopyImage-srcImageLayout-01917
  **srcImageLayout** must be **VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- VUID-vkCmdCopyImage-dstImage-01996
  The **format features** of **dstImage** must contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- VUID-vkCmdCopyImage-dstImage-01547
  If **dstImage** is non-sparse then the image or **disjoint** plane that is the destination of the copy must be bound completely and contiguously to a single **VkDeviceMemory** object

- VUID-vkCmdCopyImage-dstImageLayout-00133
  **dstImageLayout** must specify the layout of the image subresources of **dstImage** specified in **pRegions** at the time this command is executed on a **VkDevice**

- VUID-vkCmdCopyImage-dstImageLayout-01395
  **dstImageLayout** must be **VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL**, **VK_IMAGE_LAYOUT_GENERAL**, or **VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR**

- VUID-vkCmdCopyImage-srcImage-01548
  If the **VkFormat** of each of **srcImage** and **dstImage** is not a **multi-planar format**, the **VkFormat** of each of **srcImage** and **dstImage** must be compatible, as defined above

- VUID-vkCmdCopyImage-None-01549
  In a copy to or from a plane of a **multi-planar image**, the **VkFormat** of the image and plane must be compatible according to the description of compatible planes for the plane being copied

- VUID-vkCmdCopyImage-srcImage-00136
  The sample count of **srcImage** and **dstImage** must match

- VUID-vkCmdCopyImage-srcSubresource-01696
  The **srcSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **srcImage** was created

- VUID-vkCmdCopyImage-dstSubresource-01697
  The **dstSubresource.mipLevel** member of each element of **pRegions** must be less than the **mipLevels** specified in **VkImageCreateInfo** when **dstImage** was created

- VUID-vkCmdCopyImage-srcSubresource-01698
  The **srcSubresource.baseArrayLayer + srcSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **srcImage** was created

- VUID-vkCmdCopyImage-dstSubresource-01699
  The **dstSubresource.baseArrayLayer + dstSubresource.layerCount** of each element of **pRegions** must be less than or equal to the **arrayLayers** specified in **VkImageCreateInfo** when **dstImage** was created

- VUID-vkCmdCopyImage-srcOffset-01783
  The **srcOffset** and **extent** members of each element of **pRegions** must respect the image transfer granularity requirements of **commandBuffer**’s command pool’s queue family, as described in **VkQueueFamilyProperties**
The dstOffset and extent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties.

dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

If neither srcImage nor dstImage has a multi-planar image format then for each element of pRegions, srcSubresource.aspectMask and dstSubresource.aspectMask must match.

If srcImage has a VkFormat with two planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT.

If srcImage has a VkFormat with three planes then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT.

If dstImage has a VkFormat with two planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT or VK_IMAGE_ASPECT_PLANE_1_BIT.

If dstImage has a VkFormat with three planes then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT.

If srcImage has a multi-planar image format and the dstImage does not have a multi-planar image format, then for each element of pRegions, dstSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

If dstImage has a multi-planar image format and the srcImage does not have a multi-planar image format, then for each element of pRegions, srcSubresource.aspectMask must be VK_IMAGE_ASPECT_COLOR_BIT.

If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1.

If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1.

For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage.
For each element of \( pRegions \), \( dstSubresource.aspectMask \) must specify aspects present in \( dstImage \).

For each element of \( pRegions, srcOffset.x \) and \( (extent.width + srcOffset.x) \) must both be greater than or equal to 0 and less than or equal to the width of the specified \( srcSubresource \) of \( srcImage \).

For each element of \( pRegions, srcOffset.y \) and \( (extent.height + srcOffset.y) \) must both be greater than or equal to 0 and less than or equal to the height of the specified \( srcSubresource \) of \( srcImage \).

If \( srcImage \) is of type \( VK_IMAGE_TYPE_1D \), then for each element of \( pRegions, srcOffset.y \) must be 0 and \( extent.height \) must be 1.

If \( srcImage \) is of type \( VK_IMAGE_TYPE_3D \), then for each element of \( pRegions, srcOffset.z \) and \( (extent.depth + srcOffset.z) \) must both be greater than or equal to 0 and less than or equal to the depth of the specified \( srcSubresource \) of \( srcImage \).

If \( srcImage \) is of type \( VK_IMAGE_TYPE_1D \), then for each element of \( pRegions, srcOffset.z \) must be 0 and \( extent.depth \) must be 1.

If \( dstImage \) is of type \( VK_IMAGE_TYPE_1D \), then for each element of \( pRegions, dstOffset.z \) must be 0 and \( extent.depth \) must be 1.

If \( dstImage \) is of type \( VK_IMAGE_TYPE_2D \), then for each element of \( pRegions, dstOffset.z \) must be 0.

If \( dstImage \) is of type \( VK_IMAGE_TYPE_2D \), then for each element of \( pRegions, dstOffset.z \) must be 0.

If \( srcImage \) and \( dstImage \) are both of type \( VK_IMAGE_TYPE_2D \), then for each element of \( pRegions, extent.depth \) must be 1.

If \( srcImage \) is of type \( VK_IMAGE_TYPE_2D \), and \( dstImage \) is of type \( VK_IMAGE_TYPE_3D \), then for each element of \( pRegions, extent.depth \) must equal \( srcSubresource.layerCount \).

If \( dstImage \) is of type \( VK_IMAGE_TYPE_2D \), and \( srcImage \) is of type \( VK_IMAGE_TYPE_3D \), then for each element of \( pRegions, extent.depth \) must equal \( dstSubresource.layerCount \).

For each element of \( pRegions, dstOffset.x \) and \( (extent.width + dstOffset.x) \) must both be greater than or equal to 0 and less than or equal to the width of the specified \( dstSubresource \) of \( dstImage \).
For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage.

If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1.

If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage.

If srcImage is a blocked image, then for each element of pRegions, all members of srcOffset must be a multiple of the corresponding dimensions of the compressed texel block.

If srcImage is a blocked image, then for each element of pRegions, extent.width must be a multiple of the compressed texel block width or (extent.width + srcOffset.x) must equal the width of the specified srcSubresource of srcImage.

If srcImage is a blocked image, then for each element of pRegions, extent.height must be a multiple of the compressed texel block height or (extent.height + srcOffset.y) must equal the height of the specified srcSubresource of srcImage.

If srcImage is a blocked image, then for each element of pRegions, extent.depth must be a multiple of the compressed texel block depth or (extent.depth + srcOffset.z) must equal the depth of the specified srcSubresource of srcImage.

If dstImage is a blocked image, then for each element of pRegions, all members of dstOffset must be a multiple of the corresponding dimensions of the compressed texel block.

If dstImage is a blocked image, then for each element of pRegions, extent.width must be a multiple of the compressed texel block width or (extent.width + dstOffset.x) must equal the width of the specified dstSubresource of dstImage.

If dstImage is a blocked image, then for each element of pRegions, extent.height must be a multiple of the compressed texel block height or (extent.height + dstOffset.y) must equal the height of the specified dstSubresource of dstImage.

If dstImage is a blocked image, then for each element of pRegions, extent.depth must be a multiple of the compressed texel block depth or (extent.depth + dstOffset.z) must equal the depth of the specified dstSubresource of dstImage.

If the aspect member of any element of pRegions includes any flag other than
VK_IMAGE_ASPECT_STENCIL_BIT or srcImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageCreateInfo ::usage used to create srcImage

- VUID-vkCmdCopyImage-aspect-06663
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or dstImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo ::usage used to create dstImage

- VUID-vkCmdCopyImage-aspect-06664
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- VUID-vkCmdCopyImage-aspect-06665
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

Valid Usage (Implicit)

- VUID-vkCmdCopyImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdCopyImage-srcImage-parameter
  srcImage must be a valid VkImage handle

- VUID-vkCmdCopyImage-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyImage-dstImage-parameter
  dstImage must be a valid VkImage handle

- VUID-vkCmdCopyImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

- VUID-vkCmdCopyImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageCopy structures

- VUID-vkCmdCopyImage-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdCopyImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImage-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImage-videocoding
  This command must only be called outside of a video coding scope
• VUID-vkCmdCopyImage-regionCount-arraylength
  *regionCount must* be greater than 0

• VUID-vkCmdCopyImage-commonparent
  Each of *commandBuffer, dstImage, and srcImage must* have been created, allocated, or retrieved from the same *VkDevice*

---

**Host Synchronization**

• Host access to *commandBuffer must* be externally synchronized

• Host access to the *VkCommandPool* that *commandBuffer was* allocated from *must* be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>

The *VkImageCopy* structure is defined as:

```c
typedef struct VkImageCopy {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageCopy;
```

- *srcSubresource* and *dstSubresource* are *VkImageSubresourceLayers* structures specifying the image subresources of the images used for the source and destination image data, respectively.

- *srcOffset* and *dstOffset* select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.

- *extent* is the size in texels of the image to copy in width, height and depth.

For *VK_IMAGE_TYPE_3D* images, copies are performed slice by slice starting with the z member of the *srcOffset* or *dstOffset*, and copying *depth* slices. For images with multiple layers, copies are performed layer by layer starting with the *baseArrayLayer* member of the *srcSubresource* or *dstSubresource* and copying *layerCount* layers. Image data *can* be copied between images with different image types. If one image is *VK_IMAGE_TYPE_3D* and the other image is *VK_IMAGE_TYPE_2D* with
multiple layers, then each slice is copied to or from a different layer; depth slices in the 3D image correspond to layerCount layers in the 2D image, with an effective depth of 1 used for the 2D image.

Copies involving a multi-planar image format specify the region to be copied in terms of the plane to be copied, not the coordinates of the multi-planar image. This means that copies accessing the R/B planes of “.422” format images must fit the copied region within half the width of the parent image, and that copies accessing the R/B planes of “.420” format images must fit the copied region within half the width and height of the parent image.

**Valid Usage**

- VUID-VkImageCopy-extent-00140
  The number of slices of the extent (for 3D) or layers of the srcSubresource (for non-3D) must match the number of slices of the extent (for 3D) or layers of the dstSubresource (for non-3D)

- VUID-VkImageCopy-extent-06668
  extent.width must not be 0

- VUID-VkImageCopy-extent-06669
  extent.height must not be 0

- VUID-VkImageCopy-extent-06670
  extent.depth must not be 0

**Valid Usage (Implicit)**

- VUID-VkImageCopy-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure

- VUID-VkImageCopy-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

The VkImageSubresourceLayers structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageSubresourceLayers {
    VkImageAspectFlags aspectMask;
    uint32_t mipLevel;
    uint32_t baseArrayLayer;
    uint32_t layerCount;
} VkImageSubresourceLayers;
```

- aspectMask is a combination of VkImageAspectFlagBits, selecting the color, depth and/or stencil aspects to be copied.
- mipLevel is the mipmap level to copy
- baseArrayLayer and layerCount are the starting layer and number of layers to copy.
Valid Usage

• VUID-VkImageSubresourceLayers-aspectMask-00167
  If `aspectMask` contains `VK_IMAGE_ASPECT_COLOR_BIT`, it must not contain either of `VK_IMAGE_ASPECT_DEPTH_BIT` or `VK_IMAGE_ASPECT_STENCIL_BIT`

• VUID-VkImageSubresourceLayers-aspectMask-00168
  `aspectMask` must not contain `VK_IMAGE_ASPECT_MEMORY_PLANE_i_BIT_EXT` for any index `i`

• VUID-VkImageSubresourceLayers-layerCount-01700
  `layerCount` must be greater than 0

Valid Usage (Implicit)

• VUID-VkImageSubresourceLayers-aspectMask-parameter
  `aspectMask` must be a valid combination of `VkImageAspectFlagBits` values

• VUID-VkImageSubresourceLayers-aspectMask-requiredbitmask
  `aspectMask` must not be 0

A more extensible version of the copy image command is defined below.

To copy data between image objects, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageInfo2* pCopyImageInfo);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `pCopyImageInfo` is a pointer to a `VkCopyImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.
Valid Usage

- **VUID-vkCmdCopyImage2-commandBuffer-01825**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdCopyImage2-commandBuffer-01826**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- **VUID-vkCmdCopyImage2-commandBuffer-01827**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

Valid Usage (Implicit)

- **VUID-vkCmdCopyImage2-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdCopyImage2-pCopyImageInfo-parameter**
  `pCopyImageInfo` must be a valid pointer to a valid `VkCopyImageInfo2` structure

- **VUID-vkCmdCopyImage2-commandBuffer-recording**
  `commandBuffer` must be in the `recording` state

- **VUID-vkCmdCopyImage2-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations

- **VUID-vkCmdCopyImage2-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdCopyImage2-videocoding**
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
The `VkCopyImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageCopy2* pRegions;
} VkCopyImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageInfo2 VkCopyImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the current layout of the source image subresource.
- `dstImage` is the destination image.
- `dstImageLayout` is the current layout of the destination image subresource.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkImageCopy2` structures specifying the regions to copy.

**Valid Usage**

- `VUID-VkCopyImageInfo2-pRegions-00124`
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory
• VUID-VkCopyImageInfo2-srcImage-01995
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

• VUID-VkCopyImageInfo2-srcImage-01546
  If srcImage is non-sparse then the image or disjoint plane to be copied must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyImageInfo2-srcImageLayout-00128
  srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkCopyImageInfo2-srcImageLayout-01917
  srcImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-VkCopyImageInfo2-dstImage-01996
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

• VUID-VkCopyImageInfo2-dstImage-01547
  If dstImage is non-sparse then the image or disjoint plane that is the destination of the copy must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyImageInfo2-dstImageLayout-00133
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkCopyImageInfo2-dstImageLayout-01395
  dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-VkCopyImageInfo2-srcImage-01548
  If the VkFormat of each of srcImage and dstImage is not a multi-planar format, the VkFormat of each of srcImage and dstImage must be compatible, as defined above

• VUID-VkCopyImageInfo2-None-01549
  In a copy to or from a plane of a multi-planar image, the VkFormat of the image and plane must be compatible according to the description of compatible planes for the plane being copied

• VUID-VkCopyImageInfo2-srcImage-00136
  The sample count of srcImage and dstImage must match

• VUID-VkCopyImageInfo2-srcSubresource-01696
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageInfo2-dstSubresource-01697
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-VkCopyImageInfo2-srcSubresource-01698
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageInfo2-dstSubresource-01699
The \( \text{dstSubresource.baseArrayLayer} + \text{dstSubresource.layerCount} \) of each element of \( \text{pRegions} \) must be less than or equal to the \( \text{arrayLayers} \) specified in \text{VkImageCreateInfo} when \( \text{dstImage} \) was created.

- VUID-VkCopyImageInfo2-srcOffset-01783
  The \( \text{srcOffset} \) and \( \text{extent} \) members of each element of \( \text{pRegions} \) must respect the image transfer granularity requirements of \text{commandBuffer}'s command pool's queue family, as described in \text{VkQueueFamilyProperties}.

- VUID-VkCopyImageInfo2-dstOffset-01784
  The \( \text{dstOffset} \) and \( \text{extent} \) members of each element of \( \text{pRegions} \) must respect the image transfer granularity requirements of \text{commandBuffer}'s command pool's queue family, as described in \text{VkQueueFamilyProperties}.

- VUID-VkCopyImageInfo2-dstImage-02542
  \( \text{dstImage} \) and \( \text{srcImage} \) must not have been created with flags containing \text{VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT}.

- VUID-VkCopyImageInfo2-srcImage-01551
  If neither \( \text{srcImage} \) nor \( \text{dstImage} \) has a multi-planar image format then for each element of \( \text{pRegions} \), \( \text{srcSubresource.aspectMask} \) and \( \text{dstSubresource.aspectMask} \) must match.

- VUID-VkCopyImageInfo2-srcImage-01552
  If \( \text{srcImage} \) has a \text{VkFormat} with two planes then for each element of \( \text{pRegions} \), \( \text{srcSubresource.aspectMask} \) must be \text{VK_IMAGE_ASPECT_PLANE_0_BIT} or \text{VK_IMAGE_ASPECT_PLANE_1_BIT}.

- VUID-VkCopyImageInfo2-srcImage-01553
  If \( \text{srcImage} \) has a \text{VkFormat} with three planes then for each element of \( \text{pRegions} \), \( \text{srcSubresource.aspectMask} \) must be \text{VK_IMAGE_ASPECT_PLANE_0_BIT}, \text{VK_IMAGE_ASPECT_PLANE_1_BIT}, or \text{VK_IMAGE_ASPECT_PLANE_2_BIT}.

- VUID-VkCopyImageInfo2-dstImage-01554
  If \( \text{dstImage} \) has a \text{VkFormat} with two planes then for each element of \( \text{pRegions} \), \( \text{dstSubresource.aspectMask} \) must be \text{VK_IMAGE_ASPECT_PLANE_0_BIT} or \text{VK_IMAGE_ASPECT_PLANE_1_BIT}.

- VUID-VkCopyImageInfo2-dstImage-01555
  If \( \text{dstImage} \) has a \text{VkFormat} with three planes then for each element of \( \text{pRegions} \), \( \text{dstSubresource.aspectMask} \) must be \text{VK_IMAGE_ASPECT_PLANE_0_BIT}, \text{VK_IMAGE_ASPECT_PLANE_1_BIT}, or \text{VK_IMAGE_ASPECT_PLANE_2_BIT}.

- VUID-VkCopyImageInfo2-srcImage-04443
  If \( \text{srcImage} \) is of type \text{VK_IMAGE_TYPE_3D}, then for each element of \( \text{pRegions} \),
srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1

- VUID-VkCopyImageInfo2-dstImage-04444
  If dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1

- VUID-VkCopyImageInfo2-aspectMask-00142
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in srcImage

- VUID-VkCopyImageInfo2-aspectMask-00143
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in dstImage

- VUID-VkCopyImageInfo2-srcOffset-00144
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcOffset-00145
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcImage-00146
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

- VUID-VkCopyImageInfo2-srcOffset-00147
  If srcImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkCopyImageInfo2-srcImage-01785
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.z must be 0

- VUID-VkCopyImageInfo2-dstImage-01786
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.z must be 0

- VUID-VkCopyImageInfo2-srcImage-01787
  If srcImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0

- VUID-VkCopyImageInfo2-dstImage-01788
  If dstImage is of type VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0

- VUID-VkCopyImageInfo2-srcImage-01790
  If srcImage and dstImage are both of type VK_IMAGE_TYPE_2D, then for each element of pRegions, extent.depth must be 1

- VUID-VkCopyImageInfo2-srcImage-01791
  If srcImage is of type VK_IMAGE_TYPE_2D, and dstImage is of type VK_IMAGE_TYPE_3D, then for each element of pRegions, extent.depth must equal srcSubresource.layerCount
If `dstImage` is of type `VK_IMAGE_TYPE_2D`, and `srcImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `extent.depth` must equal `dstSubresource.layerCount`

For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `dstOffset.y` must be 0 and `extent.height` must be 1

If `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstOffset.z` and `(extent.depth + dstOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

If `srcImage` is a blocked image, then for each element of `pRegions`, all members of `srcOffset` must be a multiple of the corresponding dimensions of the compressed texel block

If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.width` must be a multiple of the compressed texel block width or `(extent.width + srcOffset.x)` must equal the width of the specified `srcSubresource` of `srcImage`

If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.height` must be a multiple of the compressed texel block height or `(extent.height + srcOffset.y)` must equal the height of the specified `srcSubresource` of `srcImage`

If `srcImage` is a blocked image, then for each element of `pRegions`, `extent.depth` must be a multiple of the compressed texel block depth or `(extent.depth + srcOffset.z)` must equal the depth of the specified `srcSubresource` of `srcImage`

If `dstImage` is a blocked image, then for each element of `pRegions`, all members of `dstOffset` must be a multiple of the corresponding dimensions of the compressed texel block

If `dstImage` is a blocked image, then for each element of `pRegions`, `extent.width` must be a multiple of the compressed texel block width or `(extent.width + dstOffset.x)` must equal the width of the specified `dstSubresource` of `dstImage`

If `dstImage` is a blocked image, then for each element of `pRegions`, `extent.height` must be a multiple of the compressed texel block height or `(extent.height + dstOffset.y)` must equal the width of the specified `dstSubresource` of `dstImage`
the height of the specified dstSubresource of dstImage

- **VUID-VkCopyImageInfo2-dstImage-01734**
  If dstImage is a blocked image, then for each element of pRegions, extent.depth must be a multiple of the compressed texel block depth or (extent.depth + dstOffset.z) must equal the depth of the specified dstSubresource of dstImage

- **VUID-VkCopyImageInfo2-aspect-06662**
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or srcImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageCreateInfo usage used to create srcImage

- **VUID-VkCopyImageInfo2-aspect-06663**
  If the aspect member of any element of pRegions includes any flag other than VK_IMAGE_ASPECT_STENCIL_BIT or dstImage was not created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageCreateInfo usage used to create dstImage

- **VUID-VkCopyImageInfo2-aspect-06664**
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and srcImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_SRC_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create srcImage

- **VUID-VkCopyImageInfo2-aspect-06665**
  If the aspect member of any element of pRegions includes VK_IMAGE_ASPECT_STENCIL_BIT, and dstImage was created with separate stencil usage, VK_IMAGE_USAGE_TRANSFER_DST_BIT must have been included in the VkImageStencilUsageCreateInfo::stencilUsage used to create dstImage

---

**Valid Usage ( Implicit )**

- **VUID-VkCopyImageInfo2-sType-sType**
  sType must be VK_STRUCTURE_TYPE_COPY_IMAGE_INFO_2

- **VUID-VkCopyImageInfo2-pNext-pNext**
  pNext must be NULL

- **VUID-VkCopyImageInfo2-srcImage-parameter**
  srcImage must be a valid VkImage handle

- **VUID-VkCopyImageInfo2-srcImageLayout-parameter**
  srcImageLayout must be a valid VkImageLayout value

- **VUID-VkCopyImageInfo2-dstImage-parameter**
  dstImage must be a valid VkImage handle

- **VUID-VkCopyImageInfo2-dstImageLayout-parameter**
  dstImageLayout must be a valid VkImageLayout value

- **VUID-VkCopyImageInfo2-pRegions-parameter**
  pRegions must be a valid pointer to an array of regionCount valid VkImageCopy2
structures

- VUID-VkCopyImageInfo2-regionCount-arraylength
  regionCount must be greater than 0

- VUID-VkCopyImageInfo2-commonparent
  Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageCopy2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageCopy2 {
    VkStructureType       sType;
    const void*           pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D            srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D            dstOffset;
    VkExtent3D            extent;
} VkImageCopy2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageCopy2 VkImageCopy2KHR;
```

- sType is the type of this structure.
- pNext is NULL or a pointer to a structure extending this structure.
- srcSubresource and dstSubresource are VkImageSubresourceLayers structures specifying the image subresources of the images used for the source and destination image data, respectively.
- srcOffset and dstOffset select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.
- extent is the size in texels of the image to copy in width, height and depth.

Valid Usage

- VUID-VkImageCopy2-extent-00140
  The number of slices of the extent (for 3D) or layers of the srcSubresource (for non-3D) must match the number of slices of the extent (for 3D) or layers of the dstSubresource (for non-3D)

- VUID-VkImageCopy2-extent-06668
  extent.width must not be 0

- VUID-VkImageCopy2-extent-06669
  extent.height must not be 0
• VUID-VkImageCopy2-extent-06670
  extent.depth must not be 0

Valid Usage (Implicit)

• VUID-VkImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_COPY_2
• VUID-VkImageCopy2-pNext-pNext
  pNext must be NULL
• VUID-VkImageCopy2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure
• VUID-VkImageCopy2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure

20.3. Copying Data Between Buffers and Images

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyBufferToImage(
  VkCommandBuffer commandBuffer,
  VkBuffer srcBuffer,
  VkImage dstImage,
  VkImageLayout dstImageLayout,
  uint32_t regionCount,
  const VkBufferImageCopy* pRegions);
```

• `commandBuffer` is the command buffer into which the command will be recorded.
• `srcBuffer` is the source buffer.
• `dstImage` is the destination image.
• `dstImageLayout` is the layout of the destination image subresources for the copy.
• `regionCount` is the number of regions to copy.
• `pRegions` is a pointer to an array of VkBufferImageCopy structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source buffer to the specified region of the destination image.

If `dstImage` has a multi-planar format, regions of each plane to be a target of a copy must be specified separately using the `pRegions` member of the VkBufferImageCopy structure. In this case, the `aspectMask` of `imageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in
Compatible formats of planes of multi-planar formats for the plane identified by the aspectMask of the corresponding subresource. This applies both to VkFormat and to coordinates used in the copy, which correspond to texels in the plane rather than how these texels map to coordinates in the image as a whole.

**Valid Usage**

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01828**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, srcBuffer must not be a protected buffer

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01829**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, dstImage must not be a protected image

- **VUID-vkCmdCopyBufferToImage-commandBuffer-01830**
  If commandBuffer is a protected command buffer and protectedNoFault is not supported, dstImage must not be an unprotected image

- **VUID-vkCmdCopyBufferToImage-pRegions-06217**
  The image region specified by each element of pRegions must be contained within the specified imageSubresource of dstImage

- **VUID-vkCmdCopyBufferToImage-pRegions-00171**
  srcBuffer must be large enough to contain all buffer locations that are accessed according to Buffer and Image Addressing, for each element of pRegions

- **VUID-vkCmdCopyBufferToImage-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of pRegions, must not overlap in memory

- **VUID-vkCmdCopyBufferToImage-srcBuffer-00174**
  srcBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_SRC_BIT usage flag

- **VUID-vkCmdCopyBufferToImage-dstImage-01997**
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

- **VUID-vkCmdCopyBufferToImage-srcBuffer-00176**
  If srcBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdCopyBufferToImage-dstImage-00177**
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- **VUID-vkCmdCopyBufferToImage-dstImage-00178**
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- **VUID-vkCmdCopyBufferToImage-dstImage-00179**
  dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- **VUID-vkCmdCopyBufferToImage-dstImageLayout-00180**
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice
• VUID-vkCmdCopyBufferToImage-dstImageLayout-01396
dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-vkCmdCopyBufferToImage-imageSubresource-01701
  The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyBufferToImage-imageSubresource-01702
  The imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created

• VUID-vkCmdCopyBufferToImage-imageOffset-01793
  The imageOffset and imageExtent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties

• VUID-vkCmdCopyBufferToImage-dstImage-02543
dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

• VUID-vkCmdCopyBufferToImage-commandBuffer-04477
  If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pRegions, the aspectMask member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT

• VUID-vkCmdCopyBufferToImage-pRegions-06218
  For each element of pRegions, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage

• VUID-vkCmdCopyBufferToImage-pRegions-06219
  For each element of pRegions, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage

• VUID-vkCmdCopyBufferToImage-bufferOffset-01558
  If dstImage does not have either a depth/stencil or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the format’s texel block size

• VUID-vkCmdCopyBufferToImage-bufferOffset-01559
  If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-planar formats

• VUID-vkCmdCopyBufferToImage-srcImage-00199
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

• VUID-vkCmdCopyBufferToImage-imageOffset-00200
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must
both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage

- VUID-vkCmdCopyBufferToImage-srcImage-00201
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-vkCmdCopyBufferToImage-bufferRowLength-00203
  If dstImage is a blocked image, for each element of pRegions, bufferRowLength must be a multiple of the compressed texel block width

- VUID-vkCmdCopyBufferToImage-bufferImageHeight-00204
  If dstImage is a blocked image, for each element of pRegions, bufferImageHeight must be a multiple of the compressed texel block height

- VUID-vkCmdCopyBufferToImage-imageOffset-00205
  If dstImage is a blocked image, for each element of pRegions, all members of imageOffset must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-vkCmdCopyBufferToImage-bufferOffset-00206
  If dstImage is a blocked image, for each element of pRegions, bufferOffset must be a multiple of the compressed texel block size in bytes

- VUID-vkCmdCopyBufferToImage-imageExtent-00207
  If dstImage is a blocked image, for each element of pRegions, imageExtent.width must be a multiple of the compressed texel block width or (imageExtent.width + imageOffset.x) must equal the width of the specified imageSubresource of dstImage

- VUID-vkCmdCopyBufferToImage-imageExtent-00208
  If dstImage is a blocked image, for each element of pRegions, imageExtent.height must be a multiple of the compressed texel block height or (imageExtent.height + imageOffset.y) must equal the height of the specified imageSubresource of dstImage

- VUID-vkCmdCopyBufferToImage-imageExtent-00209
  If dstImage is a blocked image, for each element of pRegions, imageExtent.depth must be a multiple of the compressed texel block depth or (imageExtent.depth + imageOffset.z) must equal the depth of the specified imageSubresource of dstImage

- VUID-vkCmdCopyBufferToImage-aspectMask-00211
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage

- VUID-vkCmdCopyBufferToImage-aspectMask-01560
  If dstImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes)

- VUID-vkCmdCopyBufferToImage-baseArrayLayer-00213
  If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1

- VUID-vkCmdCopyBufferToImage-pRegions-04725
  If dstImage is not a blocked image, for each element of pRegions, bufferRowLength multiplied by the texel block size of dstImage must be less than or equal to 2^{31}-1
If \( \text{dstImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) divided by the compressed texel block width and then multiplied by the texel block size of \( \text{dstImage} \) must be less than or equal to \( 2^{31}-1 \).

If the queue family used to create the \( \text{VkCommandPool} \) which \( \text{commandBuffer} \) was allocated from does not support \( \text{VK_QUEUE_GRAPHICS_BIT} \) or \( \text{VK_QUEUE_COMPUTE_BIT} \), the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

If \( \text{dstImage} \) has a depth/stencil format, the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

### Valid Usage (Implicit)

- \( \text{VUID-vkCmdCopyBufferToImage-commandBuffer-parameter} \) \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle.
- \( \text{VUID-vkCmdCopyBufferToImage-srcBuffer-parameter} \) \( \text{srcBuffer} \) must be a valid \( \text{VkBuffer} \) handle.
- \( \text{VUID-vkCmdCopyBufferToImage-dstImage-parameter} \) \( \text{dstImage} \) must be a valid \( \text{VkImage} \) handle.
- \( \text{VUID-vkCmdCopyBufferToImage-dstImageLayout-parameter} \) \( \text{dstImageLayout} \) must be a valid \( \text{VkImageLayout} \) value.
- \( \text{VUID-vkCmdCopyBufferToImage-pRegions-parameter} \) \( \text{pRegions} \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkBufferImageCopy} \) structures.
- \( \text{VUID-vkCmdCopyBufferToImage-commandBuffer-recording} \) \( \text{commandBuffer} \) must be in the recording state.
- \( \text{VUID-vkCmdCopyBufferToImage-commandBuffer-cmdpool} \) The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support transfer, graphics, or compute operations.
- \( \text{VUID-vkCmdCopyBufferToImage-renderpass} \) This command must only be called outside of a render pass instance.
- \( \text{VUID-vkCmdCopyBufferToImage-videocoding} \) This command must only be called outside of a video coding scope.
- \( \text{VUID-vkCmdCopyBufferToImage-regionCount-arraylength} \) \( \text{regionCount} \) must be greater than 0.
- \( \text{VUID-vkCmdCopyBufferToImage-commonparent} \) Each of \( \text{commandBuffer} \), \( \text{dstImage} \), and \( \text{srcBuffer} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \).
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdCopyImageToBuffer(
    VkCommandBuffer commandBuffer,
    VkImage srcImage,
    VkImageLayout srcImageLayout,
    VkBuffer dstBuffer,
    uint32_t regionCount,
    const VkBufferImageCopy* pRegions);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy` structures specifying the regions to copy.

Each region in `pRegions` is copied from the specified region of the source image to the specified region of the destination buffer.

If `srcImage` has a multi-planar format, regions of each plane to be a source of a copy must be specified separately using the `pRegions` member of the `VkBufferImageCopy` structure. In this case, the aspect mask of `imageSubresource` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT`. For the purposes of `vkCmdCopyBufferToImage`, each plane of a multi-planar image is treated as having the format listed in Compatible formats of planes of multi-planar formats for the plane identified by the `aspectMask` of the corresponding subresource. This applies both to `VkFormat` and to coordinates used in the copy,
which correspond to texels in the plane rather than how these texels map to coordinates in the image as a whole.

**Valid Usage**

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01831**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01832**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-01833**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

- **VUID-vkCmdCopyImageToBuffer-pRegions-06220**
  The image region specified by each element of `pRegions` must be contained within the specified `imageSubresource` of `srcImage`

- **VUID-vkCmdCopyImageToBuffer-pRegions-00183**
  `dstBuffer` must be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`

- **VUID-vkCmdCopyImageToBuffer-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, must not overlap in memory

- **VUID-vkCmdCopyImageToBuffer-srcImage-00186**
  `srcImage` must have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- **VUID-vkCmdCopyImageToBuffer-srcImage-01998**
  The `format features` of `srcImage` must contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`

- **VUID-vkCmdCopyImageToBuffer-srcImage-00187**
  If `srcImage` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00191**
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag

- **VUID-vkCmdCopyImageToBuffer-dstBuffer-00192**
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object

- **VUID-vkCmdCopyImageToBuffer-srcImage-00188**
  `srcImage` must have a sample count equal to `VK_SAMPLE_COUNT_1_BIT`

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-00189**
  `srcImageLayout` must specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`

- **VUID-vkCmdCopyImageToBuffer-srcImageLayout-01397**
  `srcImageLayout` must be `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL,`
or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01703
  The `imageSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageSubresource-01704
  The `imageSubresource.baseArrayLayer + imageSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

- VUID-vkCmdCopyImageToBuffer-imageOffset-01794
  The `imageOffset` and `imageExtent` members of each element of `pRegions` must respect the image transfer granularity requirements of `commandBuffer`'s command pool's queue family, as described in `VkQueueFamilyProperties`.

- VUID-vkCmdCopyImageToBuffer-srcImage-02544
  `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

- VUID-vkCmdCopyImageToBuffer-pRegions-06221
  For each element of `pRegions`, `imageOffset.x` and `(imageExtent.width + imageOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-pRegions-06222
  For each element of `pRegions`, `imageOffset.y` and `(imageExtent.height + imageOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01558
  If `srcImage` does not have either a depth/stencil or a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the format's texel block size.

- VUID-vkCmdCopyImageToBuffer-bufferOffset-01559
  If `srcImage` has a multi-planar format, then for each element of `pRegions`, `bufferOffset` must be a multiple of the element size of the compatible format for the format and the `aspectMask` of the `imageSubresource` as defined in Compatible formats of planes of multi-planar formats.

- VUID-vkCmdCopyImageToBuffer-srcImage-00199
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1.

- VUID-vkCmdCopyImageToBuffer-imageOffset-00200
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`.

- VUID-vkCmdCopyImageToBuffer-srcImage-00201
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1.

- VUID-vkCmdCopyImageToBuffer-bufferRowLength-00203
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` must be a
multiple of the compressed texel block width

- **VUID-vkCmdCopyImageToBuffer-bufferImageHeight-00204**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `bufferImageHeight` **must** be a multiple of the compressed texel block height

- **VUID-vkCmdCopyImageToBuffer-imageOffset-00205**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, all members of `imageOffset` **must** be a multiple of the corresponding dimensions of the compressed texel block

- **VUID-vkCmdCopyImageToBuffer-bufferOffset-00206**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `bufferOffset` **must** be a multiple of the compressed texel block size in bytes

- **VUID-vkCmdCopyImageToBuffer-imageExtent-00207**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `imageExtent.width` **must** be a multiple of the compressed texel block width or `(imageExtent.width + imageOffset.x)` **must** equal the width of the specified `imageSubresource` of `srcImage`

- **VUID-vkCmdCopyImageToBuffer-imageExtent-00208**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `imageExtent.height` **must** be a multiple of the compressed texel block height or `(imageExtent.height + imageOffset.y)` **must** equal the height of the specified `imageSubresource` of `srcImage`

- **VUID-vkCmdCopyImageToBuffer-imageExtent-00209**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `imageExtent.depth` **must** be a multiple of the compressed texel block depth or `(imageExtent.depth + imageOffset.z)` **must** equal the depth of the specified `imageSubresource` of `srcImage`

- **VUID-vkCmdCopyImageToBuffer-aspectMask-00211**
  For each element of `pRegions`, `imageSubresource.aspectMask` **must** specify aspects present in `srcImage`

- **VUID-vkCmdCopyImageToBuffer-aspectMask-01560**
  If `srcImage` has a **multi-planar format**, then for each element of `pRegions`, `imageSubresource.aspectMask` **must** be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for image formats with three planes)

- **VUID-vkCmdCopyImageToBuffer-baseArrayLayer-00213**
  If `srcImage` is of type `VK_IMAGE_TYPE_3D`, for each element of `pRegions`, `imageSubresource.baseArrayLayer` **must** be 0 and `imageSubresource.layerCount` **must** be 1

- **VUID-vkCmdCopyImageToBuffer-pRegions-04725**
  If `srcImage` is not a **blocked image**, for each element of `pRegions`, `bufferRowLength` multiplied by the texel block size of `srcImage` **must** be less than or equal to $2^{31}-1$

- **VUID-vkCmdCopyImageToBuffer-pRegions-04726**
  If `srcImage` is a **blocked image**, for each element of `pRegions`, `bufferRowLength` divided by the compressed texel block width and then multiplied by the texel block size of `srcImage` **must** be less than or equal to $2^{31}-1$

- **VUID-vkCmdCopyImageToBuffer-commandBuffer-04052**
  If the queue family used to create the `VkCommandPool` which `commandBuffer` was allocated from does not support `VK_QUEUE_GRAPHICS_BIT` or `VK_QUEUE_COMPUTE_BIT`, the `bufferOffset`
member of any element of \textit{pRegions} must be a multiple of 4

- VUID-vkCmdCopyImageToBuffer-srcImage-04053
  If \textit{srcImage} has a depth/stencil format, the \textit{bufferOffset} member of any element of \textit{pRegions} must be a multiple of 4

\section*{Valid Usage (Implicit)}

- VUID-vkCmdCopyImageToBuffer-commandBuffer-parameter
  \textit{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdCopyImageToBuffer-srcImage-parameter
  \textit{srcImage} must be a valid \texttt{VkImage} handle

- VUID-vkCmdCopyImageToBuffer-srcImageLayout-parameter
  \textit{srcImageLayout} must be a valid \texttt{VkImageLayout} value

- VUID-vkCmdCopyImageToBuffer-dstBuffer-parameter
  \textit{dstBuffer} must be a valid \texttt{VkBuffer} handle

- VUID-vkCmdCopyImageToBuffer-pRegions-parameter
  \textit{pRegions} must be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkBufferImageCopy} structures

- VUID-vkCmdCopyImageToBuffer-commandBuffer-recording
  \textit{commandBuffer} must be in the \texttt{recording state}

- VUID-vkCmdCopyImageToBuffer-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImageToBuffer-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImageToBuffer-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdCopyImageToBuffer-regionCount-arraylength
  \textit{regionCount} must be greater than 0

- VUID-vkCmdCopyImageToBuffer-commonparent
  Each of \textit{commandBuffer}, \textit{dstBuffer}, and \textit{srcImage} must have been created, allocated, or retrieved from the same \texttt{VkDevice}

\section*{Host Synchronization}

- Host access to \textit{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \textit{commandBuffer} was allocated from must be externally synchronized
### Command Properties

</tbody>
</table>

For both `vkCmdCopyBufferToImage` and `vkCmdCopyImageToBuffer`, each element of `pRegions` is a structure defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkBufferImageCopy {
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy;
```

- `bufferOffset` is the offset in bytes from the start of the buffer object where the image data is copied from or to.
- `bufferRowLength` and `bufferImageHeight` specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the `imageExtent`.
- `imageSubresource` is a `VkImageSubresourceLayers` used to specify the specific image subresources of the image used for the source or destination image data.
- `imageOffset` selects the initial `x`, `y`, `z` offsets in texels of the sub-region of the source or destination image data.
- `imageExtent` is the size in texels of the image to copy in `width`, `height` and `depth`.

When copying to or from a depth or stencil aspect, the data in buffer memory uses a layout that is a (mostly) tightly packed representation of the depth or stencil data. Specifically:

- data copied to or from the stencil aspect of any depth/stencil format is tightly packed with one `VK_FORMAT_S8_UINT` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D16_UNORM` or `VK_FORMAT_D16_UNORM_S8_UINT` format is tightly packed with one `VK_FORMAT_D16_UNORM` value per texel.
- data copied to or from the depth aspect of a `VK_FORMAT_D32_SFLOAT` or `VK_FORMAT_D32_SFLOAT_S8_UINT` format is tightly packed with one `VK_FORMAT_D32_SFLOAT` value per texel.
• data copied to or from the depth aspect of a \texttt{VK\_FORMAT\_X8\_D24\_UNORM\_PACK32} or \texttt{VK\_FORMAT\_D24\_UNORM\_S8\_UINT} format is packed with one 32-bit word per texel with the D24 value in the LSBs of the word, and undefined values in the eight MSBs.

\textbf{Note}

To copy both the depth and stencil aspects of a depth/stencil format, two entries in \texttt{pRegions} can be used, where one specifies the depth aspect in \texttt{imageSubresource}, and the other specifies the stencil aspect.

Because depth or stencil aspect buffer to image copies may require format conversions on some implementations, they are not supported on queues that do not support graphics.

When copying to a depth aspect, and the \texttt{VK\_EXT\_depth\_range\_unrestricted} extension is not enabled, the data in buffer memory must be in the range \([0,1]\), or the resulting values are undefined.

Copies are done layer by layer starting with image layer \texttt{baseArrayLayer} member of \texttt{imageSubresource}. \texttt{layerCount} layers are copied from the source image or to the destination image.

For purpose of valid usage statements here and in related copy commands, a \textit{blocked image} is defined as:

• an image with a single-plane, “\texttt{_422}” format, which is treated as a format with a \(2 \times 1\) compressed texel block, or

• a compressed image.

\textbf{Valid Usage}

- VUID-VkBufferImageCopy-bufferRowLength-00195
  \texttt{bufferRowLength} must be 0, or greater than or equal to the \texttt{width} member of \texttt{imageExtent}

- VUID-VkBufferImageCopy-bufferImageHeight-00196
  \texttt{bufferImageHeight} must be 0, or greater than or equal to the \texttt{height} member of \texttt{imageExtent}

- VUID-VkBufferImageCopy-aspectMask-00212
  The \texttt{aspectMask} member of \texttt{imageSubresource} must only have a single bit set

- VUID-VkBufferImageCopy-imageExtent-06659
  \texttt{imageExtent.width} must not be 0

- VUID-VkBufferImageCopy-imageExtent-06660
  \texttt{imageExtent.height} must not be 0

- VUID-VkBufferImageCopy-imageExtent-06661
  \texttt{imageExtent.depth} must not be 0

\textbf{Valid Usage (Implicit)}

- VUID-VkBufferImageCopy-imageSubresource-parameter
  \texttt{imageSubresource} must be a valid \texttt{VkImageSubresourceLayers} structure
More extensible versions of the commands to copy between buffers and images are defined below.

To copy data from a buffer object to an image object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyBufferToImage2(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyBufferToImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyBufferToImageInfo2* pCopyBufferToImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyBufferToImageInfo` is a pointer to a `VkCopyBufferToImageInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyBufferToImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

**Valid Usage**

- VUID-vkCmdCopyBufferToImage2-commandBuffer-01828
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcBuffer` must not be a protected buffer

- VUID-vkCmdCopyBufferToImage2-commandBuffer-01829
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- VUID-vkCmdCopyBufferToImage2-commandBuffer-01830
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image

**Valid Usage (Implicit)**

- VUID-vkCmdCopyBufferToImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyBufferToImage2-pCopyBufferToImageInfo-parameter
  `pCopyBufferToImageInfo` must be a valid pointer to a valid `VkCopyBufferToImageInfo2` structure

- VUID-vkCmdCopyBufferToImage2-commandBuffer-recording

**commandBuffer must** be in the recording state

- VUID-vkCmdCopyBufferToImage2-commandBuffer-cmdpool
  The *VkCommandPool* that *commandBuffer* was allocated from **must** support transfer, graphics, or compute operations

- VUID-vkCmdCopyBufferToImage2-renderpass
  This command **must** only be called outside of a render pass instance

- VUID-vkCmdCopyBufferToImage2-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to *commandBuffer** must** be externally synchronized
- Host access to the *VkCommandPool* that *commandBuffer* was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The *VkCopyBufferToImageInfo2* structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyBufferToImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkBuffer srcBuffer;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyBufferToImageInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyBufferToImageInfo2 VkCopyBufferToImageInfo2KHR;
```

- **sType** is the type of this structure.
• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **srcBuffer** is the source buffer.

• **dstImage** is the destination image.

• **dstImageLayout** is the layout of the destination image subresources for the copy.

• **regionCount** is the number of regions to copy.

• **pRegions** is a pointer to an array of **VkBufferImageCopy2** structures specifying the regions to copy.

---

**Valid Usage**

- **VUID-VkCopyBufferToImageInfo2-pRegions-04565**
  If the image region specified by each element of **pRegions** does not contain **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, it **must** be a region that is contained within the specified **imageSubresource** of **dstImage**

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-04554**
  If the image region specified by each element of **pRegions** contains **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, the rotated destination region as described in **Buffer and Image Addressing with Rotation** **must** be contained within **dstImage**

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-04555**
  If any element of **pRegions** contains **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, then **dstImage** **must** not be a **blocked image**

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06203**
  If any element of **pRegions** contains **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, then **dstImage** **must** be of type **VK_IMAGE_TYPE_2D**

- **VUID-VkCopyBufferToImageInfo2KHR-pRegions-06204**
  If any element of **pRegions** contains **VkCopyCommandTransformInfoQCOM** in its **pNext** chain, then **dstImage** **must** not have a **multi-planar format**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00171**
  **srcBuffer** **must** be large enough to contain all buffer locations that are accessed according to **Buffer and Image Addressing**, for each element of **pRegions**

- **VUID-VkCopyBufferToImageInfo2-pRegions-00173**
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory

- **VUID-VkCopyBufferToImageInfo2-srcBuffer-00174**
  **srcBuffer** **must** have been created with **VK_BUFFER_USAGE_TRANSFER_SRC_BIT** usage flag

- **VUID-VkCopyBufferToImageInfo2-dstImage-01997**
  The **format features** of **dstImage** **must** contain **VK_FORMAT_FEATURE_TRANSFER_DST_BIT**

- **VUID-VkCopyBufferToImageInfo2-dstImage-01998**
  If **srcBuffer** is non-sparse then it **must** be bound completely and contiguously to a single **VkDeviceMemory** object
The dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag.

If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

dstImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT.

dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

dstImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR.

The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

The imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

The imageOffset and imageExtent members of each element of pRegions must respect the image transfer granularity requirements of commandBuffer’s command pool’s queue family, as described in VkQueueFamilyProperties.

dstImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT, for each element of pRegions, the aspectMask member of imageSubresource must not be VK_IMAGE_ASPECT_DEPTH_BIT or VK_IMAGE_ASPECT_STENCIL_BIT.

For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of dstImage.

For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of dstImage.

If dstImage does not have either a depth/stencil or a multi-planar format, then for each...
element of pRegions, bufferOffset must be a multiple of the format's texel block size

- VUID-VkCopyBufferToImageInfo2-bufferOffset-01559
  If dstImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-planar formats

- VUID-VkCopyBufferToImageInfo2-srcImage-00199
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, imageOffset.y must be 0 and imageExtent.height must be 1

- VUID-VkCopyBufferToImageInfo2-imageOffset-00200
  For each element of pRegions, imageOffset.z and (imageExtent.depth + imageOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified imageSubresource of dstImage

- VUID-VkCopyBufferToImageInfo2-srcImage-00201
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, imageOffset.z must be 0 and imageExtent.depth must be 1

- VUID-VkCopyBufferToImageInfo2-bufferRowLength-00203
  If dstImage is a blocked image, for each element of pRegions, bufferRowLength must be a multiple of the compressed texel block width

- VUID-VkCopyBufferToImageInfo2-bufferImageHeight-00204
  If dstImage is a blocked image, for each element of pRegions, bufferImageHeight must be a multiple of the compressed texel block height

- VUID-VkCopyBufferToImageInfo2-imageOffset-00205
  If dstImage is a blocked image, for each element of pRegions, all members of imageOffset must be a multiple of the corresponding dimensions of the compressed texel block

- VUID-VkCopyBufferToImageInfo2-bufferOffset-00206
  If dstImage is a blocked image, for each element of pRegions, bufferOffset must be a multiple of the compressed texel block size in bytes

- VUID-VkCopyBufferToImageInfo2-imageExtent-00207
  If dstImage is a blocked image, for each element of pRegions, imageExtent.width must be a multiple of the compressed texel block width or (imageExtent.width + imageOffset.x) must equal the width of the specified imageSubresource of dstImage

- VUID-VkCopyBufferToImageInfo2-imageExtent-00208
  If dstImage is a blocked image, for each element of pRegions, imageExtent.height must be a multiple of the compressed texel block height or (imageExtent.height + imageOffset.y) must equal the height of the specified imageSubresource of dstImage

- VUID-VkCopyBufferToImageInfo2-imageExtent-00209
  If dstImage is a blocked image, for each element of pRegions, imageExtent.depth must be a multiple of the compressed texel block depth or (imageExtent.depth + imageOffset.z) must equal the depth of the specified imageSubresource of dstImage

- VUID-VkCopyBufferToImageInfo2-aspectMask-00211
  For each element of pRegions, imageSubresource.aspectMask must specify aspects present in dstImage
If dstImage has a multi-planar format, then for each element of pRegions, imageSubresource.aspectMask must be VK_IMAGE_ASPECT_PLANE_0_BIT, VK_IMAGE_ASPECT_PLANE_1_BIT, or VK_IMAGE_ASPECT_PLANE_2_BIT (with VK_IMAGE_ASPECT_PLANE_2_BIT valid only for image formats with three planes).

If dstImage is of type VK_IMAGE_TYPE_3D, for each element of pRegions, imageSubresource.baseArrayLayer must be 0 and imageSubresource.layerCount must be 1.

If dstImage is not a blocked image, for each element of pRegions, bufferRowLength multiplied by the texel block size of dstImage must be less than or equal to 2^{31}-1.

If dstImage is a blocked image, for each element of pRegions, bufferRowLength divided by the compressed texel block width and then multiplied by the texel block size of dstImage must be less than or equal to 2^{31}-1.

If the queue family used to create the VkCommandPool which commandBuffer was allocated from does not support VK_QUEUE_GRAPHICS_BIT or VK_QUEUE_COMPUTE_BIT, the bufferOffset member of any element of pRegions must be a multiple of 4.

If dstImage has a depth/stencil format, the bufferOffset member of any element of pRegions must be a multiple of 4.

Valid Usage (Implicit)

sType must be VK_STRUCTURE_TYPE_COPY_BUFFER_TO_IMAGE_INFO_2
pNext must be NULL
srcBuffer must be a valid VkBuffer handle
dstImage must be a valid VkImage handle
dstImageLayout must be a valid VkImageLayout value
pRegions must be a valid pointer to an array of regionCount valid VkBufferImageCopy2 structures
regionCount must be greater than 0
Both of dstImage, and srcBuffer must have been created, allocated, or retrieved from the
To copy data from an image object to a buffer object, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdCopyImageToBuffer2(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdCopyImageToBuffer2KHR(
    VkCommandBuffer commandBuffer,
    const VkCopyImageToBufferInfo2* pCopyImageToBufferInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pCopyImageToBufferInfo` is a pointer to a `VkCopyImageToBufferInfo2` structure describing the copy parameters.

This command is functionally identical to `vkCmdCopyImageToBuffer`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01831
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01832
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be a protected buffer

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-01833
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstBuffer` must not be an unprotected buffer

### Valid Usage (Implicit)

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdCopyImageToBuffer2-pCopyImageToBufferInfo-parameter
  `pCopyImageToBufferInfo` must be a valid pointer to a valid `VkCopyImageToBufferInfo2` structure

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdCopyImageToBuffer2-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdCopyImageToBuffer2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdCopyImageToBuffer2-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

The VkCopyImageToBufferInfo2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkCopyImageToBufferInfo2 {
    VkStructureType           sType;
    const void*               pNext;
    VkImage                   srcImage;
    VkImageLayout             srcImageLayout;
    VkBuffer                  dstBuffer;
    uint32_t                  regionCount;
    const VkBufferImageCopy2* pRegions;
} VkCopyImageToBufferInfo2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkCopyImageToBufferInfo2 VkCopyImageToBufferInfo2KHR;
```

- sType is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the copy.
- `dstBuffer` is the destination buffer.
- `regionCount` is the number of regions to copy.
- `pRegions` is a pointer to an array of `VkBufferImageCopy2` structures specifying the regions to copy.

**Valid Usage**

- **VUID-VkCopyImageToBufferInfo2-pRegions-04566**
  If the image region specified by each element of `pRegions` does not contain `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, it **must** be contained within the specified `imageSubresource` of `srcImage`.

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-04557**
  If the image region specified by each element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, the rotated source region as described in `Buffer and Image Addressing with Rotation` **must** be contained within `srcImage`.

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-04558**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` **must** not be a blocked image.

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-06205**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` **must** be of type `VK_IMAGE_TYPE_2D`.

- **VUID-VkCopyImageToBufferInfo2KHR-pRegions-06206**
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` **must** not have a multi-planar format.

- **VUID-VkCopyImageToBufferInfo2-pRegions-00183**
  `dstBuffer` **must** be large enough to contain all buffer locations that are accessed according to `Buffer and Image Addressing`, for each element of `pRegions`.

- **VUID-VkCopyImageToBufferInfo2-pRegions-00184**
  The union of all source regions, and the union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory.

- **VUID-VkCopyImageToBufferInfo2-srcImage-00186**
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- **VUID-VkCopyImageToBufferInfo2-srcImage-01998**
  The `format features` of `srcImage` **must** contain `VK_FORMAT_FEATURE_TRANSFER_SRC_BIT`.

- **VUID-VkCopyImageToBufferInfo2-srcImage-00187**
  If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
• VUID-VkCopyImageToBufferInfo2-dstBuffer-00191
dstBuffer must have been created with VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag

• VUID-VkCopyImageToBufferInfo2-dstBuffer-00192
If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkCopyImageToBufferInfo2-srcImage-00188
srcImage must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

• VUID-VkCopyImageToBufferInfo2-srcImageLayout-00189
srcImageLayout must specify the layout of the image subresources of srcImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkCopyImageToBufferInfo2-srcImageLayout-01397
srcImageLayout must be VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL, VK_IMAGE_LAYOUT_GENERAL, or VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR

• VUID-VkCopyImageToBufferInfo2-imageSubresource-01703
The imageSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageToBufferInfo2-imageSubresource-01704
The imageSubresource.baseArrayLayer + imageSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created

• VUID-VkCopyImageToBufferInfo2-imageOffset-01794
For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.x and (imageExtent.width + imageOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified imageSubresource of srcImage

• VUID-VkCopyImageToBufferInfo2-imageOffset-00197
For each element of pRegions not containing VkCopyCommandTransformInfoQCOM in its pNext chain, imageOffset.y and (imageExtent.height + imageOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified imageSubresource of srcImage

• VUID-VkCopyImageToBufferInfo2-bufferOffset-01558
If srcImage does not have either a depth/stencil or a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the format's texel block size

• VUID-VkCopyImageToBufferInfo2-bufferOffset-01559
If srcImage has a multi-planar format, then for each element of pRegions, bufferOffset must be a multiple of the element size of the compatible format for the format and the aspectMask of the imageSubresource as defined in Compatible formats of planes of multi-
planar formats

- **VUID-VkCopyImageToBufferInfo2-srcImage-00199**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `imageOffset.y` must be 0 and `imageExtent.height` must be 1

- **VUID-VkCopyImageToBufferInfo2-imageOffset-00200**
  
  For each element of `pRegions`, `imageOffset.z` and `(imageExtent.depth + imageOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-srcImage-00201**
  
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `imageOffset.z` must be 0 and `imageExtent.depth` must be 1

- **VUID-VkCopyImageToBufferInfo2-bufferRowLength-00203**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferRowLength` must be a multiple of the compressed texel block width

- **VUID-VkCopyImageToBufferInfo2-bufferImageHeight-00204**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferImageHeight` must be a multiple of the compressed texel block height

- **VUID-VkCopyImageToBufferInfo2-imageOffset-00205**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, all members of `imageOffset` must be a multiple of the corresponding dimensions of the compressed texel block

- **VUID-VkCopyImageToBufferInfo2-bufferOffset-00206**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `bufferOffset` must be a multiple of the compressed texel block size in bytes

- **VUID-VkCopyImageToBufferInfo2-imageExtent-00207**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.width` must be a multiple of the compressed texel block width or `(imageExtent.width + imageOffset.x)` must equal the width of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-imageExtent-00208**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.height` must be a multiple of the compressed texel block height or `(imageExtent.height + imageOffset.y)` must equal the height of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-imageExtent-00209**
  
  If `srcImage` is a blocked image, for each element of `pRegions`, `imageExtent.depth` must be a multiple of the compressed texel block depth or `(imageExtent.depth + imageOffset.z)` must equal the depth of the specified `imageSubresource` of `srcImage`

- **VUID-VkCopyImageToBufferInfo2-aspectMask-00211**
  
  For each element of `pRegions`, `imageSubresource.aspectMask` must specify aspects present in `srcImage`

- **VUID-VkCopyImageToBufferInfo2-aspectMask-01560**
  
  If `srcImage` has a multi-planar format, then for each element of `pRegions`, `imageSubresource.aspectMask` must be `VK_IMAGE_ASPECT_PLANE_0_BIT`, `VK_IMAGE_ASPECT_PLANE_1_BIT`, or `VK_IMAGE_ASPECT_PLANE_2_BIT` (with `VK_IMAGE_ASPECT_PLANE_2_BIT` valid only for image formats with three planes)
If \( \text{srcImage} \) is of type \( \text{VK_IMAGE_TYPE_3D} \), for each element of \( \text{pRegions} \), \( \text{imageSubresource.baseArrayLayer} \) must be 0 and \( \text{imageSubresource.layerCount} \) must be 1.

If \( \text{srcImage} \) is not a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) multiplied by the texel block size of \( \text{srcImage} \) must be less than or equal to \( 2^{31} - 1 \).

If \( \text{srcImage} \) is a blocked image, for each element of \( \text{pRegions} \), \( \text{bufferRowLength} \) divided by the compressed texel block width and then multiplied by the texel block size of \( \text{srcImage} \) must be less than or equal to \( 2^{31} - 1 \).

If the queue family used to create the \( \text{VkCommandPool} \) which \( \text{commandBuffer} \) was allocated from does not support \( \text{VK_QUEUE_GRAPHICS_BIT} \) or \( \text{VK_QUEUE_COMPUTE_BIT} \), the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

If \( \text{srcImage} \) has a depth/stencil format, the \( \text{bufferOffset} \) member of any element of \( \text{pRegions} \) must be a multiple of 4.

### Valid Usage (Implicit)

- **VUID-VkCopyImageToBufferInfo2-sType-sType**
  \( \text{sType} \) must be \( \text{VK_STRUCTURE_TYPE_COPY_IMAGE_TO_BUFFER_INFO_2} \)

- **VUID-VkCopyImageToBufferInfo2-pNext-pNext**
  \( \text{pNext} \) must be \( \text{NULL} \)

- **VUID-VkCopyImageToBufferInfo2-srcImage-parameter**
  \( \text{srcImage} \) must be a valid \( \text{VkImage} \) handle

- **VUID-VkCopyImageToBufferInfo2-srcImageLayout-parameter**
  \( \text{srcImageLayout} \) must be a valid \( \text{VkImageLayout} \) value

- **VUID-VkCopyImageToBufferInfo2-dstBuffer-parameter**
  \( \text{dstBuffer} \) must be a valid \( \text{VkBuffer} \) handle

- **VUID-VkCopyImageToBufferInfo2-pRegions-parameter**
  \( \text{pRegions} \) must be a valid pointer to an array of \( \text{regionCount} \) valid \( \text{VkBufferImageCopy2} \) structures

- **VUID-VkCopyImageToBufferInfo2-regionCount-arraylength**
  \( \text{regionCount} \) must be greater than 0

- **VUID-VkCopyImageToBufferInfo2-commonparent**
  Both of \( \text{dstBuffer} \), and \( \text{srcImage} \) must have been created, allocated, or retrieved from the same \( \text{VkDevice} \)

For both \( \text{vkCmdCopyBufferToImage2} \) and \( \text{vkCmdCopyImageToBuffer2} \), each element of \( \text{pRegions} \) is a structure defined as:
// Provided by VK_VERSION_1_3

typedef struct VkBufferImageCopy2 {
    VkStructureType sType;
    const void* pNext;
    VkDeviceSize bufferOffset;
    uint32_t bufferRowLength;
    uint32_t bufferImageHeight;
    VkImageSubresourceLayers imageSubresource;
    VkOffset3D imageOffset;
    VkExtent3D imageExtent;
} VkBufferImageCopy2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkBufferImageCopy2 VkBufferImageCopy2KHR;

• **sType** is the type of this structure.

• **pNext** is **NULL** or a pointer to a structure extending this structure.

• **bufferOffset** is the offset in bytes from the start of the buffer object where the image data is copied from or to.

• **bufferRowLength** and **bufferImageHeight** specify in texels a subregion of a larger two- or three-dimensional image in buffer memory, and control the addressing calculations. If either of these values is zero, that aspect of the buffer memory is considered to be tightly packed according to the **imageExtent**.

• **imageSubresource** is a **VkImageSubresourceLayers** used to specify the specific image subresources of the image used for the source or destination image data.

• **imageOffset** selects the initial x, y, z offsets in texels of the sub-region of the source or destination image data.

• **imageExtent** is the size in texels of the image to copy in width, height and depth.

This structure is functionally identical to **VkBufferImageCopy**, but adds **sType** and **pNext** parameters, allowing it to be more easily extended.

---

**Valid Usage**

• VUID-VkBufferImageCopy2-bufferRowLength-00195
  **bufferRowLength** must be 0, or greater than or equal to the **width** member of **imageExtent**

• VUID-VkBufferImageCopy2-bufferImageHeight-00196
  **bufferImageHeight** must be 0, or greater than or equal to the **height** member of **imageExtent**

• VUID-VkBufferImageCopy2-aspectMask-00212
  The **aspectMask** member of **imageSubresource** must only have a single bit set

• VUID-VkBufferImageCopy2-imageExtent-06659
imageExtent.width must not be 0
imageExtent.height must not be 0
imageExtent.depth must not be 0

Valid Usage (Implicit)

• VUID-VkBufferImageCopy2-sType-sType
  sType must be VK_STRUCTURE_TYPE_BUFFER_IMAGE_COPY_2

• VUID-VkBufferImageCopy2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkCopyCommandTransformInfoQCOM

• VUID-VkBufferImageCopy2-sType-unique
  The sType value of each struct in the pNext chain must be unique

• VUID-VkBufferImageCopy2-imageSubresource-parameter
  imageSubresource must be a valid VkImageSubresourceLayers structure

For both vkCmdCopyBufferToImage2 and vkCmdCopyImageToBuffer2, each region copied can include a rotation. To specify a region with rotation, add the VkCopyCommandTransformInfoQCOM to the pNext chain of VkBufferImageCopy2. When a rotation is specified, Buffer and Image Addressing with Rotation specifies how coordinates of texels in the source region are rotated by transform to produce texel coordinates in the destination region. When rotation is specified, the source and destination images must each be 2D images. They must not be blocked images or have a multi-planar format.

The VkRenderPassTransformBeginInfoQCOM structure is defined as:

```
// Provided by VK_QCOM_rotated_copy_commands
typedef struct VkCopyCommandTransformInfoQCOM {
    VkStructureType sType;
    const void*pNext;
    VkSurfaceTransformFlagBitsKHR transform;
} VkCopyCommandTransformInfoQCOM;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• transform is a VkSurfaceTransformFlagBitsKHR value describing the transform to be applied.

Valid Usage

• VUID-VkCopyCommandTransformInfoQCOM-transform-04560
  transform must be VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR,
20.3.1. Buffer and Image Addressing

Pseudocode for image/buffer addressing of uncompressed formats is:

```
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) * texelBlockSize;
where x,y,z range from (0,0,0) to region->imageExtent.{width,height,depth}.
```

Note that imageOffset does not affect addressing calculations for buffer memory. Instead, bufferOffset can be used to select the starting address in buffer memory.

For block-compressed formats, all parameters are still specified in texels rather than compressed texel blocks, but the addressing math operates on whole compressed texel blocks. Pseudocode for compressed copy addressing is:

```
rowLength = region->bufferRowLength;
if (rowLength == 0)
    rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
    imageHeight = region->imageExtent.height;

compressedTexelBlockSizeInBytes = <compressed texel block size taken from the src /dstImage>;
rowLength = (rowLength + compressedTexelBlockWidth - 1) / compressedTexelBlockWidth;
imageHeight = (imageHeight + compressedTexelBlockHeight - 1) / compressedTexelBlockHeight;
```
address of \((x,y,z) = \text{region->bufferOffset + \(((z \times \text{imageHeight}) + y) \times \text{rowLength} + x) \times \text{compressedTexelBlockSizeInBytes};}\)

where \(x,y,z\) range from \((0,0,0)\) to \(\text{region->imageExtent.}\{\text{width}/\text{compressedTexelBlockWidth, height/\text{compressedTexelBlockHeight, depth/\text{compressedTexelBlockDepth}}\}\).

Copying to or from block-compressed images is typically done in multiples of the compressed texel block size. For this reason the \text{imageExtent} must be a multiple of the compressed texel block dimension. There is one exception to this rule which is required to handle compressed images created with dimensions that are not a multiple of the compressed texel block dimensions:

- If \text{imageExtent.width} is not a multiple of the compressed texel block width, then \((\text{imageExtent.width} + \text{imageOffset.x})\) must equal the image subresource width.
- If \text{imageExtent.height} is not a multiple of the compressed texel block height, then \((\text{imageExtent.height} + \text{imageOffset.y})\) must equal the image subresource height.
- If \text{imageExtent.depth} is not a multiple of the compressed texel block depth, then \((\text{imageExtent.depth} + \text{imageOffset.z})\) must equal the image subresource depth.

This allows the last compressed texel block of the image in each non-multiple dimension to be included as a source or destination of the copy.

### 20.3.2. Buffer and Image Addressing with Rotation

When \text{VkCopyCommandTransformInfoQCOM} is in the \text{pNext} chain of \text{VkBufferImageCopy2}, a rotated copy is specified. For both \text{vkCmdCopyImageToBuffer2} and \text{vkCmdCopyBufferToImage2}, a rotation is applied to the region used for image accesses, but a non-rotated region is used for buffer accesses. In the case of rotated \text{vkCmdCopyImageToBuffer2}, the source image region is rotated. In the case of rotated \text{vkCmdCopyBufferToImage2}, the destination image region is rotated.

For a rotated copy, the following description of rotated addressing replaces the description in Buffer and Image Addressing.

The following code computes rotation of unnormalized coordinates.

```c
// Forward rotation of unnormalized coordinates
VkOffset2D RotateUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags) {
    VkOffset2D output;
    switch (flags) {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
            out.x = -in.y;
```
out.y = in.x;
break;

case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
  out.x = -in.x;
  out.y = -in.y;
  break;

case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
  out.x = in.y;
  out.y = -in.x;
  break;
}
return out;

Pseudocode for image/buffer addressing of uncompressed formats with rotation is:

```plaintext
rowLength = region->bufferRowLength;
if (rowLength == 0)
  rowLength = region->imageExtent.width;

imageHeight = region->bufferImageHeight;
if (imageHeight == 0)
  imageHeight = region->imageExtent.height;

texelBlockSize = <texel block size of the format of the src/dstImage>;

// Buffer addressing is unaffected by rotation:
address of (x,y,z) = region->bufferOffset + (((z * imageHeight) + y) * rowLength + x) * texelBlockSize;

// When copying from buffer to image, the source buffer coordinates x,y,z range from (0,0,0) to
// region->imageExtent.{width,height,depth}. The source extent is rotated by the specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated destination region.
// For each source buffer texel with coordinates (x,y) the rotated destination image texel has
// coordinates (x',y') defined as:
// (x',y')= RotateUV(x,y) + ImageOffset.{x,y}

// When copying from image to buffer, the the destination buffer coordinates x,y,z
range from (0,0,0) to
// region->imageExtent.{width,height,depth}. The destination extent is rotated by the specified
// VK_SURFACE_TRANSFORM, centered on the imageOffset, to define a rotated source region. For each destination
// buffer texel with coordinates (x,y) the rotated source image texel has coordinates
(x',y') defined as:
```
Note that \texttt{imageOffset} does not affect addressing calculations for buffer memory. Instead, \texttt{bufferOffset} can be used to select the starting address in buffer memory.

### 20.4. Image Copies with Scaling

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBlitImage(
    VkCommandBuffer commandBuffer,
    VkImage srcImage, VkImageLayout srcImageLayout,
    VkImage dstImage, VkImageLayout dstImageLayout,
    uint32_t regionCount, const VkImageBlit* pRegions,
    VkFilter filter);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{srcImage} is the source image.
- \texttt{srcImageLayout} is the layout of the source image subresources for the blit.
- \texttt{dstImage} is the destination image.
- \texttt{dstImageLayout} is the layout of the destination image subresources for the blit.
- \texttt{regionCount} is the number of regions to blit.
- \texttt{pRegions} is a pointer to an array of \texttt{VkImageBlit} structures specifying the regions to blit.
- \texttt{filter} is a \texttt{VkFilter} specifying the filter to apply if the blits require scaling.

\texttt{vkCmdBlitImage} \textbf{must} not be used for multisampled source or destination images. Use \texttt{vkCmdResolveImage} for this purpose.

As the sizes of the source and destination extents \textbf{can} differ in any dimension, texels in the source extent are scaled and filtered to the destination extent. Scaling occurs via the following operations:

- For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in \textbf{unnormalized to integer conversion}:

\[
\begin{align*}
    u_{\text{base}} &= i + \frac{1}{2} \\
    v_{\text{base}} &= j + \frac{1}{2}
\end{align*}
\]
$w_{\text{base}} = k + \frac{1}{2}$

• These base coordinates are then offset by the first destination offset:

$$u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}}$$

$$v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}$$

$$w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}}$$

$a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}$

• The scale is determined from the source and destination regions, and applied to the offset coordinates:

$$\text{scale}_u = \frac{(x_{\text{src1}} - x_{\text{src0}})}{(x_{\text{dst1}} - x_{\text{dst0}})}$$

$$\text{scale}_v = \frac{(y_{\text{src1}} - y_{\text{src0}})}{(y_{\text{dst1}} - y_{\text{dst0}})}$$

$$\text{scale}_w = \frac{(z_{\text{src1}} - z_{\text{src0}})}{(z_{\text{dst1}} - z_{\text{dst0}})}$$

$$u_{\text{scaled}} = u_{\text{offset}} \times \text{scale}_u$$

$$v_{\text{scaled}} = v_{\text{offset}} \times \text{scale}_v$$

$$w_{\text{scaled}} = w_{\text{offset}} \times \text{scale}_w$$

• Finally the source offset is added to the scaled coordinates, to determine the final unnormalized coordinates used to sample from $\text{srcImage}$:

$$u = u_{\text{scaled}} + x_{\text{src0}}$$

$$v = v_{\text{scaled}} + y_{\text{src0}}$$

$$w = w_{\text{scaled}} + z_{\text{src0}}$$
q = mipLevel

a = a_offset + baseArrayCount_src

These coordinates are used to sample from the source image, as described in Image Operations chapter, with the filter mode equal to that of filter, a mipmap mode of VK_SAMPLER_MIPMAP_MODE_NEAREST and an address mode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE. Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

Note

Due to allowable rounding errors in the generation of the source texture coordinates, it is not always possible to guarantee exactly which source texels will be sampled for a given blit. As rounding errors are implementation-dependent, the exact results of a blitting operation are also implementation-dependent.

Blits are done layer by layer starting with the baseArrayLayer member of srcSubresource for the source and dstSubresource for the destination. layerCount layers are blitted to the destination image.

When blitting 3D textures, slices in the destination region bounded by dstOffsets[0].z and dstOffsets[1].z are sampled from slices in the source region bounded by srcOffsets[0].z and srcOffsets[1].z. If the filter parameter is VK_FILTER_LINEAR then the value sampled from the source image is taken by doing linear filtering using the interpolated z coordinate represented by w in the previous equations. If the filter parameter is VK_FILTER_NEAREST then the value sampled from the source image is taken from the single nearest slice, with an implementation-dependent arithmetic rounding mode.

The following filtering and conversion rules apply:

- Integer formats can only be converted to other integer formats with the same signedness.
- No format conversion is supported between depth/stencil images. The formats must match.
- Format conversions on unorm, snorm, scaled and packed float formats of the copied aspect of the image are performed by first converting the pixels to float values.
- For sRGB source formats, nonlinear RGB values are converted to linear representation prior to filtering.
- After filtering, the float values are first clamped and then cast to the destination image format. In case of sRGB destination format, linear RGB values are converted to nonlinear representation before writing the pixel to the image.

Signed and unsigned integers are converted by first clamping to the representable range of the destination format, then casting the value.

Valid Usage

- VUID-vkCmdBlitImage-commandBuffer-01834
If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` **must** not be a protected image.

- VUID-vkCmdBlitImage-commandBuffer-01835
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be a protected image.

- VUID-vkCmdBlitImage-commandBuffer-01836
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` **must** not be an unprotected image.

- VUID-vkCmdBlitImage-pRegions-00215
  The source region specified by each element of `pRegions` **must** be a region that is contained within `srcImage`.

- VUID-vkCmdBlitImage-pRegions-00216
  The destination region specified by each element of `pRegions` **must** be a region that is contained within `dstImage`.

- VUID-vkCmdBlitImage-pRegions-00217
  The union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory with any texel that **may** be sampled during the blit operation.

- VUID-vkCmdBlitImage-srcImage-01999
  The format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`.

- VUID-vkCmdBlitImage-srcImage-06421
  `srcImage` **must** not use a format that requires a sampler Y’CnCnR conversion.

- VUID-vkCmdBlitImage-srcImage-00219
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag.

- VUID-vkCmdBlitImage-srcImage-00220
  If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdBlitImage-srcImageLayout-00221
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`.

- VUID-vkCmdBlitImage-srcImageLayout-01398
  `srcImageLayout` **must** be `VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR`, `VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL` or `VK_IMAGE_LAYOUT_GENERAL`.

- VUID-vkCmdBlitImage-dstImage-02000
  The format features of `dstImage` **must** contain `VK_FORMAT_FEATURE_BLIT_DST_BIT`.

- VUID-vkCmdBlitImage-dstImage-06422
  `dstImage` **must** not use a format that requires a sampler Y’CnCnR conversion.

- VUID-vkCmdBlitImage-dstImage-00224
  `dstImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdBlitImage-dstImage-00225
  If `dstImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.
VUID-vkCmdBlitImage-dstImageLayout-00226
dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

VUID-vkCmdBlitImage-dstImageLayout-01399
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

VUID-vkCmdBlitImage-srcImage-00229
If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat.

VUID-vkCmdBlitImage-srcImage-00230
If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat.

VUID-vkCmdBlitImage-srcImage-00231
If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format.

VUID-vkCmdBlitImage-srcImage-00232
If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST.

VUID-vkCmdBlitImage-srcImage-00233
srcImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT.

VUID-vkCmdBlitImage-dstImage-00234
dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT.

VUID-vkCmdBlitImage-filter-02001
If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT.

VUID-vkCmdBlitImage-filter-02002
If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

VUID-vkCmdBlitImage-filter-00237
If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D.

VUID-vkCmdBlitImage-srcSubresource-01705
The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

VUID-vkCmdBlitImage-dstSubresource-01706
The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

VUID-vkCmdBlitImage-srcSubresource-01707
The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

VUID-vkCmdBlitImage-dstSubresource-01708
The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo.
when dstImage was created

- VUID-vkCmdBlitImage-dstImage-02545
  dstImage and srcImage must not have been created with flags containing
  VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT

- VUID-vkCmdBlitImage-srcImage-00240
  If either srcImage or dstImage is of type VK_IMAGE_TYPE_3D, then for each element of
  pRegions, srcSubresource.baseArrayLayer and dstSubresource.baseArrayLayer must each be
  0, and srcSubresource.layerCount and dstSubresource.layerCount must each be 1

- VUID-vkCmdBlitImage-aspectMask-00241
  For each element of pRegions, srcSubresource.aspectMask must specify aspects present in
  srcImage

- VUID-vkCmdBlitImage-aspectMask-00242
  For each element of pRegions, dstSubresource.aspectMask must specify aspects present in
  dstImage

- VUID-vkCmdBlitImage-srcOffset-00243
  For each element of pRegions, srcOffsets[0].x and srcOffsets[1].x must both be greater
  than or equal to 0 and less than or equal to the width of the specified srcSubresource of
  srcImage

- VUID-vkCmdBlitImage-srcOffset-00244
  For each element of pRegions, srcOffsets[0].y and srcOffsets[1].y must both be greater
  than or equal to 0 and less than or equal to the height of the specified srcSubresource of
  srcImage

- VUID-vkCmdBlitImage-srcOffset-00245
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffsets[0].y
  must be 0 and srcOffsets[1].y must be 1

- VUID-vkCmdBlitImage-srcOffset-00246
  For each element of pRegions, srcOffsets[0].z and srcOffsets[1].z must both be greater
  than or equal to 0 and less than or equal to the depth of the specified srcSubresource of
  srcImage

- VUID-vkCmdBlitImage-srcImage-00247
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of
  pRegions, srcOffsets[0].z must be 0 and srcOffsets[1].z must be 1

- VUID-vkCmdBlitImage-dstOffset-00248
  For each element of pRegions, dstOffsets[0].x and dstOffsets[1].x must both be greater
  than or equal to 0 and less than or equal to the width of the specified dstSubresource of
dstImage

- VUID-vkCmdBlitImage-dstOffset-00249
  For each element of pRegions, dstOffsets[0].y and dstOffsets[1].y must both be greater
  than or equal to 0 and less than or equal to the height of the specified dstSubresource of
dstImage

- VUID-vkCmdBlitImage-dstImage-00250
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffsets[0].y
  must be 0 and dstOffsets[1].y must be 1
For each element of \texttt{pRegions}, \texttt{dstOffsets}[0].z and \texttt{dstOffsets}[1].z must both be greater than or equal to 0 and less than or equal to the depth of the specified \texttt{dstSubresource} of \texttt{dstImage}.

If \texttt{dstImage} is of type \texttt{VK_IMAGE_TYPE_1D} or \texttt{VK_IMAGE_TYPE_2D}, then for each element of \texttt{pRegions}, \texttt{dstOffsets}[0].z must be 0 and \texttt{dstOffsets}[1].z must be 1.

**Valid Usage (Implicit)**

- **VUID-vkCmdBlitImage-commandBuffer-parameter**
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- **VUID-vkCmdBlitImage-srcImage-parameter**
  \texttt{srcImage} must be a valid \texttt{VkImage} handle

- **VUID-vkCmdBlitImage-srcImageLayout-parameter**
  \texttt{srcImageLayout} must be a valid \texttt{VkImageLayout} value

- **VUID-vkCmdBlitImage-dstImage-parameter**
  \texttt{dstImage} must be a valid \texttt{VkImage} handle

- **VUID-vkCmdBlitImage-dstImageLayout-parameter**
  \texttt{dstImageLayout} must be a valid \texttt{VkImageLayout} value

- **VUID-vkCmdBlitImage-pRegions-parameter**
  \texttt{pRegions} must be a valid pointer to an array of \texttt{regionCount} valid \texttt{VkImageBlit} structures

- **VUID-vkCmdBlitImage-filter-parameter**
  \texttt{filter} must be a valid \texttt{VkFilter} value

- **VUID-vkCmdBlitImage-commandBuffer-recording**
  \texttt{commandBuffer} must be in the \texttt{recording state}

- **VUID-vkCmdBlitImage-commandBuffer-cmdpool**
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- **VUID-vkCmdBlitImage-renderpass**
  This command must only be called outside of a render pass instance

- **VUID-vkCmdBlitImage-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdBlitImage-regionCount-arraylength**
  \texttt{regionCount} must be greater than 0

- **VUID-vkCmdBlitImage-commonparent**
  Each of \texttt{commandBuffer}, \texttt{dstImage}, and \texttt{srcImage} must have been created, allocated, or retrieved from the same \texttt{VkDevice}
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageBlit` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageBlit {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit;
```

- `srcSubresource` is the subresource to blit from.
- `srcOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the source region within `srcSubresource`.
- `dstSubresource` is the subresource to blit into.
- `dstOffsets` is a pointer to an array of two `VkOffset3D` structures specifying the bounds of the destination region within `dstSubresource`.

For each element of the `pRegions` array, a blit operation is performed for the specified source and destination regions.

Valid Usage

- VUID-VkImageBlit-aspectMask-00238
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must match.
- VUID-VkImageBlit-layerCount-00239
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match.
Valid Usage (Implicit)

- VUID-VkImageBlit-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageBlit-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the blit image command is defined below.

To copy regions of a source image into a destination image, potentially performing format conversion, arbitrary scaling, and filtering, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBlitImage2(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```
or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdBlitImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkBlitImageInfo2* pBlitImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pBlitImageInfo` is a pointer to a `VkBlitImageInfo2` structure describing the blit parameters.

This command is functionally identical to `vkCmdBlitImage`, but includes extensible sub-structures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

Valid Usage

- VUID-vkCmdBlitImage2-commandBuffer-01834
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- VUID-vkCmdBlitImage2-commandBuffer-01835
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image

- VUID-vkCmdBlitImage2-commandBuffer-01836
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image
Valid Usage (Implicit)

- VUID-vkCmdBlitImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBlitImage2-pBlitImageInfo-parameter
  `pBlitImageInfo` must be a valid pointer to a valid `VkBlitImageInfo2` structure

- VUID-vkCmdBlitImage2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBlitImage2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBlitImage2-renderpass
  This command must only be called outside of a render pass instance

- VUID-vkCmdBlitImage2-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>

<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkBlitImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkBlitImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
    VkImage dstImage;
    VkImageLayout dstImageLayout;
    uint32_t regionCount;
    const VkImageBlit2* pRegions;
    VkFilter filter;
} VkBlitImageInfo2;
```
or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkBlitImageInfo2 VkBlitImageInfo2KHR;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `srcImage` is the source image.
- `srcImageLayout` is the layout of the source image subresources for the blit.
- `dstImage` is the destination image.
- `dstImageLayout` is the layout of the destination image subresources for the blit.
- `regionCount` is the number of regions to blit.
- `pRegions` is a pointer to an array of `VkImageBlit2` structures specifying the regions to blit.
- `filter` is a `VkFilter` specifying the filter to apply if the blits require scaling.

**Valid Usage**

- VUID-VkBlitImageInfo2-pRegions-00215
  The source region specified by each element of `pRegions` **must** be a region that is contained within `srcImage`

- VUID-VkBlitImageInfo2-pRegions-00216
  The destination region specified by each element of `pRegions` **must** be a region that is contained within `dstImage`

- VUID-VkBlitImageInfo2-pRegions-00217
  The union of all destination regions, specified by the elements of `pRegions`, **must** not overlap in memory with any texel that **may** be sampled during the blit operation

- VUID-VkBlitImageInfo2-srcImage-01999
  The format features of `srcImage` **must** contain `VK_FORMAT_FEATURE_BLIT_SRC_BIT`

- VUID-VkBlitImageInfo2-srcImage-06421
  `srcImage` **must** not use a format that requires a sampler Y′CbCr conversion

- VUID-VkBlitImageInfo2-srcImage-00219
  `srcImage` **must** have been created with `VK_IMAGE_USAGE_TRANSFER_SRC_BIT` usage flag

- VUID-VkBlitImageInfo2-srcImage-00220
  If `srcImage` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object

- VUID-VkBlitImageInfo2-srcImageLayout-00221
  `srcImageLayout` **must** specify the layout of the image subresources of `srcImage` specified in `pRegions` at the time this command is executed on a `VkDevice`
• VUID-VkBlitImageInfo2-srcImageLayout-01398
  srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkBlitImageInfo2-dstImage-02000
  The format features of dstImage must contain VK_FORMAT_FEATURE_BLIT_DST_BIT

• VUID-VkBlitImageInfo2-dstImage-06422
  dstImage must not use a format that requires a sampler Y'C'B'C'R conversion

• VUID-VkBlitImageInfo2-dstImage-00224
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-VkBlitImageInfo2-dstImage-00225
  If dstImage is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-VkBlitImageInfo2-dstImageLayout-00226
  dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice

• VUID-VkBlitImageInfo2-dstImageLayout-01399
  dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

• VUID-VkBlitImageInfo2-srcImage-00229
  If either of srcImage or dstImage was created with a signed integer VkFormat, the other must also have been created with a signed integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00230
  If either of srcImage or dstImage was created with an unsigned integer VkFormat, the other must also have been created with an unsigned integer VkFormat

• VUID-VkBlitImageInfo2-srcImage-00231
  If either of srcImage or dstImage was created with a depth/stencil format, the other must have exactly the same format

• VUID-VkBlitImageInfo2-srcImage-00232
  If srcImage was created with a depth/stencil format, filter must be VK_FILTER_NEAREST

• VUID-VkBlitImageInfo2-dstImage-00234
  dstImage must have been created with a samples value of VK_SAMPLE_COUNT_1_BIT

• VUID-VkBlitImageInfo2-srcImage-00233
  If filter is VK_FILTER_LINEAR, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

• VUID-VkBlitImageInfo2-filter-02001
  If filter is VK_FILTER_CUBIC_EXT, then the format features of srcImage must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-VkBlitImageInfo2-filter-00237
  If filter is VK_FILTER_CUBIC_EXT, srcImage must be of type VK_IMAGE_TYPE_2D
• VUID-VkBlitImageInfo2-srcSubresource-01705
  The `srcSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `srcImage` was created.

• VUID-VkBlitImageInfo2-dstSubresource-01706
  The `dstSubresource.mipLevel` member of each element of `pRegions` must be less than the `mipLevels` specified in `VkImageCreateInfo` when `dstImage` was created.

• VUID-VkBlitImageInfo2-srcSubresource-01707
  The `srcSubresource.baseArrayLayer + srcSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `srcImage` was created.

• VUID-VkBlitImageInfo2-dstSubresource-01708
  The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created.

• VUID-VkBlitImageInfo2-dstImage-02545
  `dstImage` and `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`.

• VUID-VkBlitImageInfo2-srcImage-00240
  If either `srcImage` or `dstImage` is of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` and `dstSubresource.baseArrayLayer` must each be 0, and `srcSubresource.layerCount` and `dstSubresource.layerCount` must each be 1.

• VUID-VkBlitImageInfo2-aspectMask-00241
  For each element of `pRegions`, `srcSubresource.aspectMask` must specify aspects present in `srcImage`.

• VUID-VkBlitImageInfo2-aspectMask-00242
  For each element of `pRegions`, `dstSubresource.aspectMask` must specify aspects present in `dstImage`.

• VUID-VkBlitImageInfo2-srcOffset-00243
  For each element of `pRegions`, `srcOffsets[0].x` and `srcOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`.

• VUID-VkBlitImageInfo2-srcOffset-00244
  For each element of `pRegions`, `srcOffsets[0].y` and `srcOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`.

• VUID-VkBlitImageInfo2-srcOffset-00245
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffsets[0].y` must be 0 and `srcOffsets[1].y` must be 1.

• VUID-VkBlitImageInfo2-srcOffset-00246
  For each element of `pRegions`, `srcOffsets[0].z` and `srcOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`.

• VUID-VkBlitImageInfo2-srcImage-00247
If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions, srcOffsets[0].z` must be 0 and `srcOffsets[1].z` must be 1

- VUID-VkBlitImageInfo2-dstOffset-00248
  For each element of `pRegions, dstOffsets[0].x` and `dstOffsets[1].x` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-VkBlitImageInfo2-dstOffset-00249
  For each element of `pRegions, dstOffsets[0].y` and `dstOffsets[1].y` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-VkBlitImageInfo2-dstImage-00250
  If `dstImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions, dstOffsets[0].y` must be 0 and `dstOffsets[1].y` must be 1

- VUID-VkBlitImageInfo2-dstImage-00251
  For each element of `pRegions, dstOffsets[0].z` and `dstOffsets[1].z` must both be greater than or equal to 0 and less than or equal to the depth of the specified `dstSubresource` of `dstImage`

- VUID-VkBlitImageInfo2-pRegions-04561
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` and `dstImage` must not be block-compressed images

- VUID-VkBlitImageInfo2KHR-pRegions-06207
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` must be of type `VK_IMAGE_TYPE_2D`

- VUID-VkBlitImageInfo2KHR-pRegions-06208
  If any element of `pRegions` contains `VkCopyCommandTransformInfoQCOM` in its `pNext` chain, then `srcImage` must not have a multi-planar format

---

### Valid Usage (Implicit)

- VUID-VkBlitImageInfo2-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_BLIT_IMAGE_INFO_2`

- VUID-VkBlitImageInfo2-pNext-pNext
  `pNext` must be `NULL`

- VUID-VkBlitImageInfo2-srcImage-parameter
  `srcImage` must be a valid `VkImage` handle

- VUID-VkBlitImageInfo2-srcImageLayout-parameter
  `srcImageLayout` must be a valid `VkImageLayout` value

- VUID-VkBlitImageInfo2-dstImage-parameter
  `dstImage` must be a valid `VkImage` handle
• VUID-VkBlitImageInfo2-dstImageLayout-parameter
dstImageLayout must be a valid VkImageLayout value

• VUID-VkBlitImageInfo2-pRegions-parameter
pRegions must be a valid pointer to an array of regionCount valid VkImageBlit2 structures

• VUID-VkBlitImageInfo2-filter-parameter
filter must be a valid VkFilter value

• VUID-VkBlitImageInfo2-regionCount-arraylength
regionCount must be greater than 0

• VUID-VkBlitImageInfo2-commonparent
Both of dstImage, and srcImage must have been created, allocated, or retrieved from the same VkDevice

The VkImageBlit2 structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkImageBlit2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffsets[2];
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffsets[2];
} VkImageBlit2;
```

or the equivalent

```c
// Provided by VK_KHR_copy_commands2
typedef VkImageBlit2 VkImageBlit2KHR;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• srcSubresource is the subresource to blit from.
• srcOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the source region within srcSubresource.
• dstSubresource is the subresource to blit into.
• dstOffsets is a pointer to an array of two VkOffset3D structures specifying the bounds of the destination region within dstSubresource.

For each element of the pRegions array, a blit operation is performed for the specified source and destination regions.
Valid Usage

- VUID-VkImageBlit2-aspectMask-00238
  The aspectMask member of srcSubresource and dstSubresource must match.

- VUID-VkImageBlit2-layerCount-00239
  The layerCount member of srcSubresource and dstSubresource must match.

Valid Usage (Implicit)

- VUID-VkImageBlit2-sType-sType
  sType must be VK_STRUCTURE_TYPE_IMAGE_BLIT_2.

- VUID-VkImageBlit2-pNext-pNext
  pNext must be NULL or a pointer to a valid instance of VkCopyCommandTransformInfoQCOM.

- VUID-VkImageBlit2-sType-unique
  The sType value of each struct in the pNext chain must be unique.

- VUID-VkImageBlit2-srcSubresource-parameter
  srcSubresource must be a valid VkImageSubresourceLayers structure.

- VUID-VkImageBlit2-dstSubresource-parameter
  dstSubresource must be a valid VkImageSubresourceLayers structure.

For vkCmdBlitImage2, each region copied can include a rotation. To specify a rotated region, add VkCopyCommandTransformInfoQCOM to the pNext chain of VkImageBlit2. For each region with a rotation specified, Image Blits with Scaling and Rotation specifies how coordinates are rotated prior to sampling from the source image. When rotation is specified, the source and destination images must each be 2D images. They must not be blocked images or have a multi-planar format.

20.4.1. Image Blits with Scaling and Rotation

When VkCopyCommandTransformInfoQCOM is in the pNext chain of VkImageBlit2, the specified region is rotated during the blit. The following description of rotated addressing replaces the description in vkCmdBlitImage.

The following code computes rotation of normalized coordinates.

```c
// rotation of normalized coordinates
VkOffset2D RotateNormUV(VkOffset2D in, VkSurfaceTransformFlagBitsKHR flags)
{
    VkOffset2D output;
    switch (flags)
    {
        case VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR:
            out.x = in.x;
            out.y = in.y;
            break;
        // other cases
    }
}
```
break;
case VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR:
    out.x = in.y;
    out.y = 1.0 - in.x;
    break;
case VK_SURFACE_TRANSFORM_ROTATE_180_BIT_KHR:
    out.x = 1.0 - in.x;
    out.y = 1.0 - in.y;
    break;
case VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR:
    out.x = 1.0 - in.y;
    out.y = in.x;
    break;
}
return out;
}

• For each destination texel, the integer coordinate of that texel is converted to an unnormalized texture coordinate, using the effective inverse of the equations described in unnormalized to integer conversion:

\[
u_{\text{base}} = \text{i} + \frac{1}{2}
\]

\[
v_{\text{base}} = \text{j} + \frac{1}{2}
\]

\[
w_{\text{base}} = \text{k} + \frac{1}{2}
\]

• These base coordinates are then offset by the first destination offset:

\[
u_{\text{offset}} = u_{\text{base}} - x_{\text{dst0}}
\]

\[
v_{\text{offset}} = v_{\text{base}} - y_{\text{dst0}}
\]

\[
w_{\text{offset}} = w_{\text{base}} - z_{\text{dst0}}
\]

\[
a_{\text{offset}} = a - \text{baseArrayCount}_{\text{dst}}
\]

• The UV destination coordinates are scaled by the destination region, rotated, and scaled by the source region.

\[
u_{\text{dest\_scaled}} = u_{\text{offset}} / (x_{\text{dst1}} - x_{\text{dst0}})
\]
\[ \text{v\_dest\_scaled} = \text{v\_offset} / (\text{y\_dst1} - \text{y\_dst0}) \]

\[
(\text{u\_src\_scaled}, \text{v\_src\_scaled}) = \text{RotateNormUV}(\text{u\_dest\_scaled}, \text{v\_dest\_scaled}, \text{transform})
\]

\[ \text{u\_scaled} = \text{u\_src\_scaled} \times (\text{x\_src1} - \text{x\_src0}) \]

\[ \text{v\_scaled} = \text{v\_src\_scaled} \times (\text{y\_src1} - \text{y\_src0}) \]

- The \( W \) coordinate is unaffected by rotation. The scale is determined from the ratio of source and destination regions, and applied to the offset coordinate:

\[ \text{scale\_w} = (\text{z\_src1} - \text{z\_src0}) / (\text{z\_dst1} - \text{z\_dst0}) \]

\[ \text{w\_scaled} = \text{w\_offset} \times \text{scale\_w} \]

- Finally the source offset is added to the scaled source coordinates, to determine the final unnormalized coordinates used to sample from \( \text{srcImage} \):

\[ \text{u} = \text{u\_scaled} + \text{x\_src0} \]

\[ \text{v} = \text{v\_scaled} + \text{y\_src0} \]

\[ \text{w} = \text{w\_scaled} + \text{z\_src0} \]

\[ \text{q} = \text{mipLevel} \]

\[ \text{a} = \text{a\_offset} + \text{baseArrayCount\_src} \]

These coordinates are used to sample from the source image as described for Image Operations, with the filter mode equal to that of \( \text{filter} \); a mipmap mode of \( \text{VK\_SAMPLER\_MIPMAP\_MODE\_NEAREST} \); and an address mode of \( \text{VK\_SAMPLER\_ADDRESS\_MODE\_CLAMP\_TO\_EDGE} \). Implementations must clamp at the edge of the source image, and may additionally clamp to the edge of the source region.

### 20.5. Resolving Multisample Images

To resolve a multisample color image to a non-multisample color image, call:
void vkCmdResolveImage(
  VkCommandBuffer commandBuffer,
  VkImage srcImage,
  VkImageLayout srcImageLayout,
  VkImage dstImage,
  VkImageLayout dstImageLayout,
  uint32_t regionCount,
  const VkImageResolve* pRegions);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of VkImageResolve structures specifying the regions to resolve.

During the resolve the samples corresponding to each pixel location in the source are converted to a single sample before being written to the destination. If the source formats are floating-point or normalized types, the sample values for each pixel are resolved in an implementation-dependent manner. If the source formats are integer types, a single sample’s value is selected for each pixel.

**srcOffset** and **dstOffset** select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data. **extent** is the size in texels of the source image to resolve in **width**, **height** and **depth**. Each element of **pRegions** must be a region that is contained within its corresponding image.

Resolves are done layer by layer starting with **baseArrayLayer** member of **srcSubresource** for the source and **dstSubresource** for the destination. **layerCount** layers are resolved to the destination image.

### Valid Usage

- **VUID-vkCmdResolveImage-commandBuffer-01837**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **srcImage** must not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01838**
  If **commandBuffer** is an unprotected command buffer and **protectedNoFault** is not supported, **dstImage** must not be a protected image

- **VUID-vkCmdResolveImage-commandBuffer-01839**
  If **commandBuffer** is a protected command buffer and **protectedNoFault** is not supported, **dstImage** must not be an unprotected image

- **VUID-vkCmdResolveImage-pRegions-00255**
The union of all source regions, and the union of all destination regions, specified by the elements of $pRegions$, must not overlap in memory

- VUID-vkCmdResolveImage-srcImage-00256
  If $srcImage$ is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-srcImage-00257
  $srcImage$ must have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-dstImage-00258
  If $dstImage$ is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdResolveImage-dstImage-00259
  $dstImage$ must have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-vkCmdResolveImage-srcImageLayout-01400
  $srcImageLayout$ must specify the layout of the image subresources of $srcImage$ specified in $pRegions$ at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-srcImageLayout-01401
  $srcImageLayout$ must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-dstImageLayout-00260
  $dstImageLayout$ specify the layout of the image subresources of $dstImage$ specified in $pRegions$ at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-00262
  $dstImageLayout$ must specify the layout of the image subresources of $dstImage$ specified in $pRegions$ at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-01400
  $dstImageLayout$ must specify the layout of the image subresources of $dstImage$ specified in $pRegions$ at the time this command is executed on a VkDevice

- VUID-vkCmdResolveImage-dstImageLayout-01401
  $dstImageLayout$ must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL

- VUID-vkCmdResolveImage-linearColorAttachment-06519
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, the format features of $dstImage$ must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV

- VUID-vkCmdResolveImage-srcImage-01386
  $srcImage$ and $dstImage$ must have been created with the same image format

- VUID-vkCmdResolveImage-srcSubresource-01709
  The $srcSubresource.mipLevel$ member of each element of $pRegions$ must be less than the $mipLevels$ specified in $VkImageCreateInfo$ when $srcImage$ was created

- VUID-vkCmdResolveImage-dstSubresource-01710
  The $dstSubresource.mipLevel$ member of each element of $pRegions$ must be less than the $mipLevels$ specified in $VkImageCreateInfo$ when $dstImage$ was created

- VUID-vkCmdResolveImage-srcSubresource-01711
  The $srcSubresource.baseArrayLayer + srcSubresource.layerCount$ of each element of $pRegions$ must be less than or equal to the arrayLayers specified in $VkImageCreateInfo$
when `srcImage` was created

- VUID-vkCmdResolveImage-dstSubresource-01712
  The `dstSubresource.baseArrayLayer + dstSubresource.layerCount` of each element of `pRegions` must be less than or equal to the `arrayLayers` specified in `VkImageCreateInfo` when `dstImage` was created

- VUID-vkCmdResolveImage-dstImage-02546
  `dstImage` and `srcImage` must not have been created with flags containing `VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT`

- VUID-vkCmdResolveImage-srcImage-04446
  If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `srcSubresource.baseArrayLayer` must be 0 and `srcSubresource.layerCount` must be 1

- VUID-vkCmdResolveImage-srcImage-04447
  If either `srcImage` or `dstImage` are of type `VK_IMAGE_TYPE_3D`, then for each element of `pRegions`, `dstSubresource.baseArrayLayer` must be 0 and `dstSubresource.layerCount` must be 1

- VUID-vkCmdResolveImage-srcOffset-00269
  For each element of `pRegions`, `srcOffset.x` and `(extent.width + srcOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdResolveImage-srcOffset-00270
  For each element of `pRegions`, `srcOffset.y` and `(extent.height + srcOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdResolveImage-srcImage-00271
  If `srcImage` is of type `VK_IMAGE_TYPE_1D`, then for each element of `pRegions`, `srcOffset.y` must be 0 and `extent.height` must be 1

- VUID-vkCmdResolveImage-srcOffset-00272
  For each element of `pRegions`, `srcOffset.z` and `(extent.depth + srcOffset.z)` must both be greater than or equal to 0 and less than or equal to the depth of the specified `srcSubresource` of `srcImage`

- VUID-vkCmdResolveImage-srcImage-00273
  If `srcImage` is of type `VK_IMAGE_TYPE_1D` or `VK_IMAGE_TYPE_2D`, then for each element of `pRegions`, `srcOffset.z` must be 0 and `extent.depth` must be 1

- VUID-vkCmdResolveImage-dstOffset-00274
  For each element of `pRegions`, `dstOffset.x` and `(extent.width + dstOffset.x)` must both be greater than or equal to 0 and less than or equal to the width of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdResolveImage-dstOffset-00275
  For each element of `pRegions`, `dstOffset.y` and `(extent.height + dstOffset.y)` must both be greater than or equal to 0 and less than or equal to the height of the specified `dstSubresource` of `dstImage`

- VUID-vkCmdResolveImage-dstImage-00276
If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

• VUID-vkCmdResolveImage-dstOffset-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

• VUID-vkCmdResolveImage-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

• VUID-vkCmdResolveImage-srcImage-06762
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

• VUID-vkCmdResolveImage-srcImage-06763
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

• VUID-vkCmdResolveImage-dstImage-06764
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

• VUID-vkCmdResolveImage-dstImage-06765
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT

Valid Usage (Implicit)

• VUID-vkCmdResolveImage-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdResolveImage-srcImage-parameter
  srcImage must be a valid VkImage handle

• VUID-vkCmdResolveImage-srcImageLayout-parameter
  srcImageLayout must be a valid VkImageLayout value

• VUID-vkCmdResolveImage-dstImage-parameter
  dstImage must be a valid VkImage handle

• VUID-vkCmdResolveImage-dstImageLayout-parameter
  dstImageLayout must be a valid VkImageLayout value

• VUID-vkCmdResolveImage-pRegions-parameter
  pRegions must be a valid pointer to an array of regionCount valid VkImageResolve structures

• VUID-vkCmdResolveImage-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdResolveImage-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdResolveImage-renderpass
  This command must only be called outside of a render pass instance

• VUID-vkCmdResolveImage-videocoding
This command **must** only be called outside of a video coding scope

- VUID-vkCmdResolveImage-regionCount-arraylength
  
  `regionCount` **must** be greater than 0

- VUID-vkCmdResolveImage-commonparent
  
  Each of `commandBuffer`, `dstImage`, and `srcImage` **must** have been created, allocated, or retrieved from the same `VkDevice`

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Outside</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkImageResolve` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkImageResolve {
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve;
```

- `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.

- `srcOffset` and `dstOffset` select the initial `x`, `y`, and `z` offsets in texels of the sub-regions of the source and destination image data.

- `extent` is the size in texels of the source image to resolve in `width`, `height`, and `depth`.

**Valid Usage**

- VUID-VkImageResolve-aspectMask-00266
The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- VUID-VkImageResolve-layerCount-00267
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

### Valid Usage (Implicit)

- VUID-VkImageResolve-srcSubresource-parameter
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- VUID-VkImageResolve-dstSubresource-parameter
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

A more extensible version of the resolve image command is defined below.

To resolve a multisample image to a non-multisample image, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdResolveImage2(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

or the equivalent command

```c
// Provided by VK_KHR_copy_commands2
void vkCmdResolveImage2KHR(
    VkCommandBuffer commandBuffer,
    const VkResolveImageInfo2* pResolveImageInfo);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pResolveImageInfo` is a pointer to a `VkResolveImageInfo2` structure describing the resolve parameters.

This command is functionally identical to `vkCmdResolveImage`, but includes extensible substructures that include `sType` and `pNext` parameters, allowing them to be more easily extended.

### Valid Usage

- VUID-vkCmdResolveImage2-commandBuffer-01837
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `srcImage` must not be a protected image

- VUID-vkCmdResolveImage2-commandBuffer-01838
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, `dstImage` must not be a protected image
VUID-vkCmdResolveImage2-commandBuffer-01839
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, `dstImage` must not be an unprotected image.

### Valid Usage (Implicit)

- VUID-vkCmdResolveImage2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdResolveImage2-pResolveImageInfo-parameter
  `pResolveImageInfo` must be a valid pointer to a valid `VkResolveImageInfo2` structure.
- VUID-vkCmdResolveImage2-commandBuffer-recording
  `commandBuffer` must be in the `recording` state.
- VUID-vkCmdResolveImage2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- VUID-vkCmdResolveImage2-renderpass
  This command must only be called outside of a render pass instance.
- VUID-vkCmdResolveImage2-videocoding
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

</table>

The `VkResolveImageInfo2` structure is defined as:

```c
// Provided by VK_VERSION_1_3
typedef struct VkResolveImageInfo2 {
    VkStructureType sType;
    const void* pNext;
    VkImage srcImage;
    VkImageLayout srcImageLayout;
} VkResolveImageInfo2;
```
VkImage dstImage;
VkImageLayout dstImageLayout;
uint32_t regionCount;
const VkImageResolve2* pRegions;
} VkResolveImageInfo2;

or the equivalent

// Provided by VK_KHR_copy_commands2
typedef VkResolveImageInfo2 VkResolveImageInfo2KHR;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **srcImage** is the source image.
- **srcImageLayout** is the layout of the source image subresources for the resolve.
- **dstImage** is the destination image.
- **dstImageLayout** is the layout of the destination image subresources for the resolve.
- **regionCount** is the number of regions to resolve.
- **pRegions** is a pointer to an array of VkImageResolve2 structures specifying the regions to resolve.

**Valid Usage**

- VUID-VkResolveImageInfo2-pRegions-00255
  The union of all source regions, and the union of all destination regions, specified by the elements of **pRegions**, **must** not overlap in memory

- VUID-VkResolveImageInfo2-srcImage-00256
  If **srcImage** is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkResolveImageInfo2-srcImageLayout-00260
  **srcImage must** have a sample count equal to any valid sample count value other than VK_SAMPLE_COUNT_1_BIT

- VUID-VkResolveImageInfo2-dstImage-00258
  If **dstImage** is non-sparse then it **must** be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkResolveImageInfo2-dstImageLayout-00259
  **dstImage must** have a sample count equal to VK_SAMPLE_COUNT_1_BIT

- VUID-VkResolveImageInfo2-srcImageLayout-01400
  **srcImageLayout must** specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a VkDevice

- VUID-VkResolveImageInfo2-srcImageLayout-01400
  **srcImageLayout must** specify the layout of the image subresources of **srcImage** specified in **pRegions** at the time this command is executed on a VkDevice
srcImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_SRC_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

- VUID-VkResolveImageInfo2-dstImageLayout-00262
dstImageLayout must specify the layout of the image subresources of dstImage specified in pRegions at the time this command is executed on a VkDevice.

- VUID-VkResolveImageInfo2-dstImageLayout-01401
dstImageLayout must be VK_IMAGE_LAYOUT_SHARED_PRESENT_KHR, VK_IMAGE_LAYOUT_TRANSFER_DST_OPTIMAL or VK_IMAGE_LAYOUT_GENERAL.

- VUID-VkResolveImageInfo2-dstImage-02003
  The format features of dstImage must contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BIT.

- VUID-VkResolveImageInfo2-linearColorAttachment-06519
  If the linearColorAttachment feature is enabled and the image is created with VK_IMAGE_TILING_LINEAR, the format features of dstImage must contain VK_FORMAT_FEATURE_2_LINEAR_COLOR_ATTACHMENT_BIT_NV.

- VUID-VkResolveImageInfo2-srcImage-01386
  srcImage and dstImage must have been created with the same image format.

- VUID-VkResolveImageInfo2-srcSubresource-01709
  The srcSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when srcImage was created.

- VUID-VkResolveImageInfo2-dstSubresource-01710
  The dstSubresource.mipLevel member of each element of pRegions must be less than the mipLevels specified in VkImageCreateInfo when dstImage was created.

- VUID-VkResolveImageInfo2-srcSubresource-01711
  The srcSubresource.baseArrayLayer + srcSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when srcImage was created.

- VUID-VkResolveImageInfo2-dstSubresource-01712
  The dstSubresource.baseArrayLayer + dstSubresource.layerCount of each element of pRegions must be less than or equal to the arrayLayers specified in VkImageCreateInfo when dstImage was created.

- VUID-VkResolveImageInfo2-dstImage-02546
  dstImage and srcImage must not have been created with flags containing VK_IMAGE_CREATE_SUBSAMPLED_BIT_EXT.

- VUID-VkResolveImageInfo2-srcImage-04446
  If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, srcSubresource.baseArrayLayer must be 0 and srcSubresource.layerCount must be 1.

- VUID-VkResolveImageInfo2-dstImage-04447
  If either srcImage or dstImage are of type VK_IMAGE_TYPE_3D, then for each element of pRegions, dstSubresource.baseArrayLayer must be 0 and dstSubresource.layerCount must be 1.

- VUID-VkResolveImageInfo2-srcOffset-00269
  For each element of pRegions, srcOffset.x and (extent.width + srcOffset.x) must both be
greater than or equal to 0 and less than or equal to the width of the specified srcSubresource of srcImage

- VUID-VkResolveImageInfo2-srcOffset-00270
  For each element of pRegions, srcOffset.y and (extent.height + srcOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified srcSubresource of srcImage

- VUID-VkResolveImageInfo2-srcImage-00271
  If srcImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, srcOffset.y must be 0 and extent.height must be 1

- VUID-VkResolveImageInfo2-srcOffset-00272
  For each element of pRegions, srcOffset.z and (extent.depth + srcOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified srcSubresource of srcImage

- VUID-VkResolveImageInfo2-srcImage-00273
  If srcImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, srcOffset.z must be 0 and extent.depth must be 1

- VUID-VkResolveImageInfo2-dstOffset-00274
  For each element of pRegions, dstOffset.x and (extent.width + dstOffset.x) must both be greater than or equal to 0 and less than or equal to the width of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstOffset-00275
  For each element of pRegions, dstOffset.y and (extent.height + dstOffset.y) must both be greater than or equal to 0 and less than or equal to the height of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00276
  If dstImage is of type VK_IMAGE_TYPE_1D, then for each element of pRegions, dstOffset.y must be 0 and extent.height must be 1

- VUID-VkResolveImageInfo2-dstOffset-00277
  For each element of pRegions, dstOffset.z and (extent.depth + dstOffset.z) must both be greater than or equal to 0 and less than or equal to the depth of the specified dstSubresource of dstImage

- VUID-VkResolveImageInfo2-dstImage-00278
  If dstImage is of type VK_IMAGE_TYPE_1D or VK_IMAGE_TYPE_2D, then for each element of pRegions, dstOffset.z must be 0 and extent.depth must be 1

- VUID-VkResolveImageInfo2-srcImage-06762
  srcImage must have been created with VK_IMAGE_USAGE_TRANSFER_SRC_BIT usage flag

- VUID-VkResolveImageInfo2-srcImage-06763
  The format features of srcImage must contain VK_FORMAT_FEATURE_TRANSFER_SRC_BIT

- VUID-VkResolveImageInfo2-dstImage-06764
  dstImage must have been created with VK_IMAGE_USAGE_TRANSFER_DST_BIT usage flag

- VUID-VkResolveImageInfo2-dstImage-06765
  The format features of dstImage must contain VK_FORMAT_FEATURE_TRANSFER_DST_BIT
Valid Usage (Implicit)

- **VUID-VkResolveImageInfo2-sType-sType**
  
  *sType* must be *VK_STRUCTURE_TYPE_RESOLVE_IMAGE_INFO_2*

- **VUID-VkResolveImageInfo2-pNext-pNext**
  
  *pNext* must be NULL

- **VUID-VkResolveImageInfo2-srcImage-parameter**
  
  *srcImage* must be a valid *VkImage* handle

- **VUID-VkResolveImageInfo2-srcImageLayout-parameter**
  
  *srcImageLayout* must be a valid *VkImageLayout* value

- **VUID-VkResolveImageInfo2-dstImage-parameter**
  
  *dstImage* must be a valid *VkImage* handle

- **VUID-VkResolveImageInfo2-dstImageLayout-parameter**
  
  *dstImageLayout* must be a valid *VkImageLayout* value

- **VUID-VkResolveImageInfo2-pRegions-parameter**
  
  *pNext* must be a valid pointer to an array of *regionCount* valid *VkImageResolve2* structures

- **VUID-VkResolveImageInfo2-regionCount-arraylength**
  
  *regionCount* must be greater than 0

- **VUID-VkResolveImageInfo2-commonparent**
  
  Both of *dstImage*, and *srcImage* must have been created, allocated, or retrieved from the same *VkDevice*

The *VkImageResolve2* structure is defined as:

```c
#include <vk.h>

// Provided by VK_VERSION_1_3
typedef struct VkImageResolve2 {
    VkStructureType sType;
    const void* pNext;
    VkImageSubresourceLayers srcSubresource;
    VkOffset3D srcOffset;
    VkImageSubresourceLayers dstSubresource;
    VkOffset3D dstOffset;
    VkExtent3D extent;
} VkImageResolve2;

// Provided by VK_KHR_copy_commands2
typedef VkImageResolve2 VkImageResolve2KHR;
```

- *sType* is the type of this structure.
• `pNext` is `NULL` or a pointer to a structure extending this structure.

• `srcSubresource` and `dstSubresource` are `VkImageSubresourceLayers` structures specifying the image subresources of the images used for the source and destination image data, respectively. Resolve of depth/stencil images is not supported.

• `srcOffset` and `dstOffset` select the initial x, y, and z offsets in texels of the sub-regions of the source and destination image data.

• `extent` is the size in texels of the source image to resolve in `width`, `height` and `depth`.

---

### Valid Usage

- **VUID-VkImageResolve2-aspectMask-00266**
  The `aspectMask` member of `srcSubresource` and `dstSubresource` must only contain `VK_IMAGE_ASPECT_COLOR_BIT`

- **VUID-VkImageResolve2-layerCount-00267**
  The `layerCount` member of `srcSubresource` and `dstSubresource` must match

---

### Valid Usage (Implicit)

- **VUID-VkImageResolve2-sType-sType**
  `sType` must be `VK_STRUCTURE_TYPE_IMAGE_RESOLVE_2`

- **VUID-VkImageResolve2-pNext-pNext**
  `pNext` must be `NULL`

- **VUID-VkImageResolve2-srcSubresource-parameter**
  `srcSubresource` must be a valid `VkImageSubresourceLayers` structure

- **VUID-VkImageResolve2-dstSubresource-parameter**
  `dstSubresource` must be a valid `VkImageSubresourceLayers` structure

---

### 20.6. Buffer Markers

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
void vkCmdWriteBufferMarker2AMD(
    VkCommandBuffer commandBuffer,  // Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
    VkPipelineStageFlags2 stage,    // Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
    VkBuffer dstBuffer,            // Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
    VkDeviceSize dstOffset,        // Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
    uint32_t marker);              // Provided by VK_KHR_synchronization2 with VK_AMD_buffer_marker
```

- `commandBuffer` is the command buffer into which the command will be recorded.

- `stage` specifies the pipeline stage whose completion triggers the marker write.
• **dstBuffer** is the buffer where the marker will be written.
• **dstOffset** is the byte offset into the buffer where the marker will be written.
• **marker** is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of other preceding `vkCmdWriteBufferMarker2AMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command’s specified **stage**.

While consecutive buffer marker writes with the same **stage** parameter implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations **must** still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the **VK_ACCESS_TRANSFER_WRITE_BIT**, and the pipeline stages for identifying the synchronization scope **must** include both **stage** and **VK_PIPELINE_STAGE_TRANSFER_BIT**.

**Note**

Similar to `vkCmdWriteTimestamp2`, if an implementation is unable to write a marker at any specific pipeline stage, it **may** instead do so at any logically later stage.

**Note**

Implementations **may** only support a limited number of pipelined marker write operations in flight at a given time. Thus an excessive number of marker write operations **may** degrade command execution performance.

---

**Valid Usage**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03929**
  If the **geometryShader** feature is not enabled, **stage** **must** not contain **VK_PIPELINE_STAGE_2_GEOMETRY_SHADER_BIT**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03930**
  If the **tessellationShader** feature is not enabled, **stage** **must** not contain **VK_PIPELINE_STAGE_2_TESSELLATION_CONTROL_SHADER_BIT** or **VK_PIPELINE_STAGE_2_TESSELLATION_EVALUATION_SHADER_BIT**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03931**
  If the **conditionalRendering** feature is not enabled, **stage** **must** not contain **VK_PIPELINE_STAGE_2_CONDITIONAL_RENDERING_BIT_EXT**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03932**
  If the **fragmentDensityMap** feature is not enabled, **stage** **must** not contain **VK_PIPELINE_STAGE_2_FRAGMENT_DENSITY_PROCESS_BIT_EXT**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03933**
  If the **transformFeedback** feature is not enabled, **stage** **must** not contain **VK_PIPELINE_STAGE_2_TRANSFORM_FEEDBACK_BIT_EXT**

- **VUID-vkCmdWriteBufferMarker2AMD-stage-03934**
  If the **meshShader** feature is not enabled, **stage** **must** not contain
If the taskShader feature is not enabled, the stage must not contain VK_PIPELINE_STAGE_2_TASK_SHADER_BIT_NV.

If the shadingRateImage feature is not enabled, the stage must not contain VK_PIPELINE_STAGE_2_SHADING_RATE_IMAGE_BIT_NV.

If the subpassShading feature is not enabled, the stage must not contain VK_PIPELINE_STAGE_2_SUBPASS_SHADING_BIT_HUAWEI.

If the invocationMask feature is not enabled, the stage must not contain VK_PIPELINE_STAGE_2_INVOCATION_MASK_BIT_HUAWEI.

The synchronization2 feature must be enabled.

The stage must include only a single pipeline stage.

The stage must include only stages that are valid for the queue family that was used to create the command pool that commandBuffer was allocated from.

The dstOffset must be less than or equal to the size of dstBuffer minus 4.

The dstBuffer must have been created with the VK_BUFFER_USAGE_TRANSFER_DST_BIT usage flag.

If dstBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

The dstOffset must be a multiple of 4.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

stage must be a valid combination of VkPipelineStageFlagBits2 values.

dstBuffer must be a valid VkBuffer handle.

commandBuffer must be in the recording state.

commandBuffer must be in the recording state.

commandBuffer must be in the recording state.
The VkCommandPool that commandBuffer was allocated from must support transfer, graphics, or compute operations

- VUID-vkCmdWriteBufferMarker2AMD-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdWriteBufferMarker2AMD-commonparent
  Both of commandBuffer, and dstBuffer must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Transfer Graphics Compute</td>
</tr>
</tbody>
</table>

To write a 32-bit marker value into a buffer as a pipelined operation, call:

```c
// Provided by VK_AMD_buffer_marker
void vkCmdWriteBufferMarkerAMD(
    VkCommandBuffer commandBuffer,
    VkPipelineStageFlagBits pipelineStage,
    VkBuffer dstBuffer,
    VkDeviceSize dstOffset,
    uint32_t marker);
```

- commandBuffer is the command buffer into which the command will be recorded.
- pipelineStage is a VkPipelineStageFlagBits value specifying the pipeline stage whose completion triggers the marker write.
- dstBuffer is the buffer where the marker will be written to.
- dstOffset is the byte offset into the buffer where the marker will be written to.
- marker is the 32-bit value of the marker.

The command will write the 32-bit marker value into the buffer only after all preceding commands have finished executing up to at least the specified pipeline stage. This includes the completion of
other preceding `vkCmdWriteBufferMarkerAMD` commands so long as their specified pipeline stages occur either at the same time or earlier than this command's specified `pipelineStage`.

While consecutive buffer marker writes with the same `pipelineStage` parameter are implicitly complete in submission order, memory and execution dependencies between buffer marker writes and other operations must still be explicitly ordered using synchronization commands. The access scope for buffer marker writes falls under the `VK_ACCESS_TRANSFER_WRITE_BIT`, and the pipeline stages for identifying the synchronization scope must include both `pipelineStage` and `VK_PIPELINE_STAGE_TRANSFER_BIT`.

**Note**

Similar to `vkCmdWriteTimestamp`, if an implementation is unable to write a marker at any specific pipeline stage, it may instead do so at any logically later stage.

**Note**

Implementations may only support a limited number of pipelined marker write operations in flight at a given time, thus excessive number of marker write operations may degrade command execution performance.

## Valid Usage

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04074**
  
  `pipelineStage` must be a valid stage for the queue family that was used to create the command pool that `commandBuffer` was allocated from.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04075**
  
  If the `geometryShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_GEOMETRY_SHADER_BIT`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04076**
  
  If the `tessellationShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TESSELLATION_CONTROL_SHADER_BIT` or `VK_PIPELINE_STAGE_TESSELLATION_EVALUATION_SHADER_BIT`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04077**
  
  If the `conditionalRendering` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_CONDITIONAL_RENDERING_BIT_EXT`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04078**
  
  If the `fragmentDensityMap` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_FRAGMENT_DENSITY_PROCESS_BIT_EXT`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079**
  
  If the `transformFeedback` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04079**
  
  If the `meshShader` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_MESH_SHADER_BIT_NV` or `VK_PIPELINE_STAGE_TASK_SHADER_BIT_NV`.

- **VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-04081**
If the `shadingRateImage` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_SHADING_RATE_IMAGE_BIT_NV`.

- VUID-vkCmdWriteBufferMarkerAMD-synchronization2-06489
  If the `synchronization2` feature is not enabled, `pipelineStage` must not be `VK_PIPELINE_STAGE_NONE`.

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01798
  `dstOffset` must be less than or equal to the size of `dstBuffer` minus 4.

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01799
  `dstBuffer` must have been created with `VK_BUFFER_USAGE_TRANSFER_DST_BIT` usage flag.

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-01800
  If `dstBuffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- VUID-vkCmdWriteBufferMarkerAMD-dstOffset-01801
  `dstOffset` must be a multiple of 4.

### Valid Usage (Implicit)

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdWriteBufferMarkerAMD-pipelineStage-parameter
  If `pipelineStage` is not 0, `pipelineStage` must be a valid `VkPipelineStageFlagBits` value.

- VUID-vkCmdWriteBufferMarkerAMD-dstBuffer-parameter
  `dstBuffer` must be a valid `VkBuffer` handle.

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdWriteBufferMarkerAMD-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support transfer, graphics, or compute operations.

- VUID-vkCmdWriteBufferMarkerAMD-videocoding
  This command must only be called outside of a video coding scope.

- VUID-vkCmdWriteBufferMarkerAMD-commonparent
  Both of `commandBuffer`, and `dstBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Chapter 21. Drawing Commands

Drawing commands (commands with Draw in the name) provoke work in a graphics pipeline. Drawing commands are recorded into a command buffer and when executed by a queue, will produce work which executes according to the bound graphics pipeline. A graphics pipeline must be bound to a command buffer before any drawing commands are recorded in that command buffer.

Drawing can be achieved in two modes:

- **Programmable Mesh Shading**, the mesh shader assembles primitives, or
- **Programmable Primitive Shading**, the input primitives are assembled

as follows.

Each draw is made up of zero or more vertices and zero or more instances, which are processed by the device and result in the assembly of primitives. Primitives are assembled according to the `pInputAssemblyState` member of the `VkGraphicsPipelineCreateInfo` structure, which is of type `VkPipelineInputAssemblyStateCreateInfo`:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineInputAssemblyStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineInputAssemblyStateCreateFlags flags;
    VkPrimitiveTopology topology;
    VkBool32 primitiveRestartEnable;
} VkPipelineInputAssemblyStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `topology` is a `VkPrimitiveTopology` defining the primitive topology, as described below.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. This enable only applies to indexed draws (`vkCmdDrawIndexed`, `vkCmdDrawMultiIndexedEXT`, and `vkCmdDrawIndexedIndirect`), and the special index value is either `0xFFFFFFFF` when the `indexType` parameter of `vkCmdBindIndexBuffer` is equal to `VK_INDEX_TYPE_UINT32`, `0xFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT8_EXT`, or `0xFFFF` when `indexType` is equal to `VK_INDEX_TYPE_UINT16`. Primitive restart is not allowed for “list” topologies, unless one of the features `primitiveTopologyPatchListRestart` (for `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST`) or `primitiveTopologyListRestart` (for all other list topologies) is enabled.

Restarting the assembly of primitives discards the most recent index values if those elements formed an incomplete primitive, and restarts the primitive assembly using the subsequent indices, but only assembling the immediately following element through the end of the originally specified
elements. The primitive restart index value comparison is performed before adding the vertexOffset value to the index value.

### Valid Usage

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06252**
  If topology is **VK_PRIMITIVE_TOPOLOGY_POINT_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST**, **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST**, **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY** or **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY**, and primitiveRestartEnable is **VK_TRUE**, the primitiveTopologyListRestart feature must be enabled.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-06253**
  If topology is **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**, and primitiveRestartEnable is **VK_TRUE**, the primitiveTopologyPatchListRestart feature must be enabled.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00429**
  If the geometryShader feature is not enabled, topology must not be any of **VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY**, **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY**, **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY** or **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY**.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-00430**
  If the tessellationShader feature is not enabled, topology must not be **VK_PRIMITIVE_TOPOLOGY_PATCH_LIST**.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-triangleFans-04452**
  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans is **VK_FALSE**, topology must not be **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN**.

### Valid Usage (Implicit)

- **VUID-VkPipelineInputAssemblyStateCreateInfo-sType-sType**
  sType must be **VK_STRUCTURE_TYPE_PIPELINE_INPUT_ASSEMBLY_STATE_CREATE_INFO**.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-pNext-pNext**
  pNext must be **NULL**.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-flags-zerobitmask**
  flags must be **0**.

- **VUID-VkPipelineInputAssemblyStateCreateInfo-topology-parameter**
  topology must be a valid **VkPrimitiveTopology** value.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineInputAssemblyStateCreateFlags;
```

VkPipelineInputAssemblyStateCreateFlags is a bitmask type for setting a mask, but is currently
reserved for future use.

To dynamically control whether a special vertex index value is treated as restarting the assembly of primitives, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetPrimitiveRestartEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetPrimitiveRestartEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 primitiveRestartEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveRestartEnable` controls whether a special vertex index value is treated as restarting the assembly of primitives. It behaves in the same way as `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable`

This command sets the primitive restart enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::primitiveRestartEnable` value used to create the currently active pipeline.

**Valid Usage (Implicit)**

- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-recording
  `commandBuffer must` be in the recording state
- VUID-vkCmdSetPrimitiveRestartEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations
- VUID-vkCmdSetPrimitiveRestartEnable-videocoding
  This command `must` only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer must` be externally synchronized
Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized.

---

## 21.1. Primitive Topologies

*Primitive topology* determines how consecutive vertices are organized into primitives, and determines the type of primitive that is used at the beginning of the graphics pipeline. The effective topology for later stages of the pipeline is altered by tessellation or geometry shading (if either is in use) and depends on the execution modes of those shaders. In the case of mesh shading the only effective topology is defined by the execution mode of the mesh shader.

The primitive topologies defined by VkPrimitiveTopology are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPrimitiveTopology {
    VK_PRIMITIVE_TOPOLOGY_POINT_LIST = 0,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST = 1,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP = 2,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST = 3,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP = 4,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN = 5,
    VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY = 6,
    VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY = 7,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY = 8,
    VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY = 9,
    VK_PRIMITIVE_TOPOLOGY_PATCH_LIST = 10,
} VkPrimitiveTopology;
```

- **VK_PRIMITIVE_TOPOLOGY_POINT_LIST** specifies a series of separate point primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_LIST** specifies a series of separate line primitives.
- **VK_PRIMITIVE_TOPOLOGY_LINE_STRIP** specifies a series of connected line primitives with consecutive lines sharing a vertex.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST** specifies a series of separate triangle primitives.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP** specifies a series of connected triangle primitives with consecutive triangles sharing an edge.
- **VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN** specifies a series of connected triangle primitives with all
triangles sharing a common vertex. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

- `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY` specifies a series of separate line primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY` specifies a series of connected line primitives with adjacency, with consecutive primitives sharing three vertices.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY` specifies a series of separate triangle primitives with adjacency.
- `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY` specifies connected triangle primitives with adjacency, with consecutive triangles sharing an edge.
- `VK_PRIMITIVE_TOPOLOGY_PATCH_LIST` specifies separate patch primitives.

Each primitive topology, and its construction from a list of vertices, is described in detail below with a supporting diagram, according to the following key:

| • | Vertex | A point in 3-dimensional space. Positions chosen within the diagrams are arbitrary and for illustration only. |
| 5 | Vertex Number | Sequence position of a vertex within the provided vertex data. |
| ⬤ | Provoking Vertex | Provoking vertex within the main primitive. The tail is angled towards the relevant primitive. Used in flat shading. |
| ⬤ | Primitive Edge | An edge connecting the points of a main primitive. |
| ⬤ | Adjacency Edge | Points connected by these lines do not contribute to a main primitive, and are only accessible in a geometry shader. |
| △ | Winding Order | The relative order in which vertices are defined within a primitive, used in the facing determination. This ordering has no specific start or end point. |

The diagrams are supported with mathematical definitions where the vertices ($v$) and primitives ($p$) are numbered starting from 0; $v_0$ is the first vertex in the provided data and $p_0$ is the first primitive in the set of primitives defined by the vertices and topology.

To **dynamically set** primitive topology, call:

```c
// Provided by VK_VERSION_1_3
def void vkCmdSetPrimitiveTopology(
    VkCommandBuffer commandBuffer,
    VkPrimitiveTopology primitiveTopology);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
```
```c
void vkCmdSetPrimitiveTopologyEXT(
    VkCommandBuffer commandBuffer,      // the command buffer into which the command will be recorded.
    VkPrimitiveTopology primitiveTopology); // specifies the primitive topology to use for drawing.
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `primitiveTopology` specifies the primitive topology to use for drawing.

This command sets the primitive topology for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineInputAssemblyStateCreateInfo::topology` value used to create the currently active pipeline.

**Valid Usage (Implicit)**

- VUID-vkCmdSetPrimitiveTopology-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetPrimitiveTopology-primitiveTopology-parameter
  `primitiveTopology must` be a valid `VkPrimitiveTopology` value
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-recording
  `commandBuffer must` be in the recording state
- VUID-vkCmdSetPrimitiveTopology-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from `must` support graphics operations
- VUID-vkCmdSetPrimitiveTopology-videocoding
  This command `must` only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` `must` be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from `must` be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
21.1.1. Topology Class

The primitive topologies are grouped into the following topology classes:

**Table 29. Topology classes**

<table>
<thead>
<tr>
<th>Topology Class</th>
<th>Primitive Topology</th>
</tr>
</thead>
<tbody>
<tr>
<td>Point</td>
<td>VK_PRIMITIVE_TOPOLOGY_POINT_LIST</td>
</tr>
<tr>
<td>Line</td>
<td>VK_PRIMITIVE_TOPOLOGY_LINE_LIST, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Triangle</td>
<td>VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY</td>
</tr>
<tr>
<td>Patch</td>
<td>VK_PRIMITIVE_TOPOLOGY_PATCH_LIST</td>
</tr>
</tbody>
</table>

21.1.2. Point Lists

When the topology is VK_PRIMITIVE_TOPOLOGY_POINT_LIST, each consecutive vertex defines a single point primitive, according to the equation:

\[ p_i = \{v_i\} \]

As there is only one vertex, that vertex is the provoking vertex. The number of primitives generated is equal to vertexCount.

21.1.3. Line Lists

When the primitive topology is VK_PRIMITIVE_TOPOLOGY_LINE_LIST, each consecutive pair of vertices defines a single line primitive, according to the equation:
\[ p_i = \{v_{2i}, v_{2i+1}\} \]

The number of primitives generated is equal to \( \lfloor \frac{\text{vertexCount}}{2} \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{2i+1} \).

### 21.1.4. Line Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP`, one line primitive is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-1) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).
21.1.5. Triangle Lists

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST`, each consecutive set of three vertices defines a single triangle primitive, according to the equation:

\[ p_i = \{v_{3i}, v_{3i+1}, v_{3i+2}\} \]

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/3 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{3i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{3i+2} \).

21.1.6. Triangle Strips

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP`, one triangle primitive is defined by each vertex and the two vertices that follow it, according to the equation:

\[ p_i = \{v_i, v_{i+(1+i\%2)}, v_{i+(2-i\%2)}\} \]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_i \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

\[
\textbf{Note}
\]

The ordering of the vertices in each successive triangle is reversed, so that the winding order is consistent throughout the strip.

### 21.1.7. Triangle Fans

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, triangle primitives are defined around a shared common vertex, according to the equation:

\[
p_i = \{v_{i+1}, v_{i+2}, v_0\}
\]

The number of primitives generated is equal to \( \max(0, \text{vertexCount}-2) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).
If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::triangleFans` is `VK_FALSE`, then triangle fans are not supported by the implementation, and `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN` must not be used.

### 21.1.8. Line Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY`, each consecutive set of four vertices defines a single line primitive with adjacency, according to the equation:

\[ p_i = \{v_{4i}, v_{4i+1}, v_{4i+2}, v_{4i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a geometry shader.

The number of primitives generated is equal to \(\lfloor\text{vertexCount}/4\rfloor\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_{4i+1}\).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \(p_i\) is \(v_{4i+2}\).
21.1.9. Line Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY`, one line primitive with adjacency is defined by each vertex and the following vertex, according to the equation:

\[ p_i = \{v_i, v_{i+1}, v_{i+2}, v_{i+3}\} \]

A line primitive is described by the second and third vertices of the total primitive, with the remaining two vertices only accessible in a *geometry shader*.

The number of primitives generated is equal to \( \max(0, \text{vertexCount} - 3) \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+1} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{i+2} \).

21.1.10. Triangle Lists With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY`, each consecutive set of six vertices defines a single triangle primitive with adjacency, according to the equations:

\[ p_i = \{v_{6i}, v_{6i+1}, v_{6i+2}, v_{6i+3}, v_{6i+4}, v_{6i+5}\} \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive, with the remaining three vertices only accessible in a *geometry shader*.

The number of primitives generated is equal to \( \lfloor \text{vertexCount}/6 \rfloor \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{6i} \).
When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is \( v_{6i+4} \).

### 21.1.11. Triangle Strips With Adjacency

When the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY`, one triangle primitive with adjacency is defined by each vertex and the following 5 vertices.

The number of primitives generated, \( n \), is equal to \( \lceil \text{max}(0, vertexCount - 4)/2 \rceil \).

If \( n = 1 \), the primitive is defined as:

\[
p = \{v_0, v_1, v_2, v_5, v_4, v_3\}
\]

If \( n > 1 \), the total primitive consists of different vertices according to where it is in the strip:

\[
p_i = \{v_{2i}, v_{2i+1}, v_{2i+2}, v_{2i+3}, v_{2i+4}, v_{2i+6}\} \text{ when } i=0
\]

\[
p_i = \{v_{2i}, v_{2i+3}, v_{2i+4}, v_{2i+6}, v_{2i+2}, v_{2i+1}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=1
\]

\[
p_i = \{v_{2i}, v_{2i+2}, v_{2i+4}, v_{2i+6}, v_{2i+3}\} \text{ when } i>0, i<n-1, \text{ and } i\%2=0
\]
\[ p_i = \{v_{2i}, v_{2i+3}, v_{2i+5}, v_{2i+2}, v_{2i+1}\} \text{ when } i=n-1 \text{ and } i\%2=1 \]

\[ p_i = \{v_{2i}, v_{2i+2}, v_{2i+5}, v_{2i+4}, v_{2i+3}\} \text{ when } i=n-1 \text{ and } i\%2=0 \]

A triangle primitive is described by the first, third, and fifth vertices of the total primitive in all cases, with the remaining three vertices only accessible in a geometry shader.

**Note**

The ordering of the vertices in each successive triangle is altered so that the winding order is consistent throughout the strip.

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i} \).

When the `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the provoking vertex for \( p_i \) is always \( v_{2i+4} \).
21.1.12. Patch Lists

When the primitive topology is VK_PRIMITIVE_TOPOLOGY_PATCH_LIST, each consecutive set of \( m \) vertices defines a single patch primitive, according to the equation:

\[ p_i = \{v_{mi}, v_{mi+1}, \ldots, v_{mi+(m-2)}, v_{mi+(m-1)}\} \]

where \( m \) is equal to VkPipelineTessellationStateCreateInfo::patchControlPoints.

Patch lists are never passed to vertex post-processing, and as such no provoking vertex is defined for patch primitives. The number of primitives generated is equal to \( \lfloor \text{vertexCount}/m \rfloor \).

The vertices comprising a patch have no implied geometry, and are used as inputs to tessellation shaders and the fixed-function tessellator to generate new point, line, or triangle primitives.

21.2. Primitive Order

Primitives generated by drawing commands progress through the stages of the graphics pipeline in primitive order. Primitive order is initially determined in the following way:

1. Submission order determines the initial ordering
2. For indirect drawing commands, the order in which accessed instances of the
 VkDrawIndirectCommand are stored in buffer, from lower indirect buffer addresses to higher addresses.

3. If a drawing command includes multiple instances, the order in which instances are executed, from lower numbered instances to higher.

4. The order in which primitives are specified by a drawing command:
   - For non-indexed draws, from vertices with a lower numbered vertexIndex to a higher numbered vertexIndex.
   - For indexed draws, vertices sourced from a lower index buffer addresses to higher addresses.
   - For draws using mesh shaders, the order is provided by mesh shading.

Within this order implementations further sort primitives:

5. If tessellation shading is active, by an implementation-dependent order of new primitives generated by tessellation.

6. If geometry shading is active, by the order new primitives are generated by geometry shading.

7. If the polygon mode is not VK_POLYGON_MODE_FILL, or VK_POLYGON_MODE_FILL_RECTANGLE_NV, by an implementation-dependent ordering of the new primitives generated within the original primitive.

Primitive order is later used to define rasterization order, which determines the order in which fragments output results to a framebuffer.

### 21.3. Programmable Primitive Shading

Once primitives are assembled, they proceed to the vertex shading stage of the pipeline. If the draw includes multiple instances, then the set of primitives is sent to the vertex shading stage multiple times, once for each instance.

It is implementation-dependent whether vertex shading occurs on vertices that are discarded as part of incomplete primitives, but if it does occur then it operates as if they were vertices in complete primitives and such invocations can have side effects.

Vertex shading receives two per-vertex inputs from the primitive assembly stage - the vertexIndex and the instanceIndex. How these values are generated is defined below, with each command.

Drawing commands fall roughly into two categories:

- Non-indexed drawing commands present a sequential vertexIndex to the vertex shader. The sequential index is generated automatically by the device (see Fixed-Function Vertex Processing for details on both specifying the vertex attributes indexed by vertexIndex, as well as binding vertex buffers containing those attributes to a command buffer). These commands are:
  - vkCmdDraw
  - vkCmdDrawIndirect
  - vkCmdDrawIndirectCount
Indexed drawing commands read index values from an index buffer and use this to compute the vertexIndex value for the vertex shader. These commands are:

- `vkCmdDrawIndexed`
- `vkCmdDrawIndexedIndirect`
- `vkCmdDrawIndexedIndirectCount`
- `vkCmdDrawIndexedIndirectCountKHR`
- `vkCmdDrawIndexedIndirectCountAMD`
- `vkCmdDrawMultiIndexedEXT`

To bind an index buffer to a command buffer, call:

```c
void vkCmdBindIndexBuffer(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkBuffer buffer,               // commandBuffer is the command buffer into which the command is recorded.
    VkDeviceSize offset,           // buffer is the buffer being bound.
    VkIndexType indexType);        // offset is the starting offset in bytes within buffer used in index buffer address calculations.
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer being bound.
- `offset` is the starting offset in bytes within `buffer` used in index buffer address calculations.
- `indexType` is a `VkIndexType` value specifying the size of the indices.

Valid Usage

- `VUID-vkCmdBindIndexBuffer-offset-00431`
  `offset` must be less than the size of `buffer`
- `VUID-vkCmdBindIndexBuffer-offset-00432`
  The sum of `offset` and the address of the range of `VkDeviceMemory` object that is backing `buffer`, must be a multiple of the type indicated by `indexType`
- `VUID-vkCmdBindIndexBuffer-buffer-00433`
  `buffer` must have been created with the `VK_BUFFER_USAGE_INDEX_BUFFER_BIT` flag
- `VUID-vkCmdBindIndexBuffer-buffer-00434`
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object
- `VUID-vkCmdBindIndexBuffer-indexType-02507`
  `indexType` must not be `VK_INDEX_TYPE_NONE_KHR`
If `indexType` is `VK_INDEX_TYPE_UINT8_EXT`, the `indexTypeUint8` feature must be enabled.

### Valid Usage (Implicit)

- `VUID-vkCmdBindIndexBuffer-commandBuffer-parameter` 
  - `commandBuffer` must be a valid `VkCommandBuffer` handle.
- `VUID-vkCmdBindIndexBuffer-buffer-parameter` 
  - `buffer` must be a valid `VkBuffer` handle.
- `VUID-vkCmdBindIndexBuffer-indexType-parameter` 
  - `indexType` must be a valid `VkIndexType` value.
- `VUID-vkCmdBindIndexBuffer-commandBuffer-recording` 
  - `commandBuffer` must be in the recording state.
- `VUID-vkCmdBindIndexBuffer-commandBuffer-cmdpool` 
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- `VUID-vkCmdBindIndexBuffer-videocoding` 
  - This command must only be called outside of a video coding scope.
- `VUID-vkCmdBindIndexBuffer-commonparent` 
  - Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

<td></td>
</tr>
</tbody>
</table>

Possible values of `vkCmdBindIndexBuffer::indexType`, specifying the size of indices, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkIndexType {
    VK_INDEX_TYPE_UINT16 = 0,
```
VK_INDEX_TYPE_UINT32 = 1,
  // Provided by VK_KHR_acceleration_structure
VK_INDEX_TYPE_NONE_KHR = 1000165000,
  // Provided by VK_EXT_index_type_uint8
VK_INDEX_TYPE_UINT8_EXT = 1000265000,
  // Provided by VK_NV_ray_tracing
VK_INDEX_TYPE_NONE_NV = VK_INDEX_TYPE_NONE_KHR,
} VkIndexType;

- VK_INDEX_TYPE_UINT16 specifies that indices are 16-bit unsigned integer values.
- VK_INDEX_TYPE_UINT32 specifies that indices are 32-bit unsigned integer values.
- VK_INDEX_TYPE_NONE_KHR specifies that no indices are provided.
- VK_INDEX_TYPE_UINT8_EXT specifies that indices are 8-bit unsigned integer values.

The parameters for each drawing command are specified directly in the command or read from buffer memory, depending on the command. Drawing commands that source their parameters from buffer memory are known as indirect drawing commands.

All drawing commands interact with the robustBufferAccess feature.

To record a non-indexed draw, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdDraw(
  VkCommandBuffer commandBuffer,
  uint32_t vertexCount,
  uint32_t instanceCount,
  uint32_t firstVertex,
  uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
- `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `vertexCount` consecutive vertex indices with the first `vertexIndex` value equal to `firstVertex`. The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

Valid Usage

- VUID-vkCmdDraw-magFilter-04553

1438
If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

• VUID-vkCmdDraw-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

• VUID-vkCmdDraw-None-06479
  If a `VkImageView` is sampled with `depth comparison`, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

• VUID-vkCmdDraw-None-02691
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

• VUID-vkCmdDraw-flags-02692
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

• VUID-vkCmdDraw-filterCubic-02694
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDraw-filterCubicMinmax-02695
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

• VUID-vkCmdDraw-flags-02696
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

• VUID-vkCmdDraw-OpTypeImage-06423
  Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDraw-OpTypeImage-06424
  Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

• VUID-vkCmdDraw-None-02697
For each set \( n \) that is statically used by the \( \text{VkPipeline} \) bound to the pipeline bind point used by this command, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for set \( n \), with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \), as described in \textbf{Pipeline Layout Compatibility}

- **VUID-vkCmdDraw-maintenance4-06425**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the \( \text{VkPipeline} \) bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a \( \text{VkPipelineLayout} \) that is compatible for push constants, with the \( \text{VkPipelineLayout} \) used to create the current \( \text{VkPipeline} \), as described in \textbf{Pipeline Layout Compatibility}

- **VUID-vkCmdDraw-None-02699**
  Descriptors in each bound descriptor set, specified via \( \text{vkCmdBindDescriptorSets} \), must be valid if they are statically used by the \( \text{VkPipeline} \) bound to the pipeline bind point used by this command

- **VUID-vkCmdDraw-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command

- **VUID-vkCmdDraw-commandBuffer-02701**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the \text{VK_NV_inherited_viewport_scissor} extension is enabled) for \( \text{commandBuffer} \), and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdDraw-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDraw-None-02702**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler must not be used to sample from any \( \text{VkImage} \) with a \( \text{VkImageView} \) of the type \text{VK_IMAGE_VIEW_TYPE_3D}, \text{VK_IMAGE_VIEW_TYPE_CUBE}, \text{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \text{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \text{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage

- **VUID-vkCmdDraw-None-02703**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \text{OpImageSample}* or \text{OpImageSparseSample}* instructions with \text{ImplicitLod}, \text{Dref} or \text{Proj} in their name, in any shader stage

- **VUID-vkCmdDraw-None-02704**
  If the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this command accesses a \( \text{VkSampler} \) object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \text{OpImageSample}* or \text{OpImageSparseSample}* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDraw-uniformBuffers-06935**
  If any stage of the \( \text{VkPipeline} \) object bound to the pipeline bind point used by this
command accesses a uniform buffer, and that stage was created without enabling either
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers,
and the robustBufferAccess feature is not enabled, that stage **must** not access values
outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- **VUID-vkCmdDraw-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this
  command accesses a storage buffer, and that stage was created without enabling either
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or
  VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers,
  and the robustBufferAccess feature is not enabled, that stage **must** not access values
  outside of the range of the buffer as specified in the descriptor set bound to the same
  pipeline bind point

- **VUID-vkCmdDraw-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
  any resource accessed by the VkPipeline object bound to the pipeline bind point used by
  this command **must** not be a protected resource

- **VUID-vkCmdDraw-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler or VkImageView object that enables sampler Y′CbCr conversion, that object **must**
  only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDraw-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler or VkImageView object that enables sampler Y′CbCr conversion, that object **must**
  not use the ConstOffset and Offset operands

- **VUID-vkCmdDraw-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction **must** have at least as many components as
  the image view’s format

- **VUID-vkCmdDraw-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the
  Type of the Texel operand of that instruction **must** have at least as many components as
  the buffer view’s format

- **VUID-vkCmdDraw-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a
  result of this command, the SampledType of the OpTypeImage operand of that instruction
  **must** have a Width of 64

- **VUID-vkCmdDraw-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is
  accessed as a result of this command, the SampledType of the OpTypeImage operand of that
  instruction **must** have a Width of 32

- **VUID-vkCmdDraw-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a
result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDraw-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDraw-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDraw-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDraw-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDraw-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDraw-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDraw-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDraw-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.
If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDraw-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDraw-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- VUID-vkCmdDraw-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDraw-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- VUID-vkCmdDraw-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any way other than as an attachment.

- VUID-vkCmdDraw-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- VUID-vkCmdDraw-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- VUID-vkCmdDraw-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

- VUID-vkCmdDraw-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex.

- VUID-vkCmdDraw-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set.

- VUID-vkCmdDraw-None-06666
If the bound graphics pipeline state was created with the
\texttt{VK\_DYNAMIC\_STATE\_SAMPLE\_LOCATIONS\_EXT} dynamic state enabled then
\texttt{vkCmdSetSampleLocationsEXT} \textbf{must} have been called in the current command buffer
prior to this drawing command

- \textbf{VUID-vkCmdDraw-viewportCount-03417}
  If the bound graphics pipeline state was created with the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK\_DYNAMIC\_STATE\_SCISSOR\_WITH\_COUNT} dynamic state enabled, then
  \texttt{vkCmdSetViewportWithCount} \textbf{must} have been called in the current command buffer
  prior to this drawing command, and the \texttt{viewportCount} parameter of
  \texttt{vkCmdSetViewportWithCount} \textbf{must} match the \texttt{VkPipelineViewportStateCreateInfo}\n  ::\texttt{viewportCount} of the pipeline

- \textbf{VUID-vkCmdDraw-scissorCount-03418}
  If the bound graphics pipeline state was created with the
  \texttt{VK\_DYNAMIC\_STATE\_SCISSOR\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, then
  \texttt{vkCmdSetScissorWithCount} \textbf{must} have been called in the current command buffer prior
to this drawing command, and the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount}
  \textbf{must} match the \texttt{VkPipelineViewportStateCreateInfo}::\texttt{viewportCount} of the pipeline

- \textbf{VUID-vkCmdDraw-viewportCount-04139}
  If the bound graphics pipeline state was created with both the
  \texttt{VK\_DYNAMIC\_STATE\_SCISSOR\_WITH\_COUNT} and \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic
  states enabled then both \texttt{vkCmdSetViewportWithCount} and \texttt{vkCmdSetScissorWithCount}
  \textbf{must} have been called in the current command buffer prior to this drawing command,
  and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} \textbf{must} match the
  \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount}

- \textbf{VUID-vkCmdDraw-viewportCount-04137}
  If the bound graphics pipeline state was created with the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_W\_SCALING\_NV} dynamic state enabled, then the bound graphics
  pipeline \textbf{must} have been created with \texttt{VkPipelineViewportWScalingStateCreateInfoNV}\n  ::\texttt{viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to
  \texttt{vkCmdSetViewportWithCount}

- \textbf{VUID-vkCmdDraw-viewportCount-04138}
  If the bound graphics pipeline state was created with the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} and \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_W\_SCALING\_NV} dynamic
  states enabled then the \texttt{viewportCount} parameter in the last call to
  \texttt{vkCmdSetViewportWScalingNV} \textbf{must} be greater than or equal to the \texttt{viewportCount}
  parameter in the last call to \texttt{vkCmdSetViewportWithCount}

- \textbf{VUID-vkCmdDraw-viewportCount-04139}
  If the bound graphics pipeline state was created with the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_WITH\_COUNT} dynamic state enabled, but not the
  \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV} dynamic state enabled, then the bound
  graphics pipeline \textbf{must} have been created with \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV}::\texttt{viewportCount} greater or equal
to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDraw-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDraw-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDraw-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` **must** have been called in the current command buffer prior to this drawing command and the `logicOp` **must** be a valid `VkLogicOp` value.

- **VUID-vkCmdDraw-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be 1.
If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE.

If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this command must not write any values to the depth attachment.

If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment.

If the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask.
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` array used to create the currently bound graphics pipeline must be equal to the corresponding `VkFormat` used to create each `VkRenderingInfo::imageView`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADINGRATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADINGRATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and ` VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADINGRATE_ATTACHMENT_BIT_KHR`.
VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- **VUID-vkCmdDraw-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline.

- **VUID-vkCmdDraw-pDepthAttachment-06186**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.

- **VUID-vkCmdDraw-pStencilAttachment-06187**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView.

- **VUID-vkCmdDraw-colorAttachmentCount-06188**
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline.

- **VUID-vkCmdDraw-pDepthAttachment-06189**
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView.
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource

If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource

If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- **VUID-vkCmdDraw-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDraw-None-04912**
  If the bound graphics pipeline was created with both the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT and VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-pStrides-04913**
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL.

- **VUID-vkCmdDraw-None-04914**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDraw-None-04875**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-None-04879**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDraw-stage-06481**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to VK_SHADER_STAGE_TASK_BIT_NV or VK_SHADER_STAGE_MESH_BIT_NV.

**Valid Usage (Implicit)**

- **VUID-vkCmdDraw-commandBuffer-parameter**
**commandBuffer** must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDraw-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdDraw-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDraw-renderpass**
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDraw-videocoding**
  This command must only be called outside of a video coding scope

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

To record an indexed draw, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndexed(
    VkCommandBuffer commandBuffer,
    uint32_t indexCount,
    uint32_t instanceCount,
    uint32_t firstIndex,
    int32_t vertexOffset,
    uint32_t firstInstance);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
• `firstInstance` is the instance ID of the first instance to draw.

When the command is executed, primitives are assembled using the current primitive topology and `indexCount` vertices whose indices are retrieved from the index buffer. The index buffer is treated as an array of tightly packed unsigned integers of size defined by the `vkCmdBindIndexBuffer` ::`indexType` parameter with which the buffer was bound.

The first vertex index is at an offset of `firstIndex × indexSize + offset` within the bound index buffer, where `offset` is the offset specified by `vkCmdBindIndexBuffer` and `indexSize` is the byte size of the type specified by `indexType`. Subsequent index values are retrieved from consecutive locations in the index buffer. Indices are first compared to the primitive restart value, then zero extended to 32 bits (if the `indexType` is `VK_INDEX_TYPE_UINT8_EXT` or `VK_INDEX_TYPE_UINT16`) and have `vertexOffset` added to them, before being supplied as the `vertexIndex` value.

The primitives are drawn `instanceCount` times with `instanceIndex` starting with `firstInstance` and increasing sequentially for each instance. The assembled primitives execute the bound graphics pipeline.

---

**Valid Usage**

- **VUID-vkCmdDrawIndexed-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexed-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndexed-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDrawIndexed-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndexed-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawIndexed-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexed-filterCubicMinmax-02695**

1452
Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawIndexed-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-06423**
  Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-OpTypeImage-06424**
  Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawIndexed-None-02697**
  For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**.

- **VUID-vkCmdDrawIndexed-maintenance4-06425**
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in **Pipeline Layout Compatibility**.

- **VUID-vkCmdDrawIndexed-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawIndexed-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawIndexed-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this...
command, since that pipeline was bound

• VUID-vkCmdDrawIndexed-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

• VUID-vkCmdDrawIndexed-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

• VUID-vkCmdDrawIndexed-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

• VUID-vkCmdDrawIndexed-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexed-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

• VUID-vkCmdDrawIndexed-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

• VUID-vkCmdDrawIndexed-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

• VUID-vkCmdDrawIndexed-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands
If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the `OpTypeImage` operand of that instruction must have a Width of 32.

If the sparseImageInt64Atomics feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

If the sparseImageInt64Atomics feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a SampledType with a Width of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.
If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must be created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be** `VK_STENCIL_OP_KEEP`.

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must be** less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must have been created with** the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then **vkCmdSetSampleLocationsEXT must have been called** in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then **vkCmdSetViewportWithCount must have been called** in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must match the** `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then **both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called** in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must match the** `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both **vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called** in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must match the** `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic states enabled then both **vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called** in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must match the** `scissorCount` parameter of `vkCmdSetScissorWithCount`. 

If the bound graphics pipeline state was created with the...
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-viewportCount-04138
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-viewportCount-04139
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-viewportCount-04140
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04141
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-VkPipelineViewportCreateInfo-04142
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawIndexed-None-04876
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.
member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexed-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- **VUID-vkCmdDrawIndexed-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexed-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::*viewMask* equal to `VkRenderingInfo`::*viewMask*

- **VUID-vkCmdDrawIndexed-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::*colorAttachmentCount* equal to `VkRenderingInfo`::*colorAttachmentCount*

- **VUID-vkCmdDrawIndexed-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::*colorAttachmentCount* greater than 0, then each element of the `VkRenderingInfo`::*pColorAttachments* array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::*pColorAttachmentFormats* used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndexed-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo`::*attachmentCount* of the currently bound graphics pipeline

- **VUID-vkCmdDrawIndexed-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

- **VUID-vkCmdDrawIndexed-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and
 VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::depthAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndexed-pStencilAttachment-06182
If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineRenderingCreateInfo::stencilAttachmentFormat used to create the currently bound graphics pipeline must be equal to the VkFormat used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawIndexed-imageView-06183
If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR

• VUID-vkCmdDrawIndexed-imageView-06184
If the current render pass instance was begun with vkCmdBeginRendering and VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView was not VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

• VUID-vkCmdDrawIndexed-colorAttachmentCount-06185
If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndexed-pDepthAttachment-06186
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndexed-pStencilAttachment-06187
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView
• **VUID-vkCmdDrawIndexed-colorAttachmentCount-06188**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

• **VUID-vkCmdDrawIndexed-pDepthAttachment-06189**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

• **VUID-vkCmdDrawIndexed-pStencilAttachment-06190**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

• **VUID-vkCmdDrawIndexed-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

• **VUID-vkCmdDrawIndexed-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

• **VUID-vkCmdDrawIndexed-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

• **VUID-vkCmdDrawIndexed-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.

• **VUID-vkCmdDrawIndexed-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline`...
object bound to the pipeline bind point used by this command **must** not write to any resource

- **VUID-vkCmdDrawIndexed-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the RayQueryKHR capability, then `commandBuffer` **must** not be a protected command buffer

- **VUID-vkCmdDrawIndexed-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface **must** have either valid or `VK_NULL_HANDLE` buffers bound

- **VUID-vkCmdDrawIndexed-None-04008**
  If the nullDescriptor feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface **must** not be `VK_NULL_HANDLE`

- **VUID-vkCmdDrawIndexed-None-02721**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- **VUID-vkCmdDrawIndexed-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same `topology` class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

- **VUID-vkCmdDrawIndexed-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexed-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` **must** have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` **must** not be `NULL`

- **VUID-vkCmdDrawIndexed-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command

- **VUID-vkCmdDrawIndexed-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` **must** have been called in the current command buffer
prior to this drawing command

- VUID-vkCmdDrawIndexed-None-04879
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndexed-stage-06481
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

- VUID-vkCmdDrawIndexed-firstIndex-04932
  \((\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\) must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`.

### Valid Usage (Implicit)

- VUID-vkCmdDrawIndexed-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdDrawIndexed-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdDrawIndexed-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdDrawIndexed-renderpass
  This command must only be called inside of a render pass instance.

- VUID-vkCmdDrawIndexed-videocoding
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.
To record an ordered sequence of drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
void vkCmdDrawMultiEXT(
    VkCommandBuffer commandBuffer,
    uint32_t drawCount,
    const VkMultiDrawInfoEXT* pVertexInfo,
    uint32_t instanceCount,
    uint32_t firstInstance,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pVertexInfo` is a pointer to an array of `VkMultiDrawInfoEXT` with vertex information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pVertexInfo`.

drawCount draws are executed with parameters taken from `pVertexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstVertex` and a `vertexCount` from `pVertexInfo`.

### Valid Usage

- **VUID-vkCmdDrawMultiEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMultiEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.
• VUID-vkCmdDrawMultiEXT-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

• VUID-vkCmdDrawMultiEXT-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

• VUID-vkCmdDrawMultiEXT-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

• VUID-vkCmdDrawMultiEXT-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMultiEXT-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

• VUID-vkCmdDrawMultiEXT-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

• VUID-vkCmdDrawMultiEXT-OpTypeImage-06423
  Any VkImageView or VkBufferView being written as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-OpTypeImage-06424
  Any VkImageView or VkBufferView being read as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

• VUID-vkCmdDrawMultiEXT-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

• VUID-vkCmdDrawMultiEXT-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to
create the current \texttt{VkPipeline}, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMultiEXT-None-02699
  Descriptors in each bound descriptor set, specified via \texttt{vkCmdBindDescriptorSets}, must be valid if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMultiEXT-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command.

- VUID-vkCmdDrawMultiEXT-commandBuffer-02701
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the \texttt{VK_NV_inherited_viewport_scissor} extension is enabled) for \texttt{commandBuffer}, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- VUID-vkCmdDrawMultiEXT-None-02859
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound.

- VUID-vkCmdDrawMultiEXT-None-02702
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler must not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage.

- VUID-vkCmdDrawMultiEXT-None-02703
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage.

- VUID-vkCmdDrawMultiEXT-None-02704
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage.

- VUID-vkCmdDrawMultiEXT-uniformBuffers-06935
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

- VUID-vkCmdDrawMultiEXT-storageBuffers-06936
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either
or VK_PIPELINE ROBUSTNESS_BUFFER_BEHAVIOR ROBUST_BUFFER_ACCESS_EXT

and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMultiEXT-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

- VUID-vkCmdDrawMultiEXT-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawMultiEXT-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawMultiEXT-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

- VUID-vkCmdDrawMultiEXT-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

- VUID-vkCmdDrawMultiEXT-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawMultiEXT-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawMultiEXT-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawMultiEXT-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions
through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawMultiEXT-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDrawMultiEXT-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDrawMultiEXT-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawMultiEXT-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawMultiEXT-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawMultiEXT-subpass-02685
The subpass index of the current render pass must be equal to the subpass member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawMultiEXT-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

- VUID-vkCmdDrawMultiEXT-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

- VUID-vkCmdDrawMultiEXT-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

- VUID-vkCmdDrawMultiEXT-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- VUID-vkCmdDrawMultiEXT-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- VUID-vkCmdDrawMultiEXT-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be `VK_STENCIL_OP_KEEP`.

- VUID-vkCmdDrawMultiEXT-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

- VUID-vkCmdDrawMultiEXT-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment must have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

- VUID-vkCmdDrawMultiEXT-None-06666
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawMultiEXT-viewportCount-03417
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of
vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

• VUID-vkCmdDrawMultiEXT-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

• VUID-vkCmdDrawMultiEXT-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount

• VUID-vkCmdDrawMultiEXT-viewportCount-04137
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiEXT-viewportCount-04138
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiEXT-viewportCount-04139
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiEXT-viewportCount-04140
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiEXT-VkPipelineVieportCreateInfo-04141
  If the bound graphics pipeline state was created with the
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMultiEXT-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMultiEXT-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMultiEXT-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMultiEXT-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawMultiEXT-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawMultiEXT-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawMultiEXT-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the
same as the current subpass color and/or depth/stencil attachments

• VUID-vkCmdDrawMultiEXT-imageView-06172
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

• VUID-vkCmdDrawMultiEXT-imageView-06173
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawMultiEXT-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment

• VUID-vkCmdDrawMultiEXT-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawMultiEXT-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment

• VUID-vkCmdDrawMultiEXT-imageView-06177
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment

• VUID-vkCmdDrawMultiEXT-viewMask-06178
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

• VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06179
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

• VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo`::`pColorAttachments` array with an image view not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding

1473
If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- VUID-vkCmdDrawMultiEXT-attachmentCount-06667
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- VUID-vkCmdDrawMultiEXT-attachmentCount-06815
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- VUID-vkCmdDrawMultiEXT-pDepthAttachment-06181
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- VUID-vkCmdDrawMultiEXT-pStencilAttachment-06182
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- VUID-vkCmdDrawMultiEXT-imageView-06183
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- VUID-vkCmdDrawMultiEXT-imageView-06184
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

- VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06185
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a...
sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMultiEXT-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMultiEXT-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMultiEXT-colorAttachmentCount-06188
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMultiEXT-pDepthAttachment-06189
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMultiEXT-pStencilAttachment-06190
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMultiEXT-renderPass-06198
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMultiEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawMultiEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT:rasterizationStream`.

- **VUID-vkCmdDrawMultiEXT-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.

- **VUID-vkCmdDrawMultiEXT-commandBuffer-02713**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource.

- **VUID-vkCmdDrawMultiEXT-commandBuffer-04617**
  If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.

- **VUID-vkCmdDrawMultiEXT-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDrawMultiEXT-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMultiEXT-None-02721**
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in `Vertex Input Description`.

- **VUID-vkCmdDrawMultiEXT-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same `topology class` as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.
If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

The multiDraw feature must be enabled.

drawCount must be less than `VkPhysicalDeviceMultiDrawPropertiesEXT::maxMultiDrawCount`.

If drawCount is greater than zero, `pVertexInfo` must be a valid pointer to memory containing one or more valid instances of `VkMultiDrawInfoEXT` structures.

stride must be a multiple of 4.
**Valid Usage (Implicit)**

- **VUID-vkCmdDrawMultiEXT-commandBuffer-parameter**
  
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdDrawMultiEXT-commandBuffer-recording**
  
  `commandBuffer` must be in the recording state

- **VUID-vkCmdDrawMultiEXT-commandBuffer-cmdpool**
  
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- **VUID-vkCmdDrawMultiEXT-renderpass**
  
  This command must only be called inside of a render pass instance

- **VUID-vkCmdDrawMultiEXT-videocoding**
  
  This command must only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

**Command Properties**

To record an ordered sequence of indexed drawing operations which have no state changes between them, call:

```c
// Provided by VK_EXT_multi_draw
def void vkCmdDrawMultiIndexedEXT(
    VkCommandBuffer commandBuffer,
    uint32_t drawCount,
    const VkMultiDrawIndexedInfoEXT* pIndexInfo,
    uint32_t instanceCount,
    uint32_t firstInstance,
    uint32_t stride,
    const int32_t* pVertexOffset);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `drawCount` is the number of draws to execute, and can be zero.
- `pIndexInfo` is a pointer to an array of `VkMultiDrawIndexedInfoEXT` with index information to be drawn.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `stride` is the byte stride between consecutive elements of `pIndexInfo`.
- `pVertexOffset` is NULL or a pointer to the value added to the vertex index before indexing into the vertex buffer. When specified, `VkMultiDrawIndexedInfoEXT::offset` is ignored.

`drawCount` indexed draws are executed with parameters taken from `pIndexInfo`. The number of draw commands recorded is `drawCount`, with each command reading, sequentially, a `firstIndex` and an `indexCount` from `pIndexInfo`. If `pVertexOffset` is NULL, a `vertexOffset` is also read from `pIndexInfo`, otherwise the value from dereferencing `pVertexOffset` is used.

### Valid Usage

- **VUID-vkCmdDrawMultiIndexedEXT-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

- **VUID-vkCmdDrawMultiIndexedEXT-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawMultiIndexedEXT-filterCubicMinmax-02695**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of...
either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

- **VUID-vkCmdDrawMultiIndexedEXT-flags-02696**
  Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpTypeImage-06423**
  Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-OpTypeImage-06424**
  Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02697**
  For each set \( n \) that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to \( n \) at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set \( n \), with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawMultiIndexedEXT-maintenance4-06425**
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02699**
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02700**
  A valid pipeline must be bound to the pipeline bind point used by this command.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02701**
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

- **VUID-vkCmdDrawMultiIndexedEXT-None-02859**
  There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.
If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’CbCr conversion`, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’CbCr conversion`, that object **must** not use the `ConstOffset` and `Offset` operands.
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDrawMultiIndexedEXT-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDrawMultiIndexedEXT-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawMultiIndexedEXT-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawMultiIndexedEXT-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawMultiIndexedEXT-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDrawMultiIndexedEXT-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

• VUID-vkCmdDrawMultiIndexedEXT-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdDrawMultiIndexedEXT-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM
If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be VK_STENCIL_OP_KEEP**

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` **must** have been called in the current command buffer prior to this drawing command

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** match the `scissorCount` parameter of `vkCmdSetScissorWithCount`

If the bound graphics pipeline state was created with the...
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04138
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04139
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-viewportCount-04140
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-VkPipelineVieportCreateInfo-04141
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-VkPipelineVieportCreateInfo-04142
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

• VUID-vkCmdDrawMultiIndexedEXT-None-04876
If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUTDEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawMultiIndexedEXT-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo` `::viewMask` equal to `VkRenderingInfo::viewMask`

- **VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo` `::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- **VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

- **VUID-vkCmdDrawMultiIndexedEXT-pDepthAttachment-06181**
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- **VUID-vkCmdDrawMultiIndexedEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

- **VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawMultiIndexedEXT-pDepthAttachment-06186**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-pStencilAttachment-06187**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline **must** be equal to the sample count
used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-colorAttachmentCount-06188**
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawMultiIndexedEXT-pDepthAttachment-06189**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-pStencilAttachment-06190**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- **VUID-vkCmdDrawMultiIndexedEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`

- **VUID-vkCmdDrawMultiIndexedEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawMultiIndexedEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfo::rasterizationStream`.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-02712**
  If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, any resource written to by the `VkPipeline` object bound to the pipeline bind point used by this command must not be an unprotected resource.
If `commandBuffer` is a protected command buffer and `protectedNoFault` is not supported, pipeline stages other than the framebuffer-space and compute stages in the `VkPipeline` object bound to the pipeline bind point used by this command must not write to any resource.

If any of the shader stages of the `VkPipeline` bound to the pipeline bind point used by this command uses the `RayQueryKHR` capability, then `commandBuffer` must not be a protected command buffer.

All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or `VK_NULL_HANDLE` buffers bound.

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMultiIndexedEXT-stage-06481**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo`::`stage` member of an element of `VkGraphicsPipelineCreateInfo`::`pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

- **VUID-vkCmdDrawMultiIndexedEXT-None-04937**
  The `multiDraw` feature must be enabled.

- **VUID-vkCmdDrawMultiIndexedEXT-firstIndex-04938**
  `(indexSize \times (firstIndex + indexCount) + offset)` must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`.

- **VUID-vkCmdDrawMultiIndexedEXT-drawCount-04939**
  `drawCount` must be less than `VkPhysicalDeviceMultiDrawPropertiesEXT`::`maxMultiDrawCount`.

- **VUID-vkCmdDrawMultiIndexedEXT-drawCount-04940**
  If `drawCount` is greater than zero, `pIndexInfo` must be a valid pointer to memory containing one or more valid instances of `VkMultiDrawIndexedInfoEXT` structures.

- **VUID-vkCmdDrawMultiIndexedEXT-stride-04941**
  `stride` must be a multiple of 4.

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdDrawMultiIndexedEXT-pVertexOffset-parameter**
  If `pVertexOffset` is not `NULL`, `pVertexOffset` must be a valid pointer to a valid `int32_t` value.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdDrawMultiIndexedEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- **VUID-vkCmdDrawMultiIndexedEXT-renderpass**
  This command must only be called inside of a render pass instance.

- **VUID-vkCmdDrawMultiIndexedEXT-videocoding**
This command **must** only be called outside of a video coding scope

**Host Synchronization**

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

### Command Properties

<table>

The `VkMultiDrawInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkMultiDrawInfoEXT {
    uint32_t firstVertex;
    uint32_t vertexCount;
} VkMultiDrawInfoEXT;
```

- `firstVertex` is the first vertex to draw.
- `vertexCount` is the number of vertices to draw.

The members of `VkMultiDrawInfoEXT` have the same meaning as the `firstVertex` and `vertexCount` parameters in `vkCmdDraw`.

The `VkMultiDrawIndexedInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_multi_draw
typedef struct VkMultiDrawIndexedInfoEXT {
    uint32_t firstIndex;
    uint32_t indexCount;
    int32_t vertexOffset;
} VkMultiDrawIndexedInfoEXT;
```

- `firstIndex` is the first index to draw.
- `indexCount` is the number of vertices to draw.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer for indexed multidraws.
The firstIndex, indexCount, and vertexOffset members of VkMultiDrawIndexedInfoEXT have the same meaning as the firstIndex, indexCount, and vertexOffset parameters, respectively, of vkCmdDrawIndexed.

To record a non-indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdDrawIndirect(
    VkCommandBuffer commandBuffer,  // Provided by VK_VERSION_1_0
    VkBuffer buffer,               // Provided by VK_VERSION_1_0
    VkDeviceSize offset,           // Provided by VK_VERSION_1_0
    uint32_t drawCount,            // Provided by VK_VERSION_1_0
    uint32_t stride);              // Provided by VK_VERSION_1_0
```

- commandBuffer is the command buffer into which the command is recorded.
- buffer is the buffer containing draw parameters.
- offset is the byte offset into buffer where parameters begin.
- drawCount is the number of draws to execute, and can be zero.
- stride is the byte stride between successive sets of draw parameters.

vkCmdDrawIndirect behaves similarly to vkCmdDraw except that the parameters are read by the device from a buffer during execution. drawCount draws are executed by the command, with parameters taken from buffer starting at offset and increasing by stride bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndirectCommand structures. If drawCount is less than or equal to one, stride is ignored.

**Valid Usage**

- VUID-vkCmdDrawIndirect-magFilter-04553
  If a VkSampler created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndirect-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- VUID-vkCmdDrawIndirect-None-06479
  If a VkImageView is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawIndirect-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT
If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

Any VkImageView or VkBufferView being written as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s format feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

Any VkImageView or VkBufferView being read as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view’s format feature must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set $n$ that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command.

For each set $n$ that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.
A valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirect-commandBuffer-02701**
  If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdDrawIndirect-None-02859**
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndirect-None-02702**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDrawIndirect-None-02703**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDrawIndirect-None-02704**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndirect-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirect-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported,
any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command **must** not be a protected resource

- **VUID-vkCmdDrawIndirect-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_b C_r conversion, that object **must** only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDrawIndirect-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’C_b C_r conversion, that object **must** not use the ConstOffset and Offset operands

- **VUID-vkCmdDrawIndirect-None-04115**
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the **Type** of the Texel operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawIndirect-OpImageWrite-04469**
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the **Type** of the Texel operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawIndirect-SampledType-04470**
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdDrawIndirect-SampledType-04471**
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdDrawIndirect-SampledType-04472**
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdDrawIndirect-SampledType-04473**
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction **must** have a Width of 64

- **VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04474**
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDrawIndirect-sparseImageInt64Atomics-04475**
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag **must** not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- **VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06971**
If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06972
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageBoxFilterQCOM-06973
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageBlockMatchSSDQCOM-06974
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageBlockMatchSADQCOM-06975
  If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageBlockMatchSADQCOM-06976
  If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06977
  If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-OpImageWeightedSampleQCOM-06978
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

- VUID-vkCmdDrawIndirect-renderPass-02684
  The current render pass must be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawIndirect-subpass-02685
  The subpass index of the current render pass must be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

- VUID-vkCmdDrawIndirect-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set.
• VUID-vkCmdDrawIndirect-None-06537
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawIndirect-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment

• VUID-vkCmdDrawIndirect-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

• VUID-vkCmdDrawIndirect-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**

• VUID-vkCmdDrawIndirect-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be** VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawIndirect-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawIndirect-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawIndirect-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then **vkCmdSetSampleLocationsEXT** must have been called in the current command buffer prior to this drawing command

• VUID-vkCmdDrawIndirect-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then **vkCmdSetViewportWithCount** must have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** must match the VkPipelineViewportStateCreateInfo::scissorCount of the pipeline

• VUID-vkCmdDrawIndirect-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then
vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline

- **VUID-vkCmdDrawIndirect-viewportCount-03419**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- **VUID-vkCmdDrawIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.

- **VUID-vkCmdDrawIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic state enabled, then the bound graphics pipeline must have been created with VkPipelineViewportWScalingStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount.

- **VUID-vkCmdDrawIndirect-viewportCount-04139**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportWScalingNV must be greater than or equal to the viewportCount parameter in the last call to VkCmdSetViewportWithCount.

- **VUID-vkCmdDrawIndirect-viewportCount-04140**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to VkCmdSetViewportWithCount.

- **VUID-vkCmdDrawIndirect-VkPipelineVieportCreateInfo-04141**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to VkCmdSetViewportWithCount.

- **VUID-vkCmdDrawIndirect-VkPipelineVieportCreateInfo-04142**
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to VkCmdSetViewportWithCount.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawIndirect-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirect-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be `1`.

- **VUID-vkCmdDrawIndirect-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndirect-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndirect-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of
vkCmdSetColorWriteEnableEXT **must** be greater than or equal to the 
*VkPipelineColorBlendStateCreateInfo::attachmentCount* of the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-attachmentCount-06815
  
  If the bound graphics pipeline state was created with the 
  *VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT* dynamic state enabled then 
  *vkCmdSetColorWriteEnableEXT* **must** have been called in the current command buffer 
  prior to this drawing command, and the *attachmentCount* parameter of 
  *vkCmdSetColorWriteEnableEXT* **must** be less than or equal to the *maxColorAttachments* member of *VkPhysicalDeviceLimits*

- VUID-vkCmdDrawIndirect-pDepthAttachment-06181
  
  If the current render pass instance was begun with *vkCmdBeginRendering* and 
  *VkRenderingInfo::pDepthAttachment->imageView* was not *VK_NULL_HANDLE*, the value of 
  *VkPipelineRenderingCreateInfo::depthAttachmentFormat* used to create the currently bound graphics pipeline **must** be equal to the *VkFormat* used to create *VkRenderingInfo::pDepthAttachment->imageView*

- VUID-vkCmdDrawIndirect-pStencilAttachment-06182
  
  If the current render pass instance was begun with *vkCmdBeginRendering* and 
  *VkRenderingInfo::pStencilAttachment->imageView* was not *VK_NULL_HANDLE*, the value of 
  *VkPipelineRenderingCreateInfo::stencilAttachmentFormat* used to create the currently bound graphics pipeline **must** be equal to the *VkFormat* used to create *VkRenderingInfo::pStencilAttachment->imageView*

- VUID-vkCmdDrawIndirect-imageView-06183
  
  If the current render pass instance was begun with *vkCmdBeginRendering* and 
  *VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView* was not *VK_NULL_HANDLE*, the currently bound graphics pipeline **must** have been created with 
  *VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR*

- VUID-vkCmdDrawIndirect-imageView-06184
  
  If the current render pass instance was begun with *vkCmdBeginRendering* and 
  *VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView* was not *VK_NULL_HANDLE*, the currently bound graphics pipeline **must** have been created with 
  *VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT*

- VUID-vkCmdDrawIndirect-colorAttachmentCount-06185
  
  If the currently bound pipeline was created with a *VkAttachmentSampleCountInfoAMD* or *VkAttachmentSampleCountInfoNV* structure, and the current render pass instance was begun with *vkCmdBeginRendering* with a *VkRenderingInfo::colorAttachmentCount* parameter greater than 0, then each element of the *VkRenderingInfo::pColorAttachments* array with a *imageView* not equal to *VK_NULL_HANDLE* **must** have been created with a sample count equal to the corresponding element of the *pColorAttachmentSamples* member of *VkAttachmentSampleCountInfoAMD* or *VkAttachmentSampleCountInfoNV* used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-pDepthAttachment-06186
  
  If the current render pass instance was begun with *vkCmdBeginRendering*, the currently bound pipeline was created with a *VkAttachmentSampleCountInfoAMD* or *VkAttachmentSampleCountInfoNV* structure, and *VkRenderingInfo::pDepthAttachment*...
>imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirect-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirect-colorAttachmentCount-06188
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with VkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

- VUID-vkCmdDrawIndirect-pDepthAttachment-06189
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawIndirect-pStencilAttachment-06190
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawIndirect-renderPass-06198
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

- VUID-vkCmdDrawIndirect-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.
If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

If the vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound

If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

`buffer` must have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

`offset` must be a multiple of 4.

`commandBuffer` must not be a protected command buffer.

If the `multiDrawIndirect` feature is not enabled, `drawCount` must be 0 or 1.

`drawCount` must be less than or equal to `VkPhysicalDeviceLimits::maxDrawIndirectCount`.

If the `drawIndirectFirstInstance` feature is not enabled, all the `firstInstance` members of the `VkDrawIndirectCommand` structures accessed by this command must be 0.

If `drawCount` is greater than 1, `stride` must be a multiple of 4 and must be greater than or equal to `sizeof(VkDrawIndirectCommand)`.

If `drawCount` is equal to 1, `(offset + sizeof(VkDrawIndirectCommand))` must be less than or equal to the size of `buffer`.

If `drawCount` is greater than 1, `(stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand))` must be less than or equal to the size of `buffer`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
buffer must be a valid VkBuffer handle

- VUID-vkCmdDrawIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdDrawIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdDrawIndirect-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirect-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The VkDrawIndirectCommand structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndirectCommand {
  uint32_t vertexCount;
  uint32_t instanceCount;
  uint32_t firstVertex;
  uint32_t firstInstance;
} VkDrawIndirectCommand;
```

- `vertexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstVertex` is the index of the first vertex to draw.
• `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDraw`.

Valid Usage

- VUID-VkDrawIndirectCommand-None-00500
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description

- VUID-VkDrawIndirectCommand-firstInstance-00501
  If the `drawIndirectFirstInstance` feature is not enabled, `firstInstance` must be 0

To record a non-indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndirectCountAMD(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```
uint32_t maxDrawCount,
uint32_t stride);

• `commandBuffer` is the command buffer into which the command is recorded.
• `buffer` is the buffer containing draw parameters.
• `offset` is the byte offset into `buffer` where parameters begin.
• `countBuffer` is the buffer containing the draw count.
• `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• `maxDrawCount` specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in `countBuffer` and `maxDrawCount`.
• `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawIndirectCount` behaves similarly to `vkCmdDrawIndirect` except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from `countBuffer` located at `countBufferOffset` and use this as the draw count.

### Valid Usage

- **VUID-vkCmdDrawIndirectCount-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawIndirectCount-None-06479**
  If a `VkImageView` is sampled with depth comparison, the image view's format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02691**
  If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`

- **VUID-vkCmdDrawIndirectCount-None-02692**
  If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`

- **VUID-vkCmdDrawIndirectCount-filterCubic-02694**
  Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`
Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

Any VkImageView or VkBufferView being written as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

Any VkImageView or VkBufferView being read as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

For each set $n$ that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a VkPipelineLayout that is compatible for set $n$, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be valid if they are statically used by the VkPipeline bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.

If the VkPipeline object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not
specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndirectCount-None-02702**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used to sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- **VUID-vkCmdDrawIndirectCount-None-02703**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- **VUID-vkCmdDrawIndirectCount-None-02704**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndirectCount-uniformBuffers-06935**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-storageBuffers-06936**
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectCount-commandBuffer-02707**
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

- **VUID-vkCmdDrawIndirectCount-None-06550**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- **VUID-vkCmdDrawIndirectCount-ConstOffset-06551**
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y’CbCr conversion, that object must
not use the ConstOffset and Offset operands

• VUID-vkCmdDrawIndirectCount-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format

• VUID-vkCmdDrawIndirectCount-OpImageWrite-04469
  If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view’s format

• VUID-vkCmdDrawIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawIndirectCount-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawIndirectCount-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

• VUID-vkCmdDrawIndirectCount-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

• VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDrawIndirectCount-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

• VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

• VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

• VUID-vkCmdDrawIndirectCount-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command,
then the image view's format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDrawIndirectCount-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawIndirectCount-OpImageWeightedSampleQCOM-06978
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- VUID-vkCmdDrawIndirectCount-renderPass-02684
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS

- VUID-vkCmdDrawIndirectCount-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a descriptor set

- VUID-vkCmdDrawIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

- VUID-vkCmdDrawIndirectCount-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

- VUID-vkCmdDrawIndirectCount-None-06539
  If any recorded command in the current subpass will read from an image subresource
used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment.

- VUID-vkCmdDrawIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled.

- VUID-vkCmdDrawIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP.

- VUID-vkCmdDrawIndirectCount-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex.

- VUID-vkCmdDrawIndirectCount-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set.

- VUID-vkCmdDrawIndirectCount-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer prior to this drawing command.

- VUID-vkCmdDrawIndirectCount-viewportCount-03417
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

- VUID-vkCmdDrawIndirectCount-scissorCount-03418
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT dynamic state enabled, but not the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, then vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the scissorCount parameter of vkCmdSetScissorWithCount must match the VkPipelineViewportStateCreateInfo::viewportCount of the pipeline.

- VUID-vkCmdDrawIndirectCount-viewportCount-03419
  If the bound graphics pipeline state was created with both the VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic states enabled then both vkCmdSetViewportWithCount and vkCmdSetScissorWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must match the scissorCount parameter of vkCmdSetScissorWithCount.
• **VUID-vkCmdDrawIndirectCount-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportWScalingStateCreateInfoNV`:`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline **must** have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV`:`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` **must** be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-VkPipelineVieportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportSwizzleStateCreateInfoNV`:`viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-VkPipelineVieportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV`:`exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

• **VUID-vkCmdDrawIndirectCount-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then
vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawIndirectCount-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawIndirectCount-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawIndirectCount-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirectCount-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectCount-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectCount-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL, this
command **must** not write any values to the depth attachment

- **VUID-vkCmdDrawIndirectCount-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawIndirectCount-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- **VUID-vkCmdDrawIndirectCount-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawIndirectCount-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo` ::`viewMask` equal to `VkRenderingInfo::viewMask`

- **VUID-vkCmdDrawIndirectCount-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo` ::`colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- **VUID-vkCmdDrawIndirectCount-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndirectCount-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- **VUID-vkCmdDrawIndirectCount-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments`
member of $VkPhysicalDeviceLimits$

- **VUID-vkCmdDrawIndirectCount-pDepthAttachment-06181**
  If the current render pass instance was begun with $vkCmdBeginRendering$ and $VkRenderingInfo::pDepthAttachment->imageView$ was not $VK_NULL_HANDLE$, the value of $VkPipelineRenderingCreateInfo::depthAttachmentFormat$ used to create the currently bound graphics pipeline must be equal to the $VkFormat$ used to create $VkRenderingInfo::pDepthAttachment->imageView$

- **VUID-vkCmdDrawIndirectCount-pStencilAttachment-06182**
  If the current render pass instance was begun with $vkCmdBeginRendering$ and $VkRenderingInfo::pStencilAttachment->imageView$ was not $VK_NULL_HANDLE$, the value of $VkPipelineRenderingCreateInfo::stencilAttachmentFormat$ used to create the currently bound graphics pipeline must be equal to the $VkFormat$ used to create $VkRenderingInfo::pStencilAttachment->imageView$

- **VUID-vkCmdDrawIndirectCount-imageView-06183**
  If the current render pass instance was begun with $vkCmdBeginRendering$ and $VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView$ was not $VK_NULL_HANDLE$, the currently bound graphics pipeline must have been created with $VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR$

- **VUID-vkCmdDrawIndirectCount-imageView-06184**
  If the current render pass instance was begun with $vkCmdBeginRendering$ and $VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView$ was not $VK_NULL_HANDLE$, the currently bound graphics pipeline must have been created with $VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT$

- **VUID-vkCmdDrawIndirectCount-colorAttachmentCount-06185**
  If the currently bound pipeline was created with a $VkAttachmentSampleCountInfoAMD$ or $VkAttachmentSampleCountInfoNV$ structure, and the current render pass instance was begun with $vkCmdBeginRendering$ with a $VkRenderingInfo::colorAttachmentCount$ parameter greater than 0, then each element of the $VkRenderingInfo::pColorAttachments$ array with a $imageView$ not equal to $VK_NULL_HANDLE$ must have been created with a sample count equal to the corresponding element of the $pColorAttachmentSamples$ member of $VkAttachmentSampleCountInfoAMD$ or $VkAttachmentSampleCountInfoNV$ used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndirectCount-pDepthAttachment-06186**
  If the current render pass instance was begun with $vkCmdBeginRendering$, the currently bound pipeline was created with a $VkAttachmentSampleCountInfoAMD$ or $VkAttachmentSampleCountInfoNV$ structure, and $VkRenderingInfo::pDepthAttachment->imageView$ was not $VK_NULL_HANDLE$, the value of the $depthStencilAttachmentSamples$ member of $VkAttachmentSampleCountInfoAMD$ or $VkAttachmentSampleCountInfoNV$ used to create the currently bound graphics pipeline must be equal to the sample count used to create $VkRenderingInfo::pDepthAttachment->imageView$

- **VUID-vkCmdDrawIndirectCount-pStencilAttachment-06187**
  If the current render pass instance was begun with $vkCmdBeginRendering$, the currently bound pipeline was created with a $VkAttachmentSampleCountInfoAMD$ or $VkAttachmentSampleCountInfoNV$ structure, and $VkRenderingInfo::pStencilAttachment->imageView$ was not $VK_NULL_HANDLE$, the value of the $depthStencilAttachmentSamples$
member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawIndirectCount-colorAttachmentCount-06188
If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndirectCount-pDepthAttachment-06189
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndirectCount-pStencilAttachment-06190
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawIndirectCount-renderPass-06198
If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline must have been created with a VkGraphicsPipelineCreateInfo::renderPass equal to VK_NULL_HANDLE

• VUID-vkCmdDrawIndirectCount-primitivesGeneratedQueryWithRasterizerDiscard-06708
If the primitivesGeneratedQueryWithRasterizerDiscard feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, rasterization discard must not be enabled.

• VUID-vkCmdDrawIndirectCount-primitivesGeneratedQueryWithNonZeroStreams-06709
If the primitivesGeneratedQueryWithNonZeroStreams feature is not enabled and the VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT query is active, the bound graphics pipeline must not have been created with a non-zero value in VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream.

• VUID-vkCmdDrawIndirectCount-None-04007
All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or VK_NULL_HANDLE buffers bound
If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.

For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in *Vertex Input Description*.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo`::`topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo`::`stage` member of an element of `VkGraphicsPipelineCreateInfo`::`pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

1519
If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

offset must be a multiple of 4.

commandBuffer must not be a protected command buffer.

If countBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

countBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

countBufferOffset must be a multiple of 4.

The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount.

(countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer.

If drawIndirectCount is not enabled this function must not be used.

stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndirectCommand).

If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

If the count stored in countBuffer is equal to 1, (offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndirectCommand)) must be less than or equal to the size of buffer.

Valid Usage (Implicit)

commandBuffer must be a valid VkCommandBuffer handle.

countBuffer must be a valid VkDeviceMemory object.
**buffer** must be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndirectCount-countBuffer-parameter
  `countBuffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawIndirectCount-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawIndirectCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawIndirectCount-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawIndirectCount-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawIndirectCount-commonparent
  Each of `buffer`, `commandBuffer`, and `countBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

To record an indexed indirect drawing command, call:

```c
// Provided by VK_VERSION_1_0
def void vkCmdDrawIndexedIndirect(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
• **offset** is the byte offset into **buffer** where parameters begin.

• **drawCount** is the number of draws to execute, and can be zero.

• **stride** is the byte stride between successive sets of draw parameters.

vkCmdDrawIndexedIndirect behaves similarly to vkCmdDrawIndexed except that the parameters are read by the device from a buffer during execution. drawCount draws are executed by the command, with parameters taken from **buffer** starting at offset and increasing by stride bytes for each successive draw. The parameters of each draw are encoded in an array of VkDrawIndexedIndirectCommand structures. If drawCount is less than or equal to one, stride is ignored.

### Valid Usage

- **VUID-vkCmdDrawIndexedIndirect-magFilter-04553**
  If a **VkSampler** created with magFilter or minFilter equal to VK_FILTER_LINEAR and compareEnable equal to VK_FALSE is used to sample a **VkImageView** as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDrawIndexedIndirect-mipmapMode-04770**
  If a **VkSampler** created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a **VkImageView** as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT

- **VUID-vkCmdDrawIndexedIndirect-None-06479**
  If a **VkImageView** is sampled with depth comparison, the image view’s format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- **VUID-vkCmdDrawIndexedIndirect-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- **VUID-vkCmdDrawIndexedIndirect-None-02692**
  If a **VkImageView** is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- **VUID-vkCmdDrawIndexedIndirect-filterCubic-02694**
  Any **VkImageView** being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a **VkImageViewType** and format that supports cubic filtering, as specified byVkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- **VUID-vkCmdDrawIndexedIndirect-filterCubicMinmax-02695**
  Any **VkImageView** being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a **VkImageViewType** and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by
vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawIndexedIndirect-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing
  VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be
  sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-06423
  Any VkImageView or VkBufferView being written as a storage image or storage texel
  buffer where the image format field of the OpTypeImage is Unknown then the view's format
  feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-OpTypeImage-06424
  Any VkImageView or VkBufferView being read as a storage image or storage texel buffer
  where the image format field of the OpTypeImage is Unknown then the view's format feature
  must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirect-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point
  used by this command, a descriptor set must have been bound to n at the same pipeline
  bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout
  used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirect-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically
  used by the VkPipeline bound to the pipeline bind point used by this command, a push
  constant value must have been set for the same pipeline bind point, with a VkPipelineLayout
  that is compatible for push constants, with the VkPipelineLayout used to
  create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirect-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be
  valid if they are statically used by the VkPipeline bound to the pipeline bind point used by
  this command

- VUID-vkCmdDrawIndexedIndirect-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires
  any dynamic state, that state must have been set or inherited (if the VK_NV_inherited_viewport_scissor
  extension is enabled) for commandBuffer, and done so
  after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawIndexedIndirect-None-02859
  There must not have been any calls to dynamic state setting commands for any state not
  specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this
  command, since that pipeline was bound

- VUID-vkCmdDrawIndexedIndirect-None-02702
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a
  VkSampler object that uses unnormalized coordinates, that sampler must not be used to
  sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D,
VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage

- VUID-vkCmdDrawIndexedIndirect-None-02703
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage

- VUID-vkCmdDrawIndexedIndirect-None-02704
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawIndexedIndirect-uniformBuffers-06935
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirect-storageBuffers-06936
  If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawIndexedIndirect-commandBuffer-02707
  If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

- VUID-vkCmdDrawIndexedIndirect-None-06550
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions

- VUID-vkCmdDrawIndexedIndirect-ConstOffset-06551
  If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y'CbCr conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawIndexedIndirect-None-04115
  If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view’s format
If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view’s format.

If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.
If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features **must** contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` or `OpImageBlockMatchSSDQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

If `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any way other than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.
If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must** be **VK_STENCIL_OP_KEEP**

- **VUID-vkCmdDrawIndexedIndirect-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**

- **VUID-vkCmdDrawIndexedIndirect-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set

- **VUID-vkCmdDrawIndexedIndirect-None-06666**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled then **vkCmdSetSampleLocationsEXT** **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-03417**
  If the bound graphics pipeline state was created with both the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** **must** match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-scissorCount-03418**
  If the bound graphics pipeline state was created with both the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** and **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic states enabled then both **vkCmdSetViewportWithCount** and **vkCmdSetScissorWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **scissorCount** parameter of **vkCmdSetScissorWithCount** **must** match the **VkPipelineViewportStateCreateInfo::viewportCount** of the pipeline

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04137**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV** dynamic state enabled, then the bound graphics pipeline **must** have been created with **VkPipelineViewportWScalingStateCreateInfoNV::viewportCount** greater or equal to the **viewportCount** parameter in the last call to
**vkCmdSetViewportWithCount**

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirect-viewportCount-04140**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirect-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirect-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior
to this drawing command

- **VUID-vkCmdDrawIndexedIndirect-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndexedIndirect-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawIndexedIndirect-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- **VUID-vkCmdDrawIndexedIndirect-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawIndexedIndirect-imageView-06172**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawIndexedIndirect-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawIndexedIndirect-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawIndexedIndirect-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the layout member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with an `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo`. 

1530
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and
the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndexedIndirect-pDepthAttachment-06189**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndexedIndirect-pStencilAttachment-06190**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndexedIndirect-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndexedIndirect-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawIndexedIndirect-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawIndexedIndirect-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDrawIndexedIndirect-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point’s interface must not be `VK_NULL_HANDLE`.
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be NULL.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.
• VUID-vkCmdDrawIndexedIndirect-buffer-02709
  buffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set

• VUID-vkCmdDrawIndexedIndirect-offset-02710
  offset must be a multiple of 4

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-02711
  commandBuffer must not be a protected command buffer

• VUID-vkCmdDrawIndexedIndirect-drawCount-02718
  If the multiDrawIndirect feature is not enabled, drawCount must be 0 or 1

• VUID-vkCmdDrawIndexedIndirect-drawCount-02719
  drawCount must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawIndexedIndirect-drawCount-00528
  If drawCount is greater than 1, stride must be a multiple of 4 and must be greater than or equal to sizeof(VkDrawIndexedIndirectCommand)

• VUID-vkCmdDrawIndexedIndirect-firstInstance-00530
  If the drawIndirectFirstInstance feature is not enabled, all the firstInstance members of the VkDrawIndexedIndirectCommand structures accessed by this command must be 0

• VUID-vkCmdDrawIndexedIndirect-drawCount-00539
  If drawCount is equal to 1, (offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawIndexedIndirect-drawCount-00540
  If drawCount is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawIndexedIndirect-buffer-parameter
  buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDrawIndexedIndirect-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawIndexedIndirect-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdDrawIndexedIndirect-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDrawIndexedIndirect-commonparent
  Both of buffer, and commandBuffer must have been created, allocated, or retrieved from the same VkDevice
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The `VkDrawIndexedIndirectCommand` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkDrawIndexedIndirectCommand {
    uint32_t indexCount;
    uint32_t instanceCount;
    uint32_t firstIndex;
    int32_t vertexOffset;
    uint32_t firstInstance;
} VkDrawIndexedIndirectCommand;
```

- `indexCount` is the number of vertices to draw.
- `instanceCount` is the number of instances to draw.
- `firstIndex` is the base index within the index buffer.
- `vertexOffset` is the value added to the vertex index before indexing into the vertex buffer.
- `firstInstance` is the instance ID of the first instance to draw.

The members of `VkDrawIndexedIndirectCommand` have the same meaning as the similarly named parameters of `vkCmdDrawIndexed`.

Valid Usage

- VUID-VkDrawIndexedIndirectCommand-None-00552
  For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- VUID-VkDrawIndexedIndirectCommand-indexSize-00553
  
  \[(\text{indexSize} \times (\text{firstIndex} + \text{indexCount}) + \text{offset})\] must be less than or equal to the size of the bound index buffer, with `indexSize` being based on the type specified by `indexType`, where the index buffer, `indexType`, and `offset` are specified via `vkCmdBindIndexBuffer`.
To record an indexed draw call with a draw call count sourced from a buffer, call:

```c
// Provided by VK_VERSION_1_2
void vkCmdDrawIndexedIndirectCount(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_KHR_draw_indirect_count
void vkCmdDrawIndexedIndirectCountKHR(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

or the equivalent command

```c
// Provided by VK_AMD_draw_indirect_count
void vkCmdDrawIndexedIndirectCountAMD(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `countBuffer` is the buffer containing the draw count.
- `countBufferOffset` is the byte offset into `countBuffer` where the draw count begins.
• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.

• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawIndexedIndirectCount** behaves similarly to **vkCmdDrawIndexedIndirect** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

### Valid Usage

- **VUID-vkCmdDrawIndexedIndirectCount-magFilter-04553**
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-mipmapMode-04770**
  If a **VkSampler** created with **mipmapMode** equal to **VK_SAMPLER_MIPMAP_MODE_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this command, then the image view’s **format features must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-06479**
  If a **VkImageView** is sampled with **depth comparison**, the image view’s **format features must** contain **VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02691**
  If a **VkImageView** is accessed using atomic operations as a result of this command, then the image view’s **format features must** contain **VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT**

- **VUID-vkCmdDrawIndexedIndirectCount-None-02692**
  If a **VkImageView** is sampled with **VK_FILTER_CUBIC_EXT** as a result of this command, then the **image view’s format features must** contain **VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT**

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubic-02694**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** as a result of this command **must** have a **VkImageViewType** and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexedIndirectCount-filterCubicMinmax-02695**
  Any **VkImageView** being sampled with **VK_FILTER_CUBIC_EXT** with a reduction mode of either **VK_SAMPLER_REDUCTION_MODE_MIN** or **VK_SAMPLER_REDUCTION_MODE_MAX** as a result of this command **must** have a **VkImageViewType** and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`

- **VUID-vkCmdDrawIndexedIndirectCount-flags-02696**
Any VkImage created with a VkImageCreateInfo::flags containing
VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be
sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-06423
  Any VkImageView or VkBufferView being written as a storage image or storage texel buffer
  where the image format field of the OpTypeImage is Unknown then the view's format feature
  must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-OpTypeImage-06424
  Any VkImageView or VkBufferView being read as a storage image or storage texel buffer
  where the image format field of the OpTypeImage is Unknown then the view's format feature
  must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawIndexedIndirectCount-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point
  used by this command, a descriptor set must have been bound to n at the same pipeline
  bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout
  used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawIndexedIndirectCount-None-02699
  Descriptors in each bound descriptor set, specified via vkCmdBindDescriptorSets, must be
  valid if they are statically used by the VkPipeline bound to the pipeline bind point used by
  this command

- VUID-vkCmdDrawIndexedIndirectCount-None-02700
  A valid pipeline must be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawIndexedIndirectCount-CommandBuffer-02701
  If the VkPipeline object bound to the pipeline bind point used by this command requires
  any dynamic state, that state must have been set or inherited (if the
  VK_NV_inherited_viewport_scissor extension is enabled) for commandBuffer, and done so
  after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawIndexedIndirectCount-None-02859
  There must not have been any calls to dynamic state setting commands for any state not
  specified as dynamic in the VkPipeline object bound to the pipeline bind point used by this
  command, since that pipeline was bound

- VUID-vkCmdDrawIndexedIndirectCount-None-02702
  If the VkSampler object bound to the pipeline bind point used by this command accesses a
  VkSampler object that uses unnormalized coordinates, that sampler must not be used to
  sample from any VkImage with a VkImageView of the type VK_IMAGE_VIEW_TYPE_3D,
  VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY or
  VK_IMAGE_VIEW_TYPE_CUBE_ARRAY, in any shader stage
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V OpImageSample* or OpImageSparseSample* instructions with ImplicitLod, Dref or Proj in their name, in any shader stage.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for uniformBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource.

If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler Y′C′bC′r conversion, that object must only be used with OpImageSample* or OpImageSparseSample* instructions.

If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format.

If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as.
the buffer view’s format

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04470
  If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04471
  If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04472
  If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawIndexedIndirectCount-SampledType-04473
  If a VkBufferView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04474
  If the sparseImageInt64Atomics feature is not enabled, VkImage objects created with the VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirectCount-sparseImageInt64Atomics-04475
  If the sparseImageInt64Atomics feature is not enabled, VkBuffer objects created with the VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWeightedSampleQCOM-06971
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM

- VUID-vkCmdDrawIndexedIndirectCount-OpImageWeightedSampleQCOM-06972
  If OpImageWeightedSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM

- VUID-vkCmdDrawIndexedIndirectCount-OpImageBoxFilterQCOM-06973
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM

- VUID-vkCmdDrawIndexedIndirectCount-OpImageBlockMatchSSDQCOM-06974
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

- VUID-vkCmdDrawIndexedIndirectCount-OpImageBlockMatchSADQCOM-06975
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM
command, then the image view’s format features must contain
VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM

• VUID-vkCmdDrawIndexedIndirectCount-OpImageBlockMatchSADQCOM-06976
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a
  reference image as result of this command, then the specified reference coordinates must
  not fail integer texel coordinate validation.

• VUID-vkCmdDrawIndexedIndirectCount-OpImageWeightedSampleQCOM-06977
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or
  OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler
  must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

• VUID-vkCmdDrawIndexedIndirectCount-None-06537
  Memory backing image subresources used as attachments in the current render pass must
  not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawIndexedIndirectCount-None-06538
  If any recorded command in the current subpass will write to an image subresource as an
  attachment, this command must not read from the memory backing that image
  subresource in any other way than as an attachment

• VUID-vkCmdDrawIndexedIndirectCount-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawIndexedIndirectCount-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only
  layout for the stencil aspect and stencil test is enabled, all stencil ops must be
If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to \texttt{VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex}

If the bound graphics pipeline was created with \texttt{VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable} set to \texttt{VK_TRUE} and the current subpass has a depth/stencil attachment, then that attachment must have been created with the \texttt{VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT} bit set

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT} dynamic state enabled then \texttt{vkCmdSetSampleLocationsEXT} must have been called in the current command buffer prior to this drawing command

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, then \texttt{vkCmdSetViewportWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo::viewportCount} of the pipeline

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, then \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount} must match the \texttt{VkPipelineViewportStateCreateInfo::viewportCount} of the pipeline

If the bound graphics pipeline state was created with both the \texttt{VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT} and \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic states enabled then both \texttt{vkCmdSetViewportWithCount} and \texttt{vkCmdSetScissorWithCount} must have been called in the current command buffer prior to this drawing command, and the \texttt{viewportCount} parameter of \texttt{vkCmdSetViewportWithCount} must match the \texttt{scissorCount} parameter of \texttt{vkCmdSetScissorWithCount}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV} dynamic state enabled, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportWScalingStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}

If the bound graphics pipeline state was created with the \texttt{VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT} dynamic state enabled, but not the \texttt{VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV} dynamic state enabled, then the bound graphics pipeline must have been created with \texttt{VkPipelineViewportWScalingStateCreateInfoNV::viewportCount} greater or equal to the \texttt{viewportCount} parameter in the last call to \texttt{vkCmdSetViewportWithCount}
If the bound graphics pipeline state was created with the
`VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV`
dynamic states enabled then the `viewportCount` parameter in the last call to
`vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount`
parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04139**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the
  `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the
  bound graphics pipeline must have been created with
  `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal
to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirectCount-viewportCount-04140**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV`
dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must
be greater than or equal to the `viewportCount` parameter in the last call to
`vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a
  `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from
  `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with
  `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the
  `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirectCount-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a
  `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from
  `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with
  `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the
  `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`

- **VUID-vkCmdDrawIndexedIndirectCount-None-04876**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then
  `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer
  prior to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-None-04877**
  If the bound graphics pipeline state was created with the
  `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then
  `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior
to this drawing command

- **VUID-vkCmdDrawIndexedIndirectCount-logicOp-04878**
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- VUID-vkCmdDrawIndexedIndirectCount-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- VUID-vkCmdDrawIndexedIndirectCount-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` must be `VK_FALSE`.

- VUID-vkCmdDrawIndexedIndirectCount-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` must be the same as the current subpass color and/or depth/stencil attachments.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06172
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06173
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06174
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command must not write any values to the depth attachment.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06175
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command must not write any values to the stencil attachment.

- VUID-vkCmdDrawIndexedIndirectCount-imageView-06176
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView`...
member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

- **VUID-vkCmdDrawIndexedIndirectCount-imageView-06177**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

- **VUID-vkCmdDrawIndexedIndirectCount-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`

- **VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- **VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- **VUID-vkCmdDrawIndexedIndirectCount-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- **VUID-vkCmdDrawIndexedIndirectCount-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

- **VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- **VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-06182**
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

• VUID-vkCmdDrawIndexedIndirectCount-imageView-06183
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

• VUID-vkCmdDrawIndexedIndirectCount-imageView-06184
If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`

• VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06185
If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-06186
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

• VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-06187
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

• VUID-vkCmdDrawIndexedIndirectCount-colorAttachmentCount-06188
If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of
the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndexedIndirectCount-pDepthAttachment-06189**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndexedIndirectCount-pStencilAttachment-06190**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndexedIndirectCount-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndexedIndirectCount-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, rasterization discard must not be enabled.

- **VUID-vkCmdDrawIndexedIndirectCount-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline must not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface must not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-02721**
For a given vertex buffer binding, any attribute data fetched must be entirely contained within the corresponding vertex buffer binding, as described in Vertex Input Description.

- **VUID-vkCmdDrawIndexedIndirectCount-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` must have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` must be of the same topology class as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexedIndirectCount-pStrides-04913**
  If the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdBindVertexBuffers2EXT` must have been called in the current command buffer prior to this draw command, and the `pStrides` parameter of `vkCmdBindVertexBuffers2EXT` must not be `NULL`.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04914**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then `vkCmdSetVertexInputEXT` must have been called in the current command buffer prior to this draw command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04875**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT` dynamic state enabled then `vkCmdSetPatchControlPointsEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-None-04879**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT` dynamic state enabled then `vkCmdSetPrimitiveRestartEnableEXT` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndexedIndirectCount-stage-06481**
  The bound graphics pipeline must not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_TASK_BIT_NV` or `VK_SHADER_STAGE_MESH_BIT_NV`.

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-02708**
  If `buffer` is non-sparse then it must be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-02709**

1548
**buffer** must have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-vkCmdDrawIndexedIndirectCount-offset-02710**
  - **offset** must be a multiple of 4

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-02711**
  - **commandBuffer** must not be a protected command buffer

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02714**
  - If **countBuffer** is non-sparse then it must be bound completely and contiguously to a single **VkDeviceMemory** object

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02715**
  - **countBuffer** must have been created with the **VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT** bit set

- **VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-02716**
  - **countBufferOffset** must be a multiple of 4

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-02717**
  - The count stored in **countBuffer** must be less than or equal to **VkPhysicalDeviceLimits::maxDrawIndirectCount**

- **VUID-vkCmdDrawIndexedIndirectCount-countBufferOffset-04129**
  - **(countBufferOffset + sizeof(uint32_t))** must be less than or equal to the size of **countBuffer**

- **VUID-vkCmdDrawIndexedIndirectCount-None-04445**
  - If **drawIndirectCount** is not enabled this function must not be used

- **VUID-vkCmdDrawIndexedIndirectCount-stride-03142**
  - **stride** must be a multiple of 4 and must be greater than or equal to sizeof(**VkDrawIndexedIndirectCommand**)

- **VUID-vkCmdDrawIndexedIndirectCount-maxDrawCount-03143**
  - If **maxDrawCount** is greater than or equal to 1, **(stride × (maxDrawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))** must be less than or equal to the size of **buffer**

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03153**
  - If count stored in **countBuffer** is equal to 1, **(offset + sizeof(VkDrawIndexedIndirectCommand))** must be less than or equal to the size of **buffer**

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-03154**
  - If count stored in **countBuffer** is greater than 1, **(stride × (drawCount - 1) + offset + sizeof(VkDrawIndexedIndirectCommand))** must be less than or equal to the size of **buffer**

---

**Valid Usage (Implicit)**

- **VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-parameter**
  - **commandBuffer** must be a valid **VkCommandBuffer** handle

- **VUID-vkCmdDrawIndexedIndirectCount-buffer-parameter**
  - **buffer** must be a valid **VkBuffer** handle

- **VUID-vkCmdDrawIndexedIndirectCount-countBuffer-parameter**
  - **countBuffer** must be a valid **VkBuffer** handle
• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdDrawIndexedIndirectCount-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawIndexedIndirectCount-renderpass
  This command must only be called inside of a render pass instance

• VUID-vkCmdDrawIndexedIndirectCount-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdDrawIndexedIndirectCount-commonparent
  Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or retrieved from the same VkDevice

---

Host Synchronization

• Host access to commandBuffer must be externally synchronized
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

21.3.1. Drawing Transform Feedback

It is possible to draw vertex data that was previously captured during active transform feedback by binding one or more of the transform feedback buffers as vertex buffers. A pipeline barrier is required between using the buffers as transform feedback buffers and vertex buffers to ensure all writes to the transform feedback buffers are visible when the data is read as vertex attributes. The source access is VK_ACCESS_TRANSFORM_FEEDBACK_WRITE_BIT_EXT and the destination access is VK_ACCESS_VERTEX_ATTRIBUTE_READ_BIT for the pipeline stages VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT and VK_PIPELINE_STAGE_VERTEX_INPUT_BIT respectively. The value written to the counter buffer by vkCmdEndTransformFeedbackEXT can be used to determine the vertex count for the draw. A pipeline barrier is required between using the counter buffer for vkCmdEndTransformFeedbackEXT and vkCmdDrawIndirectByteCountEXT where the source access is VK_ACCESS_TRANSFORM_FEEDBACK_COUNTER_WRITE_BIT_EXT and the destination access is VK_ACCESS_INDIRECT_COMMAND_READ_BIT for the pipeline stages VK_PIPELINE_STAGE_TRANSFORM_FEEDBACK_BIT_EXT and VK_PIPELINE_STAGE_DRAW_INDIRECT_BIT respectively.
To record a non-indexed draw call, where the vertex count is based on a byte count read from a buffer and the passed in vertex stride parameter, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdDrawIndirectByteCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t instanceCount,
    uint32_t firstInstance,
    VkBuffer counterBuffer,
    VkDeviceSize counterBufferOffset,
    uint32_t counterOffset,
    uint32_t vertexStride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `instanceCount` is the number of instances to draw.
- `firstInstance` is the instance ID of the first instance to draw.
- `counterBuffer` is the buffer handle from where the byte count is read.
- `counterBufferOffset` is the offset into the buffer used to read the byte count, which is used to calculate the vertex count for this draw call.
- `counterOffset` is subtracted from the byte count read from the `counterBuffer` at the `counterBufferOffset`.
- `vertexStride` is the stride in bytes between each element of the vertex data that is used to calculate the vertex count from the counter value. This value is typically the same value that was used in the graphics pipeline state when the transform feedback was captured as the XfbStride.

When the command is executed, primitives are assembled in the same way as done with `vkCmdDraw` except the `vertexCount` is calculated based on the byte count read from `counterBuffer` at offset `counterBufferOffset`. The assembled primitives execute the bound graphics pipeline.

The effective `vertexCount` is calculated as follows:

```c
const uint32_t * counterBufferPtr = (const uint8_t *)counterBuffer.address + counterBufferOffset;
vertexCount = floor(max(0, (*counterBufferPtr - counterOffset)) / vertexStride);
```

The effective `firstVertex` is zero.

**Valid Usage**

- `VUID-vkCmdDrawIndirectByteCountEXT-magFilter-04553`
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s `format features` must contain
If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`.

If a `VkImageView` is sampled with `depth comparison`, the image view’s format features must contain `VK_FORMAT_FEATURE_2SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`.

If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view’s format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set $n$ that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set $n$, with the `VkPipelineLayout`...
used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndirectByteCountEXT-maintenance4-06425**
  
  If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02699**
  
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02700**
  
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02701**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02859**
  
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02702**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02703**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02704**
  
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions that includes a LOD bias or any offset values, in any shader stage

- **VUID-vkCmdDrawIndirectByteCountEXT-uniformBuffers-06935**
  
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`,
and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectByteCountEXT-storageBuffers-06936**
  If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`, and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource

- **VUID-vkCmdDrawIndirectByteCountEXT-None-06550**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDrawIndirectByteCountEXT-ConstOffset-06551**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y'CbCr` conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view's format

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view's format

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawIndirectByteCountEXT-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a **Width** of 32

- **VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04474**  
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-sparseImageInt64Atomics-04475**  
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a **Width** of 64 by this command

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06971**  
  If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageWeightedSampleQCOM-06972**  
  If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageBoxFilterQCOM-06973**  
  If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view’s format features **must** contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageBlockMatchSSDQCOM-06974**  
  If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the specified reference coordinates **must** not fail integer texel coordinate validation.

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageBlockMatchSSDQCOM-06975**  
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`

- **VUID-vkCmdDrawIndirectByteCountEXT-OpImageBlockMatchSADQCOM-06976**  
  If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler **must** not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`
The current render pass **must** be compatible with the `renderPass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass **must** be equal to the `subpass` member of the `VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`.

Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set.

Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command.

If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment.

If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must** be disabled.

If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must** be `VK_STENCIL_OP_KEEP`.

If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to `VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex`.

If the bound graphics pipeline was created with `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` set to `VK_TRUE` and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the `VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT` bit set.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` dynamic state enabled then `vkCmdSetSampleLocationsEXT` **must** have been called in the current command buffer prior to this drawing command.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.
VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to `vkCmdSetViewportShadingRatePaletteNV` must be greater than or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04141**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawIndirectByteCountEXT-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the viewportCount parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled then `vkCmdSetRasterizerDiscardEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` must have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawIndirectByteCountEXT-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` must have been called in the current command buffer prior to this drawing command and the `logicOp` must be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawIndirectByteCountEXT-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must be 1.

- **VUID-vkCmdDrawIndirectByteCountEXT-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's format features do not
contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawIndirectByteCountEXT-rasterizationSamples-04740
  If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06172
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the depth attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06173
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06174
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pDepthAttachment is not VK_NULL_HANDLE, and the layout member of pDepthAttachment is VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-imageView-06175
  If the current render pass instance was begun with vkCmdBeginRendering, the imageView member of pStencilAttachment is not VK_NULL_HANDLE, and the layout member of pStencilAttachment is VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL, this command must not write any values to the stencil attachment

- VUID-vkCmdDrawIndirectByteCountEXT-viewMask-06176
  If the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask

- VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06179
  If the currently bound graphics pipeline must have been created with a VkPipelineRenderingCreateInfo::viewMask equal to VkRenderingInfo::viewMask
bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

- **VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndirectByteCountEXT-attachmentCount-06667**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

- **VUID-vkCmdDrawIndirectByteCountEXT-attachmentCount-06815**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` **must** have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` **must** be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

- **VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-06181**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

- **VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-06182**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline **must** be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndirectByteCountEXT-imageView-06183**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

- **VUID-vkCmdDrawIndirectByteCountEXT-imageView-06184**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline **must** have been created with...
• VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the corresponding element of the pColorAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pStencilAttachment->imageView

• VUID-vkCmdDrawIndirectByteCountEXT-colorAttachmentCount-06188
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline

• VUID-vkCmdDrawIndirectByteCountEXT-pDepthAttachment-06189
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView

• VUID-vkCmdDrawIndirectByteCountEXT-pStencilAttachment-06190
  If the current render pass instance was begun with vkCmdBeginRendering, the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the currently bound graphics pipeline must be equal to the sample count used to create VkRenderingInfo::pDepthAttachment->imageView
bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawIndirectByteCountEXT-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndirectByteCountEXT-primitivesGeneratedQueryWithRasterizerDiscard-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, **rasterization discard must** not be enabled.

- **VUID-vkCmdDrawIndirectByteCountEXT-primitivesGeneratedQueryWithNonZeroStreams-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04007**
  All vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** have either valid or `VK_NULL_HANDLE` buffers bound.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04008**
  If the `nullDescriptor` feature is not enabled, all vertex input bindings accessed via vertex input variables declared in the vertex shader entry point's interface **must** not be `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-02721**
  For a given vertex buffer binding, any attribute data fetched **must** be entirely contained within the corresponding vertex buffer binding, as described in **Vertex Input Description**.

- **VUID-vkCmdDrawIndirectByteCountEXT-primitiveTopology-03420**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_PRIMITIVE_TOPOLOGY_EXT` dynamic state enabled then `vkCmdSetPrimitiveTopologyEXT` **must** have been called in the current command buffer prior to this drawing command, and the `primitiveTopology` parameter of `vkCmdSetPrimitiveTopologyEXT` **must** be of the same **topology class** as the pipeline `VkPipelineInputAssemblyStateCreateInfo::topology` state.

- **VUID-vkCmdDrawIndirectByteCountEXT-None-04912**
  If the bound graphics pipeline was created with both the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` and `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT` dynamic states enabled, then `vkCmdSetVertexInputEXT` **must** have been called in the current command buffer prior to this draw command.
• VUID-vkCmdDrawIndirectByteCountEXT-pStrides-04913
  If the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE_EXT dynamic state enabled, but not the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdBindVertexBuffer2EXT must have been called in the current command buffer prior to this draw command, and the pStrides parameter of vkCmdBindVertexBuffer2EXT must not be NULL.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04914
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled, then vkCmdSetVertexInputEXT must have been called in the current command buffer prior to this draw command.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04875
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PATCH_CONTROL_POINTS_EXT dynamic state enabled then vkCmdSetPatchControlPointsEXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectByteCountEXT-None-04879
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_PRIMITIVE_RESTART_ENABLE_EXT dynamic state enabled then vkCmdSetPrimitiveRestartEnableEXT must have been called in the current command buffer prior to this drawing command.

• VUID-vkCmdDrawIndirectByteCountEXT-stage-06481
  The bound graphics pipeline must not have been created with the VkPipelineShaderStageCreateInfo::stage member of an element of VkGraphicsPipelineCreateInfo::pStages set to VK_SHADER_STAGE_TASK_BIT_NV or VK_SHADER_STAGE_MESH_BIT_NV.

• VUID-vkCmdDrawIndirectByteCountEXT-transformFeedback-02287
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled.

• VUID-vkCmdDrawIndirectByteCountEXT-transformFeedbackDraw-02288
  The implementation must support VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackDraw.

• VUID-vkCmdDrawIndirectByteCountEXT-vertexStride-02289
  vertexStride must be greater than 0 and less than or equal to VkPhysicalDeviceLimits::maxTransformFeedbackBufferDataStride.

• VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-04567
  If counterBuffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object.

• VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-02290
  counterBuffer must have been created with the VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT bit set.

• VUID-vkCmdDrawIndirectByteCountEXT-counterBufferOffset-04568
  counterBufferOffset must be a multiple of 4.

• VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-02646
commandBuffer must not be a protected command buffer

## Valid Usage (Implicit)

- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdDrawIndirectByteCountEXT-counterBuffer-parameter
  counterBuffer must be a valid VkBuffer handle
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdDrawIndirectByteCountEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdDrawIndirectByteCountEXT-renderpass
  This command must only be called inside of a render pass instance
- VUID-vkCmdDrawIndirectByteCountEXT-videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdDrawIndirectByteCountEXT-commonparent
  Both of commandBuffer, and counterBuffer must have been created, allocated, or retrieved from the same VkDevice

## Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

## Command Properties

## 21.4. Conditional Rendering

Certain rendering commands can be executed conditionally based on a value in buffer memory. These rendering commands are limited to drawing commands, dispatching commands, and clearing attachments with vkCmdClearAttachments within a conditional rendering block which is defined by commands vkCmdBeginConditionalRenderingEXT and
vkCmdEndConditionalRenderingEXT. Other rendering commands remain unaffected by conditional rendering.

After beginning conditional rendering, it is considered active within the command buffer it was called until it is ended with vkCmdEndConditionalRenderingEXT.

Conditional rendering must begin and end in the same command buffer. When conditional rendering is active, a primary command buffer can execute secondary command buffers if the inheritedConditionalRendering feature is enabled. For a secondary command buffer to be executed while conditional rendering is active in the primary command buffer, it must set the conditionalRenderingEnable flag of VkCommandBufferInheritanceConditionalRenderingInfoEXT, as described in the Command Buffer Recording section.

Conditional rendering must also either begin and end inside the same subpass of a render pass instance, or must both begin and end outside of a render pass instance (i.e. contain entire render pass instances).

To begin conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdBeginConditionalRenderingEXT(
    VkCommandBuffer commandBuffer,
    const VkConditionalRenderingBeginInfoEXT* pConditionalRenderingBegin);
```

- `commandBuffer` is the command buffer into which this command will be recorded.
- `pConditionalRenderingBegin` is a pointer to a VkConditionalRenderingBeginInfoEXT structure specifying parameters of conditional rendering.

### Valid Usage

- VUID-vkCmdBeginConditionalRenderingEXT-None-01980
  Conditional rendering must not already be active

### Valid Usage (Implicit)

- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-parameter
  `commandBuffer` must be a valid VkCommandBuffer handle
- VUID-vkCmdBeginConditionalRenderingEXT-pConditionalRenderingBegin-parameter
  `pConditionalRenderingBegin` must be a valid pointer to a valid VkConditionalRenderingBeginInfoEXT structure
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdBeginConditionalRenderingEXT-commandBuffer-cmdpool
  The VkCommandPool that `commandBuffer` was allocated from must support graphics, or compute operations
This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td>Compute</td>
</tr>
</tbody>
</table>

The `VkConditionalRenderingBeginInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_conditional_rendering
typedef struct VkConditionalRenderingBeginInfoEXT {
    VkStructureType  sType;
    const void*      pNext;
    VkBuffer         buffer;
    VkDeviceSize     offset;
    VkConditionalRenderingFlagsEXT flags;
} VkConditionalRenderingBeginInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `buffer` is a buffer containing the predicate for conditional rendering.
- `offset` is the byte offset into `buffer` where the predicate is located.
- `flags` is a bitmask of `VkConditionalRenderingFlagsEXT` specifying the behavior of conditional rendering.

If the 32-bit value at `offset` in `buffer` memory is zero, then the rendering commands are discarded, otherwise they are executed as normal. If the value of the predicate in buffer memory changes while conditional rendering is active, the rendering commands may be discarded in an implementation-dependent way. Some implementations may latch the value of the predicate upon beginning conditional rendering while others may read it before every rendering command.
Valid Usage

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01981
  If buffer is non-sparse then it must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-01982
  buffer must have been created with the VK_BUFFER_USAGE_CONDITIONAL_RENDERING_BIT_EXT bit set

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01983
  offset must be less than the size of buffer by at least 32 bits

- VUID-VkConditionalRenderingBeginInfoEXT-offset-01984
  offset must be a multiple of 4

Valid Usage (Implicit)

- VUID-VkConditionalRenderingBeginInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_CONDITIONAL_RENDERING_BEGIN_INFO_EXT

- VUID-VkConditionalRenderingBeginInfoEXT-pNext-pNext
  pNext must be NULL

- VUID-VkConditionalRenderingBeginInfoEXT-buffer-parameter
  buffer must be a valid VkBuffer handle

- VUID-VkConditionalRenderingBeginInfoEXT-flags-parameter
  flags must be a valid combination of VkConditionalRenderingFlagBitsEXT values

Bits which can be set in vkCmdBeginConditionalRenderingEXT::flags, specifying the behavior of conditional rendering, are:

```cpp
// Provided by VK_EXT_conditional_rendering
typedef enum VkConditionalRenderingFlagBitsEXT {
    VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT = 0x00000001,
} VkConditionalRenderingFlagBitsEXT;
```

- `VK_CONDITIONAL_RENDERING_INVERTED_BIT_EXT` specifies the condition used to determine whether to discard rendering commands or not. That is, if the 32-bit predicate read from buffer memory at offset is zero, the rendering commands are not discarded, and if non zero, then they are discarded.

```cpp
// Provided by VK_EXT_conditional_rendering
typedef VkFlags VkConditionalRenderingFlagsEXT;
```

`VkConditionalRenderingFlagsEXT` is a bitmask type for setting a mask of zero or more `VkConditionalRenderingFlagBitsEXT`. 

1567
To end conditional rendering, call:

```c
// Provided by VK_EXT_conditional_rendering
void vkCmdEndConditionalRenderingEXT(
    VkCommandBuffer commandBuffer);
```

- `commandBuffer` is the command buffer into which this command will be recorded.

Once ended, conditional rendering becomes inactive.

### Valid Usage

- **VUID-vkCmdEndConditionalRenderingEXT-None-01985**
  Conditional rendering must be active

- **VUID-vkCmdEndConditionalRenderingEXT-None-01986**
  If conditional rendering was made active outside of a render pass instance, it must not be ended inside a render pass instance

- **VUID-vkCmdEndConditionalRenderingEXT-None-01987**
  If conditional rendering was made active within a subpass it must be ended in the same subpass

### Valid Usage (Implicit)

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-recording**
  `commandBuffer` must be in the recording state

- **VUID-vkCmdEndConditionalRenderingEXT-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics, or compute operations

- **VUID-vkCmdEndConditionalRenderingEXT-videocoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
21.5. Programmable Mesh Shading

In this drawing approach, primitives are assembled by the mesh shader stage. Mesh shading operates similarly to dispatching compute as the shaders make use of workgroups.

To record a draw that uses the mesh pipeline, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksNV(
    VkCommandBuffer commandBuffer,
    uint32_t taskCount,
    uint32_t firstTask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `taskCount` is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.
- `firstTask` is the X component of the first workgroup ID.

When the command is executed, a global workgroup consisting of `taskCount` local workgroups is assembled.

Valid Usage

- VUID-vkCmdDrawMeshTasksNV-magFilter-04553
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-mipmapMode-04770
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- VUID-vkCmdDrawMeshTasksNV-None-06479
  If a `VkImageView` is sampled with depth comparison, the image view’s format features must contain `VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT`
If a `VkImageView` is accessed using atomic operations as a result of this command, then the image view's **format features** **must** contain `VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT`.

If a `VkImageView` is sampled with `VK_FILTER_CUBIC_EXT` as a result of this command, then the image view's **format features** **must** contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImageView` being sampled with `VK_FILTER_CUBIC_EXT` with a reduction mode of either `VK_SAMPLER_REDUCTION_MODE_MIN` or `VK_SAMPLER_REDUCTION_MODE_MAX` as a result of this command must have a `VkImageViewType` and format that supports cubic filtering together with minmax filtering, as specified by `VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax` returned by `vkGetPhysicalDeviceImageFormatProperties2`.

Any `VkImage` created with a `VkImageCreateInfo::flags` containing `VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV` sampled as a result of this command must only be sampled using a `VkSamplerAddressMode` of `VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE`.

Any `VkImageView` or `VkBufferView` being written as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT`.

Any `VkImageView` or `VkBufferView` being read as a storage image or storage texel buffer where the image format field of the `OpTypeImage` is `Unknown` then the view's format feature must contain `VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT`.

For each set `n` that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a descriptor set must have been bound to `n` at the same pipeline bind point, with a `VkPipelineLayout` that is compatible for set `n`, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

If the `maintenance4` feature is not enabled, then for each push constant that is statically used by the `VkPipeline` bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a `VkPipelineLayout` that is compatible for push constants, with the `VkPipelineLayout` used to create the current `VkPipeline`, as described in Pipeline Layout Compatibility.

Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be
valid if they are statically used by the \texttt{VkPipeline} bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-None-02700
  A valid pipeline \textbf{must} be bound to the pipeline bind point used by this command

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-02701
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command requires any dynamic state, that state \textbf{must} have been set or inherited (if the \texttt{VK_NV_inherited_viewport_scissor} extension is enabled) for \texttt{commandBuffer}, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- VUID-vkCmdDrawMeshTasksNV-None-02859
  There \textbf{must} not have been any calls to dynamic state setting commands for any state not specified as dynamic in the \texttt{VkPipeline} object bound to the pipeline bind point used by this command, since that pipeline was bound

- VUID-vkCmdDrawMeshTasksNV-None-02702
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used to sample from any \texttt{VkImage} with a \texttt{VkImageView} of the type \texttt{VK_IMAGE_VIEW_TYPE_3D}, \texttt{VK_IMAGE_VIEW_TYPE_CUBE}, \texttt{VK_IMAGE_VIEW_TYPE_1D_ARRAY}, \texttt{VK_IMAGE_VIEW_TYPE_2D_ARRAY} or \texttt{VK_IMAGE_VIEW_TYPE_CUBE_ARRAY}, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02703
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions with \texttt{ImplicitLod}, \texttt{Dref} or \texttt{Proj} in their name, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-None-02704
  If the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a \texttt{VkSampler} object that uses unnormalized coordinates, that sampler \textbf{must} not be used with any of the SPIR-V \texttt{OpImageSample*} or \texttt{OpImageSparseSample*} instructions that includes a LOD bias or any offset values, in any shader stage

- VUID-vkCmdDrawMeshTasksNV-uniformBuffers-06935
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{uniformBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksNV-storageBuffers-06936
  If any stage of the \texttt{VkPipeline} object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT} or \texttt{VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT} for \texttt{storageBuffers}, and the \texttt{robustBufferAccess} feature is not enabled, that stage \textbf{must} not access values outside of the range of the buffer as specified in the descriptor set bound to the same
pipeline bind point

- **VUID-vkCmdDrawMeshTasksNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command must not be a protected resource.

- **VUID-vkCmdDrawMeshTasksNV-None-06550**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler $Y'CB'Cr$ conversion, that object must only be used with `OpImageSample*` or `OpImageSparseSample*` instructions.

- **VUID-vkCmdDrawMeshTasksNV-ConstOffset-06551**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables sampler $Y'CB'Cr$ conversion, that object must not use the `ConstOffset` and `Offset` operands.

- **VUID-vkCmdDrawMeshTasksNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the image view's format.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction must have at least as many components as the buffer view's format.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 64.

- **VUID-vkCmdDrawMeshTasksNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a `Width` of 32.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

- **VUID-vkCmdDrawMeshTasksNV-sparseImageInt64Atomics-04475**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the
VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT flag must not be accessed by atomic instructions through an OpTypeImage with a SampledType with a Width of 64 by this command.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06971**
  If OpImageWeightedSampleQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06972**
  If OpImageWeightedSampleSampleQCOM uses a VkImageView as a sample weight image as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageBoxFilterQCOM-06973**
  If OpImageBoxFilterQCOM is used to sample a VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSSDQCOM-06974**
  If OpImageBlockMatchSSDQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSADQCOM-06975**
  If OpImageBlockMatchSADQCOM is used to read from an VkImageView as a result of this command, then the image view’s format features must contain VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageBlockMatchSADQCOM-06976**
  If OpImageBlockMatchSADQCOM or OpImageBlockMatchSSDQCOM is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06977**
  If OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-OpImageWeightedSampleQCOM-06978**
  If any command other than OpImageWeightedSampleQCOM, OpImageBoxFilterQCOM, OpImageBlockMatchSSDQCOM, or OpImageBlockMatchSADQCOM uses a VkSampler as a result of this command, then the sampler must not have been created with VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM.

- **VUID-vkCmdDrawMeshTasksNV-renderPass-02684**
  The current render pass must be compatible with the renderPass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.

- **VUID-vkCmdDrawMeshTasksNV-subpass-02685**
  The subpass index of the current render pass must be equal to the subpass member of the VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to VK_PIPELINE_BIND_POINT_GRAPHICS.
• VUID-vkCmdDrawMeshTasksNV-None-02686
Every input attachment used by the current subpass **must** be bound to the pipeline via a
descriptor set.

• VUID-vkCmdDrawMeshTasksNV-None-06537
Memory backing image subresources used as attachments in the current render pass **must**
not be written in any way other than as an attachment by this command.

• VUID-vkCmdDrawMeshTasksNV-None-06538
If any recorded command in the current subpass will write to an image subresource as an
attachment, this command **must** not read from the memory backing that image
subresource in any other way than as an attachment.

• VUID-vkCmdDrawMeshTasksNV-None-06539
If any recorded command in the current subpass will read from an image subresource
used as an attachment in any way other than as an attachment, this command **must**
not write to that image subresource as an attachment.

• VUID-vkCmdDrawMeshTasksNV-None-06886
If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the depth aspect, **depth writes must** be disabled.

• VUID-vkCmdDrawMeshTasksNV-None-06887
If the current render pass instance uses a depth/stencil attachment with a read-only
layout for the stencil aspect and stencil test is enabled, **all stencil ops must** be
**VK_STENCIL_OP_KEEP**.

• VUID-vkCmdDrawMeshTasksNV-maxMultiviewInstanceIndex-02688
If the draw is recorded in a render pass instance with multiview enabled, the maximum
instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties
::maxMultiviewInstanceIndex**.

• VUID-vkCmdDrawMeshTasksNV-sampleLocationsEnable-02689
If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE** and
the current subpass has a depth/stencil attachment, then that attachment **must** have been
created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set.

• VUID-vkCmdDrawMeshTasksNV-None-06666
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled then
**vkCmdSetSampleLocationsEXT** **must** have been called in the current command buffer
prior to this drawing command.

• VUID-vkCmdDrawMeshTasksNV-viewportCount-03417
If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the
**VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, then
**vkCmdSetViewportWithCount** **must** have been called in the current command buffer
prior to this drawing command, and the **viewportCount** parameter of
**vkCmdSetViewportWithCount** **must** match the **VkPipelineViewportStateCreateInfo
::scissorCount** of the pipeline.

• VUID-vkCmdDrawMeshTasksNV-scissorCount-03418
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline must have been created.
with `VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksNV-VkPipelineViewportCreateInfo-04142**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure chained from `VkPipelineViewportCreateInfo`, then the bound graphics pipeline **must** have been created with `VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksNV-None-04876**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE` dynamic state enabled and `vkCmdSetRasterizerDiscardEnable` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksNV-None-04877**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` dynamic state enabled then `vkCmdSetDepthBiasEnable` **must** have been called in the current command buffer prior to this drawing command.

- **VUID-vkCmdDrawMeshTasksNV-logicOp-04878**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_LOGIC_OP_EXT` dynamic state enabled then `vkCmdSetLogicOpEXT` **must** have been called in the current command buffer prior to this drawing command and the `logicOp` **must** be a valid `VkLogicOp` value.

- **VUID-vkCmdDrawMeshTasksNV-primitiveFragmentShadingRateWithMultipleViewports-04552**
  If the `primitiveFragmentShadingRateWithMultipleViewports` limit is not supported, the bound graphics pipeline was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the `PrimitiveShadingRateKHR` built-in, then `vkCmdSetViewportWithCount` **must** have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` **must** be **1**.

- **VUID-vkCmdDrawMeshTasksNV-blendEnable-04727**
  If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view's `format features` do not contain `VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT`, then the `blendEnable` member of the corresponding element of the `pAttachments` member of `pColorBlendState` **must** be `VK_FALSE`.

- **VUID-vkCmdDrawMeshTasksNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the `VK_AMD_mixed_attachment_samples` nor the `VK_NV_framebuffer_mixed_samples` extensions are enabled, then `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` **must** be the same as the current subpass multisample state.

- **VUID-vkCmdDrawMeshTasksNV-imageView-06172**
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

• **VUID-vkCmdDrawMeshTasksNV-imageView-06173**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

• **VUID-vkCmdDrawMeshTasksNV-imageView-06174**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment

• **VUID-vkCmdDrawMeshTasksNV-imageView-06175**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment

• **VUID-vkCmdDrawMeshTasksNV-imageView-06176**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment

• **VUID-vkCmdDrawMeshTasksNV-viewMask-06178**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`viewMask` equal to `VkRenderingInfo`::`viewMask`

• **VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06179**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo`::`colorAttachmentCount` equal to `VkRenderingInfo`::`colorAttachmentCount`

• **VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06180**
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo`::`colorAttachmentCount` greater than 0, then each element of the `VkPipelineRenderingCreateInfo`::`pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo`::`pColorAttachmentFormats` used to create the currently bound graphics pipeline
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to...
create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksNV-pDepthAttachment-06186
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-pStencilAttachment-06187
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-colorAttachmentCount-06188
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksNV-pDepthAttachment-06189
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-pStencilAttachment-06190
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksNV-renderPass-06198
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass`
equal to \texttt{VK\_NULL\_HANDLE}

- VUID-vkCmdDrawMeshTasksNV-primitivesGeneratedQueryWithRasterizerDiscard-06708
  If the \texttt{primitivesGeneratedQueryWithRasterizerDiscard} feature is not enabled and the \texttt{VK\_QUERY\_TYPE\_PRIMITIVES\_GENERATED\_EXT} query is active, \texttt{rasterization discard} must not be enabled.

- VUID-vkCmdDrawMeshTasksNV-primitivesGeneratedQueryWithNonZeroStreams-06709
  If the \texttt{primitivesGeneratedQueryWithNonZeroStreams} feature is not enabled and the \texttt{VK\_QUERY\_TYPE\_PRIMITIVES\_GENERATED\_EXT} query is active, the bound graphics pipeline must not have been created with a non-zero value in \texttt{VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream}.

- VUID-vkCmdDrawMeshTasksNV-stage-06480
  The bound graphics pipeline must not have been created with the \texttt{VkPipelineShaderStageCreateInfo::stage} member of an element of \texttt{VkGraphicsPipelineCreateInfo::pStages} set to \texttt{VK\_SHADER\_STAGE\_VERTEX\_BIT}, \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_CONTROL\_BIT}, \texttt{VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT} or \texttt{VK\_SHADER\_STAGE\_GEOMETRY\_BIT}

- VUID-vkCmdDrawMeshTasksNV-taskCount-02119
  \texttt{taskCount} must be less than or equal to \texttt{VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount}

### Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-recording
  \texttt{commandBuffer} must be in the recording state

- VUID-vkCmdDrawMeshTasksNV-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksNV-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized
To record an indirect mesh tasks draw, call:

```c
// Provided by VK_NV_mesh_shader
void vkCmdDrawMeshTasksIndirectNV(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    uint32_t drawCount,
    uint32_t stride);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `buffer` is the buffer containing draw parameters.
- `offset` is the byte offset into `buffer` where parameters begin.
- `drawCount` is the number of draws to execute, and can be zero.
- `stride` is the byte stride between successive sets of draw parameters.

`vkCmdDrawMeshTasksIndirectNV` behaves similarly to `vkCmdDrawMeshTasksNV` except that the parameters are read by the device from a buffer during execution. `drawCount` draws are executed by the command, with parameters taken from `buffer` starting at `offset` and increasing by `stride` bytes for each successive draw. The parameters of each draw are encoded in an array of `VkDrawMeshTasksIndirectCommandNV` structures. If `drawCount` is less than or equal to one, `stride` is ignored.

### Valid Usage

- **VUID-vkCmdDrawMeshTasksIndirectNV-magFilter-04553**
  If a `VkSampler` created with `magFilter` or `minFilter` equal to `VK_FILTER_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-mipmapMode-04770**
  If a `VkSampler` created with `mipmapMode` equal to `VK_SAMPLER_MIPMAP_MODE_LINEAR` and `compareEnable` equal to `VK_FALSE` is used to sample a `VkImageView` as a result of this command, then the image view’s format features must contain `VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT`

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06479**
If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02692
  If a VkImageView is sampled with VK_FILTER_CUBIC_EXT as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_CUBIC_BIT_EXT

- VUID-vkCmdDrawMeshTasksIndirectNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawMeshTasksIndirectNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2

- VUID-vkCmdDrawMeshTasksIndirectNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE

- VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-06423
  Any VkImageView or VkBufferView being written as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectNV-OpTypeImage-06424
  Any VkImageView or VkBufferView being read as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT

- VUID-vkCmdDrawMeshTasksIndirectNV-None-02697
  For each set n that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to n at the same pipeline bind point, with a VkPipelineLayout that is compatible for set n, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility

- VUID-vkCmdDrawMeshTasksIndirectNV-maintenance4-06425
  If the maintenance4 feature is not enabled, then for each push constant that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a push constant value must have been set for the same pipeline bind point, with a VkPipelineLayout that is compatible for push constants, with the VkPipelineLayout used to create the current VkPipeline, as described in Pipeline Layout Compatibility
Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, must be valid if they are statically used by the `VkPipeline` bound to the pipeline bind point used by this command.

A valid pipeline must be bound to the pipeline bind point used by this command.

If the `VkPipeline` object bound to the pipeline bind point used by this command requires any dynamic state, that state must have been set or inherited (if the `VK_NV_inherited_viewport_scissor` extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic.

There must not have been any calls to dynamic state setting commands for any state not specified as dynamic in the `VkPipeline` object bound to the pipeline bind point used by this command, since that pipeline was bound.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used to sample from any `VkImage` with a `VkImageView` of the type `VK_IMAGE_VIEW_TYPE_3D`, `VK_IMAGE_VIEW_TYPE_CUBE`, `VK_IMAGE_VIEW_TYPE_1D_ARRAY`, `VK_IMAGE_VIEW_TYPE_2D_ARRAY` or `VK_IMAGE_VIEW_TYPE_CUBE_ARRAY`, in any shader stage.

If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` object that uses unnormalized coordinates, that sampler must not be used with any of the SPIR-V `OpImageSample*` or `OpImageSparseSample*` instructions with `ImplicitLod`, `Dref` or `Proj` in their name, in any shader stage.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `uniformBuffers`, and the `robustBufferAccess` feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point.

If any stage of the `VkPipeline` object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT` or `VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT` for `storageBuffers`,...
and the `robustBufferAccess` feature is not enabled, that stage **must** not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- **VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02707**
  If `commandBuffer` is an unprotected command buffer and `protectedNoFault` is not supported, any resource accessed by the `VkPipeline` object bound to the pipeline bind point used by this command **must** not be a protected resource

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06550**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b C_r` conversion, that object **must** only be used with `OpImageSample*` or `OpImageSparseSample*` instructions

- **VUID-vkCmdDrawMeshTasksIndirectNV-ConstOffset-06551**
  If the `VkPipeline` object bound to the pipeline bind point used by this command accesses a `VkSampler` or `VkImageView` object that enables `sampler Y’C_b C_r` conversion, that object **must** not use the `ConstOffset` and `Offset` operands

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-04115**
  If a `VkImageView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the image view’s format

- **VUID-vkCmdDrawMeshTasksIndirectNV-OpImageWrite-04469**
  If a `VkBufferView` is accessed using `OpImageWrite` as a result of this command, then the `Type` of the `Texel` operand of that instruction **must** have at least as many components as the buffer view’s format

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04470**
  If a `VkImageView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04471**
  If a `VkImageView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04472**
  If a `VkBufferView` with a `VkFormat` that has a 64-bit component width is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 64

- **VUID-vkCmdDrawMeshTasksIndirectNV-SampledType-04473**
  If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction **must** have a `Width` of 32

- **VUID-vkCmdDrawMeshTasksIndirectNV-sparseImageInt64Atomics-04474**
  If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag **must** not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command
If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the
`VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions
through an `OpTypeImage` with a `SampledType` with a `Width` of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this
command, then the image view's `format features` must contain
`VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of
this command, then the image view's `format features` must contain
`VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this
command, then the image view's `format features` must contain
`VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this
command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or
`OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`.

The current render pass must be compatible with the `renderPass` member of the
`VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to
`VK_PIPELINE_BIND_POINT_GRAPHICS`.

The subpass index of the current render pass must be equal to the `subpass` member of the
`VkGraphicsPipelineCreateInfo` structure specified when creating the `VkPipeline` bound to
**VK_PIPELINE_BIND_POINT_GRAPHICS**

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-02686**
  Every input attachment used by the current subpass **must** be bound to the pipeline via a descriptor set

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06537**
  Memory backing image subresources used as attachments in the current render pass **must** not be written in any way other than as an attachment by this command

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06538**
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command **must** not read from the memory backing that image subresource in any other way than as an attachment

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06539**
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command **must** not write to that image subresource as an attachment

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06886**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, **depth writes must be disabled**

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06887**
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, **all stencil ops must be** **VK_STENCIL_OP_KEEP**

- **VUID-vkCmdDrawMeshTasksIndirectNV-maxMultiviewInstanceIndex-02688**
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index **must** be less than or equal to **VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex**

- **VUID-vkCmdDrawMeshTasksIndirectNV-sampleLocationsEnable-02689**
  If the bound graphics pipeline was created with **VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable** set to **VK_TRUE** and the current subpass has a depth/stencil attachment, then that attachment **must** have been created with the **VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT** bit set

- **VUID-vkCmdDrawMeshTasksIndirectNV-None-06666**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT** dynamic state enabled then **vkCmdSetSampleLocationsEXT** **must** have been called in the current command buffer prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** dynamic state enabled, but not the **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** dynamic state enabled, then **vkCmdSetViewportWithCount** **must** have been called in the current command buffer prior to this drawing command, and the **viewportCount** parameter of **vkCmdSetViewportWithCount** **must** match the **VkPipelineViewportStateCreateInfo::scissorCount** of the pipeline
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled and a `VkPipelineViewportSwizzleStateCreateInfoNV` structure chained from
VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectNV-VkPipelineViewportCreateInfo-04142 If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectNV-None-04876 If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectNV-None-04877 If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectNV-logicOp-04878 If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawMeshTasksIndirectNV-primitiveFragmentShadingRateWithMultipleViewports-04552 If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawMeshTasksIndirectNV-blendEnable-04727 If rasterization is not disabled in the bound graphics pipeline, then for each color attachment in the subpass, if the corresponding image view’s format features do not contain VK_FORMAT_FEATURE_COLOR_ATTACHMENT_BLEND_BIT, then the blendEnable member of the corresponding element of the pAttachments member of pColorBlendState must be VK_FALSE

- VUID-vkCmdDrawMeshTasksIndirectNV-rasterizationSamples-04740 If rasterization is not disabled in the bound graphics pipeline, and neither the VK_AMD_mixed_attachment_samples nor the VK_NV_framebuffer_mixed_samples extensions are enabled, then VkPipelineMultisampleStateCreateInfo::rasterizationSamples must be the same as the current subpass color and/or depth/stencil attachments
If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_STENCIL_ATTACHMENT_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_DEPTH_ATTACHMENT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pDepthAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pDepthAttachment` is `VK_IMAGE_LAYOUT_DEPTH_READ_ONLY_OPTIMAL`, this command **must** not write any values to the depth attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the `imageView` member of `pStencilAttachment` is not `VK_NULL_HANDLE`, and the `layout` member of `pStencilAttachment` is `VK_IMAGE_LAYOUT_STENCIL_READ_ONLY_OPTIMAL`, this command **must** not write any values to the stencil attachment.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::viewMask` equal to `VkRenderingInfo::viewMask`.

If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline **must** have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` **must** have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline.
If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline.

If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`.

If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT`.

If the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the corresponding element of the `pColorAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to...
create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectNV-pDepthAttachment-06186
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectNV-pStencilAttachment-06187
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created with a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of the `depthStencilAttachmentSamples` member of `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectNV-colorAttachmentCount-06188
  If the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and the current render pass instance was begun with `vkCmdBeginRendering` with a `VkRenderingInfo::colorAttachmentCount` parameter greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a sample count equal to the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectNV-pDepthAttachment-06189
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectNV-pStencilAttachment-06190
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline must be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectNV-renderPass-06198
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline must have been created with a `VkGraphicsPipelineCreateInfo::renderPass`
equal to \textit{VK\_NULL\_HANDLE}

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-primitivesGeneratedQueryWithRasterizerDiscard-06708}
  
  If the \textit{primitivesGeneratedQueryWithRasterizerDiscard} feature is not enabled and the \textit{VK\_QUERY\_TYPE\_PRIMITIVES\_GENERATED\_EXT} query is active, \textit{rasterization discard} must not be enabled.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-primitivesGeneratedQueryWithNonZeroStreams-06709}
  
  If the \textit{primitivesGeneratedQueryWithNonZeroStreams} feature is not enabled and the \textit{VK\_QUERY\_TYPE\_PRIMITIVES\_GENERATED\_EXT} query is active, the bound graphics pipeline must not have been created with a non-zero value in \textit{VkPipelineRasterizationStateStreamCreateInfoEXT.rasterizationStream}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-stage-06480}
  
  The bound graphics pipeline must not have been created with the \textit{VkPipelineShaderStageCreateInfo.stage} member of an element of \textit{VkGraphicsPipelineCreateInfo.pStages} set to \textit{VK\_SHADER\_STAGE\_VERTEX\_BIT}, \textit{VK\_SHADER\_STAGE\_TESSELLATION\_CONTROL\_BIT}, \textit{VK\_SHADER\_STAGE\_TESSELLATION\_EVALUATION\_BIT} or \textit{VK\_SHADER\_STAGE\_GEOMETRY\_BIT}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02708}
  
  If \textit{buffer} is non-sparse then it must be bound completely and contiguously to a single \textit{VkDeviceMemory} object.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-buffer-02709}
  
  \textit{buffer} must have been created with the \textit{VK\_BUFFER\_USAGE\_INDIRECT\_BUFFER\_BIT} bit set.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-offset-02710}
  
  \textit{offset} must be a multiple of \textit{4}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-02711}
  
  \textit{commandBuffer} must not be a protected command buffer.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02718}
  
  If the \textit{multiDrawIndirect} feature is not enabled, \textit{drawCount} must be \textit{0} or \textit{1}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02719}
  
  \textit{drawCount} must be less than or equal to \textit{VkPhysicalDeviceLimits.maxDrawIndirectCount}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02146}
  
  If \textit{drawCount} is greater than \textit{1}, \textit{stride} must be a multiple of \textit{4} and must be greater than or equal to \textit{sizeof(VkDrawMeshTasksIndirectCommandNV)}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02156}
  
  If \textit{drawCount} is equal to \textit{1}, \textit{(offset + sizeof(VkDrawMeshTasksIndirectCommandNV))} must be less than or equal to the size of \textit{buffer}.

- \textbf{VUID-vkCmdDrawMeshTasksIndirectNV-drawCount-02157}
  
  If \textit{drawCount} is greater than \textit{1}, \textit{(stride \times (drawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV))} must be less than or equal to the size of \textit{buffer}.
Valid Usage (Implicit)

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdDrawMeshTasksIndirectNV-buffer-parameter
  `buffer` must be a valid `VkBuffer` handle

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdDrawMeshTasksIndirectNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdDrawMeshTasksIndirectNV-renderpass
  This command must only be called inside of a render pass instance

- VUID-vkCmdDrawMeshTasksIndirectNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdDrawMeshTasksIndirectNV-commonparent
  Both of `buffer`, and `commandBuffer` must have been created, allocated, or retrieved from the same `VkDevice`

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

The `VkDrawMeshTasksIndirectCommandNV` structure is defined as:

```c
// Provided by VK_NV_mesh_shader
typedef struct VkDrawMeshTasksIndirectCommandNV {
    uint32_t    taskCount;
    uint32_t    firstTask;
} VkDrawMeshTasksIndirectCommandNV;
```
• **taskCount** is the number of local workgroups to dispatch in the X dimension. Y and Z dimension are implicitly set to one.

• **firstTask** is the X component of the first workgroup ID.

The members of **VkDrawMeshTasksIndirectCommandNV** have the same meaning as the similarly named parameters of **vkCmdDrawMeshTasksNV**.

---

**Valid Usage**

- **VUID-VkDrawMeshTasksIndirectCommandNV-taskCount-02175**
  
  taskCount must be less than or equal to **VkPhysicalDeviceMeshShaderPropertiesNV::maxDrawMeshTasksCount**

To record an indirect mesh tasks draw with the draw count sourced from a buffer, call:

```c
void vkCmdDrawMeshTasksIndirectCountNV(
    VkCommandBuffer commandBuffer,
    VkBuffer buffer,
    VkDeviceSize offset,
    VkBuffer countBuffer,
    VkDeviceSize countBufferOffset,
    uint32_t maxDrawCount,
    uint32_t stride);
```

• **commandBuffer** is the command buffer into which the command is recorded.

• **buffer** is the buffer containing draw parameters.

• **offset** is the byte offset into **buffer** where parameters begin.

• **countBuffer** is the buffer containing the draw count.

• **countBufferOffset** is the byte offset into **countBuffer** where the draw count begins.

• **maxDrawCount** specifies the maximum number of draws that will be executed. The actual number of executed draw calls is the minimum of the count specified in **countBuffer** and **maxDrawCount**.

• **stride** is the byte stride between successive sets of draw parameters.

**vkCmdDrawMeshTasksIndirectCountNV** behaves similarly to **vkCmdDrawMeshTasksIndirectNV** except that the draw count is read by the device from a buffer during execution. The command will read an unsigned 32-bit integer from **countBuffer** located at **countBufferOffset** and use this as the draw count.

---

**Valid Usage**

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-magFilter-04553**
  
  If a **VkSampler** created with **magFilter** or **minFilter** equal to **VK_FILTER_LINEAR** and **compareEnable** equal to **VK_FALSE** is used to sample a **VkImageView** as a result of this
command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-mipmapMode-04770
  If a VkSampler created with mipmapMode equal to VK_SAMPLER_MIPMAP_MODE_LINEAR and compareEnable equal to VK_FALSE is used to sample a VkImageView as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_SAMPLED_IMAGE_FILTER_LINEAR_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06479
  If a VkImageView is sampled with depth comparison, the image view's format features must contain VK_FORMAT_FEATURE_2_SAMPLED_IMAGE_DEPTH_COMPARISON_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02691
  If a VkImageView is accessed using atomic operations as a result of this command, then the image view's format features must contain VK_FORMAT_FEATURE_STORAGE_IMAGE_ATOMIC_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubic-02694
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT as a result of this command must have a VkImageViewType and format that supports cubic filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubic returned by vkGetPhysicalDeviceImageFormatProperties2.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-filterCubicMinmax-02695
  Any VkImageView being sampled with VK_FILTER_CUBIC_EXT with a reduction mode of either VK_SAMPLER_REDUCTION_MODE_MIN or VK_SAMPLER_REDUCTION_MODE_MAX as a result of this command must have a VkImageViewType and format that supports cubic filtering together with minmax filtering, as specified by VkFilterCubicImageViewImageFormatPropertiesEXT::filterCubicMinmax returned by vkGetPhysicalDeviceImageFormatProperties2.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-flags-02696
  Any VkImage created with a VkImageCreateInfo::flags containing VK_IMAGE_CREATE_CORNER_SAMPLED_BIT_NV sampled as a result of this command must only be sampled using a VkSamplerAddressMode of VK_SAMPLER_ADDRESS_MODE_CLAMP_TO_EDGE.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-06423
  Any VkImageView or VkBufferView being written as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_WRITE_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpTypeImage-06424
  Any VkImageView or VkBufferView being read as a storage image or storage texel buffer where the image format field of the OpTypeImage is Unknown then the view's format feature must contain VK_FORMAT_FEATURE_2_STORAGE_READ_WITHOUT_FORMAT_BIT.

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02697
  For each set $n$ that is statically used by the VkPipeline bound to the pipeline bind point used by this command, a descriptor set must have been bound to $n$ at the same pipeline.
bind point, with a *VkPipelineLayout* that is compatible for set \( n \), with the *VkPipelineLayout* used to create the current *VkPipeline*, as described in *Pipeline Layout Compatibility*

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-maintenance4-06425*
  If the *maintenance4* feature is not enabled, then for each push constant that is statically used by the *VkPipeline* bound to the pipeline bind point used by this command, a push constant value **must** have been set for the same pipeline bind point, with a *VkPipelineLayout* that is compatible for push constants, with the *VkPipelineLayout* used to create the current *VkPipeline*, as described in *Pipeline Layout Compatibility*

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02699*
  Descriptors in each bound descriptor set, specified via `vkCmdBindDescriptorSets`, **must** be valid if they are statically used by the *VkPipeline* bound to the pipeline bind point used by this command

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02700*
  A valid pipeline **must** be bound to the pipeline bind point used by this command

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02701*
  If the *VkPipeline* object bound to the pipeline bind point used by this command requires any dynamic state, that state **must** have been set or inherited (if the *VK_NV_inherited_viewport_scissor* extension is enabled) for `commandBuffer`, and done so after any previously bound pipeline with the corresponding state not specified as dynamic

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02859*
  There **must** not have been any calls to dynamic state setting commands for any state not specified as dynamic in the *VkPipeline* object bound to the pipeline bind point used by this command, since that pipeline was bound

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02702*
  If the *VkPipeline* object bound to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used to sample from any *VkImage* with a *VkImageView* of the type *VK_IMAGE_VIEW_TYPE_3D, VK_IMAGE_VIEW_TYPE_CUBE, VK_IMAGE_VIEW_TYPE_1D_ARRAY, VK_IMAGE_VIEW_TYPE_2D_ARRAY* or *VK_IMAGE_VIEW_TYPE_CUBE_ARRAY*, in any shader stage

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02703*
  If the *VkPipeline* object bound to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V *OpImageSample* or *OpImageSparseSample* instructions with *ImplicitLod, Dref* or *Proj* in their name, in any shader stage

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02704*
  If the *VkPipeline* object bound to the pipeline bind point used by this command accesses a *VkSampler* object that uses unnormalized coordinates, that sampler **must** not be used with any of the SPIR-V *OpImageSample* or *OpImageSparseSample* instructions that includes a LOD bias or any offset values, in any shader stage

- *VUID-vkCmdDrawMeshTasksIndirectCountNV-uniformBuffers-06935*
  If any stage of the *VkPipeline* object bound to the pipeline bind point used by this command accesses a uniform buffer, and that stage was created without enabling either *VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT* or
and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCountNV-storageBuffers-06936
If any stage of the VkPipeline object bound to the pipeline bind point used by this command accesses a storage buffer, and that stage was created without enabling either VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_EXT or VK_PIPELINE_ROBUSTNESS_BUFFER_BEHAVIOR_ROBUST_BUFFER_ACCESS_2_EXT for storageBuffers, and the robustBufferAccess feature is not enabled, that stage must not access values outside of the range of the buffer as specified in the descriptor set bound to the same pipeline bind point

- VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02707
If commandBuffer is an unprotected command buffer and protectedNoFault is not supported, any resource accessed by the VkPipeline object bound to the pipeline bind point used by this command must not be a protected resource

- VUID-vkCmdDrawMeshTasksIndirectCountNV-ConstOffset-06551
If the VkPipeline object bound to the pipeline bind point used by this command accesses a VkSampler or VkImageView object that enables sampler YCbCr conversion, that object must not use the ConstOffset and Offset operands

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04115
If a VkImageView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the image view's format

- VUID-vkCmdDrawMeshTasksIndirectCountNV-OpImageWrite-04469
If a VkBufferView is accessed using OpImageWrite as a result of this command, then the Type of the Texel operand of that instruction must have at least as many components as the buffer view's format

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04470
If a VkImageView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04471
If a VkImageView with a VkFormat that has a component width less than 64-bit is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 32

- VUID-vkCmdDrawMeshTasksIndirectCountNV-SampledType-04472
If a VkBufferView with a VkFormat that has a 64-bit component width is accessed as a result of this command, the SampledType of the OpTypeImage operand of that instruction must have a Width of 64
If a `VkBufferView` with a `VkFormat` that has a component width less than 64-bit is accessed as a result of this command, the `SampledType` of the `OpTypeImage` operand of that instruction must have a width of 32.

If the `sparseImageInt64Atomics` feature is not enabled, `VkImage` objects created with the `VK_IMAGE_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a width of 64 by this command.

If the `sparseImageInt64Atomics` feature is not enabled, `VkBuffer` objects created with the `VK_BUFFER_CREATE_SPARSE_RESIDENCY_BIT` flag must not be accessed by atomic instructions through an `OpTypeImage` with a `SampledType` with a width of 64 by this command.

If `OpImageWeightedSampleQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_SAMPLED_IMAGE_BIT_QCOM`.

If `OpImageWeightedSampleQCOM` uses a `VkImageView` as a sample weight image as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_WEIGHT_IMAGE_BIT_QCOM`.

If `OpImageBoxFilterQCOM` is used to sample a `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BOX_FILTER_SAMPLED_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSADQCOM` is used to read from an `VkImageView` as a result of this command, then the image view's format features must contain `VK_FORMAT_FEATURE_2_BLOCK_MATCHING_BIT_QCOM`.

If `OpImageBlockMatchSSDQCOM` or `OpImageBlockMatchSADQCOM` is used to read from a reference image as result of this command, then the specified reference coordinates must not fail integer texel coordinate validation.

If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must have been created with `VK_SAMPLER_CREATE_IMAGE_PROCESSING_BIT_QCOM`. If any command other than `OpImageWeightedSampleQCOM`, `OpImageBoxFilterQCOM`, `OpImageBlockMatchSSDQCOM`, or `OpImageBlockMatchSADQCOM` uses a `VkSampler` as a result of this command, then the sampler must not have been created with...
• VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-02684
  The current render pass must be compatible with the renderPass member of the 
  VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to 
  VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawMeshTasksIndirectCountNV-subpass-02685
  The subpass index of the current render pass must be equal to the subpass member of the 
  VkGraphicsPipelineCreateInfo structure specified when creating the VkPipeline bound to 
  VK_PIPELINE_BIND_POINT_GRAPHICS

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-02686
  Every input attachment used by the current subpass must be bound to the pipeline via a 
  descriptor set

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06537
  Memory backing image subresources used as attachments in the current render pass must not be written in any way other than as an attachment by this command

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06538
  If any recorded command in the current subpass will write to an image subresource as an attachment, this command must not read from the memory backing that image subresource in any other way than as an attachment

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06539
  If any recorded command in the current subpass will read from an image subresource used as an attachment in any way other than as an attachment, this command must not write to that image subresource as an attachment

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06886
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the depth aspect, depth writes must be disabled

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06887
  If the current render pass instance uses a depth/stencil attachment with a read-only layout for the stencil aspect and stencil test is enabled, all stencil ops must be VK_STENCIL_OP_KEEP

• VUID-vkCmdDrawMeshTasksIndirectCountNV-maxMultiviewInstanceIndex-02688
  If the draw is recorded in a render pass instance with multiview enabled, the maximum instance index must be less than or equal to VkPhysicalDeviceMultiviewProperties::maxMultiviewInstanceIndex

• VUID-vkCmdDrawMeshTasksIndirectCountNV-sampleLocationsEnable-02689
  If the bound graphics pipeline was created with VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable set to VK_TRUE and the current subpass has a depth/stencil attachment, then that attachment must have been created with the VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT bit set

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-06666
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT dynamic state enabled then vkCmdSetSampleLocationsEXT must have been called in the current command buffer
prior to this drawing command

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03417**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, then `vkCmdSetViewportWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `VkPipelineViewportStateCreateInfo::viewportCount` of the pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-scissorCount-03418**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, then `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `scissorCount` parameter of `vkCmdSetScissorWithCount` must match the `VkPipelineViewportStateCreateInfo::scissorCount` of the pipeline.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-03419**
  If the bound graphics pipeline state was created with both the `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic states enabled then both `vkCmdSetViewportWithCount` and `vkCmdSetScissorWithCount` must have been called in the current command buffer prior to this drawing command, and the `viewportCount` parameter of `vkCmdSetViewportWithCount` must match the `scissorCount` parameter of `vkCmdSetScissorWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04137**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportWScalingStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04138**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` and `VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV` dynamic states enabled then the `viewportCount` parameter in the last call to `vkCmdSetViewportWScalingNV` must be greater than or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04139**
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` dynamic state enabled, but not the `VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV` dynamic state enabled, then the bound graphics pipeline must have been created with `VkPipelineViewportShadingRateImageStateCreateInfoNV::viewportCount` greater or equal to the `viewportCount` parameter in the last call to `vkCmdSetViewportWithCount`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewportCount-04140**
  If the bound graphics pipeline state was created with the...
VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT and VK_DYNAMIC_STATE_VIEWPORT_SHADING_RATE_PALETTE_NV dynamic states enabled then the viewportCount parameter in the last call to vkCmdSetViewportShadingRatePaletteNV must be greater than or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04141
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportSwizzleStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportSwizzleStateCreateInfoNV::viewportCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectCountNV-VkPipelineViewportCreateInfo-04142
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled and a VkPipelineViewportExclusiveScissorStateCreateInfoNV structure chained from VkPipelineViewportCreateInfo, then the bound graphics pipeline must have been created with VkPipelineViewportExclusiveScissorStateCreateInfoNV::exclusiveScissorCount greater or equal to the viewportCount parameter in the last call to vkCmdSetViewportWithCount

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04876
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_RASTERIZER_DISCARD_ENABLE dynamic state enabled then vkCmdSetRasterizerDiscardEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04877
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE dynamic state enabled then vkCmdSetDepthBiasEnable must have been called in the current command buffer prior to this drawing command

- VUID-vkCmdDrawMeshTasksIndirectCountNV-logicOp-04878
  If the bound graphics pipeline state was created with the VK_DYNAMIC_STATE_LOGIC_OP_EXT dynamic state enabled then vkCmdSetLogicOpEXT must have been called in the current command buffer prior to this drawing command and the logicOp must be a valid VkLogicOp value

- VUID-vkCmdDrawMeshTasksIndirectCountNV-primitiveFragmentShadingRateWithMultipleViewports-04552
  If the primitiveFragmentShadingRateWithMultipleViewports limit is not supported, the bound graphics pipeline was created with the VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT dynamic state enabled, and any of the shader stages of the bound graphics pipeline write to the PrimitiveShadingRateKHR built-in, then vkCmdSetViewportWithCount must have been called in the current command buffer prior to this drawing command, and the viewportCount parameter of vkCmdSetViewportWithCount must be 1

- VUID-vkCmdDrawMeshTasksIndirectCountNV-blendEnable-04727
  If rasterization is not disabled in the bound graphics pipeline, then for each color
attachment in the subpass, if the corresponding image view’s format features do not contain \texttt{VK\_FORMAT\_FEATURE\_COLOR\_ATTACHMENT\_BLEND\_BIT}, then the blendEnable member of the corresponding element of the \texttt{pAttachments} member of \texttt{pColorBlendState} must be \texttt{VK\_FALSE}.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-rasterizationSamples-04740**
  If rasterization is not disabled in the bound graphics pipeline, and neither the \texttt{VK\_AMD\_mixed\_attachment\_samples} nor the \texttt{VK\_NV\_framebuffer\_mixed\_samples} extensions are enabled, then \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples} must be the same as the current subpass color and/or depth/stencil attachments.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06172**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_READ\_ONLY\_OPTIMAL}, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06173**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_STENCIL\_READ\_ONLY\_OPTIMAL}, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06174**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_STENCIL\_ATTACHMENT\_OPTIMAL}, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06175**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_ATTACHMENT\_STENCIL\_READ\_ONLY\_OPTIMAL}, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06176**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pDepthAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pDepthAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_DEPTH\_READ\_ONLY\_OPTIMAL}, this command must not write any values to the depth attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06177**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the \texttt{imageView} member of \texttt{pStencilAttachment} is not \texttt{VK\_NULL\_HANDLE}, and the \texttt{layout} member of \texttt{pStencilAttachment} is \texttt{VK\_IMAGE\_LAYOUT\_STENCIL\_READ\_ONLY\_OPTIMAL}, this command must not write any values to the stencil attachment.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-viewMask-06178**
  If the current render pass instance was begun with \texttt{vkCmdBeginRendering}, the currently bound graphics pipeline must have been created with a \texttt{VkPipelineRenderingCreateInfo::viewMask} equal to \texttt{VkRenderingInfo::viewMask}.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06179**
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound graphics pipeline must have been created with a `VkPipelineRenderingCreateInfo::colorAttachmentCount` equal to `VkRenderingInfo::colorAttachmentCount`

- VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06180
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::colorAttachmentCount` greater than 0, then each element of the `VkRenderingInfo::pColorAttachments` array with a `imageView` not equal to `VK_NULL_HANDLE` must have been created with a `VkFormat` equal to the corresponding element of `VkPipelineRenderingCreateInfo::pColorAttachmentFormats` used to create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-attachmentCount-06667
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be greater than or equal to the `VkPipelineColorBlendStateCreateInfo::attachmentCount` of the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-attachmentCount-06815
  If the bound graphics pipeline state was created with the `VK_DYNAMIC_STATE_COLOR_WRITE_ENABLE_EXT` dynamic state enabled then `vkCmdSetColorWriteEnableEXT` must have been called in the current command buffer prior to this drawing command, and the `attachmentCount` parameter of `vkCmdSetColorWriteEnableEXT` must be less than or equal to the `maxColorAttachments` member of `VkPhysicalDeviceLimits`

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pDepthAttachment-06181
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pDepthAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::depthAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pDepthAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pStencilAttachment-06182
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineRenderingCreateInfo::stencilAttachmentFormat` used to create the currently bound graphics pipeline must be equal to the `VkFormat` used to create `VkRenderingInfo::pStencilAttachment->imageView`

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06183
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentShadingRateAttachmentInfoKHR::imageView` was not `VK_NULL_HANDLE`, the currently bound graphics pipeline must have been created with `VK_PIPELINE_CREATE_RENDERING_FRAGMENT_SHADING_RATE_ATTACHMENT_BIT_KHR`

- VUID-vkCmdDrawMeshTasksIndirectCountNV-imageView-06184
  If the current render pass instance was begun with `vkCmdBeginRendering` and `VkRenderingFragmentDensityMapAttachmentInfoEXT::imageView` was not

VK_NULL_HANDLE, the currently bound graphics pipeline must have been created with 
VK_PIPELINE_CREATE_RENDERING_FRAGMENT_DENSITY_MAP_ATTACHMENT_BIT_EXT

- VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06185
  If the currently bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and the current render pass instance was 
  begun with vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount 
  parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments 
  array with a imageView not equal to VK_NULL_HANDLE must have been created with a 
  sample count equal to the corresponding element of the pColorAttachmentSamples member 
  of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV used to 
  create the currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pDepthAttachment-06186
  If the current render pass instance was begun with vkCmdBeginRendering, the currently 
  bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView 
  was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples 
  member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV 
  used to create the currently bound graphics pipeline must be equal to the sample count 
  used to create VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pStencilAttachment-06187
  If the current render pass instance was begun with vkCmdBeginRendering, the currently 
  bound pipeline was created with a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pStencilAttachment->imageView 
  was not VK_NULL_HANDLE, the value of the depthStencilAttachmentSamples 
  member of VkAttachmentSampleCountInfoAMD or VkAttachmentSampleCountInfoNV 
  used to create the currently bound graphics pipeline must be equal to the sample count 
  used to create VkRenderingInfo::pStencilAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountNV-colorAttachmentCount-06188
  If the currently bound pipeline was created without a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and the current render pass instance was begun with 
  vkCmdBeginRendering with a VkRenderingInfo::colorAttachmentCount 
  parameter greater than 0, then each element of the VkRenderingInfo::pColorAttachments 
  array with a imageView not equal to VK_NULL_HANDLE must have been created with a sample count 
  equal to the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used to create the 
  currently bound graphics pipeline

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pDepthAttachment-06189
  If the current render pass instance was begun with vkCmdBeginRendering, the currently 
  bound pipeline was created without a VkAttachmentSampleCountInfoAMD or 
  VkAttachmentSampleCountInfoNV structure, and VkRenderingInfo::pDepthAttachment->imageView 
  was not VK_NULL_HANDLE, the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples used 
  to create the currently bound graphics pipeline must be equal to the sample count used to create 
  VkRenderingInfo::pDepthAttachment->imageView

- VUID-vkCmdDrawMeshTasksIndirectCountNV-pStencilAttachment-06190
If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline was created without a `VkAttachmentSampleCountInfoAMD` or `VkAttachmentSampleCountInfoNV` structure, and `VkRenderingInfo::pStencilAttachment->imageView` was not `VK_NULL_HANDLE`, the value of `VkPipelineMultisampleStateCreateInfo::rasterizationSamples` used to create the currently bound graphics pipeline **must** be equal to the sample count used to create `VkRenderingInfo::pStencilAttachment->imageView`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-renderPass-06198**
  If the current render pass instance was begun with `vkCmdBeginRendering`, the currently bound pipeline **must** have been created with a `VkGraphicsPipelineCreateInfo::renderPass` equal to `VK_NULL_HANDLE`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitivesGeneratedQueryWithRast-06708**
  If the `primitivesGeneratedQueryWithRasterizerDiscard` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, **rasterization discard must not be enabled**.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-primitivesGenera-06709**
  If the `primitivesGeneratedQueryWithNonZeroStreams` feature is not enabled and the `VK_QUERY_TYPE_PRIMITIVES_GENERATED_EXT` query is active, the bound graphics pipeline **must** not have been created with a non-zero value in `VkPipelineRasterizationStateStreamCreateInfoEXT::rasterizationStream`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-stage-06480**
  The bound graphics pipeline **must** not have been created with the `VkPipelineShaderStageCreateInfo::stage` member of an element of `VkGraphicsPipelineCreateInfo::pStages` set to `VK_SHADER_STAGE_VERTEX_BIT`, `VK_SHADER_STAGE_TESSELLATION_CONTROL_BIT`, `VK_SHADER_STAGE_TESSELLATION_EVALUATION_BIT` or `VK_SHADER_STAGE_GEOMETRY_BIT`.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02708**
  If `buffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-02709**
  `buffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-offset-02710**
  `offset` **must** be a multiple of 4.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-02711**
  `commandBuffer` **must** not be a protected command buffer.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02714**
  If `countBuffer` is non-sparse then it **must** be bound completely and contiguously to a single `VkDeviceMemory` object.

- **VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02715**
  `countBuffer` **must** have been created with the `VK_BUFFER_USAGE_INDIRECT_BUFFER_BIT` bit set.
• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-02716
countBufferOffset must be a multiple of 4

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02717
The count stored in countBuffer must be less than or equal to VkPhysicalDeviceLimits::maxDrawIndirectCount

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBufferOffset-04129
(countBufferOffset + sizeof(uint32_t)) must be less than or equal to the size of countBuffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-None-04445
If drawIndirectCount is not enabled this function must not be used

• VUID-vkCmdDrawMeshTasksIndirectCountNV-stride-02182
stride must be a multiple of 4 and must be greater than or equal to sizeof (VkDrawMeshTasksIndirectCommandNV)

• VUID-vkCmdDrawMeshTasksIndirectCountNV-maxDrawCount-02183
If maxDrawCount is greater than or equal to 1, (stride × (maxDrawCount - 1) + offset + sizeof (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02191
If the count stored in countBuffer is equal to 1, (offset + sizeof (VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-02192
If the count stored in countBuffer is greater than 1, (stride × (drawCount - 1) + offset + sizeof(VkDrawMeshTasksIndirectCommandNV)) must be less than or equal to the size of buffer

Valid Usage (Implicit)

• VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdDrawMeshTasksIndirectCountNV-buffer-parameter
buffer must be a valid VkBuffer handle

• VUID-vkCmdDrawMeshTasksIndirectCountNV-countBuffer-parameter
countBuffer must be a valid VkBuffer handle

• VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdDrawMeshTasksIndirectCountNV-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdDrawMeshTasksIndirectCountNV-renderpass
This command must only be called inside of a render pass instance

• VUID-vkCmdDrawMeshTasksIndirectCountNV-videocoding
This command must only be called outside of a video coding scope

• VUID-vkCmdDrawMeshTasksIndirectCountNV-commonparent
Each of buffer, commandBuffer, and countBuffer must have been created, allocated, or
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

Chapter 22. Fixed-Function Vertex Processing

Vertex fetching is controlled via configurable state, as a logically distinct graphics pipeline stage.

22.1. Vertex Attributes

Vertex shaders can define input variables, which receive vertex attribute data transferred from one or more VkBuffer(s) by drawing commands. Vertex shader input variables are bound to buffers via an indirect binding where the vertex shader associates a vertex input attribute number with each variable, vertex input attributes are associated to vertex input bindings on a per-pipeline basis, and vertex input bindings are associated with specific buffers on a per-draw basis via the vkCmdBindVertexBuffers command. Vertex input attribute and vertex input binding descriptions also contain format information controlling how data is extracted from buffer memory and converted to the format expected by the vertex shader.

There are VkPhysicalDeviceLimits::maxVertexInputAttributes number of vertex input attributes and VkPhysicalDeviceLimits::maxVertexInputBindings number of vertex input bindings (each referred to by zero-based indices), where there are at least as many vertex input attributes as there are vertex input bindings. Applications can store multiple vertex input attributes interleaved in a single buffer, and use a single vertex input binding to access those attributes.

In GLSL, vertex shaders associate input variables with a vertex input attribute number using the location layout qualifier. The component layout qualifier associates components of a vertex shader input variable with components of a vertex input attribute.

**GLSL example**

```glsl
// Assign location M to variableName
layout (location=M, component=2) in vec2 variableName;

// Assign locations [N,N+L) to the array elements of variableNameArray
layout (location=N) in vec4 variableNameArray[L];
```

In SPIR-V, vertex shaders associate input variables with a vertex input attribute number using the Location decoration. The Component decoration associates components of a vertex shader input variable with components of a vertex input attribute. The Location and Component decorations are specified via the OpDecorate instruction.

**SPIR-V example**

```assembly
... %1 = OpExtInstImport "GLSL.std.450"
...
OpName %9 "variableName"
OpName %15 "variableNameArray"
OpDecorate %18 BuiltIn VertexIndex
```
22.1.1. Attribute Location and Component Assignment

Vertex shaders allow Location and Component decorations on input variable declarations. The Location decoration specifies which vertex input attribute is used to read and interpret the data that a variable will consume. The Component decoration allows the location to be more finely specified for scalars and vectors, down to the individual components within a location that are consumed. The components within a location are 0, 1, 2, and 3. A variable starting at component N will consume components N, N+1, N+2, ... up through its size. For single precision types, it is invalid if the sequence of components gets larger than 3.

When a vertex shader input variable declared using a 16- or 32-bit scalar or vector data type is assigned a location, its value(s) are taken from the components of the input attribute specified with the corresponding VkVertexInputAttributeDescription::location. The components used depend on the type of variable and the Component decoration specified in the variable declaration, as identified in Input attribute components accessed by 16-bit and 32-bit input variables. Any 16-bit or 32-bit scalar or vector input will consume a single location. For 16-bit and 32-bit data types, missing components are filled in with default values as described below.

Table 30. Input attribute components accessed by 16-bit and 32-bit input variables

<table>
<thead>
<tr>
<th>16-bit or 32-bit data type</th>
<th>Component decoration</th>
<th>Components consumed</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>three-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, z, o)</td>
</tr>
<tr>
<td>three-component vector</td>
<td>1</td>
<td>(o, y, z, w)</td>
</tr>
<tr>
<td>four-component vector</td>
<td>0 or unspecified</td>
<td>(x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input format (if present), or the default value.

When a vertex shader input variable declared using a 32-bit floating point matrix type is assigned a location \(i\), its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. Such matrices are treated as an array of column vectors with values taken from the input attributes identified in Input attributes accessed by 32-bit input matrix variables. The `VkVertexInputAttributeDescription::format` must be specified with a `VkFormat` that corresponds to the appropriate type of column vector. The `Component` decoration must not be used with matrix types.

**Table 31. Input attributes accessed by 32-bit input matrix variables**

<table>
<thead>
<tr>

<td>(x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat3x4</td>
<td>four-component vector</td>
<td>i, i+1, i+2</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
<tr>
<td>mat4x2</td>
<td>two-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, o, o), (x, y, o, o), (x, y, o, o), (x, y, o, o)</td>
</tr>
<tr>
<td>mat4x3</td>
<td>three-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, o), (x, y, z, o), (x, y, z, o), (x, y, z, o)</td>
</tr>
<tr>
<td>mat4</td>
<td>four-component vector</td>
<td>i, i+1, i+2, i+3</td>
<td>(x, y, z, w), (x, y, z, w), (x, y, z, w), (x, y, z, w)</td>
</tr>
</tbody>
</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute, and if used, are either filled with the corresponding component from the input (if present), or the default value.
When a vertex shader input variable declared using a scalar or vector 64-bit data type is assigned a location \( i \), its values are taken from consecutive input attributes starting with the corresponding \texttt{VkVertexInputAttributeDescription::location}. The locations and components used depend on the type of variable and the \texttt{Component} decoration specified in the variable declaration, as identified in \textit{Input attribute locations and components accessed by 64-bit input variables}. For 64-bit data types, no default attribute values are provided. Input variables \textbf{must} not use more components than provided by the attribute. Input attributes which have one- or two-component 64-bit formats will consume a single location. Input attributes which have three- or four-component 64-bit formats will consume two consecutive locations. A 64-bit scalar data type will consume two components, and a 64-bit two-component vector data type will consume all four components available within a location. A three- or four-component 64-bit data type \textbf{must} not specify a component. A three-component 64-bit data type will consume all four components of the first location and components 0 and 1 of the second location. This leaves components 2 and 3 available for other component-qualified declarations. A four-component 64-bit data type will consume all four components of the first location and all four components of the second location. It is invalid for a scalar or two-component 64-bit data type to specify a component of 1 or 3.

</table>

Components indicated by “o” are available for use by other input variables which are sourced from the same attribute. Components indicated by “-” are not available for input variables as there are no default values provided for 64-bit data types, and there is no data provided by the input format.

When a vertex shader input variable declared using a 64-bit floating-point matrix type is assigned a location $i$, its values are taken from consecutive input attribute locations. Such matrices are treated as an array of column vectors with values taken from the input attributes as shown in **Input attribute locations and components accessed by 64-bit input variables**. Each column vector starts at the location immediately following the last location of the previous column vector. The number of attributes and components assigned to each matrix is determined by the matrix dimensions and ranges from two to eight locations.

When a vertex shader input variable declared using an array type is assigned a location, its values are taken from consecutive input attributes starting with the corresponding `VkVertexInputAttributeDescription::location`. The number of attributes and components assigned to each element are determined according to the data type of the array elements and Component decoration (if any) specified in the declaration of the array, as described above. Each element of the array, in order, is assigned to consecutive locations, but all at the same specified component within each location.

Only input variables declared with the data types and component decorations as specified above are supported. **Location aliasing** is causing two variables to have the same location number. **Component aliasing** is assigning the same (or overlapping) component number for two location aliases. Location aliasing is allowed only if it does not cause component aliasing. Further, when
location aliasing, the aliases sharing the location **must** all have the same SPIR-V floating-point component type or all have the same width integer-type components.

## 22.2. Vertex Input Description

Applications specify vertex input attribute and vertex input binding descriptions as part of graphics pipeline creation by setting the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer to a `VkPipelineVertexInputStateCreateInfo` structure. Alternatively, if the graphics pipeline is created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` dynamic state enabled, then the vertex input attribute and vertex input binding descriptions are specified dynamically with `vkCmdSetVertexInputEXT`, and the `VkGraphicsPipelineCreateInfo::pVertexInputState` pointer is ignored.

The `VkPipelineVertexInputStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineVertexInputStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineVertexInputStateCreateFlags flags;
    uint32_t vertexBindingDescriptionCount;
    const VkVertexInputBindingDescription* pVertexBindingDescriptions;
    uint32_t vertexAttributeDescriptionCount;
    const VkVertexInputAttributeDescription* pVertexAttributeDescriptions;
} VkPipelineVertexInputStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **vertexBindingDescriptionCount** is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
- **pVertexBindingDescriptions** is a pointer to an array of `VkVertexInputBindingDescription` structures.
- **vertexAttributeDescriptionCount** is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
- **pVertexAttributeDescriptions** is a pointer to an array of `VkVertexInputAttributeDescription` structures.

### Valid Usage

- VUID-VkPipelineVertexInputStateCreateInfo-vertexBindingDescriptionCount-00613 `vertexBindingDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
- VUID-VkPipelineVertexInputStateCreateInfo-vertexAttributeDescriptionCount-00614 `vertexAttributeDescriptionCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`
maxVertexInputAttributes

- **VUID-VkPipelineVertexInputStateCreateInfo-binding-00615**
  For every binding specified by each element of pVertexAttributeDescriptions, a VkVertexInputBindingDescription must exist in pVertexBindingDescriptions with the same value of binding.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-00616**
  All elements of pVertexBindingDescriptions must describe distinct binding numbers.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-00617**
  All elements of pVertexAttributeDescriptions must describe distinct attribute locations.

### Valid Usage (Implicit)

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_STATE_CREATE_INFO.

- **VUID-VkPipelineVertexInputStateCreateInfo-pNext-pNext**
  pNext must be NULL or a pointer to a valid instance of VkPipelineVertexInputDivisorStateCreateInfoEXT.

- **VUID-VkPipelineVertexInputStateCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique.

- **VUID-VkPipelineVertexInputStateCreateInfo-flags-zerobitmask**
  flags must be 0.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexBindingDescriptions-parameter**
  If vertexBindingDescriptionCount is not 0, pVertexBindingDescriptions must be a valid pointer to an array of vertexBindingDescriptionCount valid VkVertexInputBindingDescription structures.

- **VUID-VkPipelineVertexInputStateCreateInfo-pVertexAttributeDescriptions-parameter**
  If vertexAttributeDescriptionCount is not 0, pVertexAttributeDescriptions must be a valid pointer to an array of vertexAttributeDescriptionCount valid VkVertexInputAttributeDescription structures.

---

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineVertexInputStateCreateFlags;
```

VkPipelineVertexInputStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

Each vertex input binding is specified by the VkVertexInputBindingDescription structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputBindingDescription {
    uint32_t binding;
    uint32_t stride;
}
```
VkVertexInputRate inputRate;
} VkVertexInputBindingDescription;

- `binding` is the binding number that this structure describes.
- `stride` is the byte stride between consecutive elements within the buffer.
- `inputRate` is a `VkVertexInputRate` value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.

### Valid Usage

- **VUID-VkVertexInputBindingDescription-binding-00618**
  `binding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`
- **VUID-VkVertexInputBindingDescription-stride-00619**
  `stride` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`
- **VUID-VkVertexInputBindingDescription-stride-04456**
  If the `VK_KHR_portability_subset` extension is enabled, `stride` must be a multiple of, and at least as large as, `VkPhysicalDevicePortabilitySubsetPropertiesKHR::minVertexInputBindingStrideAlignment`

### Valid Usage (Implicit)

- **VUID-VkVertexInputBindingDescription-inputRate-parameter**
  `inputRate` must be a valid `VkVertexInputRate` value

Possible values of `VkVertexInputBindingDescription::inputRate`, specifying the rate at which vertex attributes are pulled from buffers, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkVertexInputRate {
    VK_VERTEX_INPUT_RATE_VERTEX = 0,
    VK_VERTEX_INPUT_RATE_INSTANCE = 1,
} VkVertexInputRate;
```

- `VK_VERTEX_INPUT_RATE_VERTEX` specifies that vertex attribute addressing is a function of the vertex index.
- `VK_VERTEX_INPUT_RATE_INSTANCE` specifies that vertex attribute addressing is a function of the instance index.

Each vertex input attribute is specified by the `VkVertexInputAttributeDescription` structure, defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkVertexInputAttributeDescription {
```
uint32_t location;
uint32_t binding;
VkFormat format;
uint32_t offset;
} VkVertexInputAttributeDescription;

- **location** is the shader input location number for this attribute.
- **binding** is the binding number which this attribute takes its data from.
- **format** is the size and type of the vertex attribute data.
- **offset** is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- **VUID-VkVertexInputAttributeDescription-location-00620**

  location must be less than VkPhysicalDeviceLimits::maxVertexInputAttributes

- **VUID-VkVertexInputAttributeDescription-binding-00621**

  binding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- **VUID-VkVertexInputAttributeDescription-offset-00622**

  offset must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputAttributeOffset

- **VUID-VkVertexInputAttributeDescription-format-00623**

  format must be allowed as a vertex buffer format, as specified by the VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT flag in VkFormatProperties::bufferFeatures returned by vkGetPhysicalDeviceFormatProperties

- **VUID-VkVertexInputAttributeDescription-vertexAttributeAccessBeyondStride-04457**

  If the VK_KHR_portability_subset extension is enabled, and VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride is VK_FALSE, the sum of offset plus the size of the vertex attribute data described by format must not be greater than stride in the VkVertexInputBindingDescription referenced in binding

### Valid Usage (Implicit)

- **VUID-VkVertexInputAttributeDescription-format-parameter**

  format must be a valid VkFormat value

To **dynamically set** the vertex input attribute and vertex input binding descriptions, call:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
void vkCmdSetVertexInputEXT(
    VkCommandBuffer commandBuffer,
    uint32_t vertexBindingDescriptionCount,
```

1616
const VkVertexInputBindingDescription2EXT* pVertexBindingDescriptions, uint32_t vertexAttributeDescriptionCount, const VkVertexInputAttributeDescription2EXT* pVertexAttributeDescriptions);

• `commandBuffer` is the command buffer into which the command will be recorded.
• `vertexBindingDescriptionCount` is the number of vertex binding descriptions provided in `pVertexBindingDescriptions`.
• `pVertexBindingDescriptions` is a pointer to an array of `VkVertexInputBindingDescription2EXT` structures.
• `vertexAttributeDescriptionCount` is the number of vertex attribute descriptions provided in `pVertexAttributeDescriptions`.
• `pVertexAttributeDescriptions` is a pointer to an array of `VkVertexInputAttributeDescription2EXT` structures.

This command sets the vertex input attribute and vertex input binding descriptions state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VERTEX_INPUT_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the ` VkGraphicsPipelineCreateInfo::pVertexInputState` values used to create the currently active pipeline.

If the bound pipeline state object was also created with the `VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE` dynamic state enabled, then `vkCmdBindVertexBuffers2` can be used instead of `vkCmdSetVertexInputEXT` to dynamically set the stride.

**Valid Usage**

- VUID-vkCmdSetVertexInputEXT-None-04790
  The `vertexInputDynamicState` feature **must** be enabled

- VUID-vkCmdSetVertexInputEXT-vertexBindingDescriptionCount-04791
  `vertexBindingDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdSetVertexInputEXT-vertexAttributeDescriptionCount-04792
  `vertexAttributeDescriptionCount` **must** be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputAttributes`

- VUID-vkCmdSetVertexInputEXT-binding-04793
  For every binding specified by each element of `pVertexAttributeDescriptions`, a `VkVertexInputBindingDescription2EXT` **must** exist in `pVertexBindingDescriptions` with the same value of binding

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-04794
  All elements of `pVertexBindingDescriptions` **must** describe distinct binding numbers

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-04795
  All elements of `pVertexAttributeDescriptions` **must** describe distinct attribute locations
Valid Usage (Implicit)

- VUID-vkCmdSetVertexInputEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetVertexInputEXT-pVertexBindingDescriptions-parameter
  If `vertexBindingDescriptionCount` is not 0, `pVertexBindingDescriptions` must be a valid
  pointer to an array of `vertexBindingDescriptionCount` valid `VkVertexInputBindingDescription2EXT`
  structures

- VUID-vkCmdSetVertexInputEXT-pVertexAttributeDescriptions-parameter
  If `vertexAttributeDescriptionCount` is not 0, `pVertexAttributeDescriptions` must be a valid
  pointer to an array of `vertexAttributeDescriptionCount` valid `VkVertexInputAttributeDescription2EXT`
  structures

- VUID-vkCmdSetVertexInputEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetVertexInputEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetVertexInputEXT-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally
  synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

The `VkVertexInputBindingDescription2EXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputBindingDescription2EXT {
    VkStructureType sType;
    void* pNext;
    uint32_t binding;
    uint32_t stride;
} VkVertexInputBindingDescription2EXT;
```
• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• binding is the binding number that this structure describes.
• stride is the byte stride between consecutive elements within the buffer.
• inputRate is a VkVertexInputRate value specifying whether vertex attribute addressing is a function of the vertex index or of the instance index.
• divisor is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. This member can be set to a value other than 1 if the vertexAttributeInstanceRateDivisor feature is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of divisor is implementation-dependent and can be queried using VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT:maxVertexAttribDivisor. A value of 0 can be used for the divisor if the vertexAttributeInstanceRateZeroDivisor feature is enabled. In this case, the same vertex attribute will be applied to all instances.

Valid Usage

• VUID-VkVertexInputBindingDescription2EXT-binding-04796
  binding must be less than VkPhysicalDeviceLimits:maxVertexInputBindings

• VUID-VkVertexInputBindingDescription2EXT-stride-04797
  stride must be less than or equal to VkPhysicalDeviceLimits:maxVertexInputBindingStride

• VUID-VkVertexInputBindingDescription2EXT-divisor-04798
  If the vertexAttributeInstanceRateZeroDivisor feature is not enabled, divisor must not be 0

• VUID-VkVertexInputBindingDescription2EXT-divisor-04799
  If the vertexAttributeInstanceRateDivisor feature is not enabled, divisor must be 1

• VUID-VkVertexInputBindingDescription2EXT-divisor-06226
  divisor must be a value between 0 and VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT:maxVertexAttribDivisor, inclusive

• VUID-VkVertexInputBindingDescription2EXT-divisor-06227
  If divisor is not 1 then inputRate must be of type VK_VERTEX_INPUT_RATE_INSTANCE

Valid Usage (Implicit)

• VUID-VkVertexInputBindingDescription2EXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_VERTEX_INPUT_BINDING_DESCRIPTION_2_EXT

• VUID-VkVertexInputBindingDescription2EXT-inputRate-parameter
  inputRate must be a valid VkVertexInputRate value
The \texttt{VkVertexInputAttributeDescription2EXT} structure is defined as:

```c
// Provided by VK_EXT_vertex_input_dynamic_state
typedef struct VkVertexInputAttributeDescription2EXT {
    VkStructureType sType;
    void*pNext;
    uint32_t location;
    uint32_t binding;
    VkFormat format;
    uint32_t offset;
} VkVertexInputAttributeDescription2EXT;
```

- \texttt{sType} is the type of this structure.
- \texttt{pNext} is \texttt{NULL} or a pointer to a structure extending this structure.
- \texttt{location} is the shader input location number for this attribute.
- \texttt{binding} is the binding number which this attribute takes its data from.
- \texttt{format} is the size and type of the vertex attribute data.
- \texttt{offset} is a byte offset of this attribute relative to the start of an element in the vertex input binding.

### Valid Usage

- VUID-VkVertexInputAttributeDescription2EXT-location-06228
  \texttt{location} must be less than \texttt{VkPhysicalDeviceLimits::maxVertexInputAttributes}
- VUID-VkVertexInputAttributeDescription2EXT-binding-06229
  \texttt{binding} must be less than \texttt{VkPhysicalDeviceLimits::maxVertexInputBindings}
- VUID-VkVertexInputAttributeDescription2EXT-offset-06230
  \texttt{offset} must be less than or equal to \texttt{VkPhysicalDeviceLimits::maxVertexInputAttributeOffset}
- VUID-VkVertexInputAttributeDescription2EXT-format-04805
  \texttt{format} must be allowed as a vertex buffer format, as specified by the \texttt{VK_FORMAT_FEATURE_VERTEX_BUFFER_BIT} flag in \texttt{VkFormatProperties::bufferFeatures} returned by \texttt{vkGetPhysicalDeviceFormatProperties}
- VUID-VkVertexInputAttributeDescription2EXT-vertexAttributeAccessBeyondStride-04806
  If the \texttt{VK_KHR_portability_subset} extension is enabled, and \texttt{VkPhysicalDevicePortabilitySubsetFeaturesKHR::vertexAttributeAccessBeyondStride} is \texttt{VK_FALSE}, the sum of \texttt{offset} plus the size of the vertex attribute data described by \texttt{format} must not be greater than \texttt{stride} in the \texttt{VkVertexInputBindingDescription2EXT} referenced in \texttt{binding}.
Valid Usage (Implicit)

- VUID-VkVertexInputAttributeDescription2EXT-sType-sType
  
  `sType` must be `VK_STRUCTURE_TYPE_VERTEX_INPUT_ATTRIBUTE_DESCRIPTION_2_EXT`

- VUID-VkVertexInputAttributeDescription2EXT-format-parameter
  
  `format` must be a valid `VkFormat` value

To bind vertex buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdBindVertexBuffers(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for i in `[0, bindingCount)`. The vertex input binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the `nullDescriptor` feature is enabled, elements of `pBuffers` can be `VK_NULL_HANDLE`, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is `VK_NULL_HANDLE`, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

Valid Usage

- VUID-vkCmdBindVertexBuffers-firstBinding-00624
  
  `firstBinding` must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-firstBinding-00625
  
  The sum of `firstBinding` and `bindingCount` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindings`

- VUID-vkCmdBindVertexBuffers-pOffsets-00626
  
  All elements of `pOffsets` must be less than the size of the corresponding element in `pBuffers`
• VUID-vkCmdBindVertexBuffers-pBuffers-00627
All elements of pBuffers must have been created with the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

• VUID-vkCmdBindVertexBuffers-pBuffers-00628
Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBindVertexBuffers-pBuffers-04001
If the nullDescriptor feature is not enabled, all elements of pBuffers must not be VK_NULL_HANDLE

• VUID-vkCmdBindVertexBuffers-pBuffers-04002
If an element of pBuffers is VK_NULL_HANDLE, then the corresponding element of pOffsets must be zero

### Valid Usage (Implicit)

• VUID-vkCmdBindVertexBuffers-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindVertexBuffers-pBuffers-parameter
pBuffers must be a valid pointer to an array of bindingCount valid or VK_NULL_HANDLE VkBuffer handles

• VUID-vkCmdBindVertexBuffers-pOffsets-parameter
pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindVertexBuffers-commandBuffer-recording
commandBuffer must be in the recording state

• VUID-vkCmdBindVertexBuffers-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindVertexBuffers-videocoding
This command must only be called outside of a video coding scope

• VUID-vkCmdBindVertexBuffers-bindingCount-arraylength
bindingCount must be greater than 0

• VUID-vkCmdBindVertexBuffers-commonparent
Both of commandBuffer, and the elements of pBuffers that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same VkDevice

### Host Synchronization

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Alternatively, to bind vertex buffers, along with their sizes and strides, to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdBindVertexBuffers2(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdBindVertexBuffers2EXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstBinding,
    uint32_t bindingCount,
    const VkBuffer* pBuffers,
    const VkDeviceSize* pOffsets,
    const VkDeviceSize* pSizes,
    const VkDeviceSize* pStrides);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first vertex input binding whose state is updated by the command.
- `bindingCount` is the number of vertex input bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of the size in bytes of vertex data bound from `pBuffers`.
- `pStrides` is `NULL` or a pointer to an array of buffer strides.

The values taken from elements i of `pBuffers` and `pOffsets` replace the current state for the vertex input binding `firstBinding + i`, for i in [0, `bindingCount`). The vertex input binding is updated to start
at the offset indicated by $p\text{Offsets}[i]$ from the start of the buffer $p\text{Buffers}[i]$. If $p\text{Sizes}$ is not NULL then $p\text{Sizes}[i]$ specifies the bound size of the vertex buffer starting from the corresponding elements of $p\text{Buffers}[i]$ plus $p\text{Offsets}[i]$. All vertex input attributes that use each of these bindings will use these updated addresses in their address calculations for subsequent drawing commands. If the nullDescriptor feature is enabled, elements of $p\text{Buffers}$ can be VK_NULL_HANDLE, and can be used by the vertex shader. If a vertex input attribute is bound to a vertex input binding that is VK_NULL_HANDLE, the values taken from memory are considered to be zero, and missing G, B, or A components are filled with (0,0,1).

This command also dynamically sets the byte strides between consecutive elements within buffer $p\text{Buffers}[i]$ to the corresponding $p\text{Strides}[i]$ value when the graphics pipeline is created with VK_DYNAMIC_STATE_VERTEX_INPUT_BINDING_STRIDE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, strides are specified by the VkVertexInputBindingDescription::stride values used to create the currently active pipeline.

If the bound pipeline state object was also created with the VK_DYNAMIC_STATE_VERTEX_INPUT_EXT dynamic state enabled then vkCmdSetVertexInputEXT can be used instead of vkCmdBindVertexBuffers2 to set the stride.

### Valid Usage

- VUID-vkCmdBindVertexBuffers2-firstBinding-03355
  firstBinding must be less than VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2-firstBinding-03356
  The sum of firstBinding and bindingCount must be less than or equal to VkPhysicalDeviceLimits::maxVertexInputBindings

- VUID-vkCmdBindVertexBuffers2-pOffsets-03357
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

- VUID-vkCmdBindVertexBuffers2-pSizes-03358
  If pSizes is not NULL, all elements of pOffsets plus pSizes must be less than or equal to the size of the corresponding element in pBuffers

- VUID-vkCmdBindVertexBuffers2-pBuffers-03359
  All elements of pBuffers must have been created with the VK_BUFFER_USAGE_VERTEX_BUFFER_BIT flag

- VUID-vkCmdBindVertexBuffers2-pBuffers-03360
  Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

- VUID-vkCmdBindVertexBuffers2-pBuffers-04111
  If the nullDescriptor feature is not enabled, all elements of pBuffers must not be VK_NULL_HANDLE

- VUID-vkCmdBindVertexBuffers2-pBuffers-04112
  If an element of pBuffers is VK_NULL_HANDLE, then the corresponding element of pOffsets must be zero

- VUID-vkCmdBindVertexBuffers2-pStrides-03362
If `pStrides` is not `NULL` each element of `pStrides` must be less than or equal to `VkPhysicalDeviceLimits::maxVertexInputBindingStride`

- VUID-vkCmdBindVertexBuffers2-pStrides-06209
  If `pStrides` is not `NULL` each element of `pStrides` must be either 0 or greater than or equal to the maximum extent of all vertex input attributes fetched from the corresponding binding, where the extent is calculated as the `VkVertexInputAttributeDescription::offset` plus `VkVertexInputAttributeDescription::format` size

---

**Valid Usage (Implicit)**

- VUID-vkCmdBindVertexBuffers2-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdBindVertexBuffers2-pBuffers-parameter
  `pBuffers` must be a valid pointer to an array of `bindingCount` valid or `VK_NULL_HANDLE` `VkBuffer` handles

- VUID-vkCmdBindVertexBuffers2-pOffsets-parameter
  `pOffsets` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-pSizes-parameter
  If `pSizes` is not `NULL`, `pSizes` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-pStrides-parameter
  If `pStrides` is not `NULL`, `pStrides` must be a valid pointer to an array of `bindingCount` `VkDeviceSize` values

- VUID-vkCmdBindVertexBuffers2-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdBindVertexBuffers2-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdBindVertexBuffers2-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdBindVertexBuffers2-bindingCount-arraylength
  If any of `pSizes`, or `pStrides` are not `NULL`, `bindingCount` must be greater than 0

- VUID-vkCmdBindVertexBuffers2-commonparent
  Both of `commandBuffer`, and the elements of `pBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`

---

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
22.3. Vertex Attribute Divisor in Instanced Rendering

If the `vertexAttributeInstanceRateDivisor` feature is enabled and the `pNext` chain of `VkPipelineVertexInputStateCreateInfo` includes a `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure, then that structure controls how vertex attributes are assigned to an instance when instanced rendering is enabled.

The `VkPipelineVertexInputDivisorStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkPipelineVertexInputDivisorStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    uint32_t vertexBindingDivisorCount;
    const VkVertexInputBindingDivisorDescriptionEXT* pVertexBindingDivisors;
} VkPipelineVertexInputDivisorStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `vertexBindingDivisorCount` is the number of elements in the `pVertexBindingDivisors` array.
- `pVertexBindingDivisors` is a pointer to an array of `VkVertexInputBindingDivisorDescriptionEXT` structures specifying the divisor value for each binding.

Valid Usage (Implicit)

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VERTEX_INPUT_DIVISOR_STATE_CREATE_INFO_EXT`

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-pVertexBindingDivisors-parameter
  `pVertexBindingDivisors` must be a valid pointer to an array of `vertexBindingDivisorCount` `VkVertexInputBindingDivisorDescriptionEXT` structures

- VUID-VkPipelineVertexInputDivisorStateCreateInfoEXT-vertexBindingDivisorCount-arraylength
  `vertexBindingDivisorCount` must be greater than 0
The individual divisor values per binding are specified using the `VkVertexInputBindingDivisorDescriptionEXT` structure which is defined as:

```c
// Provided by VK_EXT_vertex_attribute_divisor
typedef struct VkVertexInputBindingDivisorDescriptionEXT {
    uint32_t binding;
    uint32_t divisor;
} VkVertexInputBindingDivisorDescriptionEXT;
```

- `binding` is the binding number for which the divisor is specified.
- `divisor` is the number of successive instances that will use the same value of the vertex attribute when instanced rendering is enabled. For example, if the divisor is N, the same vertex attribute will be applied to N successive instances before moving on to the next vertex attribute. The maximum value of `divisor` is implementation-dependent and can be queried using `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`. A value of 0 can be used for the divisor if the `vertexAttributeInstanceRateZeroDivisor` feature is enabled. In this case, the same vertex attribute will be applied to all instances.

If this structure is not used to define a divisor value for an attribute, then the divisor has a logical default value of 1.

### Valid Usage

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-binding-01869**
  binding must be less than `VkPhysicalDeviceLimits::maxVertexInputBindings`

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateZeroDivisor-02228**
  If the `vertexAttributeInstanceRateZeroDivisor` feature is not enabled, divisor must not be 0

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-vertexAttributeInstanceRateDivisor-02229**
  If the `vertexAttributeInstanceRateDivisor` feature is not enabled, divisor must be 1

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-divisor-01870**
  divisor must be a value between 0 and `VkPhysicalDeviceVertexAttributeDivisorPropertiesEXT::maxVertexAttribDivisor`, inclusive

- **VUID-VkVertexInputBindingDivisorDescriptionEXT-inputRate-01871**
  `VkVertexInputBindingDescription::inputRate` must be of type `VK_VERTEX_INPUT_RATE_INSTANCE` for this binding

### 22.4. Vertex Input Address Calculation

The address of each attribute for each `vertexIndex` and `instanceIndex` is calculated as follows:

- Let `attribDesc` be the member of `VkPipelineVertexInputStateCreateInfo`

Let bindingDesc be the member of VkPipelineVertexInputStateCreateInfo::pVertexBindingDescriptions with VkVertexInputAttributeDescription::binding equal to the vertex input attribute number.

Let vertexIndex be the index of the vertex within the draw (a value between firstVertex and firstVertex+vertexCount for vkCmdDraw, or a value taken from the index buffer plus vertexOffset for vkCmdDrawIndexed), and let instanceIndex be the instance number of the draw (a value between firstInstance and firstInstance+instanceCount).

Let offset be an array of offsets into the currently bound vertex buffers specified during vkCmdBindVertexBuffers or vkCmdBindVertexBuffers2 with pOffsets.

Let divisor be the member of VkPipelineVertexInputDivisorStateCreateInfoEXT::pVertexBindingDivisors with VkVertexInputBindingDivisorDescriptionEXT::binding equal to attribDesc.binding.

bufferBindingAddress = buffer[binding].baseAddress + offset[binding];

if (bindingDesc.inputRate == VK_VERTEX_INPUT_RATE_VERTEX)
    effectiveVertexOffset = vertexIndex * bindingDesc.stride;
else
    if (divisor == 0)
        effectiveVertexOffset = firstInstance * bindingDesc.stride;
    else
        effectiveVertexOffset = (firstInstance + ((instanceIndex - firstInstance) / divisor)) * bindingDesc.stride;

attribAddress = bufferBindingAddress + effectiveVertexOffset + attribDesc.offset;

### 22.4.1. Vertex Input Extraction

For each attribute, raw data is extracted starting at attribAddress and is converted from the VkVertexInputAttributeDescription's format to either floating-point, unsigned integer, or signed integer based on the base type of the format; the base type of the format must match the base type of the input variable in the shader. The input variable in the shader must be declared as a 64-bit data type if and only if format is a 64-bit data type. If format is a packed format, attribAddress must be a multiple of the size in bytes of the whole attribute data type as described in Packed Formats. Otherwise, attribAddress must be a multiple of the size in bytes of the component type indicated by format (see Formats). For attributes that are not 64-bit data types, each component is converted to the format of the input variable based on its type and size (as defined in the Format Definition section for each VkFormat), using the appropriate equations in 16-Bit Floating-Point Numbers, Unsigned 11-Bit Floating-Point Numbers, Unsigned 10-Bit Floating-Point Numbers, Fixed-Point Data Conversion, and Shared Exponent to RGB. Signed integer components smaller than 32 bits are sign-extended. Attributes that are not 64-bit data types are expanded to four components in the same way as described in conversion to RGBA. The number of components in the vertex shader input variable need not exactly match the number of components in the format. If the vertex shader has fewer components, the extra components are discarded.
Chapter 23. Tessellation

Tessellation involves three pipeline stages. First, a **tessellation control shader** transforms control points of a patch and can produce per-patch data. Second, a fixed-function tessellator generates multiple primitives corresponding to a tessellation of the patch in \((u,v)\) or \((u,v,w)\) parameter space. Third, a **tessellation evaluation shader** transforms the vertices of the tessellated patch, for example to compute their positions and attributes as part of the tessellated surface. The tessellator is enabled when the pipeline contains both a tessellation control shader and a tessellation evaluation shader.

### 23.1. Tessellator

If a pipeline includes both tessellation shaders (control and evaluation), the tessellator consumes each input patch (after vertex shading) and produces a new set of independent primitives (points, lines, or triangles). These primitives are logically produced by subdividing a geometric primitive (rectangle or triangle) according to the per-patch outer and inner tessellation levels written by the tessellation control shader. These levels are specified using the built-in variables `TessLevelOuter` and `TessLevelInner`, respectively. This subdivision is performed in an implementation-dependent manner. If no tessellation shaders are present in the pipeline, the tessellator is disabled and incoming primitives are passed through without modification.

The type of subdivision performed by the tessellator is specified by an `OpExecutionMode` instruction in the tessellation evaluation or tessellation control shader using one of execution modes **Triangles**, **Quads**, and **IsoLines**. Other tessellation-related execution modes can also be specified in either the tessellation control or tessellation evaluation shaders, and if they are specified in both then the modes must be the same.

**Tessellation execution modes include:**

- **Triangles**, **Quads**, and **IsoLines**. These control the type of subdivision and topology of the output primitives. One mode must be set in at least one of the tessellation shader stages. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation, and **IsoLines** must not be used in either tessellation shader stage.

- **VertexOrderCw** and **VertexOrderCcw**. These control the orientation of triangles generated by the tessellator. One mode must be set in at least one of the tessellation shader stages.

- **PointMode**. Controls generation of points rather than triangles or lines. This functionality defaults to disabled, and is enabled if either shader stage includes the execution mode. If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then point mode tessellation is not supported by the implementation, and **PointMode** must not be used in either tessellation shader stage.

- **SpacingEqual**, **SpacingFractionalEven**, and **SpacingFractionalOdd**. Controls the spacing of segments on the edges of tessellated primitives. One mode must be set in at least one of the tessellation shader stages.
• **OutputVertices.** Controls the size of the output patch of the tessellation control shader. One value **must** be set in at least one of the tessellation shader stages.

For triangles, the tessellator subdivides a triangle primitive into smaller triangles. For quads, the tessellator subdivides a rectangle primitive into smaller triangles. For isolines, the tessellator subdivides a rectangle primitive into a collection of line segments arranged in strips stretching across the rectangle in the u dimension (i.e. the coordinates in **TessCoord** are of the form (0,x) through (1,x) for all tessellation evaluation shader invocations that share a line).

Each vertex produced by the tessellator has an associated (u,v,w) or (u,v) position in a normalized parameter space, with parameter values in the range [0,1], as illustrated in figures **Domain parameterization for tessellation primitive modes (upper-left origin)** and **Domain parameterization for tessellation primitive modes (lower-left origin)**. The domain space **can** have either an upper-left or lower-left origin, selected by the **domainOrigin** member of **VkPipelineTessellationDomainOriginStateCreateInfo**.

![Diagram of tessellation primitive modes](image)

*Figure 15. Domain parameterization for tessellation primitive modes (upper-left origin)*
In the domain parameterization diagrams, the coordinates illustrate the value of \texttt{TessCoord} at the corners of the domain. The labels on the edges indicate the inner (\texttt{IL0} and \texttt{IL1}) and outer (\texttt{OL0} through \texttt{OL3}) tessellation level values used to control the number of subdivisions along each edge of the domain.

For triangles, the vertex’s position is a barycentric coordinate \((u,v,w)\), where \(u + v + w = 1.0\), and indicates the relative influence of the three vertices of the triangle on the position of the vertex. For quads and isolines, the position is a \((u,v)\) coordinate indicating the relative horizontal and vertical position of the vertex relative to the subdivided rectangle. The subdivision process is explained in more detail in subsequent sections.

### 23.2. Tessellator Patch Discard

A patch is discarded by the tessellator if any relevant outer tessellation level is less than or equal to zero.

Patches will also be discarded if any relevant outer tessellation level corresponds to a floating-point
NaN (not a number) in implementations supporting NaN.

No new primitives are generated and the tessellation evaluation shader is not executed for patches that are discarded. For Quads, all four outer levels are relevant. For Triangles and IsoLines, only the first three or two outer levels, respectively, are relevant. Negative inner levels will not cause a patch to be discarded; they will be clamped as described below.

### 23.3. Tessellator Spacing

Each of the tessellation levels is used to determine the number and spacing of segments used to subdivide a corresponding edge. The method used to derive the number and spacing of segments is specified by an `OpExecutionMode` in the tessellation control or tessellation evaluation shader using one of the identifiers SpacingEqual, SpacingFractionalEven, or SpacingFractionalOdd.

If SpacingEqual is used, the floating-point tessellation level is first clamped to $[1, \text{maxLevel}]$, where maxLevel is the implementation-dependent maximum tessellation level (VkPhysicalDeviceLimits::maxTessellationGenerationLevel). The result is rounded up to the nearest integer $n$, and the corresponding edge is divided into $n$ segments of equal length in (u,v) space.

If SpacingFractionalEven is used, the tessellation level is first clamped to $[2, \text{maxLevel}]$ and then rounded up to the nearest even integer $n$. If SpacingFractionalOdd is used, the tessellation level is clamped to $[1, \text{maxLevel} - 1]$ and then rounded up to the nearest odd integer $n$. If $n$ is one, the edge will not be subdivided. Otherwise, the corresponding edge will be divided into $n - 2$ segments of equal length, and two additional segments of equal length that are typically shorter than the other segments. The length of the two additional segments relative to the others will decrease monotonically with $n - f$, where $f$ is the clamped floating-point tessellation level. When $n - f$ is zero, the additional segments will have equal length to the other segments. As $n - f$ approaches 2.0, the relative length of the additional segments approaches zero. The two additional segments must be placed symmetrically on opposite sides of the subdivided edge. The relative location of these two segments is implementation-dependent, but must be identical for any pair of subdivided edges with identical values of $f$.

When tessellating triangles or quads using point mode with fractional odd spacing, the tessellator may produce interior vertices that are positioned on the edge of the patch if an inner tessellation level is less than or equal to one. Such vertices are considered distinct from vertices produced by subdividing the outer edge of the patch, even if there are pairs of vertices with identical coordinates.

### 23.4. Tessellation Primitive Ordering

Few guarantees are provided for the relative ordering of primitives produced by tessellation, as they pertain to primitive order.

- The output primitives generated from each input primitive are passed to subsequent pipeline stages in an implementation-dependent order.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.
23.5. Tessellator Vertex Winding Order

When the tessellator produces triangles (in the Triangles or Quads modes), the orientation of all triangles is specified with an OpExecutionMode of VertexOrderCw or VertexOrderCcw in the tessellation control or tessellation evaluation shaders. If the order is VertexOrderCw, the vertices of all generated triangles will have clockwise ordering in (u,v) or (u,v,w) space. If the order is VertexOrderCcw, the vertices will have counter-clockwise ordering in that space.

If the tessellation domain has an upper-left origin, the vertices of a triangle have counter-clockwise ordering if

\[ a = u_0 v_1 - u_1 v_0 + u_1 v_2 - u_2 v_1 + u_2 v_0 - u_0 v_2 \]

is negative, and clockwise ordering if a is positive. \( u_i \) and \( v_i \) are the \( u \) and \( v \) coordinates in normalized parameter space of the \( i \)th vertex of the triangle. If the tessellation domain has a lower-left origin, the vertices of a triangle have counter-clockwise ordering if \( a \) is positive, and clockwise ordering if \( a \) is negative.

Note
The value \( a \) is proportional (with a positive factor) to the signed area of the triangle.

In Triangles mode, even though the vertex coordinates have a \( w \) value, it does not participate directly in the computation of \( a \), being an affine combination of \( u \) and \( v \).

23.6. Triangle Tessellation

If the tessellation primitive mode is Triangles, an equilateral triangle is subdivided into a collection of triangles covering the area of the original triangle. First, the original triangle is subdivided into a collection of concentric equilateral triangles. The edges of each of these triangles are subdivided, and the area between each triangle pair is filled by triangles produced by joining the vertices on the subdivided edges. The number of concentric triangles and the number of subdivisions along each triangle except the outermost is derived from the first inner tessellation level. The edges of the outermost triangle are subdivided independently, using the first, second, and third outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), and \( w = 0 \) (right) edges, respectively. The second inner tessellation level and the fourth outer tessellation level have no effect in this mode.

If the first inner tessellation level and all three outer tessellation levels are exactly one after clamping and rounding, only a single triangle with \((u,v,w)\) coordinates of \((0,0,1)\), \((1,0,0)\), and \((0,1,0)\) is generated. If the inner tessellation level is one and any of the outer tessellation levels is greater than one, the inner tessellation level is treated as though it were originally specified as \(1 + \varepsilon\) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the triangle.
If any tessellation level is greater than one, tessellation begins by producing a set of concentric inner triangles and subdividing their edges. First, the three outer edges are temporarily subdivided using the clamped and rounded first inner tessellation level and the specified tessellation spacing, generating n segments. For the outermost inner triangle, the inner triangle is degenerate — a single point at the center of the triangle — if n is two. Otherwise, for each corner of the outer triangle, an inner triangle corner is produced at the intersection of two lines extended perpendicular to the corner’s two adjacent edges running through the vertex of the subdivided outer edge nearest that corner. If n is three, the edges of the inner triangle are not subdivided and it is the final triangle in the set of concentric triangles. Otherwise, each edge of the inner triangle is divided into n - 2 segments, with the n - 1 vertices of this subdivision produced by intersecting the inner edge with lines perpendicular to the edge running through the n - 1 innermost vertices of the subdivision of the outer edge. Once the outermost inner triangle is subdivided, the previous subdivision process repeats itself, using the generated triangle as an outer triangle. This subdivision process is illustrated in Inner Triangle Tessellation.

![Inner Triangle Tessellation](image)

**Caption**

In the Inner Triangle Tessellation diagram, inner tessellation levels of (a) four and (b) five are shown (not to scale). Solid black circles depict vertices along the edges of the concentric triangles. The edges of inner triangles are subdivided by intersecting the edge with segments perpendicular to the edge running through the n - 1 innermost vertices of the subdivision of the outer edge. Dotted lines depict edges connecting corresponding vertices on the inner and outer triangle edges.

Once all the concentric triangles are produced and their edges are subdivided, the area between each pair of adjacent inner triangles is filled completely with a set of non-overlapping triangles. In this subdivision, two of the three vertices of each triangle are taken from adjacent vertices on a subdivided edge of one triangle; the third is one of the vertices on the corresponding edge of the other triangle. If the innermost triangle is degenerate (i.e., a point), the triangle containing it is subdivided into six triangles by connecting each of the six vertices on that triangle with the center point. If the innermost triangle is not degenerate, that triangle is added to the set of generated triangles as-is.
After the area corresponding to any inner triangles is filled, the tessellator generates triangles to cover the area between the outermost triangle and the outermost inner triangle. To do this, the temporary subdivision of the outer triangle edge above is discarded. Instead, the \( u = 0 \), \( v = 0 \), and \( w = 0 \) edges are subdivided according to the first, second, and third outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the first inner triangle is retained. The area between the outer and first inner triangles is completely filled by non-overlapping triangles as described above. If the first (and only) inner triangle is degenerate, a set of triangles is produced by connecting each vertex on the outer triangle edges with the center point.

After all triangles are generated, each vertex in the subdivided triangle is assigned a barycentric \((u,v,w)\) coordinate based on its location relative to the three vertices of the outer triangle.

The algorithm used to subdivide the triangular domain in \((u,v,w)\) space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is consistent across the domain as described in Tessellator Vertex Winding Order.

### 23.7. Quad Tessellation

If the tessellation primitive mode is Quads, a rectangle is subdivided into a collection of triangles covering the area of the original rectangle. First, the original rectangle is subdivided into a regular mesh of rectangles, where the number of rectangles along the \( u = 0 \) and \( u = 1 \) (vertical) and \( v = 0 \) and \( v = 1 \) (horizontal) edges are derived from the first and second inner tessellation levels, respectively. All rectangles, except those adjacent to one of the outer rectangle edges, are decomposed into triangle pairs. The outermost rectangle edges are subdivided independently, using the first, second, third, and fourth outer tessellation levels to control the number of subdivisions of the \( u = 0 \) (left), \( v = 0 \) (bottom), \( u = 1 \) (right), and \( v = 1 \) (top) edges, respectively. The area between the inner rectangles of the mesh and the outer rectangle edges are filled by triangles produced by joining the vertices on the subdivided outer edges to the vertices on the edge of the inner rectangle mesh.

If both clamped inner tessellation levels and all four clamped outer tessellation levels are exactly one, only a single triangle pair covering the outer rectangle is generated. Otherwise, if either clamped inner tessellation level is one, that tessellation level is treated as though it was originally specified as \( 1 + \epsilon \) and will result in a two- or three-segment subdivision depending on the tessellation spacing. When used with fractional odd spacing, the three-segment subdivision may produce inner vertices positioned on the edge of the rectangle.

If any tessellation level is greater than one, tessellation begins by subdividing the \( u = 0 \) and \( u = 1 \) edges of the outer rectangle into \( m \) segments using the clamped and rounded first inner tessellation level and the tessellation spacing. The \( v = 0 \) and \( v = 1 \) edges are subdivided into \( n \) segments using the second inner tessellation level. Each vertex on the \( u = 0 \) and \( v = 0 \) edges are joined with the corresponding vertex on the \( u = 1 \) and \( v = 1 \) edges to produce a set of vertical and horizontal lines that divide the rectangle into a grid of smaller rectangles. The primitive generator emits a pair of
non-overlapping triangles covering each such rectangle not adjacent to an edge of the outer rectangle. The boundary of the region covered by these triangles forms an inner rectangle, the edges of which are subdivided by the grid vertices that lie on the edge. If either $m$ or $n$ is two, the inner rectangle is degenerate, and one or both of the rectangle’s edges consist of a single point. This subdivision is illustrated in Figure Inner Quad Tessellation.

![Inner Quad Tessellation](https://via.placeholder.com/150)

**Figure 18. Inner Quad Tessellation**

**Caption**

In the Inner Quad Tessellation diagram, inner quad tessellation levels of (a) (4,2) and (b) (7,4) are shown. The regions highlighted in red in figure (b) depict the 10 inner rectangles, each of which will be subdivided into two triangles. Solid black circles depict vertices on the boundary of the outer and inner rectangles, where the inner rectangle of figure (a) is degenerate (a single line segment). Dotted lines depict the horizontal and vertical edges connecting corresponding vertices on the inner and outer rectangle edges.

After the area corresponding to the inner rectangle is filled, the tessellator must produce triangles to cover the area between the inner and outer rectangles. To do this, the subdivision of the outer rectangle edge above is discarded. Instead, the $u = 0$, $v = 0$, $u = 1$, and $v = 1$ edges are subdivided according to the first, second, third, and fourth outer tessellation levels, respectively, and the tessellation spacing. The original subdivision of the inner rectangle is retained. The area between the outer and inner rectangles is completely filled by non-overlapping triangles. Two of the three vertices of each triangle are adjacent vertices on a subdivided edge of one rectangle; the third is one of the vertices on the corresponding edge of the other rectangle. If either edge of the innermost rectangle is degenerate, the area near the corresponding outer edges is filled by connecting each vertex on the outer edge with the single vertex making up the inner edge.

The algorithm used to subdivide the rectangular domain in $(u,v)$ space into individual triangles is implementation-dependent. However, the set of triangles produced will completely cover the domain, and no portion of the domain will be covered by multiple triangles.

Output triangles are generated with a topology similar to triangle lists, except that the order in which each triangle is generated, and the order in which the vertices are generated for each triangle, are implementation-dependent. However, the order of vertices in each triangle is
consistent across the domain as described in Tessellator Vertex Winding Order.

23.8. Isoline Tessellation

If the tessellation primitive mode is **Isolines**, a set of independent horizontal line segments is drawn. The segments are arranged into connected strips called **isolines**, where the vertices of each isoline have a constant v coordinate and u coordinates covering the full range [0,1]. The number of isolines generated is derived from the first outer tessellation level; the number of segments in each isoline is derived from the second outer tessellation level. Both inner tessellation levels and the third and fourth outer tessellation levels have no effect in this mode.

As with quad tessellation above, isoline tessellation begins with a rectangle. The u = 0 and u = 1 edges of the rectangle are subdivided according to the first outer tessellation level. For the purposes of this subdivision, the tessellation spacing mode is ignored and treated as equal_spacing. An isoline is drawn connecting each vertex on the u = 0 rectangle edge to the corresponding vertex on the u = 1 rectangle edge, except that no line is drawn between (0,1) and (1,1). If the number of isolines on the subdivided u = 0 and u = 1 edges is n, this process will result in n equally spaced lines with constant v coordinates of 0, \( \frac{1}{n} \), \( \frac{2}{n} \), ..., \( \frac{n-1}{n} \).

Each of the n isolines is then subdivided according to the second outer tessellation level and the tessellation spacing, resulting in m line segments. Each segment of each line is emitted by the tessellator. These line segments are generated with a topology similar to line lists, except that the order in which each line is generated, and the order in which the vertices are generated for each line segment, are implementation-dependent.

---

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationIsolines` is `VK_FALSE`, then isoline tessellation is not supported by the implementation.

23.9. Tessellation Point Mode

For all primitive modes, the tessellator is capable of generating points instead of lines or triangles. If the tessellation control or tessellation evaluation shader specifies the `OpExecutionMode PointMode`, the primitive generator will generate one point for each distinct vertex produced by tessellation, rather than emitting triangles or lines. Otherwise, the tessellator will produce a collection of line segments or triangles according to the primitive mode. These points are generated with a topology similar to point lists, except the order in which the points are generated for each input primitive is undefined.

---

**Note**

If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::tessellationPointMode` is `VK_FALSE`, then tessellation point mode is not supported by the implementation.
23.10. Tessellation Pipeline State

The `pTessellationState` member of `VkGraphicsPipelineCreateInfo` is a pointer to a `VkPipelineTessellationStateCreateInfo` structure.

The `VkPipelineTessellationStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineTessellationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineTessellationStateCreateFlags flags;
    uint32_t patchControlPoints;
} VkPipelineTessellationStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `patchControlPoints` is the number of control points per patch.

### Valid Usage

- VUID-VkPipelineTessellationStateCreateInfo-patchControlPoints-01214
  `patchControlPoints` must be greater than zero and less than or equal to `VkPhysicalDeviceLimits::maxTessellationPatchSize`

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationStateCreateInfo-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_STATE_CREATE_INFO`

- VUID-VkPipelineTessellationStateCreateInfo-pNext-pNext
  `pNext` must be `NULL` or a pointer to a valid instance of `VkPipelineTessellationDomainOriginStateCreateInfo`

- VUID-VkPipelineTessellationStateCreateInfo-sType-unique
  The `sType` value of each struct in the `pNext` chain must be unique

- VUID-VkPipelineTessellationStateCreateInfo-flags-zerobitmask
  `flags` must be `0`

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineTessellationStateCreateFlags;
```

`VkPipelineTessellationStateCreateFlags` is a bitmask type for setting a mask, but is currently
reserved for future use.

The VkPipelineTessellationDomainOriginStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_1
typedef struct VkPipelineTessellationDomainOriginStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkTessellationDomainOrigin domainOrigin;
} VkPipelineTessellationDomainOriginStateCreateInfo;
```
or the equivalent

```c
// Provided by VK_KHR_maintenance2
typedef VkPipelineTessellationDomainOriginStateCreateInfo
VkPipelineTessellationDomainOriginStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `domainOrigin` is a VkTessellationDomainOrigin value controlling the origin of the tessellation domain space.

If the VkPipelineTessellationDomainOriginStateCreateInfo structure is included in the `pNext` chain of VkPipelineTessellationStateCreateInfo, it controls the origin of the tessellation domain. If this structure is not present, it is as if `domainOrigin` was VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT.

### Valid Usage (Implicit)

- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-sType-sType `sType` must be VK_STRUCTURE_TYPE_PIPELINE_TESSELLATION_DOMAIN_ORIGIN_STATE_CREATE_INFO
- VUID-VkPipelineTessellationDomainOriginStateCreateInfo-domainOrigin-parameter `domainOrigin` must be a valid VkTessellationDomainOrigin value

The possible tessellation domain origins are specified by the VkTessellationDomainOrigin enumeration:

```c
// Provided by VK_VERSION_1_1
typedef enum VkTessellationDomainOrigin {
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT = 0,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT = 1,
    // Provided by VK_KHR_maintenance2
    VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT_KHR = 1639,
    VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT_KHR =
} VkTessellationDomainOrigin;
```
VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT,
} VkTessellationDomainOrigin;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkTessellationDomainOrigin VkTessellationDomainOriginKHR;

• VK_TESSELLATION_DOMAIN_ORIGIN_UPPER_LEFT specifies that the origin of the domain space is in the upper left corner, as shown in figure Domain parameterization for tessellation primitive modes (upper-left origin).

• VK_TESSELLATION_DOMAIN_ORIGIN_LOWER_LEFT specifies that the origin of the domain space is in the lower left corner, as shown in figure Domain parameterization for tessellation primitive modes (lower-left origin).

This enum affects how the VertexOrderCw and VertexOrderCcw tessellation execution modes are interpreted, since the winding is defined relative to the orientation of the domain.
Chapter 24. Geometry Shading

The geometry shader operates on a group of vertices and their associated data assembled from a single input primitive, and emits zero or more output primitives and the group of vertices and their associated data required for each output primitive. Geometry shading is enabled when a geometry shader is included in the pipeline.

24.1. Geometry Shader Input Primitives

Each geometry shader invocation has access to all vertices in the primitive (and their associated data), which are presented to the shader as an array of inputs.

The input primitive type expected by the geometry shader is specified with an OpExecutionMode instruction in the geometry shader, and must match the incoming primitive type specified by either the pipeline's primitive topology if tessellation is inactive, or the tessellation mode if tessellation is active, as follows:

- An input primitive type of InputPoints must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_POINT_LIST, or with a tessellation shader specifying PointMode. The input arrays always contain one element, as described by the point list topology or tessellation in point mode.

- An input primitive type of InputLines must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP, or with a tessellation shader specifying IsoLines that does not specify PointMode. The input arrays always contain two elements, as described by the line list topology or line strip topology, or by isolate tessellation.

- An input primitive type of InputLinesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_LINE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_LINE_STRIP_WITH_ADJACENCY. The input arrays always contain four elements, as described by the line list with adjacency topology or line strip with adjacency topology.

- An input primitive type of Triangles must only be used with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST, VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP, or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN; or with a tessellation shader specifying Quads or Triangles that does not specify PointMode. The input arrays always contain three elements, as described by the triangle list topology, triangle strip topology, or triangle fan topology, or by triangle or quad tessellation. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order.

- An input primitive type of InputTrianglesAdjacency must only be used when tessellation is inactive, with a pipeline topology of VK_PRIMITIVE_TOPOLOGY_TRIANGLE_LIST_WITH_ADJACENCY or VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP_WITH_ADJACENCY. The input arrays always contain six elements, as described by the triangle list with adjacency topology or triangle strip with adjacency topology. Vertices may be in a different absolute order than specified by the topology, but must adhere to the specified winding order, and the vertices making up the main primitive must still occur at the first, third, and fifth index.
24.2. Geometry Shader Output Primitives

A geometry shader generates primitives in one of three output modes: points, line strips, or triangle strips. The primitive mode is specified in the shader using an `OpExecutionMode` instruction with the `OutputPoints`, `OutputLineStrip`, or `OutputTriangleStrip` modes, respectively. Each geometry shader must include exactly one output primitive mode.

The vertices output by the geometry shader are assembled into points, lines, or triangles based on the output primitive type and the resulting primitives are then further processed as described in Rasterization. If the number of vertices emitted by the geometry shader is not sufficient to produce a single primitive, vertices corresponding to incomplete primitives are not processed by subsequent pipeline stages. The number of vertices output by the geometry shader is limited to a maximum count specified in the shader.

The maximum output vertex count is specified in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and the maximum number of vertices that will be produced by the geometry shader specified as a literal. Each geometry shader must specify a maximum output vertex count.

24.3. Multiple Invocations of Geometry Shaders

Geometry shaders can be invoked more than one time for each input primitive. This is known as geometry shader instancing and is requested by including an `OpExecutionMode` instruction with mode specified as `Invocations` and the number of invocations specified as an integer literal.

In this mode, the geometry shader will execute at least n times for each input primitive, where n is the number of invocations specified in the `OpExecutionMode` instruction. The instance number is available to each invocation as a built-in input using `InvocationId`.

24.4. Geometry Shader Primitive Ordering

Limited guarantees are provided for the relative ordering of primitives produced by a geometry shader, as they pertain to primitive order.

- For instanced geometry shaders, the output primitives generated from each input primitive are passed to subsequent pipeline stages using the invocation number to order the primitives, from least to greatest.
- All output primitives generated from a given input primitive are passed to subsequent pipeline stages before any output primitives generated from subsequent input primitives.

24.5. Geometry Shader Passthrough

A geometry shader that uses the `PassthroughNV` decoration on a variable in its input interface is considered a passthrough geometry shader. Output primitives in a passthrough geometry shader must have the same topology as the input primitive and are not produced by emitting vertices. The vertices of the output primitive have two different types of attributes, per-vertex and per-primitive. Geometry shader input variables with `PassthroughNV` decoration are considered to produce per-
vertex outputs, where values for each output vertex are copied from the corresponding input vertex. Any built-in or user-defined geometry shader outputs are considered per-primitive in a passthrough geometry shader, where a single output value is copied to all output vertices.

The remainder of this section details the usage of the PassthroughNV decoration and modifications to the interface matching rules when using passthrough geometry shaders.

24.5.1. PassthroughNV Decoration

Decorating a geometry shader input variable with the PassthroughNV decoration indicates that values of this input are copied through to the corresponding vertex of the output primitive. Input variables and block members which do not have the PassthroughNV decoration are consumed by the geometry shader without being passed through to subsequent stages.

The PassthroughNV decoration must only be used within a geometry shader.

Any variable decorated with PassthroughNV must be declared using the Input storage class.

The PassthroughNV decoration must not be used with any of:

- an input primitive type other than InputPoints, InputLines, or Triangles, as specified by the mode for OpExecutionMode.
- an invocation count other than one, as specified by the Invocations mode for OpExecutionMode.
- an OpEntryPoint which statically uses the Op EmitVertex or OpEndPrimitive instructions.
- a variable decorated with the InvocationId built-in decoration.
- a variable decorated with the PrimitiveId built-in decoration that is declared using the Input storage class.

24.5.2. Passthrough Interface Matching

When a passthrough geometry shader is in use, the Interface Matching rules involving the geometry shader input and output interfaces operate as described in this section.

For the purposes of matching passthrough geometry shader inputs with outputs of the previous pipeline stages, the PassthroughNV decoration is ignored.

For the purposes of matching the outputs of the geometry shader with subsequent pipeline stages, each input variable with the PassthroughNV decoration is considered to add an equivalent output variable with the same type, decoration (other than PassthroughNV), number, and declaration order on the output interface. The output variable declaration corresponding to an input variable decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such variables is removed. The output block declaration corresponding to an input block decorated with PassthroughNV or having members decorated with PassthroughNV will be identical to the input declaration, except that the outermost array dimension of such declaration is removed.

If an input block is decorated with PassthroughNV, the equivalent output block contains all the members of the input block. Otherwise, the equivalent output block contains only those input block
members decorated with `PassthroughNV`. All members of the corresponding output block are assigned `Location` and `Component` decorations identical to those assigned to the corresponding input block members.

Output variables and blocks generated from inputs decorated with `PassthroughNV` will only exist for the purposes of interface matching; these declarations are not available to geometry shader code or listed in the module interface.

For the purposes of component counting, passthrough geometry shaders count all statically used input variable components declared with the `PassthroughNV` decoration as output components as well, since their values will be copied to the output primitive produced by the geometry shader.
Chapter 25. Mesh Shading

Task and mesh shaders operate in workgroups to produce a collection of primitives that will be processed by subsequent stages of the graphics pipeline.

Work on the mesh pipeline is initiated by the application drawing a set of mesh tasks organized in global workgroups. If the optional task shader is active, each workgroup triggers the execution of task shader invocations that will create a new set of mesh workgroups upon completion. Each of these created workgroups, or each of the original workgroups if no task shader is present, triggers the execution of mesh shader invocations.

Each mesh shader workgroup emits zero or more output primitives along with the group of vertices and their associated data required for each output primitive.

25.1. Task Shader Input

For every workgroup issued via the drawing commands a group of task shader invocations is executed. There are no inputs other than the builtin workgroup identifiers.

25.2. Task Shader Output

The task shader can emit zero or more mesh workgroups to be generated using the built-in variable TaskCountNV. This value must be less than or equal to VkPhysicalDeviceMeshShaderPropertiesNV::maxTaskOutputCount.

It can also output user-defined data that is passed as input to all mesh shader invocations that the task creates. These outputs are decorated as PerTaskNV.

25.3. Mesh Generation

If a task shader exists, the mesh assembler creates a variable amount of mesh workgroups depending on each task’s output. If there is no task shader, the drawing commands emit the mesh shader invocations directly.

25.4. Mesh Shader Input

The only inputs available to the mesh shader are variables identifying the specific workgroup and invocation and, if applicable, any outputs written as PerTaskNV by the task shader that spawned the mesh shader’s workgroup. The mesh shader can operate without a task shader as well.

25.5. Mesh Shader Output Primitives

A mesh shader generates primitives in one of three output modes: points, lines, or triangles. The primitive mode is specified in the shader using an OpExecutionMode instruction with the OutputPoints, OutputLinesNV, or OutputTrianglesNV modes, respectively. Each mesh shader must include exactly one output primitive mode.
The maximum output vertex count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputVertices` and **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputVertices`.

The maximum output primitive count is specified as a literal in the shader using an `OpExecutionMode` instruction with the mode set to `OutputPrimitivesNV` and **must** be less than or equal to `VkPhysicalDeviceMeshShaderPropertiesNV::maxMeshOutputPrimitives`.

The number of primitives output by the mesh shader is provided via writing to the built-in variable `PrimitiveCountNV` and **must** be less than or equal to the maximum output primitive count specified in the shader. A variable decorated with `PrimitiveIndicesNV` is an output array of local index values into the vertex output arrays from which primitives are assembled according to the output primitive type. These resulting primitives are then further processed as described in Rasterization.

### 25.6. Mesh Shader Per-View Outputs

The mesh shader outputs decorated with the `PositionPerViewNV`, `ClipDistancePerViewNV`, `CullDistancePerViewNV`, `LayerPerViewNV`, and `ViewportMaskPerViewNV` built-in decorations are the per-view versions of the single-view variables with equivalent names (that is `Position`, `ClipDistance`, `CullDistance`, `Layer`, and `ViewportMaskNV`, respectively). If a shader statically assigns a value to any element of a per-view array it **must** not statically assign a value to the equivalent single-view variable.

Each of these outputs is considered arrayed, with separate values for each view. The view number is used to index the first dimension of these arrays.

The second dimension of the `ClipDistancePerViewNV`, and `CullDistancePerViewNV` arrays have the same requirements as the `ClipDistance`, and `CullDistance` arrays.

If a mesh shader output is *per-view*, the corresponding fragment shader input is taken from the element of the per-view output array that corresponds to the view that is currently being processed by the fragment shader.

### 25.7. Mesh Shader Primitive Ordering

Following guarantees are provided for the relative ordering of primitives produced by a mesh shader, as they pertain to *primitive order*.

- When a task shader is used, mesh workgroups spawned from lower tasks will be ordered prior those workgroups from subsequent tasks.
- All output primitives generated from a given mesh workgroup are passed to subsequent pipeline stages before any output primitives generated from subsequent input workgroups.
- All output primitives within a mesh workgroup, will be generated in the ordering provided by the builtin primitive indexbuffer (from low address to high address).
Chapter 26. Fixed-Function Vertex Post-Processing

After pre-rasterization shader stages, the following fixed-function operations are applied to vertices of the resulting primitives:

- Transform feedback (see Transform Feedback)
- Viewport swizzle (see Viewport Swizzle)
- Flat shading (see Flat Shading).
- Primitive clipping, including client-defined half-spaces (see Primitive Clipping).
- Shader output attribute clipping (see Clipping Shader Outputs).
- Clip space W scaling (see Controlling Viewport W Scaling).
- Perspective division on clip coordinates (see Coordinate Transformations).
- Viewport mapping, including depth range scaling (see Controlling the Viewport).
- Front face determination for polygon primitives (see Basic Polygon Rasterization).

Next, rasterization is performed on primitives as described in chapter Rasterization.

26.1. Transform Feedback

Before any other fixed-function vertex post-processing, vertex outputs from the last shader in the pre-rasterization shader stage can be written out to one or more transform feedback buffers bound to the command buffer. To capture vertex outputs the last pre-rasterization shader stage shader must be declared with the Xfb execution mode. Outputs decorated with XfbBuffer will be written out to the corresponding transform feedback buffers bound to the command buffer when transform feedback is active. Transform feedback buffers are bound to the command buffer by using vkCmdBindTransformFeedbackBuffersEXT. Transform feedback is made active by calling vkCmdBeginTransformFeedbackEXT and made inactive by calling vkCmdEndTransformFeedbackEXT. After vertex data is written it is possible to use vkCmdDrawIndirectByteCountEXT to start a new draw where the vertexCount is derived from the number of bytes written by a previous transform feedback.

When an individual point, line, or triangle primitive reaches the transform feedback stage while transform feedback is active, the values of the specified output variables are assembled into primitives and appended to the bound transform feedback buffers. After activating transform feedback, the values of the first assembled primitive are written at the starting offsets of the bound transform feedback buffers, and subsequent primitives are appended to the buffer. If the optional pCounterBuffers and pCounterBufferOffsets parameters are specified, the starting points within the transform feedback buffers are adjusted so data is appended to the previously written values indicated by the value stored by the implementation in the counter buffer.

For multi-vertex primitives, all values for a given vertex are written before writing values for any other vertex. When transformFeedbackPreservesProvokingVertex is not enabled, implementations may write out any vertex within the primitive first, but all subsequent vertices for that primitive
must be written out in a consistent winding order defined as follows:

- If neither geometry or tessellation shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `VkPipelineInputAssemblyStateCreateInfo::topology` used to execute the drawing command.
- If geometry shading is active, vertices within a primitive are appended according to the winding order described by the primitive topology defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.
- If tessellation shading is active but geometry shading is not, vertices within a primitive are appended according to the winding order defined by triangle tessellation, quad tessellation, and isoline tessellation.

When `transformFeedbackPreservesProvokingVertex` is enabled, then in addition to writing vertices with a consistent winding order, the vertex order must preserve the provoking vertex of each primitive:

- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT`, the primitive's provoking vertex must be the first vertex written.
- When the pipeline's provoking vertex mode is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, the primitive's provoking vertex must be the last vertex written.

If `transformFeedbackPreservesTriangleFanProvokingVertex` is `VK_FALSE`, neither geometry nor tessellation shading is active, and the primitive topology is `VK_PRIMITIVE_TOPOLOGY_TRIANGLE_FAN`, then the first vertex written from each primitive is implementation-defined even when `transformFeedbackPreservesProvokingVertex` is enabled.

When capturing vertices, the stride associated with each transform feedback buffer, as indicated by the `XfbStride` decoration, indicates the number of bytes of storage reserved for each vertex in the transform feedback buffer. For every vertex captured, each output attribute with a `Offset` decoration will be written to the storage reserved for the vertex at the associated transform feedback buffer. When writing output variables that are arrays or structures, individual array elements or structure members are written tightly packed in order. For vector types, individual components are written in order. For matrix types, outputs are written as an array of column vectors.

If any component of an output with an assigned transform feedback offset was not written to by its shader, the value recorded for that component is undefined. All components of an output variable must be written at an offset aligned to the size of the component. The size of each component of an output variable must be at least 32-bits. When capturing a vertex, any portion of the reserved storage not associated with an output variable with an assigned transform feedback offset will be unmodified.

When transform feedback is inactive, no vertices are recorded. If there is a valid counter buffer handle and counter buffer offset in the `pCounterBuffers` and `pCounterBufferOffsets` arrays, writes to the corresponding transform feedback buffer will start at the byte offset represented by the value stored in the counter buffer location.

Individual lines or triangles of a strip or fan primitive will be extracted and recorded separately.
Incomplete primitives are not recorded.

When using a geometry shader that emits vertices to multiple vertex streams, a primitive will be assembled and output for each stream when there are enough vertices emitted for the output primitive type. All outputs assigned to a given transform feedback buffer are required to come from a single vertex stream.

The sizes of the transform feedback buffers are defined by the `vkCmdBindTransformFeedbackBuffersEXT` `pSizes` parameter for each of the bound buffers, or the size of the bound buffer, whichever is the lesser. If there is less space remaining in any of the transform feedback buffers than the size of all of the vertex data for that primitive based on the `XfbStride` for that `XfbBuffer` then no vertex data of that primitive is recorded in any transform feedback buffer, and the value for the number of primitives written in the corresponding `VK_QUERY_TYPE_TRANSFORM_FEEDBACK_STREAM_EXT` query for all transform feedback buffers is no longer incremented.

Any outputs made to a `XfbBuffer` that is not bound to a transform feedback buffer is ignored.

To bind transform feedback buffers to a command buffer for use in subsequent drawing commands, call:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBindTransformFeedbackBuffersEXT(  
    VkCommandBuffer commandBuffer,  
    uint32_t firstBinding,  
    uint32_t bindingCount,  
    const VkBuffer* pBuffers,  
    const VkDeviceSize* pOffsets,  
    const VkDeviceSize* pSizes);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstBinding` is the index of the first transform feedback binding whose state is updated by the command.
- `bindingCount` is the number of transform feedback bindings whose state is updated by the command.
- `pBuffers` is a pointer to an array of buffer handles.
- `pOffsets` is a pointer to an array of buffer offsets.
- `pSizes` is `NULL` or a pointer to an array of `VkDeviceSize` buffer sizes, specifying the maximum number of bytes to capture to the corresponding transform feedback buffer. If `pSizes` is `NULL`, or the value of the `pSizes` array element is `VK_WHOLE_SIZE`, then the maximum number of bytes captured will be the size of the corresponding buffer minus the buffer offset.

The values taken from elements i of `pBuffers`, `pOffsets` and `pSizes` replace the current state for the transform feedback binding `firstBinding + i`, for i in `[0, bindingCount)`. The transform feedback binding is updated to start at the offset indicated by `pOffsets[i]` from the start of the buffer `pBuffers[i]`. 
Valid Usage

• VUID-vkCmdBindTransformFeedbackBuffersEXT-transformFeedback-02355
  \( \text{VkPhysicalDeviceTransformFeedbackFeaturesEXT} \) must be enabled

• VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02356
  firstBinding must be less than \( \text{VkPhysicalDeviceTransformFeedbackPropertiesEXT} \)

• VUID-vkCmdBindTransformFeedbackBuffersEXT-firstBinding-02357
  The sum of firstBinding and bindingCount must be less than or equal to \( \text{VkPhysicalDeviceTransformFeedbackPropertiesEXT} \)

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02358
  All elements of pOffsets must be less than the size of the corresponding element in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02359
  All elements of pOffsets must be a multiple of 4

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02360
  All elements of pBuffers must have been created with the \( \text{VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_BUFFER_BIT_EXT} \) flag

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pSize-02361
  If the optional pSize array is specified, each element of pSizes must either be VK_WHOLE_SIZE, or be less than or equal to \( \text{VkPhysicalDeviceTransformFeedbackPropertiesEXT} \)

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pSizes-02362
  All elements of pSizes must be either VK_WHOLE_SIZE, or less than or equal to the size of the corresponding buffer in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-02363
  All elements of pOffsets plus pSizes, where the pSizes element is not VK_WHOLE_SIZE, must be less than or equal to the size of the corresponding buffer in pBuffers

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-02364
  Each element of pBuffers that is non-sparse must be bound completely and contiguously to a single VkDeviceMemory object

• VUID-vkCmdBindTransformFeedbackBuffersEXT-None-02365
  Transform feedback must not be active when the vkCmdBindTransformFeedbackBuffersEXT command is recorded

Valid Usage (Implicit)

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdBindTransformFeedbackBuffersEXT-pBuffers-parameter
  pBuffers must be a valid pointer to an array of bindingCount valid VkBuffer handles
• VUID-vkCmdBindTransformFeedbackBuffersEXT-pOffsets-parameter
  pOffsets must be a valid pointer to an array of bindingCount VkDeviceSize values

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

• VUID-vkCmdBindTransformFeedbackBuffersEXT-videocoding
  This command must only be called outside of a video coding scope

• VUID-vkCmdBindTransformFeedbackBuffersEXT-bindingCount-arraylength
  bindingCount must be greater than 0

• VUID-vkCmdBindTransformFeedbackBuffersEXT-commonparent
  Both of commandBuffer, and the elements of pBuffer must have been created, allocated, or retrieved from the same VkDevice

---

**Host Synchronization**

• Host access to commandBuffer must be externally synchronized

• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

---

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>

<td></td>
</tr>
</tbody>
</table>

Transform feedback for specific transform feedback buffers is made active by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdBeginTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

• commandBuffer is the command buffer into which the command is recorded.

• firstCounterBuffer is the index of the first transform feedback buffer corresponding to pCounterBuffers[0] and pCounterBufferOffsets[0].
• counterBufferCount is the size of the pCounterBuffers and pCounterBufferOffsets arrays.

• pCounterBuffers is NULL or a pointer to an array of VkBuffer handles to counter buffers. Each buffer contains a 4 byte integer value representing the byte offset from the start of the corresponding transform feedback buffer from where to start capturing vertex data. If the byte offset stored to the counter buffer location was done using vkCmdEndTransformFeedbackEXT it can be used to resume transform feedback from the previous location. If pCounterBuffers is NULL, then transform feedback will start capturing vertex data to byte offset zero in all bound transform feedback buffers. For each element of pCounterBuffers that is VK_NULL_HANDLE, transform feedback will start capturing vertex data to byte zero in the corresponding bound transform feedback buffer.

• pCounterBufferOffsets is NULL or a pointer to an array of VkDeviceSize values specifying offsets within each of the pCounterBuffers where the counter values were previously written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. This data is the number of bytes captured by the previous transform feedback to this buffer. If pCounterBufferOffsets is NULL, then it is assumed the offsets are zero.

The active transform feedback buffers will capture primitives emitted from the corresponding XfbBuffer in the bound graphics pipeline. Any XfbBuffer emitted that does not output to an active transform feedback buffer will not be captured.

Valid Usage

• VUID-vkCmdBeginTransformFeedbackEXT-transformFeedback-02366
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback must be enabled

• VUID-vkCmdBeginTransformFeedbackEXT-None-02367
  Transform feedback must not be active

• VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02368
  firstCounterBuffer must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBeginTransformFeedbackEXT-firstCounterBuffer-02369
  The sum of firstCounterBuffer and counterBufferCount must be less than or equal to VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers

• VUID-vkCmdBeginTransformFeedbackEXT-counterBufferCount-02607
  If counterBufferCount is not 0, and pCounterBuffers is not NULL, pCounterBuffers must be a valid pointer to an array of counterBufferCount VkBuffer handles that are either valid or VK_NULL_HANDLE

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-02370
  For each buffer handle in the array, if it is not VK_NULL_HANDLE it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the pCounterBufferOffsets array

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffer-02371
  If pCounterBuffer is NULL, then pCounterBufferOffsets must also be NULL

• VUID-vkCmdBeginTransformFeedbackEXT-pCounterBuffers-02372
  For each buffer handle in the pCounterBuffers array that is not VK_NULL_HANDLE it must
have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`

- VUID-vkCmdBeginTransformFeedbackEXT-None-06233
  A valid graphics pipeline **must** be bound to `VK_PIPELINE_BIND_POINT_GRAPHICS`

- VUID-vkCmdBeginTransformFeedbackEXT-None-04128
  The last pre-rasterization shader stage of the bound graphics pipeline **must** have been declared with the Xfb execution mode

- VUID-vkCmdBeginTransformFeedbackEXT-None-02373
  Transform feedback **must** not be made active in a render pass instance with multiview enabled

### Valid Usage (Implicit)

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-parameter
  `commandBuffer` **must** be a valid `VkCommandBuffer` handle

- VUID-vkCmdBeginTransformFeedbackEXT-pCounterBufferOffsets-parameter
  If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` **must** be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-recording
  `commandBuffer` **must** be in the recording state

- VUID-vkCmdBeginTransformFeedbackEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations

- VUID-vkCmdBeginTransformFeedbackEXT-renderpass
  This command **must** only be called inside of a render pass instance

- VUID-vkCmdBeginTransformFeedbackEXT-videocoding
  This command **must** only be called outside of a video coding scope

- VUID-vkCmdBeginTransformFeedbackEXT-commonparent
  Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters **must** have been created, allocated, or retrieved from the same `VkDevice`

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
Transform feedback for specific transform feedback buffers is made inactive by calling:

```c
// Provided by VK_EXT_transform_feedback
void vkCmdEndTransformFeedbackEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstCounterBuffer,
    uint32_t counterBufferCount,
    const VkBuffer* pCounterBuffers,
    const VkDeviceSize* pCounterBufferOffsets);
```

- `commandBuffer` is the command buffer into which the command is recorded.
- `firstCounterBuffer` is the index of the first transform feedback buffer corresponding to `pCounterBuffers[0]` and `pCounterBufferOffsets[0].`
- `counterBufferCount` is the size of the `pCounterBuffers` and `pCounterBufferOffsets` arrays.
- `pCounterBuffers` is `NULL` or a pointer to an array of `VkBuffer` handles to counter buffers. The counter buffers are used to record the current byte positions of each transform feedback buffer where the next vertex output data would be captured. This can be used by a subsequent `vkCmdBeginTransformFeedbackEXT` call to resume transform feedback capture from this position. It can also be used by `vkCmdDrawIndirectByteCountEXT` to determine the vertex count of the draw call.
- `pCounterBufferOffsets` is `NULL` or a pointer to an array of `VkDeviceSize` values specifying offsets within each of the `pCounterBuffers` where the counter values can be written. The location in each counter buffer at these offsets must be large enough to contain 4 bytes of data. The data stored at this location is the byte offset from the start of the transform feedback buffer binding where the next vertex data would be written. If `pCounterBufferOffsets` is `NULL`, then it is assumed the offsets are zero.

### Valid Usage

- `VUID-vkCmdEndTransformFeedbackEXT-transformFeedback-02374`  
  `VkPhysicalDeviceTransformFeedbackFeaturesEXT::transformFeedback` must be enabled
- `VUID-vkCmdEndTransformFeedbackEXT-None-02375`  
  Transform feedback must be active
- `VUID-vkCmdEndTransformFeedbackEXT-firstCounterBuffer-02376`  
  `firstCounterBuffer` must be less than `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`
The sum of `firstCounterBuffer` and `counterBufferCount` must be less than or equal to `VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBuffers`.

If `counterBufferCount` is not 0, and `pCounterBuffers` is not NULL, `pCounterBuffers` must be a valid pointer to an array of `counterBufferCount` `VkBuffer` handles that are either valid or `VK_NULL_HANDLE`.

For each buffer handle in the array, if it is not `VK_NULL_HANDLE` it must reference a buffer large enough to hold 4 bytes at the corresponding offset from the `pCounterBufferOffsets` array.

If `pCounterBuffer` is NULL, then `pCounterBufferOffsets` must also be NULL.

For each buffer handle in the `pCounterBuffers` array that is not `VK_NULL_HANDLE` it must have been created with a usage value containing `VK_BUFFER_USAGE_TRANSFORM_FEEDBACK_COUNTER_BUFFER_BIT_EXT`.

Valid Usage (Implicit)

- `commandBuffer` must be a valid `VkCommandBuffer` handle.
- If `counterBufferCount` is not 0, and `pCounterBufferOffsets` is not NULL, `pCounterBufferOffsets` must be a valid pointer to an array of `counterBufferCount` `VkDeviceSize` values.
- `commandBuffer` must be in the recording state.
- The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- This command must only be called inside of a render pass instance.
- This command must only be called outside of a video coding scope.
- Both of `commandBuffer`, and the elements of `pCounterBuffers` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
• Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

26.2. Viewport Swizzle

Each primitive sent to a given viewport has a swizzle and optional negation applied to its clip coordinates. The swizzle that is applied depends on the viewport index, and is controlled by the VkPipelineViewportSwizzleStateCreateInfoNV pipeline state:

```c
// Provided by VK_NV_viewport_swizzle
typedef struct VkPipelineViewportSwizzleStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportSwizzleStateCreateFlagsNV flags;
    uint32_t viewportCount;
    const VkViewportSwizzleNV* pViewportSwizzles;
} VkPipelineViewportSwizzleStateCreateInfoNV;
```

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• flags is reserved for future use.
• viewportCount is the number of viewport swizzles used by the pipeline.
• pViewportSwizzles is a pointer to an array of VkViewportSwizzleNV structures, defining the viewport swizzles.

Valid Usage

• VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-01215
  viewportCount must be greater than or equal to the viewportCount set in VkPipelineViewportStateCreateInfo

Valid Usage (Implicit)

• VUID-VkPipelineViewportSwizzleStateCreateInfoNV-sType-sType
**sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SWIZZLE_STATE_CREATE_INFO_NV**

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-flags-zerobitmask
  **flags** must be 0

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-pViewportSwizzles-parameter
  **pViewportSwizzles** must be a valid pointer to an array of **viewportCount** valid **VkViewportSwizzleNV** structures

- VUID-VkPipelineViewportSwizzleStateCreateInfoNV-viewportCount-arraylength
  **viewportCount** must be greater than 0

// Provided by VK_NV_viewport_swizzle
typedef VkFlags VkPipelineViewportSwizzleStateCreateFlagsNV;

**VkPipelineViewportSwizzleStateCreateFlagsNV** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineViewportSwizzleStateCreateInfoNV** state is set by adding this structure to the **pNext** chain of a **VkPipelineViewportStateCreateInfo** structure and setting the graphics pipeline state with **vkCreateGraphicsPipelines**.

Each viewport specified from 0 to **viewportCount** - 1 has its x,y,z,w swizzle state set to the corresponding x, y, z and w in the **VkViewportSwizzleNV** structure. Each component is of type **VkViewportCoordinateSwizzleNV**, which determines the type of swizzle for that component. The value of x computes the new x component of the position as:

```c
if (x == VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_X_NV) x' = x;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_NEGATIVE_X_NV) x' = -x;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_Y_NV) x' = y;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_NEGATIVE_Y_NV) x' = -y;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_Z_NV) x' = z;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_NEGATIVE_Z_NV) x' = -z;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_W_NV) x' = w;
if (x == VK_VIEWPORTCoordinate_SWIZZLE_NEGATIVE_W_NV) x' = -w;
```

Similar selections are performed for the y, z, and w coordinates. This swizzling is applied before clipping and perspective divide. If the swizzle for an active viewport index is not specified, the swizzle for x is **VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_X_NV**, y is **VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_Y_NV**, z is **VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_Z_NV** and w is **VK_VIEWPORTCoordinate_SWIZZLE_POSITIVE_W_NV**.

Viewport swizzle parameters are specified by setting the **pNext** pointer of **VkGraphicsPipelineCreateInfo** to point to a **VkPipelineViewportSwizzleStateCreateInfoNV** structure. **VkPipelineViewportSwizzleStateCreateInfoNV** uses **VkViewportSwizzleNV** to set the viewport swizzle parameters.

The **VkViewportSwizzleNV** structure is defined as:
typedef struct VkViewportSwizzleNV {
    VkViewportCoordinateSwizzleNV x;
    VkViewportCoordinateSwizzleNV y;
    VkViewportCoordinateSwizzleNV z;
    VkViewportCoordinateSwizzleNV w;
} VkViewportSwizzleNV;

- `x` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the `x` component of the primitive
- `y` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the `y` component of the primitive
- `z` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the `z` component of the primitive
- `w` is a `VkViewportCoordinateSwizzleNV` value specifying the swizzle operation to apply to the `w` component of the primitive

Valid Usage (Implicit)

- VUID-VkViewportSwizzleNV-x-parameter `x` must be a valid `VkViewportCoordinateSwizzleNV` value
- VUID-VkViewportSwizzleNV-y-parameter `y` must be a valid `VkViewportCoordinateSwizzleNV` value
- VUID-VkViewportSwizzleNV-z-parameter `z` must be a valid `VkViewportCoordinateSwizzleNV` value
- VUID-VkViewportSwizzleNV-w-parameter `w` must be a valid `VkViewportCoordinateSwizzleNV` value

Possible values of the `VkViewportSwizzleNV::x, y, z,` and `w` members, specifying swizzling of the corresponding components of primitives, are:

typedef enum VkViewportCoordinateSwizzleNV {
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_X_NV = 0,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_X_NV = 1,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Y_NV = 2,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Y_NV = 3,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_Z_NV = 4,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_Z_NV = 5,
    VK_VIEWPORT_COORDINATE_SWIZZLE_POSITIVE_W_NV = 6,
    VK_VIEWPORT_COORDINATE_SWIZZLE_NEGATIVE_W_NV = 7,
} VkViewportCoordinateSwizzleNV;

These values are described in detail in Viewport Swizzle.
26.3. Flat Shading

Flat shading a vertex output attribute means to assign all vertices of the primitive the same value for that output. The output values assigned are those of the provoking vertex of the primitive. Flat shading is applied to those vertex attributes that match fragment input attributes which are decorated as Flat.

If neither geometry nor tessellation shading is active, the provoking vertex is determined by the primitive topology defined by `VkPipelineInputAssemblyStateCreateInfo:topology` used to execute the drawing command.

If geometry shading is active, the provoking vertex is determined by the primitive topology defined by the `OutputPoints`, `OutputLineStrips`, or `OutputTriangleStrips` execution mode.

If tessellation shading is active but geometry shading is not, the provoking vertex may be any of the vertices in each primitive.

For a given primitive topology, the pipeline’s provoking vertex mode determines which vertex is the provoking vertex. To specify the provoking vertex mode, include a `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure in the `VkPipelineRasterizationStateCreateInfo::pNext` chain when creating the pipeline.

The `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_provoking_vertex
typedef struct VkPipelineRasterizationProvokingVertexStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkProvokingVertexModeEXT provokingVertexMode;
} VkPipelineRasterizationProvokingVertexStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `provokingVertexMode` is a `VkProvokingVertexModeEXT` value selecting the provoking vertex mode.

If this struct is not provided when creating the pipeline, the pipeline will use the `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` mode.

If the `provokingVertexModePerPipeline` limit is `VK_FALSE`, then all pipelines bound within a render pass instance must have the same `provokingVertexMode`.

**Valid Usage**

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-04883
  If `provokingVertexMode` is `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT`, then the
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_PROVOKING_VERTEX_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationProvokingVertexStateCreateInfoEXT-provokingVertexMode-parameter provokingVertexMode must be a valid `VkProvokingVertexModeEXT` value

Possible values of `VkPipelineRasterizationProvokingVertexStateCreateInfoEXT::provokingVertexMode` are:

```c
// Provided by VK_EXT_provoking_vertex
typedef enum VkProvokingVertexModeEXT {
    VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT = 0,
    VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT = 1,
} VkProvokingVertexModeEXT;
```

- `VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT` specifies that the provoking vertex is the first non-adjacency vertex in the list of vertices used by a primitive.
- `VK_PROVOKING_VERTEX_MODE_LAST_VERTEX_EXT` specifies that the provoking vertex is the last non-adjacency vertex in the list of vertices used by a primitive.

These modes are described more precisely in Primitive Topologies.

26.4. Primitive Clipping

Primitives are culled against the *cull volume* and then clipped to the *clip volume*. In clip coordinates, the *view volume* is defined by:

\[-w_c \leq x_c \leq w_c \\
-w_c \leq y_c \leq w_c \\
z_m \leq z_c \leq w_c\]

where if `VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne` is `VK_TRUE` \( z_m \) is equal to \(-w_c\), otherwise \( z_m \) is equal to zero.

This view volume can be further restricted by as many as `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces.

The cull volume is the intersection of up to `VkPhysicalDeviceLimits::maxCullDistances` client-defined half-spaces (if no client-defined cull half-spaces are enabled, culling against the cull volume is skipped).
A shader **must** write a single cull distance for each enabled cull half-space to elements of the `CullDistance` array. If the cull distance for any enabled cull half-space is negative for all of the vertices of the primitive under consideration, the primitive is discarded. Otherwise the primitive is clipped against the clip volume as defined below.

The clip volume is the intersection of up to `VkPhysicalDeviceLimits::maxClipDistances` client-defined half-spaces with the view volume (if no client-defined clip half-spaces are enabled, the clip volume is the view volume).

A shader **must** write a single clip distance for each enabled clip half-space to elements of the `ClipDistance` array. Clip half-space $i$ is then given by the set of points satisfying the inequality

$$c_i(P) \geq 0$$

where $c_i(P)$ is the clip distance $i$ at point $P$. For point primitives, $c_i(P)$ is simply the clip distance for the vertex in question. For line and triangle primitives, per-vertex clip distances are interpolated using a weighted mean, with weights derived according to the algorithms described in sections Basic Line Segment Rasterization and Basic Polygon Rasterization, using the perspective interpolation equations.

The number of client-defined clip and cull half-spaces that are enabled is determined by the explicit size of the built-in arrays `ClipDistance` and `CullDistance`, respectively, declared as an output in the interface of the entry point of the final shader stage before clipping.

If `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is present in the graphics pipeline state then depth clipping is disabled if `VkPipelineRasterizationDepthClipStateCreateInfoEXT::depthClipEnable` is `VK_FALSE`. Otherwise, if `VkPipelineRasterizationDepthClipStateCreateInfoEXT` is not present, depth clipping is disabled when `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is `VK_TRUE`. When depth clipping is disabled, the plane equation

$$z_m \leq z_c \leq w_c$$

(see the clip volume definition above) is ignored by view volume clipping (effectively, there is no near or far plane clipping).

If the primitive under consideration is a point or line segment, then clipping passes it unchanged if its vertices lie entirely within the clip volume.

Possible values of `VkPhysicalDevicePointClippingProperties::pointClippingBehavior`, specifying clipping behavior of a point primitive whose vertex lies outside the clip volume, are:

```c
// Provided by VK_VERSION_1_1
typedef enum VkPointClippingBehavior {
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES = 0,
    VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY = 1,
    // Provided by VK_KHR_maintenance2
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES_KHR =
    VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES,
```
VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY_KHR =
VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY,
} VkPointClippingBehavior;

or the equivalent

// Provided by VK_KHR_maintenance2
typedef VkPointClippingBehavior VkPointClippingBehaviorKHR;

- **VK_POINT_CLIPPING_BEHAVIOR_ALL_CLIP_PLANES** specifies that the primitive is discarded if the vertex lies outside any clip plane, including the planes bounding the view volume.

- **VK_POINT_CLIPPING_BEHAVIOR_USER_CLIP_PLANES_ONLY** specifies that the primitive is discarded only if the vertex lies outside any user clip plane.

If either of a line segment’s vertices lie outside of the clip volume, the line segment may be clipped, with new vertex coordinates computed for each vertex that lies outside the clip volume. A clipped line segment endpoint lies on both the original line segment and the boundary of the clip volume.

This clipping produces a value, $0 \leq t \leq 1$, for each clipped vertex. If the coordinates of a clipped vertex are $P$ and the unclipped line segment’s vertex coordinates are $P_1$ and $P_2$, then $t$ satisfies the following equation

$$ P = tP_1 + (1-t)P_2. $$

t is used to clip vertex output attributes as described in Clipping Shader Outputs.

If the primitive is a polygon, it passes unchanged if every one of its edges lies entirely inside the clip volume, and is either clipped or discarded otherwise. If the edges of the polygon intersect the boundary of the clip volume, the intersecting edges are reconnected by new edges that lie along the boundary of the clip volume - in some cases requiring the introduction of new vertices into a polygon.

If a polygon intersects an edge of the clip volume’s boundary, the clipped polygon must include a point on this boundary edge.

Primitives rendered with user-defined half-spaces must satisfy a complementarity criterion. Suppose a series of primitives is drawn where each vertex i has a single specified clip distance $d_i$ (or a number of similarly specified clip distances, if multiple half-spaces are enabled). Next, suppose that the same series of primitives are drawn again with each such clip distance replaced by -$d_i$ (and the graphics pipeline is otherwise the same). In this case, primitives must not be missing any pixels, and pixels must not be drawn twice in regions where those primitives are cut by the clip planes.

The `VkPipelineViewportDepthClipControlCreateInfoEXT` structure is defined as:

// Provided by VK_EXT_depth_clip_control
typedef struct VkPipelineViewportDepthClipControlCreateInfoEXT {

1662
 VkStructureType sType;
 const void* pNext;
 VkBool32 negativeOneToOne;
} VkPipelineViewportDepthClipControlCreateInfoEXT;

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **negativeOneToOne** sets the \( z \) in the view volume to \(-w_c\)

### Valid Usage

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-negativeOneToOne-06470
  If depthClipControl is not enabled, **negativeOneToOne** must be **VK_FALSE**

### Valid Usage (Implicit)

- VUID-VkPipelineViewportDepthClipControlCreateInfoEXT-sType-sType
  **sType** must be **VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_DEPTH_CLIP_CONTROL_CREATE_INFO_EXT**

## 26.5. Clipping Shader Outputs

Next, vertex output attributes are clipped. The output values associated with a vertex that lies within the clip volume are unaffected by clipping. If a primitive is clipped, however, the output values assigned to vertices produced by clipping are clipped.

Let the output values assigned to the two vertices \( P_1 \) and \( P_2 \) of an unclipped edge be \( c_1 \) and \( c_2 \). The value of \( t \) (see **Primitive Clipping**) for a clipped point \( P \) is used to obtain the output value associated with \( P \) as

\[
c = t c_1 + (1-t) c_2.
\]

(Multiplying an output value by a scalar means multiplying each of \( x, y, z, \) and \( w \) by the scalar.)

Since this computation is performed in clip space before division by \( w_c \), clipped output values are perspective-correct.

Polygon clipping creates a clipped vertex along an edge of the clip volume’s boundary. This situation is handled by noting that polygon clipping proceeds by clipping against one half-space at a time. Output value clipping is done in the same way, so that clipped points always occur at the intersection of polygon edges (possibly already clipped) with the clip volume’s boundary.

For vertex output attributes whose matching fragment input attributes are decorated with **NoPerspective**, the value of \( t \) used to obtain the output value associated with \( P \) will be adjusted to produce results that vary linearly in framebuffer space.
Output attributes of integer or unsigned integer type must always be flat shaded. Flat shaded attributes are constant over the primitive being rasterized (see Basic Line Segment Rasterization and Basic Polygon Rasterization), and no interpolation is performed. The output value \( c \) is taken from either \( c_1 \) or \( c_2 \), since flat shading has already occurred and the two values are identical.

### 26.6. Controlling Viewport W Scaling

If viewport \( W \) scaling is enabled, the \( W \) component of the clip coordinate is modified by the provided coefficients from the corresponding viewport as follows.

\[
W'_c = x_{\text{coeff}} x_c + y_{\text{coeff}} y_c + w_c
\]

The `VkPipelineViewportWScalingStateCreateInfoNV` structure is defined as:

```cpp
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkPipelineViewportWScalingStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 viewportWScalingEnable;
    uint32_t viewportCount;
    const VkViewportWScalingNV* pViewportWScalings;
} VkPipelineViewportWScalingStateCreateInfoNV;
```

- \( sType \) is the type of this structure.
- \( pNext \) is NULL or a pointer to a structure extending this structure.
- \( viewportWScalingEnable \) controls whether viewport \( W \) scaling is enabled.
- \( viewportCount \) is the number of viewports used by \( W \) scaling, and must match the number of viewports in the pipeline if viewport \( W \) scaling is enabled.
- \( pViewportWScalings \) is a pointer to an array of `VkViewportWScalingNV` structures defining the \( W \) scaling parameters for the corresponding viewports. If the viewport \( W \) scaling state is dynamic, this member is ignored.

**Valid Usage (Implicit)**

- VUID-VkPipelineViewportWScalingStateCreateInfoNV-sType-sType
  \( sType \) must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_W_SCALING_STATE_CREATE_INFO_NV`

- VUID-VkPipelineViewportWScalingStateCreateInfoNV-viewportCount-arraylength
  \( viewportCount \) must be greater than 0

The `VkPipelineViewportWScalingStateCreateInfoNV` state is set by adding this structure to the `pNext` chain of a `VkPipelineViewportStateCreateInfo` structure and setting the graphics pipeline state with `vkCreateGraphicsPipelines`.

To dynamically set the viewport \( W \) scaling parameters, call:
// Provided by VK_NV_clip_space_w_scaling
void vkCmdSetViewportWScalingNV(
  VkCommandBuffer commandBuffer,
  uint32_t firstViewport,
  uint32_t viewportCount,
  const VkViewportWScalingNV* pViewportWScalings);

- **commandBuffer** is the command buffer into which the command will be recorded.
- **firstViewport** is the index of the first viewport whose parameters are updated by the command.
- **viewportCount** is the number of viewports whose parameters are updated by the command.
- **pViewportWScalings** is a pointer to an array of VkViewportWScalingNV structures specifying viewport parameters.

The viewport parameters taken from element i of pViewportWScalings replace the current state for the viewport index firstViewport + i, for i in [0, viewportCount).

This command sets the viewport W scaling for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT_W_SCALING_NV set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportWScalingStateCreateInfoNV::pViewportWScalings values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWScalingNV-firstViewport-01324
  The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewportWScalingNV-pViewportWScalings-parameter
  pViewportWScalings must be a valid pointer to an array of viewportCount VkViewportWScalingNV structures

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewportWScalingNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetViewportWScalingNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewportWScalingNV-viewportCount-arraylength
  1665
viewports must be greater than 0

**Host Synchronization**

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Both VkPipelineViewportWScalingStateCreateInfoNV and vkCmdSetViewportWScalingNV use VkViewportWScalingNV to set the viewport transformation parameters.

The VkViewportWScalingNV structure is defined as:

```c
// Provided by VK_NV_clip_space_w_scaling
typedef struct VkViewportWScalingNV {
    float xcoeff;
    float ycoeff;
} VkViewportWScalingNV;
```

- xcoeff and ycoeff are the viewport’s W scaling factor for x and y respectively.

### 26.7. Coordinate Transformations

*Clip coordinates* for a vertex result from shader execution, which yields a vertex coordinate *Position*.

Perspective division on clip coordinates yields *normalized device coordinates*, followed by a *viewport* transformation (see *Controlling the Viewport*) to convert these coordinates into *framebuffer coordinates*.

If a vertex in clip coordinates has a position given by

\[
\begin{pmatrix}
    x_c \\
    y_c \\
    z_c \\
    w_c
\end{pmatrix}
\]
then the vertex’s normalized device coordinates are

\[
\begin{pmatrix}
    x_d \\
y_d \\
z_d
\end{pmatrix} = \begin{pmatrix}
x_c \\
w_c \\
y_c \\
w_c \\
z_c \\
w_c
\end{pmatrix}
\]

### 26.8. Render Pass Transform

A render pass transform can be enabled for render pass instances. The clip coordinates \((x_c, y_c)\) that result from vertex shader execution are transformed by a rotation of 0, 90, 180, or 270 degrees in the XY plane, centered at the origin.

When render pass transform is enabled for a render pass instance, the following additional features are enabled:

- Each VkViewport specified by either VkPipelineViewportStateCreateInfo::pViewports or vkCmdSetViewport will have its width/height \((p_x, p_y)\) and its center \((o_x, o_y)\) similarly transformed by the implementation.
- Each scissor specified by VkPipelineViewportStateCreateInfo::pScissors or vkCmdSetScissor will have its \((offset_x, offset_y)\) and \((extent_x, extent_y)\) similarly transformed by the implementation.
- The renderArea specified in VkCommandBufferInheritanceRenderPassTransformInfoQCOM and
VkRenderPassBeginInfo will be similarly transformed by the implementation.

- The (x, y) components of shader variables with built-in decorations FragCoord, SamplePosition, or PointCoord will be similarly transformed by the implementation.
- The (x,y) components of the offset operand of the InterpolateAtOffset extended instruction will be similarly transformed by the implementation.
- The values returned by SPIR-V derivative instructions OpDPdx, OpDPdy, OpDPdxCourse, OpDPdyCourse, OpDPdxFine, OpDPdyFine will be similarly transformed by the implementation.

The net result of the above, is that applications can act as if rendering to a framebuffer oriented with the VkSurfaceCapabilitiesKHR::currentTransform. In other words, applications can act as if the presentation engine will be performing the transformation of the swapchain image after rendering and prior to presentation to the user. In fact, the transformation of the various items cited above are being handled by the implementation as the rendering takes place.

### 26.9. Controlling the Viewport

The viewport transformation is determined by the selected viewport's width and height in pixels, px and py, respectively, and its center (ox, oy) (also in pixels), as well as its depth range min and max determining a depth range scale value p, and a depth range bias value o, (defined below). The vertex's framebuffer coordinates (xf, yf, zf) are given by

\[
x_f = \left( \frac{p_x}{2} \right) x_d + o_x
\]

\[
y_f = \left( \frac{p_y}{2} \right) y_d + o_y
\]

\[
z_f = p_z \times z_d + o_z
\]

Multiple viewports are available, numbered zero up to VkPhysicalDeviceLimits::maxViewports minus one. The number of viewports used by a pipeline is controlled by the viewportCount member of the VkPipelineViewportStateCreateInfo structure used in pipeline creation.

xf and yf have limited precision, where the number of fractional bits retained is specified by VkPhysicalDeviceLimits::subPixelPrecisionBits. When rasterizing line segments, the number of fractional bits is specified by VkPhysicalDeviceLineRasterizationPropertiesEXT::lineSubPixelPrecisionBits.

The VkPipelineViewportStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineViewportStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineViewportStateCreateFlags flags;
    uint32_t viewportCount;
} VkPipelineViewportStateCreateInfo;
```

1668
const VkViewport* pViewports;
uint32_t scissorCount;
const VkRect2D* pScissors;
} VkPipelineViewportStateCreateInfo;

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **viewportCount** is the number of viewports used by the pipeline.
- **pViewports** is a pointer to an array of **VkViewport** structures, defining the viewport transforms. If the viewport state is dynamic, this member is ignored.
- **scissorCount** is the number of *scissors* and **must** match the number of viewports.
- **pScissors** is a pointer to an array of **VkRect2D** structures defining the rectangular bounds of the scissor for the corresponding viewport. If the scissor state is dynamic, this member is ignored.

### Valid Usage

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-01216**
  If the **multiViewport** feature is not enabled, **viewportCount** **must** not be greater than 1

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-01217**
  If the **multiViewport** feature is not enabled, **scissorCount** **must** not be greater than 1

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-01218**
  **viewportCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxViewports**

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-01219**
  **scissorCount** **must** be less than or equal to **VkPhysicalDeviceLimits::maxViewports**

- **VUID-VkPipelineViewportStateCreateInfo-x-02821**
  The *x* and *y* members of **offset** member of any element of **pScissors** **must** be greater than or equal to 0

- **VUID-VkPipelineViewportStateCreateInfo-offset-02822**
  Evaluation of \((offset.x + extent.width)\) **must** not cause a signed integer addition overflow for any element of **pScissors**

- **VUID-VkPipelineViewportStateCreateInfo-offset-02823**
  Evaluation of \((offset.y + extent.height)\) **must** not cause a signed integer addition overflow for any element of **pScissors**

- **VUID-VkPipelineViewportStateCreateInfo-scissorCount-04134**
  If the graphics pipeline is being created without **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** and **VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT** set then **scissorCount** and **viewportCount** **must** be identical

- **VUID-VkPipelineViewportStateCreateInfo-viewportCount-04135**
  If the graphics pipeline is being created with **VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT** set then **viewportCount** **must** be 0, otherwise it **must** be greater than 0
If the graphics pipeline is being created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set then `scissorCount` must be 0, otherwise it must be greater than 0.

If the `viewportWScalingEnable` member of a `VkPipelineViewportWScalingStateCreateInfoNV` structure included in the `pNext` chain is `VK_TRUE`, the `viewportCount` member of the `VkPipelineViewportWScalingStateCreateInfoNV` structure must be greater than or equal to `VkPipelineViewportStateCreateInfo::viewportCount`.

### Valid Usage (Implicit)

- **VUID-VkPipelineViewportStateCreateInfo-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_STATE_CREATE_INFO`

- **VUID-VkPipelineViewportStateCreateInfo-pNext-pNext**
  
  Each `pNext` member of any structure (including this one) in the `pNext` chain must be either `NULL` or a pointer to a valid instance of `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV`, `VkPipelineViewportDepthClipControlCreateInfoEXT`, `VkPipelineViewportExclusiveScissorStateCreateInfoNV`, `VkPipelineViewportShadingRateImageStateCreateInfoNV`, `VkPipelineViewportSwizzleStateCreateInfoNV`, or `VkPipelineViewportWScalingStateCreateInfoNV`.

- **VUID-VkPipelineViewportStateCreateInfo-sType-unique**
  
  The `sType` value of each struct in the `pNext` chain must be unique.

- **VUID-VkPipelineViewportStateCreateInfo-flags-zerobitmask**
  
  `flags` must be 0.

To dynamically set the viewport count and viewports, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetViewportWithCount(
    VkCommandBuffer commandBuffer, 
    uint32_t viewportCount,  
    const VkViewport* pViewports);
```

or the equivalent command:

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetViewportWithCountEXT(
    VkCommandBuffer commandBuffer, 
    uint32_t viewportCount,  
    const VkViewport* pViewports);
```
• `commandBuffer` is the command buffer into which the command will be recorded.
• `viewportCount` specifies the viewport count.
• `pViewports` specifies the viewports to use for drawing.

This command sets the viewport count and viewports state for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::viewportCount` and `pViewports` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportWithCount-viewportCount-03394
  `viewportCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetViewportWithCount-viewportCount-03395
  If the `multiViewport` feature is not enabled, `viewportCount` must be 1
- VUID-vkCmdSetViewportWithCount-commandBuffer-04819
  `commandBuffer` must not have `VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D` enabled

### Valid Usage (Implicit)

- VUID-vkCmdSetViewportWithCount-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetViewportWithCount-pViewports-parameter
  `pViewports` must be a valid pointer to an array of `viewportCount` valid `VkViewport` structures
- VUID-vkCmdSetViewportWithCount-commandBuffer-recording
  `commandBuffer` must be in the recording state
- VUID-vkCmdSetViewportWithCount-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetViewportWithCount- videocoding
  This command must only be called outside of a video coding scope
- VUID-vkCmdSetViewportWithCount-viewportCount-arraylength
  `viewportCount` must be greater than 0

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
To **dynamically set** the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  - `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  - If the `multiViewport` feature is not enabled, `scissorCount` must be 1
- **VUID-vkCmdSetScissorWithCount-x-03399**
  - The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- **VUID-vkCmdSetScissorWithCount-offset-03400**

---

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  - `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  - If the `multiViewport` feature is not enabled, `scissorCount` must be 1
- **VUID-vkCmdSetScissorWithCount-x-03399**
  - The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- **VUID-vkCmdSetScissorWithCount-offset-03400**

---

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  - `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  - If the `multiViewport` feature is not enabled, `scissorCount` must be 1
- **VUID-vkCmdSetScissorWithCount-x-03399**
  - The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- **VUID-vkCmdSetScissorWithCount-offset-03400**

---

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  - `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  - If the `multiViewport` feature is not enabled, `scissorCount` must be 1
- **VUID-vkCmdSetScissorWithCount-x-03399**
  - The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- **VUID-vkCmdSetScissorWithCount-offset-03400**

---

To dynamically set the scissor count and scissor rectangular bounds, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetScissorWithCount(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetScissorWithCountEXT(
    VkCommandBuffer commandBuffer,
    uint32_t scissorCount,
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `scissorCount` specifies the scissor count.
- `pScissors` specifies the scissors to use for drawing.

This command sets the scissor count and scissor rectangular bounds state for subsequence drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR_WITH_COUNT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineViewportStateCreateInfo::scissorCount` and `pScissors` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetScissorWithCount-scissorCount-03397**
  - `scissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- **VUID-vkCmdSetScissorWithCount-scissorCount-03398**
  - If the `multiViewport` feature is not enabled, `scissorCount` must be 1
- **VUID-vkCmdSetScissorWithCount-x-03399**
  - The `x` and `y` members of `offset` member of any element of `pScissors` must be greater than or equal to 0
- **VUID-vkCmdSetScissorWithCount-offset-03400**

---
Evaluation of \((\text{offset.x} + \text{extent.width})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- VUID-vkCmdSetScissorWithCount-offset-03401
  Evaluation of \((\text{offset.y} + \text{extent.height})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- VUID-vkCmdSetScissorWithCount-commandBuffer-04820
  \(\text{commandBuffer}\) must not have \(\text{VkCommandBufferInheritanceViewportScissorInfoNV}::\text{viewportScissor2D}\) enabled

**Valid Usage (Implicit)**

- VUID-vkCmdSetScissorWithCount-commandBuffer-parameter
  \(\text{commandBuffer}\) must be a valid \(\text{VkCommandBuffer}\) handle

- VUID-vkCmdSetScissorWithCount-pScissors-parameter
  \(p\text{Scissors}\) must be a valid pointer to an array of \(\text{scissorCount} \text{VkRect2D}\) structures

- VUID-vkCmdSetScissorWithCount-commandBuffer-recording
  \(\text{commandBuffer}\) must be in the recording state

- VUID-vkCmdSetScissorWithCount-commandBuffer-cmdpool
  The \(\text{VkCommandPool}\) that \(\text{commandBuffer}\) was allocated from must support graphics operations

- VUID-vkCmdSetScissorWithCount-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissorWithCount-scissorCount-arraylength
  \(\text{scissorCount}\) must be greater than 0

**Host Synchronization**

- Host access to \(\text{commandBuffer}\) must be externally synchronized

- Host access to the \(\text{VkCommandPool}\) that \(\text{commandBuffer}\) was allocated from must be externally synchronized

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineViewportStateCreateFlags;

VkPipelineViewportStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

A **pre-rasterization shader stage** can direct each primitive to zero or more viewports. The destination viewports for a primitive are selected by the last active pre-rasterization shader stage that has an output variable decorated with ViewportIndex (selecting a single viewport) or ViewportMaskNV (selecting multiple viewports). The viewport transform uses the viewport corresponding to either the value assigned to ViewportIndex or one of the bits set in ViewportMaskNV, and taken from an implementation-dependent vertex of each primitive. If ViewportIndex or any of the bits in ViewportMaskNV are outside the range zero to viewportCount minus one for a primitive, or if the last active pre-rasterization shader stage did not assign a value to either ViewportIndex or ViewportMaskNV for all vertices of a primitive due to flow control, the values resulting from the viewport transformation of the vertices of such primitives are undefined. If the last pre-rasterization shader stage does not have an output decorated with ViewportIndex or ViewportMaskNV, the viewport numbered zero is used by the viewport transformation.

A single vertex can be used in more than one individual primitive, in primitives such as VK_PRIMITIVE_TOPOLOGY_TRIANGLE_STRIP. In this case, the viewport transformation is applied separately for each primitive.

To **dynamically set** the viewport transformation parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetViewport(
    VkCommandBuffer commandBuffer,
    uint32_t firstViewport,
    uint32_t viewportCount,
    const VkViewport* pViewports);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstViewport` is the index of the first viewport whose parameters are updated by the command.
- `viewportCount` is the number of viewports whose parameters are updated by the command.
- `pViewports` is a pointer to an array of VkViewport structures specifying viewport parameters.

This command sets the viewport transformation parameters state for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_VIEWPORT set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineViewportStateCreateInfo::pViewports values used to create the currently active pipeline.

The viewport parameters taken from element i of pViewports replace the current state for the viewport index firstViewport + i, for i in [0, viewportCount).
Valid Usage

- VUID-vkCmdSetViewport-firstViewport-01223
  The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetViewport-firstViewport-01224
  If the multiViewport feature is not enabled, firstViewport must be 0

- VUID-vkCmdSetViewport-viewportCount-01225
  If the multiViewport feature is not enabled, viewportCount must be 1

- VUID-vkCmdSetViewport-commandBuffer-04821
  commandBuffer must not have VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D enabled

Valid Usage (Implicit)

- VUID-vkCmdSetViewport-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewport-pViewports-parameter
  pViewports must be a valid pointer to an array of viewportCount valid VkViewport structures

- VUID-vkCmdSetViewport-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewport-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetViewport-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewport-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized
Both `VkPipelineViewportStateCreateInfo` and `vkCmdSetViewport` use `VkViewport` to set the viewport transformation parameters.

The `VkViewport` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkViewport {
    float x;
    float y;
    float width;
    float height;
    float minDepth;
    float maxDepth;
} VkViewport;
```

- `x` and `y` are the viewport’s upper left corner \((x, y)\).
- `width` and `height` are the viewport’s width and height, respectively.
- `minDepth` and `maxDepth` are the depth range for the viewport.

**Note**

Despite their names, `minDepth` can be less than, equal to, or greater than `maxDepth`.

The framebuffer depth coordinate \(z\) may be represented using either a fixed-point or floating-point representation. However, a floating-point representation must be used if the depth/stencil attachment has a floating-point depth component. If an \(m\)-bit fixed-point representation is used, we assume that it represents each value \(k\) \(\in\) \(\{0, 1, ..., 2^m-1\}\), as \(k\) (e.g. 1.0 is represented in binary as a string of all ones).

The viewport parameters shown in the above equations are found from these values as

\[
o_x = x + \frac{\text{width}}{2}
\]

\[
o_y = y + \frac{\text{height}}{2}
\]

\[
o_z = \text{minDepth} \text{ (or } \frac{\text{maxDepth} + \text{minDepth}}{2} \text{ if } \text{VkPipelineViewportDepthClipControlCreateInfoEXT}
\]
negativeOneToOne is VK_TRUE)

\[ \begin{align*}
  p_x &= \text{width} \\
  p_y &= \text{height} \\
  p_z &= \maxDepth - \minDepth \quad \text{(or} \quad (\maxDepth - \minDepth) / 2 \text{ if}} \\
  \text{VkPipelineViewportDepthClipControlCreateInfoEXT::negativeOneToOne is VK_TRUE)} \end{align*} \]

If a render pass transform is enabled, the values \((p_x, p_y)\) and \((o_x, o_y)\) defining the viewport are transformed as described in render pass transform before participating in the viewport transform.

The application can specify a negative term for height, which has the effect of negating the y coordinate in clip space before performing the transform. When using a negative height, the application should also adjust the y value to point to the lower left corner of the viewport instead of the upper left corner. Using the negative height allows the application to avoid having to negate the y component of the Position output from the last pre-rasterization shader stage.

The width and height of the implementation-dependent maximum viewport dimensions must be greater than or equal to the width and height of the largest image which can be created and attached to a framebuffer.

The floating-point viewport bounds are represented with an implementation-dependent precision.

---

**Valid Usage**

- **VUID-VkViewport-width-01770**
  width must be greater than 0.0

- **VUID-VkViewport-width-01771**
  width must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[0]

- **VUID-VkViewport-height-01773**
  The absolute value of height must be less than or equal to VkPhysicalDeviceLimits::maxViewportDimensions[1]

- **VUID-VkViewport-x-01774**
  x must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-x-01232**
  \((x + \text{width})\) must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01775**
  y must be greater than or equal to viewportBoundsRange[0]

- **VUID-VkViewport-y-01776**
  y must be less than or equal to viewportBoundsRange[1]

- **VUID-VkViewport-y-01777**
  \((y + \text{height})\) must be greater than or equal to viewportBoundsRange[0]
• VUID-VkViewport-y-01233
  \((y + \text{height})\) must be less than or equal to \(\text{viewportBoundsRange}[1]\)

• VUID-VkViewport-minDepth-01234
  Unless \(\text{VK_EXT_depth_range_unrestricted}\) extension is enabled \(\text{minDepth}\) must be between 0.0 and 1.0, inclusive

• VUID-VkViewport-maxDepth-01235
  Unless \(\text{VK_EXT_depth_range_unrestricted}\) extension is enabled \(\text{maxDepth}\) must be between 0.0 and 1.0, inclusive
Chapter 27. Rasterization

Rasterization is the process by which a primitive is converted to a two-dimensional image. Each discrete location of this image contains associated data such as depth, color, or other attributes.

Rasterizing a primitive begins by determining which squares of an integer grid in framebuffer coordinates are occupied by the primitive, and assigning one or more depth values to each such square. This process is described below for points, lines, and polygons.

A grid square, including its (x,y) framebuffer coordinates, z (depth), and associated data added by fragment shaders, is called a fragment. A fragment is located by its upper left corner, which lies on integer grid coordinates.

Rasterization operations also refer to a fragment’s sample locations, which are offset by fractional values from its upper left corner. The rasterization rules for points, lines, and triangles involve testing whether each sample location is inside the primitive. Fragments need not actually be square, and rasterization rules are not affected by the aspect ratio of fragments. Display of non-square grids, however, will cause rasterized points and line segments to appear fatter in one direction than the other.

We assume that fragments are square, since it simplifies antialiasing and texturing. After rasterization, fragments are processed by fragment operations.

Several factors affect rasterization, including the members of VkPipelineRasterizationStateCreateInfo and VkPipelineMultisampleStateCreateInfo.

The VkPipelineRasterizationStateCreateInfo structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineRasterizationStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlags flags;
    VkBool32 depthClampEnable;
    VkBool32 rasterizerDiscardEnable;
    VkPolygonMode polygonMode;
    VkCullModeFlags cullMode;
    VkFrontFace frontFace;
    float lineWidth;
    float depthBiasConstantFactor;
    float depthBiasClamp;
    float depthBiasSlopeFactor;
} VkPipelineRasterizationStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
• **depthClampEnable** controls whether to clamp the fragment’s depth values as described in **Depth Test**. If the pipeline is not created with **VkPipelineRasterizationDepthClipStateCreateInfoEXT** present then enabling depth clamp will also disable clipping primitives to the z planes of the frustrum as described in **Primitive Clipping**. Otherwise depth clipping is controlled by the state set in **VkPipelineRasterizationDepthClipStateCreateInfoEXT**.

• **rasterizerDiscardEnable** controls whether primitives are discarded immediately before the rasterization stage.

• **polygonMode** is the triangle rendering mode. See **VkPolygonMode**.

• **cullMode** is the triangle facing direction used for primitive culling. See **VkCullModeFlagBits**.

• **frontFace** is a **VkFrontFace** value specifying the front-facing triangle orientation to be used for culling.

• **depthBiasEnable** controls whether to bias fragment depth values.

• **depthBiasConstantFactor** is a scalar factor controlling the constant depth value added to each fragment.

• **depthBiasClamp** is the maximum (or minimum) depth bias of a fragment.

• **depthBiasSlopeFactor** is a scalar factor applied to a fragment’s slope in depth bias calculations.

• **lineWidth** is the width of rasterized line segments.

The application can also add a **VkPipelineRasterizationStateRasterizationOrderAMD** structure to the `pNext` chain of a **VkPipelineRasterizationStateCreateInfo** structure. This structure enables selecting the rasterization order to use when rendering with the corresponding graphics pipeline as described in **Rasterization Order**.

### Valid Usage

- **VUID-VkPipelineRasterizationStateCreateInfo-depthClampEnable-00782**
  If the `depthClamp` feature is not enabled, `depthClampEnable` must be **VK_FALSE**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01507**
  If the `fillModeNonSolid` feature is not enabled, `polygonMode` must be **VK_POLYGON_MODE_FILL** or **VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-01414**
  If the **VK_NV_fill_rectangle** extension is not enabled, `polygonMode` must not be **VK_POLYGON_MODE_FILL_RECTANGLE_NV**

- **VUID-VkPipelineRasterizationStateCreateInfo-pointPolygons-04458**
  If the **VK_KHR_portability_subset** extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::pointPolygons` is **VK_FALSE**, and `rasterizerDiscardEnable` is **VK_FALSE**, `polygonMode` must not be **VK_POLYGON_MODE_POINT**

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateCreateInfo-sType-sType**
  `sType` must be **VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_CREATE_INFO**
• VUID-VkPipelineRasterizationStateCreateInfo-pNext-pNext
Each *pNext* member of any structure (including this one) in the *pNext* chain *must* be either *NULL* or a pointer to a valid instance of
VkPipelineRasterizationConservativeStateCreateInfoEXT,
VkPipelineRasterizationDepthClipStateCreateInfoEXT,
VkPipelineRasterizationLineStateCreateInfoEXT,
VkPipelineRasterizationProvokingVertexStateCreateInfoEXT,
VkPipelineRasterizationStateRasterizationOrderAMD, or
VkPipelineRasterizationStateStreamCreateInfoEXT

• VUID-VkPipelineRasterizationStateCreateInfo-sType-unique
The *sType* value of each struct in the *pNext* chain *must* be unique

• VUID-VkPipelineRasterizationStateCreateInfo-flags-zerobitmask
flags *must* be 0

• VUID-VkPipelineRasterizationStateCreateInfo-polygonMode-parameter
*polygonMode* *must* be a valid *VkPolygonMode* value

• VUID-VkPipelineRasterizationStateCreateInfo-cullMode-parameter
*cullMode* *must* be a valid combination of *VkCullModeFlagBits* values

• VUID-VkPipelineRasterizationStateCreateInfo-frontFace-parameter
*frontFace* *must* be a valid *VkFrontFace* value

// Provided by VK_VERSION_1_0
typedef VkFlags VkPipelineRasterizationStateCreateInfo; VkPipelineRasterizationStateCreateInfoCreateFlags; is a bitmask type for setting a mask, but is currently reserved for future use.

If the *pNext* chain of *VkPipelineRasterizationStateCreateInfo* includes a
VkPipelineRasterizationDepthClipStateCreateInfoEXT structure, then that structure controls
whether depth clipping is enabled or disabled.

The *VkPipelineRasterizationDepthClipStateCreateInfoEXT* structure is defined as:

// Provided by VK_EXT_depth_clip_enable
typedef struct VkPipelineRasterizationDepthClipStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationDepthClipStateCreateInfoCreateFlags flags;
    VkBool32 depthClipEnable;
} VkPipelineRasterizationDepthClipStateCreateInfoEXT;

• *sType* is the type of this structure.
• *pNext* is *NULL* or a pointer to a structure extending this structure.
• *flags* is reserved for future use.
• **depthClipEnable** controls whether depth clipping is enabled as described in **Primitive Clipping**.

**Valid Usage (Implicit)**

- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_DEPTH_CLIP_STATE_CREATE_INFO_EXT`
- VUID-VkPipelineRasterizationDepthClipStateCreateInfoEXT-flags-zerobitmask flags must be 0

```cpp
// Provided by VK_EXT_depth_clip_enable
typedef VkFlags VkPipelineRasterizationDepthClipStateCreateFlagsEXT;
```

**VkPipelineRasterizationDepthClipStateCreateFlagsEXT** is a bitmask type for setting a mask, but is currently reserved for future use.

The **VkPipelineMultisampleStateCreateInfo** structure is defined as:

```cpp
// Provided by VK_VERSION_1_0
typedef struct VkPipelineMultisampleStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineMultisampleStateCreateFlags flags;
    VkSampleCountFlagBits rasterizationSamples;
    VkBool32 sampleShadingEnable;
    float minSampleShading;
    const VkSampleMask* pSampleMask;
    VkBool32 alphaToCoverageEnable;
    VkBool32 alphaToOneEnable;
} VkPipelineMultisampleStateCreateInfo;
```

- **sType** is the type of this structure.
- **pNext** is **NULL** or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationSamples** is a **VkSampleCountFlagBits** value specifying the number of samples used in rasterization.
- **sampleShadingEnable** can be used to enable **Sample Shading**.
- **minSampleShading** specifies a minimum fraction of sample shading if **sampleShadingEnable** is set to **VK_TRUE**.
- **pSampleMask** is a pointer to an array of **VkSampleMask** values used in the sample mask test.
- **alphaToCoverageEnable** controls whether a temporary coverage value is generated based on the alpha component of the fragment's first color output as specified in the **Multisample Coverage** section.
• **alphaToOneEnable** controls whether the alpha component of the fragment’s first color output is replaced with one as described in **Multisample Coverage**.

Each bit in the sample mask is associated with a unique sample index as defined for the coverage mask. Each bit b for mask word w in the sample mask corresponds to sample index i, where \( i = 32 \times w + b \). The \( pSampleMask \) has a length equal to \( \lceil \frac{rasterizationSamples}{32} \rceil \) words.

If \( pSampleMask \) is NULL, it is treated as if the mask has all bits set to 1.

### Valid Usage

- **VUID-VkPipelineMultisampleStateCreateInfo-sampleShadingEnable-00784**
  If the sampleRateShading feature is not enabled, sampleShadingEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-alphaToOneEnable-00785**
  If the alphaToOne feature is not enabled, alphaToOneEnable must be VK_FALSE

- **VUID-VkPipelineMultisampleStateCreateInfo-minSampleShading-00786**
  minSampleShading must be in the range [0,1]

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-01415**
  If the VK_NV_framebuffer_mixed_samples extension is enabled, and if the subpass has any color attachments and rasterizationSamples is greater than the number of color samples, then sampleShadingEnable must be VK_FALSE

### Valid Usage (Implicit)

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-sType**
  sType must be VK_STRUCTURE_TYPE_PIPELINE_MULTISAMPLE_STATE_CREATE_INFO

- **VUID-VkPipelineMultisampleStateCreateInfo-pNext-pNext**
  Each pNext member of any structure (including this one) in the pNext chain must be either NULL or a pointer to a valid instance of VkPipelineCoverageModulationStateCreateInfoNV, VkPipelineCoverageReductionStateCreateInfoNV, or VkPipelineSampleLocationsStateCreateInfoEXT

- **VUID-VkPipelineMultisampleStateCreateInfo-sType-unique**
  The sType value of each struct in the pNext chain must be unique

- **VUID-VkPipelineMultisampleStateCreateInfo-flags-zerobitmask**
  flags must be 0

- **VUID-VkPipelineMultisampleStateCreateInfo-rasterizationSamples-parameter**
  rasterizationSamples must be a valid VkSampleCountFlagBits value

- **VUID-VkPipelineMultisampleStateCreateInfo-pSampleMask-parameter**
  If pSampleMask is not NULL, pSampleMask must be a valid pointer to an array of \( \lceil \frac{rasterizationSamples}{32} \rceil \) VkSampleMask values
typedef VkFlags VkPipelineMultisampleStateCreateFlags;

VkPipelineMultisampleStateCreateFlags is a bitmask type for setting a mask, but is currently reserved for future use.

The elements of the sample mask array are of type VkSampleMask, each representing 32 bits of coverage information:

typedef uint32_t VkSampleMask;

Rasterization only generates fragments which cover one or more pixels inside the framebuffer. Pixels outside the framebuffer are never considered covered in the fragment. Fragments which would be produced by application of any of the primitive rasterization rules described below but which lie outside the framebuffer are not produced, nor are they processed by any later stage of the pipeline, including any of the fragment operations.

Surviving fragments are processed by fragment shaders. Fragment shaders determine associated data for fragments, and can also modify or replace their assigned depth values.

27.1. Discarding Primitives Before Rasterization

Primitives are discarded before rasterization if the rasterizerDiscardEnable member of VkPipelineRasterizationStateCreateInfo is enabled. When enabled, primitives are discarded after they are processed by the last active shader stage in the pipeline before rasterization.

To dynamically enable whether primitives are discarded before the rasterization stage, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetRasterizerDiscardEnable(VkCommandBuffer commandBuffer, VkBool32 rasterizerDiscardEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetRasterizerDiscardEnableEXT(VkCommandBuffer commandBuffer, VkBool32 rasterizerDiscardEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `rasterizerDiscardEnable` controls whether primitives are discarded immediately before the rasterization stage.
This command sets the discard enable for subsequent drawing commands when the graphics pipeline is created with \texttt{VK\_DYNAMIC\_STATE\_RASTERIZER\_DISCARD\_ENABLE} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRasterizationStateCreateInfo::rasterizerDiscardEnable} value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-parameter
  commandBuffer must be a valid \texttt{VkCommandBuffer} handle
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetRasterizerDiscardEnable-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetRasterizerDiscardEnable-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the \texttt{VkCommandPool} that commandBuffer was allocated from must be externally synchronized

### Command Properties

### 27.2. Controlling the Vertex Stream Used for Rasterization

By default vertex data output from the last pre-rasterization shader stage are directed to vertex stream zero. Geometry shaders can emit primitives to multiple independent vertex streams. Each vertex emitted by the geometry shader is directed at one of the vertex streams. As vertices are received on each vertex stream, they are arranged into primitives of the type specified by the geometry shader output primitive type. The shading language instructions \texttt{OpEndPrimitive} and \texttt{OpEndStreamPrimitive} can be used to end the primitive being assembled on a given vertex stream and start a new empty primitive of the same type. An implementation supports up to
VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams streams, which is at least 1. The individual streams are numbered 0 through maxTransformFeedbackStreams minus 1. There is no requirement on the order of the streams to which vertices are emitted, and the number of vertices emitted to each vertex stream can be completely independent, subject only to the VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreamDataSize and VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackBufferDataSize limits. The primitives output from all vertex streams are passed to the transform feedback stage to be captured to transform feedback buffers in the manner specified by the last pre-rasterization shader stage shader's XfbBuffer, XfbStride, and Offsets decorations on the output interface variables in the graphics pipeline. To use a vertex stream other than zero, or to use multiple streams, the GeometryStreams capability must be specified.

By default, the primitives output from vertex stream zero are rasterized. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect property it is possible to rasterize a vertex stream other than zero.

By default, geometry shaders that emit vertices to multiple vertex streams are limited to using only the OutputPoints output primitive type. If the implementation supports the VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackStreamsLinesTriangles property it is possible to emit OutputLineStrip or OutputTriangleStrip in addition to OutputPoints.

The vertex stream used for rasterization is specified by adding a VkPipelineRasterizationStateStreamCreateInfoEXT structure to the pNext chain of a VkPipelineRasterizationStateCreateInfoEXT structure.

The VkPipelineRasterizationStateStreamCreateInfoEXT structure is defined as:

```c
// Provided by VK_EXT_transform_feedback
typedef struct VkPipelineRasterizationStateStreamCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationStateCreateFlagsEXT flags;
    uint32_t rasterizationStream;
} VkPipelineRasterizationStateStreamCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **flags** is reserved for future use.
- **rasterizationStream** is the vertex stream selected for rasterization.

If this structure is not present, rasterizationStream is assumed to be zero.

**Valid Usage**

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-geometryStreams-02324
  VkPhysicalDeviceTransformFeedbackFeaturesEXT::geometryStreams must be enabled
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02325
  rasterizationStream must be less than VkPhysicalDeviceTransformFeedbackPropertiesEXT::maxTransformFeedbackStreams

- VUID-VkPipelineRasterizationStateStreamCreateInfoEXT-rasterizationStream-02326
  rasterizationStream must be zero if VkPhysicalDeviceTransformFeedbackPropertiesEXT::transformFeedbackRasterizationStreamSelect is VK_FALSE

```c
typedef VkFlags VkPipelineRasterizationStateStreamCreateFlagsEXT;
```

VkPipelineRasterizationStateStreamCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

## 27.3. Rasterization Order

Within a subpass of a render pass instance, for a given (x,y,layer,sample) sample location, the following operations are guaranteed to execute in rasterization order, for each separate primitive that includes that sample location:

1. Fragment operations, in the order defined
2. Blending, logic operations, and color writes

Execution of these operations for each primitive in a subpass occurs in an order determined by the application.

The rasterization order to use for a graphics pipeline is specified by adding a VkPipelineRasterizationStateRasterizationOrderAMD structure to the pNext chain of a VkPipelineRasterizationStateCreateInfo structure.

The `VkPipelineRasterizationStateRasterizationOrderAMD` structure is defined as:

```c
typedef struct VkPipelineRasterizationStateRasterizationOrderAMD {
    VkStructureType sType;
    const void* pNext;
    VkRasterizationOrderAMD rasterizationOrder;
} VkPipelineRasterizationStateRasterizationOrderAMD;
```
• **sType** is the type of this structure.

• **pNext** is NULL or a pointer to a structure extending this structure.

• **rasterizationOrder** is a `VkRasterizationOrderAMD` value specifying the primitive rasterization order to use.

### Valid Usage (Implicit)

- **VUID-VkPipelineRasterizationStateRasterizationOrderAMD-sType-sType**
  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_STATE_RASTERIZATION_ORDER_AMD`

- **VUID-VkPipelineRasterizationStateRasterizationOrderAMD-rasterizationOrder-parameter**
  
  `rasterizationOrder` must be a valid `VkRasterizationOrderAMD` value

If the **VK_AMD_rasterization_order** device extension is not enabled or the application does not request a particular rasterization order through specifying a `VkPipelineRasterizationStateRasterizationOrderAMD` structure then the rasterization order used by the graphics pipeline defaults to `VK_RASTERIZATION_ORDER_STRICT_AMD`.

Possible values of `VkPipelineRasterizationStateRasterizationOrderAMD::rasterizationOrder`, specifying the primitive rasterization order, are:

```c
// Provided by VK_AMD_rasterization_order
typedef enum VkRasterizationOrderAMD {
    VK_RASTERIZATION_ORDER_STRICT_AMD = 0,
    VK_RASTERIZATION_ORDER_RELAXED_AMD = 1,
} VkRasterizationOrderAMD;
```

- **VK_RASTERIZATION_ORDER_STRICT_AMD** specifies that operations for each primitive in a subpass must occur in **primitive order**.

- **VK_RASTERIZATION_ORDER_RELAXED_AMD** specifies that operations for each primitive in a subpass may not occur in **primitive order**.

### 27.4. Multisampling

Multisampling is a mechanism to antialias all Vulkan primitives: points, lines, and polygons. The technique is to sample all primitives multiple times at each pixel. Each sample in each framebuffer attachment has storage for a color, depth, and/or stencil value, such that per-fragment operations apply to each sample independently. The color sample values can be later resolved to a single color (see **Resolving Multisample Images** and the **Render Pass** chapter for more details on how to resolve multisample images to non-multisample images).

Vulkan defines rasterization rules for single-sample modes in a way that is equivalent to a multisample mode with a single sample in the center of each fragment.

Each fragment includes a **coverage mask** with a single bit for each sample in the fragment, and a number of depth values and associated data for each sample.
It is understood that each pixel has \texttt{rasterizationSamples} locations associated with it. These locations are exact positions, rather than regions or areas, and each is referred to as a sample point. The sample points associated with a pixel \textbf{must} be located inside or on the boundary of the unit square that is considered to bound the pixel. Furthermore, the relative locations of sample points \textbf{may} be identical for each pixel in the framebuffer, or they \textbf{may} differ.

If the render pass has a fragment density map attachment, each fragment only has \texttt{rasterizationSamples} locations associated with it regardless of how many pixels are covered in the fragment area. Fragment sample locations are defined as if the fragment had an area of (1,1) and its sample points \textbf{must} be located within these bounds. Their actual location in the framebuffer is calculated by scaling the sample location by the fragment area. Attachments with storage for multiple samples per pixel are located at the pixel sample locations. Otherwise, the fragment's sample locations are generally used for evaluation of associated data and fragment operations.

If the current pipeline includes a fragment shader with one or more variables in its interface decorated with \texttt{Sample} and \texttt{Input}, the data associated with those variables will be assigned independently for each sample. The values for each sample \textbf{must} be evaluated at the location of the sample. The data associated with any other variables not decorated with \texttt{Sample} and \texttt{Input} need not be evaluated independently for each sample.

A \textit{coverage mask} is generated for each fragment, based on which samples within that fragment are determined to be within the area of the primitive that generated the fragment.

Single pixel fragments and multi-pixel fragments defined by a \textbf{fragment density map} have one set of samples. Multi-pixel fragments defined by a \textbf{shading rate image} have one set of samples per pixel. Multi-pixel fragments defined by setting the \textbf{fragment shading rate} have one set of samples per pixel. Each set of samples has a number of samples determined by \texttt{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}. Each sample in a set is assigned a unique \textit{sample index} \(i\) in the range \([0, \texttt{rasterizationSamples})\). Each sample in a fragment is also assigned a unique \textit{coverage index} \(j\) in the range \([0, n \times \texttt{rasterizationSamples})\), where \(n\) is the number of sets in the fragment. If the fragment contains a single set of samples, the \textit{coverage index} is always equal to the \textit{sample index}. If a \textbf{shading rate image} is used and a fragment covers multiple pixels, the coverage index is determined as defined by \texttt{VkPipelineViewportCoarseSampleOrderStateCreateInfoNV} or \texttt{vkCmdSetCoarseSampleOrderNV}.

If the \textbf{fragment shading rate} is set, the coverage index \(j\) is determined as a function of the \textit{pixel index} \(p\), the \textit{sample index} \(i\), and the number of rasterization samples \(r\) as:

\[
    j = i + r \times ((f_w \times f_h) - 1 - p)
\]

where the pixel index \(p\) is determined as a function of the pixel's framebuffer location \((x,y)\) and the fragment size \((f_w,f_h)\):

\[
    p_x = x \% f_w
\]
\[ p_y = y \% f_h \]

\[ p = p_x + (p_y \times f_w) \]

The table below illustrates the pixel index for multi-pixel fragments:

**Table 33. Pixel indices - 1 wide**

<table>
<thead>
<tr>
<th>1x1</th>
<th>1x2</th>
<th>1x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1.png" alt="Diagram" /></td>
<td><img src="image2.png" alt="Diagram" /></td>
<td><img src="image3.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**Table 34. Pixel indices - 2 wide**

<table>
<thead>
<tr>
<th>2x1</th>
<th>2x2</th>
<th>2x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image4.png" alt="Diagram" /></td>
<td><img src="image5.png" alt="Diagram" /></td>
<td><img src="image6.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>

**Table 35. Pixel indices - 4 wide**

<table>
<thead>
<tr>
<th>4x1</th>
<th>4x2</th>
<th>4x4</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image7.png" alt="Diagram" /></td>
<td><img src="image8.png" alt="Diagram" /></td>
<td><img src="image9.png" alt="Diagram" /></td>
</tr>
</tbody>
</table>
The coverage mask includes $B$ bits packed into $W$ words, defined as:

$$B = n \times \text{rasterizationSamples}$$

$$W = \lceil B/32 \rceil$$

Bit $b$ in coverage mask word $w$ is 1 if the sample with coverage index $j = 32 \times w + b$ is covered, and 0 otherwise.

If the `standardSampleLocations` member of `VkPhysicalDeviceLimits` is `VK_TRUE`, then the sample counts `VK_SAMPLE_COUNT_1_BIT`, `VK_SAMPLE_COUNT_2_BIT`, `VK_SAMPLE_COUNT_4_BIT`, `VK_SAMPLE_COUNT_8_BIT`, and `VK_SAMPLE_COUNT_16_BIT` have sample locations as listed in the following table, with the $i$th entry in the table corresponding to sample index $i$. `VK_SAMPLE_COUNT_32_BIT` and `VK_SAMPLE_COUNT_64_BIT` do not have standard sample locations. Locations are defined relative to an origin in the upper left corner of the fragment.
Color images created with multiple samples per pixel use a compression technique where there are
two arrays of data associated with each pixel. The first array contains one element per sample where each element stores an index to the second array defining the fragment mask of the pixel. The second array contains one element per color fragment and each element stores a unique color value in the format of the image. With this compression technique it is not always necessary to actually use unique storage locations for each color sample: when multiple samples share the same color value the fragment mask may have two samples referring to the same color fragment. The number of color fragments is determined by the samples member of the VkImageCreateInfo structure used to create the image. The VK_AMD_shader_fragment_mask device extension provides shader instructions enabling the application to get direct access to the fragment mask and the individual color fragment values.

![Fragment Mask](image)

Figure 19. Fragment Mask

### 27.5. Custom Sample Locations

Applications can also control the sample locations used for rasterization.

If the pNext chain of the VkPipelineMultisampleStateCreateInfo structure specified at pipeline creation time includes a VkPipelineSampleLocationsStateCreateInfoEXT structure, then that structure controls the sample locations used when rasterizing primitives with the pipeline.

The VkPipelineSampleLocationsStateCreateInfoEXT structure is defined as:

```c
typedef struct VkPipelineSampleLocationsStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkBool32 sampleLocationsEnable;
    VkSampleLocationsInfoEXT sampleLocationsInfo;
} VkPipelineSampleLocationsStateCreateInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationsEnable** controls whether custom sample locations are used. If sampleLocationsEnable is VK_FALSE, the default sample locations are used and the values specified in sampleLocationsInfo are ignored.
- **sampleLocationsInfo** is the sample locations to use during rasterization if sampleLocationsEnable is VK_TRUE and the graphics pipeline is not created with VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT.
Valid Usage (Implicit)

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_PIPELINE_SAMPLE_LOCATIONS_STATE_CREATE_INFO_EXT

- VUID-VkPipelineSampleLocationsStateCreateInfoEXT-sampleLocationsInfo-parameter
  sampleLocationsInfo must be a valid VkSampleLocationsInfoEXT structure

The VkSampleLocationsInfoEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationsInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkSampleCountFlagBits sampleLocationsPerPixel;
    VkExtent2D sampleLocationGridSize;
    uint32_t sampleLocationsCount;
    const VkSampleLocationEXT* pSampleLocations;
} VkSampleLocationsInfoEXT;
```

- **sType** is the type of this structure.
- **pNext** is NULL or a pointer to a structure extending this structure.
- **sampleLocationsPerPixel** is a VkSampleCountFlagBits value specifying the number of sample locations per pixel.
- **sampleLocationGridSize** is the size of the sample location grid to select custom sample locations for.
- **sampleLocationsCount** is the number of sample locations in **pSampleLocations**.
- **pSampleLocations** is a pointer to an array of sampleLocationsCount VkSampleLocationEXT structures.

This structure can be used either to specify the sample locations to be used for rendering or to specify the set of sample locations an image subresource has been last rendered with for the purposes of layout transitions of depth/stencil images created with VK_IMAGE_CREATE_SAMPLE_LOCATIONS_COMPATIBLE_DEPTH_BIT_EXT.

The sample locations in **pSampleLocations** specify sampleLocationsPerPixel number of sample locations for each pixel in the grid of the size specified in sampleLocationGridSize. The sample location for sample i at the pixel grid location (x,y) is taken from pSampleLocations[(x + y × sampleLocationGridSize.width) × sampleLocationsPerPixel + i].

If the render pass has a fragment density map, the implementation will choose the sample locations for the fragment and the contents of **pSampleLocations** may be ignored.
Valid Usage

- VUID-VkSampleLocationsInfoEXT-sampleLocationsPerPixel-01526
  sampleLocationsPerPixel must be a bit value that is set in VkPhysicalDeviceSampleLocationsPropertiesEXT::sampleLocationSampleCounts

- VUID-VkSampleLocationsInfoEXT-sampleLocationsCount-01527
  sampleLocationsCount must equal sampleLocationsPerPixel × sampleLocationGridSize.width × sampleLocationGridSize.height

Valid Usage (Implicit)

- VUID-VkSampleLocationsInfoEXT-sType-sType
  sType must be VK_STRUCTURE_TYPE_SAMPLE_LOCATIONS_INFO_EXT

- VUID-VkSampleLocationsInfoEXT-pSampleLocations-parameter
  If sampleLocationsCount is not 0, pSampleLocations must be a valid pointer to an array of sampleLocationsCount VkSampleLocationEXT structures

The VkSampleLocationEXT structure is defined as:

```c
// Provided by VK_EXT_sample_locations
typedef struct VkSampleLocationEXT {
    float x;
    float y;
} VkSampleLocationEXT;
```

- x is the horizontal coordinate of the sample's location.
- y is the vertical coordinate of the sample's location.

The domain space of the sample location coordinates has an upper-left origin within the pixel in framebuffer space.

The values specified in a VkSampleLocationEXT structure are always clamped to the implementation-dependent sample location coordinate range [sampleLocationCoordinateRange[0], sampleLocationCoordinateRange[1]] that can be queried using VkPhysicalDeviceSampleLocationsPropertiesEXT.

To dynamically set the sample locations used for rasterization, call:

```c
// Provided by VK_EXT_sample_locations
void vkCmdSetSampleLocationsEXT(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    const VkSampleLocationsInfoEXT* pSampleLocationsInfo);
```
• **pSampleLocationsInfo** is the sample locations state to set.

This command sets the custom sample locations for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SAMPLE_LOCATIONS_EXT` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`, and when the `VkPipelineSampleLocationsStateCreateInfo::sampleLocationsEnable` property of the bound graphics pipeline is `VK_TRUE`. Otherwise, this state is specified by the `VkPipelineSampleLocationsStateCreateInfo::sampleLocationsInfo` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetSampleLocationsEXT-sampleLocationsPerPixel-01529
  The `sampleLocationsPerPixel` member of `pSampleLocationsInfo` must equal the `rasterizationSamples` member of the `VkPipelineMultisampleStateCreateInfo` structure the bound graphics pipeline has been created with.

- VUID-vkCmdSetSampleLocationsEXT-variableSampleLocations-01530
  If `VkPhysicalDeviceSampleLocationsPropertiesEXT::variableSampleLocations` is `VK_FALSE` then the current render pass must have been begun by specifying a `VkRenderPassSampleLocationsBeginInfoEXT` structure whose `pPostSubpassSampleLocations` member contains an element with a `subpassIndex` matching the current subpass index and the `sampleLocationsInfo` member of that element must match the sample locations state pointed to by `pSampleLocationsInfo`.

### Valid Usage (Implicit)

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- VUID-vkCmdSetSampleLocationsEXT-pSampleLocationsInfo-parameter
  `pSampleLocationsInfo` must be a valid pointer to a valid `VkSampleLocationsInfoEXT` structure.

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-recording
  `commandBuffer` must be in the recording state.

- VUID-vkCmdSetSampleLocationsEXT-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.

- VUID-vkCmdSetSampleLocationsEXT-videocoding
  This command must only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.

- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally...
27.6. Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateFeaturesKHR allow an application to control the shading rate of a given fragment shader invocation.

The fragment shading rate strongly interacts with Multisampling, and the set of available rates for an implementation may be restricted by sample rate.

To query available shading rates, call:

```c
// Provided by VK_KHR_fragment_shading_rate
VkResult vkGetPhysicalDeviceFragmentShadingRatesKHR(
    VkPhysicalDevice physicalDevice, 
    uint32_t* pFragmentShadingRateCount, 
    VkPhysicalDeviceFragmentShadingRateKHR* pFragmentShadingRates);
```

- `physicalDevice` is the handle to the physical device whose properties will be queried.
- `pFragmentShadingRateCount` is a pointer to an integer related to the number of fragment shading rates available or queried, as described below.
- `pFragmentShadingRates` is either `NULL` or a pointer to an array of VkPhysicalDeviceFragmentShadingRateKHR structures.

If `pFragmentShadingRates` is `NULL`, then the number of fragment shading rates available is returned in `pFragmentShadingRateCount`. Otherwise, `pFragmentShadingRateCount` must point to a variable set by the user to the number of elements in the `pFragmentShadingRates` array, and on return the variable is overwritten with the number of structures actually written to `pFragmentShadingRates`. If `pFragmentShadingRateCount` is less than the number of fragment shading rates available, at most `pFragmentShadingRateCount` structures will be written, and `VK_INCOMPLETE` will be returned instead of `VK_SUCCESS`, to indicate that not all the available fragment shading rates were returned.

The returned array of fragment shading rates must be ordered from largest `fragmentSize.width` value to smallest, and each set of fragment shading rates with the same `fragmentSize.width` value must be ordered from largest `fragmentSize.height` to smallest. Any two entries in the array must not have the same `fragmentSize` values.

For any entry in the array, the following rules also apply:
• The value of `fragmentSize.width` must be less than or equal to `maxFragmentSize.width`.
• The value of `fragmentSize.width` must be greater than or equal to 1.
• The value of `fragmentSize.width` must be a power-of-two.
• The value of `fragmentSize.height` must be less than or equal to `maxFragmentSize.height`.
• The value of `fragmentSize.height` must be greater than or equal to 1.
• The value of `fragmentSize.height` must be a power-of-two.
• The highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateRasterizationSamples`.
• The product of `fragmentSize.width`, `fragmentSize.height`, and the highest sample count in `sampleCounts` must be less than or equal to `maxFragmentShadingRateCoverageSamples`.

Implementations must support at least the following shading rates:

<table>
<thead>
<tr>
<th><code>sampleCounts</code></th>
<th><code>fragmentSize</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT</td>
</tr>
<tr>
<td>VK_SAMPLE_COUNT_1_BIT</td>
<td>VK_SAMPLE_COUNT_4_BIT</td>
</tr>
<tr>
<td>~0</td>
<td>{1,1}</td>
</tr>
</tbody>
</table>

If `framebufferColorSampleCounts`, includes `VK_SAMPLE_COUNT_2_BIT`, the required rates must also include `VK_SAMPLE_COUNT_2_BIT`.

**Note**
Including the {1,1} fragment size is done for completeness; it has no actual effect on the support of rendering without setting the fragment size. All sample counts and render pass transforms are supported for this rate.

The returned set of fragment shading rates must be returned in the native (rotated) coordinate system. For rasterization using render pass transform not equal to `VK_SURFACE_TRANSFORM_IDENTITY_BIT_KHR`, the application must transform the returned fragment shading rates into the current (unrotated) coordinate system to get the supported rates for that transform.

**Note**
For example, consider an implementation returning support for 4x2, but not 2x4 in the set of supported fragment shading rates. This means that for transforms `VK_SURFACE_TRANSFORM_ROTATE_90_BIT_KHR` and `VK_SURFACE_TRANSFORM_ROTATE_270_BIT_KHR`, 2x4 is a supported rate, but 4x2 is an unsupported rate.

**Valid Usage (Implicit)**

- VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-physicalDevice-parameter
  physicalDevice must be a valid VkPhysicalDevice handle
• VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRateCount-parameter
  pFragmentShadingRateCount must be a valid pointer to a uint32_t value

• VUID-vkGetPhysicalDeviceFragmentShadingRatesKHR-pFragmentShadingRates-parameter
  If the value referenced by pFragmentShadingRateCount is not 0, and pFragmentShadingRates is not NULL, pFragmentShadingRates must be a valid pointer to an array of pFragmentShadingRateCount VkPhysicalDeviceFragmentShadingRateKHR structures

## Return Codes

**Success**
- VK_SUCCESS
- VK_INCOMPLETE

**Failure**
- VK_ERROR_OUT_OF_HOST_MEMORY

The VkPhysicalDeviceFragmentShadingRateKHR structure is defined as

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPhysicalDeviceFragmentShadingRateKHR {
    VkStructureType       sType;
    void*                 pNext;
    VkSampleCountFlags    sampleCounts;
    VkExtent2D            fragmentSize;
} VkPhysicalDeviceFragmentShadingRateKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `sampleCounts` is a bitmask of sample counts for which the shading rate described by `fragmentSize` is supported.
- `fragmentSize` is a VkExtent2D describing the width and height of a supported shading rate.

## Valid Usage (Implicit)

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-sType-sType
  sType must be VK_STRUCTURE_TYPE_PHYSICAL_DEVICE_FRAGMENT_SHADING_RATE_KHR

- VUID-VkPhysicalDeviceFragmentShadingRateKHR-pNext-pNext
  pNext must be NULL

Fragment shading rates can be set at three points, with the three rates combined to determine the final shading rate.
27.6.1. Pipeline Fragment Shading Rate

The pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via `vkCmdSetFragmentShadingRateKHR`.

The `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure is defined as:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef struct VkPipelineFragmentShadingRateStateCreateInfoKHR {
    VkStructureType sType;
    const void* pNext;
    VkExtent2D fragmentSize;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateStateCreateInfoKHR;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `fragmentSize` specifies a `VkExtent2D` structure containing the fragment size used to define the pipeline fragment shading rate for drawing commands using this pipeline.
- `combinerOps` specifies a `VkFragmentShadingRateCombinerOpKHR` value determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `fragmentSize` is considered to be equal to (1,1), and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

Valid Usage (Implicit)

- VUID-VkPipelineFragmentShadingRateStateCreateInfoKHR-sType-sType
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_STATE_CREATE_INFO_KHR`

To dynamically set the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_KHR_fragment_shading_rate
void vkCmdSetFragmentShadingRateKHR(
    VkCommandBuffer commandBuffer,
    const VkExtent2D* pFragmentSize,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `pFragmentSize` specifies the pipeline fragment shading rate for subsequent drawing commands.
• **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the **pipeline**, **primitive**, and **attachment shading rates** are **combined** for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04507**
  
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->width` **must** be **1**

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04508**
  
  If `pipelineFragmentShadingRate` is not enabled, `pFragmentSize->height` **must** be **1**

- **VUID-vkCmdSetFragmentShadingRateKHR-pipelineFragmentShadingRate-04509**
  
  One of `pipelineFragmentShadingRate`, `primitiveFragmentShadingRate`, or `attachmentFragmentShadingRate` **must** be enabled

- **VUID-vkCmdSetFragmentShadingRateKHR-primitiveFragmentShadingRate-04510**
  
  If the `primitiveFragmentShadingRate` feature is not enabled, `combinerOps[0]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-attachmentFragmentShadingRate-04511**
  
  If the `attachmentFragmentShadingRate` feature is not enabled, `combinerOps[1]` **must** be `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-fragmentSizeNonTrivialCombinerOps-04512**
  
  If the `fragmentSizeNonTrivialCombinerOps` limit is not supported, elements of `combinerOps` **must** be either `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` or `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR`

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04513**
  
  `pFragmentSize->width` **must** be greater than or equal to **1**

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04514**
  
  `pFragmentSize->height` **must** be greater than or equal to **1**

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04515**
  
  `pFragmentSize->width` **must** be a power-of-two value

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04516**
  
  `pFragmentSize->height` **must** be a power-of-two value

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04517**
  
  `pFragmentSize->width` **must** be less than or equal to **4**

- **VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-04518**
  
  `pFragmentSize->height` **must** be less than or equal to **4**
Valid Usage (Implicit)

- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-parameter
  \texttt{commandBuffer} \textbf{must} be a valid \texttt{VkCommandBuffer} handle
- VUID-vkCmdSetFragmentShadingRateKHR-pFragmentSize-parameter
  \texttt{pFragmentSize} \textbf{must} be a valid pointer to a valid \texttt{VkExtent2D} structure
- VUID-vkCmdSetFragmentShadingRateKHR-combinerOps-parameter
  Any given element of \texttt{combinerOps} \textbf{must} be a valid \texttt{VkFragmentShadingRateCombinerOpKHR} value
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-recording
  \texttt{commandBuffer} \textbf{must} be in the \textit{recording} state
- VUID-vkCmdSetFragmentShadingRateKHR-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} support graphics operations
- VUID-vkCmdSetFragmentShadingRateKHR-videocoding
  This command \textbf{must} only be called outside of a video coding scope

Host Synchronization

- Host access to \texttt{commandBuffer} \textbf{must} be externally synchronized
- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from \textbf{must} be externally synchronized

27.6.2. Primitive Fragment Shading Rate

The \textit{primitive fragment shading rate} \textbf{can} be set via the \texttt{PrimitiveShadingRateKHR} built-in in the last active \textit{pre-rasterization shader stage}. The rate associated with a given primitive is sourced from the value written to \texttt{PrimitiveShadingRateKHR} by that primitive's \textit{provoking vertex}.

27.6.3. Attachment Fragment Shading Rate

The \textit{attachment shading rate} \textbf{can} be set by including \texttt{VkFragmentShadingRateAttachmentInfoKHR} in a subpass to define a \textit{fragment shading rate attachment}. Each pixel in the framebuffer is assigned an attachment fragment shading rate by the corresponding texel in the fragment shading rate.
attachment, according to:

\[ x' = \text{floor}(x / \text{region}_x) \]

\[ y' = \text{floor}(y / \text{region}_y) \]

where \( x' \) and \( y' \) are the coordinates of a texel in the fragment shading rate attachment, \( x \) and \( y \) are the coordinates of the pixel in the framebuffer, and \( \text{region}_x \) and \( \text{region}_y \) are the size of the region each texel corresponds to, as defined by the \text{shadingRateAttachmentTexelSize} member of \text{VkFragmentShadingRateAttachmentInfoKHR}.

If \text{multiview} is enabled and the shading rate attachment has multiple layers, the shading rate attachment texel is selected from the layer determined by the \text{ViewIndex} built-in. If \text{multiview} is disabled, and both the shading rate attachment and the framebuffer have multiple layers, the shading rate attachment texel is selected from the layer determined by the \text{Layer} built-in. Otherwise, the texel is unconditionally selected from the first layer of the attachment.

The fragment size is encoded into the first component of the identified texel as follows:

\[ \text{size}_w = 2^{((\text{texel} / 4) \& 3)} \]

\[ \text{size}_h = 2^{(\text{texel} \& 3)} \]

where \( \text{texel} \) is the value in the first component of the identified texel, and \( \text{size}_w \) and \( \text{size}_h \) are the width and height of the fragment size, decoded from the texel.

If no fragment shading rate attachment is specified, this size is calculated as \( \text{size}_w = \text{size}_h = 1 \). Applications must not specify a width or height greater than 4 by this method.

The \text{Fragment Shading Rate} enumeration in SPIR-V adheres to the above encoding.

27.6.4. Combining the Fragment Shading Rates

The final rate (\( C_{xy}' \)) used for fragment shading must be one of the rates returned by \text{vkGetPhysicalDeviceFragmentShadingRatesKHR} for the sample count and render pass transform used by rasterization.

If any of the following conditions are met, \( C_{xy}' \) must be set to \( \{1,1\} \):

- If \text{Sample Shading} is enabled.
- The \text{fragmentShadingRateWithSampleMask} limit is not supported, and \text{VkPipelineMultisampleStateCreateInfo}::pSampleMask contains a zero value in any bit used by fragment operations.
- The \text{fragmentShadingRateWithShaderSampleMask} is not supported, and the fragment shader has \text{SampleMask} in the input or output interface.
• The `fragmentShadingRateWithShaderDepthStencilWrites` limit is not supported, and the fragment shader declares the `FragDepth` or `FragStencilRefEXT` built-in.

• The `fragmentShadingRateWithConservativeRasterization` limit is not supported, and `VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`.

• The `fragmentShadingRateWithFragmentShaderInterlock` limit is not supported, and the fragment shader declares any of the fragment shader interlock execution modes.

• The `fragmentShadingRateWithCustomSampleLocations` limit is not supported, and `VkPipelineSampleLocationsStateCreateInfoEXT::sampleLocationsEnable` is `VK_TRUE`.

Otherwise, each of the specified shading rates are combined and then used to derive the value of $C_{xy}'$. As there are three ways to specify shading rates, two combiner operations are specified - between the pipeline and primitive shading rates, and between the result of that and the attachment shading rate.

The equation used for each combiner operation is defined by `VkFragmentShadingRateCombinerOpKHR`:

```c
// Provided by VK_KHR_fragment_shading_rate
typedef enum VkFragmentShadingRateCombinerOpKHR {
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR = 0,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR = 1,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR = 2,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR = 3,
    VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR = 4,
} VkFragmentShadingRateCombinerOpKHR;
```

- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = B_{xy}$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \min(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = \max(A_{xy}, B_{xy})$.
- `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` specifies a combiner operation of $\text{combine}(A_{xy}, B_{xy}) = A_{xy} \times B_{xy}$.

where $\text{combine}(A_{xy}, B_{xy})$ is the combine operation, and $A_{xy}$ and $B_{xy}$ are the inputs to the operation.

If `fragmentShadingRateStrictMultiplyCombiner` is `VK_FALSE`, using `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR` with values of 1 for both $A$ and $B$ in the same dimension results in the value 2 being produced for that dimension. See the definition of `fragmentShadingRateStrictMultiplyCombiner` for more information.

These operations are performed in a component-wise fashion.
This is used to generate a combined fragment area using the equation:

\[ C_{xy} = \text{combine}(A_{xy}, B_{xy}) \]

where \( C_{xy} \) is the combined fragment area result, and \( A_{xy} \) and \( B_{xy} \) are the fragment areas of the fragment shading rates being combined.

Two combine operations are performed, first with \( A_{xy} \) equal to the pipeline fragment shading rate and \( B_{xy} \) equal to the primitive fragment shading rate, with the combine() operation selected by combinerOps[0]. A second combination is then performed, with \( A_{xy} \) equal to the result of the first combination and \( B_{xy} \) equal to the attachment fragment shading rate, with the combine() operation selected by combinerOps[1]. The result of the second combination is used as the final fragment shading rate, reported via the ShadingRateKHR built-in.

Implementations may clamp the \( C_{xy} \) result of each combiner operation separately, or only after the second combiner operation.

If the final combined rate is one of the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization, \( C_{xy}' = C_{xy} \). Otherwise, \( C_{xy}' \) is selected from the rates returned by vkGetPhysicalDeviceFragmentShadingRatesKHR for the sample count and render pass transform used by rasterization. From this list of supported rates, the following steps are applied in order, to select a single value:

1. Keep only rates where \( C_x' \leq C_x \) and \( C_y' \leq C_y \).
   - Implementations may also keep rates where \( C_x' \leq C_y \) and \( C_y' \leq C_x \).
2. Keep only rates with the highest area \((C_x' \times C_y')\).
3. Keep only rates with the lowest aspect ratio \((C_x' + C_y')\).
4. In cases where a wide (e.g. 4x1) and tall (e.g. 1x4) rate remain, the implementation may choose either rate. However, it must choose this rate consistently for the same shading rates, render pass transform, and combiner operations for the lifetime of the VkDevice.

### 27.6.5. Extended Fragment Shading Rates

The features advertised by VkPhysicalDeviceFragmentShadingRateEnumsFeaturesNV provide support for additional fragment shading rates beyond those specifying one fragment shader invocation covering all pixels in a fragment whose size is indicated by the fragment shading rate.

If the fragmentShadingRateEnums feature is enabled, fragment shading rates may be specified using the VkFragmentShadingRateNV enumerated type defined as:

```c
// Provided by VK_NV_fragment_shading_rate Enums
typedef enum VkFragmentShadingRateNV {
  VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV = 0,
  VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV = 1,
  VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV = 4,
  VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV = 5,
};
```
VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV specifies a fragment size of 1x1 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_1X2_PIXELS_NV specifies a fragment size of 1x2 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X1_PIXELS_NV specifies a fragment size of 2x1 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X2_PIXELS_NV specifies a fragment size of 2x2 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_2X4_PIXELS_NV specifies a fragment size of 2x4 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X2_PIXELS_NV specifies a fragment size of 4x2 pixels.

VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_4X4_PIXELS_NV specifies a fragment size of 4x4 pixels.

VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with two fragment shader invocations per fragment.

VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with four fragment shader invocations per fragment.

VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with eight fragment shader invocations per fragment.

VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV specifies a fragment size of 1x1 pixels, with sixteen fragment shader invocations per fragment.

VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV specifies that any portions of a primitive that use that shading rate should be discarded without invoking any fragment shader.

To use the shading rates VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV, VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV, and VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV as a pipeline, primitive, or attachment shading rate, the supersampleFragmentShadingRates feature must be enabled. To use the shading rate VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV as a pipeline, primitive, or attachment shading rate, the noInvocationFragmentShadingRates feature must be enabled.

When using fragment shading rate enums, the pipeline fragment shading rate can be set on a per-draw basis by either setting the rate in a graphics pipeline, or dynamically via
The `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_fragment_shading_rate_enums
typedef struct VkPipelineFragmentShadingRateEnumStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkFragmentShadingRateTypeNV shadingRateType;
    VkFragmentShadingRateNV shadingRate;
    VkFragmentShadingRateCombinerOpKHR combinerOps[2];
} VkPipelineFragmentShadingRateEnumStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `shadingRateType` specifies a `VkFragmentShadingRateTypeNV` value indicating whether fragment shading rates are specified using fragment sizes or `VkFragmentShadingRateNV` enums.
- `shadingRate` specifies a `VkFragmentShadingRateNV` value indicating the pipeline fragment shading rate.
- `combinerOps` specifies `VkFragmentShadingRateCombinerOpKHR` values determining how the pipeline, primitive, and attachment shading rates are combined for fragments generated by drawing commands using the created pipeline.

If the `pNext` chain of `VkGraphicsPipelineCreateInfo` includes a `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure, then that structure includes parameters controlling the pipeline fragment shading rate.

If this structure is not present, `shadingRateType` is considered to be equal to `VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV`, `shadingRate` is considered to be equal to `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`, and both elements of `combinerOps` are considered to be equal to `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR`.

**Valid Usage (Implicit)**

- `VUID-VkPipelineFragmentShadingRateEnumStateCreateInfoNV-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_FRAGMENT_SHADING_RATE_ENUM_STATE_CREATE_INFO_NV`
• **VK_FRAGMENT_SHADING_RATE_TYPE_FRAGMENT_SIZE_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure and that any state specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure should be ignored.

• **VK_FRAGMENT_SHADING_RATE_TYPE_ENUMS_NV** specifies that a graphics pipeline should obtain its pipeline fragment shading rate and shading rate combiner state from the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` structure and that any state specified by the `VkPipelineFragmentShadingRateStateCreateInfoKHR` structure should be ignored.

To **dynamically set** the pipeline fragment shading rate and combiner operation, call:

```c
// Provided by VK_NV_fragment_shading_rate_enums
void vkCmdSetFragmentShadingRateEnumNV(
    VkCommandBuffer commandBuffer,
    VkFragmentShadingRateNV shadingRate,
    const VkFragmentShadingRateCombinerOpKHR combinerOps[2]);
```

• **commandBuffer** is the command buffer into which the command will be recorded.

• **shadingRate** specifies a `VkFragmentShadingRateNV` enum indicating the pipeline fragment shading rate for subsequent drawing commands.

• **combinerOps** specifies a `VkFragmentShadingRateCombinerOpKHR` determining how the **pipeline**, **primitive**, and **attachment** shading rates are **combined** for fragments generated by subsequent drawing commands.

This command sets the pipeline fragment shading rate and combiner operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_FRAGMENT_SHADING_RATE_KHR` set in `VkPipelineDynamicStateCreateInfo`::`pDynamicStates`. Otherwise, this state is specified by the `VkPipelineFragmentShadingRateEnumStateCreateInfoNV` values used to create the currently active NV pipeline.

**Note**

This command allows specifying additional shading rates beyond those supported by `vkCmdSetFragmentShadingRateKHR`. For more information, refer to the `VK_NV_fragment_shading_rate Enums` appendix.

**Valid Usage**

• **VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04576**
  If **pipelineFragmentShadingRate** is not enabled, **shadingRate** must be `VK_FRAGMENT_SHADING_RATE_1_INVOCATION_PER_PIXEL_NV`
• VUID-vkCmdSetFragmentShadingRateEnumNV-supersampleFragmentShadingRates-04577
  If supersampleFragmentShadingRates is not enabled, shadingRate must not be
  VK_FRAGMENT_SHADING_RATE_2_INVOCATIONS_PER_PIXEL_NV,
  VK_FRAGMENT_SHADING_RATE_4_INVOCATIONS_PER_PIXEL_NV,
  VK_FRAGMENT_SHADING_RATE_8_INVOCATIONS_PER_PIXEL_NV,
  or
  VK_FRAGMENT_SHADING_RATE_16_INVOCATIONS_PER_PIXEL_NV

• VUID-vkCmdSetFragmentShadingRateEnumNV-noInvocationFragmentShadingRates-04578
  If noInvocationFragmentShadingRates is not enabled, shadingRate must not be
  VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV

• VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentShadingRateEnums-04579
  The fragmentShadingRateEnums feature must be enabled

• VUID-vkCmdSetFragmentShadingRateEnumNV-pipelineFragmentShadingRate-04580
  One of the pipelineFragmentShadingRate, primitiveFragmentShadingRate, or
  attachmentFragmentShadingRate features must be enabled

• VUID-vkCmdSetFragmentShadingRateEnumNV-primitiveFragmentShadingRate-04581
  If the primitiveFragmentShadingRate feature is not enabled, combinerOps[0] must be
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

• VUID-vkCmdSetFragmentShadingRateEnumNV-attachmentFragmentShadingRate-04582
  If the attachmentFragmentShadingRate feature is not enabled, combinerOps[1] must be
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR

• VUID-vkCmdSetFragmentShadingRateEnumNV-fragmentSizeNonTrivialCombinerOps-04583
  If the fragmentSizeNonTrivialCombinerOps limit is not supported, elements of combinerOps
  must be either VK_FRAGMENT_SHADING_RATE_COMBINER_OP_KEEP_KHR or
  VK_FRAGMENT_SHADING_RATE_COMBINER_OP_REPLACE_KHR

### Valid Usage (Implicit)

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

• VUID-vkCmdSetFragmentShadingRateEnumNV-shadingRate-parameter
  shadingRate must be a valid VkFragmentShadingRateNV value

• VUID-vkCmdSetFragmentShadingRateEnumNV-combinerOps-parameter
  Any given element of combinerOps must be a valid
  VkFragmentShadingRateCombinerOpKHR value

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-recording
  commandBuffer must be in the recording state

• VUID-vkCmdSetFragmentShadingRateEnumNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
This command **must** only be called outside of a video coding scope.

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized.

### Command Properties

When the `supersampleFragmentShadingRates` or `noInvocationFragmentShadingRates` features are enabled, the behavior of the shading rate combiner operations is extended to support the shading rates enabled by those features. Primitive and attachment shading rate values are interpreted as `VkFragmentShadingRateNV` values and the behavior of the combiners is modified as follows:

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, and `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, if either $A_{xy}$ or $B_{xy}$ is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, `combine(A_{xy}, B_{xy})` produces a shading rate of `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, regardless of the other input shading rate.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MIN_KHR`, `combine(A_{xy}, B_{xy})` produces a shading rate whose fragment size is the smaller of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the larger of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MAX_KHR`, `combine(A_{xy}, B_{xy})` produces a shading rate whose fragment size is the larger of the fragment sizes of $A_{xy}$ and $B_{xy}$ and whose invocation count is the smaller of the invocation counts of $A_{xy}$ and $B_{xy}$.

- For `VK_FRAGMENT_SHADING_RATE_COMBINER_OP_MUL_KHR`, `combine(A_{xy}, B_{xy})` produces a shading rate whose fragment size and invocation count is the product of the fragment sizes and invocation counts, respectively, of $A_{xy}$ and $B_{xy}$. If the resulting shading rate has both multiple pixels and multiple invocations per fragment, an implementation **may** adjust the shading rate by reducing both the pixel and invocation counts.

If the final shading rate from the combiners is `VK_FRAGMENT_SHADING_RATE_NO_INVOCATIONS_NV`, no fragments will be generated for any portion of a primitive using that shading rate.

If the final shading rate from the combiners specifies multiple fragment shader invocations per fragment, the fragment will be processed with multiple unique samples as in **sample shading**.
where the total number of invocations is taken from the shading rate and then clamped to `rasterizationSamples` and `maxFragmentShadingRateInvocationCount`.

### 27.7. Shading Rate Image

The `shadingRateImage` feature allows pipelines to use a shading rate image to control the fragment area and the minimum number of fragment shader invocations launched for each fragment. When the shading rate image is enabled, the rasterizer determines a base shading rate for each region of the framebuffer covered by a primitive by fetching a value from the shading rate image and translating it to a shading rate using a per-viewport shading rate palette. This base shading rate is then adjusted to derive a final shading rate. The final shading rate specifies the fragment area and fragment shader invocation count to use for fragments generated in the region.

If the `pNext` chain of `VkPipelineViewportStateCreateInfo` includes a `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure, then that structure includes parameters controlling the shading rate.

The `VkPipelineViewportShadingRateImageStateCreateInfoNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportShadingRateImageStateCreateInfoNV {
    VkStructureType sType;
    const void* pNext;
    VkBool32 shadingRateImageEnable;
    uint32_t viewportCount;
    const VkShadingRatePaletteNV* pShadingRatePalettes;
} VkPipelineViewportShadingRateImageStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is NULL or a pointer to a structure extending this structure.
- `shadingRateImageEnable` specifies whether shading rate image and palettes are used during rasterization.
- `viewportCount` specifies the number of per-viewport palettes used to translate values stored in shading rate images.
- `pShadingRatePalettes` is a pointer to an array of `VkShadingRatePaletteNV` structures defining the palette for each viewport. If the shading rate palette state is dynamic, this member is ignored.

If this structure is not present, `shadingRateImageEnable` is considered to be `VK_FALSE`, and the shading rate image and palettes are not used.

**Valid Usage**

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02054
  If the multiViewport feature is not enabled, `viewportCount` must be 0 or 1
- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-viewportCount-02055
viewportCount must be less than or equal to VkPhysicalDeviceLimits::maxViewports

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-shadingRateImageEnable-02056
  If shadingRateImageEnable is VK_TRUE, viewportCount must be greater or equal to the viewportCount member of VkPipelineViewportStateCreateInfo

Valid Usage (Implicit)

- VUID-VkPipelineViewportShadingRateImageStateCreateInfoNV-sType-sType must be
  VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_SHADING_RATE_IMAGE_STATE_CREATE_INFO_NV

When shading rate image usage is enabled in the bound pipeline, the pipeline uses a shading rate image specified by the command:

```
// Provided by VK_NV_shading_rate_image

void vkCmdBindShadingRateImageNV(
    VkCommandBuffer commandBuffer,
    VkImageView imageView,
    VkImageLayout imageLayout);
```

- commandBuffer is the command buffer into which the command will be recorded.
- imageView is an image view handle specifying the shading rate image. imageView may be set to VK_NULL_HANDLE, which is equivalent to specifying a view of an image filled with zero values.
- imageLayout is the layout that the image subresources accessible from imageView will be in when the shading rate image is accessed.

Valid Usage

- VUID-vkCmdBindShadingRateImageNV-None-02058
  The shadingRateImage feature must be enabled

- VUID-vkCmdBindShadingRateImageNV-imageView-02059
  If imageView is not VK_NULL_HANDLE, it must be a valid VkImageView handle of type VK_IMAGE_VIEW_TYPE_2D or VK_IMAGE_VIEW_TYPE_2D_ARRAY

- VUID-vkCmdBindShadingRateImageNV-imageView-02060
  If imageView is not VK_NULL_HANDLE, it must have a format of VK_FORMAT_R8_UINT

- VUID-vkCmdBindShadingRateImageNV-imageView-02061
  If imageView is not VK_NULL_HANDLE, it must have been created with a usage value including VK_IMAGE_USAGE_SHADING_RATE_IMAGE_BIT_NV

- VUID-vkCmdBindShadingRateImageNV-imageView-02062
  If imageView is not VK_NULL_HANDLE, imageLayout must match the actual VkImageLayout of each subresource accessible from imageView at the time the subresource is accessed
If `imageView` is not `VK_NULL_HANDLE`, `imageLayout` must be `VK_IMAGE_LAYOUT_SHADING_RATE_OPTIMAL_NV` or `VK_IMAGE_LAYOUT_GENERAL`.

**Valid Usage (Implicit)**

- VUID-vkCmdBindShadingRateImageNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle.
- VUID-vkCmdBindShadingRateImageNV-imageView-parameter
  If `imageView` is not `VK_NULL_HANDLE`, `imageView` must be a valid `VkImageView` handle.
- VUID-vkCmdBindShadingRateImageNV-imageLayout-parameter
  `imageLayout` must be a valid `VkImageLayout` value.
- VUID-vkCmdBindShadingRateImageNV-commandBuffer-recording
  `commandBuffer` must be in the recording state.
- VUID-vkCmdBindShadingRateImageNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations.
- VUID-vkCmdBindShadingRateImageNV-videocoding
  This command must only be called outside of a video coding scope.
- VUID-vkCmdBindShadingRateImageNV-commonparent
  Both of `commandBuffer` and `imageView` that are valid handles of non-ignored parameters must have been created, allocated, or retrieved from the same `VkDevice`.

**Host Synchronization**

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary, Secondary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
</tbody>
</table>

When the shading rate image is enabled in the current pipeline, rasterizing a primitive covering the pixel with coordinates `(x, y)` will fetch a shading rate index value from the shading rate image bound by `vkCmdBindShadingRateImageNV`. If the shading rate image view has a type of `VK_IMAGE_VIEW_TYPE_2D`, the lookup will use texel coordinates `(u, v)` where \( u = \frac{x}{\text{width}} \), \( v = \frac{y}{\text{height}} \).
and \texttt{twidth} and \texttt{theight} are the width and height of the implementation-dependent shading rate texel size. If the shading rate image view has a type of \texttt{VK\_IMAGE\_VIEW\_TYPE\_2D\_ARRAY}, the lookup will use texel coordinates \((u,v)\) to extract a texel from the layer \(l\), where \(l\) is the layer of the framebuffer being rendered to. If \(l\) is greater than or equal to the number of layers in the image view, layer zero will be used.

If the bound shading rate image view is not \texttt{VK\_NULL\_HANDLE} and contains a texel with coordinates \((u,v)\) in layer \(l\) (if applicable), the single unsigned integer component for that texel will be used as the shading rate index. If the \((u,v)\) coordinate is outside the extents of the subresource used by the shading rate image view, or if the image view is \texttt{VK\_NULL\_HANDLE}, the shading rate index is zero. If the shading rate image view has multiple mipmap levels, the base level identified by \texttt{VkImageSubresourceRange::baseMipLevel} will be used.

A shading rate index is mapped to a base shading rate using a lookup table called the shading rate image palette. There is a separate palette for each viewport. The number of entries in each palette is given by the implementation-dependent shading rate image palette size.

To dynamically set the per-viewport shading rate image palettes, call:

```c
// Provided by \texttt{VK\_NV\_shading\_rate\_image}
void \texttt{vkCmdSetViewportShadingRatePaletteNV}(  
    VkCommandBuffer commandBuffer,  
    uint32_t firstViewport,  
    uint32_t viewportCount,  
    const \texttt{VkShadingRatePaletteNV}* pShadingRatePalettes);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{firstViewport} is the index of the first viewport whose shading rate palette is updated by the command.
- \texttt{viewportCount} is the number of viewports whose shading rate palettes are updated by the command.
- \texttt{pShadingRatePalettes} is a pointer to an array of \texttt{VkShadingRatePaletteNV} structures defining the palette for each viewport.

This command sets the per-viewport shading rate image palettes for subsequent drawing commands when the graphics pipeline is created with \texttt{VK\_DYNAMIC\_STATE\_VIEWPORT\_SHADING\_RATE\_PALETTE\_NV} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineViewportShadingRateImageStateCreateInfoNV::pShadingRatePalettes} values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetViewportShadingRatePaletteNV-None-02064
  The shadingRateImage feature must be enabled
- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02067
The sum of firstViewport and viewportCount must be between 1 and VkPhysicalDeviceLimits::maxViewports, inclusive

- VUID-vkCmdSetViewportShadingRatePaletteNV-firstViewport-02068
  If the multiViewport feature is not enabled, firstViewport must be 0

- VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-02069
  If the multiViewport feature is not enabled, viewportCount must be 1

Valid Usage (Implicit)

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetViewportShadingRatePaletteNV-pShadingRatePalettes-parameter
  pShadingRatePalettes must be a valid pointer to an array of viewportCount valid VkShadingRatePaletteNV structures

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetViewportShadingRatePaletteNV-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetViewportShadingRatePaletteNV-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetViewportShadingRatePaletteNV-viewportCount-arraylength
  viewportCount must be greater than 0

Host Synchronization

- Host access to commandBuffer must be externally synchronized

- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The VkShadingRatePaletteNV structure specifies to contents of a single shading rate image palette and is defined as:
// Provided by VK_NV_shading_rate_image

typedef struct VkShadingRatePaletteNV {
    uint32_t shadingRatePaletteEntryCount;
    const VkShadingRatePaletteEntryNV* pShadingRatePaletteEntries;
} VkShadingRatePaletteNV;

• shadingRatePaletteEntryCount specifies the number of entries in the shading rate image palette.
• pShadingRatePaletteEntries is a pointer to an array of VkShadingRatePaletteEntryNV enums defining the shading rate for each palette entry.

Valid Usage

• VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-02071
  shadingRatePaletteEntryCount must be between 1 and VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRatePaletteSize, inclusive

Valid Usage (Implicit)

• VUID-VkShadingRatePaletteNV-pShadingRatePaletteEntries-parameter
  pShadingRatePaletteEntries must be a valid pointer to an array of shadingRatePaletteEntryCount valid VkShadingRatePaletteEntryNV values
• VUID-VkShadingRatePaletteNV-shadingRatePaletteEntryCount-arraylength
  shadingRatePaletteEntryCount must be greater than 0

To determine the base shading rate image, a shading rate index i is mapped to array element i in the array pShadingRatePaletteEntries for the palette corresponding to the viewport used for the fragment. If i is greater than or equal to the palette size shadingRatePaletteEntryCount, the base shading rate is undefined.

The supported shading rate image palette entries are defined by VkShadingRatePaletteEntryNV:

// Provided by VK_NV_shading_rate_image

typedef enum VkShadingRatePaletteEntryNV {
    VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV = 0,
    VK_SHADING_RATE_PALETTE_ENTRY_16_INVOCATIONS_PER_PIXEL_NV = 1,
    VK_SHADING_RATE_PALETTE_ENTRY_8_INVOCATIONS_PER_PIXEL_NV = 2,
    VK_SHADING_RATE_PALETTE_ENTRY_4_INVOCATIONS_PER_PIXEL_NV = 3,
    VK_SHADING_RATE_PALETTE_ENTRY_2_INVOCATIONS_PER_PIXEL_NV = 4,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV = 5,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X1_PIXELS_NV = 6,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_1X2_PIXELS_NV = 7,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X2_PIXELS_NV = 8,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X2_PIXELS_NV = 9,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_2X4_PIXELS_NV = 10,
    VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_4X4_PIXELS_NV = 11,
};
The following table indicates the width and height (in pixels) of each fragment generated using the
indicated shading rate, as well as the maximum number of fragment shader invocations launched
for each fragment. When processing regions of a primitive that have a shading rate of
VK_SHADING_RATE_PALETTE_ENTRY_NO_INVOCATIONS_NV, no fragments will be generated in that region.

</tbody>
</table>

When the shading rate image is disabled, a shading rate of
VK_SHADING_RATE_PALETTE_ENTRY_1_INVOCATION_PER_PIXEL_NV will be used as the base shading rate.

Once a base shading rate has been established, it is adjusted to produce a final shading rate. First, if
the base shading rate uses multiple pixels for each fragment, the implementation may reduce the fragment area to ensure that the total number of coverage samples for all pixels in a fragment does not exceed an implementation-dependent maximum.

If sample shading is active in the current pipeline and would result in processing \( n \) \((n > 1)\) unique samples per fragment when the shading rate image is disabled, the shading rate is adjusted in an implementation-dependent manner to increase the number of fragment shader invocations spawned by the primitive. If the shading rate indicates \( fs \) pixels per fragment and \( fs \) is greater than \( n \), the fragment area is adjusted so each fragment has approximately \( \frac{fs}{n} \) pixels. Otherwise, if the shading rate indicates \( ipf \) invocations per fragment, the fragment area will be adjusted to a single pixel with approximately \( ipf \times \frac{n}{fs} \) invocations per fragment.

If sample shading occurs due to the use of a fragment shader input variable decorated with SampleId or SamplePosition, the shading rate is ignored. Each fragment will have a single pixel and will spawn up to rasterizationSamples fragment shader invocations, as when using sample shading without a shading rate image.

Finally, if the shading rate specifies multiple fragment shader invocations per fragment, the total number of invocations in the shading rate is clamped to be no larger than rasterizationSamples.

When the final shading rate for a primitive covering pixel \((x, y)\) has a fragment area of \(fw \times fh\), the fragment for that pixel will cover all pixels with coordinates \((x', y')\) that satisfy the equations:

\[
\frac{|x|}{fw} = |x'| \quad \frac{|y|}{fh} = |y'|
\]

This combined fragment is considered to have multiple coverage samples; the total number of samples in this fragment is given by \(samples = fw \times fh \times rs\) where \(rs\) indicates the value of VkPipelineMultisampleStateCreateInfo::rasterizationSamples specified at pipeline creation time. The set of coverage samples in the fragment is the union of the per-pixel coverage samples in each of the fragment’s pixels. The location and order of coverage samples within each pixel in the combined fragment are assigned as described in Multisampling and Custom Sample Locations. Each coverage sample in the set of pixels belonging to the combined fragment is assigned a unique coverage index in the range \([0, samples-1]\). If the shadingRateCoarseSampleOrder feature is supported, the order of coverage samples can be specified for each combination of fragment area and coverage sample count. If this feature is not supported, the sample order is implementation-dependent.

If the pNext chain of VkPipelineViewportStateCreateInfo includes a VkPipelineViewportCoarseSampleOrderStateCreateInfoNV structure, then that structure includes parameters controlling the order of coverage samples in fragments larger than one pixel.

The VkPipelineViewportCoarseSampleOrderStateCreateInfoNV structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkPipelineViewportCoarseSampleOrderStateCreateInfoNV {
    VkStructureType sType;
    // other fields...
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;
```
const void* pNext;
VkCoarseSampleOrderTypeNV sampleOrderType;
uint32_t customSampleOrderCount;
const VkCoarseSampleOrderCustomNV* pCustomSampleOrders;
} VkPipelineViewportCoarseSampleOrderStateCreateInfoNV;

• sType is the type of this structure.
• pNext is NULL or a pointer to a structure extending this structure.
• sampleOrderType specifies the mechanism used to order coverage samples in fragments larger than one pixel.
• customSampleOrderCount specifies the number of custom sample orderings to use when ordering coverage samples.
• pCustomSampleOrders is a pointer to an array of customSampleOrderCount VkCoarseSampleOrderCustomNV structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If this structure is not present, sampleOrderType is considered to be VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If sampleOrderType is VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in pCustomSampleOrders will be identical to that used for VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV.

If the pipeline was created with VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV, the contents of this structure (if present) are ignored, and the coverage sample order is instead specified by vkCmdSetCoarseSampleOrderNV.

Valid Usage

• VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-02072 If sampleOrderType is not VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV, customSamplerOrderCount must be 0
• VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-02234 The array pCustomSampleOrders must not contain two structures with matching values for both the shadingRate and sampleCount members

Valid Usage (Implicit)

• VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_COARSE_SAMPLE_ORDER_STATE_CREATE_INFO_NV
• VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-sampleOrderType-parameter
sampleOrderType must be a valid VkCoarseSampleOrderTypeNV value

- VUID-VkPipelineViewportCoarseSampleOrderStateCreateInfoNV-pCustomSampleOrders-
  parameter
  If customSampleOrderCount is not 0, pCustomSampleOrders must be a valid pointer to an array
  of customSampleOrderCount valid VkCoarseSampleOrderCustomNV structures

The type VkCoarseSampleOrderTypeNV specifies the technique used to order coverage samples in
fragments larger than one pixel, and is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef enum VkCoarseSampleOrderTypeNV {
    VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV = 0,
    VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV = 1,
    VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV = 2,
    VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV = 3,
} VkCoarseSampleOrderTypeNV;
```

- VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV specifies that coverage samples will be ordered in
  an implementation-dependent manner.
- VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV specifies that coverage samples will be ordered
  according to the array of custom orderings provided in either the pCustomSampleOrders member
  of VkPipelineViewportCoarseSampleOrderStateCreateInfoNV or the pCustomSampleOrders member of
  vkCmdSetCoarseSampleOrderNV.
- VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV specifies that coverage samples will be ordered
  sequentially, sorted first by pixel coordinate (in row-major order) and then by sample index.
- VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV specifies that coverage samples will be ordered
  sequentially, sorted first by sample index and then by pixel coordinate (in row-major order).

When using a coarse sample order of VK_COARSE_SAMPLE_ORDER_TYPE_PIXEL_MAJOR_NV for a fragment
with an upper-left corner of \((f_x, f_y)\) with a width of \(f_w \times f_h\) and \(f_sc\) samples per pixel, coverage
index \(cs\) of the fragment will be assigned to sample index \(fs\) of pixel \((px, py)\) as follows:

\[
px = f_x + \left(\left\lfloor\frac{cs}{f_sc} \right\rfloor \times f_w \right) \\
py = f_y + \left\lfloor\frac{cs}{f_sc \times f_w}\right\rfloor \\
fs = cs \times f_sc
\]

When using a coarse sample order of VK_COARSE_SAMPLE_ORDER_TYPE_SAMPLE_MAJOR_NV, coverage index
\(cs\) will be assigned as follows:

\[
px = f_x + cs \times f_w \\
py = \left( f_y + \left\lfloor\frac{cs}{f_w} \right\rfloor \times f_h \right) \\
fs = \left\lfloor\frac{cs}{f_w \times f_h}\right\rfloor
\]
The `VkCoarseSampleOrderCustomNV` structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleOrderCustomNV {
    VkShadingRatePaletteEntryNV shadingRate;
    uint32_t sampleCount;
    uint32_t sampleLocationCount;
    const VkCoarseSampleLocationNV* pSampleLocations;
} VkCoarseSampleOrderCustomNV;
```

- **shadingRate** is a shading rate palette entry that identifies the fragment width and height for the combination of fragment area and per-pixel coverage sample count to control.
- **sampleCount** identifies the per-pixel coverage sample count for the combination of fragment area and coverage sample count to control.
- **sampleLocationCount** specifies the number of sample locations in the custom ordering.
- **pSampleLocations** is a pointer to an array of `VkCoarseSampleLocationNV` structures specifying the location of each sample in the custom ordering.

The `VkCoarseSampleOrderCustomNV` structure is used with a coverage sample ordering type of `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV` to specify the order of coverage samples for one combination of fragment width, fragment height, and coverage sample count.

When using a custom sample ordering, element $j$ in `pSampleLocations` specifies a specific pixel location and sample index that corresponds to coverage index $j$ in the multi-pixel fragment.

### Valid Usage

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-02073**
  - `shadingRate` must be a shading rate that generates fragments with more than one pixel

- **VUID-VkCoarseSampleOrderCustomNV-sampleCount-02074**
  - `sampleCount` must correspond to a sample count enumerated in `VkSampleCountFlags` whose corresponding bit is set in `VkPhysicalDeviceLimits::framebufferNoAttachmentsSampleCounts`

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02075**
  - `sampleLocationCount` must be equal to the product of `sampleCount`, the fragment width for `shadingRate`, and the fragment height for `shadingRate`

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-02076**
  - `sampleLocationCount` must be less than or equal to the value of `VkPhysicalDeviceShadingRateImagePropertiesNV::shadingRateMaxCoarseSamples`

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-02077**
  - The array `pSampleLocations` must contain exactly one entry for every combination of valid values for `pixelX`, `pixelY`, and `sample` in the structure `VkCoarseSampleOrderCustomNV`
Valid Usage (Implicit)

- **VUID-VkCoarseSampleOrderCustomNV-shadingRate-parameter**
  
  shadingRate must be a valid VkShadingRatePaletteEntryNV value

- **VUID-VkCoarseSampleOrderCustomNV-pSampleLocations-parameter**
  
  pSampleLocations must be a valid pointer to an array of sampleLocationCount VkCoarseSampleLocationNV structures

- **VUID-VkCoarseSampleOrderCustomNV-sampleLocationCount-arraylength**
  
  sampleLocationCount must be greater than 0

The VkCoarseSampleLocationNV structure identifies a specific pixel and sample index for one of the coverage samples in a fragment that is larger than one pixel. This structure is defined as:

```c
// Provided by VK_NV_shading_rate_image
typedef struct VkCoarseSampleLocationNV {
    uint32_t pixelX;
    uint32_t pixelY;
    uint32_t sample;
} VkCoarseSampleLocationNV;
```

- **pixelX** is added to the x coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
- **pixelY** is added to the y coordinate of the upper-leftmost pixel of each fragment to identify the pixel containing the coverage sample.
- **sample** is the number of the coverage sample in the pixel identified by pixelX and pixelY.

Valid Usage

- **VUID-VkCoarseSampleLocationNV-pixelX-02078**
  
  pixelX must be less than the width (in pixels) of the fragment

- **VUID-VkCoarseSampleLocationNV-pixelY-02079**
  
  pixelY must be less than the height (in pixels) of the fragment

- **VUID-VkCoarseSampleLocationNV-sample-02080**
  
  sample must be less than the number of coverage samples in each pixel belonging to the fragment

To dynamically set the order of coverage samples in fragments larger than one pixel, call:

```c
// Provided by VK_NV_shading_rate_image
void vkCmdSetCoarseSampleOrderNV(
    VkCommandBuffer commandBuffer,
    VkCoarseSampleOrderTypeNV sampleOrderType,
    uint32_t customSampleOrderCount,
);```
const VkCoarseSampleOrderCustomNV* pCustomSampleOrders);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `sampleOrderType` specifies the mechanism used to order coverage samples in fragments larger than one pixel.
- `customSampleOrderCount` specifies the number of custom sample orderings to use when ordering coverage samples.
- `pCustomSampleOrders` is a pointer to an array of `VkCoarseSampleOrderCustomNV` structures, each structure specifying the coverage sample order for a single combination of fragment area and coverage sample count.

If `sampleOrderType` is `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, the coverage sample order used for any combination of fragment area and coverage sample count not enumerated in `pCustomSampleOrders` will be identical to that used for `VK_COARSE_SAMPLE_ORDER_TYPE_DEFAULT_NV`.

This command sets the order of coverage samples for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_VIEWPORT_COARSE_SAMPLE_ORDER_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportCoarseSampleOrderStateCreateInfoNV` values used to create the currently active pipeline.

**Valid Usage**

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-02081
  If `sampleOrderType` is not `VK_COARSE_SAMPLE_ORDER_TYPE_CUSTOM_NV`, `customSamplerOrderCount` must be 0

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-02235
  The array `pCustomSampleOrders` must not contain two structures with matching values for both the `shadingRate` and `sampleCount` members

**Valid Usage (Implicit)**

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-parameter
  `commandBuffer` must be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetCoarseSampleOrderNV-sampleOrderType-parameter
  `sampleOrderType` must be a valid `VkCoarseSampleOrderTypeNV` value

- VUID-vkCmdSetCoarseSampleOrderNV-pCustomSampleOrders-parameter
  If `customSampleOrderCount` is not 0, `pCustomSampleOrders` must be a valid pointer to an array of `customSampleOrderCount` valid `VkCoarseSampleOrderCustomNV` structures

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-recording
  `commandBuffer` must be in the recording state

- VUID-vkCmdSetCoarseSampleOrderNV-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

If the final shading rate for a primitive covering pixel \((x,y)\) results in \(n\) invocations per pixel \((n > 1)\), \(n\) separate fragment shader invocations will be generated for the fragment. Each coverage sample in the fragment will be assigned to one of the \(n\) fragment shader invocations in an implementation-dependent manner. The outputs from the fragment output interface of each shader invocation will be broadcast to all of the framebuffer samples associated with the invocation. If none of the coverage samples associated with a fragment shader invocation is covered by a primitive, the implementation may discard the fragment shader invocation for those samples.

If the final shading rate for a primitive covering pixel \((x,y)\) results in a fragment containing multiple pixels, a single set of fragment shader invocations will be generated for all pixels in the combined fragment. Outputs from the fragment output interface will be broadcast to all covered framebuffer samples belonging to the fragment. If the fragment shader executes code discarding the fragment, none of the samples of the fragment will be updated.

27.8. Sample Shading

Sample shading can be used to specify a minimum number of unique samples to process for each fragment. If sample shading is enabled, an implementation must invoke the fragment shader at least \(\max(\lceil \frac{\text{VkPipelineMultisampleStateCreateInfo::minSampleShading} \times \text{VkPipelineMultisampleStateCreateInfo::rasterizationSamples}}{1} \rceil, 1)\) times per fragment. If a fragment shader entry point's interface includes an input variable decorated with a `BuiltIn` of `SampleId` or `SamplePosition`, a value of 1.0 is used instead of `minSampleShading`. If the `VK_AMD_mixed_attachment_samples` extension is enabled and the subpass uses color attachments, the `samples` value used to create each color attachment is used instead of `rasterizationSamples`.

Sample shading is enabled if at least one of the following conditions is true:
• VkPipelineMultisampleStateCreateInfo::sampleShadingEnable is set to VK_TRUE, or
• the fragment shader’s entry point interface includes input variables decorated with a BuiltIn of SampleId or SamplePosition built-ins.

If there are fewer invocations than covered samples, implementations may include those samples in fragment shader invocations in any manner as long as covered samples are all shaded at least once.

27.9. Barycentric Interpolation

When the fragmentShaderBarycentric feature is enabled, the PerVertexKHR interpolation decoration can be used with fragment shader inputs to indicate that the decorated inputs do not have associated data in the fragment. Such inputs can only be accessed in a fragment shader using an array index whose value (0, 1, or 2) identifies one of the vertices of the primitive that produced the fragment. Reads of per-vertex values for missing vertices, such as the third vertex of a line primitive, will return values from the valid vertex with the highest index. This means that the per-vertex values of indices 1 and 2 for point primitives will be equal to those of index 0, and the per-vertex values of index 2 for line primitives will be equal to those of index 1.

When tessellation, geometry shading, and mesh shading are not active, fragment shader inputs decorated with PerVertexKHR will take values from one of the vertices of the primitive that produced the fragment, identified by the extra index provided in SPIR-V code accessing the input. If the n vertices passed to a draw call are numbered 0 through n-1, and the point, line, and triangle primitives produced by the draw call are numbered with consecutive integers beginning with zero, the following table indicates the original vertex numbers used when the provoking vertex mode is VK_PROVOKING_VERTEX_MODE_FIRST_VERTEX_EXT for index values of 0, 1, and 2. If an input decorated with PerVertexKHR is accessed with any other vertex index value, or is accessed while rasterizing a polygon when the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline is not VK_POLYGON_MODE_FILL, an undefined value is returned.

When geometry or mesh shading is active, primitives processed by fragment shaders are assembled from the vertices emitted by the geometry or mesh shader. In this case, the vertices used for fragment shader inputs decorated with **PerVertexKHR** are derived by treating the primitives produced by the shader as though they were specified by a draw call and consulting the table above.

When using tessellation without geometry shading, the tessellator produces primitives in an implementation-dependent manner. While there is no defined vertex ordering for inputs decorated with **PerVertexKHR**, the vertex ordering used in this case will be consistent with the ordering used to derive the values of inputs decorated with **BaryCoordKHR** or **BaryCoordNoPerspKHR**.
Fragment shader inputs decorated with `BaryCoordKHR` or `BaryCoordNoPerspKHR` hold three-component vectors with barycentric weights that indicate the location of the fragment relative to the screen-space locations of vertices of its primitive. For point primitives, such variables are always assigned the value (1,0,0). For line primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0 and 1 are (1,0,0) and (0,1,0), respectively. For polygon primitives, the built-ins are obtained by interpolating an attribute whose values for the vertices numbered 0, 1, and 2 are (1,0,0), (0,1,0), and (0,0,1), respectively. For `BaryCoordKHR`, the values are obtained using perspective interpolation. For `BaryCoordNoPerspKHR`, the values are obtained using linear interpolation. The values of `BaryCoordKHR` and `BaryCoordNoPerspKHR` are undefined while rasterizing a polygon when the `VkPipelineRasterizationStateCreateInfo::polygonMode` property of the currently active pipeline is not `VK_POLYGON_MODE_FILL`.

### 27.10. Points

A point is drawn by generating a set of fragments in the shape of a square centered around the vertex of the point. Each vertex has an associated point size controlling the width/height of that square. The point size is taken from the (potentially clipped) shader built-in `PointSize` written by:

- the geometry shader, if active;
- the tessellation evaluation shader, if active and no geometry shader is active;
- the vertex shader, otherwise

and clamped to the implementation-dependent point size range `[pointSizeRange[0], pointSizeRange[1]]`. The value written to `PointSize` must be greater than zero.

Not all point sizes need be supported, but the size 1.0 must be supported. The range of supported sizes and the size of evenly-spaced gradations within that range are implementation-dependent. The range and gradations are obtained from the `pointSizeRange` and `pointSizeGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional point sizes may also be supported. There is no requirement that these sizes be equally spaced. If an unsupported size is requested, the nearest supported size is used instead.

Further, if the render pass has a fragment density map attachment, point size may be rounded by the implementation to a multiple of the fragment’s width or height.

### 27.10.1. Basic Point Rasterization

Point rasterization produces a fragment for each fragment area group of framebuffer pixels with one or more sample points that intersect a region centered at the point’s \((x_f, y_f)\). This region is a square with side equal to the current point size. Coverage bits that correspond to sample points that intersect the region are 1, other coverage bits are 0. All fragments produced in rasterizing a point are assigned the same associated data, which are those of the vertex corresponding to the point. However, the fragment shader built-in `PointCoord` contains point sprite texture coordinates. The \(s\) and \(t\) point sprite texture coordinates vary from zero to one across the point horizontally left-to-right and vertically top-to-bottom, respectively. The following formulas are used to evaluate \(s\) and \(t\):
where size is the point's size; \((x_p, y_p)\) is the location at which the point sprite coordinates are evaluated - this may be the framebuffer coordinates of the fragment center, or the location of a sample; and \((x_f, y_f)\) is the exact, unrounded framebuffer coordinate of the vertex for the point.

### 27.11. Line Segments

Line segment rasterization options are controlled by the `VkPipelineRasterizationLineStateCreateInfoEXT` structure.

The `VkPipelineRasterizationLineStateCreateInfoEXT` structure is defined as:

```c
// Provided by VK_EXT_line_rasterization
typedef struct VkPipelineRasterizationLineStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkLineRasterizationModeEXT lineRasterizationMode;
    VkBool32 stippledLineEnable;
    uint32_t lineStippleFactor;
    uint16_t lineStipplePattern;
} VkPipelineRasterizationLineStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `lineRasterizationMode` is a `VkLineRasterizationModeEXT` value selecting the style of line rasterization.
- `stippledLineEnable` enables stippled line rasterization.
- `lineStippleFactor` is the repeat factor used in stippled line rasterization.
- `lineStipplePattern` is the bit pattern used in stippled line rasterization.

If `stippledLineEnable` is `VK_FALSE`, the values of `lineStippleFactor` and `lineStipplePattern` are ignored.

**Valid Usage**

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02768
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the `rectangularLines` feature must be enabled.

- VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02769
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the
**bresenhamLines** feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-02770**
  If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the **bresenhamLines** feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02771**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`, then the **stippledRectangularLines** feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02772**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the **stippledBresenhamLines** feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02773**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then the **stippledSmoothLines** feature **must** be enabled

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-stippledLineEnable-02774**
  If `stippledLineEnable` is `VK_TRUE` and `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, then the **stippledRectangularLines** feature **must** be enabled and **VkPhysicalDeviceLimits::strictLines** **must** be `VK_TRUE`

**Valid Usage (Implicit)**

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-sType-sType**
  `sType` **must** be `VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_LINE_STATE_CREATE_INFO_EXT`

- **VUID-VkPipelineRasterizationLineStateCreateInfoEXT-lineRasterizationMode-parameter**
  `lineRasterizationMode` **must** be a valid `VkLineRasterizationModeEXT` value

Possible values of `VkPipelineRasterizationLineStateCreateInfoEXT::lineRasterizationMode` are:

```cpp
// Provided by VK_EXT_line_rasterization
typedef enum VkLineRasterizationModeEXT {
    VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT = 0,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT = 1,
    VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT = 2,
    VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT = 3,
} VkLineRasterizationModeEXT;
```

- `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT` is equivalent to `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` if `VkPhysicalDeviceLimits::strictLines` is `VK_TRUE`, otherwise lines are drawn as non-`strictLines` parallelograms. Both of these modes are defined in **Basic Line Segment Rasterization**.

- `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` specifies lines drawn as if they were rectangles
extruded from the line

- **VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT** specifies lines drawn by determining which pixel diamonds the line intersects and exits, as defined in [Bresenham Line Segment Rasterization](#).
- **VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT** specifies lines drawn if they were rectangles extruded from the line, with alpha falloff, as defined in Smooth Lines.

To **dynamically set** the line width, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetLineWidth(
    VkCommandBuffer commandBuffer,  // commandBuffer is the command buffer into which the command will be recorded.
    float lineWidth);               // lineWidth is the width of rasterized line segments.
```

This command sets the line width for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_LINE_WIDTH** set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::lineWidth` value used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetLineWidth-lineWidth-00788**
  - If the `wideLines` feature is not enabled, `lineWidth` must be `1.0`

### Valid Usage (Implicit)

- **VUID-vkCmdSetLineWidth-commandBuffer-parameter**
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetLineWidth-commandBuffer-recording**
  - `commandBuffer` must be in the recording state
- **VUID-vkCmdSetLineWidth-commandBuffer-cmdpool**
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetLineWidth-videocoding**
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
Not all line widths need be supported for line segment rasterization, but width 1.0 antialiased segments must be provided. The range and gradations are obtained from the `lineWidthRange` and `lineWidthGranularity` members of `VkPhysicalDeviceLimits`. If, for instance, the size range is from 0.1 to 2.0 and the gradation size is 0.1, then the sizes 0.1, 0.2, ..., 1.9, 2.0 are supported. Additional line widths may also be supported. There is no requirement that these widths be equally spaced. If an unsupported width is requested, the nearest supported width is used instead.

Further, if the render pass has a fragment density map attachment, line width may be rounded by the implementation to a multiple of the fragment’s width or height.

### 27.11.1. Basic Line Segment Rasterization

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK LINE RASTERIZATION MODE RECTANGULAR_EXT`, rasterized line segments produce fragments which intersect a rectangle centered on the line segment. Two of the edges are parallel to the specified line segment; each is at a distance of one-half the current width from that segment in directions perpendicular to the direction of the line. The other two edges pass through the line endpoints and are perpendicular to the direction of the specified line segment. Coverage bits that correspond to sample points that intersect the rectangle are 1, other coverage bits are 0.

Next we specify how the data associated with each rasterized fragment are obtained. Let \( p_r = (x_d, y_d) \) be the framebuffer coordinates at which associated data are evaluated. This may be the center of a fragment or the location of a sample within the fragment. When `rasterizationSamples` is `VK SAMPLE COUNT 1 BIT`, the fragment center must be used. Let \( p_a = (x_a, y_a) \) and \( p_b = (x_b, y_b) \) be initial and final endpoints of the line segment, respectively. Set

\[
 t = \frac{(p_r - p_a) \cdot (p_b - p_a)}{\| p_b - p_a \|^2}
\]

(Note that \( t = 0 \) at \( p_a \), and \( t = 1 \) at \( p_b \). Also note that this calculation projects the vector from \( p_a \) to \( p_r \) onto the line, and thus computes the normalized distance of the fragment along the line.)

If `strictLines` is `VK_TRUE`, line segments are rasterized using perspective or linear interpolation.

**Perspective interpolation** for a line segment interpolates two values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the line segment’s clip coordinates. An interpolated value \( f \) can be determined by
where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively; \( w_a \) and \( w_b \) are the clip \( w \) coordinates of the starting and ending endpoints of the segment, respectively.

**Linear interpolation** for a line segment directly interpolates two values, and an interpolated value \( f \) can be determined by

\[
f = (1 - t)f_a + tf_b
\]

where \( f_a \) and \( f_b \) are the data associated with the starting and ending endpoints of the segment, respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

The above description documents the preferred method of line rasterization, and **must** be used when `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT`.

When `strictLines` is `VK_FALSE`, and when the `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_DEFAULT_EXT`, the edges of the lines are generated as a parallelogram surrounding the original line. The major axis is chosen by noting the axis in which there is the greatest distance between the line start and end points. If the difference is equal in both directions then the X axis is chosen as the major axis. Edges 2 and 3 are aligned to the minor axis and are centered on the endpoints of the line as in **Non strict lines**, and each is `lineWidth` long. Edges 0 and 1 are parallel to the line and connect the endpoints of edges 2 and 3. Coverage bits that correspond to sample points that intersect the parallelogram are 1, other coverage bits are 0.

Samples that fall exactly on the edge of the parallelogram follow the polygon rasterization rules.

Interpolation occurs as if the parallelogram was decomposed into two triangles where each pair of vertices at each end of the line has identical attributes.
Only when `strictLines` is `VK_FALSE` implementations may deviate from the non-strict line algorithm described above in the following ways:

- Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization using the original line segment endpoints.
- Rasterization of non-antialiased non-strict line segments may be performed using the rules defined in Bresenham Line Segment Rasterization.

27.11.2. Bresenham Line Segment Rasterization

If `lineRasterizationMode` is `VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT`, then the following rules replace the line rasterization rules defined in Basic Line Segment Rasterization.

Non-strict lines may also follow these rasterization rules for non-antialiased lines.

Line segment rasterization begins by characterizing the segment as either `x-major` or `y-major`. `x-major` line segments have slope in the closed interval [-1,1]; all other line segments are `y-major` (slope is determined by the segment’s endpoints). We specify rasterization only for `x-major` segments except in cases where the modifications for `y-major` segments are not self-evident.

Ideally, Vulkan uses a diamond-exit rule to determine those fragments that are produced by rasterizing a line segment. For each fragment \( f \) with center at framebuffer coordinates \( x_f \) and \( y_f \), define a diamond-shaped region that is the intersection of four half planes:

\[
R_f = \{(x, y) | |x - x_f| + |y - y_f| < \frac{1}{2}\}
\]

Essentially, a line segment starting at \( p_a \) and ending at \( p_b \) produces those fragments \( f \) for which the segment intersects \( R_f \) except if \( p_b \) is contained in \( R_f \).
To avoid difficulties when an endpoint lies on a boundary of $R_f$, we (in principle) perturb the supplied endpoints by a tiny amount. Let $p_a$ and $p_b$ have framebuffer coordinates $(x_a, y_a)$ and $(x_b, y_b)$, respectively. Obtain the perturbed endpoints $p'_a$ given by $(x_a, y_a) - (\varepsilon, \varepsilon^2)$ and $p'_b$ given by $(x_b, y_b) - (\varepsilon, \varepsilon^2)$. Rasterizing the line segment starting at $p_a$ and ending at $p_b$ produces those fragments $f$ for which the segment starting at $p'_a$ and ending on $p'_b$ intersects $R_f$, except if $p'_b$ is contained in $R_f$. $\varepsilon$ is chosen to be so small that rasterizing the line segment produces the same fragments when $\delta$ is substituted for $\varepsilon$ for any $0 < \delta \leq \varepsilon$.

When $p_a$ and $p_b$ lie on fragment centers, this characterization of fragments reduces to Bresenham’s algorithm with one modification: lines produced in this description are “half-open”, meaning that the final fragment (corresponding to $p_b$) is not drawn. This means that when rasterizing a series of connected line segments, shared endpoints will be produced only once rather than twice (as would occur with Bresenham’s algorithm).

Implementations may use other line segment rasterization algorithms, subject to the following rules:

- The coordinates of a fragment produced by the algorithm must not deviate by more than one unit in either x or y framebuffer coordinates from a corresponding fragment produced by the diamond-exit rule.
- The total number of fragments produced by the algorithm must not differ from that produced by the diamond-exit rule by no more than one.
- For an x-major line, two fragments that lie in the same framebuffer-coordinate column must not be produced (for a y-major line, two fragments that lie in the same framebuffer-coordinate row must not be produced).
If two line segments share a common endpoint, and both segments are either x-major (both left-to-right or both right-to-left) or y-major (both bottom-to-top or both top-to-bottom), then rasterizing both segments must not produce duplicate fragments. Fragments also must not be omitted so as to interrupt continuity of the connected segments.

The actual width \( w \) of Bresenham lines is determined by rounding the line width to the nearest integer, clamping it to the implementation-dependent \texttt{lineWidthRange} (with both values rounded to the nearest integer), then clamping it to be no less than 1.

Bresenham line segments of width other than one are rasterized by offsetting them in the minor direction (for an x-major line, the minor direction is y, and for a y-major line, the minor direction is x) and producing a row or column of fragments in the minor direction. If the line segment has endpoints given by \((x_0, y_0)\) and \((x_1, y_1)\) in framebuffer coordinates, the segment with endpoints \((x_0, y_0 - \frac{w-1}{2})\) and \((x_1, y_1 - \frac{w-1}{2})\) is rasterized, but instead of a single fragment, a column of fragments of height \( w \) (a row of fragments of length \( w \) for a y-major segment) is produced at each x (y for y-major) location. The lowest fragment of this column is the fragment that would be produced by rasterizing the segment of width 1 with the modified coordinates.

The preferred method of attribute interpolation for a wide line is to generate the same attribute values for all fragments in the row or column described above, as if the adjusted line was used for interpolation and those values replicated to the other fragments, except for \texttt{FragCoord} which is interpolated as usual. Implementations may instead interpolate each fragment according to the formula in Basic Line Segment Rasterization, using the original line segment endpoints.

When Bresenham lines are being rasterized, sample locations may all be treated as being at the pixel center (this may affect attribute and depth interpolation).

\begin{quote}
\textbf{Note}

The sample locations described above are not used for determining coverage, they are only used for things like attribute interpolation. The rasterization rules that determine coverage are defined in terms of whether the line intersects pixels, as opposed to the point sampling rules used for other primitive types. So these rules are independent of the sample locations. One consequence of this is that Bresenham lines cover the same pixels regardless of the number of rasterization samples, and cover all samples in those pixels (unless masked out or killed).
\end{quote}

### 27.11.3. Line Stipple

If the \texttt{stippledLineEnable} member of \texttt{VkPipelineRasterizationLineStateCreateInfoEXT} is \texttt{VK_TRUE}, then lines are rasterized with a line stipple determined by \texttt{lineStippleFactor} and \texttt{lineStipplePattern}. \texttt{lineStipplePattern} is an unsigned 16-bit integer that determines which fragments are to be drawn or discarded when the line is rasterized. \texttt{lineStippleFactor} is a count that is used to modify the effective line stipple by causing each bit in \texttt{lineStipplePattern} to be used \texttt{lineStippleFactor} times.

Line stippling discards certain fragments that are produced by rasterization. The masking is achieved using three parameters: the 16-bit line stipple pattern \( p \), the line stipple factor \( r \), and an integer stipple counter \( s \). Let
\[ b = \left\lfloor \frac{s}{f} \right\rfloor \mod 16 \]

Then a fragment is produced if the \( b \)'th bit of \( p \) is 1, and discarded otherwise. The bits of \( p \) are numbered with 0 being the least significant and 15 being the most significant.

The initial value of \( s \) is zero. For \texttt{VK_LINE_RASTERIZATION_MODE_BRESENHAM_EXT} lines, \( s \) is incremented after production of each fragment of a line segment (fragments are produced in order, beginning at the starting point and working towards the ending point). For \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT} and \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT} lines, the rectangular region is subdivided into adjacent unit-length rectangles, and \( s \) is incremented once for each rectangle. Rectangles with a value of \( s \) such that the \( b \)'th bit of \( p \) is zero are discarded. If the last rectangle in a line segment is shorter than unit-length, then the remainder \textbf{may} carry over to the next line segment in the line strip using the same value of \( s \) (this is the preferred behavior, for the stipple pattern to appear more consistent through the strip).

\( s \) is reset to 0 at the start of each strip (for line strips), and before every line segment in a group of independent segments.

If the line segment has been clipped, then the value of \( s \) at the beginning of the line segment is implementation-dependent.

To \textbf{dynamically set} the line stipple state, call:

```c
// Provided by VK_EXT_line_rasterization
void vkCmdSetLineStippleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t lineStippleFactor,
    uint16_t lineStipplePattern);
```

- \texttt{commandBuffer} is the command buffer into which the command will be recorded.
- \texttt{lineStippleFactor} is the repeat factor used in stippled line rasterization.
- \texttt{lineStipplePattern} is the bit pattern used in stippled line rasterization.

This command sets the line stipple state for subsequent drawing commands when the graphics pipeline is created with \texttt{VK_DYNAMIC_STATE_LINE_STIPPLE_EXT} set in \texttt{VkPipelineDynamicStateCreateInfo::pDynamicStates}. Otherwise, this state is specified by the \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStippleFactor} and \texttt{VkPipelineRasterizationLineStateCreateInfoEXT::lineStipplePattern} values used to create the currently active pipeline.

\textbf{Valid Usage}

- \textbf{VUID-vkCmdSetLineStippleEXT-lineStippleFactor-02776} \texttt{lineStippleFactor} \textbf{must} be in the range [1,256]
Valid Usage (Implicit)

- VUID-vkCmdSetLineStippleEXT-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetLineStippleEXT-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetLineStippleEXT-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetLineStippleEXT-videocoding This command must only be called outside of a video coding scope

Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

27.11.4. Smooth Lines

If the `lineRasterizationMode` member of `VkPipelineRasterizationLineStateCreateInfoEXT` is `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT`, then lines are considered to be rectangles using the same geometry as for `VK_LINE_RASTERIZATION_MODE_RECTANGULAR_EXT` lines. The rules for determining which pixels are covered are implementation-dependent, and may include nearby pixels where no sample locations are covered or where the rectangle does not intersect the pixel at all. For each pixel that is considered covered, the fragment computes a coverage value that approximates the area of the intersection of the rectangle with the pixel square, and this coverage value is multiplied into the color location 0’s alpha value after fragment shading, as described in Multisample Coverage.

Note

The details of the rasterization rules and area calculation are left intentionally vague, to allow implementations to generate coverage and values that are aesthetically pleasing.
27.12. Polygons

A polygon results from the decomposition of a triangle strip, triangle fan or a series of independent triangles. Like points and line segments, polygon rasterization is controlled by several variables in the VkPipelineRasterizationStateCreateInfo structure.

27.12.1. Basic Polygon Rasterization

The first step of polygon rasterization is to determine whether the triangle is back-facing or front-facing. This determination is made based on the sign of the (clipped or unclipped) polygon’s area computed in framebuffer coordinates. One way to compute this area is:

\[ a = -\frac{1}{2} \sum_{i=0}^{n-1} x_i y_{i+1} - x_{i+1} y_i \]

where \( x_i \) and \( y_i \) are the x and y framebuffer coordinates of the \( i \)th vertex of the \( n \)-vertex polygon (vertices are numbered starting at zero for the purposes of this computation) and \( i \oplus 1 \) is \((i + 1) \text{ mod } n\).

The interpretation of the sign of \( a \) is determined by the VkPipelineRasterizationStateCreateInfo ::frontFace property of the currently active pipeline. Possible values are:

- **VK_FRONT_FACE_COUNTER_CLOCKWISE** specifies that a triangle with positive area is considered front-facing.
- **VK_FRONT_FACE_CLOCKWISE** specifies that a triangle with negative area is considered front-facing.

Any triangle which is not front-facing is back-facing, including zero-area triangles.

To dynamically set the front face orientation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetFrontFace(
    VkCommandBuffer commandBuffer,  
    VkFrontFace frontFace);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetFrontFaceEXT(
    VkCommandBuffer commandBuffer,
    VkFrontFace frontFace);
```
commandBuffer is the command buffer into which the command will be recorded.
frontFace is a VkFrontFace value specifying the front-facing triangle orientation to be used for culling.

This command sets the front face orientation for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_FRONT_FACE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineRasterizationStateCreateInfo::frontFace value used to create the currently active pipeline.

**Valid Usage (Implicit)**
- VUID-vkCmdSetFrontFace-commandBuffer-parameter
commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetFrontFace-frontFace-parameter
frontFace must be a valid VkFrontFace value
- VUID-vkCmdSetFrontFace-commandBuffer-recording
commandBuffer must be in the recording state
- VUID-vkCmdSetFrontFace-commandBuffer-cmdpool
The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetFrontFace-videocoding
This command must only be called outside of a video coding scope

**Host Synchronization**
- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Once the orientation of triangles is determined, they are culled according to the VkPipelineRasterizationStateCreateInfo::cullMode property of the currently active pipeline. Possible
values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkCullModeFlagBits {
    VK_CULL_MODE_NONE = 0,
    VK_CULL_MODE_FRONT_BIT = 0x00000001,
    VK_CULL_MODE_BACK_BIT = 0x00000002,
    VK_CULL_MODE_FRONT_AND_BACK = 0x00000003,
} VkCullModeFlagBits;
```

- **VK_CULL_MODE_NONE** specifies that no triangles are discarded
- **VK_CULL_MODE_FRONT_BIT** specifies that front-facing triangles are discarded
- **VK_CULL_MODE_BACK_BIT** specifies that back-facing triangles are discarded
- **VK_CULL_MODE_FRONT_AND_BACK** specifies that all triangles are discarded.

Following culling, fragments are produced for any triangles which have not been discarded.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkCullModeFlags;
```

**VkCullModeFlags** is a bitmask type for setting a mask of zero or more **VkCullModeFlagBits**.

To **dynamically set** the cull mode, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetCullMode(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetCullModeEXT(
    VkCommandBuffer commandBuffer,
    VkCullModeFlags cullMode);
```

- **commandBuffer** is the command buffer into which the command will be recorded.
- **cullMode** specifies the cull mode property to use for drawing.

This command sets the cull mode for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_CULL_MODE** set in **VkPipelineDynamicStateCreateInfo::pDynamicStates**. Otherwise, this state is specified by the **VkPipelineRasterizationStateCreateInfo::cullMode** value used to create the currently active pipeline.
The rule for determining which fragments are produced by polygon rasterization is called \textit{point sampling}. The two-dimensional projection obtained by taking the x and y framebuffer coordinates of the polygon’s vertices is formed. Fragments are produced for any fragment area groups of pixels for which any sample points lie inside of this polygon. Coverage bits that correspond to sample points that satisfy the point sampling criteria are 1, other coverage bits are 0. Special treatment is given to a sample whose sample location lies on a polygon edge. In such a case, if two polygons lie on either side of a common edge (with identical endpoints) on which a sample point lies, then exactly one of the polygons \textbf{must} result in a covered sample for that fragment during rasterization. As for the data associated with each fragment produced by rasterizing a polygon, we begin by specifying how these values are produced for fragments in a triangle.

\textbf{Barycentric coordinates} are a set of three numbers, a, b, and c, each in the range [0,1], with \(a + b + c = 1\). These coordinates uniquely specify any point \(p\) within the triangle or on the triangle’s boundary as
\[ p = a p_a + b p_b + c p_c \]

where \( p_a, p_b, \) and \( p_c \) are the vertices of the triangle. \( a, b, \) and \( c \) are determined by:

\[
\begin{align*}
  a &= \frac{A(p_a p_b p_c)}{A(p_a p_b p_c)}, \\
  b &= \frac{A(p_a p_a p_c)}{A(p_a p_b p_c)}, \\
  c &= \frac{A(p_a p_b p_a)}{A(p_a p_b p_c)},
\end{align*}
\]

where \( A(lmn) \) denotes the area in framebuffer coordinates of the triangle with vertices \( l, m, \) and \( n. \)

Denote an associated datum at \( p_a, p_b, \) or \( p_c \) as \( f_a, f_b, \) or \( f_c, \) respectively.

**Perspective interpolation** for a triangle interpolates three values in a manner that is correct when taking the perspective of the viewport into consideration, by way of the triangle's clip coordinates. An interpolated value \( f \) can be determined by

\[
f = \frac{a f_a / w_a + b f_b / w_b + c f_c / w_c}{a / w_a + b / w_b + c / w_c}
\]

where \( w_a, w_b, \) and \( w_c \) are the clip \( w \) coordinates of \( p_a, p_b, \) and \( p_c, \) respectively. \( a, b, \) and \( c \) are the barycentric coordinates of the location at which the data are produced.

**Linear interpolation** for a triangle directly interpolates three values, and an interpolated value \( f \) can be determined by

\[
f = a f_a + b f_b + c f_c
\]

where \( f_a, f_b, \) and \( f_c \) are the data associated with \( p_a, p_b, \) and \( p_c, \) respectively.

The clip coordinate \( w \) for a sample is determined using perspective interpolation. The depth value \( z \) for a sample is determined using linear interpolation. Interpolation of fragment shader input values are determined by Interpolation decorations.

For a polygon with more than three edges, such as are produced by clipping a triangle, a convex combination of the values of the datum at the polygon's vertices must be used to obtain the value assigned to each fragment produced by the rasterization algorithm. That is, it must be the case that at every fragment

\[
f = \sum_{i=1}^{n} a_i f_i
\]

where \( n \) is the number of vertices in the polygon and \( f_i \) is the value of \( f \) at vertex \( i. \) For each \( i, 0 \leq a_i \leq 1 \) and \( \sum_{i=1}^{n} a_i = 1. \) The values of \( a_i \) may differ from fragment to fragment, but at vertex \( i, a_i = 1 \) and \( a_j = 0 \) for \( j \neq i. \)

**Note**

One algorithm that achieves the required behavior is to triangulate a polygon (without adding any vertices) and then treat each triangle individually as already discussed. A scan-line rasterizer that linearly interpolates data along each edge.
and then linearly interpolates data across each horizontal span from edge to edge also satisfies the restrictions (in this case the numerator and denominator of perspective interpolation are iterated independently, and a division is performed for each fragment).

27.12.2. Polygon Mode

Possible values of the VkPipelineRasterizationStateCreateInfo::polygonMode property of the currently active pipeline, specifying the method of rasterization for polygons, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkPolygonMode {
    VK_POLYGON_MODE_FILL = 0,
    VK_POLYGON_MODE_LINE = 1,
    VK_POLYGON_MODE_POINT = 2,
    // Provided by VK_NV_fill_rectangle
    VK_POLYGON_MODE_FILL_RECTANGLE_NV = 1000153000,
} VkPolygonMode;
```

- **VK_POLYGON_MODE_POINT** specifies that polygon vertices are drawn as points.
- **VK_POLYGON_MODE_LINE** specifies that polygon edges are drawn as line segments.
- **VK_POLYGON_MODE_FILL** specifies that polygons are rendered using the polygon rasterization rules in this section.
- **VK_POLYGON_MODE_FILL_RECTANGLE_NV** specifies that polygons are rendered using polygon rasterization rules, modified to consider a sample within the primitive if the sample location is inside the axis-aligned bounding box of the triangle after projection. Note that the barycentric weights used in attribute interpolation can extend outside the range [0,1] when these primitives are shaded. Special treatment is given to a sample position on the boundary edge of the bounding box. In such a case, if two rectangles lie on either side of a common edge (with identical endpoints) on which a sample position lies, then exactly one of the triangles must produce a fragment that covers that sample during rasterization.

Polygons rendered in VK_POLYGON_MODE_FILL_RECTANGLE_NV mode may be clipped by the frustum or by user clip planes. If clipping is applied, the triangle is culled rather than clipped.

Area calculation and facingness are determined for VK_POLYGON_MODE_FILL_RECTANGLE_NV mode using the triangle’s vertices.

These modes affect only the final rasterization of polygons: in particular, a polygon’s vertices are shaded and the polygon is clipped and possibly culled before these modes are applied.

27.12.3. Depth Bias

The depth values of all fragments generated by the rasterization of a polygon can be biased (offset) by a single depth bias value that is computed for that polygon.
**Depth Bias Enable**

The depth bias computation is enabled by the `depthBiasEnable` set with `vkCmdSetDepthBiasEnable` and `vkCmdSetDepthBiasEnableEXT`, or the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline. If the depth bias enable is `VK_FALSE`, no bias is applied and the fragment’s depth values are unchanged.

To **dynamically enable** whether to bias fragment depth values, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthBiasEnable(
    VkCommandBuffer commandBuffer,    // Provided by VK_VERSION_1_3
    VkBool32 depthBiasEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state2
void vkCmdSetDepthBiasEnableEXT(
    VkCommandBuffer commandBuffer,    // Provided by VK_VERSION_1_3
    VkBool32 depthBiasEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasEnable` controls whether to bias fragment depth values.

This command sets the depth bias enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineRasterizationStateCreateInfo::depthBiasEnable` value used to create the currently active pipeline.

**Valid Usage (Implicit)**

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-parameter
  `commandBuffer must` be a valid `VkCommandBuffer` handle

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-recording
  `commandBuffer must` be in the recording state

- VUID-vkCmdSetDepthBiasEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetDepthBiasEnable-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to commandBuffer **must** be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from **must** be externally synchronized

Command Properties

<table>

<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Depth Bias Computation

The depth bias depends on three parameters:

- `depthBiasSlopeFactor` scales the maximum depth slope \( m \) of the polygon
- `depthBiasConstantFactor` scales the minimum resolvable difference \( r \) of the depth attachment
- the scaled terms are summed to produce a value which is then clamped to a minimum or maximum value specified by `depthBiasClamp`

`depthBiasSlopeFactor`, `depthBiasConstantFactor`, and `depthBiasClamp` **can** each be positive, negative, or zero. These parameters are set as described for `vkCmdSetDepthBias` below.

The maximum depth slope \( m \) of a triangle is

\[
m = \sqrt{\left( \frac{\partial Z_f}{\partial x_f} \right)^2 + \left( \frac{\partial Z_f}{\partial y_f} \right)^2}
\]

where \((x_f, y_f, z_f)\) is a point on the triangle. \( m \) **may** be approximated as

\[
m = \max \left( \left| \frac{\partial Z_f}{\partial x_f} \right|, \left| \frac{\partial Z_f}{\partial y_f} \right| \right).
\]

The minimum resolvable difference \( r \) is a parameter that depends on the depth attachment representation. It is the smallest difference in framebuffer coordinate \( z \) values that is guaranteed to remain distinct throughout polygon rasterization and in the depth attachment. All pairs of fragments generated by the rasterization of two polygons with otherwise identical vertices, but \( z_f \) values that differ by \( r \), will have distinct depth values.

For fixed-point depth attachment representations, \( r \) is constant throughout the range of the entire depth attachment. Its value is implementation-dependent but **must** be at most
\[ r = 2 \times 2^n \]

for an n-bit buffer. For floating-point depth attachment, there is no single minimum resolvable difference. In this case, the minimum resolvable difference for a given polygon is dependent on the maximum exponent, \( e \), in the range of \( z \) values spanned by the primitive. If \( n \) is the number of bits in the floating-point mantissa, the minimum resolvable difference, \( r \), for the given primitive is defined as

\[ r = 2^{e-n} \]

If a triangle is rasterized using the `VK_POLYGON_MODE_FILL_RECTANGLE_NV` polygon mode, then this minimum resolvable difference may not be resolvable for samples outside of the triangle, where the depth is extrapolated.

If no depth attachment is present, \( r \) is undefined.

The bias value \( o \) for a polygon is

\[
o = \text{dbclamp}(m \times \text{depthBiasSlopeFactor} + r \times \text{depthBiasConstantFactor})
\]

where \( \text{dbclamp}(x) = \begin{cases} 
  x & \text{depthBiasClamp} = 0 \text{ or } NaN \\
  \min(x, \text{depthBiasClamp}) & \text{depthBiasClamp} > 0 \\
  \max(x, \text{depthBiasClamp}) & \text{depthBiasClamp} < 0 
\end{cases} \)

\( m \) is computed as described above. If the depth attachment uses a fixed-point representation, \( m \) is a function of depth values in the range \([0,1]\), and \( o \) is applied to depth values in the same range.

Depth bias is applied to triangle topology primitives received by the rasterizer regardless of polygon mode. Depth bias may also be applied to line and point topology primitives received by the rasterizer.

To dynamically set the depth bias parameters, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBias(
    VkCommandBuffer commandBuffer,
    float depthBiasConstantFactor,
    float depthBiasClamp,
    float depthBiasSlopeFactor);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBiasConstantFactor` is a scalar factor controlling the constant depth value added to each fragment.
- `depthBiasClamp` is the maximum (or minimum) depth bias of a fragment.
- `depthBiasSlopeFactor` is a scalar factor applied to a fragment's slope in depth bias calculations.
This command sets the depth bias parameters for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BIAS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineRasterizationStateCreateInfo::depthBiasConstantFactor`, `depthBiasClamp`, and `depthBiasSlopeFactor` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBias-depthBiasClamp-00790**
  If the `depthBiasClamp` feature is not enabled, `depthBiasClamp` must be 0.0

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBias-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle
- **VUID-vkCmdSetDepthBias-commandBuffer-recording**
  `commandBuffer` must be in the recording state
- **VUID-vkCmdSetDepthBias-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- **VUID-vkCmdSetDepthBias-videoencoding**
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

### 27.12.4. Conservative Rasterization

If the `pNext` chain of `VkPipelineRasterizationStateCreateInfo::pDynamicStates` includes a `VkPipelineRasterizationConservativeStateCreateInfoEXT` structure, then that structure includes parameters controlling conservative rasterization.
VkPipelineRasterizationConservativeStateCreateInfoEXT is defined as:

```c
// Provided by VK_EXT_conservative_rasterization
typedef struct VkPipelineRasterizationConservativeStateCreateInfoEXT {
    VkStructureType sType;
    const void* pNext;
    VkPipelineRasterizationConservativeStateCreateFlagsEXT flags;
    VkConservativeRasterizationModeEXT conservativeRasterizationMode;
    float extraPrimitiveOverestimationSize;
} VkPipelineRasterizationConservativeStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `conservativeRasterizationMode` is the conservative rasterization mode to use.
- `extraPrimitiveOverestimationSize` is the extra size in pixels to increase the generating primitive during conservative rasterization at each of its edges in `X` and `Y` equally in screen space beyond the base overestimation specified in `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::primitiveOverestimationSize`. If `conservativeRasterizationMode` is not `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT`, this value is ignored.

If this structure is not included in the `pNext` chain, `conservativeRasterizationMode` is considered to be `VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT`, and conservative rasterization is disabled.

Polygon rasterization can be made conservative by setting `conservativeRasterizationMode` to `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` or `VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT` in `VkPipelineRasterizationConservativeStateCreateInfoEXT`.

**Note**

If `conservativePointAndLineRasterization` is supported, conservative rasterization can be applied to line and point primitives, otherwise it must be disabled.

**Valid Usage**

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-extraPrimitiveOverestimationSize-01769: `extraPrimitiveOverestimationSize` must be in the range of `0.0` to `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::maxExtraPrimitiveOverestimationSize` inclusive.
Valid Usage (Implicit)

- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-sType-sType must be VK_STRUCTURE_TYPE_PIPELINE_RASTERIZATION_CONSERVATIVE_STATE_CREATE_INFO_EXT
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-flags-zerobitmask flags must be 0
- VUID-VkPipelineRasterizationConservativeStateCreateInfoEXT-conservativeRasterizationMode-parameter conservativeRasterizationMode must be a valid VkConservativeRasterizationModeEXT value

// Provided by VK_EXT_conservative_rasterization
typedef VkFlags VkPipelineRasterizationConservativeStateCreateFlagsEXT;

VkPipelineRasterizationConservativeStateCreateFlagsEXT is a bitmask type for setting a mask, but is currently reserved for future use.

Possible values of VkPipelineRasterizationConservativeStateCreateInfoEXT::conservativeRasterizationMode, specifying the conservative rasterization mode are:

// Provided by VK_EXT_conservative_rasterization
typedef enum VkConservativeRasterizationModeEXT {
    VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT = 0,
    VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT = 1,
    VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT = 2,
} VkConservativeRasterizationModeEXT;

- VK_CONSERVATIVE_RASTERIZATION_MODE_DISABLED_EXT specifies that conservative rasterization is disabled and rasterization proceeds as normal.
- VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT specifies that conservative rasterization is enabled in overestimation mode.
- VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT specifies that conservative rasterization is enabled in underestimation mode.

When overestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether any portion of the pixel (including its edges and corners) is covered by the primitive. If any portion of the pixel is covered, then all bits of the coverage mask for the fragment corresponding to that pixel are enabled. If the render pass has a fragment density map attachment and any bit of the coverage mask for the fragment is enabled, then all bits of the coverage mask for the fragment are enabled.

For the purposes of evaluating which pixels are covered by the primitive, implementations can increase the size of the primitive by up to VkPhysicalDeviceConservativeRasterizationPropertiesEXT
::primitiveOverestimationSize pixels at each of the primitive edges. This **may** increase the number of fragments generated by this primitive and represents an overestimation of the pixel coverage.

This overestimation size can be increased further by setting the `extraPrimitiveOverestimationSize` value above *0.0* in steps of `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSizeGranularity` up to and including `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::extraPrimitiveOverestimationSize`. This will further increase the number of fragments generated by this primitive.

The actual precision of the overestimation size used for conservative rasterization **may** vary between implementations and produce results that only approximate the `primitiveOverestimationSize` and `extraPrimitiveOverestimationSizeGranularity` properties. Implementations **may** especially vary these approximations when the render pass has a fragment density map and the fragment area covers multiple pixels.

For triangles if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, fragments will be generated if the primitive area covers any portion of any pixel inside the fragment area, including their edges or corners. The tie-breaking rule described in Basic Polygon Rasterization does not apply during conservative rasterization and coverage is set for all fragments generated from shared edges of polygons. Degenerate triangles that evaluate to zero area after rasterization, even for pixels containing a vertex or edge of the zero-area polygon, will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateTrianglesRasterized` is `VK_FALSE` or will generate fragments if `degenerateTrianglesRasterized` is `VK_TRUE`. The fragment input values for these degenerate triangles take their attribute and depth values from the provoking vertex. Degenerate triangles are considered backfacing and the application **can** enable backface culling if desired. Triangles that are zero area before rasterization **may** be culled regardless.

For lines if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the line covers any portion of any pixel inside the fragment area, including their edges or corners. Degenerate lines that evaluate to zero length after rasterization will be culled if `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::degenerateLinesRasterized` is `VK_FALSE` or will generate fragments if `degenerateLinesRasterized` is `VK_TRUE`. The fragments input values for these degenerate lines take their attribute and depth values from the provoking vertex. Lines that are zero length before rasterization **may** be culled regardless.

For points if `VK_CONSERVATIVE_RASTERIZATION_MODE_OVERESTIMATE_EXT` is enabled, and the implementation sets `VkPhysicalDeviceConservativeRasterizationPropertiesEXT::conservativePointAndLineRasterization` to `VK_TRUE`, fragments will be generated if the point square covers any portion of any pixel inside the fragment area, including their edges or corners.

When underestimate conservative rasterization is enabled, rather than evaluating coverage at individual sample locations, a determination is made of whether all of the pixel (including its edges and corners) is covered by the primitive. If the entire pixel is covered, then a fragment is generated with all bits of its coverage mask corresponding to the pixel enabled, otherwise the pixel is not considered covered even if some portion of the pixel is covered. The fragment is discarded if no pixels inside the fragment area are considered covered. If the render pass has a fragment density map attachment and any pixel inside the fragment area is not considered covered, then the....
fragment is discarded even if some pixels are considered covered.

For triangles, if \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT} is enabled, fragments will only be generated if any pixel inside the fragment area is fully covered by the generating primitive, including its edges and corners.

For lines, if \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT} is enabled, fragments will be generated if any pixel inside the fragment area, including its edges and corners, are entirely covered by the line.

For points, if \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT} is enabled, fragments will only be generated if the point square covers the entirety of any pixel square inside the fragment area, including its edges or corners.

If the render pass has a fragment density map and \texttt{VK_CONSERVATIVE_RASTERIZATION_MODE_UNDERESTIMATE_EXT} is enabled, fragments will only be generated if the entirety of all pixels inside the fragment area are covered by the generating primitive, line, or point.

For both overestimate and underestimate conservative rasterization modes a fragment has all of its pixel squares fully covered by the generating primitive \textbf{must} set \texttt{FullyCoveredEXT} to \texttt{VK_TRUE} if the implementation enables the \texttt{VkPhysicalDeviceConservativeRasterizationPropertiesEXT} ::\texttt{fullyCoveredFragmentShaderInputVariable} feature.

When the use of a shading rate image or setting the fragment shading rate results in fragments covering multiple pixels, coverage for conservative rasterization is still evaluated on a per-pixel basis and may result in fragments with partial coverage. For fragment shader inputs decorated with \texttt{FullyCoveredEXT}, a fragment is considered fully covered if and only if all pixels in the fragment are fully covered by the generating primitive.
Chapter 28. Fragment Operations

Fragments produced by rasterization go through a number of operations to determine whether or how values produced by fragment shading are written to the framebuffer.

The following fragment operations adhere to rasterization order, and are typically performed in this order:

1. Discard rectangles test
2. Scissor test
3. Exclusive scissor test
4. Sample mask test
5. Certain Fragment shading operations:
   ○ Sample Mask Accesses
   ○ Depth Replacement
   ○ Stencil Reference Replacement
   ○ Interlocked Operations
6. Multisample coverage
7. Depth bounds test
8. Stencil test
9. Depth test
10. Representative fragment test
11. Sample counting
12. Coverage to color
13. Coverage reduction
14. Coverage modulation

The coverage mask generated by rasterization describes the initial coverage of each sample covered by the fragment. Fragment operations will update the coverage mask to add or subtract coverage where appropriate. If a fragment operation results in all bits of the coverage mask being 0, the fragment is discarded, and no further operations are performed. Fragments can also be programmatically discarded in a fragment shader by executing one of

- OpTerminateInvocation
- OpDemoteToHelperInvocationEXT
- OpKill.

When one of the fragment operations in this chapter is described as “replacing” a fragment shader output, that output is replaced unconditionally, even if no fragment shader previously wrote to that output.

1752
If the fragment shader declares the PostDepthCoverage execution mode, the sample mask test is instead performed after the depth test.

If the fragment shader declares the EarlyFragmentTests execution mode, fragment shading and multisample coverage operations should instead be performed after sample counting.

If the fragment shader declares the EarlyAndLateFragmentTestsAMD execution mode, and does not declare the StencilRefReplacingEXT or DepthReplacing execution mode, fragment shading and multisample coverage operations are instead be performed after sample counting.

For a pipeline with the following properties:

- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the StencilRefReplacingEXT execution mode;
- either
  - the fragment shader specifies the StencilRefUnchangedFrontAMD execution mode;
  - the fragment shader specifies the StencilRefGreaterFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefLessFrontAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::front.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL; and
- either
  - the fragment shader specifies the StencilRefUnchangedBackAMD execution mode;
  - the fragment shader specifies the StencilRefGreaterBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_GREATER or VK_COMPARE_OP_GREATER_OR_EQUAL; or
  - the fragment shader specifies the StencilRefLessBackAMD execution mode and the pipeline uses a VkPipelineDepthStencilStateCreateInfo::back.compareOp of VK_COMPARE_OP_LESS or VK_COMPARE_OP_LESS_OR_EQUAL

an additional stencil test may be performed before fragment shading, using the stencil reference value specified by VkPipelineDepthStencilStateCreateInfo::front.reference or VkPipelineDepthStencilStateCreateInfo::back.reference.

For a pipeline with the following properties:

- the fragment shader either specifies EarlyAndLateFragmentTestsAMD or does not write to storage resources;
- the fragment shader specifies the DepthReplacing execution mode; and
- either
  - the fragment shader specifies the DepthUnchanged execution mode;
  - the fragment shader specifies the DepthGreater execution mode and the pipeline uses a
the implementation may perform depth bounds test before fragment shading and perform an additional depth test immediately after that using the interpolated depth value generated by rasterization.

Once all fragment operations have completed, fragment shader outputs for covered color attachment samples pass through framebuffer operations.

## 28.1. Discard Rectangles Test

The discard rectangle test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a set of discard rectangles.

Each discard rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineDiscardRectangleStateCreateInfoEXT` structure during pipeline creation, or dynamically by the `vkCmdSetDiscardRectangleEXT` command.

A given sample is considered inside a discard rectangle if the \(x_f\) is in the range \([VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)\), and \(y_f\) is in the range \([VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)\). If the test is set to be inclusive, samples that are not inside any of the discard rectangles will have their coverage set to \(0\). If the test is set to be exclusive, samples that are inside any of the discard rectangles will have their coverage set to \(0\).

If no discard rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineDiscardRectangleStateCreateInfoEXT` structure is defined as:

```c
typedef struct VkPipelineDiscardRectangleStateCreateInfoEXT {  
    VkStructureType sType;  
    const void* pNext;  
    VkPipelineDiscardRectangleStateCreateFlagsEXT flags;  
    VkDiscardRectangleModeEXT discardRectangleMode;  
    uint32_t discardRectangleCount;  
    const VkRect2D* pDiscardRectangles;  
} VkPipelineDiscardRectangleStateCreateInfoEXT;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is reserved for future use.
- `discardRectangleMode` is a `VkDiscardRectangleModeEXT` value determining whether the discard rectangle test is inclusive or exclusive.
• **discardRectangleCount** is the number of discard rectangles to use.

• **pDiscardRectangles** is a pointer to an array of \texttt{VkRect2D} structures defining discard rectangles.

If the **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** dynamic state is enabled for a pipeline, the \texttt{pDiscardRectangles} member is ignored.

When this structure is included in the \texttt{pNext} chain of \texttt{VkGraphicsPipelineCreateInfo}, it defines parameters of the discard rectangle test. If this structure is not included in the \texttt{pNext} chain, it is equivalent to specifying this structure with a **discardRectangleCount** of 0.

### Valid Usage

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleCount-00582**
  
  \texttt{discardRectangleCount} must be less than or equal to \texttt{VkPhysicalDeviceDiscardRectanglePropertiesEXT::maxDiscardRectangles}

### Valid Usage (Implicit)

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-sType-sType**
  
  \texttt{sType} must be \texttt{VK_STRUCTURE_TYPE_PIPELINE_DISCARD_RECTANGLE_STATE_CREATE_INFO_EXT}

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-flags-zerobitmask**
  
  \texttt{flags} must be 0

- **VUID-VkPipelineDiscardRectangleStateCreateInfoEXT-discardRectangleMode-parameter**
  
  \texttt{discardRectangleMode} must be a valid \texttt{VkDiscardRectangleModeEXT} value

---

// Provided by VK_EXT_discard_rectangles

typedef VkFlags VkPipelineDiscardRectangleStateCreateFlagsEXT;

\texttt{VkPipelineDiscardRectangleStateCreateFlagsEXT} is a bitmask type for setting a mask, but is currently reserved for future use.

\texttt{VkDiscardRectangleModeEXT} values are:

---

// Provided by VK_EXT_discard_rectangles

typedef enum VkDiscardRectangleModeEXT {
  \texttt{VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT} = 0,
  \texttt{VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT} = 1,
} VkDiscardRectangleModeEXT;

- **\texttt{VK_DISCARD_RECTANGLE_MODE_INCLUSIVE_EXT}** specifies that the discard rectangle test is inclusive.

- **\texttt{VK_DISCARD_RECTANGLE_MODE_EXCLUSIVE_EXT}** specifies that the discard rectangle test is exclusive.

To dynamically set the discard rectangles, call:
// Provided by VK_EXT_discard_rectangles
void vkCmdSetDiscardRectangleEXT(
    VkCommandBuffer commandBuffer,
    uint32_t firstDiscardRectangle,
    uint32_t discardRectangleCount,
    const VkRect2D* pDiscardRectangles);

- **commandBuffer** is the command buffer into which the command will be recorded.

- **firstDiscardRectangle** is the index of the first discard rectangle whose state is updated by the command.

- **discardRectangleCount** is the number of discard rectangles whose state are updated by the command.

- **pDiscardRectangles** is a pointer to an array of **VkRect2D** structures specifying discard rectangles.

The discard rectangle taken from element i of **pDiscardRectangles** replace the current state for the discard rectangle at index **firstDiscardRectangle + i**, for i in [0, **discardRectangleCount**).

This command sets the discard rectangles for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_DISCARD_RECTANGLE_EXT** set in **VkPipelineDynamicStateCreateInfo**::*pDynamicStates*. Otherwise, this state is specified by the **VkPipelineDiscardRectangleStateCreateInfoEXT**::*pDiscardRectangles* values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDiscardRectangleEXT-firstDiscardRectangle-00585**
  The sum of **firstDiscardRectangle** and **discardRectangleCount** must be less than or equal to **VkPhysicalDeviceDiscardRectanglePropertiesEXT**::*maxDiscardRectangles*

- **VUID-vkCmdSetDiscardRectangleEXT-x-00587**
  The x and y member of **offset** in each **VkRect2D** element of **pDiscardRectangles** must be greater than or equal to 0

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00588**
  Evaluation of (**offset.x** + **extent.width**) in each **VkRect2D** element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-offset-00589**
  Evaluation of (**offset.y** + **extent.height**) in each **VkRect2D** element of **pDiscardRectangles** must not cause a signed integer addition overflow

- **VUID-vkCmdSetDiscardRectangleEXT-viewportScissor2D-04788**
  If this command is recorded in a secondary command buffer with **VkCommandBufferInheritanceViewportScissorInfoNV**::*viewportScissor2D* enabled, then this function must not be called
28.2. Scissor Test

The scissor test compares the framebuffer coordinates \((x_f, y_f)\) of each sample covered by a fragment against a scissor rectangle at the index equal to the fragment’s ViewportIndex.

Each scissor rectangle is defined by a VkRect2D. These values are either set by the VkPipelineViewportStateCreateInfo structure during pipeline creation, or dynamically by the vkCmdSetScissor command.

A given sample is considered inside a scissor rectangle if \(x_f\) is in the range \([\text{VkRect2D}::\text{offset}.x, \text{VkRect2D}::\text{offset}.x + \text{VkRect2D}::\text{extent}.x)\), and \(y_f\) is in the range \([\text{VkRect2D}::\text{offset}.y, \text{VkRect2D}::\text{offset}.y + \text{VkRect2D}::\text{extent}.y)\).
Samples with coordinates outside the scissor rectangle at the corresponding ViewportIndex will have their coverage set to 0.

If a render pass transform is enabled, the (offset.x and offset.y) and (extent.width and extent.height) values are transformed as described in render pass transform before participating in the scissor test.

To dynamically set the scissor rectangles, call:

```cpp
// Provided by VK_VERSION_1_0
void vkCmdSetScissor(
    VkCommandBuffer commandBuffer, 
    uint32_t firstScissor, 
    uint32_t scissorCount, 
    const VkRect2D* pScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstScissor` is the index of the first scissor whose state is updated by the command.
- `scissorCount` is the number of scissors whose rectangles are updated by the command.
- `pScissors` is a pointer to an array of VkRect2D structures defining scissor rectangles.

The scissor rectangles taken from element i of `pScissors` replace the current state for the scissor index `firstScissor + i`, for i in [0, `scissorCount`).

This command sets the scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_SCISSOR` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportStateCreateInfo::pScissors` values used to create the currently active pipeline.

### Valid Usage

- VUID-vkCmdSetScissor-firstScissor-00592
  The sum of `firstScissor` and `scissorCount` **must** be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive

- VUID-vkCmdSetScissor-firstScissor-00593
  If the `multiViewport` feature is not enabled, `firstScissor` **must** be 0

- VUID-vkCmdSetScissor-scissorCount-00594
  If the `multiViewport` feature is not enabled, `scissorCount` **must** be 1

- VUID-vkCmdSetScissor-x-00595
  The x and y members of offset member of any element of `pScissors` **must** be greater than or equal to 0

- VUID-vkCmdSetScissor-offset-00596
  Evaluation of `(offset.x + extent.width)` **must** not cause a signed integer addition overflow for any element of `pScissors`

- VUID-vkCmdSetScissor-offset-00597
Evaluation of \((\text{offset.y} + \text{extent.height})\) must not cause a signed integer addition overflow for any element of \(p\text{Scissors}\)

- VUID-vkCmdSetScissor-viewportScissor2D-04789
  If this command is recorded in a secondary command buffer with \texttt{VkCommandBufferInheritanceViewportScissorInfoNV::viewportScissor2D} enabled, then this function must not be called

### Valid Usage (Implicit)

- VUID-vkCmdSetScissor-commandBuffer-parameter
  \texttt{commandBuffer} must be a valid \texttt{VkCommandBuffer} handle

- VUID-vkCmdSetScissor-pScissors-parameter
  \texttt{pScissors} must be a valid pointer to an array of \texttt{scissorCount} \texttt{VkRect2D} structures

- VUID-vkCmdSetScissor-commandBuffer-recording
  \texttt{commandBuffer} must be in the \texttt{recording state}

- VUID-vkCmdSetScissor-commandBuffer-cmdpool
  The \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must support graphics operations

- VUID-vkCmdSetScissor-videocoding
  This command must only be called outside of a video coding scope

- VUID-vkCmdSetScissor-scissorCount-arraylength
  \texttt{scissorCount} must be greater than 0

### Host Synchronization

- Host access to \texttt{commandBuffer} must be externally synchronized

- Host access to the \texttt{VkCommandPool} that \texttt{commandBuffer} was allocated from must be externally synchronized

### Command Properties

### 28.3. Exclusive Scissor Test

The exclusive scissor test compares the framebuffer coordinates \((x, y)\) of each sample covered by a fragment against an **exclusive scissor rectangle** at the index equal to the fragment’s \texttt{ViewportIndex}. 

---

1759
Each exclusive scissor rectangle is defined by a `VkRect2D`. These values are either set by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure during pipeline creation, or dynamically by the `vkCmdSetExclusiveScissorNV` command.

A given sample is considered inside an exclusive scissor rectangle if $x_f$ is in the range $[VkRect2D::offset.x, VkRect2D::offset.x + VkRect2D::extent.x)$, and $y_f$ is in the range $[VkRect2D::offset.y, VkRect2D::offset.y + VkRect2D::extent.y)$. Samples with coordinates inside the exclusive scissor rectangle at the corresponding `ViewportIndex` will have their coverage set to 0.

If no exclusive scissor rectangles are specified, the coverage mask is unmodified by this operation.

The `VkPipelineViewportExclusiveScissorStateCreateInfoNV` structure is defined as:

```cpp
// Provided by VK_NV_scissor_exclusive
typedef struct VkPipelineViewportExclusiveScissorStateCreateInfoNV {
    VkStructureType     sType;
    const void*          pNext;
    uint32_t             exclusiveScissorCount;
    const VkRect2D*      pExclusiveScissors;
} VkPipelineViewportExclusiveScissorStateCreateInfoNV;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

If the `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` dynamic state is enabled for a pipeline, the `pExclusiveScissors` member is ignored.

When this structure is included in the `pNext` chain of `VkGraphicsPipelineCreateInfo`, it defines parameters of the exclusive scissor test. If this structure is not included in the `pNext` chain, it is equivalent to specifying this structure with a `exclusiveScissorCount` of 0.

### Valid Usage

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02027
  If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 0 or 1

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02028
  `exclusiveScissorCount` must be less than or equal to `VkPhysicalDeviceLimits::maxViewports`

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-exclusiveScissorCount-02029
  `exclusiveScissorCount` must be 0 or greater than or equal to the `viewportCount` member of `VkPipelineViewportStateCreateInfo`
Valid Usage (Implicit)

- VUID-VkPipelineViewportExclusiveScissorStateCreateInfoNV-sType-sType must be `VK_STRUCTURE_TYPE_PIPELINE_VIEWPORT_EXCLUSIVE_SCISSOR_STATE_CREATE_INFO_NV`

To dynamically set the exclusive scissor rectangles, call:

```c
// Provided by VK_NV_scissor_exclusive
void vkCmdSetExclusiveScissorNV(
    VkCommandBuffer commandBuffer,
    uint32_t firstExclusiveScissor,
    uint32_t exclusiveScissorCount,
    const VkRect2D* pExclusiveScissors);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `firstExclusiveScissor` is the index of the first exclusive scissor rectangle whose state is updated by the command.
- `exclusiveScissorCount` is the number of exclusive scissor rectangles updated by the command.
- `pExclusiveScissors` is a pointer to an array of `VkRect2D` structures defining exclusive scissor rectangles.

The scissor rectangles taken from element `i` of `pExclusiveScissors` replace the current state for the scissor index `firstExclusiveScissor + i`, for `i` in `[0, exclusiveScissorCount)`.

This command sets the exclusive scissor rectangles for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_EXCLUSIVE_SCISSOR_NV` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineViewportExclusiveScissorStateCreateInfoNV::pExclusiveScissors` values used to create the currently active pipeline.

Valid Usage

- VUID-vkCmdSetExclusiveScissorNV-None-02031 The `exclusiveScissor` feature must be enabled
- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02034 The sum of `firstExclusiveScissor` and `exclusiveScissorCount` must be between 1 and `VkPhysicalDeviceLimits::maxViewports`, inclusive
- VUID-vkCmdSetExclusiveScissorNV-firstExclusiveScissor-02035 If the `multiViewport` feature is not enabled, `firstExclusiveScissor` must be 0
- VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-02036 If the `multiViewport` feature is not enabled, `exclusiveScissorCount` must be 1
- VUID-vkCmdSetExclusiveScissorNV-x-02037
The \( x \) and \( y \) members of \( \text{offset} \) in each member of \( \text{pExclusiveScissors} \) must be greater than or equal to 0

- **VUID-vkCmdSetExclusiveScissorNV-offset-02038**
  Evaluation of \((\text{offset}.x + \text{extent}.width)\) for each member of \( \text{pExclusiveScissors} \) must not cause a signed integer addition overflow

- **VUID-vkCmdSetExclusiveScissorNV-offset-02039**
  Evaluation of \((\text{offset}.y + \text{extent}.height)\) for each member of \( \text{pExclusiveScissors} \) must not cause a signed integer addition overflow

**Valid Usage (Implicit)**

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-parameter**
  \( \text{commandBuffer} \) must be a valid \( \text{VkCommandBuffer} \) handle

- **VUID-vkCmdSetExclusiveScissorNV-pExclusiveScissors-parameter**
  \( \text{pExclusiveScissors} \) must be a valid pointer to an array of \( \text{exclusiveScissorCount} \) \( \text{VkRect2D} \) structures

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-recording**
  \( \text{commandBuffer} \) must be in the recording state

- **VUID-vkCmdSetExclusiveScissorNV-commandBuffer-cmdpool**
  The \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must support graphics operations

- **VUID-vkCmdSetExclusiveScissorNV-videocoding**
  This command must only be called outside of a video coding scope

- **VUID-vkCmdSetExclusiveScissorNV-exclusiveScissorCount-arraylength**
  \( \text{exclusiveScissorCount} \) must be greater than 0

**Host Synchronization**

- Host access to \( \text{commandBuffer} \) must be externally synchronized

- Host access to the \( \text{VkCommandPool} \) that \( \text{commandBuffer} \) was allocated from must be externally synchronized

28.4. Sample Mask Test

The sample mask test compares the coverage mask for a fragment with the sample mask defined by 
VkPipelineMultisampleStateCreateInfo::pSampleMask.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in VkPipelineMultisampleStateCreateInfo::pSampleMask which is associated with that same sample index is set to 0, the coverage mask bit is set to 0.

28.5. Fragment Shading

Fragment shaders are invoked for each fragment, or as helper invocations.

Most operations in the fragment shader are not performed in rasterization order, with exceptions called out in the following sections.

For fragment shaders invoked by fragments, the following rules apply:

- A fragment shader must not be executed if a fragment operation that executes before fragment shading discards the fragment.
- A fragment shader may not be executed if:
  - An implementation determines that another fragment shader, invoked by a subsequent primitive in primitive order, overwrites all results computed by the shader (including writes to storage resources).
  - Any other fragment operation discards the fragment, and the shader does not write to any storage resources.
- Otherwise, at least one fragment shader must be executed.
  - If sample shading is enabled and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - If a shading rate image is used and multiple invocations per fragment are required, additional invocations must be executed as specified.
  - Each covered sample must be included in at least one fragment shader invocation.

Note

Multiple fragment shader invocations may be executed for the same fragment for any number of implementation-dependent reasons. When there is more than one fragment shader invocation per fragment, the association of samples to invocations is implementation-dependent. Stores and atomics performed by these additional invocations have the normal effect.

For example, if the subpass includes multiple views in its view mask, a fragment shader may be invoked separately for each view.

Similarly, if the render pass has a fragment density map attachment, more than one fragment shader invocation may be invoked for each covered sample. Such additional invocations are only produced if
VkPhysicalDeviceFragmentDensityMapPropertiesEXT::fragmentDensityInvocations is VK_TRUE. Implementations may generate these additional fragment shader invocations in order to make transitions between fragment areas with different fragment densities more smooth.

### 28.5.1. Sample Mask

Reading from the SampleMask built-in in the Input storage class will return the coverage mask for the current fragment as calculated by fragment operations that executed prior to fragment shading.

If sample shading is enabled, fragment shaders will only see values of 1 for samples being shaded - other bits will be 0.

Each bit of the coverage mask is associated with a sample index as described in the rasterization chapter. If the bit in SampleMask which is associated with that same sample index is set to 0, that coverage mask bit is set to 0.

Values written to the SampleMask built-in in the Output storage class will be used by the multisample coverage operation, with the same encoding as the input built-in.

### 28.5.2. Depth Replacement

Writing to the FragDepth built-in will replace the fragment's calculated depth values for each sample in the input SampleMask. Depth testing performed after the fragment shader for this fragment will use this new value as \(z_f\).

### 28.5.3. Stencil Reference Replacement

Writing to the FragStencilRefEXT built-in will replace the fragment's stencil reference value for each sample in the input SampleMask. Stencil testing performed after the fragment shader for this fragment will use this new value as \(s_r\).

### 28.5.4. Interlocked Operations

OpBeginInvocationInterlockEXT and OpEndInvocationInterlockEXT define a section of a fragment shader which imposes additional ordering constraints on operations performed within them. These operations are defined as interlocked operations. How interlocked operations are ordered against other fragment shader invocations depends on the specified execution modes.

If the ShadingRateInterlockOrderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before interlocked operations in fragment shader invocations that execute later in rasterization order and cover at least one sample in the same fragment area, and must happen after interlocked operations in a fragment shader that executes earlier in rasterization order and cover at least one sample in the same fragment area.

If the ShadingRateInterlockUnorderedEXT execution mode is specified, any interlocked operations in a fragment shader must happen before or after interlocked operations in fragment shader invocations that execute earlier or later in rasterization order and cover at least one sample in the same fragment area.
If the \texttt{PixelInterlockOrderedEXT} execution mode is specified, any interlocked operations in a fragment shader \textbf{must} happen before interlocked operations in fragment shader invocations that execute later in \textit{rasterization order} and cover at least one sample in the same pixel, and \textbf{must} happen after interlocked operations in a fragment shader that executes earlier in \textit{rasterization order} and cover at least one sample in the same pixel.

If the \texttt{PixelInterlockUnorderedEXT} execution mode is specified, any interlocked operations in a fragment shader \textbf{must} happen before or after interlocked operations in fragment shader invocations that execute earlier or later in \textit{rasterization order} and cover at least one sample in the same pixel.

If the \texttt{SampleInterlockOrderedEXT} execution mode is specified, any interlocked operations in a fragment shader \textbf{must} happen before interlocked operations in fragment shader invocations that execute later in \textit{rasterization order} and cover at least one of the same samples, and \textbf{must} happen after interlocked operations in a fragment shader that executes earlier in \textit{rasterization order} and cover at least one of the same samples.

If the \texttt{SampleInterlockUnorderedEXT} execution mode is specified, any interlocked operations in a fragment shader \textbf{must} happen before or after interlocked operations in fragment shader invocations that execute earlier or later in \textit{rasterization order} and cover at least one of the same samples.

### 28.6. Multisample Coverage

If a fragment shader is active and its entry point's interface includes a built-in output variable decorated with \texttt{SampleMask}, but not \texttt{OverrideCoverageNV}, the coverage mask is \texttt{ANDed} with the bits of the \texttt{SampleMask} built-in to generate a new coverage mask. If the \texttt{SampleMask} built-in is also decorated with \texttt{OverrideCoverageNV}, the coverage mask is replaced with the mask bits set in the shader. If \textit{sample shading} is enabled, bits written to \texttt{SampleMask} corresponding to samples that are not being shaded by the fragment shader invocation are ignored. If no fragment shader is active, or if the active fragment shader does not include \texttt{SampleMask} in its interface, the coverage mask is not modified.

Next, the fragment alpha value and coverage mask are modified based on the line coverage factor if the \texttt{lineRasterizationMode} member of the \texttt{VkPipelineRasterizationStateCreateInfo} structure is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT}, and the \texttt{alphaToCoverageEnable} and \texttt{alphaToOneEnable} members of the \texttt{VkPipelineMultisampleStateCreateInfo} structure.

All alpha values in this section refer only to the alpha component of the fragment shader output that has a \texttt{Location} and \texttt{Index} decoration of zero (see the \texttt{Fragment Output Interface} section). If that shader output has an integer or unsigned integer type, then these operations are skipped.

If the \texttt{lineRasterizationMode} member of the \texttt{VkPipelineRasterizationStateCreateInfo} structure is \texttt{VK_LINE_RASTERIZATION_MODE_RECTANGULAR_SMOOTH_EXT} and the fragment came from a line segment, then the alpha value is replaced by multiplying it by the coverage factor for the fragment computed during \textit{smooth line rasterization}.

If \texttt{alphaToCoverageEnable} is enabled, a temporary coverage mask is generated where each bit is determined by the fragment's alpha value, which is \texttt{ANDed} with the fragment coverage mask.
No specific algorithm is specified for converting the alpha value to a temporary coverage mask. It is intended that the number of 1’s in this value be proportional to the alpha value (clamped to \([0,1]\)) with all 1’s corresponding to a value of 1.0 and all 0’s corresponding to 0.0. The algorithm may be different at different framebuffer coordinates.

**Note**

Using different algorithms at different framebuffer coordinates may help to avoid artifacts caused by regular coverage sample locations.

Finally, if `alphaToOneEnable` is enabled, each alpha value is replaced by the maximum representable alpha value for fixed-point color attachments, or by 1.0 for floating-point attachments. Otherwise, the alpha values are not changed.

### 28.7. Depth and Stencil Operations

Pipeline state controlling the depth bounds tests, stencil test, and depth test is specified through the members of the `VkPipelineDepthStencilStateCreateInfo` structure.

The `VkPipelineDepthStencilStateCreateInfo` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkPipelineDepthStencilStateCreateInfo {
    VkStructureType sType;
    const void* pNext;
    VkPipelineDepthStencilStateCreateFlags flags;
    VkBool32 depthTestEnable;
    VkBool32 depthWriteEnable;
    VkCompareOp depthCompareOp;
    VkBool32 depthBoundsTestEnable;
    VkBool32 stencilTestEnable;
    VkStencilOpState front;
    VkStencilOpState back;
    float minDepthBounds;
    float maxDepthBounds;
} VkPipelineDepthStencilStateCreateInfo;
```

- `sType` is the type of this structure.
- `pNext` is `NULL` or a pointer to a structure extending this structure.
- `flags` is a bitmask of `VkPipelineDepthStencilStateCreateFlagBits` specifying additional depth/stencil state information.
- `depthTestEnable` controls whether depth testing is enabled.
- `depthWriteEnable` controls whether depth writes are enabled when `depthTestEnable` is `VK_TRUE`. Depth writes are always disabled when `depthTestEnable` is `VK_FALSE`.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator to use in the Depth Comparison step of the depth test.
• `depthBoundsTestEnable` controls whether **depth bounds testing** is enabled.
• `stencilTestEnable` controls whether **stencil testing** is enabled.
• `front` and `back` control the parameters of the **stencil test**.
• `minDepthBounds` is the minimum depth bound used in the **depth bounds test**.
• `maxDepthBounds` is the maximum depth bound used in the **depth bounds test**.

### Valid Usage

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthBoundsTestEnable-00598**  
  If the `depthBounds` feature is not enabled, `depthBoundsTestEnable` must be `VK_FALSE`

- **VUID-VkPipelineDepthStencilStateCreateInfo-separateStencilMaskRef-04453**  
  If the `VK_KHR_portability_subset` extension is enabled, and `VkPhysicalDevicePortabilitySubsetFeaturesKHR::separateStencilMaskRef` is `VK_FALSE`, and the value of `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable` is `VK_TRUE`, and the value of `reference` in each of the `VkStencilOpState` structs in `front` and `back` must be the same

### Valid Usage (Implicit)

- **VUID-VkPipelineDepthStencilStateCreateInfo-sType-sType**  
  `sType` must be `VK_STRUCTURE_TYPE_PIPELINE_DEPTH_STENCIL_STATE_CREATE_INFO`

- **VUID-VkPipelineDepthStencilStateCreateInfo-pNext-pNext**  
  `pNext` must be `NULL`

- **VUID-VkPipelineDepthStencilStateCreateInfo-flags-parameter**  
  `flags` must be a valid combination of `VkPipelineDepthStencilStateCreateFlagBits` values

- **VUID-VkPipelineDepthStencilStateCreateInfo-depthCompareOp-parameter**  
  `depthCompareOp` must be a valid `VkCompareOp` value

- **VUID-VkPipelineDepthStencilStateCreateInfo-front-parameter**  
  `front` must be a valid `VkStencilOpState` structure

- **VUID-VkPipelineDepthStencilStateCreateInfo-back-parameter**
vkPipelineDepthStencilStateCreateFlags is a bitmask type for setting a mask of zero or more VkPipelineDepthStencilStateCreateFlagBits.

Bits which can be set in the VkPipelineDepthStencilStateCreateInfo::flags parameter are:

```c
// Provided by VK_ARM_rasterization_order_attachment_access
typedef enum VkPipelineDepthStencilStateCreateFlagBits {
    // Provided by VK_ARM_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM = 0x00000001,
    // Provided by VK_ARM_rasterization_order_attachment_access

    VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM = 0x00000002,
} VkPipelineDepthStencilStateCreateFlagBits;
```

- **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_DEPTH_ACCESS_BIT_ARM** indicates that access to the depth aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies. See renderpass feedback loops for more information.

- **VK_PIPELINE_DEPTH_STENCIL_STATE_CREATE_RASTERIZATION_ORDER_ATTACHMENT_STENCIL_ACCESS_BIT_ARM** indicates that access to the stencil aspects of depth/stencil and input attachments will have implicit framebuffer-local memory dependencies. See renderpass feedback loops for more information.

28.8. Depth Bounds Test

The depth bounds test compares the depth value $z_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against a set of depth bounds.

The depth bounds are determined by two floating point values defining a minimum ($\text{minDepthBounds}$) and maximum ($\text{maxDepthBounds}$) depth value. These values are either set by the VkPipelineDepthStencilStateCreateInfo structure during pipeline creation, or dynamically by vkCmdSetDepthBoundsTestEnable and vkCmdSetDepthBounds.

A given sample is considered within the depth bounds if $z_a$ is in the range $[\text{minDepthBounds}, \text{maxDepthBounds}]$. Samples with depth attachment values outside of the depth bounds will have their coverage set to 0.

If the depth bounds test is disabled, or if there is no depth attachment, the coverage mask is unmodified by this operation.

To dynamically enable or disable the depth bounds test, call:
```c
void vkCmdSetDepthBoundsTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

or the equivalent command

```c
void vkCmdSetDepthBoundsTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthBoundsTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthBoundsTestEnable` specifies if the depth bounds test is enabled.

This command sets the depth bounds enable for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS_TEST_ENABLE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthBoundsTestEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-parameter
  commandBuffer must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-recording
  commandBuffer must be in the recording state
- VUID-vkCmdSetDepthBoundsTestEnable-commandBuffer-cmdpool
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthBoundsTestEnable-videocoding
  This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized
**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the depth bounds range, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetDepthBounds(
    VkCommandBuffer commandBuffer,
    float minDepthBounds,
    float maxDepthBounds);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `minDepthBounds` is the minimum depth bound.
- `maxDepthBounds` is the maximum depth bound.

This command sets the depth bounds range for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_BOUNDS` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::minDepthBounds` and `VkPipelineDepthStencilStateCreateInfo::maxDepthBounds` values used to create the currently active pipeline.

### Valid Usage

- **VUID-vkCmdSetDepthBounds-minDepthBounds-00600**
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `minDepthBounds` must be between 0.0 and 1.0, inclusive.

- **VUID-vkCmdSetDepthBounds-maxDepthBounds-00601**
  Unless the `VK_EXT_depth_range_unrestricted` extension is enabled, `maxDepthBounds` must be between 0.0 and 1.0, inclusive.

### Valid Usage (Implicit)

- **VUID-vkCmdSetDepthBounds-commandBuffer-parameter**
  `commandBuffer` must be a valid `VkCommandBuffer` handle.

- **VUID-vkCmdSetDepthBounds-commandBuffer-recording**
  `commandBuffer` must be in the recording state.

- **VUID-vkCmdSetDepthBounds-commandBuffer-cmdpool**
  The `VkCommandPool` that `commandBuffer` was allocated from must support graphics.
• VUID-vkCmdSetDepthBounds-videocoding
  This command **must** only be called outside of a video coding scope

**Host Synchronization**

• Host access to `commandBuffer` **must** be externally synchronized
• Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized

**Command Properties**

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 28.9. Stencil Test

The stencil test compares the stencil attachment value \( s_a \) in the depth/stencil attachment at each sample’s framebuffer coordinates \((x_f, y_f)\) and sample index \( i \) against a **stencil reference value**.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels, there is an implementation-dependent association of coverage samples to stencil attachment samples within the fragment. However, if all samples in the fragment are covered, and the stencil attachment value is updated as a result of this test, all stencil attachment samples will be updated.

If the stencil test is not enabled, as specified by `vkCmdSetStencilTestEnable` or `VkPipelineDepthStencilStateCreateInfo::stencilTestEnable`, or if there is no stencil attachment, the coverage mask is unmodified by this operation.

The stencil test is controlled by one of two sets of stencil-related state, the front stencil state and the back stencil state. Stencil tests and writes use the back stencil state when processing fragments generated by **back-facing polygons**, and the front stencil state when processing fragments generated by **front-facing polygons** or any other primitives.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetStencilOp::compareOp`, or by `VkStencilOpState::compareOp` during pipeline creation.

The compare mask \( s_c \) and stencil reference value \( s_r \) of the front or the back stencil state set determine arguments of the comparison operation. \( s_c \) is set by the `VkPipelineDepthStencilStateCreateInfo` structure during pipeline creation, or by the `vkCmdSetStencilCompareMask` command. \( s_r \) is set by `VkPipelineDepthStencilStateCreateInfo` or by `vkCmdSetStencilReference`.  

---

1771
s_r and s_a are each independently combined with s_c using a bitwise AND operation to create masked reference and attachment values s'_r and s'_a. s'_r and s'_a are used as the reference and test values, respectively, in the operation specified by the VkCompareOp.

If the comparison evaluates to false, the coverage for the sample is set to 0.

A new stencil value s_g is generated according to a stencil operation defined by VkStencilOp parameters set by vkCmdSetStencilOp or VkPipelineDepthStencilStateCreateInfo. If the stencil test fails, failOp defines the stencil operation used. If the stencil test passes however, the stencil op used is based on the depth test - if it passes, VkPipelineDepthStencilStateCreateInfo::passOp is used, otherwise VkPipelineDepthStencilStateCreateInfo::depthFailOp is used.

The stencil attachment value s_a is then updated with the generated stencil value s_g according to the write mask s_w defined by VkPipelineDepthStencilStateCreateInfo::writeMask as:

\[ s_a = (s_a \& \neg s_w) \mid (s_g \& s_w) \]

To dynamically enable or disable the stencil test, call:

```c
void vkCmdSetStencilTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

or the equivalent command

```c
void vkCmdSetStencilTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 stencilTestEnable);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `stencilTestEnable` specifies if the stencil test is enabled.

This command sets the stencil test enable for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_TEST_ENABLE set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkPipelineDepthStencilStateCreateInfo::stencilTestEnable value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilTestEnable-commandBuffer-parameter
- commandBuffer must be a valid VkCommandBuffer handle
- VUID-vkCmdSetStencilTestEnable-commandBuffer-recording
commandBuffer must be in the recording state

- VUID-vkCmdSetStencilTestEnable-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations
- VUID-vkCmdSetStencilTestEnable-videocoding
  This command must only be called outside of a video coding scope

Host Synchronization

- Host access to commandBuffer must be externally synchronized
- Host access to the VkCommandPool that commandBuffer was allocated from must be externally synchronized

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To dynamically set the stencil operation, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetStencilOp(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetStencilOpEXT(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    VkStencilOp failOp,
    VkStencilOp passOp,
    VkStencilOp depthFailOp,
    VkCompareOp compareOp);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **faceMask** is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the stencil operation.
• **failOp** is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
• **passOp** is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
• **depthFailOp** is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
• **compareOp** is a `VkCompareOp` value specifying the comparison operator used in the stencil test.

This command sets the stencil operation for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the corresponding `VkPipelineDepthStencilStateCreateInfo::failOp`, `passOp`, `depthFailOp`, and `compareOp` values used to create the currently active pipeline, for both front and back faces.

---

**Valid Usage (Implicit)**

- VUID-vkCmdSetStencilOp-commandBuffer-parameter
  commandBuffer **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilOp-faceMask-parameter
  faceMask **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilOp-faceMask-required bitmask
  faceMask **must** not be 0
- VUID-vkCmdSetStencilOp-failOp-parameter
  failOp **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-passOp-parameter
  passOp **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-depthFailOp-parameter
  depthFailOp **must** be a valid `VkStencilOp` value
- VUID-vkCmdSetStencilOp-compareOp-parameter
  compareOp **must** be a valid `VkCompareOp` value
- VUID-vkCmdSetStencilOp-commandBuffer-recording
  commandBuffer **must** be in the recording state
- VUID-vkCmdSetStencilOp-commandBuffer-cmdpool
  The `VkCommandPool` that commandBuffer was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilOp-videocoding
  This command **must** only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

The `VkStencilOpState` structure is defined as:

```c
// Provided by VK_VERSION_1_0
typedef struct VkStencilOpState {
    VkStencilOp failOp;
    VkStencilOp passOp;
    VkStencilOp depthFailOp;
    VkCompareOp compareOp;
    uint32_t compareMask;
    uint32_t writeMask;
    uint32_t reference;
} VkStencilOpState;
```

- `failOp` is a `VkStencilOp` value specifying the action performed on samples that fail the stencil test.
- `passOp` is a `VkStencilOp` value specifying the action performed on samples that pass both the depth and stencil tests.
- `depthFailOp` is a `VkStencilOp` value specifying the action performed on samples that pass the stencil test and fail the depth test.
- `compareOp` is a `VkCompareOp` value specifying the comparison operator used in the stencil test.
- `compareMask` selects the bits of the unsigned integer stencil values participating in the stencil test.
- `writeMask` selects the bits of the unsigned integer stencil values updated by the stencil test in the stencil framebuffer attachment.
- `reference` is an integer stencil reference value that is used in the unsigned stencil comparison.

Valid Usage (Implicit)

- VUID-VkStencilOpState-failOp-parameter
failOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-passOp-parameter
  passOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-depthFailOp-parameter
  depthFailOp must be a valid VkStencilOp value

- VUID-VkStencilOpState-compareOp-parameter
  compareOp must be a valid VkCompareOp value

To dynamically set the stencil compare mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilCompareMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t compareMask);
```

- commandBuffer is the command buffer into which the command will be recorded.
- faceMask is a bitmask of VkStencilFaceFlagBits specifying the set of stencil state for which to update the compare mask.
- compareMask is the new value to use as the stencil compare mask.

This command sets the stencil compare mask for subsequent drawing commands when the graphics pipeline is created with VK_DYNAMIC_STATE_STENCIL_COMPARE_MASK set in VkPipelineDynamicStateCreateInfo::pDynamicStates. Otherwise, this state is specified by the VkStencilOpState::compareMask value used to create the currently active pipeline, for both front and back faces.

Valid Usage (Implicit)

- VUID-vkCmdSetStencilCompareMask-commandBuffer-parameter
  commandBuffer must be a valid VkCommandBuffer handle

- VUID-vkCmdSetStencilCompareMask-faceMask-parameter
  faceMask must be a valid combination of VkStencilFaceFlagBits values

- VUID-vkCmdSetStencilCompareMask-faceMask-requiredbitsetmask
  faceMask must not be 0

- VUID-vkCmdSetStencilCompareMask-commandBuffer-recording
  commandBuffer must be in the recording state

- VUID-vkCmdSetStencilCompareMask-commandBuffer-cmdpool
  The VkCommandPool that commandBuffer was allocated from must support graphics operations

- VUID-vkCmdSetStencilCompareMask-videocoding
  This command must only be called outside of a video coding scope
Host Synchronization

- Host access to `commandBuffer` must be externally synchronized.
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized.

Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

`VkStencilFaceFlagBits` values are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilFaceFlagBits {
    VK_STENCIL_FACE_FRONT_BIT = 0x00000001,
    VK_STENCIL_FACE_BACK_BIT = 0x00000002,
    VK_STENCIL_FACE_FRONT_AND_BACK = 0x00000003,
    VK_STENCIL_FRONT_AND_BACK = VK_STENCIL_FACE_FRONT_AND_BACK,
} VkStencilFaceFlagBits;
```

- `VK_STENCIL_FACE_FRONT_BIT` specifies that only the front set of stencil state is updated.
- `VK_STENCIL_FACE_BACK_BIT` specifies that only the back set of stencil state is updated.
- `VK_STENCIL_FACE_FRONT_AND_BACK` is the combination of `VK_STENCIL_FACE_FRONT_BIT` and `VK_STENCIL_FACE_BACK_BIT`, and specifies that both sets of stencil state are updated.

```c
// Provided by VK_VERSION_1_0
typedef VkFlags VkStencilFaceFlags;
```

`VkStencilFaceFlags` is a bitmask type for setting a mask of zero or more `VkStencilFaceFlagBits`.

To dynamically set the stencil write mask, call:

```c
// Provided by VK_VERSION_1_0
void vkCmdSetStencilWriteMask(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t writeMask);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
• **faceMask** is a bitmask of *VkStencilFaceFlagBits* specifying the set of stencil state for which to update the write mask, as described above for *vkCmdSetStencilCompareMask*.

• **writeMask** is the new value to use as the stencil write mask.

This command sets the stencil write mask for subsequent drawing commands when the graphics pipeline is created with *VK_DYNAMIC_STATE_STENCIL_WRITE_MASK* set in *VkPipelineDynamicStateCreateInfo::pDynamicStates*. Otherwise, this state is specified by the *VkPipelineDepthStencilStateCreateInfo::writeMask* value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilWriteMask-commandBuffer-parameter
  - `commandBuffer` must be a valid *VkCommandBuffer* handle

- VUID-vkCmdSetStencilWriteMask-faceMask-parameter
  - `faceMask` must be a valid combination of *VkStencilFaceFlagBits* values

- VUID-vkCmdSetStencilWriteMask-faceMask-requiredbitmask
  - `faceMask` must not be 0

- VUID-vkCmdSetStencilWriteMask-commandBuffer-recording
  - `commandBuffer` must be in the recording state

- VUID-vkCmdSetStencilWriteMask-commandBuffer-cmdpool
  - The *VkCommandPool* that `commandBuffer` was allocated from must support graphics operations

- VUID-vkCmdSetStencilWriteMask-videoencoding
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized

- Host access to the *VkCommandPool* that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>

<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

To **dynamically set** the stencil reference value, call:
void vkCmdSetStencilReference(
    VkCommandBuffer commandBuffer,
    VkStencilFaceFlags faceMask,
    uint32_t reference);

- `commandBuffer` is the command buffer into which the command will be recorded.
- `faceMask` is a bitmask of `VkStencilFaceFlagBits` specifying the set of stencil state for which to update the reference value, as described above for `vkCmdSetStencilCompareMask`.
- `reference` is the new value to use as the stencil reference value.

This command sets the stencil reference value for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_STENCIL_REFERENCE` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::reference` value used to create the currently active pipeline, for both front and back faces.

### Valid Usage (Implicit)

- VUID-vkCmdSetStencilReference-commandBuffer-parameter
  - `commandBuffer` **must** be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetStencilReference-faceMask-parameter
  - `faceMask` **must** be a valid combination of `VkStencilFaceFlagBits` values
- VUID-vkCmdSetStencilReference-faceMask-requiredbitmask
  - `faceMask` **must** not be 0
- VUID-vkCmdSetStencilReference-commandBuffer-recording
  - `commandBuffer` **must** be in the recording state
- VUID-vkCmdSetStencilReference-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from **must** support graphics operations
- VUID-vkCmdSetStencilReference-videocoding
  - This command **must** only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` **must** be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from **must** be externally synchronized
## Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Possible values of the `failOp`, `passOp`, and `depthFailOp` members of `VkStencilOpState`, specifying what happens to the stored stencil value if this or certain subsequent tests fail or pass, are:

```c
// Provided by VK_VERSION_1_0
typedef enum VkStencilOp {
    VK_STENCIL_OP_KEEP = 0,
    VK_STENCIL_OP_ZERO = 1,
    VK_STENCIL_OP_REPLACE = 2,
    VK_STENCIL_OP_INCREMENT_AND_CLAMP = 3,
    VK_STENCIL_OP_DECREMENT_AND_CLAMP = 4,
    VK_STENCIL_OP_INVERT = 5,
    VK_STENCIL_OP_INCREMENT_AND_WRAP = 6,
    VK_STENCIL_OP_DECREMENT_AND_WRAP = 7,
} VkStencilOp;
```

- `VK_STENCIL_OP_KEEP` keeps the current value.
- `VK_STENCIL_OP_ZERO` sets the value to 0.
- `VK_STENCIL_OP_REPLACE` sets the value to reference.
- `VK_STENCIL_OP_INCREMENT_AND_CLAMP` increments the current value and clamps to the maximum representable unsigned value.
- `VK_STENCIL_OP_DECREMENT_AND_CLAMP` decrements the current value and clamps to 0.
- `VK_STENCIL_OP_INVERT` bitwise-inverts the current value.
- `VK_STENCIL_OP_INCREMENT_AND_WRAP` increments the current value and wraps to 0 when the maximum value would have been exceeded.
- `VK_STENCIL_OP_DECREMENT_AND_WRAP` decrements the current value and wraps to the maximum possible value when the value would go below 0.

For purposes of increment and decrement, the stencil bits are considered as an unsigned integer.

### 28.10. Depth Test

The depth test compares the depth value $z_a$ in the depth/stencil attachment at each sample’s framebuffer coordinates $(x_f, y_f)$ and sample index $i$ against the sample’s depth value $z_f$. If there is no depth attachment then the depth test is skipped.

If the render pass has a fragment density map attachment and the fragment covers multiple pixels,
there is an implementation-dependent association of rasterization samples to depth attachment samples within the fragment. However, if all samples in the fragment are covered, and the depth attachment value is updated as a result of this test, all depth attachment samples will be updated.

The depth test occurs in three stages, as detailed in the following sections.

### 28.10.1. Depth Clamping and Range Adjustment

If `VkPipelineRasterizationStateCreateInfo::depthClampEnable` is enabled, before the sample’s \( z_t \) is compared to \( z_a \), \( z_t \) is clamped to \([\min(n,f),\max(n,f)]\), where \( n \) and \( f \) are the `minDepth` and `maxDepth` depth range values of the viewport used by this fragment, respectively.

If depth clamping is not enabled and \( z_t \) is not in the range \([0, 1]\) and either `VK_EXT_depth_range_unrestricted` is not enabled, or the depth attachment has a fixed-point format, then \( z_t \) is undefined following this step.

### 28.10.2. Depth Comparison

If the depth test is not enabled, as specified by `vkCmdSetDepthTestEnable` or `VkPipelineDepthStencilStateCreateInfo::depthTestEnable`, then this step is skipped.

The comparison operation performed is determined by the `VkCompareOp` value set by `vkCmdSetDepthCompareOp`, or by `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` during pipeline creation. \( z_t \) and \( z_a \) are used as the `reference` and `test` values, respectively, in the operation specified by the `VkCompareOp`.

If the comparison evaluates to false, the coverage for the sample is set to 0.

### 28.10.3. Depth Attachment Writes

If depth writes are enabled, as specified by `vkCmdSetDepthWriteEnable` or `VkPipelineDepthStencilStateCreateInfo::depthWriteEnable`, and the comparison evaluated to true, the depth attachment value \( z_a \) is set to the sample’s depth value \( z_t \). If there is no depth attachment, no value is written.

To dynamically enable or disable the depth test, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthTestEnable(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```

or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthTestEnableEXT(
    VkCommandBuffer commandBuffer,
    VkBool32 depthTestEnable);
```
• **commandBuffer** is the command buffer into which the command will be recorded.
• **depthTestEnable** specifies if the depth test is enabled.

This command sets the depth test enable for subsequent drawing commands when the graphics pipeline is created with **VK_DYNAMIC_STATE_DEPTH_TEST_ENABLE** set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthTestEnable` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthTestEnable-commandBuffer-parameter
  - `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthTestEnable-commandBuffer-recording
  - `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthTestEnable-commandBuffer-cmdpool
  - The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthTestEnable-videocoding
  - This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
- Host access to the `VkCommandPool` that `commandBuffer` was allocated from must be externally synchronized

### Command Properties

<table>
<thead>
<tr>
<th>Command Buffer Levels</th>
<th>Render Pass Scope</th>
<th>Video Coding Scope</th>
<th>Supported Queue Types</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Both</td>
<td>Outside</td>
<td>Graphics</td>
</tr>
<tr>
<td>Secondary</td>
<td></td>
<td></td>
<td></td>

</tbody>
</table>

To **dynamically set** the depth compare operator, call:

```c
// Provided by VK_VERSION_1_3
void vkCmdSetDepthCompareOp(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```
or the equivalent command

```c
// Provided by VK_EXT_extended_dynamic_state
void vkCmdSetDepthCompareOpEXT(
    VkCommandBuffer commandBuffer,
    VkCompareOp depthCompareOp);
```

- `commandBuffer` is the command buffer into which the command will be recorded.
- `depthCompareOp` is a `VkCompareOp` value specifying the comparison operator used for the Depth Comparison step of the depth test.

This command sets the depth comparison operator for subsequent drawing commands when the graphics pipeline is created with `VK_DYNAMIC_STATE_DEPTH_COMPARE_OP` set in `VkPipelineDynamicStateCreateInfo::pDynamicStates`. Otherwise, this state is specified by the `VkPipelineDepthStencilStateCreateInfo::depthCompareOp` value used to create the currently active pipeline.

### Valid Usage (Implicit)

- VUID-vkCmdSetDepthCompareOp-commandBuffer-parameter `commandBuffer` must be a valid `VkCommandBuffer` handle
- VUID-vkCmdSetDepthCompareOp-depthCompareOp-parameter `depthCompareOp` must be a valid `VkCompareOp` value
- VUID-vkCmdSetDepthCompareOp-commandBuffer-recording `commandBuffer` must be in the recording state
- VUID-vkCmdSetDepthCompareOp-commandBuffer-cmdpool The `VkCommandPool` that `commandBuffer` was allocated from must support graphics operations
- VUID-vkCmdSetDepthCompareOp-videocoding This command must only be called outside of a video coding scope

### Host Synchronization

- Host access to `commandBuffer` must be externally synchronized
